I am writing to register my concerns about the proposal to build an IRY on the land east of Eastlands Industrial Estate and would be grateful for answers to the following questions which clearly reflect my specific concerns about this development, assuming that it goes ahead :

When is it likely that the IRY will be built?

For how many years will the IRY be operational?

Will the IRY be removed once work on the nuclear power station has been completed or will the IRY be retained, eg for ongoing service and maintenance of the main site?

Concerning pollutants, particularly air pollution, what are the types of gases, particulates and other polluting material, whether solid, liquid or gas, which the IRY will produce?

Considering the location of the proposed IRY is within 100 to 200 metres of domestic dwellings in Leiston, what control measures will be in place to prevent the escape of any pollutants or other materials harmful to human health and the local environment?

What are the permitted legal prescriptions (concentrations in air, water and soil) in respect of the release into the immediate and local environment of any pollutants or other materials resulting from the operation of the IRY?

How will pollution from the IRY be monitored, over what area (radius in metres/kilometres), how frequently and by whom (eg independently by Environment Agency)?

Will all monitoring data be made available immediately to local residents and in the wider public domain?

Given the location is in close proximity of domestic dwellings, what are the legally permissable levels of light and noise pollution resulting from the IRY operation?

Over what period of time per day is it permitted to maintain these intensive light and noise levels?

I would be grateful for clear and complete answers to each of these specific questions, item by item, rather than a reference via a digital link to documentary information.

Timothy Rose
