LSE	Likely Significant Effect
SAC	Special Area of Conservation
SCI	Site of Community Importance
SPA	Special Protection Area

East Anglia TWO Offshore Windfarm 5.3.2 Information to Support AA – Screening Matrices

Glossary of Terminology

Applicant	East Anglia TWO Limited.
East Anglia TWO project	The proposed project consisting of up to 75 wind turbines, up to four offshore electrical platforms, up to one construction, operation and maintenance platform, inter-array cables, platform link cables, up to one operational meteorological mast, up to two offshore export cables, fibre optic cables, landfall infrastructure, onshore cables and ducts, onshore substation, and National Grid infrastructure.
East Anglia TWO windfarm site	The offshore area within which wind turbines and offshore platforms will be located.
European site	Sites designated for nature conservation under the Habitats Directive and Birds Directive, as defined in regulation 8 of the Conservation of Habitats and Species Regulations 2017 and regulation 18 of the Conservation of Offshore Marine Habitats and Species Regulations 2017. These include candidate Special Areas of Conservation, Sites of Community Importance, Special Areas of Conservation and Special Protection Areas.
Evidence Plan Process (EPP)	A voluntary consultation process with specialist stakeholders to agree the approach to the EIA and the information required to support HRA.
Natura 2000 site	A site forming part of the network of sites made up of Special Areas of Conservation and Special Protection Areas designated respectively under the Habitats Directive and Birds Directive.
Offshore cable corridor	This is the area which will contain the offshore export cables between offshore electrical platforms and landfall.
Offshore development area	The East Anglia TWO windfarm site and offshore cable corridor (up to Mean High Water Springs).
Offshore export cables	The cables which would bring electricity from the offshore electrical platforms to the landfall. These cables will include fibre optic cables.
Offshore infrastructure	All of the offshore infrastructure including wind turbines, platforms, and cables.

2.3	Assessment of potential effects	16

1 Introduction

- This document provides the Information to Support Appropriate Assessment Report screening matrices for the proposed East Anglia TWO project. The matrices summarise information provided in *Appendix 1* (Offshore Habitats Regulations Assessment (HRA) Screening) of the Information to Support Appropriate Assessment (AA) report (document reference 5.3).
- 2. For Deadline 1 this document has been revised to address the following:
 - A request from the Examining Authority to include the following sites that were missing from the Screening Matrices submitted with the application (Question 1.2.3):
 - Plymouth Sound and Estuaries SAC
 - Severn Estuary SAC
 - o River Avon SAC
 - Havet Omkring Nordre Ronner (SAC or SPA not stated)
 - Knudegrund SAC
 - Lønstrup Rødgrund SAC
 - Sandbanker ud for Thorsminde SAC
 - Sandbanker ud for Thyboron SAC
 - Thyboron Stenvolde SCI
 - Littoral Cauchois SAC
 - Panache De La Gironde Et Plateau Rocheux De Cordouan (Système Pertuis Gironde) SAC
 - Pertuis Charentais SAC
 - Mühlenberger Loch / Nessand SCISPA
 - SchleswigHolsteinisches Elbastuar und angrenzende Flachen SAC
 - Unterelbe SCI
 - Saxa Water SPA and Ramsar site (this was a typographic error in the HRA screening report (APP-044) and should be 'Hamford Water SPA and Ramsar site'. Hamford Water SPA and Ramsar site was excluded from the screening matrices in error and has now been included)
 - Schleswig-Holsteinisches Elbastuar und angrenzende Flachen SAC

 Provide a revised version of the matrices with footnotes updated to include document and paragraph number references to the application materials where the evidence can be found (Question 1.2.4).

2 Screening Matrices

2.1 Effects Considered

4.3. Potential effects upon the European sites which are considered within the submitted Information to Support AA report are provided in *Table 2.1*.

Table 2.1 Potential Effects consider in Screening

Site Type	Feature(s)	Potential Effects
Special Protection Area (SPA)	All birds	Offshore effects:
Special Area of Conservation/Site of Community Importance (SAC/SCI)	Benthic habitats	 Permanent loss (and introduction of new sediment where applicable) Temporary physical disturbance Smothering due to increased suspended sediment Re- mobilisation of contaminated sediments Underwater noise and vibration Cumulative/ In-combination
	Marine mammals	 Underwater noise Vessel Interactions Indirect effects on prey Changes to water quality Cumulative/ In-combination

Site Type	Feature(s)	Potential Effects
	Fish	Permanent loss (and introduction of new sediment where applicable)
		Temporary physical disturbance
		Smothering due to increased suspended sediment
		Re- mobilisation of contaminated sediments
		Underwater noise and vibration
		Electromagnetic fields (EMF)
		Cumulative/ In-combination
	Terrestrial	Direct effects (e.g. habitat loss)
		Impacts on ex-situ habitats functionally connected to the SAC
		 Impacts from alterations to geology and land contamination
		Disturbance due to groundwater / hydrology changes
		Impacts from noise disturbance
		Impacts from changing air quality
		Impacts from light disturbance
		Impacts from visual disturbance

2.2 Sites Considered

- 2.4. The methodology for screening of sites and effects is discussed in Appendix 1 of the Information to Support AA report.
- 3.5. The following sites displayed in *Table 2.2* were included in the Screening stage.

Table 2.2 Sites included in Screening

5.3.2 Information to Support AA – Screening Matrices

2.3 Assessment of potential effects

- 4.6. A summary of the evidence presented in the determination of the risk of likely significant effects (LSE) on the relevant qualifying features of a site is detailed within the footnotes to the screening matrices below.
- 5.7. The following abbreviations are used within the screening matrices:
 - Y = LSE cannot be excluded
 - N = LSE can be excluded
 - C = construction
 - O = operation
 - D = decommissioning

East Anglia TWO Offshore Windfarm 5.3.2 Information to Support AA – Screening Matrices

6.8. Where effects are not applicable to a particular feature they are greyed out.

Site	1														
Name of European Site:	Abberto	n Reserv	oir SPA a	and Rams	ar										
Distance to East Anglia TWO (km)	88 (wind	dfarm site	e) and 62	(offshore	cable cor	ridor)									
Site Features	Likely ef	fect(s) of E	East Angli	a TWO											
	Collision	mortality		Displace	ment/Dist	urbance	Barrier E	Effect		Cumulat	ive/In-com	bination			
	С	O D C O D C O D C O D N(a) N(a) N(a) N(a) N(a) N(a) N(b) N(c) N(c) N(c)													
Wintering and passage waterbird assemblage including as named features shoveler Anas clypeata, teal Anas crecca, wigeon Mareca penelope, gadwall Mareca strepera, pochard Mareca strepera, tufted duck Aythya fuligula, goldeneye Bucephala clangula, mute swan Cygnus olor, coot Fulica atra, great crested grebe Podiceps cristatus		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (c)	N (c)	N (c)			
Breeding cormorant <i>Phalacrocorax</i> carbo		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)			

- a) Survey data show little or no evidence of the SPA features found at that site occurring in the East Anglia TWO windfarm site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO windfarm site (see section 5.1 of Appendix 12.2 (APP-470), none of these species were recorded in the East Anglia TWO windfarm site). Also see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Maximum foraging range of breeding cormorants from their colonies is 35km (Thaxter et al. 2012); the East Anglia TWO site is therefore located beyond the maximum range and so has no breeding season connectivity. It is extremely unlikely that cormorants from Abberton Reservoir SPA would visit the East Anglia TWO windfarm site in the non-breeding season as they mostly overwinter in freshwater habitat in southern England Survey data show no evidence of cormorant occurring in the East Anglia TWO windfarm site (see section 5.1 of Appendix 12.2 (APP-470).

Site 1

Name of European Site: Abberton Reservoir SPA and Ramsar

c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Abberton Reservoir SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Site	2		(s) of East Anglia TWO													
Name of European Site:	Abers -	Côtes I	Des Leç	jendes :	SAC											
Distance to East Anglia TWO (km)	599 (win	dfarm	site)

Nonbreeding ruff <i>Philomachus pugnax</i> , avocet, redshank <i>Tringa totanus</i>		N (g)	N (g)	N (g)	N (g)	N (g)	N (g)	N (g)	N (h)	N (h)	N (h)
Seabird assemblage of international importance		Y (i)	N (h	N (h	N (h	N (h	N (h	N (h	N (h	Y (i)	N (h

- a) Model predictions of collision mortality indicate that LSE cannot be ruled out at screening and so requires further consideration (see paragraph 266 of the HRA Screening Report (APP-044)).
- b) Evidence indicates that lesser black-backed gulls are not affected by displacement, disturbance or barrier effects at offshore wind farms (see Table 12.4 Chapter 12 – Offshore Ornithology (APP-060).
- c) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea.
- d) Avocet has not been observed in the East Anglia TWO windfarm site during bird surveys (see section 5.1 of Appendix 12.2 (APP-470)). It is highly unlikely that avocets from this SPA will migrate through the East Anglia TWO windfarm site, and if they did, their flight height is likely not to be at collision risk height.

Site 6

Name of European Site: Alde-Ore Estuary SPA and Ramsar

Distance to East Anglia TWO (km) 37 (windfarm site) and 4 (offshore cable corridor)

- e) Breeding little tern has a maximum foraging range of 11km from colonies, so would have no connectivity with the East Anglia TWO site. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO windfarm site.
- f) Breeding Sandwich tern has a maximum foraging range of 54km from colonies, so would have connectivity with the East Anglia TWO windfarm site. However, only very small numbers of terns of any species were observed in the East Anglia TWO site in surveys (see section 5.2 of Appendix 12.2 (APP-470)). Migrating Sandwich terns from this SPA population will form a very small fraction of the very small total numbers of terns passing the site on passage.
- g) Ruff, avocet and redshank were not have not been observed during bird surveys at the East Anglia TWO windfarm site (see section 5.1 of Appendix 12.2 (APP-470)). It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height.
- h) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Alde-Ore Estuary SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).
- i) Herring gull populations may have connectivity with East Anglia TWO. This SPA holds the closest large colony of these species to East Anglia TWO, and some birds from that SPA may pass through East Anglia TWO during migration (screened in as per paragraph 266 of the HRA Screening Report (APP-044) however 0 collisions assessed for project-alone so no HRA assessment required within the Information to Support Appropriate Assessment Report (APP-043)).

Breeding, wintering and passage waterbirds		N(a)		N(a)	N(a)	N(a)	N(a)	N(a)	N(a)	N(b)	N(b)	N(b)

- a) Survey data show little or no evidence of Baie de Seine Occidentale SPA features occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site, as most migrant waterfowl moving between northern breeding areas and southern wintering areas and using staging areas such as Baie de Seine Occidentale in France pass along the west European flyway along the continental coast rather than crossing the North Sea to the UK. At a distance of 341km, the chances of birds from this SPA moving through the East Anglia TWO site are extremely small (see section 5.1 of Appendix 12.2 (APP-470), none of SPA features were recorded in the East Anglia TWO windfarm site). Also see Table 8.2 of the HRA Screening Report (APP-044)).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Baie de Seine Occidentale SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

- a) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration relative to the size of Biologically Defined Minimum Population Scale (BDMPS) regional populations. Not only are the sites 320km apart, but much of the seasonal movement of birds avoids crossing of the North Sea so that birds on the continental side of the North Sea are more likely to move along the continental coast rather than crossing to the UK (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Borkum-Riffgrund SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Breeding common tern Sterna hirundo		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (d)	N (d)	N (d)

- a) Band model estimates of collision mortality indicate that LSE cannot be ruled out at the Screening stage (see Appendix 12.2 Annex 4 (APP-470)).
- b) Survey data show little or no evidence of SPA features occurring in East Anglia TWO and migrations of birds from this SPA are likely to result in negligible numbers passing through the site during migration (see section 5.1 of Appendix 12.2 (APP-470), none of these species were recorded in the East Anglia TWO windfarm site).
- c) SPA is far beyond the maximum foraging range of common tern (30km) so has no breeding season connectivity. Numbers of SPA common tern migrating through the East Anglia TWO windfarm site are likely to be extremely small relative to BDMPS (see section 5.1 of Appendix 12.2 (APP-470), common terns recorded in very low numbers within the East Anglia TWO windfarm site).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Breydon Water SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

- b) Survey data show little or no evidence of SPA features occurring in East Anglia TWO and migrations of birds from this SPA are likely to result in negligible numbers passing through the site during migration (see section 5.1 of Appendix 12.2 (APP-470), none of these species were recorded in the East Anglia TWO windfarm site).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features (see Table 8.2 of the HRA Screening Report (APP-044)).at Breydon Water SPA and Ramsar

Site 27 Name of European Site: Bruine Bank (Brown Ridge) pSPA **Distance to East Anglia TWO** 82 (offshore cable corridor) (km) Site Features Likely effect(s) of East Anglia TWO Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/Incombination C 0 D C 0 D С 0 D 0 D Nonbreeding common guillemots Uria N(a)N N (b)N N (b)N N (b)N N (b)N N (b)N N (b)N N (c)N N (c)N N (c)N aalge and razorbills Alca torda (c)

- a) The designated features of Bruine Bank pSPA are likely to be common guillemot and razorbill, species for which low flight height results in low risk of collision with offshore wind turbines. Furthermore, birds wintering on Bruine Bank are likely to remain at the pSPA because it is a high-quality feeding habitat (i.e. the reason why this concentration of birds is being proposed for SPA status), and so these birds are unlikely to be at risk of collision at the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044))..
- b) Bruine Bank is high quality feeding habitat for nonbreeding piscivorous seabirds from breeding areas further north, so the birds in that pSPA are unlikely to pass through the East Anglia TWO site on migration as it lies west rather than north of the pSPA. Therefore, displacement, disturbance and barrier effect at the East Anglia TWO site will not be likely to affect birds on Bruine Bank pSPA (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Bruine Bank pSPA (see Table 8.2 of the HRA Screening Report (APP-044)).

- a) The Falaise du Bessin Occidental SPA is far beyond maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS, as these species are likely to migrate into the Atlantic rather than northwards into the North Sea in autumn, and are unlikely to pass through the North Sea in spring (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Nonbreeding red-throated divers at this SPA are likely to include birds from Scandinavia and the UK, especially juveniles which winter further south than adults. Their migrations between breeding grounds and the SPA probably take most individuals along the continental coast of Europe rather than across the North Sea. Small numbers may cross the North Sea towards the UK or Icelandic breeding grounds. However, red-throated divers tend to fly low over the sea so will be at very low risk of collision. Red-throated divers strongly avoid disturbance and offshore wind farms and so may have to fly further by flying around the East Anglia TWO site rather than through the wind farm. However, in the context of a migration of over

Site	57											
Name of European Site:	Falaise du	Bessin O	ccidental	SPA								
Distance to East Anglia TWO (km)	365											
Site Features	Likely ef	fect(s) of I	East Anglia	a TWO								
	Collision	mortality		Displace	ment/Dist	urbance	Barrier E	Effect		Cumulat	ive/In-com	bination
	С	0	D	С	0	D	С	0	D	С	0	D

1000km, the extra distance flown to pass an offshore wind farm represents a negligible increase in energy expenditure for the very few individuals that might be affected (see Table 8.2 of the HRA Screening Report (APP-044)).

- c) Cormorants, shags and red-breasted mergansers do not normally occur at the East Anglia TWO site based on bird survey data (see section 5.1 of Appendix 12.2 (APP-470). Furthermore, these species tend to fly low over the sea and so would be at negligible risk of collision, and do not show displacement or barrier effects. Indeed, cormorants seem to benefit from offshore wind farm structures permitting them to extend foraging range offshore, and the same may be true for shag and red-breasted merganser which may also benefit from foraging opportunities around turbine bases.
- d) Nonbreeding guillemots and razorbills fly low over the sea and so are at very low risk of collision. However, they are partially displaced from offshore wind farms and may fly around rather than through offshore wind farms. A very small proportion of the guillemots and razorbills from this SPA might migrate through the East Anglia TWO site towards breeding areas further north, but the area of foraging habitat lost to these birds if they avoid the East Anglia TWO site would be negligible in relation to the wider area of the North Sea and Channel over which they forage, and the increase in migration distance to fly around rather than through the wind farm would be negligible in relation to a migration distance of hundreds of kilometres (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) Peregrines in western Europe do not normally migrate, so would be extremely unlikely to move between this SPA and the East Anglia TWO site. Short-eared owls are more migratory, and sometimes cross the North Sea, but since this SPA is 445km from the East Anglia TWO site, the chances of a short-eared owl from the SPA passing through the East Anglia TWO site are extremely small (see Table 8.2 of the HRA Screening Report (APP-044)).
- f) Dartford warbler is a resident species that is unlikely to move from this SPA (see Table 8.2 of the HRA Screening Report (APP-044)).
- g) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Falaise du Bessin Occidental SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

- a) Fetlar SPA is beyond the maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Dunlin, whimbrel and red-necked phalarope have not been observed migrating through the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470). Red-necked phalaropes from Fetlar SPA have been tracked by geolocator and migrate from Shetland to the Pacific Ocean via Iceland, Greenland and Canada, and so would not pass near to East Anglia TWO (see Table 8.2 of the HRA Screening Report (APP-044). Dunlin and whimbrel from Fetlar SPA migrate south, but are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Fetlar SPA (see Table 8.2 of the HRA Screening Report (APP-044).

Site 62

- a) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration. Therefore, proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Firth of Forth SPA & Ramsar -(see Table 8.2 of the HRA Screening Report (APP-044).

Site 63 Name of European Site: Firth of Tay & Eden Estuary SPA & Ramsar **Distance to East Anglia TWO** 551 (windfarm site) and 542 (offshore cable corridor) (km) Site Features Likely effect(s) of East Anglia TWO Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination С 0 D С 0 D С 0 D С 0 D N (a) Wintering and passage waterbird N (a) N (a) N (a) N (d) N (d) N (d) N (a) N (a) N (a) assemblage including as named features common scoter, cormorant, eider, goosander Mergus merganser, grey plover, long-tailed duck, redbreasted merganser, sanderling, velvet scoter, dunlin, greylag goose, redshank, oystercatcher, bar-tailed godwit, goldeneye, Icelandic blacktailed godwit Limosa limosa islandica, pink-footed goose N (b) Breeding marsh harrier N (b) Breeding little tern N (c) N (c)

Applicable to East Anglia TWO

a) Survey data show little or no evidence of Firth of Tay & Eden Estuary SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).

- b) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers from Scotland migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea, and so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- c) Breeding little tern has a maximum foraging range of 11km from colonies, so would have no connectivity with the East Anglia TWO site. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Firth of Tay & Eden Estuary SPA & Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

- b) Kittiwakes are not considered to be at risk of disturbance and displacement or barrier effects at offshore wind farms therefore LSE can be ruled out.
- c) The predicted effect attributable to the proposed East Anglia TWO project is so small that it would not significantly contribute to or alter the overall incombination assessment for these features at Flamborough and Filey Coast SPA (see Table 8.2 of the HRA Screening Report (APP-044).
- d) Flamborough and Filey Coast SPA is 239km from East Anglia TWO. Thaxter et al. (2012) report a mean foraging range of breeding gannets as 92.5km, and a maximum recorded distance of 590km. East Anglia TWO is therefore considerably beyond the mean foraging range of breeding gannets, but within their maximum range (see paragraph 269 of the HRA Screening Report (APP-044). Breeding gannets from Flamborough & Filey Coast SPA may therefore be affected by displacement (see Table 8.2 of the HRA Screening Report (APP-044). Searle et al. (2014) found that even for offshore wind farms considerably closer to a gannet breeding colony than under consideration here, impacts of displacement were negligible for this species because of its very long foraging range and large area used for foraging. Similarly, impacts of displacement during migration are considered likely to be negligible. Nonetheless, Natural England consider that an LSE cannot be ruled out at the Screening stage.

Breeding common guillemot

Breeding razorbill

Breeding puffin

Site 65

Name of European Site: Flamborough and Filey Coast SPA

Distance to East Anglia TWO 248

(km)

- e) Gannets are not considered at risk of barrier effects due to their wide ranging habits (see (d)), and migrating gannets cover very large distances, extending from the North Sea to West Africa, so that slight local effects would be negligible in the context of their large migrations and area use, therefore LSE can be ruled out.
- f) Common guillemots, razorbills and puffins tend to fly low over the sea so have a very low risk of collision mortality, therefore LSE can be ruled out (see Table 8.2 of the HRA Screening Report (APP-044).
- g) Construction and decommissioning impacts are temporary and localised therefore LSE can be ruled out.
- h) Flamborough and Filey Coast SPA is 216km from East Anglia TWO. Thaxter et al. (2012) report a mean foraging range of breeding common guillemots as 37.8km, and a maximum recorded distance of 135km. Thaxter et al. (2012) report a mean foraging range of breeding razorbills as 23.7km, and a maximum recorded distance of 95km. Thaxter et al. (2012) report a mean foraging range of breeding puffin as 4km, and a maximum recorded distance of 200km. East Anglia TWO is therefore considerably beyond the normal foraging range of these species from Flamborough and Filey Coast SPA. It is therefore unlikely that any breeding adults from Flamborough and Filey Coast SPA will be present at East Anglia TWO during the breeding season. During the nonbreeding season, birds from Flamborough and Filey Coast SPA are likely to be mixed with the large BDMPS populations of these species so that apportioning of the impact of the low level of displacement mortality generates a negligible impact to Flamborough and Filey Coast SPA. Nonetheless, Natural England consider that an LSE cannot be ruled out at the Screening stage (see paragraph 271 of the HRA Screening Report (APP-044).
- i) Since East Anglia TWO is beyond the normal foraging range of breeding common guillemots, razorbills and puffins from Flamborough and Filey Coast SPA, there will be no breeding season barrier impact for those populations. During the nonbreeding period birds from Flamborough and Filey Coast SPA are likely to be mixed with the large BDMPS populations of these species so that apportioning of the impact of the low level of displacement to this very large BDMPS population apportions a negligible impact to Flamborough and Filey Coast SPA (see paragraph 269 of the HRA Screening Report (APP-044)...

Distance to East Anglia TWO (km)	85 (windfa	rm site) and	d 69 (off	shore cal	ole corrid	or)						
Nonbreeding hen harrier		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (e)	N (e)	N (e)
Breeding ringed plover, avocet		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)
Breeding little tern, common tern, Sandwich tern		N (d)		N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (d)

- a) Survey data show little or no evidence of Foulness SPA features occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see section 5.1 of Appendix 12.2 (APP-470).
- b) Survey data show no evidence of hen harrier occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration, as the species is likely to migrate overland rather than over sea where the option is available (see section 5.1 of Appendix 12.2 (APP-470), none of these species/SPA features were recorded in the East Anglia TWO windfarm site) (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Ringed plover and avocet have not been observed during bird site-specific surveys. It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively, so there is no connectivity between the SPA and East Anglia TWO site. Furthermore, these species tend to forage in coastal waters rather than offshore.

 Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Foulness SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

--	---	--	-------	--	-------	-------	-------	-------	-------	-------	-------	-------	-------

- a) Migrations of birds from this pSPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration relative to the size of BDMPS regional populations (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Frisian Front pSPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Site	72											
Name of European Site:	Gibraltar F	Point SPA	and Ram	sar								
Distance to East Anglia TWO (km)	149											
Site Features	Likely e	ffect(s) of	East Angli	a TWO								
	Collision	n mortality		Displace	ement/Dis	turbance	Barrier E	Effect		Cumulat	tive/In-cor	nbination
	С	0	D	С	0	D	С	0	D	С	0	D
Nonbreeding sanderling, bar-tailed godwit, grey plover		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (c)	N (c)	N (c)
Breeding little tern		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)

- a) Survey data show no evidence of Gibraltar Point SPA features (sanderling, bar-tailed godwit, grey plover) occurring in the East Anglia TWO site, (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Breeding little tern has a maximum foraging range of 11km (Thaxter et al. 2012) from colonies, so would have no connectivity with the East Anglia TWO site. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 72

Name of European Site: Gibraltar Point SPA and Ramsar

Distance to East Anglia TWO (km) 149

c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Gibraltar Point SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 73

Name of European Site: Great Yarmouth and North Denes SPA

Distance to East Anglia TWO (km) 43 (windfarm site) and 34 (offshore cable corridor)

Site Features	Likely ef	fect(s) of I	East Anglia	a TWO								
	Collision	mortality		Displace	ment/Dist	urbance	Barrier E	ffect		Cumulat	ive/In-com	bination
	С	0	D	С	0	D	С	0	D	С	0	D
Breeding little tern		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (b)	N (b)	N (b)

- a) Great Yarmouth & North Denes SPA is beyond the maximum foraging range of little tern (11km) and foraging tends to be coastal so has no breeding season connectivity. Proportions of this population migrating through the East Anglia TWO site are likely to be small as the species is thought to remain close to shore during much of its migration through UK waters (see Table 8.2 of the HRA Screening Report (APP-044))..
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Great Yarmouth & North Denes SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Applicable to East Anglia TWO

Site 74 Name of European Site: **Greater Wash SPA** Distance to East Anglia TWO (km) 38 (windfarm site) and 24 (offshore cable corridor) Site Features Likely effect(s) of East Anglia TWO Collision mortality Cumulative/In-combination Displacement/Disturbance **Barrier Effect** C 0 D С 0 D 0 D N (a) Breeding seabirds (little tern, common N (a) tern, Sandwich tern) N (b) Y (c) Y (c) Nonbreeding red-throated diver Y (i) N (d) N (b) N (b) N (b) Y (i) N (h)

a) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively, which suggests potential connectivity between the SPA and the East Anglia TWO site. However, the tern colonies are at locations along the Norfolk coast which are beyond these foraging distances from the East Anglia TWO site. Therefore, connectivity between the SPA and East Anglia TWO site is ruled out on the basis of distance. Furthermore, these species tend to forage in coastal waters rather than offshore. Hence, collision risk, displacement and barrier effects can be excluded (see paragraph 273 of the HRA Screening Report (APP-044)).

N (h)

N (h)

N (f)

N (g)

b) Red-throated divers fly close to the sea surface and are therefore at extremely low risk of collisions or barrier effects.

Y (e)

N (g)

- c) LSE cannot be ruled out at screening for impacts of Displacement/Disturbance to nonbreeding red-throated divers as a result of construction work (specifically for export cable laying operations through part of the Greater Wash SPA) (see paragraph 274 of the HRA Screening Report (APP-044)).
- d) Displacement/Disturbance of red-throated diver during operation and decommissioning is considered negligible as the increase in vessel traffic within the SPA due to East Anglia TWO will be negligible compared to the current baseline (see paragraph 274 of the HRA Screening Report (APP-044)).
- e) There is potential for little gull connectivity between the SPA and the East Anglia TWO site, therefore LSE cannot be ruled out at screening for collision risk impacts to nonbreeding little gull.

Nonbreeding little gull

Nonbreeding common scoter

N (h)

N (h)

Y (e)

N (h)

Site 74

Name of European Site: Greater Wash SPA

Distance to East Anglia TWO (km) 38 (windfarm site) and 24 (offshore cable corridor)

- f) Displacement of little gulls by offshore wind farms appears to be negligible**, indicating no LSE for this SPA feature as a consequence of displacement or barrier effects (see paragraph 264 of the Information to Support Appropriate Assessment Report (APP-043)).
- g) Surveys found no common scoters in the East Anglia TWO site since this species favours waters <20m in depth (see section 5.1 of Appendix 12.2 (APP-470). Common scoter was also only present at very low densities along the export cable route, therefore no LSE for this SPA feature is predicted.
- h) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Greater Wash SPA (see Table 8.2 of the HRA Screening Report (APP-044).
- i) Following advice from Natural England it is considered that Operations and Maintenance vessels may disturb red-throated divers whilst transiting through the SPA therefore an LSE cannot be screened out (see Appendix 12.1 (APP-469)).

Site 8876

Name of European Site: Humber Estuary SPA and Ramsar

Distance to East Anglia TWO (km) 178 (windfarm site) and 164 (offshore cable corridor)

- a) Survey data show little or no evidence of Humber Estuary SPA features occurring in the East Anglia TWO sites (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Survey data show no evidence of Humber Estuary SPA feature hen harrier occurring in the East Anglia TWO sites, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration as UK birds are likely to migrate overland rather than over the sea where possible (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Bittern has not been observed during bird surveys at East Anglia TWO (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea.
- e) Avocet has not been observed during bird site specific surveys. It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height (see Table 8.2 of the HRA Screening Report (APP-044)).
- f) Breeding little tern has a maximum foraging range of 11km from colonies, so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- g) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Humber Estuary SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

- a) East Anglia TWO is within the theoretical maximum foraging range of breeding gannets from this SPA but tracking data show that breeding gannets from the SPA do not reach East Anglia TWO. The SPA is far beyond maximum foraging range of other designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through East Anglia TWO are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) None of these species has been recorded during bird surveys at the East Anglia TWO site. It is unlikely that birds from the SPA will migrate through the East Anglia TWO site, as these species are generally scarce migrants in the UK, and their migrations tend to be coastal rather than over open sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Breeding peregrines in western Europe tend to remain close to their breeding site throughout the year so it is extremely unlikely that any from the SPA would reach East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) Woodlark is a very scarce migrant to the UK, so it is very unlikely that individuals from the SPA would reach the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Littoral Seino-Marin SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Breeding little tern, common tern		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)			

- a) Survey data show little or no evidence of Medway Estuary & Marshes SPA features occurring in the East Anglia TWO site site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Avocet has not been observed during bird site-specific surveys site (see section 5.1 of Appendix 12.2 (APP-470). It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so

Site 1<u>101</u>06

Name of European Site: Medway Estuary & Marshes SPA and Ramsar

are unlikely to pass through the East Anglia TWO site. Breeding common tern has a maximum foraging range of 30km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating common terns are unlikely to pass through the East Anglia TWO site as their migration tends to be coastal where that is an option (see Table 8.2 of the HRA Screening Report (APP-044)).

d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Medway Estuary & Marshes SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see section 6.2.1, of the HRA Screening Report (APP-044)).

b) The distance between the offshore project area and the designated site is beyond the range of any potential LSE. Indirect far-field effects are limited to 1km of the works and for the duration of 1 tidal cycle (see paragraph 118 of APP-044).

111307 Site Name of European Site: Minsmere - Walberswick SPA and Ramsar **Distance to East Anglia TWO** 34 (windfarm site) and 2 (cable corridor) (km) Site Features Likely effect(s) of East Anglia TWO Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination С 0 D С 0 D С С 0 0 D Wintering shoveler, gadwall, white-N (a) N (g) N (g) N (g) fronted goose Nonbreeding hen harrier N (b) N (g) N (g) N (g) Breeding shoveler, teal, gadwall, N (c) N (c) N (c) N (c) N (c) N (g) N (c) N (c) N (g) N (g) bittern, avocet Breeding nightjar Caprimulgus N (d) N (g) N (g) N (g) europaeus N (e) Breeding marsh harrier N (e) Breeding little tern N (f) N (f)

Site 1<u>143</u>07

Name of European Site: Minsmere - Walberswick SPA and Ramsar

Distance to East Anglia TWO 34 (windfarm site) and 2 (cable corridor)

(km)

- a) Survey data show no evidence of Minsmere-Walberswick SPA features shoveler, gadwall or white-fronted goose occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site.
- b) Survey data show no evidence of hen harrier occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site as UK birds are likely to migrate overland rather than over the sea where possible (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Survey data show no evidence of Minsmere-Walberswick SPA features shoveler, teal, gadwall, bittern or avocet occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Survey data show no evidence of nightjar occurring in the East Anglia TWO OWF sites (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site as UK birds are likely to migrate overland rather than over the sea where possible and make short sea crossings from southern England to France (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea_(see Table 8.2 of the HRA Screening Report (APP-044)).
- f) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- g) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Minsmere-Walberswick SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Breeding osprey		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)			

- a) Survey data show little or no evidence of Moray & Nairn Coast SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2) of the HRA Screening Report (APP-044)).
- b) Osprey has not been observed in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and it is improbable that any ospreys from the SPA migrate through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Moray & Nairn Coast SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 11460 Name of European Site: Mousa SPA **Distance to East Anglia TWO** 883 (km) Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance Cumulative/In-combination **Barrier Effect** С 0 D С С С 0 0 D 0 D D Breeding Arctic tern N (a) N (c) N (c) N (c) Breeding European storm-petrel N (b) Hydrobates pelagicus

- a) Mousa SPA is beyond maximum foraging range of Arctic tern (30km, Thaxter et al. 2012) so has no breeding season connectivity. The proportion of the population migrating through the East Anglia TWO site is likely to be extremely small relative to BDMPS(see Table 8.2 of the HRA Screening Report (APP-044)).
- b) European storm-petrels were not observed in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and are rarely seen anywhere in the southern North Sea, so evidence suggests that this species migrates from its breeding site on Mousa into the North Atlantic and not normally through the North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Mousa SPA(see Table 8.2 of the HRA Screening Report (APP-044)).

5.3.2 Information to Support AA – Screening Matrices

Site	1 <u>235</u> 48													
Name of European Site:	North Ca	ithness C	liffs SPA											
Distance to East Anglia TWO (km)	769													
Site Features	Likely ef	ely effect(s) of East Anglia TWO												
	Collision	mortality		Displace	ement/Dist	urbance	Barrier E	Effect		Cumulat	ive/In-con	nbination		
	С	0	D	С	0	D	С	0	D	С	0	D		
Breeding seabird assemblage including as named features fulmar, guillemot, kittiwake, razorbill, puffin		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (c)	N (c)	N (c)		
Breeding peregrine		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)		

- a) North Caithness Cliffs SPA is far beyond the maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Peregrines breeding in the UK normally remain close to their breeding areas throughout the year, and are very unlikely to migrate offshore from the UK (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at North Caithness Cliffs SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Site	1 <u>246</u> 19

Distance to East Anglia TWO (km)	99 (windfa	arm site) a	and 87 (ca	ble corri	dor)							
	С	0	D	С	0	D	С	0	D	С	0	D
Wintering and passage waterbird assemblage including as named features wigeon, pink-footed goose, brent goose, knot, avocet		Y (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (f)	Y (a)	N (f)
Breeding bittern		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (f)	N (f)	N (f)
Breeding marsh harrier		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (f)	N (f)	N (f)
Breeding avocet		N (d)		N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (f)	N (f)	N (f)
Breeding little tern, common tern, Sandwich tern		N (e)		N (e)	N (e)	N (e)	N (e)	N (e)	N (e)	N (f)	N (f)	N (f)

- a) Survey data show little or no evidence of North Norfolk Coast SPA features wigeon, pink-footed goose, brent goose, knot, avocet occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Survey data show no evidence of North Norfolk Coast SPA feature bittern occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Survey data show no evidence of North Norfolk Coast SPA feature avocet occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively (Thaxter et al. 2012), so there is no connectivity between the SPA and East Anglia TWO site. Furthermore, these species tend to forage in coastal waters rather than offshore. Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 1<u>246</u>19

Name of European Site: North Norfolk Coast SPA and Ramsar

Distance to East Anglia TWO (km) 99 (windfarm site) and 87 (cable corridor)

f) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at North Norfolk Coast SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Breeding little tern		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)

- a) Survey data show little or no evidence of SPA features occurring in East Anglia TWO (see section 5.1 of Appendix 12.2 (APP-470) and migrations of birds from this SPA are likely to result in negligible numbers passing through the site during migration (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Northumbria Coast SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

Applicable to East Anglia TWO

a) The primary feature of the SAC is a series of percolation lagoons which are separated from the marine environment by the Orford shingle beach. These features are described as non-marine as they occur landward of highest astronomical tide. Therefore, due to a physical barrier there is no pathway between the source of any effects in the marine environment and the receptor (see Table 5.2 of HRA Screening Report (APP-470).

Site	1 <u>335</u> 28											
Name of European Site:	Outer Thai	nes Estua	ry SPA a	and pSPA	extension							
Distance to East Anglia TWO (km)	Within cab	le corrido	r									
Site Features	Likely	effect(s) of	East An	glia TWO								
	Collisio	n mortality	/	Displac	ement/Dis	sturbance	Barrier	Effect		Cumula	tive/In-co	mbination
	С	0	D	С	0	D	С	0	D	С	0	D
Nonbreeding red-throated divers		Y (a)		Y (b)	Y (c)	Y (b)	Y (b)	Y (a)	Y (b)	Y (a)	Y (a)	N (e)
Breeding little tern and common tern							N (d)	N (d)	N (d)	N (d)	N (d)	N (d)

- a) Given the overlap of the East Anglia TWO cable corridor with this SPA-and pSPA, collision risk cannot be ruled out at this stage and further assessment is required (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Given the overlap of the East Anglia TWO cable corridor with this SPA and pSPA, further detailed assessment is appropriate. Disturbance to red-throated diver is possible, especially during export cable installation. Great Yarmouth may be used as a port for construction vessels for the East Anglia TWO site; this port is located very close to the northern extent of the SPA however is outside the main concentrations of red-throated divers. This, together with the extent of existing vessel movements in the area means the addition of construction traffic as a result of <a href="https://doi.org/10.1007/jhear-10.10
- c) Following advice from Natural England it is considered that Operations and Maintenance vessels may disturb red-throated divers whilst transiting through the SPA therefore an LSE cannot be screened out <u>(see Appendix 12.1 (APP-469))</u>.

- d) SPA is beyond maximum foraging range of designated breeding seabird species (terns) and tern foraging tends to be coastal so has no breeding season connectivity. Proportions of these populations migrating through East Anglia TWO are likely to be small as these species are thought to remain close to shore during much of their migration through UK waters (see Table 8.2 of the HRA Screening Report (APP-044).
- e) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Outer Thames Estuary SPA (see Table 8.2 of the HRA Screening Report (APP-044).

Site	1 <u>346</u> 29											
Name of European Site:	Papa Sto	ur SPA										
Distance to East Anglia TWO (km)	922

Breeding ringed plover		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)

- a) Papa Stour SPA is beyond maximum foraging range of Arctic tern so has no breeding season connectivity. The proportion of the population migrating through the East Anglia TWO site is very small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Ringed plovers breeding in Scotland 'tend to winter locally or move only short distances' (Forrester et al. 2007) so birds from Papa Stour are extremely unlikely to reach the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Papa Stour SPA (see Table 8.2 of the HRA Screening Report (APP-044).

Terrestrial birds (various species)		N (d)		N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (d)		

- a) The East Anglia TWO site is beyond maximum foraging range of designated breeding seabird species from this SPA, so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site relative to the size of BDMPS regional populations, not only because of the distance, but also because seabirds and waterbirds from this SPA are likely to migrate predominantly along the continental coast of the North Sea towards northern breeding grounds rather than across the southern North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Survey data show little or no evidence of these waterbird features occurring in the East Anglia TWO OWF site (see section 5.1 of Appendix 12.2 (APP-470))s, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site, as most of these birds are likely to remain on the continental side of the North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Terrestrial birds from this SPA are very unlikely to migrate to the UK; those that do migrate are more likely to follow the west European flyway along the continental coast (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at this SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

River lamprey	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)

a) River lamprey are restricted to rivers and coasts so there can be no direct interaction with the proposed East Anglia TWO project. Sea lamprey could in theory be present in the vicinity of the proposed East Anglia TWO project, but given their life history interaction would be limited. The distance between the proposed project and the site precludes direct impact upon the site and its supporting habitats (see Table 5.2 of the HRA Screening Report (APP-470)).

Site	14 <u>9151</u> 0														
Name of European Site:	Ronas Hi	II - North	Roe and T	Tingon SP	A										
Distance to East Anglia TWO (km)	938	938													
Site Features	Likely e	Likely effect(s) of East Anglia TWO													
	Collision	n mortality		Displace	ment/Distu	ırbance	Barrier I	Effect		Cumula					
	С	0	D	С	0	D	С	0	D	С	0	D			
Breeding great skua		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (d)	N (d)	N (d)			
Breeding red-throated diver	N (b) N (d) N (d)									N (d)					
Breeding merlin		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (d)	N (d)	N (d)			

- a) Ronas Hill, North Roe & Tingon SPA is beyond maximum foraging range of great skua so has no breeding season connectivity. The proportion of the population migrating through the East Anglia TWO site is likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Ronas Hill, North Roe & Tingon SPA is beyond maximum foraging range of red-throated diver so has no breeding season connectivity. The proportion of the population migrating through the East Anglia TWO site is likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Merlins from this population are likely to migrate to wintering areas that are predominantly within the UK. A few, mostly young birds, may winter on the European continent so could possibly pass through the East Anglia TWO site. However, no merlins have been seen during site specific surveys, and the chances of any from this SPA passing through the site are likely to be extremely low (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Ronas Hill, North Roe & Tingon SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

	5 <mark>02</mark> 44 ousay SP <i>i</i>	4

Nonbreeding seabird assemblage including razorbill, black-throated diver, red-throated diver, common gull, lesser black-backed gull, little gull, kittiwake, common scoter, red-necked grebe, eider, common tern, Arctic tern, Sandwich tern, gannet, guillemot		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (c)	N (c)	N (c)

- a) Tracking data from gannets breeding on Helgoland show these birds do not travel in the direction of or as far as the East Anglia TWO site despite this site being within theoretical maximum foraging range of gannet. East Anglia TWO is beyond the maximum foraging range of other seabird species at Seevogelschutzgebeit Helgoland SPA. Proportions of these populations migrating through East Anglia TWO are likely to be very small relative to BDMPS regional populations (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration relative to the size of BDMPS regional populations, not only because the sites are 428km apart, but also because nonbreeding seabirds from this SPA are likely to migrate predominantly along the continental coast of the North Sea towards northern breeding grounds rather than across the southern North Sea.

Site 1<u>63</u>49

Name of European Site: Seevogelschutzgebiet Helgoland SPA

Distance to East Anglia TWO 428

(km)

c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Seevogelschutzgebeit Helgoland SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

- a) Survey data show little or no evidence of Solent & Southampton Water SPA and Ramsar features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this site are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).-
- b) No Mediterranean gulls were recorded in the East Anglia TWO site during bird surveys. This species is scarce in England, although increasing. Birds from the SPA are unlikely to migrate through the East Anglia TWO site. Thaxter et al. (2012) report the maximum foraging range of breeding Mediterranean gulls as 20km, so birds from this SPA will not have connectivity with the East Anglia TWO site during breeding (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Little tern, common tern, roseate tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km, 30km and 54km respectively (Thaxter et al. 2012), so there is no connectivity between the SPA and the East Anglia TWO site which are 244km apart. Furthermore, these species tend to forage in coastal waters rather than offshore. Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Solent & Southampton Water SPA and Ramsar(see Table 8.2 of the HRA Screening Report (APP-044)).-

- a) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site relative to the size of BDMPS regional populations, not only because the sites are 400km apart, but also because nonbreeding seabirds from this SPA are likely to migrate predominantly along the continental coast of the North Sea towards northern breeding grounds rather than across the southern North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Sylter Außenriff SPA (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) It was agreed as part of the East Anglia TWO Scoping and Evidence Plan Process (EPP) (see Appendix 10.1 (APP-462) Report that transboundary impacts on fish would be scoped out of the EIA. We have therefore screened them out from consideration in the HRA.

Applicable to East Anglia TWO

Site	1 <u>78</u> 63														
Name of European Site:	Teesmoutl	and Clev	eland Coa	ast SPA a	nd Ramsa	ır									
Distance to East Anglia TWO (km)	332														
Site Features	Likely	kely effect(s) of East Anglia TWO													
	Collisio	n mortality		Displace	ement/Dis	turbance	Barrier I	Effect		Cumula	tive/In-co	mbination			
	С	0	D	С	0	D	С	0	D	С	0	D			
Nonbreeding knot, redshank		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (d)	N (d)	N (d)			
Nonbreeding Sandwich tern		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (d)	N (d)	N (d)			
Breeding little tern		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)			

- a) Survey data show little or no evidence of Teesmouth & Cleveland Coast SPA features knot or redshank occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site.
- b) Nonbreeding Sandwich terns at Teesmouth & Cleveland Coast SPA may migrate between the SPA and wintering areas off west Africa. This could take them near to East Anglia TWO. However, very few terns of any species were seen in the East Anglia TWO site during bird surveys, and the Sandwich tern tends to migrate close to the coast where that is possible, so there are unlikely to be significant numbers reaching the East Anglia TWO site. The few that do will have a very low collision risk due to their generally low flight height and displacement/barrier effects will be negligible in the context of a migration of thousands of kilometres- (see Table 8.2 of the HRA Screening Report (APP-044).
- c) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).-
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Teesmouth & Cleveland Coast SPA and Ramsar_(see Table 8.2 of the HRA Screening Report (APP-044).-

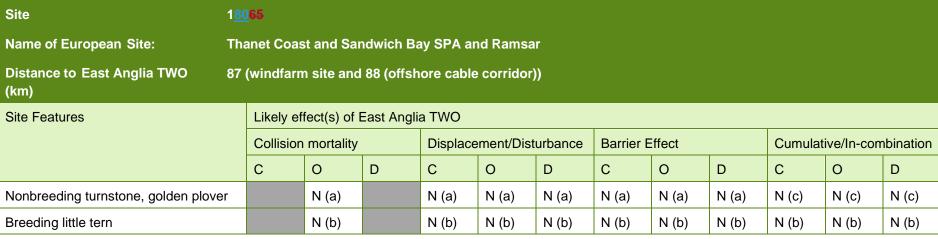

Site 17964 Name of European Site: **Thames Estuary and Marshes SPA and Ramsar** Distance to East Anglia TWO (km) 116 (windfarm site) and 99 (offshore cable corridor) Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination D С 0 С 0 D С 0 D С 0 D Wintering and passage waterbird N (a) N (a) N (c) N (a) N (a) N (a) N (a) N (a) N (c) N (c) assemblage including as named features dunlin, knot, ringed plover, black-tailed godwit, grey plover, avocet, redshank Nonbreeding hen harrier N (b) N (c) N (c) N (c)

- a) Survey data show little or no evidence of Thames Estuary & Marshes SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Survey data show no evidence of hen harrier occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site, as the species is likely to migrate overland rather than over sea where the option is available (see Table 8.2 of the HRA Screening Report (APP-044).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Thames Estuary & Marshes SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).-

- a) Survey data show little or no evidence of Thanet Coast & Sandwich Bay SPA features turnstone or golden plover occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site.
- b) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with the East Anglia TWO site. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).-
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Thanet Coast & Sandwich Bay SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

Site 18774

Name of European Site: Troup, Pennan and Lion's Heads SPA

Distance to East Anglia TWO (km) 657

a) Troup, Pennan & Lion's Heads SPA is beyond maximum foraging range of designated seabird species so has no breeding season connectivity.

Proportions of these populations migrating through the East Anglia TWO site are likely to be very small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).-

b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Troup, Pennan & Lion's Heads SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 1<u>9679</u>

Name of European Site: Waddenzee (Wadden Sea) SPA

Distance to East Anglia TWO 186

(km)

- a) The East Anglia TWO site is far beyond the mean maximum foraging range of designated breeding seabird species from this SPA, so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS, not only because of the distance, but also because birds from this SPA are likely to use the west European flyway along the continental coast rather than crossing the southern North Sea. Lesser black-backed gull tracking has shown breeding birds do not cross the North Sea therefore no connectivity is expected for this species (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Survey data show little or no evidence of Waddenzee SPA breeding waterbird features occurring in the East Anglia TWO site see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Survey data show little or no evidence of Waddenzee SPA nonbreeding waterbird features occurring in the East Anglia TWO site see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Waddenzee SPA- (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 19982 Name of European Westerschelde & Saeftinghe SAC Site: 106 (windfarm site) and 128 (offshore cable corridor) **Distance to East** Anglia TWO (km) River Ν lamprey (a) Twaite Ν Shad (a) (a)

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE.

a) There is no potential for any direct disturbance as a result of activities within the East Anglia TWO windfarm site due to the distance between the site and the closest point onshore (31km). There is also no potential for any direct disturbance as a result of activities within the East Anglia TWO offshore cable corridor due to the distance between the nearest major haul-out site at Winterton-Horsey and the cable landfall at Sizewell, which is located over 60km along the coast (Table 7.3 of the HRA Screening Report (APP-044)).

Site	<u>202</u> 485											
Name of European Site:	Ythan Estua	ry, Sands c	of Forvie	and Meil	kle Loch :	SPA						
Distance to East Anglia TWO (km)	615											
Wintering and passage waterbird assemblage including as named features lapwing, eider, pink-footed goose, redshank		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (c)	N (c)	N (c)
Breeding little tern, common tern, Sandwich tern		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)

- a) Survey data show little or no evidence of Ythan Estuary, Sands of Forvie & Meikle Loch SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively, so there is no connectivity between the SPA and East Anglia TWO site which are 608km apart. Furthermore, these species tend to forage in coastal waters rather than offshore. Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Ythan Estuary, Sands of Forvie & Meikle Loch SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Applicable to East Anglia TWO
