EIA	Environmental Impact Assessment
EMF	Electromagnetic Field
HRA	Habitats Regulations Assessment
LSE	Likely Significant Effect
SAC	Special Area of Conservation
SCI	Site of Community Importance
SPA	Special Protection Area

East Anglia TWO Offshore Windfarm 5.3.2 Information to Support AA – Screening Matrices

Glossary of Terminology

Applicant	East Anglia TWO Limited.
East Anglia TWO project	The proposed project consisting of up to 75 wind turbines, up to four offshore electrical platforms, up to one construction, operation and maintenance platform, inter-array cables, platform link cables, up to one operational meteorological mast, up to two offshore export cables, fibre optic cables, landfall infrastructure, onshore cables and ducts, onshore substation, and National Grid infrastructure.
East Anglia TWO windfarm site	The offshore area within which wind turbines and offshore platforms will be located.
European site	Sites designated for nature conservation under the Habitats Directive and Birds Directive, as defined in regulation 8 of the Conservation of Habitats and Species Regulations 2017 and regulation 18 of the Conservation of Offshore Marine Habitats and Species Regulations 2017. These include candidate Special Areas of Conservation, Sites of Community Importance, Special Areas of Conservation and Special Protection Areas.
Evidence Plan Process (EPP)	A voluntary consultation process with specialist stakeholders to agree the approach to the EIA and the information required to support HRA.
Natura 2000 site	A site forming part of the network of sites made up of Special Areas of Conservation and Special Protection Areas designated respectively under the Habitats Directive and Birds Directive.
Offshore cable corridor	This is the area which will contain the offshore export cables between offshore electrical platforms and landfall.
Offshore development area	The East Anglia TWO windfarm site and offshore cable corridor (up to Mean High Water Springs).
Offshore export cables	The cables which would bring electricity from the offshore electrical platforms to the landfall. These cables will include fibre optic cables.
Offshore infrastructure	All of the offshore infrastructure including wind turbines, platforms, and cables.

2.3	Assessment of potential effects	16

1 Introduction

- 1. This document provides the Information to Support Appropriate Assessment Report screening matrices for the proposed East Anglia TWO project. The matrices summarise information provided in *Appendix 1* (Offshore Habitats Regulations Assessment (HRA) Screening) of the Information to Support Appropriate Assessment (AA) report (document reference 5.3).
- 2. For Deadline 1 this document has been revised to address the following:
 - A request from the Examining Authority to include the following sites that were missing from the Screening Matrices submitted with the application (Question 1.2.3):
 - Plymouth Sound and Estuaries SAC
 - Severn Estuary SAC
 - River Avon SAC
 - Havet Omkring Nordre Ronner (SAC or SPA not stated)
 - Knudegrund SAC
 - Lønstrup Rødgrund SAC
 - Sandbanker ud for Thorsminde SAC
 - Sandbanker ud for Thyboron SAC
 - Thyboron Stenvolde SCI
 - Littoral Cauchois SAC
 - Panache De La Gironde Et Plateau Rocheux De Cordouan (Système Pertuis Gironde) SAC
 - Pertuis Charentais SAC
 - Mühlenberger Loch SPA
 - SchleswigHolsteinisches Elbastuar und angrenzende Flachen SAC
 - Unterelbe SCI
 - Saxa Water SPA and Ramsar site (this was a typographic error in the HRA screening report (APP-044) and should be 'Hamford Water SPA and Ramsar site'. Hamford Water SPA and Ramsar site was excluded from the screening matrices in error and has now been included)
 - Schleswig-Holsteinisches Elbastuar und angrenzende Flachen SAC

 Provide a revised version of the matrices with footnotes updated to include document and paragraph number references to the application materials where the evidence can be found (Question 1.2.4).

2 Screening Matrices

2.1 Effects Considered

3. Potential effects upon the European sites which are considered within the submitted Information to Support AA report are provided in *Table 2.1*.

Table 2.1 Potential Effects consider in Screening

Site Type	Feature(s)	Potential Effects
Special Protection Area (SPA)	All birds	Offshore effects:
Special Area of Conservation/Site of Community Importance (SAC/SCI)	Benthic habitats	 Permanent loss (and introduction of new sediment where applicable) Temporary physical disturbance Smothering due to increased suspended sediment Re- mobilisation of contaminated sediments Underwater noise and vibration Cumulative/ In-combination Underwater noise
	mammals	 Underwater noise Vessel Interactions Indirect effects on prey Changes to water quality Cumulative/ In-combination

Site Type	Feature(s)	Potential Effects
	Fish	 Permanent loss (and introduction of new sediment where applicable)
		Temporary physical disturbance
		Smothering due to increased suspended sediment
		Re- mobilisation of contaminated sediments
		Underwater noise and vibration
		Electromagnetic fields (EMF)
		Cumulative/ In-combination
	Terrestrial	Direct effects (e.g. habitat loss)
		Impacts on ex-situ habitats functionally connected to the SAC
		 Impacts from alterations to geology and land contamination
		Disturbance due to groundwater / hydrology changes
		Impacts from noise disturbance
		Impacts from changing air quality
		Impacts from light disturbance
		Impacts from visual disturbance

2.2 Sites Considered

- 4. The methodology for screening of sites and effects is discussed in *Appendix 1* of the Information to Support AA report.
- 5. The following sites displayed in *Table 2.2* were included in the Screening stage.

Table 2.2 Sites included in Screening

2.3 Assessment of potential effects

- 6. A summary of the evidence presented in the determination of the risk of likely significant effects (LSE) on the relevant qualifying features of a site is detailed within the footnotes to the screening matrices below.
- 7. The following abbreviations are used within the screening matrices:
 - Y = LSE cannot be excluded
 - N = LSE can be excluded
 - C = construction
 - O = operation
 - D = decommissioning
- 8. Where effects are not applicable to a particular feature they are greyed out.

- a) Survey data show little or no evidence of the SPA features found at that site occurring in the East Anglia TWO windfarm site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO windfarm site (see section 5.1 of Appendix 12.2 (APP-470), none of these species were recorded in the East Anglia TWO windfarm site). Also see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Maximum foraging range of breeding cormorants from their colonies is 35km (Thaxter et al. 2012); the East Anglia TWO site is therefore located beyond the maximum range and so has no breeding season connectivity. It is extremely unlikely that cormorants from Abberton Reservoir SPA would visit the East Anglia TWO windfarm site in the non-breeding season as they mostly overwinter in freshwater habitat in southern England Survey data show no evidence of cormorant occurring in the East Anglia TWO windfarm site (see section 5.1 of Appendix 12.2 (APP-470).

Site 1

Name of European Site: Abberton Reservoir SPA and Ramsar

c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Abberton Reservoir SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Breeding Sandwich tern Sterna sandvicensis		N (f)		N (f)	N (f)	N (f)	N (f)	N (f)	N (f)	N (h)	N (h)	N (h)		
Nonbreeding ruff <i>Philomachus pugnax</i> , avocet, redshank <i>Tringa totanus</i>		N (g)		N (g)	N (g)	N (g)	N (g)	N (g)	N (g)	N (h)	N (h)	N (h)		

- a) Model predictions of collision mortality indicate that LSE cannot be ruled out at screening and so requires further consideration (see paragraph 266 of the HRA Screening Report (APP-044)).
- b) Evidence indicates that lesser black-backed gulls are not affected by displacement, disturbance or barrier effects at offshore wind farms (see Table 12.4 Chapter 12 – Offshore Ornithology (APP-060).
- c) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea.

Site 6

Name of European Site: Alde-Ore Estuary SPA and Ramsar

Distance to East Anglia TWO (km) 37 (windfarm site) and 4 (offshore cable corridor)

- d) Avocet has not been observed in the East Anglia TWO windfarm site during bird surveys (see section 5.1 of Appendix 12.2 (APP-470)). It is highly unlikely that avocets from this SPA will migrate through the East Anglia TWO windfarm site, and if they did, their flight height is likely not to be at collision risk height.
- e) Breeding little tern has a maximum foraging range of 11km from colonies, so would have no connectivity with the East Anglia TWO site. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO windfarm site.
- f) Breeding Sandwich tern has a maximum foraging range of 54km from colonies, so would have connectivity with the East Anglia TWO windfarm site. However, only very small numbers of terns of any species were observed in the East Anglia TWO site in surveys (see section 5.2 of Appendix 12.2 (APP-470)). Migrating Sandwich terns from this SPA population will form a very small fraction of the very small total numbers of terns passing the site on passage.
- g) Ruff, avocet and redshank were not observed during bird surveys at the East Anglia TWO windfarm site (see section 5.1 of Appendix 12.2 (APP-470)). It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height.
- h) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Alde-Ore Estuary SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Herring gull populations may have connectivity with East Anglia TWO. This SPA holds the closest large colony of these species to East Anglia TWO, and some birds from that SPA may pass through East Anglia TWO during migration (screened in as per paragraph 266 of the HRA Screening Report (APP-044) however 0 collisions assessed for project-alone so no HRA assessment required within the Information to Support Appropriate Assessment Report (APP-043)).

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraph 219 and 220 for harbour seal and paragraphs 168 and 169 for harbour porpoise and Table 7.3 of the HRA). Screening Report (APP-044)).

Site 12 Name of European Site: Baie de Seine Occidentale SPA **Distance to East Anglia TWO** 350 (km) Site Features Likely effect(s) of East Anglia TWO Displacement/Disturbance Collision mortality **Barrier Effect** Cumulative/In-combination 0 D 0 D C 0 D C C 0 D Breeding, wintering and N(a) N(b) N(b) N(a) N(a) N(a) N(a) N(a) N(a) N(b) passage waterbirds

- a) Survey data show little or no evidence of Baie de Seine Occidentale SPA features occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site, as most migrant waterfowl moving between northern breeding areas and southern wintering areas and using staging areas such as Baie de Seine Occidentale in France pass along the west European flyway along the continental coast rather than crossing the North Sea to the UK. At a distance of 341km, the chances of birds from this SPA moving through the East Anglia TWO site are extremely small (see section 5.1 of Appendix 12.2 (APP-470), none of SPA features were recorded in the East Anglia TWO windfarm site). Also see Table 8.2 of the HRA Screening Report (APP-044)).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Baie de Seine Occidentale SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Distance to East Anglia TWO (km)	320											
Site Features	Likely effe	ct(s) of E	ast Anglia	TWO								
	Collision r	nortality		Displace	ement/Dis	turbance	Barrier	Effect		Cumula	tive/In-co	mbination
	С	0	D	С	0	D	С	0	D	С	0	D
Nonbreeding seabird assemblage including as named features black-throated diver <i>Gavia arctica</i> , red-throated diver <i>Gavia stellata</i> , common gull <i>Larus canus</i> , lesser black-backed gull, great black-backed gull <i>Larus marinus</i> , little gull <i>Larus minutus</i> , kittiwake <i>Rissa tridactyla</i> , common tern <i>Sterna hirundo</i> , Arctic tern <i>Sterna paradisaea</i> , Sandwich tern, gannet <i>Morus bassanus</i> , guillemot <i>Uria aalge</i>		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (b)	N (b)	N (b)

- a) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration relative to the size of Biologically Defined Minimum Population Scale (BDMPS) regional populations. Not only are the sites 320km apart, but much of the seasonal movement of birds avoids crossing of the North Sea so that birds on the continental side of the North Sea are more likely to move along the continental coast rather than crossing to the UK (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Borkum-Riffgrund SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Breeding common tern Sterna hirundo		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (d)	N (d)	N (d)

- a) Band model estimates of collision mortality indicate that LSE cannot be ruled out at the Screening stage (see Appendix 12.2 Annex 4 (APP-470)).
- b) Survey data show little or no evidence of SPA features occurring in East Anglia TWO and migrations of birds from this SPA are likely to result in negligible numbers passing through the site during migration (see section 5.1 of Appendix 12.2 (APP-470), none of these species were recorded in the East Anglia TWO windfarm site).
- c) SPA is far beyond the maximum foraging range of common tern (30km) so has no breeding season connectivity. Numbers of SPA common tern migrating through the East Anglia TWO windfarm site are likely to be extremely small relative to BDMPS (see section 5.1 of Appendix 12.2 (APP-470), common terns recorded in very low numbers within the East Anglia TWO windfarm site).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Breydon Water SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

Site 26

- a) Band model estimates of collision mortality indicate that LSE cannot be ruled out at the Screening stage (see Appendix 12.2 Annex 4 (APP-470)).
- b) Survey data show little or no evidence of SPA features occurring in East Anglia TWO and migrations of birds from this SPA are likely to result in negligible numbers passing through the site during migration (see section 5.1 of Appendix 12.2 (APP-470), none of these species were recorded in the East Anglia TWO windfarm site).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features (see Table 8.2 of the HRA Screening Report (APP-044)).

Site	27											
Name of European Site:	Bruine Ba	nk (Browi	n Ridge) բ	SPA								
Distance to East Anglia TWO (km)	82 (offsho	re cable (corridor)									
Site Features	Likely e	ffect(s) of	East Angl	ia TWO								
	Collision	n mortality		Displace	ement/Dis	turbance	Barrier E	Effect		Cumulat combina		
	C O D			С	0	D	С	0	D	С	0	D
Nonbreeding common guillemots <i>Uria</i> aalge and razorbills <i>Alca torda</i>		N (a)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (c)	N (c)	N (c)

- a) The designated features of Bruine Bank pSPA are likely to be common guillemot and razorbill, species for which low flight height results in low risk of collision with offshore wind turbines. Furthermore, birds wintering on Bruine Bank are likely to remain at the pSPA because it is a high-quality feeding habitat (i.e. the reason why this concentration of birds is being proposed for SPA status), and so these birds are unlikely to be at risk of collision at the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044))..
- b) Bruine Bank is high quality feeding habitat for nonbreeding piscivorous seabirds from breeding areas further north, so the birds in that pSPA are unlikely to pass through the East Anglia TWO site on migration as it lies west rather than north of the pSPA. Therefore, displacement, disturbance and barrier effect at the East Anglia TWO site will not be likely to affect birds on Bruine Bank pSPA (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Bruine Bank pSPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 45

Name of European Site: Dornoch Firth and Loch Fleet SPA & Ramsar

Distance to East Anglia TWO 722 (windfarm site) and 714 (offshore cable corridor)

(km)

Site Features	Likely ef	fect(s) of I	East Angli	a TWO								
	Collision	mortality		Displace	ement/Dist	turbance	Barrier E	Effect		Cumulat	tive/In-con	nbination
	С	0	D	С	0	D	С	0	D	С	0	D
Wintering and passage waterbird assemblage including as named features curlew, dunlin, greylag goose, wigeon, bar-tailed godwit, teal, oystercatcher		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (c)	N (c)	N (c)
Breeding osprey		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)

- a) Survey data show little or no evidence of these features occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), none of these species/SPA features were recorded in the East Anglia TWO windfarm site)..
- b) Osprey has not been observed in the East Anglia TWO site, and it is improbable than any ospreys from the SPA migrate through the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), none of these species/SPA features were recorded in the East Anglia TWO windfarm site).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features (see Table 8.2 of the HRA Screening Report (APP-044).

5.3.2 Information to Support AA – Screening Matrices

Nonbreeding red-throated diver		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (g)	N (g)	N (g)
Nonbreeding cormorant, shag, red- breasted merganser		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (g)	N (g)	N (g)
Nonbreeding guillemot, razorbill		N (d)		N (d)	N (d)	N (d)	N (d)	N (d)	N (d)	N (g)	N (g)	N (g)
Nonbreeding peregrine, short-eared owl Asio flammeus		N (e)		N (e)	N (e)	N (e)	N (e)	N (e)	N (e)	N (g)	N (g)	N (g)
Breeding Dartford warbler Sylvia undata		N (f)		N (f)	N (f)	N (f)	N (f)	N (f)	N (f)	N (f)	N (f)	N (f)

- a) The SPA is far beyond maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS, as these species are likely to migrate into the Atlantic rather than northwards into the North Sea in autumn, and are unlikely to pass through the North Sea in spring (see Table 8.2 of the HRA Screening Report (APP-044))..
- b) Nonbreeding red-throated divers at this SPA are likely to include birds from Scandinavia and the UK, especially juveniles which winter further south than adults. Their migrations between breeding grounds and the SPA probably take most individuals along the continental coast of Europe rather than across the North Sea. Small numbers may cross the North Sea towards the UK or Icelandic breeding grounds. However, red-throated divers tend to fly low over the sea so will be at very low risk of collision. Red-throated divers strongly avoid disturbance and offshore wind farms and so may have to fly further by flying around the East Anglia TWO site rather than through the wind farm. However, in the context of a migration of over

Site	57											
Name of European Site:	Falaise du	Bessin O	ccidental	SPA								
Distance to East Anglia TWO (km)	365											
Site Features	Likely ef	fect(s) of l	East Angli	a TWO								
	Collision	mortality		Displace	ement/Dist	urbance	Barrier E	Effect		Cumulat	ive/In-com	nbination
	С	0	D	С	0	D	С	0	D	С	0	D

1000km, the extra distance flown to pass an offshore wind farm represents a negligible increase in energy expenditure for the very few individuals that might be affected (see Table 8.2 of the HRA Screening Report (APP-044)).

- c) Cormorants, shags and red-breasted mergansers do not normally occur at the East Anglia TWO site based on bird survey data (see section 5.1 of Appendix 12.2 (APP-470). Furthermore, these species tend to fly low over the sea and so would be at negligible risk of collision, and do not show displacement or barrier effects. Indeed, cormorants seem to benefit from offshore wind farm structures permitting them to extend foraging range offshore, and the same may be true for shag and red-breasted merganser which may also benefit from foraging opportunities around turbine bases.
- d) Nonbreeding guillemots and razorbills fly low over the sea and so are at very low risk of collision. However, they are partially displaced from offshore wind farms and may fly around rather than through offshore wind farms. A very small proportion of the guillemots and razorbills from this SPA might migrate through the East Anglia TWO site towards breeding areas further north, but the area of foraging habitat lost to these birds if they avoid the East Anglia TWO site would be negligible in relation to the wider area of the North Sea and Channel over which they forage, and the increase in migration distance to fly around rather than through the wind farm would be negligible in relation to a migration distance of hundreds of kilometres (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) Peregrines in western Europe do not normally migrate, so would be extremely unlikely to move between this SPA and the East Anglia TWO site. Short-eared owls are more migratory, and sometimes cross the North Sea, but since this SPA is 445km from the East Anglia TWO site, the chances of a short-eared owl from the SPA passing through the East Anglia TWO site are extremely small (see Table 8.2 of the HRA Screening Report (APP-044)).
- f) Dartford warbler is a resident species that is unlikely to move from this SPA (see Table 8.2 of the HRA Screening Report (APP-044)).
- g) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Falaise du Bessin Occidental SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

- a) Fetlar SPA is beyond the maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Dunlin, whimbrel and red-necked phalarope have not been observed migrating through the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470). Red-necked phalaropes from Fetlar SPA have been tracked by geolocator and migrate from Shetland to the Pacific Ocean via Iceland, Greenland and Canada, and so would not pass near to East Anglia TWO (see Table 8.2 of the HRA Screening Report (APP-044). Dunlin and whimbrel from Fetlar SPA migrate south, but are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Fetlar SPA (see Table 8.2 of the HRA Screening Report (APP-044).

Site 62

Name of European Site: Firth of Forth SPA & Ramsar

Distance to East Anglia TWO (km) 511 (windfarm site) and 501 (offshore cable corridor)

Site Features	Likely ef	fect(s) of I	East Angli	a TWO								
	Collision	mortality		Displace	ment/Dist	urbance	Barrier E	Effect		Cumulat	ive/In-com	nbination
	С	0	D	С	0	D	С	0	D	С	0	D
Wintering and passage waterbird assemblage including as named features curlew, dunlin, goldeneye, great crested grebe, knot, lapwing, mallard Anas platyrhynchos, pinkfooted goose Anser brachyrhynchus, red-breasted merganser, ringed plover, Sandwich tern, Slavonian grebe, turnstone, wigeon, common scoter Melanitta nigra, golden plover, longtailed duck Clangula hyemalis, redshank, shelduck, bar-tailed godwit, cormorant, eider Somateria mollissima, grey plover, oystercatcher, red-throated diver, scaup, velvet scoter Melanitta fusca		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (b)	N (b)	N (b)

- a) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration. Therefore, proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Firth of Forth SPA & Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

Site 63 Name of European Site: Firth of Tay & Eden Estuary SPA & Ramsar **Distance to East Anglia TWO** 551 (windfarm site) and 542 (offshore cable corridor) (km) Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination С 0 D С 0 D С 0 D С 0 D N (a) N (a) Wintering and passage waterbird N (a) N (a) N (a) N (a) N (d) N (d) N (d) N (a) assemblage including as named features common scoter, cormorant, eider, goosander Mergus merganser, grey plover, long-tailed duck, redbreasted merganser, sanderling, velvet scoter, dunlin, greylag goose, redshank, oystercatcher, bar-tailed godwit, goldeneye, Icelandic blacktailed godwit Limosa limosa islandica, pink-footed goose N (b) Breeding marsh harrier N (b) Breeding little tern N (c) N (c)

Applicable to East Anglia TWO

a) Survey data show little or no evidence of Firth of Tay & Eden Estuary SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).

- b) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers from Scotland migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea, and so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- c) Breeding little tern has a maximum foraging range of 11km from colonies, so would have no connectivity with the East Anglia TWO site. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Firth of Tay & Eden Estuary SPA & Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)..

- a) Band model estimates of collision mortality indicate that LSE cannot be ruled out at the Screening stage (see Appendix 12.1 Annex 4 (APP-470)).
- b) Kittiwakes are not considered to be at risk of disturbance and displacement or barrier effects at offshore wind farms therefore LSE can be ruled out.
- c) The predicted effect attributable to the proposed East Anglia TWO project is so small that it would not significantly contribute to or alter the overall incombination assessment for these features at Flamborough and Filey Coast SPA (see Table 8.2 of the HRA Screening Report (APP-044).
- d) Flamborough and Filey Coast SPA is 239km from East Anglia TWO. Thaxter et al. (2012) report a mean foraging range of breeding gannets as 92.5km, and a maximum recorded distance of 590km. East Anglia TWO is therefore considerably beyond the mean foraging range of breeding gannets, but within their maximum range (see paragraph 269 of the HRA Screening Report (APP-044). Breeding gannets from Flamborough & Filey Coast SPA may therefore be affected by displacement (see Table 8.2 of the HRA Screening Report (APP-044). Searle et al. (2014) found that even for offshore wind farms considerably closer to a gannet breeding colony than under consideration here, impacts of displacement were negligible for this species because of its very long foraging range and large area used for foraging. Similarly, impacts of displacement during migration are considered likely to be negligible. Nonetheless, Natural England consider that an LSE cannot be ruled out at the Screening stage.

Site 65

Name of European Site: Flamborough and Filey Coast SPA

Distance to East Anglia TWO 248

(km)

- e) Gannets are not considered at risk of barrier effects due to their wide ranging habits (see (d)), and migrating gannets cover very large distances, extending from the North Sea to West Africa, so that slight local effects would be negligible in the context of their large migrations and area use, therefore LSE can be ruled out.
- f) Common guillemots, razorbills and puffins tend to fly low over the sea so have a very low risk of collision mortality, therefore LSE can be ruled out (see Table 8.2 of the HRA Screening Report (APP-044).
- g) Construction and decommissioning impacts are temporary and localised therefore LSE can be ruled out.
- h) Flamborough and Filey Coast SPA is 216km from East Anglia TWO. Thaxter et al. (2012) report a mean foraging range of breeding common guillemots as 37.8km, and a maximum recorded distance of 135km. Thaxter et al. (2012) report a mean foraging range of breeding puffin as 4km, and a maximum recorded distance of 95km. Thaxter et al. (2012) report a mean foraging range of breeding puffin as 4km, and a maximum recorded distance of 200km. East Anglia TWO is therefore considerably beyond the normal foraging range of these species from Flamborough and Filey Coast SPA. It is therefore unlikely that any breeding adults from Flamborough and Filey Coast SPA will be present at East Anglia TWO during the breeding season. During the nonbreeding season, birds from Flamborough and Filey Coast SPA are likely to be mixed with the large BDMPS populations of these species so that apportioning of the impact of the low level of displacement mortality generates a negligible impact to Flamborough and Filey Coast SPA. Nonetheless, Natural England consider that an LSE cannot be ruled out at the Screening stage (see paragraph 271 of the HRA Screening Report (APP-044).
- i) Since East Anglia TWO is beyond the normal foraging range of breeding common guillemots, razorbills and puffins from Flamborough and Filey Coast SPA, there will be no breeding season barrier impact for those populations. During the nonbreeding period birds from Flamborough and Filey Coast SPA are likely to be mixed with the large BDMPS populations of these species so that apportioning of the impact of the low level of displacement to this very large BDMPS population apportions a negligible impact to Flamborough and Filey Coast SPA (see paragraph 269 of the HRA Screening Report (APP-044)..

- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Foula SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Applicable to East Anglia TWO

Page 94

Site 69 Name of European Site: **Foulness SPA and Ramsar** Distance to East Anglia TWO (km) 85 (windfarm site) and 69 (offshore cable corridor) Site Features Likely effect(s) of East Anglia TWO Collision mortality Displacement/Disturbance Cumulative/In-combination **Barrier Effect** C 0 D С \circ 0 D С 0 D Wintering and passage waterbird N (a) N (a) N (a) N (a) N (a) N (a) N (e) N (e) N (a) N (e) assemblage including as named features brent goose, knot, oystercatcher, bar-tailed godwit, grey plover, avocet, redshank Nonbreeding hen harrier N (b) N (e) N (e) N (e) N (c) Breeding ringed plover, avocet N (c) Breeding little tern, common tern, N (d) Sandwich tern

- a) Survey data show little or no evidence of Foulness SPA features occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see section 5.1 of Appendix 12.2 (APP-470).
- b) Survey data show no evidence of hen harrier occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration, as the species is likely to migrate overland rather than over sea where the option is available (see section 5.1 of Appendix 12.2 (APP-470), none of these species/SPA features were recorded in the East Anglia TWO windfarm site) (see Table 8.2 of the HRA Screening Report (APP-044))..
- c) Ringed plover and avocet have not been observed during bird site-specific surveys. It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 69

Name of European Site: Foulness SPA and Ramsar

Distance to East Anglia TWO (km) 85 (windfarm site) and 69 (offshore cable corridor)

d) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively, so there is no connectivity between the SPA and East Anglia TWO site. Furthermore, these species tend to forage in coastal waters rather than offshore.

Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).

e) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Foulness SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

Applicable to East Anglia TWO

Distance to East Anglia TWO (km) 38 (windfarm site) and 24 (offshore cable corridor)

Site Features	Likely effect(s) of East Anglia TWO													
	Collision mortality		Displace	ement/Dis	turbance	Barrier I	Effect		Cumulative/In-combination					
	С	0	D	С	0	D	С	0	D	С	0	D		
Breeding seabirds (little tern, common tern, Sandwich tern)		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (a)		
Nonbreeding red-throated diver		N (b)		Y (c)	Y (i)	N (d)	N (b)	N (b)	N (b)	Y (c)	Y (i)	N (h)		
Nonbreeding little gull		Y (e)		N (f)	N (f)	N (f)	N (f)	N (f)	N (f)	N (h)	Y (e)	N (h)		
Nonbreeding common scoter		N (g)		N (g)	N (g)	N (g)	N (g)	N (g)	N (g)	N (h)	N (h)	N (h)		

- a) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively, which suggests potential connectivity between the SPA and the East Anglia TWO site. However, the tern colonies are at locations along the Norfolk coast which are beyond these foraging distances from the East Anglia TWO site. Therefore, connectivity between the SPA and East Anglia TWO site is ruled out on the basis of distance. Furthermore, these species tend to forage in coastal waters rather than offshore. Hence, collision risk, displacement and barrier effects can be excluded (see paragraph 273 of the HRA Screening Report (APP-044)).
- b) Red-throated divers fly close to the sea surface and are therefore at extremely low risk of collisions or barrier effects.
- c) LSE cannot be ruled out at screening for impacts of Displacement/Disturbance to nonbreeding red-throated divers as a result of construction work (specifically for export cable laying operations through part of the Greater Wash SPA) (see paragraph 274 of the HRA Screening Report (APP-044)).
- d) Displacement/Disturbance of red-throated diver during operation and decommissioning is considered negligible as the increase in vessel traffic within the SPA due to East Anglia TWO will be negligible compared to the current baseline (see paragraph 274 of the HRA Screening Report (APP-044)).
- e) There is potential for little gull connectivity between the SPA and the East Anglia TWO site, therefore LSE cannot be ruled out at screening for collision risk impacts to nonbreeding little gull.

Site 74

Name of European Site: Greater Wash SPA

Distance to East Anglia TWO (km) 38 (windfarm site) and 24 (offshore cable corridor)

- f) Displacement of little gulls by offshore wind farms appears to be negligible**, indicating no LSE for this SPA feature as a consequence of displacement or barrier effects (see paragraph 264 of the Information to Support Appropriate Assessment Report (APP-043)).
- g) Surveys found no common scoters in the East Anglia TWO site since this species favours waters <20m in depth (see section 5.1 of Appendix 12.2 (APP-470). Common scoter was also only present at very low densities along the export cable route, therefore no LSE for this SPA feature is predicted.
- h) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Greater Wash SPA (see Table 8.2 of the HRA Screening Report (APP-044).
- i) Following advice from Natural England it is considered that Operations and Maintenance vessels may disturb red-throated divers whilst transiting through the SPA therefore an LSE cannot be screened out (see Appendix 12.1 (APP-469)).

5.3.2 Information to Support AA – Screening Matrices

Site 88

Name of European Site: Humber Estuary SPA and Ramsar

Distance to East Anglia TWO (km) 178 (windfarm site) and 164 (offshore cable corridor)

- a) Survey data show little or no evidence of Humber Estuary SPA features occurring in the East Anglia TWO sites (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Survey data show no evidence of Humber Estuary SPA feature hen harrier occurring in the East Anglia TWO sites, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration as UK birds are likely to migrate overland rather than over the sea where possible (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Bittern has not been observed during bird surveys at East Anglia TWO (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea.
- e) Avocet has not been observed during bird site specific surveys. It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height (see Table 8.2 of the HRA Screening Report (APP-044)).
- f) Breeding little tern has a maximum foraging range of 11km from colonies, so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- g) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Humber Estuary SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

a) The distance between the potential impact range of the proposed project and the site is beyond that of potential for direct or indirect effects (see paragraphs 190 and 191 of the HRA Screening Report (APP-044))..

Site	99														
Name of European Site:	_indisfarn	e SPA and	d Ramsar												
Distance to East Anglia TWO (km)	146 (windf	arm site)	and 437 (offshore (cable cori	ridor)									
Site Features	Likely ef	fect(s) of	East Angli	a TWO											
	Collision	Displacement/Disturbance Barrier Effect Cumulative/In-combination													
	С	O D C O D C O D													
Wintering and passage waterbird assemblage including as named features wigeon, greylag goose, brent goose, sanderling, dunlin, ringed plover, goldeneye, whooper swan, black-tailed godwit, common scoter, red-breasted merganser, golden plover, grey plover, eider, shelduck, redshank		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (c)	N (c)	N (c)			
Breeding little tern, roseate tern		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)			

- a) Survey data show little or no evidence of SPA features occurring in East Anglia TWO (see section 5.1 of Appendix 12.2 (APP-470)) and migrations of birds from this SPA are likely to result in negligible numbers passing through the site during migration (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Breeding little tern has a maximum foraging range of 11km from colonies, so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site. Breeding roseate tern has a maximum foraging range of 30km from colonies, so would have no connectivity with East Anglia TWO. Migrating roseate terns are unlikely to pass through the East Anglia TWO site as their migration tends to be coastal (see Table 8.2 of the HRA Screening Report (APP-044).
- The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Lindisfarne SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

Site 101 Name of European Site: **Littoral Seino-Marin SPA Distance to East Anglia TWO** 229 (km) N (e) Nonbreeding woodlark Lullula arborea N (e) N (e)

- a) East Anglia TWO is within the theoretical maximum foraging range of breeding gannets from this SPA but tracking data show that breeding gannets from the SPA do not reach East Anglia TWO. The SPA is far beyond maximum foraging range of other designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through East Anglia TWO are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) None of these species has been recorded during bird surveys at the East Anglia TWO site. It is unlikely that birds from the SPA will migrate through the East Anglia TWO site, as these species are generally scarce migrants in the UK, and their migrations tend to be coastal rather than over open sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Breeding peregrines in western Europe tend to remain close to their breeding site throughout the year so it is extremely unlikely that any from the SPA would reach East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) Woodlark is a very scarce migrant to the UK, so it is very unlikely that individuals from the SPA would reach the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Littoral Seino-Marin SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

	Collision	mortality		Displace	ment/Dist	urbance	Barrier E	Effect		Cumulat	ive/In-com	bination
	С	0	D	С	0	D	С	0	D	С	0	D
Wintering and passage waterbird assemblage including as named features pintail, shoveler, teal, wigeon, turnstone, brent goose, dunlin, knot, ringed plover Bewick's swan, oystercatcher, black-tailed godwit, curlew, grey plover, great crested grebe, avocet, shelduck, greenshank, redshank		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (d)	N (d)	N (d)
Breeding avocet		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)
Breeding little tern, common tern		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (c)

- a) Survey data show little or no evidence of Medway Estuary & Marshes SPA features occurring in the East Anglia TWO site site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Avocet has not been observed during bird site-specific surveys site (see section 5.1 of Appendix 12.2 (APP-470). It is highly unlikely that these birds would migrate through the East Anglia TWO site as their migration is likely to take a coastal route and cross sea at narrow points such as The English Channel. If they did migrate through the East Anglia TWO site their flight height is likely not to be at collision risk height (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so

Site

Name of European Site: Medway Estuary & Marshes SPA and Ramsar

111

are unlikely to pass through the East Anglia TWO site. Breeding common tern has a maximum foraging range of 30km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating common terns are unlikely to pass through the East Anglia TWO site as their migration tends to be coastal where that is an option (see Table 8.2 of the HRA Screening Report (APP-044)).

d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Medway Estuary & Marshes SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see section 6.2.1, of the HRA Screening Report (APP-044)).

b) The distance between the offshore project area and the designated site is beyond the range of any potential LSE. Indirect far-field effects are limited to 1km of the works and for the duration of 1 tidal cycle (see paragraph 118 of APP-044).

Site 113 Name of European Site: **Minsmere - Walberswick SPA and Ramsar Distance to East Anglia TWO** 34 (windfarm site) and 2 (cable corridor) (km) Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance Cumulative/In-combination **Barrier Effect** 0 D 0 D С 0 С С D С 0 D Wintering shoveler, gadwall, white-N (a) N (g) N (g) N (g) fronted goose Nonbreeding hen harrier N (b) N (b) N (b) N (b) N (b) N (g) N (b) N (b) N (g) N (g) Breeding shoveler, teal, gadwall, N (c) N (g) N (g) N (g) bittern, avocet Breeding nightjar Caprimulgus N (d) N (g) N (d) N (d) N (d) N (d) N (d) N (d) N (g) N (g) europaeus Breeding marsh harrier N (e) Breeding little tern N (f) N (f)

Site 113

Name of European Site: Minsmere - Walberswick SPA and Ramsar

Distance to East Anglia TWO 34 (windfarm site) and 2 (cable corridor)

(km)

- a) Survey data show no evidence of Minsmere-Walberswick SPA features shoveler, gadwall or white-fronted goose occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site.
- b) Survey data show no evidence of hen harrier occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site as UK birds are likely to migrate overland rather than over the sea where possible (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Survey data show no evidence of Minsmere-Walberswick SPA features shoveler, teal, gadwall, bittern or avocet occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Survey data show no evidence of nightjar occurring in the East Anglia TWO OWF site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site as UK birds are likely to migrate overland rather than over the sea where possible and make short sea crossings from southern England to France (see Table 8.2 of the HRA Screening Report (APP-044)).
- e) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- f) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- g) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Minsmere-Walberswick SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraphs 219 and 220 for harbour seal and paragraphs 190 and 191 for harbour porpoise, of the HRA Screening Report (APP-044)).

125 Site Name of European Site: **North Caithness Cliffs SPA** Distance to East Anglia TWO (km) 769 Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination D С 0 С 0 0 D 0 D Breeding seabird assemblage including N (a) N (a) N (c) N (a) N (a) N (a) N (a) N (c) N (c) N (a) as named features fulmar, guillemot, kittiwake, razorbill, puffin N (b) Breeding peregrine N (b) N (b) N (b)

- a) North Caithness Cliffs SPA is far beyond the maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Peregrines breeding in the UK normally remain close to their breeding areas throughout the year, and are very unlikely to migrate offshore from the UK (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at North Caithness Cliffs SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Applicable to East Anglia TWO

Site 126 Name of European Site: North Norfolk Coast SPA and Ramsar Distance to East Anglia TWO (km) 99 (windfarm site) and 87 (cable corridor) Site Features Likely effect(s) of East Anglia TWO Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination C 0 D С \circ C D С 0 D Y (a) Wintering and passage waterbird N (a) N (a) N (a) Y (a) N (f) N (a) N (a) N (a) N (f) assemblage including as named features wigeon, pink-footed goose, brent goose, knot, avocet Breeding bittern N (b) N (f) N (f) N (f) Breeding marsh harrier N (c) N (f) N (f) N (f) Breeding avocet N (d) N (d) N (d) N (d) N (f) N (f) N (f) N (d) N (d) N (d) N (e) Breeding little tern, common tern, N (e) N (e) N (e) N (e) N (e) N (e) N (f) N (f) N (f) Sandwich tern

- a) Survey data show little or no evidence of North Norfolk Coast SPA features wigeon, pink-footed goose, brent goose, knot, avocet occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Survey data show no evidence of North Norfolk Coast SPA feature bittern occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Marsh harrier is a migrant species. Satellite tracking suggests that marsh harriers migrate overland to the south coast of England and over the Channel to France, rather than across the North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) Survey data show no evidence of North Norfolk Coast SPA feature avocet occurring in the East Anglia TWO site, and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 126

Name of European Site: North Norfolk Coast SPA and Ramsar

Distance to East Anglia TWO (km) 99 (windfarm site) and 87 (cable corridor)

e) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively (Thaxter et al. 2012), so there is no connectivity between the SPA and East Anglia TWO site. Furthermore, these species tend to forage in coastal waters rather than offshore. Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).

f) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at North Norfolk Coast SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044)).

a) Survey data show little or no evidence of SPA features occurring in East Anglia TWO (see section 5.1 of Appendix 12.2 (APP-470) and migrations of birds from this SPA are likely to result in negligible numbers passing through the site during migration (see Table 8.2 of the HRA Screening Report (APP-044).

N (b)

- b) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Northumbria Coast SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

N (b)

N (b)

N (b)

- a) SPA is far beyond maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through East Anglia TWO are small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Noss SPA (see Table 8.2 of the HRA Screening Report (APP-044).

Applicable to East Anglia TWO

Site 130 NTP S-H Wattenmeer und angrenzende Kustengebiete SAC Name of European Site: 448 **Distance to East Anglia TWO** (km) Site Features Likely effect(s) of East Anglia TWO Indirect effects on Changes to water Underwater noise **Vessel Interactions** In-combination quality prey С 0 D С 0 С 0 D С 0 D С 0 D D Harbour porpoise *Phocoena* N(a) phocoena Grey seal Halichoerus grypus N(a) Harbour seal Phoca vitulina N(a) N(a)

a) The distance between the potential impact range of the proposed project and the site is beyond that of potential for direct or indirect effects (see paragraphs 219 and 220 for harbour seal, paragraphs 190 and 191 for grey seal and paragraphs 168 and 169 for harbour porpoise, of the HRA Screening Report (APP-044)).

Site 131 **Oosterschelde SAC** Name of European Site: 104 **Distance to East Anglia TWO** (km) Site Features Likely effect(s) of East Anglia TWO **Vessel Interactions** Changes to water Underwater noise Indirect effects on In-combination quality prev С С С С С 0 D 0 D 0 D 0 D 0 D Harbour porpoise Phocoena N(a) phocoena Grey seal Halichoerus grypus N(a) Harbour seal Phoca vitulina N(a) N(a)

a) The distance between the potential impact range of the proposed project and the extent of any impact on individuals from this site result are negligible and would result in no potential for LSE (see paragraphs 219 and 220 for harbour seal, paragraphs 190 and 191 for grey seal and paragraphs 168 and 169 for harbour porpoise, of the HRA Screening Report (APP-044)).

Site 132 Name of European Site: **Orfordness - Shingle Street SAC** 37 (windfarm site) and 5 (cable corridor) **Distance to East Anglia TWO** (km) Site Likely effect(s) of East Anglia TWO Features Permanent loss Temporary physical Smothering due to Re-mobilisation of Underwater noise In-combination disturbance increased contaminated and vibration suspended sediments sediment 0 С С 0 С 0 С 0 С 0 С D 0 D D D D D N (a) Coastal

lagoons

a) The primary feature of the SAC is a series of percolation lagoons which are separated from the marine environment by the Orford shingle beach. These features are described as non-marine as they occur landward of highest astronomical tide. Therefore, due to a physical barrier there is no pathway between the source of any effects in the marine environment and the receptor (see Table 5.2 of HRA Screening Report (APP-470).

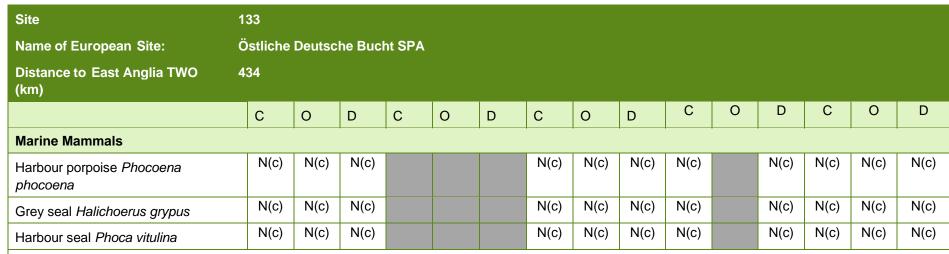

Site 133 Name of European Site: Östliche Deutsche Bucht SPA **Distance to East Anglia TWO** 434 (km) Site Features Likely effect(s) of East Anglia TWO Displacement/Disturbance Collision mortality **Barrier Effect** Cumulative/In-combination С 0 D 0 D С 0 D 0 D Ornithology Nonbreeding seabirds (razorbill, N (a) N (a) N (a) N (a) N (a) N (a) N (b) N (b) N (b) N (a) fulmar, black-throated diver, redthroated diver, herring gull, common gull, lesser black-backed gull, great black-backed gull, little gull, blackheaded gull Chroicocephalus ridibundus, common scoter, great crested grebe, kittiwake, common tern, Arctic tern, sandwich tern, gannet, guillemot) a) Migrations of birds from this SPA are likely to result in negligible numbers passing through East Anglia TWO during migration relative to the size of BDMPS regional populations (see Table 5.2 of HRA Screening Report (APP-470)). b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at östliche Deutsche Bucht SPA (see Table 5.2 of HRA Screening Report (APP-470)). Site Features Likely effect(s) of East Anglia TWO Changes to water In-combination Underwater noise Vessel Interactions Indirect effects on quality prey

c) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE. (see paragraphs 219 and 220 for harbour seal, paragraphs 190 and 191 for grey seal and paragraphs 168 and 169 for harbour porpoise, of the HRA Screening Report (APP-044)).

134 Site **Ouessant-Molene SAC** Name of European Site: 630 **Distance to East Anglia TWO** (km) Site Features Likely effect(s) of East Anglia TWO Changes to water Underwater noise **Vessel Interactions** Indirect effects on In-combination quality prey С С С 0 0 0 D 0 D С 0 D D С D Grey seal Halichoerus grypus N(a) N(a)

a) The distance between the potential impact range of East Anglia TWO and the extent of any impact on individuals from this site result are negligible and would result in no potential for LSE (see paragraphs 190 and 191 and Table 8.2 of the HRA Screening Report (APP-044)).

Site 135 Name of European Site: **Outer Thames Estuary SPA and pSPA extension** Within cable corridor Distance to East Anglia TWO (km) Likely effect(s) of East Anglia TWO Site Features Displacement/Disturbance Collision mortality Cumulative/In-combination **Barrier Effect** С С 0 D 0 С С 0 D 0 D D Nonbreeding red-throated divers Y (b) Y (ab) Y (a) & Y (a) Y (b) Y (c) Y (b) Y (a) Y (b) N-Y (c) (eb) Breeding little tern and common tern N (d) N (d)

- a) Given the overlap of the East Anglia TWO cable corridor with this SPA, collision risk cannot be ruled out at this stage and further assessment is required (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Given the overlap of the East Anglia TWO cable corridor with this SPA, further detailed assessment is appropriate. Disturbance to red-throated diver is possible, especially during export cable installation. Great Yarmouth may be used as a port for construction vessels for the East Anglia TWO site; this port is located very close to the northern extent of the SPA however is outside the main concentrations of red-throated divers. This, together with the extent of existing vessel movements in the area means the addition of construction traffic as a result of the Project will make little difference to the existing baseline and therefore the potential for LSE is considered to be negligible (see Table 8.2 of the HRA Screening Report (APP-044).
- c) Following advice from Natural England it is considered that Operations and Maintenance vessels <u>and the operational windfarm array site itself</u> may disturb red-throated divers whilst transiting through the SPA therefore an LSE cannot be screened out (see Appendix 12.1 (APP-469)).
- d) SPA is beyond maximum foraging range of designated breeding seabird species (terns) and tern foraging tends to be coastal so has no breeding season connectivity. Proportions of these populations migrating through East Anglia TWO are likely to be small as these species are thought to remain close to shore during much of their migration through UK waters (see Table 8.2 of the HRA Screening Report (APP-044).

The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Outer Thames Estuary SPA (see Table 8.2 of the HRA Screening Report (APP-044).

Site 136

Name of European Site: Papa Stour SPA

Distance to East Anglia TWO (km) 922

Site Features	Likely e	ffect(s) of I	East Angli	lia TWO

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraphs 190 and 191 and Table 8.2 of the HRA Screening Report (APP-044)).

Site 145 Name of European Site: Ramsar-Gebiet S-H Wattenmeer und angrenzende Küstengebiete SPA Distance to East Anglia TWO (km) 448 Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination C 0 С С С D 0 D 0 D 0 D Breeding seabirds including common N (a) N (e) N (e) N (e) gull, lesser black-backed gull, great black-backed gull, Mediterranean gull, black-headed gull, little tern, common tern, Arctic tern, Sandwich tern, black tern, gull-billed tern Gelochelidon nilotica N (b) Nonbreeding seabirds including N (b) N (b) N (b) N (b) N (b) N (b) N (e) N (e) N (e) razorbill, black-throated diver, redthroated diver, common gull, lesser black-backed gull, great black-backed gull, Mediterranean gull, black-headed gull, little gull, kittiwake, little tern, common tern, Arctic tern, Sandwich tern, cormorant, guillemot Waterbirds including pintail, shoveler, N (c) N (e) N (e) N (e) teal, wigeon, mallard, garganey Anas querquedula, grey heron Ardea cinerea, turnstone, bittern, brent goose, barnacle goose, sanderling, dunlin, curlew sandpiper, ringed plover, Kentish plover Charadrius

Site 145 Name of European Site: Ramsar-Gebiet S-H Wattenmeer und angrenzende Küstengebiete SPA Distance to East Anglia TWO (km) 448 Likely effect(s) of East Anglia TWO Site Features Displacement/Disturbance Cumulative/In-combination Collision mortality **Barrier Effect** C 0 C D C D С 0 0 0 alexandrinus, Bewick's swan, whooper swan, snipe Gallinago gallinago, oystercatcher, black-winged stilt Himantopus himantopus, bar-tailed godwit, black-tailed godwit, common scoter, red-breasted merganser, curlew, whimbrel, ruff, spoonbill, golden plover, grey plover, red-necked grebe Podiceps grisegena, black-necked grebe Podiceps nigricollis, avocet, eider, shelduck, greenshank, redshank, lapwing Terrestrial birds (various species) N (d) N (d)

- a) The East Anglia TWO site is beyond maximum foraging range of designated breeding seabird species from this SPA, so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site relative to the size of BDMPS regional populations, not only because of the distance, but also because seabirds and waterbirds from this SPA are likely to migrate predominantly along the continental coast of the North Sea towards northern breeding grounds rather than across the southern North Sea (see Table 8.2 of the HRA Screening Report (APP-044)).

a) River lamprey are restricted to rivers and coasts so there can be no direct interaction with the proposed East Anglia TWO project. Sea lamprey could in theory be present in the vicinity of the proposed East Anglia TWO project, but given their life history interaction would be limited. The distance between the proposed project and the site precludes direct impact upon the site and its supporting habitats (see Table 5.2 of the HRA Screening Report (APP-470)).

Site	151														
Name of European Site:	Ronas H	lill - North	Roe and	Tingon Si	PA										
Distance to East Anglia TWO (km)	938														
Site Features	Likely	xely effect(s) of East Anglia TWO													
	Collisio	billision mortality Displacement/Disturbance Barrier Effect Cumulative/Incombination													
	С	0	D	С	0	D	С	0	D	С	0	D			
Breeding great skua		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (d)	N (d)	N (d)			
Breeding red-throated diver		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (d)	N (d)	N (d)			
Breeding merlin		N (c)		N (c)	N (c)	N (c)	N (c)	N (c)	N (c)	N (d)	N (d)	N (d)			

- a) Ronas Hill, North Roe & Tingon SPA is beyond maximum foraging range of great skua so has no breeding season connectivity. The proportion of the population migrating through the East Anglia TWO site is likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Ronas Hill, North Roe & Tingon SPA is beyond maximum foraging range of red-throated diver so has no breeding season connectivity. The proportion of the population migrating through the East Anglia TWO site is likely to be extremely small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Merlins from this population are likely to migrate to wintering areas that are predominantly within the UK. A few, mostly young birds, may winter on the European continent so could possibly pass through the East Anglia TWO site. However, no merlins have been seen during site specific surveys, and the chances of any from this SPA passing through the site are likely to be extremely low (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Ronas Hill, North Roe & Tingon SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 152 Name of European Site: **Rousay SPA Distance to East Anglia TWO** 826 (km) Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination D С С 0 С 0 D 0 D С 0 D Breeding seabird assemblage including N (a) N (a) N (a) N (a) N (a) N (b) N (b) N (a) N (a) N (b) as named features guillemot, Arctic skua, Arctic tern, kittiwake, fulmar

- a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraphs 218 and 219, of the HRA Screening Report (APP-044)).
- b) It was agreed as part of the East Anglia TWO Scoping and Evidence Plan Process (EPP) (see Appendix 9.1 (APP-458) and Appendix 10.1 (APP-462) that transboundary impacts on benthic habitats fish would be scoped out of the EIA. We have therefore screened them out from consideration in the HRA

Site 163 Name of European Site: Seevogelschutzgebiet Helgoland SPA 428 **Distance to East Anglia TWO** (km) Site Features Likely effect(s) of East Anglia TWO Displacement/Disturbance **Barrier Effect** Cumulative/In-combination Collision mortality 0 D С 0 D С D С 0 0 D Breeding seabird assemblage including N (a) N (c) N (c) N (c) as named features razorbill, fulmar, herring gull, lesser black-backed gull, kittiwake, gannet, guillemot Nonbreeding seabird assemblage N (b) N (c) N (c) N (c) including razorbill, black-throated diver, red-throated diver, common gull, lesser black-backed gull, little gull, kittiwake, common scoter, red-necked grebe, eider, common tern, Arctic tern, Sandwich tern, gannet, guillemot

- a) Tracking data from gannets breeding on Helgoland show these birds do not travel in the direction of or as far as the East Anglia TWO site despite this site being within theoretical maximum foraging range of gannet. East Anglia TWO is beyond the maximum foraging range of other seabird species at Seevogelschutzgebeit Helgoland SPA. Proportions of these populations migrating through East Anglia TWO are likely to be very small relative to BDMPS regional populations (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site during migration relative to the size of BDMPS regional populations, not only because the sites are 428km apart, but also because nonbreeding seabirds from this SPA are likely to migrate predominantly along the continental coast of the North Sea towards northern breeding grounds rather than across the southern North Sea.

Site 163

Name of European Site: Seevogelschutzgebiet Helgoland SPA

Distance to East Anglia TWO 428

(km)

c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Seevogelschutzgebeit Helgoland SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Page 213

a) The distance between the potential impact range of East Anglia TWO and the site is beyond that of potential for direct or indirect effects (see paragraphs 168 and 169, of the HRA Screening Report (APP-044))..

Site 166 Name of European Site: Solent & Southampton Water SPA & Ramsar (offshore cable corridor) Distance to East Anglia TWO (km) 267 Site Features Likely effect(s) of East Anglia TWO Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination C 0 D С \circ D C 0 D С 0 D N (a) Nonbreeding teal, brent goose, ringed N (a) N (a) N (a) N (d) N (a) N (a) N (a) N (d) N (d) plover, black-tailed godwit N (b) Breeding Mediterranean gull N (b) Breeding little tern, common tern, N (c) roseate tern, Sandwich tern

- a) Survey data show little or no evidence of Solent & Southampton Water SPA and Ramsar features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this site are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) No Mediterranean gulls were recorded in the East Anglia TWO site during bird surveys. This species is scarce in England, although increasing. Birds from the SPA are unlikely to migrate through the East Anglia TWO site. Thaxter et al. (2012) report the maximum foraging range of breeding Mediterranean gulls as 20km, so birds from this SPA will not have connectivity with the East Anglia TWO site during breeding (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Little tern, common tern, roseate tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km, 30km and 54km respectively (Thaxter et al. 2012), so there is no connectivity between the SPA and the East Anglia TWO site which are 244km apart. Furthermore, these species tend to forage in coastal waters rather than offshore. Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Solent & Southampton Water SPA and Ramsar(see Table 8.2 of the HRA Screening Report (APP-044)).

Applicable to East Anglia TWO

Page 226

Site 178 Name of European Site: **Teesmouth and Cleveland Coast SPA and Ramsar** 332 **Distance to East Anglia TWO** (km) Site Features Likely effect(s) of East Anglia TWO Displacement/Disturbance **Barrier Effect** Cumulative/In-combination Collision mortality С 0 D С D С D С 0 0 0 D N (a) N (a) Nonbreeding knot, redshank N (a) N (a) N (a) N (a) N (a) N (d) N (d) N (d) Nonbreeding Sandwich tern N (b) N (d) N (d) N (d) Breeding little tern N (c) N (c)

- a) Survey data show little or no evidence of Teesmouth & Cleveland Coast SPA features knot or redshank occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site.
- b) Nonbreeding Sandwich terns at Teesmouth & Cleveland Coast SPA may migrate between the SPA and wintering areas off west Africa. This could take them near to East Anglia TWO. However, very few terns of any species were seen in the East Anglia TWO site during bird surveys, and the Sandwich tern tends to migrate close to the coast where that is possible, so there are unlikely to be significant numbers reaching the East Anglia TWO site. The few that do will have a very low collision risk due to their generally low flight height and displacement/barrier effects will be negligible in the context of a migration of thousands of kilometres (see Table 8.2 of the HRA Screening Report (APP-044).
- c) Breeding little tern has a maximum foraging range of 11km from colonies (Thaxter et al. 2012), so would have no connectivity with East Anglia TWO. Migrating little terns are considered to be 'extremely coastal on passage with very few sightings in open ocean or inland' (Forrester et al. 2007), so are unlikely to pass through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Teesmouth & Cleveland Coast SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

Site 179 Name of European Site: **Thames Estuary and Marshes SPA and Ramsar** Distance to East Anglia TWO (km) 116 (windfarm site) and 99 (offshore cable corridor) Likely effect(s) of East Anglia TWO Site Features Displacement/Disturbance Collision mortality **Barrier Effect** Cumulative/In-combination D С 0 С 0 D С 0 D С 0 D Wintering and passage waterbird N (a) N (a) N (a) N (c) N (a) N (a) N (a) N (a) N (c) N (c) assemblage including as named features dunlin, knot, ringed plover, black-tailed godwit, grey plover, avocet, redshank Nonbreeding hen harrier N (b) N (c) N (c) N (c)

- a) Survey data show little or no evidence of Thames Estuary & Marshes SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044).
- b) Survey data show no evidence of hen harrier occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site, as the species is likely to migrate overland rather than over sea where the option is available (see Table 8.2 of the HRA Screening Report (APP-044).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Thames Estuary & Marshes SPA and Ramsar (see Table 8.2 of the HRA Screening Report (APP-044).

- a) Potential effects from underwater noise; vessel interactions; changes to water quality; changes to prey resources; and disturbance at seal haul-out sites for foraging grey and harbour seal cannot be ruled out. Nearest SAC for harbour seal to East Anglia TWO. Assumed that all harbour seal in the East Anglia TWO area are associated with this SAC. Potential for vessel interactions and disturbance at seal haul-out sites depending on vessel route and therefore LSE cannot be ruled out see Table 7.2 of the HRA Screening Report (APP-044).
- b) The distance between East Anglia TWO and the designated site is beyond the range of any potential LSE. Indirect far-field effects are limited to 1km of the works and for the duration of 1 tidal cycle (see paragraph 118 of APP-044)

Site 184

Name of European Site: The Wash SPA and Ramsar

Distance to East Anglia TWO (km) 128 (windfarm site) and 106 (cable corridor)

Site Features	Likely ef	fect(s) of I	East Anglia	a TWO								
	Collision	mortality		Displace	ement/Dist	urbance	Barrier E	Effect		Cumulat	tive/In-con	nbination
	С	0	D	С	0	D	С	0	D	С	0	D
Wintering and passage waterbird assemblage including as named features pintail, wigeon, gadwall, pinkfooted goose, turnstone, brent goose, goldeneye, sanderling, dunlin, knot, Bewick's swan, oystercatcher, bartailed godwit, black-tailed godwit, common scoter, curlew, grey plover, shelduck, redshank		N (a)		N (a)	N (a)	N (a)	N (a)	N (a)	N (a)	N (c)	N (c)	N (c)
Breeding little tern, common tern		N (b)		N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)	N (b)

- a) Survey data show little or no evidence of The Wash SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Little tern and common tern have maximum foraging ranges from colonies of 11km and 30km respectively (Thaxter et al. 2012), so there is no connectivity between the SPA and East Anglia TWO site which are 106km apart. Furthermore, these species tend to forage in coastal waters rather than offshore. Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at The Wash SPA and Ramsar(see Table 8.2 of the HRA Screening Report (APP-044)).

Site 185 **Thyboron Stenvolde SCI** Name of European Site: **Distance to East Anglia TWO** 595 (km) Site Features Likely effect(s) of East Anglia TWO **Vessel Interactions** Indirect effects on Changes to water In-combination Underwater noise quality prey С 0 D С 0 D С 0 D С 0 D С 0 D Harbour Porpoise *Phocoena* N(a) phocoena

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraphs 167 and 168 and Table 7.3 of the HRA Screening Report (APP-044)).

Site 186 Tregor Goëlo SAC Name of European Site: 498 **Distance to East Anglia TWO** (km) Site Features Likely effect(s) of East Anglia TWO Underwater noise **Vessel Interactions** Indirect effects on Changes to water In-combination quality prey С 0 D С 0 С 0 D С 0 D С 0 D D Grey seal Halichoerus grypus N(a) N(a)

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraphs 190 and 191 and Table 8.2 of the HRA Screening Report (APP-044)).

Site 187 Name of European Site: Troup, Pennan and Lion's Heads SPA Distance to East Anglia TWO (km) 657 Likely effect(s) of East Anglia TWO Site Features Displacement/Disturbance Cumulative/In-combination Collision mortality **Barrier Effect** С 0 D С С 0 0 D 0 D D Breeding seabird assemblage including N (a) N (b) N (b) N (b) as named features razorbill, fulmar, guillemot, kittiwake, herring gull

- a) Troup, Pennan & Lion's Heads SPA is beyond maximum foraging range of designated seabird species so has no breeding season connectivity.

 Proportions of these populations migrating through the East Anglia TWO site are likely to be very small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Troup, Pennan & Lion's Heads SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 196

Name of European Site: Waddenzee (Wadden Sea) SPA

Distance to East Anglia TWO (km)

greenshank, redshank, lapwing

- a) The East Anglia TWO site is far beyond the mean maximum foraging range of designated breeding seabird species from this SPA, so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are likely to be extremely small relative to BDMPS, not only because of the distance, but also because birds from this SPA are likely to use the west European flyway along the continental coast rather than crossing the southern North Sea. Lesser black-backed gull tracking has shown breeding birds do not cross the North Sea therefore no connectivity is expected for this species (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Survey data show little or no evidence of Waddenzee SPA breeding waterbird features occurring in the East Anglia TWO site see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) Survey data show little or no evidence of Waddenzee SPA nonbreeding waterbird features occurring in the East Anglia TWO site see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- d) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Waddenzee SPA (see Table 8.2 of the HRA Screening Report (APP-044)).

Site 197 Waddenzee SAC Name of European Site: 186 **Distance to East Anglia TWO** (km) **Marine Mammals** Site Features Likely effect(s) of East Anglia TWO Changes to water Underwater noise **Vessel Interactions** Indirect effects on In-combination quality prey С 0 D С 0 D С 0 D С 0 D С 0 D Harbour porpoise N(a) Phocoena phocoena Grey seal Halichoerus N(a) grypus Harbour seal Phoca N(a) vitulina **Benthic Habitats** Temporary physical Smothering due to Permanent loss Re- mobilisation of Underwater noise Site Features In-combination disturbance increased contaminate d and vibration suspended sediments sediment С 0 D С 0 D С 0 D С 0 D С 0 D С 0 D Sandbanks which are N (b) Ν N (b) N (b) Ν Ν Ν Ν Ν N (b) Ν N (b) Ν N (b) N (b) N (b) slightly covered by sea (b) (b) (b) (b) (b) (b) (b) (b) water all the time Estuaries N (b) Ν N (b) N (b) N (b) Ν N (b) Ν N (b) N (b) N (b) Ν Ν Ν Ν Ν (b) (b) (b) (b) (b) (b) (b) (b) Mudflats and sandflats N (b) Ν Ν N (b) Ν N (b) N (b) Ν Ν N (b) Ν Ν N (b) N (b) N (b) Ν not covered by (b) (b) (b) (b) (b) (b) (b) (b) seawater at low tide

Site 197

Name of European Site: Waddenzee SAC

Distance to East Anglia TWO 186

(km)

- a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraphs 219 and 220 for harbour seal, paragraphs 190 and 191 for grey seal and paragraphs 168 and 169 for harbour porpoise, of the HRA Screening Report (APP-044)).
- b) As it has been agreed through the scoping and Evidence Plan Process (EPP) (see Appendix 9.1 (APP-458)) that transboundary effects are scoped out for EIA (given the distance to sites in other Members States jurisdictions) these have also been screened out from consideration for HRA purposes.

Site 198 Name of European Site: **West Westray SPA** Distance to East Anglia TWO (km) 837 Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination 0 С С 0 0 D С D D С 0 D Breeding seabird assemblage including N (a) N (b) N (b) N (b) as named features kittiwake, Arctic tern, fulmar, razorbill, Arctic skua,

- a) West Westray SPA is beyond maximum foraging range of designated seabird species so has no breeding season connectivity. Proportions of these populations migrating through the East Anglia TWO site are likely to be very small relative to BDMPS (see Table 8.2 of the HRA Screening Report (APP-044).
- b) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at West Westray SPA (see Table 8.2 of the HRA Screening Report (APP-044).

a) There is no potential for any direct disturbance as a result of activities within the East Anglia TWO windfarm site due to the distance between the site and the closest point onshore (31km). There is also no potential for any direct disturbance as a result of activities within the East Anglia TWO offshore cable corridor due to the distance between the nearest major haul-out site at Winterton-Horsey and the cable landfall at Sizewell, which is located over 60km along the coast (Table 7.3 of the HRA Screening Report (APP-044)).

a) The distance between the potential impact range of East Anglia TWO and the extent of any effect on individuals from this site would result in no potential for LSE (see paragraphs 219 and 220 and Table 7.3 of the HRA Screening Report (APP-044)).

Site 202 Name of European Site: Ythan Estuary, Sands of Forvie and Meikle Loch SPA **Distance to East Anglia TWO** 615 (km) Likely effect(s) of East Anglia TWO Site Features Collision mortality Displacement/Disturbance **Barrier Effect** Cumulative/In-combination С 0 D С 0 С С 0 D 0 D D Wintering and passage waterbird N (a) N (c) N (c) N (c) assemblage including as named features lapwing, eider, pink-footed goose, redshank Breeding little tern, common tern, N (b) Sandwich tern

- a) Survey data show little or no evidence of Ythan Estuary, Sands of Forvie & Meikle Loch SPA features occurring in the East Anglia TWO site (see section 5.1 of Appendix 12.2 (APP-470), and migrations of birds from this SPA are likely to result in negligible numbers passing through the East Anglia TWO site (see Table 8.2 of the HRA Screening Report (APP-044)).
- b) Little tern, common tern and Sandwich tern have maximum foraging ranges from colonies of 11km, 30km and 54km respectively, so there is no connectivity between the SPA and East Anglia TWO site which are 608km apart. Furthermore, these species tend to forage in coastal waters rather than offshore. Therefore, collision risk, displacement and barrier effects can be excluded (see Table 8.2 of the HRA Screening Report (APP-044)).
- c) The predicted effect attributable to East Anglia TWO is so small that it would not significantly contribute to or alter the overall in-combination assessment for these features at Ythan Estuary, Sands of Forvie & Meikle Loch SPA (see Table 8.2 of the HRA Screening Report (APP-044)).
