

The aerial flyover footage submitted by the Developer is shocking, and it is incomplete with the omission of the Steeple Renewables project. Therefore, a fifth of the impact has been ignored.

The 5 schemes, which would connect into the Cottam and West Burton 400kv substations, would have a combined installed capacity of 2,500MW. However, with solar generation in the UK having such a low output, the average generation would only be around 280MW this is less than 10% of the generating capacity of the now closed Cottam and West Burton power stations.

I say that the dominating visual impact clearly shown by this incomplete footage is not worth this tiny amount of electrical generation. This amount of development in the area would have damaging impacts on residential wellbeing.

Residents must be listened to.
