

Further to my submission on visual impact, viewed particularly from the B1398.

I have now seen the Island Green Power video of the multiple solar farms proposed for this area. This video backs up my statements about being able to clearly pick out individual fields and the harms of 4.5m high panels on this landscape, even though panel height is not indicated in the footage.

If these schemes get approval, then due to vast public opposition, Democracy really is in question. These schemes will be energy follies of the future.

There would be irretrievable harms caused by this scale of development.

The vast acreage of this accumulation of solar schemes in the area that only produce a modest output, surely means that if consented, the planning system would also be in question. There is demonstrably no balance here between the needs, the gains, and the harms of this concentration of solar. It really is sickening.
