

It is hard to believe, that after such a long and extended time, this ridiculous proposal is near to being out of our hands. Issues of flooding that grow with each year and climate change. Taking land away from agriculture and food production. Claiming to be green, yet comprehensively damaging our local environment when it would be so easy to adjust the application in ways that would turn many of us to favour the proposal as we recognise the need for green energy, but not when the cost is too high. Then, experimentally including these battery systems that have been shown to spontaneously burst into flames leaving dangerous chemicals in the area and risking these getting into our water courses. And so many more good reasons to block this cynical proposal that's only there because of the proximity of the Sellinge sub station. Does this process actually give weight to the local objections or is this just an expensive and time consuming appeasement? I really do wonder as it's hard to understand how in a nation such as ours such a cynical and damaging proposal could even get this far. It should have been stopped years ago.
