

Large industrial solar & battery storage sites are being sold to the public as being essential for our energy security. In an ideal world that may be the case. However, we don't live in an ideal world. Large solar sites are extremely vulnerable to acts of vandalism & terrorism. With very little effort or expense a significant amount of damage can be inflicted. The proposed East Park Energy site is located on the north facing side of the Kym valley. In the event of a fire there are densely populated areas to the N/E of the site, which, with the prevailing winds would be in the path of any toxic fumes. Any run off on the land from fire fighting would likely find its way into the river Kym, which flows into the Gt Ouse, which in turn supplies Grafham Water reservoir.
