1. EXECUTIVE SUMMARY

1.1. This assessment considers the potential impacts on ground-based receptors such as roads, rail, residential dwellings, and bridleways as well as aviation assets. A 1km study area around the Solar PV Site is considered adequate for the assessment of ground-based (residential, rail, road, and bridleway) receptors, whilst a 30km study area is chosen for aviation receptors. Within the ground-based study areas of the Solar PV Site, there are 176 residential receptors, including 20 residential areas, 171 road receptors and 99 bridleway receptors that were considered. As per the methodology section, where there are several residential receptors within close proximity, a representative dwelling or dwellings is/are chosen for full assessment as the impacts will not vary to any significant degree. Where small groups of receptors have been evident, the receptors on either end of the group have been assessed in detail. Two residential receptors, one road receptor and 12 bridleway receptors were dismissed as they are located within the non-reflection zones. 42 aerodromes are located within the 30km study area; two of which, Old Warden Airport and Sackville Farm Aerodrome required detailed assessments as the Solar PV Site is located within their respective safeguarding buffer zones. The other 40 aerodromes did not require a detailed assessment due to their size and/or orientation in relation to the Solar PV Site.

1.2. Geometric analysis was conducted at 174 individual residential receptors, including 20 residential areas, 170 road receptors, and 87 bridleway receptors. Also, geometric analysis was conducted at four runway approach paths at Old Warden Airport and Sackville Farm Aerodrome.

1.3. Following an initial assessment, rail receptors were scoped out as assets that will be impacted upon from the Proposed Development as no rail receptors fell within the 1km study area. The assessment concludes that:

- Solar reflections are possible at 112 of the 174 residential receptors assessed within the 1km study area. Once reviewing the actual visibility of the receptors, glint and glare impacts remain High at four receptors, Low at one receptor and reduce to None for 169 receptors. Once mitigation taken into consideration the impacts all residential receptors reduced to None. Therefore, overall impacts on residential receptors are considered to be None.

- Solar reflections are possible at 168 of the 170 road receptors assessed within the 1km study area. Once reviewing the actual visibility of the receptors, glint and glare impacts remain High at 22 receptors, Low at two receptors and reduced to None for 146 receptors. Once mitigation taken into consideration the impacts all road receptors reduced to None. Therefore, overall impacts on road receptors are considered to be None.

- Solar reflections are possible at 81 of the 87 bridleway receptors assessed within the 1km study area. Once reviewing the actual visibility of the receptors, glint and glare impacts remain **High** at 23 receptors and reduce to **None** at 54 receptors. Once mitigation taken into consideration the impacts all bridleway receptors reduced to **None**. Therefore, overall impacts on bridleway receptors are considered to be **None**.
- **No impact** on train drivers or railway infrastructure is predicted.
- Eight runway approach paths were assessed in detailed at Old Warden Airport, Sackville Farm Aerodrome, Little Staughton Airfield, Bedford Aerodrome and Bedford Aerodrome Helipads. Only green glare impacts were predicted at Runway 08 at Bedford Aerodrome and Bedford Aerodrome ATCT. Green glare and yellow glare impacts were predicted for Runway 13 at Sackville Farm Aerodrome, Runways 06 and 24 at Little Staughton Airfield and Bedford Aerodrome Helipad 4 northwest approach. Green glare is an **acceptable impact** upon runways according to FAA guidance. Upon inspection of the types of aircraft using Sackville Farm Aerodrome, Little Staughton Airfield and Bedford Aerodrome, the time of impact, operating hours, likely landing directions due to wind, google earth imagery, daily glare duration periods, ground elevation profile, and pilot mitigation strategies, overall impacts on aviation assets fall in line with FAA guidance and are **acceptable** and **Not Significant**. ~~Four runway approach paths were assessed in detailed at Old Warden Airport and Sackville Farm Aerodrome. Green glare and yellow glare impacts were predicted for Runway 13 at Sackville Farm Aerodrome. Green glare is an **acceptable impact** upon runways according to FAA guidance. Upon inspection of the type of aircraft using Sackville Farm Aerodrome, time of impact, position of the sun and use of existing pilot mitigation strategies when landing in the direction of the sun, as well as the likely landing direction for the runway and Google Earth aerial imagery indicating the airfield is not in use, all impacts at Sackville Farm Aerodrome can be deemed **acceptable**. Overall impacts on aviation assets are **acceptable** and **Not Significant**.~~

1.4. **Mitigation** is required due to the **High** impacts at four Residential Receptors, 22 road and 25 Bridleway Receptors. Measures have also been included to mitigate the **Low** impact views from one Residential and two Road Receptors. Mitigation Measures include native hedgerows to be planted/infilled and maintained to a height of at least 3.5m along the north/south/southwest boundary of Array 1, east/north/northwest boundary of Array 2, east/southeast boundary of Array 5, northeast/west/northwest/east/southeast and lining the roads that cross the boundary of Array 6, west/southwest/northeast/east boundary of Array 7, west boundary of

Array 8, south boundary of Array 9, northeast/south/southeast boundary of Array 10, southwest boundary of Array 11, and the north/northwest/east boundary of Array 12.

1.5. The effects of glint and glare and their impact on local receptors has been analysed in detail and there is predicted to be **No impacts** at the runway approach paths. Impacts upon ground-based receptors are predicted to be **None.** Therefore, overall impacts are **Negligible**.

2. INTRODUCTION

BACKGROUND

2.1. Neo Environmental Ltd has been appointed by BSSL Cambsbed 1 Ltd (the "Applicant") to undertake a Glint and Glare Assessment for the East Park Energy project (the "Scheme") on lands approximately 14 km north of Bedford.

SCHEME DESCRIPTION

2.2. The Scheme comprises a new ground-mounted solar photovoltaic energy generating station and an associated on-site Battery Energy Storage System (BESS) on land to the north-west of St Neots. The Scheme also includes the associated infrastructure for connection to the national grid at the Eaton Socon National Grid Substation.

2.3. A detailed description of the Scheme is provided in ES Vol 1 Chapter 2: The Scheme [EN010141/DR/6.1], but in summary the Scheme has been divided into 10 Work Packages or 'Works' as follows:

- Work No. 1 – a ground mounted solar photovoltaic generating station;
- Work No. 2 – a Battery Energy Storage System (BESS);
- Work No. 3 – an on-site substation (East Park Substation);
- Work No. 4 – a 400 kV electrical cable connection to the Eaton Socon Substation;
- Work No. 5 – works within the Eaton Socon Substation;
- Work No. 6 – works for internal cabling and ancillary infrastructure;
- Work No. 7 – works for temporary construction and decommissioning compounds and laydown areas;
- Work No. 8 – works to create, enhance and maintain green infrastructure;
- Work No. 9 – works to facilitate access; and
- Work No. 10 – works to create an 'Agrisolar' research area.

2.4. Work No. 1 is the focus of this assessment, as this will be where all solar PV infrastructure would be located, and therefore is where the glint and glare impacts will originate from. For reference, Work No. 1 is shown on the **Works Plan [EN010141/DR/2.3]**.

2.5. Consideration is also given to **ES Vol 3 Figure 2-1: Illustrative Environmental Masterplan [EN010141/DR/6.3]** which illustrates the likely extent and location of planted mitigation that would come forward. The mitigation is located in Work No. 8 and is secured by the Requirement to develop the final landscape proposals in substantial accordance with the Illustrative Landscape Proposals at Appendix A of the **outline Landscape and Ecological Management Plan [EN010141/DR/7.7].**

2.6. Subject to the Scheme securing Development Consent in Winter 2026/27 it is anticipated that works would start on site in early 2028 and be completed by mid-to late 2030. The Scheme comprises a temporary development with an operation phase of 40 years; decommissioning activities would therefore likely commence in 2070, forty years after final commissioning.

Site Description

2.7. The Site is located to the north-west of the town of St Neots, and is across two administrative areas; Bedford Borough Council (a unitary authority) and Huntingdonshire District Council (a two tier authority with Cambridgeshire County Council).

2.8. The Site area extends to approximately 773 hectares (ha) which includes all land required to construct, operate and decommission the Scheme.

2.9. Work No. 1 in which the solar photovoltaic infrastructure would be located covers approximately 446 hectares of land contained within 48 separate development parcels across East Park Sites A, B, C and D. The fields in which the development parcels are located are predominantly in arable agricultural use and bounded by hedgerows. Ground levels within the solar site vary from approximately 27 m above ordnance datum (AOD) to 74 m AOD.

2.10. Settlement around the Site comprises a number of villages, including Pertenhall and Great Staughton to the north, Little Staughton and Keysoe to the south, Swineshead to the west, and Hail Weston to the east.

Scope of Report

2.11. Although there may be small amounts of glint and glare from the metal structures associated with the solar PV panels, this is not likely to be significant. The main source of glint and glare will be from the solar PV panels themselves and this will be the focus of this assessment. Since the Grid Connection Corridor comprises below ground infrastructure and does not comprise of

reflective surfaces, there is no potential for glint and glare effects, therefore this is not considered further in this assessment.

2.12. Solar PV panels are designed to absorb as much light as possible and not to reflect it. However, glint can be produced as a reflection of the sun from the surface of the solar PV panel. This can also be described as a momentary flash. This may be an issue due to visual impact and viewer distraction on ground-based receptors and on aviation.

2.13. Glare is significantly less intense in comparison to glint and can be described as a continuous source of bright light, relative to diffused lighting. This is not a direct reflection of the sun, but a reflection of the sky around the sun, therefore being a significantly lesser of a nuisance than direct sunlight.

2.14. This report focusses on the effects of glint and glare and its impact on local receptors and will be supported with the following Figures and Appendices.

- APPENDIX A: FIGURES:

- Appendix ~~R~~T: Bridleway Receptor Glare Results (Receptors 75 – 87) (15 Degrees)
- Appendix ~~S~~U: Bridleway Receptor Glare Results (Receptors 75 – 87) (25 Degrees)
- Appendix ~~T~~V: Visibility Assessment Evidence
- Appendix ~~U~~W: Solar Module Glare and Reflectance Technical Memo

STATEMENT OF COMPETENCE

2.15. This Glint and Glare Assessment has been produced by [redacted] of Neo Environmental. [redacted] has produced Glint and Glare assessments for over 2GW of solar farm developments across the UK and Ireland. [redacted]

[redacted] has been working on various technical assessments including glint and glare reports for numerous solar farms in Ireland and the UK. [redacted]r of Science degree in Geography and has previously worked in the transport planning field before joining Neo as a Graduate Environmental Engineer in 2024.

DEFINITIONS

2.16. This study examined the potential hazard and nuisance effects of glint and glare in relation to ground-based receptors, which includes the occupants of surrounding dwellings as well as road users. The US Federal Aviation Administration (FAA) in their "*Technical Guidance for Evaluating Selected Solar Technologies on Airports*"[1] have defined the terms 'Glint' and 'Glare' as meaning;

- Glint – "*A momentary flash of bright light*"; and
- Glare – "*A continuous source of bright light*".

2.17. Glint and glare are essentially the unwanted reflection of sunlight from reflective surfaces. This study used a multi-step process of elimination to determine which receptors have the potential to experience the effects of glint and glare. It then examined, using a computer-generated geometric model, the times of the year and the times of the day such effects could occur. This is based on the relative angles between the sun, the panels, and the receptor throughout the year.

2.18. The ocular impact upon a receptor will be assessed and used as the basis of categorising the magnitude of impact at each receptor. For the avoidance of doubt specular impact is a term that refers to the impact produced by the PV panels, whilst ocular impact is the impact observed by the observer.

General Nature of Reflectance from Photovoltaic Panels

2.19. In terms of reflectance, solar PV panels are by no means a highly reflective surface. They are designed to absorb sunlight and not to reflect it. Nonetheless, solar PV panels have a flat polished surface that omit 'specular' reflectance rather than a 'diffuse' reflectance, which would occur from a rough surface. Several studies have shown that solar PV panels (as opposed to Concentrated Solar Power) have similar reflectance characteristics to water, which is much lower than the likes of glass, steel, snow and white concrete by comparison (See Appendix ~~U~~W). Similar levels of reflectance can be found in rural environments from the likes of shed roofs and

1 Harris, Miller, Miller & Hanson Inc. (November 2010). Technical Guidance for Evaluating Selected Solar Technologies on Airports; 3.1.2 Reflectivity. Technical Guidance for Evaluating Selected Solar Technologies on Airports. Available at:

https://documents.pub/document/technical-guidance-for-evaluating-selected-solar-technologies-on.html?page=1

the lines of plastic mulch used in cropping. In terms of the potential for reflectance from solar PV panels to cause hazard and/ or nuisance effects, there have been a number of studies undertaken in respect of schemes in close proximity to airports. The most recent of these was compiled by the Solar Trade Association (STA) in April 2016 and used a number of case studies and expert opinions, including that from Neo. The summary of this report states that "*the STA does not believe that there is cause for concern in relation to the impact of glint and glare from solar PV on aviation and airports…*"[2].

Time Zones / Datums

2.20. Locations in this report are given in Eastings and Northings using the 'British National Grid' grid reference system unless otherwise stated.

2.21. England uses British Summer Time (BST, UTC + 01:00) in the summer months and Greenwich Mean Time (UTC+0) in the winter period. For the purposes of this report all time references are in GMT.

2 Solar Trade Association. (April 2016). Summary of evidence compiled by the Solar Trade Association to help inform the debate around permitted development for non - domestic solar PV in Scotland. Impact of solar PV on aviation and airports. Available at: https://docs.planning.org.uk/20210222/90/QNMZQ4EXINS00/i4uv1hvoemy3m7f5.pdf

3. LEGISLATION AND GUIDANCE

3.1. There is no legislation and limited guidance or policy available in the UK at present in relation to the assessment of glint and glare from Scheme developments. Available UK guidance is reviewed below, in addition to references to international guidance where deemed suitable.

NATIONAL PLANNING POLICY GUIDANCE (NPPG) ON RENEWABLE AND LOW CARBON ENERGY (UK) [3]

3.2. Paragraph 013 (Reference ID: 5-013-20150327) sets out planning considerations that relate to large scale ground-mounted solar PV farms. This determines that the deployment of large-scale solar farms can have a negative impact on the rural environment, particularly in undulating landscapes. However, the visual impact of a well-planned and well-screened solar farm can be properly addressed within the landscape if planned sensitively. Considerations to be taken into account by local planning authorities are:

- *"The proposal's visual impact, the effect on landscape of glint and glare and on neighbouring uses and aircraft safety;*
- *I extent to which there may be additional impacts if solar arrays follow the daily movement of the sun."*

NATIONAL POLICY STATEMENT FOR RENEWABLE ENERGY INFRASTRUCTURE, NOVEMBER 2023

3.3. Section 2.10 of the EN-3 provides the following commentary in relation to Glint and Glare impacts:

> *"2.10.102 Solar panels are specifically designed to absorb, not reflect, irradiation. However, solar panels may reflect the sun's rays at certain angles, causing glint and glare. Glint is defined as a momentary flash of light that may be produced as a direct reflection of the sun in the solar panel. Glare is a continuous source of excessive brightness experienced by a stationary observer located in the path of reflected sunlight from the face of the panel. The effect occurs when the solar panel is stationed between or at an angle of the sun and the receptor.*

[3] NPPG Renewable and Low Carbon Energy. Available at: http://planningguidance.communities.gov.uk/blog/guidance/renewable-and-low-carbon-energy/particular-planning-considerations-for-hydropower-active-solar-technology-solar-farms-and-wind-turbines/#paragraph_012

2.10.103 Applicants should map receptors to qualitatively identify potential glint and glare issues and determine if a glint and glare assessment is necessary as part of the application.

2.10.104 When a quantitative glint and glare assessment is necessary, applicants are expected to consider the geometric possibility of glint and glare affecting nearby receptors and provide an assessment of potential impact and impairment based on the angle and duration of incidence and the intensity of the reflection.

2.10.105 The extent of reflectivity analysis required to assess potential impacts will depend on the specific project site and design. This may need to account for 'tracking' panels if they are proposed as these may cause differential diurnal and/or seasonal impacts.

2.10.106 When a glint and glare assessment is undertaken, the potential for solar PV panels, frames and supports to have a combined reflective quality may need to be assessed, although the glint and glare of the frames and supports is likely to be significantly less than the panels."

"2.10.134 Applicants should consider using, and in some cases the Secretary of State may require, solar panels to comprise of (or be covered with) anti-glare/anti-reflective coating with a specified angle of maximum reflection attenuation for the lifetime of the permission.

2.10.135 Applicants may consider using screening between potentially affected receptors and the reflecting panels to mitigate the effects.

2.10.136 Applicants may consider adjusting the azimuth alignment of or changing the elevation tilt angle of a solar panel, within the economically viable range, to alter the angle of incidence. In practice this is unlikely to remove the potential impact altogether but in marginal cases may contribute to a mitigation strategy."

"2.10.158 Solar PV panels are designed to absorb, not reflect, irradiation. However, the Secretary of State should assess the potential impact of glint and glare on nearby homes, motorists, public rights of way, and aviation infrastructure (including aircraft departure and arrival flight paths).

2.10.159 Whilst there is some evidence that glint and glare from solar farms can be experienced by pilots and air traffic controllers in certain conditions, there is no evidence that glint and glare from solar farms results in significant impairment on aircraft safety. Therefore, unless a significant impairment can be demonstrated, the Secretary of State is unlikely to give any more than limited weight to claims of aviation interference because of glint and glare from solar farms."

3.4. This Glint and Glare Assessment will be taking account of impacts upon nearby homes, motorists, and aviation receptors. Due to assuming complete coverage in the area where solar panels are located within the Solar PV Site, glint and glare impacts from frames and supports are considered within this assessment.

PLANNING GUIDANCE FOR THE DEVELOPMENT OF LARGE-SCALE GROUND MOUNTED SOLAR PV SYSTEMS

3.5. As outlined within the BRE document 'Planning Guidance for the Development of Large-Scale Ground Mounted Solar PV Systems'[4]:

> *"Glint may be produced as a direct reflection of the sun in the surface of the solar PV panel. It may be the source of the visual issues regarding viewer distraction. Glare is a continuous source of brightness, relative to diffused lighting. This is not a direct reflection of the sun, but rather a reflection of the bright sky around the sun. Glare is significantly less intense than glint.*
>
> *Solar PV panels are designed to absorb, not reflect, irradiation. However, the sensitivities associated with glint and glare, and the landscape/ visual impact and the potential impact on aircraft safety, should be a consideration. In some instances, it may be necessary to seek a glint and glare assessment as part of a planning application. This may be particularly important if 'tracking' panels are proposed as these may cause differential diurnal and/or seasonal impacts.*
>
> *The potential for solar PV panels, frames and supports to have a combined reflective quality should be assessed. This assessment needs to consider the likely reflective capacity of all of the materials used in the construction of the solar PV farm."*

3.6. This Glint and Glare Assessment will be taking account of impacts upon nearby homes, motorists, and aviation receptors. Due to assuming complete coverage in the area where solar panels are located within the Solar PV Site, glint and glare impacts from frames and supports are considered within this assessment.

INTERIM CAA GUIDANCE – SOLAR PHOTOVOLTAIC SYSTEMS (2010)

3.7. There is little guidance on the assessment of glint and glare from solar farms with regards to aviation safety. The Civil Aviation Authority (CAA) has published interim guidance on 'Solar Photovoltaic Systems[5]', they also intend to undertake a review of the potential impacts of solar PV developments upon aviation, however this is yet to be published.

3.8. The interim guidance identifies the key safety issues with regards to aviation, including *"glare, dazzling pilots leading them to confuse reflections with aeronautical lights."* It is outlined that

[4] BRE (2013) *Planning Guidance for the Development of Large Scale Ground Mounted Solar PV Systems*. Available at: https://www.bre.co.uk/filelibrary/pdf/other_pdfs/KN5524_Planning_Guidance_reduced.pdf

[5] *CAA (2010) Interim CAA Guidance – Solar Photovoltaic Systems. Available at: https://webarchive.nationalarchives.gov.uk/ukgwa/20141202114709/https://www.caa.co.uk/docs/697/srg_asd_solarphotovoltaicsystguidance.pdf*

solar farm developers should be aware of the requirements to comply with the Air Navigation Order (ANO), published in 2016 and amended in 2022. In particular, developers should be cognisant of the following articles of the ANO[6], including:

- *Article 240 – Endangering safety of an aircraft – "A person must not recklessly or negligently act in a manner likely to endanger an aircraft, or any person in an aircraft."*
- *Article 224 - Lights liable to endanger – "A person must not exhibit in the United Kingdom any light which:*

– *a) by reason of its glare is liable to endanger aircraft taking off or from landing at an aerodrome; or*

– *b) by reason of its liability to be mistaken for an aeronautical ground light liable to endanger aircraft."*

- *Article 225 – Lights which dazzle or distract – "A person must not in the United Kingdom direct or shine any light at any aircraft in flight so as to dazzle or distract the pilot of the aircraft."*

3.9. Relevant studies generally agree that there is potential for glint and glare from photovoltaic panels to cause a hazard or nuisance for surrounding receptors, but that the intensity of such reflections is similar to that emanating from still water. This is considerably lower than for other manmade materials such as glass, steel or white concrete (SunPower – 2009).

3.10. These Articles are considered within the assessment of glint and glare for the Scheme.

CAA – CAP738: SAFEGUARDING OF AERODROMES 3RD EDITION[7]

3.11. In 2003, the CAA first introduced the CAP738 document to help provide advice and guidance to ensure aerodrome safeguarding. Subsequently, there have been two updates to this document in 2006 and 2020.

3.12. Within the latest edition of CAP738, it outlines that the purpose of the document is to protect an aerodrome and to ensure safe operation. Specifically stating:

"Its purpose is to protect:

[6] CAA (2016) Air Navigation: The Order and Regulations. Available at: https://www.legislation.gov.uk/uksi/2017/1112/contents/made

[7] Civil Aviation Authority (2020). CAP738 – Safeguarding of Aerodromes 3rd Edition. Available at: [redacted]

Aircraft from the risk of glint and glare e.g. solar panels."

3.13. Within the section named as "Appendix C – Solar Photovoltaic Cells", the following is stated:

"Policy

1. In 2010 the CAA published interim guidance on Solar Photovoltaic Cells (SPCs). At that time, it was agreed that we would review our policy based on research carried out by the Federal Aviation Authorities (FAA) in the United States, in addition to reviewing guidance issued by other National Aviation Authorities. New information and field experience, particularly with respect to compatibility and glare, has resulted in the FAA reviewing its original document 'Technical Guidance for Evaluating Selected Solar Technologies on Airports', which is likely to be subject to change, see link;

https://www.federalregister.gov/documents/2013/10/23/2013-24729/interimpolicy-faa-review-of-solar-energy-system-projects-on-federally-obligated-airports

2. In the United Kingdom there has been a further increase in SPV cells, including some located close to aerodrome boundaries; to date the CAA has not received any detrimental comments or issues of glare at these established sites. Whilst this early indication is encouraging, those responsible for safeguarding should remain vigilant to the possibility."

In summary, the above is stating that to date, there has not been any complications on airfields due to glare originating from solar farms across the UK.

US Federal Aviation Administration Policy

3.14. The US Federal Aviation Administration (FAA) in their Solar Guide (Federal Aviation Authority, 2010)[8] incorporates a chapter on the impact and assessment of glint from solar panels. It concludes that (although subject to revision):

"…evidence suggests that either significant glare is not occurring during times of operation or if glare is occurring, it is not a negative effect and is a minor part of the landscape to which pilots and tower personnel are exposed."

3.15. The interim policy (Federal Register, 2013)[9] demands that an ocular impact assessment must be assessed at 1-minute intervals from when the sun rises above the horizon until the sun sets below the horizon. Specifically, the developer must use the 'Solar Glare Hazard Analysis Tool' (SGHAT) tool specifically and reference its results as this was developed by the FAA and Sandia

[8] FAA (2010), Technical Guidance for Evaluating Selected Solar Technologies on Airports. Available at https://www.faa.gov/sites/faa.gov/files/airports/environmental/FAA-Airport-Solar-Guide-2018.pdf

[9] FAA (2013), Interim Policy, *FAA Review of Solar Energy System Projects on Federally Obligated Airports*. Available at https://www.federalregister.gov/documents/2013/10/23/2013-24729/interim-policy-faa-review-of-solar-energy-system-projects-on-federally-obligated-airports

National Laboratories as a standard and approved methodology for assessing potential impacts on aviation interests, although it notes other assessment methods may be considered. The SGHAT tool has since been licensed to a private organisation who were also involved in its development and it is the software model used in this assessment.

3.16. Crucially, the policy provides a quantitative threshold that is lacking in the English guidance. This outlines that a solar development will not automatically receive an objection on glint grounds if low intensity glint is visible to pilots on final approach. In other words, low intensity glint with a low potential to form a temporary after-image (Green Glare) would be considered acceptable under US guidance. Due to the lack of legislation and guidance within England, this US document has been utilised as guidance for this report, which is accepted as best practice in the UK with the absence of quantitative guidance.

3.17. The FAA guidance states that for a solar PV development to obtain FAA approval or to receive no objection, the following two criteria must be met:

- No potential for glint or glare in the existing or planned Air Traffic Control Tower (ATCT); and
- No potential for glare (glint) or "low potential for after-image" (Green Glare) along the final approach path for any existing or future runway landing thresholds (including planned or interim phases), as shown by the approved layout plan (ALP). The final approach path is defined as 2 miles from 50 feet above the landing threshold using a standard 3-degree glide path.

3.18. The geometric analysis included later in this report, which defines the extent and time at which glint may occur, is required by the FAA as the methodology to be used when assessing glint and glare impacts on aviation receptors. This report follows the methodology required by the FAA as it offers the most robust assessment method currently available.

FAA Policy: Review of Solar Energy Systems Projects on Federa–ly - Obligated Airports[10]

3.19. The FAA updated their Interim Policy from 2013 as part of their commitment to "*update policies and procedures as part of an iterative process as new information and technologies become available.*" The main development regarding Glint and Glare since the Interim Policy is the following:

[10] FAA (2021). FAA Policy: Review of Solar Energy Systems Projects on Federally – Obligated Airports. Available at: https://www.federalregister.gov/documents/2021/05/11/2021-09862/federal-aviation-administration-policy-review-of-solar-energy-system-projects-on-federally-obligated

"Initially, FAA believed that solar energy systems could introduce a novel glint and glare effect to pilots on final approach. FAA has subsequently concluded that in most cases, the glint and glare from solar energy systems to pilots on final approach is similar to glint and glare pilots routinely experience from water bodies, glass-façade buildings, parking lots, and similar features. However, FAA has continued to receive reports of potential glint and glare from on-airport solar energy systems on personnel working in ATCT cabs."

3.20. This is outlining that solar panels are similar to nuisances that are already caused by other existing infrastructure, such as car parks, glass buildings and water bodies. Furthermore, the ATCT has been outlined as the key receptor to be assessed when determining Glint and Glare impacts from a solar farm.

3.21. Again, in respect of an absence of UK guidance, this is used as the best practice when assessing aviation receptors.

REVIEW OF LOCAL PLAN

Bedford Local Plan 2030

3.22. Bedford Borough Council has prepared a Local Plan[11] which was adopted by Full Council on 15 January 2020.

3.23. The plan states in **Policy 57 – Renewable energy – general impact** that:

'Proposals for development involving the provision of renewable and/or low carbon energy generation, including community energy projects, will be supported, subject to the acceptability of their wider impacts. As part of such proposals it shall be demonstrated that all of the following potential impacts (including cumulative impacts) have been fully addressed in consultation with affected local communities.

Additional impacts for solar energy schemes

xi. Amenity impacts – disturbance, noise, glint and glare.

xiii. Aviation.'

3.24. Bedford Borough Council is preparing Local Plan 2040[12] which builds on the Local Plan 2030 strategy and rolls the planning of the Borough on a further 10 years to 2040. The consultation on the Local Plan 2040 is now closed and took place between 15 June 2022 and 29 July 2022.

[11] Bedford Local Plan 2030, available at: https://www.bedford.gov.uk/planning-and-building-control/planning-policy/local-plan-2030/local-plan-2030-overview

[12] Bedford Local Plan 2040, available at: https://www.bedford.gov.uk/planning-and-building-control/planning-policy/local-plan-2040

3.25. There are no policies contained within the Local Plan 2040 which are of relevance to this glint and glare report.

Huntingdonshire Local Plan to 2036

3.26. The Huntingdonshire Local Plan to 2036[13] was formally adopted by Huntingdonshire District Council on 15 May 2019.

3.27. There are no policies contained within the Local Plan to 2036 which are of relevance to this glint and glare report.

3.28. On 24 January 2023, Huntingdonshire District Council's Cabinet agreed to the preparation of a full update[14] to the adopted Local Plan. There are currently no published policies for the Local Plan update.

[13] Huntingdonshire Local Plan to 2036, available at: https://www.huntingdonshire.gov.uk/planning/local-plan-to-2036/

[14] Huntingdonshire Local Plan Update, available at: https://www.huntingdonshire.gov.uk/planning/local-plan-update/

4. METHODOLOGY

4.1. A desk-based assessment was undertaken to identify when and where glint and glare may be visible at receptors within the vicinity of the Scheme, throughout the day and the year.

SUN POSITION AND REFLECTION MODEL

Sun Data Model

4.2. The calculations in the solar position calculator are based on equations from Astronomical Algorithms[15]. The sunrise and sunset results are theoretically accurate to within a minute for locations between +/- 72° latitude, and within 10 minutes outside of those latitudes. However, due to variations in atmospheric composition, temperature, pressure and conditions, observed values may vary from calculations.

Solar Reflection Model

4.3. The position of the sun is calculated at one-minute intervals of a typical year.

4.4. In order to determine if a solar reflection will reach a receptor, the following variables are required:

- Sun position;
- Observer location; and
- Tilt, orientation, and extent of the modules in the solar array.

4.5. The model assumes that the azimuth and horizontal angle of the sun is the same across the whole Solar PV Site. This is considered acceptable due to the distance of the sun from the Scheme and the miniscule differences in location of the sun over the Solar PV Site.

4.6. Once the position of the sun is known for each time interval, a vector reflection equation determines the reflected sun vector, based on the normal vector of the solar array panels. This assumes that the angle of reflection is equal to the angle of incidence reflected across a normal plane. In this instance, the plane being the vector which the solar panels are facing.

4.7. On knowing the vector of the solar reflection, the azimuth is calculated and the horizontal reflection from multiple points within the Solar PV Site. These are then compared with the azimuth and horizontal angle of the receptor from the Solar PV Site to determine if it is within range to receive solar reflections.

[15] Jean Meeus, Astronomical Algorithms (Second Edition), 1999

4.8. The solar reflection in the model is considered to be specular as a worst-case scenario. In practice, the light from the sun will not be fully reflected as solar panels are designed to absorb light rather than reflect it. The text above and Appendix ~~U~~ W outlines the reflective properties of solar glass and compares it to other reflective surfaces. Although the exact figures in this report could contain a margin of error, it is included as a visual guide and it agrees with most other reports, in that solar glass has less reflective properties than other types of glass, bodies of water and snow, and that the amount of reflective energy drops as the angle of incidence decreases.

4.9. Most modern solar PV panels have a slight surface texture which should have a small effect on diffusing the solar radiation further. Although, this has not been modelled to conform with the worst-case scenario assessment.

4.10. The panel reflectivity has been modelled to assume an anti-reflective coating (ARC), which is the industry standard for solar PV panels and further reduces the reflective properties of the solar PV panels.

Determination of Ocular Impact

4.11. The software used for this assessment is based on the Sandia Laboratories Solar Glare Hazard Analysis Tool (SGHAT). This tool is specifically mentioned in the FAA guidance as the software that should be used in this type of assessment. Again, this is following the current best practice available due to the lack of UK guidance.

4.12. Determination of the ocular impact requires knowledge of the direct normal irradiance, solar PV panel reflectance, size and orientation of the array, optical properties of the PV module, and ocular parameters. These values are used to determine the retinal irradiance and subtended source angle used in the ocular hazard plot.

4.13. The ocular impact[16] of viewed glare can be classified into three levels based on the retinal irradiance and subtended source angle: low potential for after-image (green), potential for after-image (yellow), and potential for permanent eye damage (red).

4.14. Green glare can be ignored when looking at ground based and some aviation receptors. Green glare does not cause temporary flash blindness and happens at an instant with very slight disturbance. As per FAA guidelines, mitigation is only required for green glare when affecting an Air Traffic Control Tower, but not for when affecting pilots. Therefore, it can be assumed that green glare is acceptable for ground-based receptors.

4.15. The subtended source angle represents the size of the glare viewed by an observer, while the retinal irradiance determines the amount of energy impacting the retina of the observer. Larger source angles can result in glare of high intensity, even if the retinal irradiance is low.

[16] Ho, C.K., C.M. Ghanbari, and R.B. Diver, 2011, Methodology to Assess Potential Glint and Glare Hazards From Concentrating Solar Power Plants: Analytical Models and Experimental Validation, Journal of Solar Energy Engineering-Transactions of the Asme, 133(3).

4.16. The modelling software outputs a hazard plot for each receptor predicted to be impacted by glare from the PV array. An orange dot is plotted for each minute of glare indicating the irradiance (power density) of the reflected solar light. A yellow dot is plotted to show the irradiance of the Sun when it is viewed directly. The hazard plot shows that the irradiance of the Sun is approximately three orders of magnitude greater than the reflected irradiance, i.e., the power density of solar reflections from photovoltaic panels are approximately 0.1% that of viewing the Sun. Due to the disparity in irradiance, whenever the Sun is observed in the same frame as solar reflections from a PV array, the Sun will be main source of glare impacts upon the observer. In such a case, the impact is deemed to be Low as a worst-case scenario.

Relevant Parameters of the Scheme

4.17. The photovoltaic panels are oriented in a southwards direction to maximise solar gain and will remain in a fixed position throughout the day and during the year (i.e. they will not rotate to track the movement of the sun). The panels will face southwards and will be inclined at an angle of between 15 and 25 degrees.

4.18. The height of the panels above ground level is a maximum of 3m and points at the top of the panels are used to determine the potential for glint and glare generation.

IDENTIFICATION OF RECEPTORS

Ground Based Receptors

4.19. Glint is most likely to impact upon a ground-based receptor close to dusk and dawn, when the sun is at its lowest in the sky. Therefore, any effect would likely occur early in the day or late in the day, reflected to the west at dawn and east at dusk.

4.20. A 1km Study Area from the panels was deemed appropriate for the assessment of ground-based receptors as this seemed to contain a good spread of residential and road receptors in most directions from the Solar PV Site. The further distance a receptor is from a solar farm, the less chance it has of being affected by glint and glare due to scattering of the reflected beam and atmospheric attenuation, in addition to obstructions from ground sources, such as any intervening vegetation or buildings. This is based on best practice and our experience of completing Glint and Glare Assessments across the UK and Ireland.

4.21. An observer height of 2m was utilised for residential receptors, as this is a typical height for a ground-floor window. With regards to road users, a receptor height of 1.5m was employed as this is typical of eye level. Horse rider eye level has been assumed to be 2.5m above ground level for bridleway receptors.

4.22. An assessment was undertaken to determine zones where solar reflections will never be directed near ground level.

4.23. Where there are several residential receptors within close proximity, a representative dwelling or dwellings is/are chosen for full assessment as the impacts will not vary to any significant degree. Where small groups of receptors have been evident, the receptors on either end of the group have been analysed in detail with the worst-case impacts attributed to that receptor.

Aviation

4.24. Glint is only considered to be an issue with regards to aviation safety when the solar farm lies within close proximity to a runway, particularly when the aircraft is descending to land. This is outlined within the FAA guidance as being the key aviation receptors to assess ad is considered best practice in the absence of UK guidance.

4.25. Should a solar farm be proposed within the safeguarded zone of an aerodrome, then a full geometric study may be required which would determine if there is potential for glint and glare at key locations, most likely on the descent to land.

4.26. Buffer zones to identify aviation assets vary depending on the safeguarding criteria of that asset. All aerodromes within 30 km will be identified, however, generally the detailed assessments are only required within: 20 km for large international aerodromes, 10km for military aerodromes and 5 km for small aerodromes.

MAGNITUDE OF IMPACT

Static Receptors

4.27. Although there is no specific guidance set out to identify the magnitude of impact from solar reflections, the following criteria has been set out for the purposes of this report and has been accepted for assessing numerous solar farms across the UK and Ireland:

- High - Solar reflections impacts of over 30 hours per year or over 30 minutes per day.
- Medium - Solar reflections impacts between 20 and 30 hours per year or between 20 minutes and 30 minutes per day.
- Low - Solar reflections impacts up to 20 hours per year or up to 20 minutes per day.
- None - Effects not geometrically possible or no visibility of reflective surfaces likely due to high levels of intervening screening

Moving Receptors (Road and Rail)

4.28. Again, no specific guidance is available to identify the magnitude of impact from solar reflections on moving receptors except in aviation, however, it is thought that a similar

approach should be applied to moving receptors as aviation, based on the ocular impact and the potential for after-image.

4.29. The FAA guidance states that for a solar PV development to obtain FAA approval or to receive no objection, the following criteria must be met:

- No potential for glare (glint) or "*low potential for after-image*" along the final approach path for any existing or future runway landing thresholds (including planned or interim phases), as shown by the approved layout plan (ALP).

4.30. The following criteria has been set out for the purposes of this report:

- High - Solar reflections impacts consisting of any amount of yellow glare.
- Low - Solar reflections impacts consisting of any amount of only green glare.
- None - Effects not geometrically possible or no visibility of reflective surfaces likely due to high levels of intervening screening.

4.31. The FAA produced an evaluation of glare as a hazard and concluded in their report[17] that:

"The more forward the glare is and the longer the glare duration, the greater the impairment to the pilots' ability to see their instruments and to fly the aircraft. These results taken together suggest that any sources of glare at an airport may be potentially mitigated if the angle of the glare is greater than 25 deg from the direction that the pilot is looking in. We therefore recommend that the design of any solar installation at an airport consider the approach of pilots and ensure that any solar installation that is developed is placed such that they will not have to face glare that is straight ahead of them or within 25 deg of straight ahead during final approach."

4.32. It is reasonable to assume that although this report is assessing pilots vision impairment, it can also be applied to drivers of other road and rail vehicles. Therefore, the driver's field of view will also be analysed where required and if the glare is out with 25 degrees either side of their line of sight then any impacts will reduce to None.

Moving Receptors (Aviation)

Approach Paths

4.33. Each final approach path which has the potential to receive glint is assessed using the SGHAT model. The model assumes an approach bearing on the runway centreline, a 3-degree glide path with the origin 50 ft (15.24 m) above the runway threshold.

[17] Federal Aviation Authority, Evaluation of Glare as a Hazard for General Aviation Pilots on Final Approach (2015), Available at https://libraryonline.erau.edu/online-full-text/faa-aviation-medicine-reports/AM15-12.pdf

4.34. The computer model considers the pilots field of view. The azimuthal field of view (AFOV) or horizontal field of view (HFOV) as it is sometimes referred, refers to the extents of the pilot's horizontal field of view measured in degrees left and right from directly in front of the cockpit. The vertical field of view (VFOV) refers to the extents of the pilot's vertical field of view measured in degrees from directly in front of the cockpit. The HFOV is modelled at 50 degrees left and right from the front of the cockpit whilst the VFOV is modelled at 30 degrees.

4.35. The FAA guidance states that there should be no potential for glare or '*low potential for after-image*' at any existing or future planned runway landing thresholds for the Scheme to be acceptable. Given the FAA guidance and commentary on impacts, the following criteria has been set out for the purposes of this report:

- High - Solar reflections impacts consisting of any amount of yellow glare.
- Low - Solar reflections impacts consisting of any amount of only green glare.
- None - Effects not geometrically possible or no visibility of reflective surfaces likely due to high levels of intervening screening.

Air Traffic Control Tower (ATCT)

4.36. An air traffic controller uses the visual control room to monitor and direct aircraft on the ground, approaching and departing the aerodrome. It is essential that air traffic controllers have a clear unobstructed view of the aviation activity. The key areas on an aerodrome are the views towards the runway thresholds, taxiways and aircraft bays.

4.37. The FAA guidance states that no solar reflection towards the ATCT should be produced by a proposed solar development, however, this should be assessed on a site by site case and will depend on the operations at a particular aerodrome.

4.38. In order to determine the impact on the ATCT, the location and height of the tower will need to be fed into the SGHAT model and where there is a potential for 'low potential for After-Image' or more, then mitigation measures will be required.

Assessment Limitations

4.39. Below is a list of assumptions and limitations of the model and methods used within this report:

- The model does not consider obstacles (either man-made or natural) between the observation points and the prescribed solar installation that may obstruct observed glare, such as trees, vegetation, hills, buildings, etc (that is, it calculates a "bare-earth" scenario);

- The model does not rigorously represent the detailed geometry of a system; detailed features such as gaps between modules, variable height of the PV array, and support structures may impact actual glare results;
- Due to variations in atmospheric composition, temperature, pressure and conditions, observed values may vary slightly from calculated positions;
- The model does not account for the effects of diffraction; however, buffers are applied as a factor of safety; and
- The model assumes clear skies at all times and does not account for meteorological effects such as cloud cover, fog, or any other weather event which may screen the sun.

4.40. Due to these assumptions and limitations the model overestimates the number of minutes of glint and glare which are possible at each receptor and presents the worst-case scenario. Where glint and glare are predicted a visibility assessment is carried out to determine a more accurate, real-world prediction of the impacts.

5. BASELINE CONDITIONS (BARE-EARTH)

GROUND BASED RECEPTORS REFLECTION ZONES

5.1. Based on the relatively flat topography in the area, solar reflections between five degrees below the horizontal plane to five degrees above it are described as near horizontal. Reflections from the Scheme within this arc have the potential to be seen by receptors at or near ground level.

5.2. Further analysis showed that this will only occur between the azimuth of 238.92 degrees and 298.18 degrees in the western direction (late day reflections) and 64.36 degrees and 129.27 degrees in the eastern direction (morning reflections) and therefore any ground-based receptor outside these arcs will not have any impact from solar reflections.

5.3. **Figure 1, 2 and 3 of Appendix A** show the respective study areas whilst also subtracting from this the areas where solar reflections will not impact on ground-based receptors due to the reasons set out in **paragraphs 5.1 to 5.2.**

Residential Receptors

5.4. Residential receptors located within 1km of the Solar PV Site have been identified (**Table 5 - 1**). Glint was assumed to be possible if the receptor is located within the ground-based receptor zones as outlined previously.

5.5. There are two residential receptors (Receptors 175 and 176) which are within the no-reflection zones and are clearly identifiable in **Figure 1A - D: Appendix A.** The process of how these are calculated is explained in **paragraphs 5.1 to 5.2** of this report.

5.6. As per the methodology section, where there are a number of residential receptors within close proximity, a representative dwelling or dwellings is/are chosen for detailed analysis as the impacts will not vary to any significant degree. Where small groups of receptors are evident, the receptors on either end of the group have been assessed in detail.

Table 5 - 1: Residential Based Receptors

Receptor	Easting	Northing	Glint and Glare Possible

Road / Rail Receptors

5.7. There are 21 roads containing 171 receptors within the 1km Study Area that requires a detailed Glint and Glare Assessment: Swineshead Road, Green End, Kimbolton Road, Little Staughton Road, Staughton Road, Green End Road, The Town Road, Green Lane, The Highway Road, Moor Road, the B645, Colmworth Road, High Street, Spring Hill, Westend Road, Keysoe Row East, Wybridge Road, Mill Hill Road, Church Road, Riseley Road, and Pertenhall Road. There are some minor roads that serve dwellings; however, these have been dismissed as vehicle users of these roads will likely be travelling at low speeds and therefore, there is a negligible risk of safety impacts resulting from glint and glare of the Scheme.

5.8. The ground receptor no-reflection zones are clearly identifiable on **Figure 2: Appendix A** and the process of how these are calculated is explained in **paragraphs 5.1 to 5.2** of this report.

5.9. **Table 5 - 2** shows a list of receptors points within the study area which are 200 m apart.

5.10. There are no railway lines within 1 km of the Solar PV Site that requires a detailed Glint and Glare Assessment.

Bridleway Receptors

5.11. All bridleways within 1km of the Scheme have been considered.

5.12. The ground receptor no-reflection zones are clearly identifiable on **Figure 3: Appendix A** and the process of how these are calculated is explained in **paragraphs 5.1 to 5.2** of this report.

5.13. **Table 5 – 3** shows a list of receptors points within the study area which are 200m apart.

Aviation Receptors

5.14. Aerodromes within 30km of the Solar PV Site can be found in **Table 5 - 4.**

Table 5 - 4: Airfields within close proximity

Airfield	Distance (km)	Use
Little Staughton Airfield	1.01	Unlicensed Private Airfield
Sackville Farm	2.05	Small grass strip
Bedford Aerodrome	2.58	Unlicensed Airfield
Bedford Aerodrome Helipads	3.85	Helipad
Abbotsley Airfield	9.93	Small grass strip
Brookfield Farm	11.14	Small grass strip
Woodlands Manor Hotel	11.25	Helipad

Airfield	Distance (km)	Use
Bedford Helipad	11.41	Helipad
Tower Farm	13.76	Small grass strip
Little Gransden Airfield	14.14	Small grass strip
Longacre Farm	14.61	Small grass strip
Prospect Farm	14.98	Small grass strip
Winwick West Airfield	15.04	Small grass strip
Gransden Lodge Airfield	15.49	Small grass strip
Rotary Farm	16.06	Small grass strip
Hall Farm	16.54	Small grass strip
Wold Lodge Airfield	16.69	Small grass strip
Glebe Farm	16.93	Small grass strip
Easton Maudit Airfield	18.04	Small grass strip
Old Warden Airport	18.72	Licensed airport
Bourn Airfield	19.04	Small concrete strip
Top Farm	19.43	Small grass strip
Armshold Farm	21.80	Small grass strip
Manor Farm	22.11	Small grass strip
Lyveden Airfield	22.49	Small grass strip
Pytchley Grange Airfield	22.63	Small grass strip
Upwood Airfield	22.87	Small grass strip
Cranfield Airport	23.41	Licensed airport
Northampton Airport	23.66	Licensed airport
Over Hill Farm	23.98	Small grass strip
Glatton Airfield	23.99	Small concrete strip
Hold Farm	24.25	Small grass strip
Willingham Airfield	24.94	Small grass strip
Meppershall Airfield	25.58	Small grass strip

Airfield	Distance (km)	Use
Henlow Airfield	25.77	Small grass strip
Bakersfield Farm	25.89	Small grass strip
Deenethorpe Airfield	26.86	Small concrete strip
Hulcote Farm	27.52	Small grass strip
Lodge Farm	28.21	Small grass strip
Valley Farm	28.35	Small grass strip
Milton Keynes Helipad	29.36	Helipad
Pitsford Airfield	29.42	Small grass strip
Sutton Meadows Airfield	29.61	Small grass strip
Radwell Lodge Airfield	29.83	Small grass strip
Newnham Airfield	29.89	Small grass strip

5.15. As shown in **Table 5 - 4**, there are ~~42~~ 45 aerodromes within 30km of the Solar PV Site. However, only Old Warden Airport (A), ~~and~~ Sackville Farm (B), Little Staughton Airfield, Bedford Aerodrome and Bedford Aerodrome Helipads (C) will require a detailed assessment as the Solar PV Site is located within their safeguarding buffer zones, outlined in **paragraph 4.24 - 4.26.**

5.16. The other 40 aerodromes do not require detailed assessments due to their location in relation to the Solar PV Site falling outside of the buffer zones outlined in **paragraph 4.24 - 4.26.**

Old Warden Airport

5.17. Old Warden Airport (ICAO code EGTH) is an VFR aerodrome. It is located approximately 6.27 nautical miles (NM) or 11.6km southeast of Bedford.

5.18. The elevation of the aerodrome is 127 ft (38.7m). It has two grass runways, details of which are given in **Table 5 - 5.**

Table 5 - 5: Runways at Old Warden Airport

Runway Designation	True Bearing (°)	Length (m)	Width (m)
02	025.06	799	21
20	205.07	799	21
02X	025.06	1000	21

20X	205.07	1000	21

5.19. The threshold location and height of the runway at Old Warden Airport are given in Table 5 - 6.

Table 5 - 6: Runway Threshold Locations and Heights

Runway Designation	Threshold Latitude	Threshold Longitude	Height AOD (m)
02	52° 04′ 56.65″ N	000° 19′ 18.62″ W	38.61
20	52° 05′ 20.07″ N	000° 19′ 00.84″ W	30.81
02X	52° 04′ 50.76″ N	000° 19′ 23.09″ W	39.38
20X	52° 05′ 20.07″ N	000° 19′ 00.84″ W	30.81

5.20. The ARP is located 260m south of Runway 20 Threshold. The actual location of the ARP is given in Table 5 - 7. There is no ATCT present at Old Warden Airport.

Table 5 - 7: Old Warden Airport Reference Point

	Latitude	Longitude	Eastings	Northings
ARP	52° 05′ 12′′ N	000° 19′ 07′′ W	515301	244480

Sackville Farm

5.21. Sackville Farm is a small unlicensed grass strip. It is located approximately 7.5 nautical miles (NM) or 13.85 km north of Bedford.

5.22. The elevation of the aerodrome is 206 ft (63 m). It has two grass runways, details of which are given in Table 5 - 8.

Table 5 - 8: Runways at Sackville Farm

Runway Designation	True Bearing (°)	Length (m)	Width (m)
13	115.5	730	23
31	295.5	730	23

5.23. The threshold location and height of the runway at Sackville Farm are given in Table 5 - 9.

Table 5 - 9: Runway Threshold Locations and Heights

Runway Designation	Threshold Latitude	Threshold Longitude	Height AOD (m)
13	52° 15′ 47″ N	000° 29′ 20″ W	72
31	52° 15′ 38″ N	000° 28′ 46″ W	62

5.24. The ARP is located at the midpoint of Runway 13/31. The actual location of the ARP is given in Table 5 - 10. There is no ATCT at Sackville Farm.

Table 5 - 10: Sackville Farm Reference Point

	Latitude	Longitude	Eastings	Northings
ARP	52° 15′ 43′′ N	000° 29′ 03′′ W	503556	263711

Bedford Aerodrome

5.25. Bedford Aerodrome is an unlicensed airfield, as seen in Figure 9: Appendix A, currently under a condition to be used as car storage until August 2027, the airfield is expected to return to operation once the condition has concluded. Additionally, a proposed 1,200m grass strip runway is proposed to run parallel to the south of the current runway, therefore, the impacts found at Bedford Aerodrome will be similar to the grass strip runway proposed and can be applied materially to both runways. It is located approximately 5.4 nautical miles (NM) or 10.5km north of Bedford.

5.26. The elevation of the aerodrome is 273 ft (83.2m). It has one asphalt runway, details of which are given in Table 5 - 11.

Table 5 - 11: Runways at Bedford Aerodrome.

Runway Designation	True Bearing (°)	Length (m)	Width (m)
08	082.00	1095	30
26	262.00	1095	30

5.27. The threshold location and height of the runway at Bedford Aerodrome are given in Table 5 - 12.

Table 5 - 12: Runway Threshold Locations and Heights

Runway Designation	Threshold Latitude	Threshold Longitude	Height AOD (m)
08	52° 13′ 54.75″ N	000° 27′ 09.18″ W	84.00
26	52° 13′ 59.85″ N	000° 26′ 18.61″ W	82.00

5.28. The ARP is located in the centre of runway 08/26. The actual location of the ARP is given in **Table 5 - 13**. There is a small observation building present at Bedford Aerodrome which has an approximate height of 3m, which was confirmed in an email with Jessica Pratt, Executive Assistant to Johnathan Palmer & MSV Group, on Friday the 13th February 2026.

Table 5 - 13: Bedford Aerodrome Reference Point

	Latitude	Longitude	Eastings	Northings
ARP	52° 13′ 57″ N	000° 26′ 44″ W	506262	260516
ATC	52° 14′ 04″ N	000° 26′ 35″ W	506423	260725

Bedford Aerodrome Helipads 1 - 3

5.29. Bedford Aerodrome Helipads 1 - 3 are used primarily by the Bedford Autodrome Circuit. Bedford Aerodrome outlined for Helipads 1 – 3 to the south of the autodrome building, that all entry and exit traffic will approach from the south above the racecourse via an email with Jessica Pratt, Executive Assistant to Johnathan Palmer & MSV Group, on Friday the 13th February 2026. The direction that is mentioned in **Table 5 - 14** is direction in which the helicopter will approach the helipad from i.e. South will mean that the helicopter is travelling from south to north.

Table 5 - 14: Bedford Aerodrome Helipads 1 - 3

Helipad Approach	Bearing (°)
South	000.00

5.30. Each direction will be assessed as a 2-mile flight path to ensure that every possible approach into the helipad can be assessed.

Bedford Aerodrome Helipad 4

5.31. Bedford Aerodrome Helipad 4 is used primarily by the Bedford Autodrome Circuit. Bedford Helipad 4 Chart, as seen in **Figure 8: Appendix A,** outlines that all air traffic will be from two corridors from the east and west of the helipad. The directions that are mentioned in **Table 5 -**

15 is direction in which the helicopter will approach the helipad from i.e. Northwest will mean that the helicopter is travelling from northwest to southeast.

Table 5 - 15: Bedford Aerodrome Helipad 4

Helipad Approach	Bearing (°)
Northeast	264.90
Northwest	108.10

5.32. Each direction will be assessed as a 2-mile flight path to ensure that every possible approach into the helipad can be assessed.

Little Staughton Airfield

5.33. Little Staughton Airfield, **Figure 10: Appendix A**, (ICAO code EGK8) is an unlicensed private airfield. It is located approximately 4 nautical miles (NM) or 7.4km west northwest of St. Neots.

5.34. The elevation of the aerodrome is 225 ft (68.5m). It has one asphalt runway, details of which are given in **Table 5 - 16.**

Table 5 - 16: Runways at Little Staughton Airfield.

Runway Designation	True Bearing (°)	Length (m)	Width (m)
06	062.00	922	46
24	242.00	922	46

5.35. The threshold location and height of the runway at Little Staughton Airfield are given in **Table 5 - 17**.

Table 5 - 17: Runway Threshold Locations and Heights

Runway Designation	Threshold Latitude	Threshold Longitude	Height AOD (m)
06	52° 14′ 25″ N	000° 22′ 20″ W	69.00
24	52° 14′ 47″ N	000° 21′ 14″ W	62.00

5.36. The ARP is located in the centre of runway 06/24. The actual location of the ARP is given in **Table 5 - 18**. There is no ATCT present at Little Staughton Airfield.

Table 5 - 18: Little Staughton Airfield Reference Point

	Latitude	Longitude	Eastings	Northings
ARP	52° 14′ 37″ N	000° 21′ 43″ W	511937	261877

6. IMPACT ASSESSMENT

6.1. Following the methodology outlined earlier in this report, geometrical analysis comparing the azimuth and horizontal angle of the receptors from the Scheme and the solar reflection was conducted. Although this model did not take into account obstructions such as vegetation and buildings, discussion on the potentially impacted receptors is provided where necessary. Such obstructions will be taken into account during the visibility assessment and will be discussed for each relevant receptor.

GROUND BASED RECEPTORS

Residential Receptors

6.2. Table 6-1 identifies the receptors that will experience solar reflections based on solar reflection modelling and whether the reflections will be experienced in the morning (AM), evening (PM), or both. The number in brackets indicates which residential area the receptor belongs.

6.3. The two receptors, 175 and 176, which were within the no-reflection zones outlined previously have been excluded from the detailed modelling as they will never receive any glint and glare impacts from the Scheme.

6.4. Appendix B - G shows the analysis with the ground mounted solar panels at a tilt angle of between 15 and 25 degrees. Appendix B shows the analysis for Receptors 1 – 65 at an angle of 15 degrees, Appendix C shows the analysis for Receptors 1 – 65 at an angle of 25 degrees. Appendix D shows the analysis for Receptors 66 – 123 at an angle of 15 degrees, Appendix E shows the analysis for Receptors 66 – 123 at an angle of 25 degrees. Appendix F shows the analysis for Receptors 124 – 174 at an angle of 15 degrees, Appendix G shows the analysis for Receptors 124 – 174 at an angle of 25 degrees

6.5. Table 6 - 1 shows the worst-case impact at each receptor, based on a theoretical modelled impact without consideration of existing or proposed local vegetation or other obstacles (ie a bare-earth scenario) and assuming no cloud at any point in the year.

Table 6 - 1: Potential for Glint and Glare Impact on Residential Receptors (Bald Earth)

Receptor	Glint Possible from Site		Potential Glare Impact (per year)		Magnitude of Impact	Worst Case Tilt Angle (Degrees)

6.6. As can be seen in **Table 6 - 1**, there is a **High** impact at 36 receptors, including five residential areas, **Medium** impact at 15 receptors, including five residential areas, **Low** impact at 61 receptors, including four residential areas, and a **None** impact at 39 receptors, including six residential areas. **Appendix B - G** shows detailed analysis of when the glare impacts are possible, whilst also showing which parts of the solar farm the solar glare is reflected from.

6.7. **Appendix ~~T~~ V** shows Google Earth images that give an insight into how each receptor will be impacted by the glint and glare from the Solar PV Site. There is a mixture of images used, which include aerial, ground level and street level. The aerial images show the location of the receptor with the solar farm drawn as a white polygon and can be seen on the images when the solar farm is theoretically visible. The area of the solar farm from where reflections may be possible has been drawn as a yellow polygon. The ground level terrain is based on the height data of the surrounding land showing no intervening vegetation or buildings. The white and yellow polygons can be seen in this view also. The street view gives a good indication as to whether the area of the solar farm where reflections are theoretically possible will be visible from the receptor point. Also, where appropriate images that have been taken from within the Solar PV Site have been used to show up to date imagery.

Receptor 14 (Appendix B and C Receptor 14)

6.8. The 'Glare Reflections on PV Footprint' chart in **Appendix C** shows that reflections from the northern half of Array 12 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.9. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). The second image is street view image with a view towards the receptor. This image confirms that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **Low**.

Receptors 21, 22, 26, 27, and 28 (Appendix B and C Receptors 21, 22, 26, 27, and 28)

6.10. The 'Glare Reflections on PV Footprint' chart in **Appendix B and C** shows that reflections from Array 11 and, a northern section of Array 12 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.11. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation and intervening buildings between the Solar PV Site and the receptor. The second image is a photo taken from a field within the development boundary with a view towards the receptors. This image confirms that the vegetation and intervening buildings are sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptor 29 (Appendix B and C Receptor 29)

6.12. The 'Glare Reflections on PV Footprint' chart in **Appendix C** shows that reflections from the centre of Array 11 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.13. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptors. The second image is a photograph taken from an adjacent field within the development boundary with a view towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 30 and 31 (Appendix B and C Receptors 30 and 31)

6.14. The 'Glare Reflections on PV Footprint' chart in **Appendix B and C** shows that reflections from a northern section of Array 11 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.15. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptors. The second image is a street view image with a view towards the receptors. This image confirms that the vegetation and topography are sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 32 - 40 (Appendix B and C Receptors 32 - 40)

6.16. The 'Glare Reflections on PV Footprint' chart in **Appendix B and C** shows that reflections from a central section of Array 11 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.17. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation and intervening buildings between the Solar PV Site and the receptors. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation and intervening buildings are sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 41 - 43 (Appendix B and C Receptors 41 - 43)

6.18. The 'Glare Reflections on PV Footprint' chart in **Appendix B** shows that reflections from most, except a northeast, northwest and southern section, of Array 11 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.19. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptors. The second image is a street view image with a view of the vegetation to the northeast of the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 47 - 49 (Appendix A and B Receptors 47 - 49)

6.20. The 'Glare Reflections on PV Footprint' chart in **Appendix B** shows that reflections from a section of Array's 6, 7, 8, and 10 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.21. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a photo taken from Array 10 with a view west along the panel boundary. The third image is a photo taken from within the development boundary of Array 7 with a view west towards the receptors. The third image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 50 - 52 (Appendix B and C Receptors 50 - 52)

6.22. The 'Glare Reflections on PV Footprint' chart in **Appendix C** shows that reflections from Array 7 and 10 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.23. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a photo taken from Array 10 with a view west along the panel boundary. The third image is a photo taken from within the development boundary of Array 7 with a view west towards the receptors. The third image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 53 - 55 (Appendix B and C Receptors 53 - 55)

6.24. The 'Glare Reflections on PV Footprint' chart in **Appendix B and C** shows that reflections from Array 6 and 7 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.25. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation and intervening buildings between the Solar PV Site and the receptor. The second image is a photo from within the development boundary with a view towards the receptors. This image confirms that the vegetation and intervening buildings are sufficient to screen all views of the Solar PV Site where glint and glare is possible for receptors 54 and 55. Therefore, the impact for them reduces to **None**. However, the image also confirms that the vegetation and intervening buildings are not sufficient to screen all views of the Solar PV Site where glint and glare is possible for receptor 53, therefore the impact for receptor 53 remains **High**.

Receptors 56 - 58 (Appendix B and C Receptors 56 - 58)

6.26. The 'Glare Reflections on PV Footprint' chart in **Appendix B** shows that reflections from a central section of Array 7 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.27. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a photo from within the development boundary with a view towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 60 - 65 (Appendix B and C Receptors 60 - 65)

6.28. The 'Glare Reflections on PV Footprint' chart in **Appendix B** shows that reflections from a central section of Array 7 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.29. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a photo from within the development boundary with a view towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 66 - 68 (Appendix D and E Receptors 1 - 3)

6.30. The 'Glare Reflections on PV Footprint' chart in **Appendix D and E** shows that reflections from a central section of Array 6 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.31. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a photo from within the development boundary with a view towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible for receptors 66 - 68. Therefore, the impacts reduce to **None**.

Receptors 69 - 75 (Appendix D and E Receptors 4 - 10)

6.32. The 'Glare Reflections on PV Footprint' chart in **Appendix D and E** shows that reflections from a central section of Array 6 and 7 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.33. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a photo from within the development boundary with a view towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible for receptors 69 - 74. Therefore, their impact reduces to **None**. Receptor 75 does not have sufficient vegetation to screen all views of the Solar PV Site where glint and glare is possible. Therefore receptor 75's impact remains **High**.

Receptors 76 - 79 (Appendix D and E Receptors 11 - 14)

6.34. The 'Glare Reflections on PV Footprint' chart in **Appendix D** shows that reflections from a southern section of Array 6 and two southern sections of Array 7 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.35. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 80 - 82 (Appendix D and E Receptors 15 - 17)

6.36. The 'Glare Reflections on PV Footprint' chart in **Appendix D** shows that reflections from a southern section of Array 7(see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.37. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation and intervening buildings between the Solar PV Site and the receptor. The second image is a photo with a view towards the receptor from within Array 7 in the Solar PV Site. This image confirms that the vegetation within the Solar PV Site boundary is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**

Receptor 83 (Appendix D and E Receptor 18)

6.38. The 'Glare Reflections on PV Footprint' chart in **Appendix D** shows that reflections from a southern section of Array 7(see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.39. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation and intervening buildings between the Solar PV Site and the receptor. The second image is a photo with a view towards the receptor from within Array 7 in the Solar PV Site. This image confirms that the vegetation within the Solar PV Site boundary is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptors 84 - 89 (Appendix D and E Receptors 19 - 24)

6.40. The 'Glare Reflections on PV Footprint' chart in **Appendix D and E** shows that reflections from an eastern section of Array 3 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.41. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation and intervening buildings between the Solar PV Site and the receptor. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 90 - 93 (Appendix D and E Receptors 25 - 28)

6.42. The 'Glare Reflections on PV Footprint' chart in **Appendix D** shows that reflections from Array 3, 4, and 7(see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.43. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a photo taken from the road alongside the receptors with a view east towards Array 4. The third image is a photo taken from within the development boundary of Array 7 with a view east towards the receptors. The second and third images confirm that the vegetation is sufficient to screen all views of the Solar PV Sites where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptors 94 - 97 (Appendix D and E Receptors 29 - 32)

6.44. The 'Glare Reflections on PV Footprint' chart in **Appendix D and E** shows that reflections from a south section of Array 7 and sections of Array 4 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.45. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a street-view image with a view east towards Array 4. The third image is a street-view image with a view west towards Array 7. The second and third images confirm that the vegetation is sufficient to screen all views of the Solar PV Sites where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptors 98 - 101 (Appendix D and E Receptors 33 - 36)

6.46. The 'Glare Reflections on PV Footprint' chart in **Appendix D and E** shows that reflections from a central section of Array 7 and sections of Array 3 and 4(see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.47. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a street-view image taken with a view east towards the panel boundary. The third image is a street-view image taken with a view west towards the panel boundary. The second and third images confirm that the vegetation is sufficient to screen all views of the Solar PV Sites where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptors 102 - 106 (Appendix D and E Receptors 37 - 41)

6.48. The 'Glare Reflections on PV Footprint' chart in **Appendix D and E** shows that reflections from a central section of Array 7 and sections of Array 3 and 4(see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.49. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a photo taken from within Array 7 with a view east towards the panel boundary. The third image is a photo taken from within Array 4 with a view west towards the panel boundary. The second and third images confirm that the vegetation is sufficient to screen all views of the Solar PV Sites where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptors 107 - 111 (Appendix D and E Receptors 44 - 50)

6.50. The 'Glare Reflections on PV Footprint' chart in **Appendix D and E** shows that reflections from a central section of Array 7 and parts of Array 4 and 6 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.51. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a photo taken from within Array 7 with a view east towards the panel boundary. The third image is a photo taken from within Array 4 with a view west towards the panel boundary. The second and third images confirm that the vegetation is sufficient to screen all views of the Solar PV Sites where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptors 112 and 113 (Appendix D and E Receptors 47 and 48)

6.52. The 'Glare Reflections on PV Footprint' chart in **Appendix E** shows that reflections from a central section of Array 7 and parts of Array 4, and 6(see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.53. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a photo taken from within Array 7 with a view east towards the panel boundary. The third image is a street view image taken with a view towards Array 6. The second and third images confirm that the vegetation is sufficient to screen all views of the Solar PV Sites where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptors 114 and 115 (Appendix D and E Receptors 49 and 50)

6.54. The 'Glare Reflections on PV Footprint' chart in **Appendix D** shows that reflections from a central section of Array 7 and parts of Array 5, 6, and 10 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.55. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot and blue dot respectively). This image shows dense vegetation and intervening buildings between the Solar PV Site. The second image is a street view image taken with a view east towards the Array 6. The third image is a photo taken from within Array 7 with a view east towards the panel boundary. The second and third images confirm that the vegetation is sufficient to screen all views of the Solar PV Sites where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptor 116 (Appendix D and E Receptor 51)

6.56. The 'Glare Reflections on PV Footprint' chart in **Appendix D** shows that reflections from most, except a southern section, of Array 5, a central section of Array 6, a northern section of Array 7, a northern section of Array 8 and a southern section of Array 9 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.57. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with an eastern view towards Arrays 5 and 6 in the Solar PV Site. This image confirms that the vegetation is sufficient to screen ground floor views in the Solar PV Site where glint and glare is possible. The third image is a street view image with a western view towards Arrays 7, 8 and 9 in the Solar PV Site. This image confirms that the vegetation is insufficient to screen views in the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptor 117 (Appendix D and E Receptor 52)

6.58. The 'Glare Reflections on PV Footprint' chart in **Appendix D** shows that reflections from a central section of Array 6, a northern section of Array 7, a northern section of Array 8 and a southern section of Array 9 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.59. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second and third images were taken (red and blue dot respectively). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with an eastern view towards Arrays 5 and 6 in the Solar PV Site. This image confirms that the vegetation is sufficient to screen ground floor views of the Solar PV Site where glint and glare is possible. The third image is a photo with an eastward view from within Array 7 in the Solar PV Site. This image confirms that the vegetation is sufficient to screen views of the Solar PV Site where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptor 118 (Appendix D and E Receptor 54)

6.60. The 'Glare Reflections on PV Footprint' chart in **Appendix E** shows that reflections from a northern section of Array 6, a northern section of Array 7, a northern section of Array 8 and a northern section of Array 11 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.61. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with an eastwards view towards Array 6 in the Solar PV Site. The third image is a street view image with a westward view towards Arrays 6, 7, 8 and 9 in the Solar PV Site. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 119 – 123 (Appendix D and E Receptors 54 - 58)

6.62. The 'Glare Reflections on PV Footprint' chart in **Appendix E** shows that reflections from a northern section of Array 12 and all of Array 13 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.63. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**

Receptor 124 (Appendix F and G Receptor 1)

6.64. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from a northern section of Array 6 and the northern half of Array 12 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.65. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptors 125 – 132 (Appendix F and G Receptors 2 - 9)

6.66. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from a northern section of Array 6 and the northern half of Array 11 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.67. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 133 (Appendix F and G Receptor 10)

6.68. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from a northern section of Array 6 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.69. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 156 - 159 (Appendix F and G Receptor 33 - 36)

6.70. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from a northern section of Array 1, a northern section of Array 3, most, except a southern section, of Array 4 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.71. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second and third images were taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with an eastward view towards Array 1 in the Solar PV Site. The third image is a street view image with a westward view towards Array 3 in the Solar PV Site. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 160 (Appendix F and G Receptors 37)

6.72. The 'Glare Reflections on PV Footprint' chart in **Appendix F and G** shows that reflections from a northern section of Array 2, and a southern section of Array 1, (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.73. The first image in Appendix ~~I~~ V is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second and third images were taken (red and blue dot respectively). This image shows vegetation between the Solar PV Site and the receptor The second image is a street view image taken looking west from within Array 2 in the Solar PV Site. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 161 (Appendix F and G Receptor 38)

6.74. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from a central section of Array 7 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.75. The first image in Appendix ~~I~~ V is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptors 162 - 167 (Appendix F and G Receptor 39 - 44)

6.76. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from the northern half of Array 1 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.77. The first image in Appendix ~~I~~ V is an aerial view which shows the location of the receptors (yellow pins) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows vegetation between the Solar PV Site and the receptors. The second image is a street view image with a view towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 168 (Appendix F and G Receptor 45)

6.78. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from most, except a northern and southern section, of Array 1 and most, except a northern and southeast section, of Array 3 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.79. The first image in Appendix ~~I~~ V is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows dense vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view of the vegetation to the west of the

receptor. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 169 (Appendix F and G Receptor 46)

6.80. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from most, except a northern and southern section, of Array 1 and most, except a northern section, of Array 3 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.81. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows dense vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view of the vegetation towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 170 (Appendix F and G Receptor 47)

6.82. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from most, except a northern and southern section, of Array 1 and most, except a northern section, of Array 3 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.83. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows dense vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view of the vegetation towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptors 171 - 173 (Appendix F and G Receptors 48 - 50)

6.84. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from the northern half of Array 2, all of Array 3 and most, except a northern section, of Array 4 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.85. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows dense vegetation between the Solar PV Site and the receptors. The second image is a photo taken from within Array 2 with a view east towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Receptor 174 (Appendix F and G Receptor 51)

6.86. The 'Glare Reflections on PV Footprint' chart in **Appendix G** shows that reflections from most, except a northern and southern section, of Array 1 and most, except a northern section, of Array 3 (see **Figure 5: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.87. The first image in **Appendix ~~I~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site, and the location from which the second image was taken (red dot). This image shows dense vegetation between the Solar PV Site and the receptor. The second image is a street view image with a view of the vegetation towards the Solar PV Site. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None.**

Residential Area 1

6.88. This encompasses a number of residential receptors including those at Receptors 1 - 8 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these eight receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 2

6.89. This encompasses a number of residential receptors including those at Receptors 11 - 13 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these three receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 3

6.90. This encompasses a number of residential receptors including those at Receptors 15 - 17 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these three receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 4

6.91. This encompasses a number of residential receptors including those at Receptors 26 - 28 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these four receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 5

6.92. This encompasses a number of residential receptors including those at Receptors 32 - 37 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these six receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 6

6.93. This encompasses a number of residential receptors including those at Receptors 41 - 43 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these three receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 7

6.94. This encompasses a number of residential receptors including those at Receptors 44 - 46 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these three receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 8

6.95. This encompasses a number of residential receptors including those at Receptors 53 - 57 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and

it was concluded their impacts were similar. As per the assessments of these five receptors, the impacts on the other receptors within this area are assessed as being **High (worst case scenario)**.

Residential Area 9

6.96. This encompasses a number of residential receptors including those at Receptors 58 - 63 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these six receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 10

6.97. This encompasses a number of residential receptors including those at Receptors 64 and 65 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these two receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 11

6.98. This encompasses a number of residential receptors including those at Receptors 66 - 71 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these six receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 12

6.99. This encompasses a number of residential receptors including those at Receptors 72 - 75 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these four receptors, the impacts on the other receptors within this area are assessed as being **High (worst case scenario)**.

Residential Area 13

6.100. This encompasses a number of residential receptors including those at Receptors 80 and 81 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these two receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 14

6.101. This encompasses a number of residential receptors including those at Receptors 84 - 89 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these six receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 15

6.102. This encompasses a number of residential receptors including those at Receptors 94 - 99 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these six receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 16

6.103. This encompasses a number of residential receptors including those at Receptors 100 - 115 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these 16 receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 17

6.104. This encompasses a number of residential receptors including those at Receptors 129 - 134 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple

receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these six receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 18

6.105. This encompasses a number of residential receptors including those at Receptors 137 - 141 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these five receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 19

6.106. This encompasses a number of residential receptors including those at Receptors 143 - 157 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these 15 receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Residential Area 20

6.107. This encompasses a number of residential receptors including those at Receptors 166 - 168 (assessed previously) (See **Figure 1: Appendix A**). Each receptor assessed represents multiple receptors as they are in close proximity of each other, so the worst-case scenario is assumed for the impact of glint and glare. All receptors were considered within the visibility analysis, and it was concluded their impacts were similar. As per the assessments of these three receptors, the impacts on the other receptors within this area are assessed as being **None (worst case scenario)**.

Road Receptors

6.108. **Table 6 - 2** shows a summary of the modelling results for each of the Road Receptor Points whilst the detailed results and ocular impact charts can be viewed in **Appendix H, I, J, and K**.

6.109. **Appendix H** shows the analysis for receptors 1-86 at a tilt angle of 15 degrees, **Appendix I** shows the analysis for receptors 1-86 at a tilt angle of 25 degrees. **Appendix J** shows the analysis for

receptors 87-170 at a tilt angle of 15 degrees, whilst Appendix K shows the analysis for receptors 87-170 at a tilt angle of 25 degrees.

6.110. Receptor number 171 has been excluded from the results as it is positioned in a no-reflection zone. The ground receptor no-reflection zones are clearly identifiable on Figure 2: Appendix A and the process of how these are calculated is explained in paragraphs 5.1 to 5.2 of this report.

6.111. Table 6 -2 shows the worst-case impact at each receptor, based on a theoretical modelled impact without consideration of existing or proposed local vegetation or other obstacles (ie a bare-earth scenario) and assuming no cloud at any point in the year.

Table 6 - 2: Potential for Glint and Glare Impact on Road Based Receptors

Receptor	Green Glare (mins)	Yellow Glare (mins)	Red Glare (mins)	Magnitude of Impact	Worst Case Tilt Angle (degrees)
1	5237	0	0	Low	15
2	6141	154	0	High	15

6.112. As can be seen in **Table 6 - 2**, there are 114 receptors that have potential glare impacts with the "potential for after-image" (Yellow Glare), which is a **High** impact, 54 receptors with the "low potential for after-image" (Green Glare), which is a **Low** impact, and 2 receptors with the "no potential for after-image" (Green and Yellow Glare), which is **None** impact. **Appendix H, I, J, and K** show detailed analysis of when the glint and glare impacts are possible, whilst also showing from which parts of the Solar PV Site the solar glint is reflected from.

6.113. **Appendix ~~T~~ V** shows Google Earth images taken towards the Solar PV Site location at each of the receptor points where an impact is anticipated. The first image is a ground level terrain view and is based on the height data of the surrounding land showing no intervening vegetation or buildings. The Solar PV Site has been drawn as a white polygon and can be seen on the images when the Solar PV Site is theoretically visible. The area of the Solar PV Site from where reflections may be possible has been drawn as a yellow or green polygon. The second image is a street view image pointing in the same direction as the terrain image. This gives a good indication as to whether the area of the Solar PV Site where reflections are theoretically possible will be visible from the receptor point. For some receptors, a view from within the Proposed Development has been provided to display the vegetation on the boundary blocking all views of from the receptor to the Proposed Development.

6.114. As can be seen in **Appendix ~~T~~V**, views of the Solar PV Site are screened from those with a potential glare impact, except for receptors 14 – 17, 62, 63, 65, 94, 95, 98 – 100, 120 – 127, 145 – 148, by a mixture of intervening vegetation, topography and buildings or are outside the field of view of the driver. Therefore, impacts upon these receptors reduce to **None**.

Bridleway Receptors

6.115. **Table 6 - 4** shows a summary of the modelling results for each of the Bridleway Receptor Points whilst the detailed results and ocular impact charts can be viewed in **Appendix ~~P~~ R - ~~S~~ U** shows the analysis with the ground mounted solar panels at a tilt angle of between 15 and 25 degrees. **Appendix ~~P~~ R** shows the analysis for Receptors 1 – 74 at an angle of 15 degrees, **Appendix ~~Q~~ S** shows the analysis for Receptors 1 – 74 at an angle of 25 degrees. **Appendix ~~R~~ T** shows the analysis for Receptors 75 – 87 at an angle of 15 degrees, **Appendix ~~S~~ U** shows the analysis for Receptors 75 – 87 at an angle of 25 degrees.

6.116. The 11 receptors (88 - 99) within the no-reflection zones outlined previously has been excluded from the detailed modelling as they will never receive glint and glare impacts from the Scheme.

6.117. **Table 6 - 4** shows the **worst-case** impact at each receptor, based on a theoretical modelled impact without consideration of existing or proposed local vegetation or other obstacles (ie a bare-earth scenario) and assuming no cloud at any point in the year.

Table 6 - 4: Summary of Bridleway Glare Results

Receptor	Green Glare (mins)	Yellow Glare (mins)	Red Glare (mins)	Magnitude of Impact	Worst Case Tilt Angle (degrees)

6.118. As can be seen in **Table 6 - 4**, there are 63 receptor points with the "high potential for after-image" (Yellow Glare), which is a **High** impact. There are 18 receptor points which have potential glare impacts with the "low potential for after-image" (Green Glare), which is a **Low** impact. Also, there are and there are six receptor points which have no potential Glare impacts which labels the impacts as **None**. **Appendix ~~P~~R, ~~Q~~S, ~~R~~T, and ~~S~~ U** show detailed analysis of when the glint and glare impacts are possible, whilst also showing from which parts of the Solar PV Site the solar glint is reflected from.

6.119. **Appendix ~~T~~ V** shows Google Earth images that give an insight into how each receptor will be impacted by the glint and glare from the Solar PV Site. There is a mixture of images used, which include aerial, ground level and street level. The aerial images show the location of the receptor with the solar farm drawn as a white polygon and can be seen on the images when the solar farm is theoretically visible, as well as the field of view of a train driver drawn between two red lines. The area of the solar farm from where reflections may be possible has been drawn as a yellow or green polygon. The ground level terrain is based on the height data of the surrounding land showing no intervening vegetation or buildings. The white and yellow polygons can be seen in this view also. The street view gives a good indication as to whether the area of the solar farm where reflections are theoretically possible will be visible from the receptor point. Also, where appropriate images that have been taken from within the Application Site have been used to show up to date imagery.

Receptors 4 and 5

6.120. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Array 12 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.121. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from a road to the west of the receptor with a view west towards the Array 12. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptor 9

6.122. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Arrays 11 and 12 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.123. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from a road to the west of the receptor with a view west towards the Arrays 11 and 12. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptor 10

6.124. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 11 and 12 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.125. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from a road which runs alongside the receptor with a view to the east towards the Arrays 11 and 12. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 11, 12, 13, and 14

6.126. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Array 11 and some sections of Array 12 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.127. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from a central area of Array 11 with a view west towards the receptors. This image confirms that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptors 15 and 16

6.128. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from sections of Arrays 7, 8, 9, 10, and 11 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.129. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from a the B660 looking west towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible for receptor 15 therefore impacts reduce to **None**. Impacts upon receptor 16 coming from Array 10 are not screened by the existing vegetation due to the bridleway running adjacent to the field. Therefore, the impact remains **High**.

Receptors 17, 18, 19, 20, and 21

6.130. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 5, 6, 7, 8, 9, and 10 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.131. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from the boundary of Array 10 with a view along the southern boundary of the Array. The third image is a photo taken from the east of Array 10 looking east towards Arrays 5, 6, 7, 8, and 9. These images confirm that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptors 22 and 23

6.132. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 6, 7, 8, 9, 10, and 11 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.133. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site. The impacts from arrays to the east of the receptor are "**low** potential for after-image" (Green Light) which is an acceptable impact. However, the impacts seen from Array 10 are "**High** potential for after-image" (Yellow Glare) but will be screened by the mitigation that will be implemented for receptors mentioned within the Assessment. Therefore, the impact remains **High**.

Receptors 24, 25, 26, and 27

6.134. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Array 11 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.135. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from the B660 with a view west towards the receptors and impacting array. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 28, 29, 30, 31, 32 and 33

6.136. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 5, 6, 7, 8, 9, and 10 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.137. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from The second image is a photo taken from the B660 with a view west towards the receptors and impacting array. This image confirms

that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptor 34

6.138. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Arrays 2, 3, 4, 5, 6, 7, and 8 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.139. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from within Array 7 with a view west towards the receptor. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 35, 36, and 37

6.140. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 2, 3, 4, 5, 6, 7, 8, and 9 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.141. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from within Array 7 with a view west towards the receptor. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 38, 39, and 40

6.142. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 3, 4, 5, 6, 7, 8, and 9 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.143. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from within Array 7 with a view west towards the receptor. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 41 and 42

6.144. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 3, 4, 5, 6, 7, 8, and 9 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.145. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from within Array 7 with a view west towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 43, 44, 45, and 46

6.146. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Arrays 3, 4, 5, 6, 7, 8, and 9 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.147. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from within Array 7 with a view west towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptor 47

6.148. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 3, 4, 6, and 7 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.149. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from a within Array 7 with a view west towards the receptor. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 48, 49, 50, and 51

6.150. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, 4, 5, 6, and 7 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.151. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from a within Array 7 with a view west towards the receptors. The third image is a photo taken from the southern boundary of Array 7 with a view west towards the receptors. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 52, 53, 54 and 55

6.152. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 2, 3, 4, 5, 6, and 7 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.153. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from the southern boundary of Array 7 with a view west towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 56 and 57

6.154. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, and 4 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.155. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from the southern boundary of Array 7 with a view west towards the receptors. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 58 and 59

6.156. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, and 4 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.157. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from an adjacent road to the receptors with a view northeast towards the Arrays 1, 2, 3, and 4. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 60, 61, 62, 63, 64, and 65

6.158. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, and 3 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.159. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second image was taken (red dot). The second image is a photo taken from a road to the east of the receptors with a view north showing the intervening vegetation running along the road. This image confirms that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 66 and 67

6.160. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, 4, 7, and 10 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.161. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from a road to the east of the receptors with a view north showing the intervening vegetation running along the road. The third image is a photo taken from the south boundary of Array 10 with a view southwest along the Boundary. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 68, 69, and 70

6.162. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, 4, 7, 8, 10, and 11 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.163. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from within Array 3 with a view west towards the receptors. The third image is a street view image taken from the road to the south of the receptors with a view north along the bridleway. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 71 and 72

6.164. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, 4, 7, and 10 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.165. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from a

road to the east of the receptors showing the intervening vegetation with a view south. The third image is a street view image taken from the road to the north of the receptors with a view south along the bridleway. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 73 and 74

6.166. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, 7 and 10 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.167. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from a road to the east of the receptors showing the intervening vegetation with a view north. The third image is a street view image taken from the road to the northwest of the receptors with a view northwest towards Array 7 and 10. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 75 and 76

6.168. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R** shows that reflections from Arrays 1, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.169. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from within the boundary of Array 1 with a view looking west towards the receptor. The third image is a photo taken from within the boundary of Array 3 with a view looking east towards the receptor. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact reduces to **None**.

Receptors 77 and 78

6.170. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R** shows that reflections from Arrays 1, 2, 3, and 4(see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.171. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from within the boundary of Array 1 with a view looking west towards the receptor. The third image

is a photo taken from within the boundary of Array 3 with a view looking east towards the receptor. These images confirm that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptor 79

6.172. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, and 4 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.173. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from the northern boundary of Array 2 with a view looking northeast towards the reflections from Array 1. The third image is a photo taken from within the boundary of Array 3 with a view looking east towards the receptor. These images confirm that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptor 80

6.174. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, and 4 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.175. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from the northern boundary of Array 2 with a view looking northeast towards the reflections from Array 1. The third image is a photo taken from within the boundary of Array 3 with a view looking east towards the receptor. These images confirm that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptor 81

6.176. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, and 4 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptor.

6.177. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptor (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from the northern boundary of Array 2 with a view looking northeast towards the reflections from

Array 1. The third image is a photo taken from within the boundary of Array 3 with a view looking east towards the receptor. These images confirm that the vegetation is insufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact remains **High**.

Receptors 82 and 83

6.178. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, and 4 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.179. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from within the boundary of Array 1 with a view looking east towards the receptors. The third image is a photo taken from within the boundary of Array 3 with a view looking east towards the receptor. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact is reduced to **None**.

Receptors 84, 85, 86, 87, and 88

6.180. The 'Glare Reflections on PV Footprint' chart in **Appendix ~~P~~ R and ~~Q~~ S** shows that reflections from Arrays 1, 2, 3, and 4 (see **Figure 4: Appendix A**) of the Solar PV Site can potentially impact on the receptors.

6.181. The first image in **Appendix ~~T~~ V** is an aerial view which shows the location of the receptors (yellow pin) in relation to the Solar PV Site and the location from which the second and third images were taken (red and blue dots respectively). The second image is a photo taken from within the boundary of Array 2 with a view looking east towards the receptors. The third image is a photo taken from within the boundary of Array 3 with a view looking east towards the receptor. These images confirm that the vegetation is sufficient to screen all views of the Solar PV Site where glint and glare is possible. Therefore, the impact is reduced to **None**.

Aviation Receptors

6.182. **Table 6 - 5** shows a summary of the modelling results for each of the runway approach paths, whilst the detailed results and ocular impact charts can be viewed in **Appendix L, M, N, ~~and~~ O, P and Q**.

6.183. **Appendix L** shows the analysis for a tilt angle of 15 degrees at Old Warden Airport, **Appendix M** shows the analysis for a tilt angle of 25 degrees at Old Warden Airport, whilst **Appendix N** shows the analysis for a tilt angle of 15 degrees at Sackville Farm, and **Appendix O** shows the analysis for a tilt angle of 25 degrees at Sackville Farm. **Appendix P** shows the analysis for a tilt angle of 15 degrees at Bedford Aerodrome, Bedford Aerodrome Helipads and Little Staughton Airfield,

Appendix Q shows the analysis for a tilt angle of 25 degrees at Bedford Aerodrome, Bedford Aerodrome Helipads and Little Staughton Airfield.

Table 6 - 5: Summary of Aviation Glare Results

Component	Green Glare (mins)	Yellow Glare (mins)	Red Glare (mins)	Worst Case Tilt Angle (degrees)
Old Warden Airport				
Runway 02	0	0	0	N/A
Runway 20	0	0	0	N/A
Sackville Farm				
Runway 31	0	0	0	N/A
Runway 13	12679	171	0	25
Little Staughton Airfield				
Runway 06	Runway 06	Runway 06	Runway 06	Runway 06
Runway 24	Runway 24	Runway 24	Runway 24	Runway 24
Bedford Aerodrome				
Runway 08	Runway 08	Runway 08	Runway 08	Runway 08
Runway 26	Runway 26	Runway 26	Runway 26	Runway 26
ATCT	ATCT	ATCT	ATCT	ATCT
Bedford Helipads 1 – 3				
South	South	South	South	South
Bedford Helipad 4				
NortheEast	NortheEast	NortheEast	NortheEast	NortheEast
NorthwWest	NorthwWest	NorthwWest	NorthwWest	NorthwWest

6.184. As can be seen in **Table 6 - 5**, there are no Glare impacts for the receptors at Old Warden Airport, ~~or~~ the Runway 31 approach path at Sackville Farm, Runway 26 at Bedford Aerodrome, Bedford Helipads 1-3 south approach and Bedford Helipad 4 northeast approach/exit. There is only green glare at Bedford Aerodrome Runway 26 and Bedford Aerodrome ATCT. There is yellow glare and green glare potential for the Runway 13 approach path at Sackville Farm. Runways 06 and 24 at Little Staughton Airfield and Bedford Helipad 4 northwest approach. Green glare is an **acceptable impact** upon runways according to FAA guidance.

6.185. Given the following is stated within the NPS EN-3 "Whilst there is some evidence that glint and glare from solar farms can be experienced by pilots and air traffic controllers in certain conditions, there is no evidence that glint and glare from solar farms results in significant impairment on aircraft safety. Therefore, unless a significant impairment can be demonstrated, the Secretary of State is unlikely to give any more than limited weight to claims of aviation interference because of glint and glare from solar farms", and there are a significant number of solar farms co-located with airport land across the world with there yet to be a major issue due to glare.

Sackville Farm – Runway 13

~~6.185.~~6.186. To determine the actual impact of glare for pilots upon approach at Runway 13 at Sackville Farm, a visibility assessment of where the sun will be located at the time of impact in relation to each array has been undertaken, with these images visible in **Appendix O**. The approach path to Runway 13 has been drawn as a red line.

~~6.186.~~6.187. As outlined in **paragraph 4.16** the sun's reflections will be far greater than those reflections from the solar array. Pilots on approach are often landing into the sun at sunset or sunrise. The sun's impact can be mitigated by wearing sunglasses, using darkened cockpit sun visors, overflying and inspecting the runway, landing in the opposite direction if wind conditions allow and planning their flight to land outside the times when sun glare if possible. In addition, given the glare impacts occur at or just after sunrise and the type of small aircraft using this airfield, it is unlikely that these aircraft will be setting off early enough (in the dark) to arrive at the times at which glare is predicted to occur for approaches to Runway 13 approach path at Sackville Farm. Also, given the caravan park at the approach end of Runway 13, pilots will most likely use the Runway 31 approach. The most recent Google Earth aerial imagery from 28th May 2020 suggests that the airfield is quiet and rarely used.

~~6.187.~~6.188. It is important to note that these predicted results are the absolute worst-case scenario as the model does not account for variations such as cloud cover. Once cloud cover is considered, the total duration of predicted glare will decrease significantly and as such, will decrease impact further. Additionally, as outlined within the updated policy from the FAA and the CAA's CAP738 document, glare impacts have not been reported to cause pilots more impact than other existing infrastructure, such as; car parks, glass buildings and water bodies. Thus, the FAA have reduced the assessment criteria to only assess glare impacts at ATCTs, therefore, overall impacts on Sackville Farm are **Low** and **Not Significant**.

Little Staughton -Runway 06 and 24

6.189. To determine the actual impact of glare for pilots upon approach at Runway 06 and 24 at Little Staughton Airfield, a visibility assessment of where the sun will be located at the time of impact in relation to each array has been undertaken, with these images visible in **Appendix P**. The approach path to the runways have been drawn as a red line.

6.190. The yellow glare predicted to impact Runway 06 at Little Staughton Airfield is solely from Array 2, which in **Appendix P** states impacts are expected to occur at 05:00 – 06:00 UTC in the months of May – August. Little Staughton Aerodrome Chart, **Appendix A – Figure 10**, states the opening hours for the facility is 08:00 year--round, outlining impacts will occur outside operating hours reducing Runway 06 impacts to **None**.

6.191. As outlined in **paragraph 4.16** the sun's reflections will be far greater than those reflections from the solar array. Pilots on approach are often landing into the sun at sunset or sunrise. The sun's impact can be mitigated by wearing sunglasses, using darkened cockpit sun visors, overflying and inspecting the runway, landing in the opposite direction if wind conditions allow and planning their flight to land outside the times when sun glare if possible. In Addition, The Airfield is located within the confines of a Solar Farm therefore, any conditions experienced by pilots landing at the airfield once construction is complete will be similar to the conditions experienced by pilots currently operating at the aerodrome.

6.192. Impacts predicted at Runway 24 at Little Staughton Aerodrome are expected to be a maximum daily duration of approximately 30 minutes in the months of March and September only. It is important to note that these predicted results are the absolute worst-case scenario as the model does not account for variations such as cloud cover. Once cloud cover is considered, the total duration of predicted glare will decrease significantly and as such, will decrease impact further. Additionally, as outlined within the updated policy from the FAA and the CAA's CAP738 document, glare impacts have not been reported to cause pilots more impact than other existing infrastructure, such as; car parks, glass buildings and water bodies. Thus, the FAA have reduced the assessment criteria to only assess glare impacts at ATCTs, therefore, overall impacts on Runway 24 at Little Staughton Airfield are **Low** and **Not Significant**.

Bedford Aerodrome – ATCT

6.193. A ground elevation profile as can be seen in **Appendix A Figure 11** was conducted to show the elevation between the ATCT (82m AOD) and the Proposed Development (51m AOD). The results show the difference between the ATCT, and the Proposed Development is approximately 31m and an intervening landscape feature reaches a height of 83m blocking all views of the Proposed Development from the ATCT. Therefore, the impact on the ATCT at Bedford Aerodrome is deemed as **None** and **Not Significant**.

Bedford Aerodrome – Helipad 4 northwest approach

6.194. To determine the actual impact of glare for pilots upon approach at Helipad 4 at Bedford Aerodrome, a visibility assessment of where the sun will be located at the time of impact in relation to each array has been undertaken, with these images visible in **Appendix P**. The approach path to the helipad have been drawn as a red line.

6.195. As outlined in **paragraph 4.16** the sun's reflections will be far greater than those reflections from the solar array. Pilots on approach are often landing into the sun at sunset or sunrise. The sun's impact can be mitigated by wearing sunglasses, using darkened cockpit sun visors,

overflying and inspecting the runway, landing in the opposite direction if wind conditions allow and planning their flight to land outside the times when sun glare if possible.

6.196. The impacts expected to occur upon the northwest approach of Helipad 4 at Bedford Aerodrome have a daily duration of a max 30 minutes in the months of April and August only. In addition to this c.65% of the wind originates from a western direction as per annual Met Office Windrose data[18] for the nearby Cranfield Airport. This further reduces the chance for impacts to occur upon a pilot using the northwest approach to Helipad 4. It is important to further note that these predicted results are the absolute worst-case scenario as the model does not account for variations such as cloud cover. Once cloud cover is considered, the total duration of predicted glare will decrease significantly and as such, will decrease impact further. Additionally, as outlined within the updated policy from the FAA and the CAA's CAP738 document, glare impacts have not been reported to cause pilots more impact than other existing infrastructure, such as; car parks, glass buildings and water bodies. Thus, the FAA have reduced the assessment criteria to only assess glare impacts ATCTs, therefore, overall impacts on Bedford Aerodrome Helipad 4 are **Low** and **Not Significant**.

~~6.188. Given the following is stated within the NPS EN-3 "*Whilst there is some evidence that glint and glare from solar farms can be experienced by pilots and air traffic controllers in certain conditions, there is no evidence that glint and glare from solar farms results in significant impairment on aircraft safety. Therefore, unless a significant impairment can be demonstrated, the Secretary of State is unlikely to give any more than limited weight to claims of aviation interference because of glint and glare from solar farms*", and there are a significant number of solar farms co-located with airport land across the world with there yet to be a major issue due to glare, overall impacts on Aviation receptors is **Low** and **Not Significant**.~~

[18] Met Office Windrose Data, available at: https://www.metoffice.gov.uk/services/transport/aviation/regulated/airfield-climate-data#Cranfield

7. GROUND BASED RECEPTOR MITIGATION

7.1. Mitigation is required due to the **High** impacts found at four Residential, 22 Road and 25 bridleway receptors. Measures have also been included to mitigate the **Low** impact views from one Residential and two Road Receptors. These measures can be seen on **Figure 5: Appendix A** and include:

- Native hedgerows to be planted/infilled and maintained to a height of at least 3m along the east/southwest boundaries of Array 1, north/east/northwest boundaries of Array 2, east/southeast boundaries of Array 5, northwest/boundary with road/east/southeast boundaries of Array 6, northeast/east/southwest/west boundaries of Array 7, western boundary of Array 8, southern boundary of Array 9, northeast, southeast/south boundaries of Array 10, southwest boundary of Array 11 and the east/northwest/north boundaries of Array 12.

7.2. **Table 7 - 1, Table 7 - 2 and Table 7 - 3** show the impacts at each stage of the glint and glare analysis, with the final residual impacts considered once the mitigation is in place.

Table 7 - 1: Residual Glint and Glare Impacts on Residential Receptors

7.3. **Table 7 - 4, Table 7 - 5, and Table 7 - 6** show the overall impacts for all residential, road and bridleway receptors.

Table 7 - 4: Solar Reflection: Residential Receptors

Magnitude	Theoretical Visibility (Bald Earth)	Actual Visibility (No Mitigation)	Actual Visibility with Mitigation
High	36	4	0
Medium	15	0	0
Low	61	1	0
None	62	169	174

- **High –** Solar reflections impacts of over 30 hours per year or over 30 minutes per day

- **Medium -** Solar reflections impacts between 20 and 30 hours per year or between 20 minutes and 30 minutes per day
- **Low -** Solar reflections impacts between 0 and 20 hours per year or between 0 minutes and 20 minutes per day
- **None -** Effects not geometrically possible or no visibility of reflective surfaces likely due to high levels of intervening screening

Table 7 - 5: Solar Reflection: Road Receptors

Magnitude	Theoretical Visibility (Bald Earth)	Actual Visibility (No Mitigation)	Actual Visibility with Mitigation
High	114	22	0
Low	54	2	0
None	2	146	170

- **High -** Solar reflections impacts with yellow glare (potential for after-image).
- **Low -** Solar reflections impacts with only green glare (low potential for after-image)
- **None -** Effects not geometrically possible or no visibility of reflective surfaces likely due to high levels of intervening screening or being outside the drivers field of view

Table 7 - 6: Solar Reflection: Bridleway Receptors

Magnitude	Theoretical Visibility (Bald Earth)	Actual Visibility (No Mitigation)	Actual Visibility with Mitigation
High	63	23	0
Low	18	0	0
None	6	64	87

- **High -** Solar reflections impacts with yellow glare (potential for after-image).
- **Low -** Solar reflections impacts with only green glare (low potential for after-image)
- **None -** Effects not geometrically possible or no visibility of reflective surfaces likely due to high levels of intervening screening or being outside the drivers field of view

8. SUMMARY

8.1. This assessment considers the potential impacts on ground-based receptors such as roads, rail, residential dwellings, and bridleways as well as aviation assets. A 1km study area around the Solar PV Site is considered adequate for the assessment of ground-based (residential, rail, road, and bridleway) receptors, whilst a 30km study area is chosen for aviation receptors. Within the ground-based study areas of the Solar PV Site, there are 176 residential receptors, including 20 residential areas, 171 road receptors and 99 bridleway receptors that were considered. As per the methodology section, where there are several residential receptors within close proximity, a representative dwelling or dwellings is/are chosen for full assessment as the impacts will not vary to any significant degree. Where small groups of receptors have been evident, the receptors on either end of the group have been assessed in detail. Two residential receptors, one road receptor and 12 bridleway receptors were dismissed as they are located within the non-reflection zones. ~~42~~ 45 aerodromes are located within the 30km study area; ~~two~~ five of which, Old Warden Airport, ~~and~~ Sackville Farm Aerodrome, Little Staughton Airfield, Bedford Aerodrome and Bedford Aerodrome Helipads required detailed assessments as the Solar PV Site is located within their respective safeguarding buffer zones. The other 40 aerodromes did not require a detailed assessment due to their size and/or orientation in relation to the Solar PV Site.

8.2. Geometric analysis was conducted at 174 individual residential receptors, including 20 residential areas, 170 road receptors, and 87 bridleway receptors. Also, geometric analysis was conducted at ~~four~~ eight runway approach paths and three helipad approach paths at Old Warden Airport, ~~and~~ Sackville Farm Aerodrome, Little Staughton Airfield, Bedford Aerodrome and Bedford Aerodrome Helipads.

8.3. Following an initial assessment, rail receptors were scoped out as assets that will be impacted upon from the Proposed Development as no rail receptors fell within the 1km study area. The assessment concludes that:

- Solar reflections are possible at 112 of the 174 residential receptors assessed within the 1km study area. Once reviewing the actual visibility of the receptors, glint and glare impacts remain **High** at four receptors, **Low** at one receptor and reduce to **None** for 169 receptors. Once mitigation taken into consideration the impacts all residential receptors reduced to **None**. Therefore, overall impacts on residential receptors are considered to be **None**.

- Solar reflections are possible at 168 of the 170 road receptors assessed within the 1km study area. Once reviewing the actual visibility of the receptors, glint and glare impacts remain **High** at 22 receptors, **Low** at two receptors and reduced to **None** for 146 receptors. Once mitigation taken into consideration the impacts all road receptors

reduced to **None**. Therefore, overall impacts on road receptors are considered to be **None.**

- Solar reflections are possible at 81 of the 87 bridleway receptors assessed within the 1km study area. Once reviewing the actual visibility of the receptors, glint and glare impacts remain **High** at 23 receptors and reduce to **None** at 54 receptors. Once mitigation taken into consideration the impacts all bridleway receptors reduced to **None**. Therefore, overall impacts on bridleway receptors are considered to be **None**.
- **No impact** on train drivers or railway infrastructure is predicted.
- Eight runway approach paths were assessed in detailed at Old Warden Airport, Sackville Farm Aerodrome, Little Staughton Airfield, Bedford Aerodrome and Bedford Aerodrome Helipads. Only green glare impacts were predicted at Runway 08 at Bedford Aerodrome and Bedford Aerodrome ATCT. Green glare and yellow glare impacts were predicted for Runway 13 at Sackville Farm Aerodrome, Runways 06 and 24 at Little Staughton Airfield and Bedford Aerodrome Helipad 4 northwest approach. Green glare is an **acceptable impact** upon runways according to FAA guidance. Upon inspection of the types of aircraft using Sackville Farm Aerodrome, Little Staughton Airfield and Bedford Aerodrome, the time of impact, operating hours, likely landing directions due to wind, google earth imagery, daily glare duration periods, ground elevation profile, and pilot mitigation strategies, overall impacts on aviation assets fall in line with FAA guidance and are **acceptable** and **Not Significant**. ~~Four runway approach paths were assessed in detailed at Old Warden Airport and Sackville Farm Aerodrome. Green glare and yellow glare impacts were predicted for Runway 13 at Sackville Farm Aerodrome. Green glare is an **acceptable impact** upon runways according to FAA guidance. Upon inspection of the type of aircraft using Sackville Farm Aerodrome, time of impact, position of the sun and use of existing pilot mitigation strategies when landing in the direction of the sun, as well as the likely landing direction for the runway and Google Earth aerial imagery indicating the airfield is not in use, all impacts at Sackville Farm Aerodrome can be deemed **acceptable**. Overall impacts on aviation assets are **acceptable** and **Not Significant**~~.

8.4. **Mitigation** is required due to the **High** impacts at four Residential Receptors, 22 road and 25 Bridleway Receptors. Measures have also been included to mitigate the **Low** impact views from one Residential and two Road Receptors. Mitigation Measures include native hedgerows to be planted/infilled and maintained to a height of at least 3.5m along the north/south/southwest boundary of Array 1, east/north/northwest boundary of Array 2, east/southeast boundary of

Array 5, northeast/west/northwest/east/southeast and lining the roads that cross the boundary of Array 6, west/southwest/northeast/east boundary of Array 7, west boundary of Array 8, south boundary of Array 9, northeast/south/southeast boundary of Array 10, southwest boundary of Array 11, and the north/northwest/east boundary of Array 12.

8.5. The effects of glint and glare and their impact on local receptors has been analysed in detail and there is predicted to be **No impacts** at the runway approach paths. Impacts upon ground-based receptors are predicted to be **None.** Therefore, overall impacts are **Negligible**.

A/G	119.025	BEDFORD RADIO

CHANGE (8/12): MAG VAR. AD ELEVATION AMENDED.

Rwy	Dim(m)	Surface	TORA(m)	LDA(m)	Lighting
06/24	922x46	Asphalt	Unlicensed		Nil

Op hrs: PPR (via website). Summer: 0800-2000 daily. Winter: 0800-SS daily.

Landing Fee: On application. **Customs:** 24 hrs PNR.

Hangarage: Available. **Maintenance:** IAE Ltd.

Remarks: Operated by IAE Ltd, Little Staughton Airfield, MK44 2BN.
Unlicensed airfield, strictly PPR and at pilots own risk.
The operator accepts no responsibility or liability for aircraft operating to/from Little Staughton.
Circuits: All circuits to the South at 1000ft QFE - Avoid local villages.

Warnings: Taxiway to IAE Ltd crosses the asphalt perimeter road which is also used by motor vehicles.
Agricultural vehicles may temporarily use the runway.

Restaurant: Pub in village.

Appendix A – Figure 11: Ground Elevation Profile

Elevation Profile Between Proposed Development and Bedford Aerodrome ATCT

Bedford Aerodrome ATCT 82m (High Point 83m)

Proposed Development 51m

Appendix B: Residential Receptor Glare Results (1-65) (15 Deg)

East Park Solar

Residential Receptors 1 - 65 15 Deg

Client: Axis

Created Jun 12, 2024
Updated Aug 29, 2025
Time-step 1 minute
Timezone offset UTC0
Minimum sun altitude 0.0 deg
Site ID 121500.20781

Project type Advanced
Project status: active
Category 100 MW to 1 GW

Misc. Analysis Settings

DNI: **varies (1,000.0 W/m^2 peak)**
Ocular transmission coefficient: **0.5**
Pupil diameter: **0.002 m**
Eye focal length: **0.017 m**
Sun subtended angle: **9.3 mrad**

PV Analysis Methodology: **Version 2**
Enhanced subtended angle calculation: **On**

Summary of Results Glare with potential for temporary after-image predicted

PV Name	Tilt	Orientation	"Green" Glare	"Yellow" Glare	Energy Produced

Component Data

PV Array(s)

Total PV footprint area: 5,297,679 m^2

Name: PV array 1
Footprint area: 340,804 m^2
Axis tracking: Fixed (no rotation)
Tilt: 15.0 deg
Orientation: 180.0 deg

Rated power: -
Panel material: Light textured glass with AR coating
Vary reflectivity with sun position? Yes
Correlate slope error with surface type? Yes
Slope error: 9.16 mrad

Vertex	Latitude	Longitude	Ground elevation	Height above ground	Total elevation

Name: PV array 8
Footprint area: 138,869 m^2
Axis tracking: Fixed (no rotation)
Tilt: 15.0 deg
Orientation: 180.0 deg

Rated power: -
Panel material: Light textured glass with AR coating
Vary reflectivity with sun position? Yes
Correlate slope error with surface type? Yes
Slope error: 9.16 mrad

Vertex	Latitude	Longitude	Ground elevation	Height above ground	Total elevation
	deg	deg	m	m	m
1	52.262727	-0.418148	38.98	3.00	41.98

PV array 10: OP 47

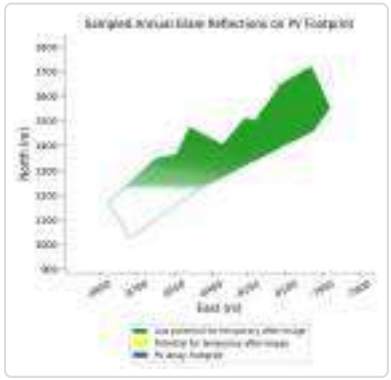

PV array is expected to produce the following glare for this receptor:

- 3,424 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

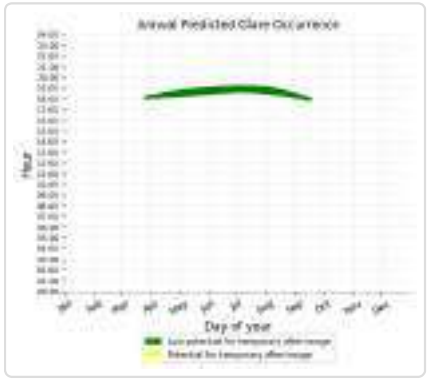

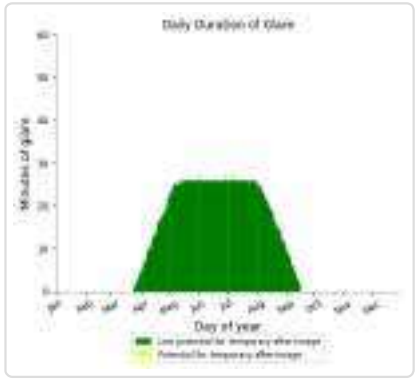

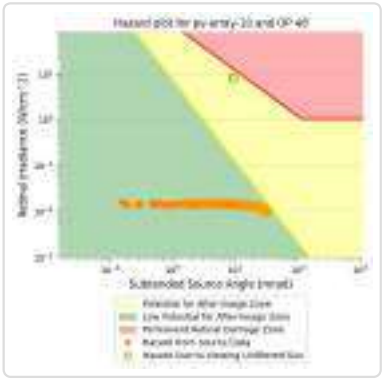

PV array 10: OP 48

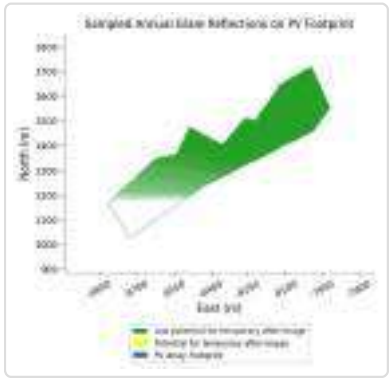

PV array is expected to produce the following glare for this receptor:

- 3,469 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

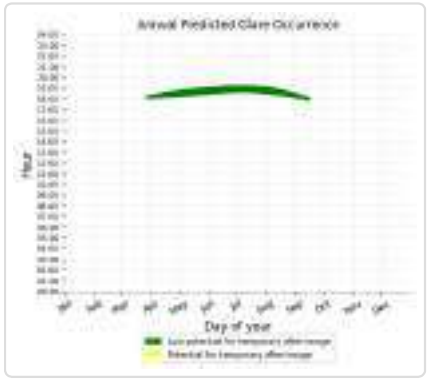

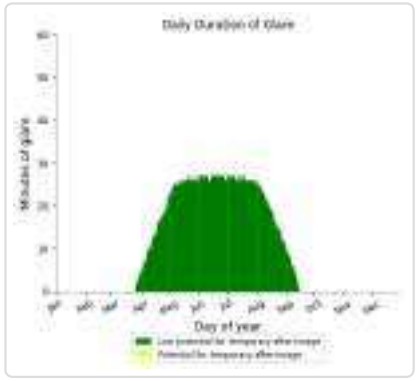

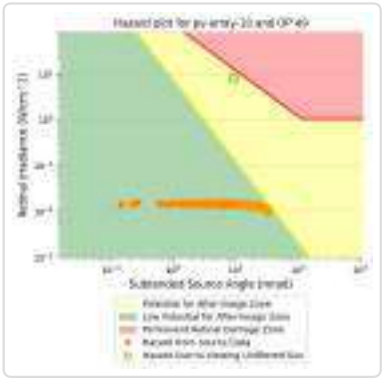

PV array 10: OP 49

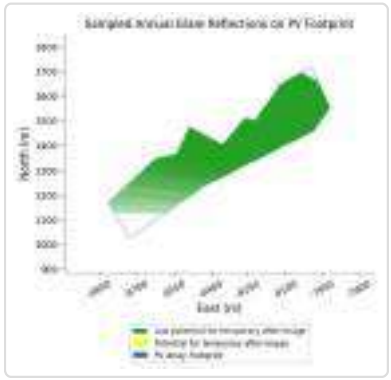

PV array is expected to produce the following glare for this receptor:

- 3,500 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

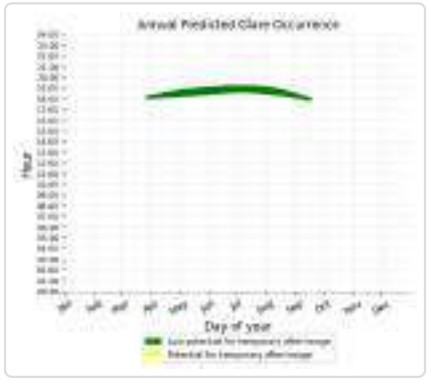

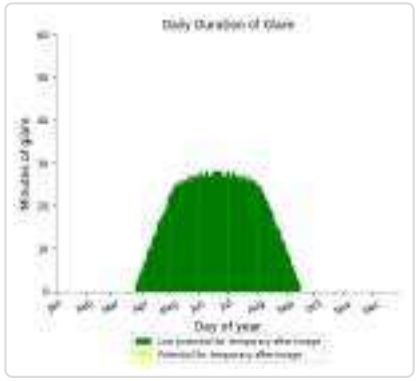

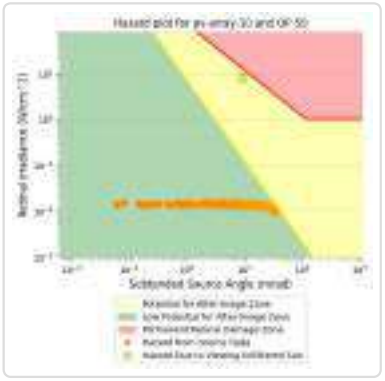

PV array 10: OP 50

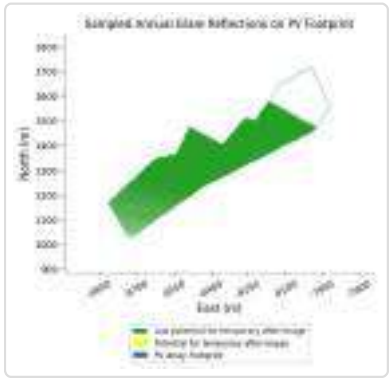

PV array is expected to produce the following glare for this receptor:

- 3,540 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

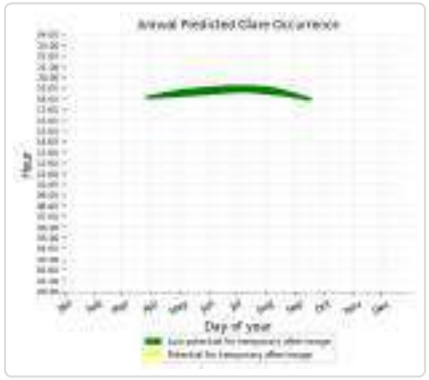

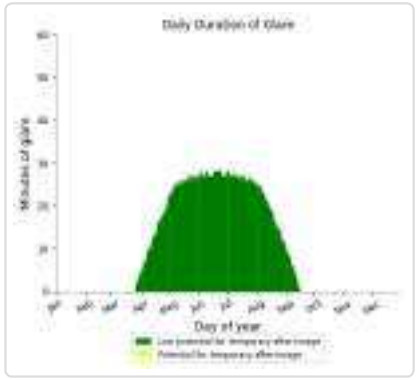

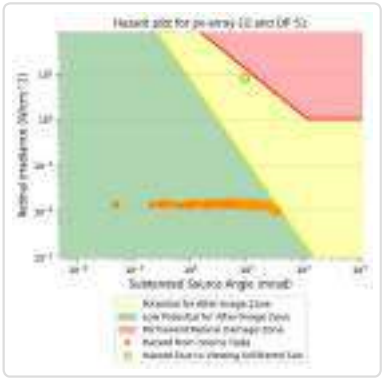

PV array 10: OP 51

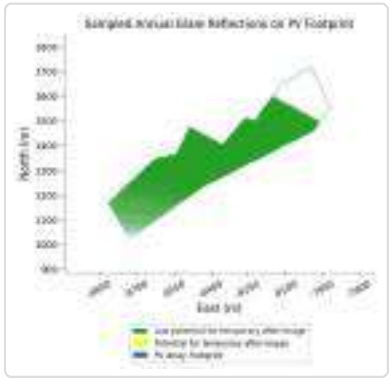

PV array is expected to produce the following glare for this receptor:

- 3,528 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

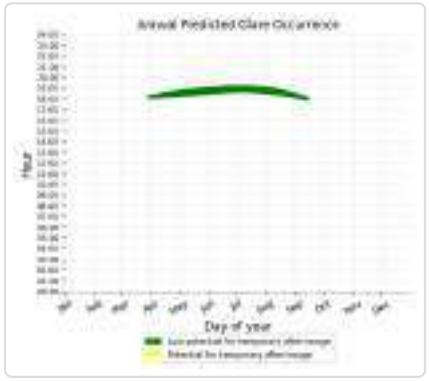

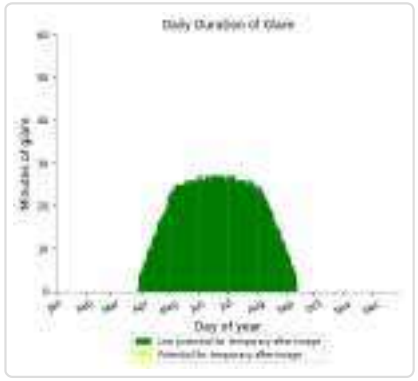

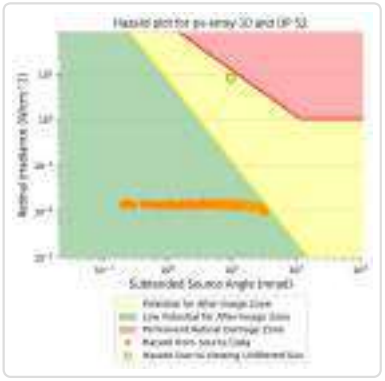

PV array 10: OP 52

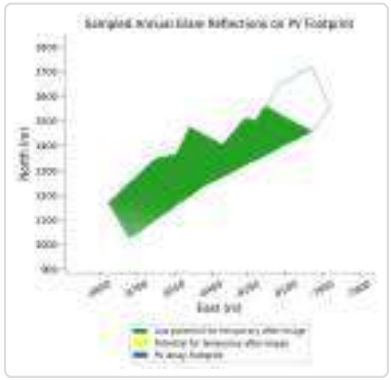

PV array is expected to produce the following glare for this receptor:

- 3,467 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

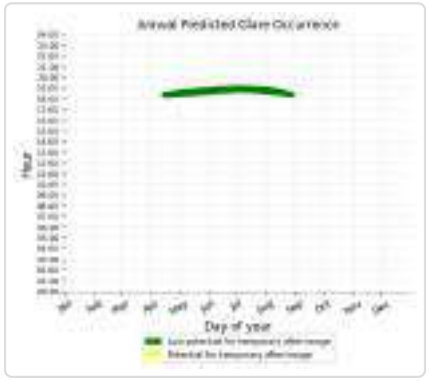

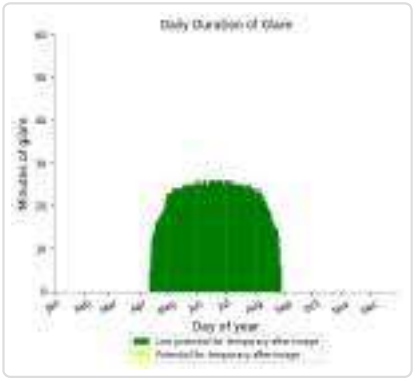

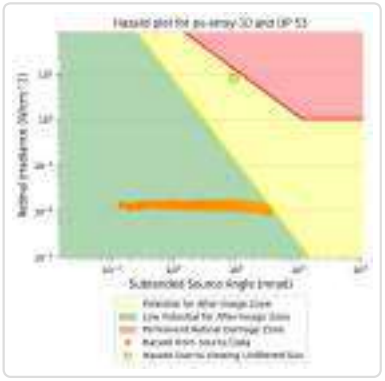

PV array 10: OP 53

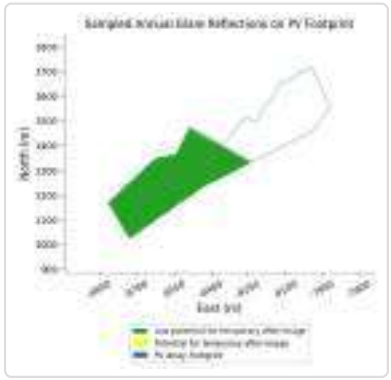

PV array is expected to produce the following glare for this receptor:

- 3,138 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

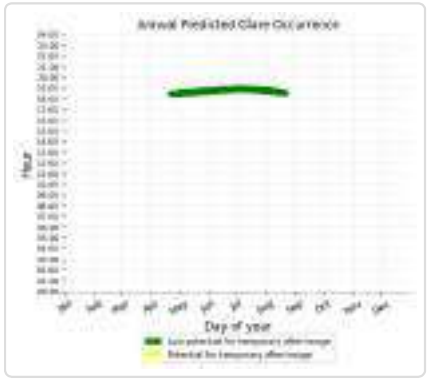

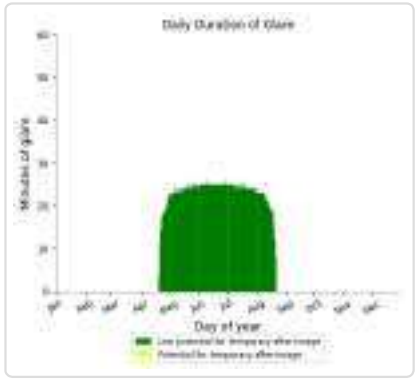

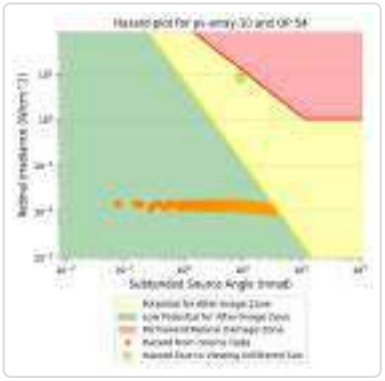

PV array 10: OP 54

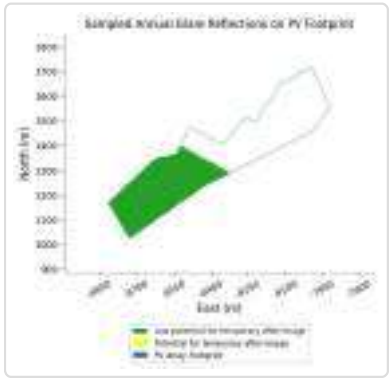

PV array is expected to produce the following glare for this receptor:

- 2,871 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

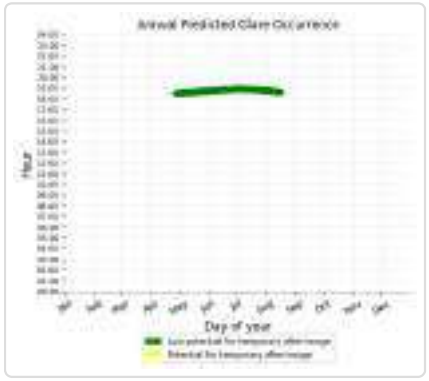

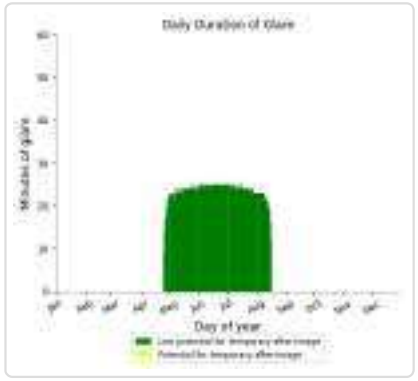

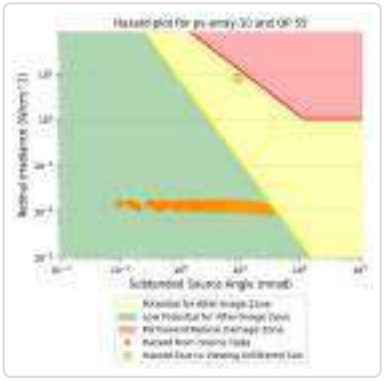

PV array 10: OP 55

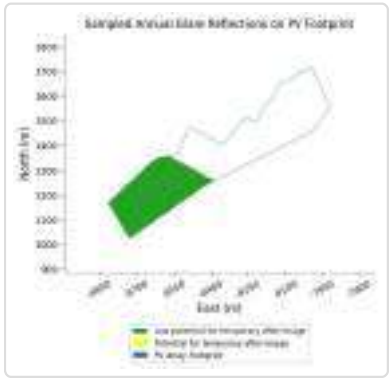

PV array is expected to produce the following glare for this receptor:

- 2,691 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

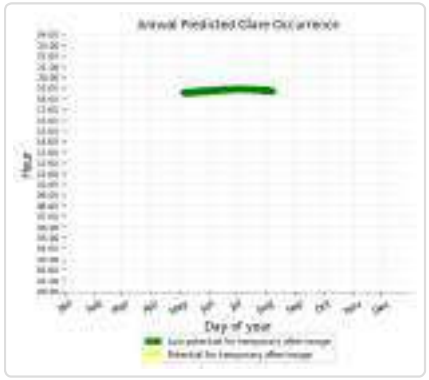

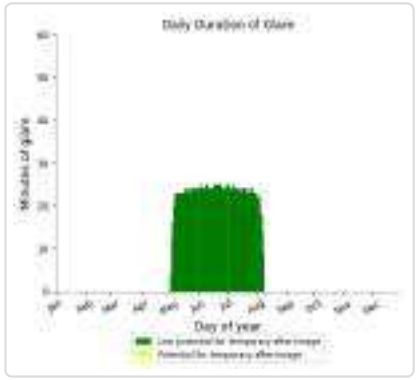

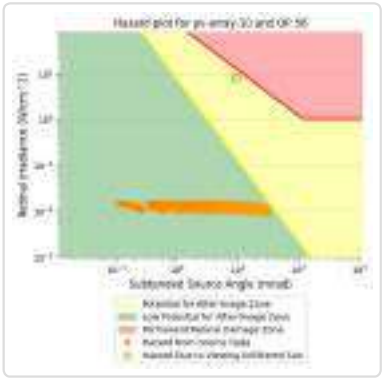

PV array 10: OP 56

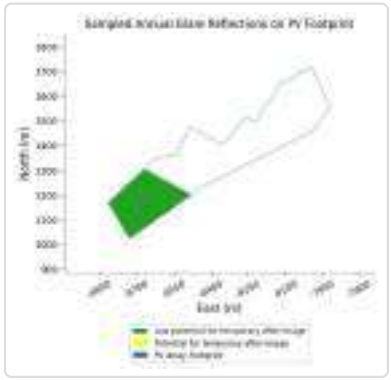

PV array is expected to produce the following glare for this receptor:

- 2,284 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

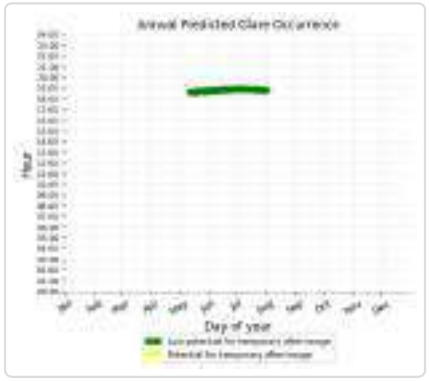

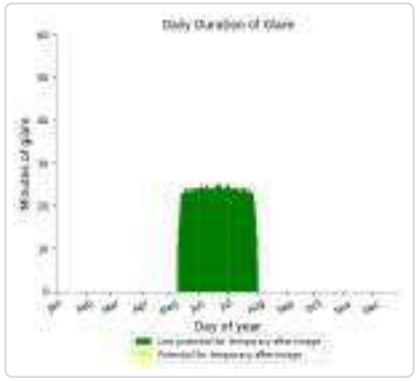

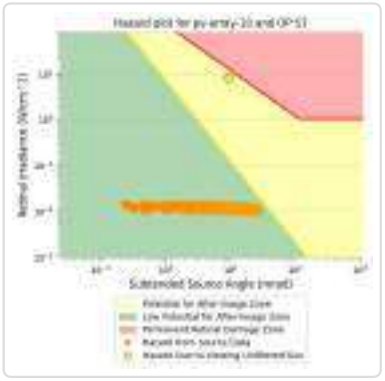

PV array 10: OP 57

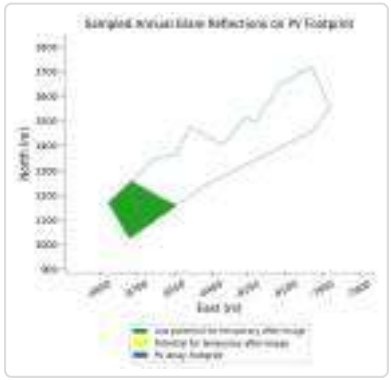

PV array is expected to produce the following glare for this receptor:

- 1,986 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

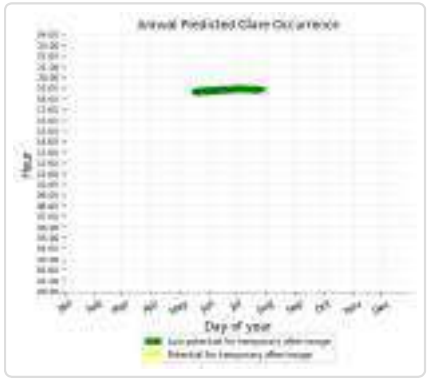

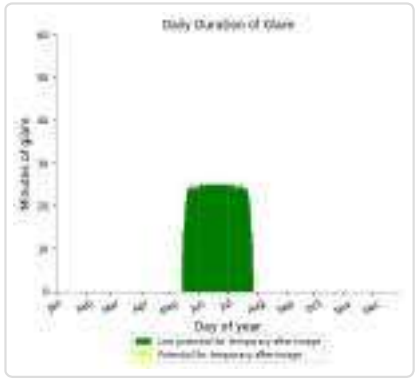

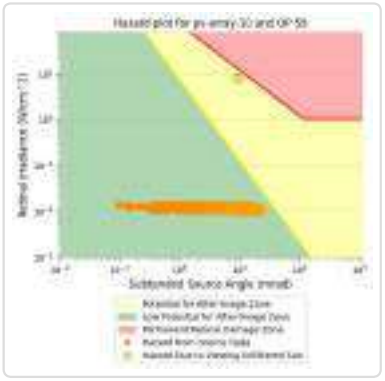

PV array 10: OP 58

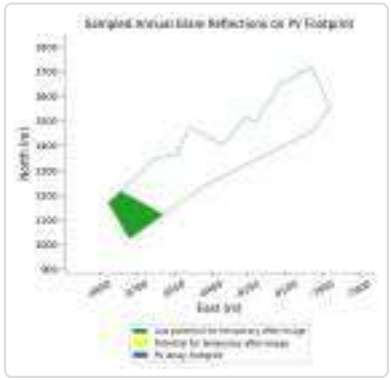

PV array is expected to produce the following glare for this receptor:

- 1,767 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

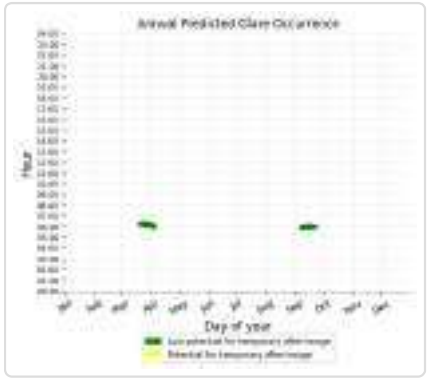

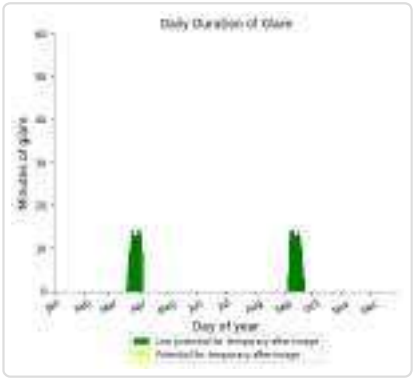

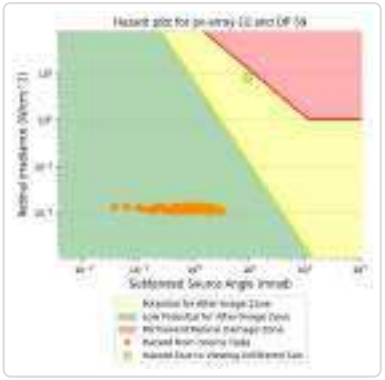

PV array 10: OP 59

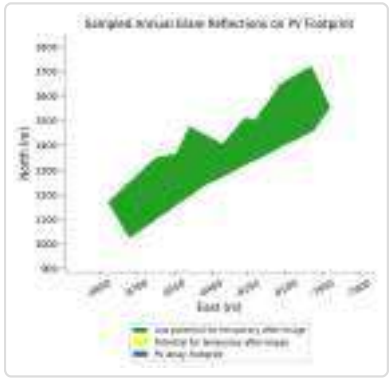

PV array is expected to produce the following glare for this receptor:

- 403 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array is expected to produce the following glare for this receptor:

- 250 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

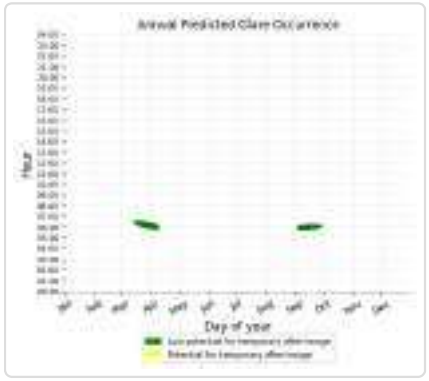

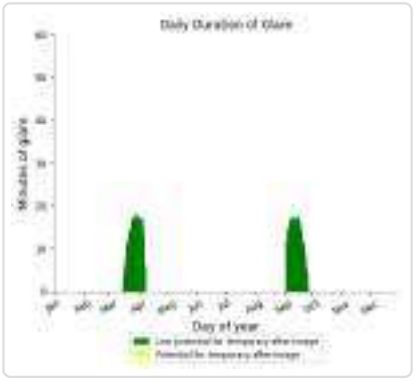

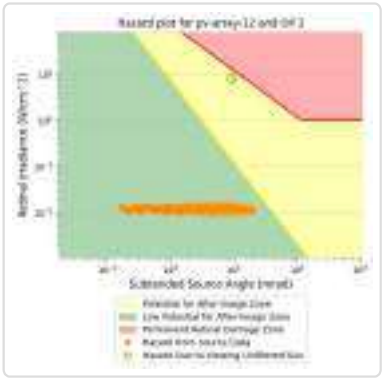

PV array 12: OP 2

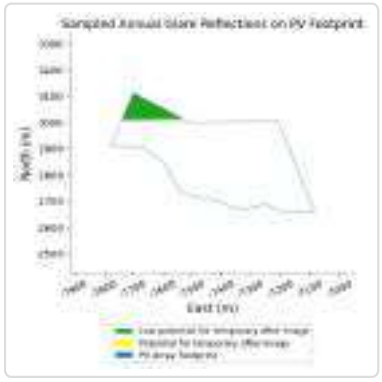

PV array is expected to produce the following glare for this receptor:

- 676 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

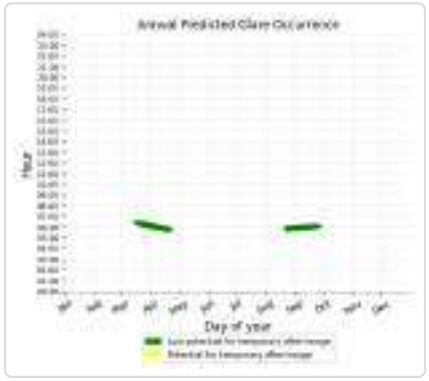

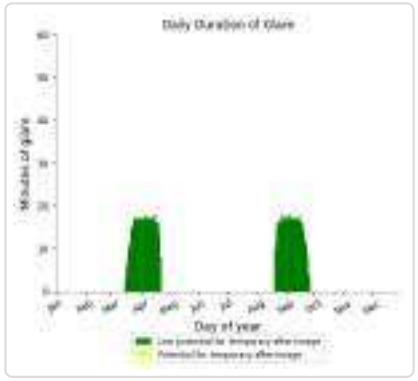

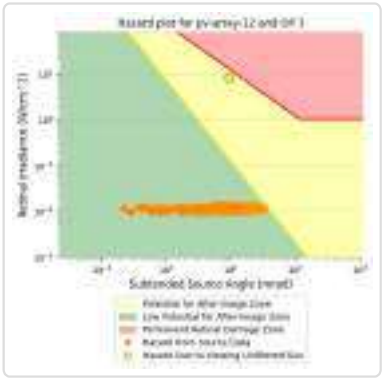

PV array 12: OP 3

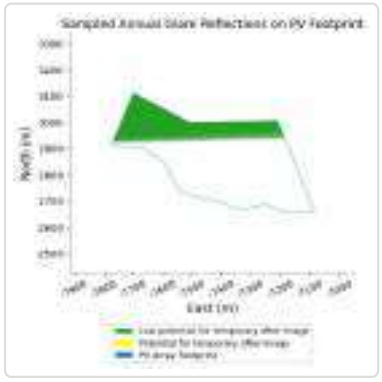

PV array is expected to produce the following glare for this receptor:

- 1,144 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

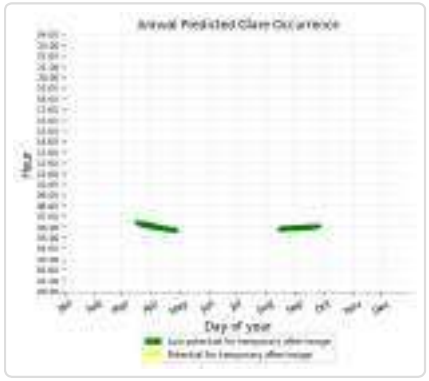

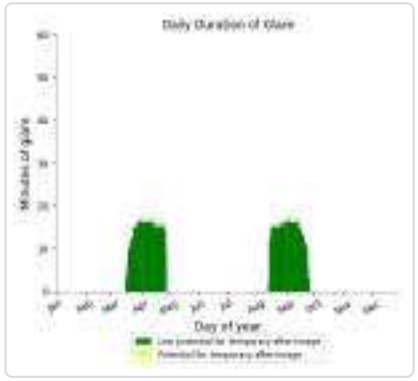

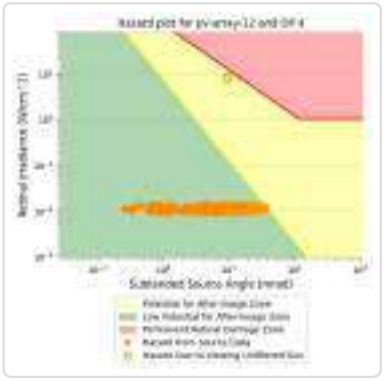

PV array 12: OP 4

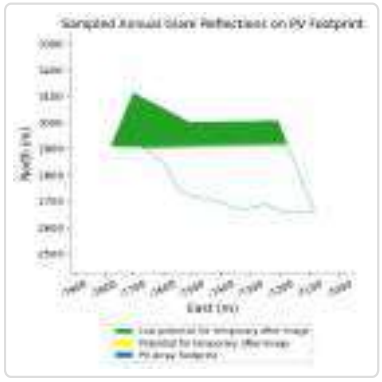

PV array is expected to produce the following glare for this receptor:

- 1,253 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

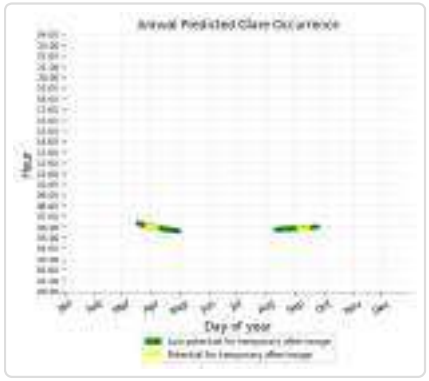

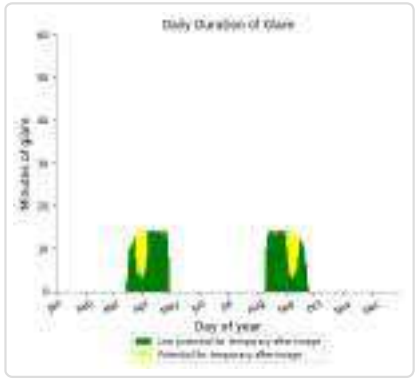

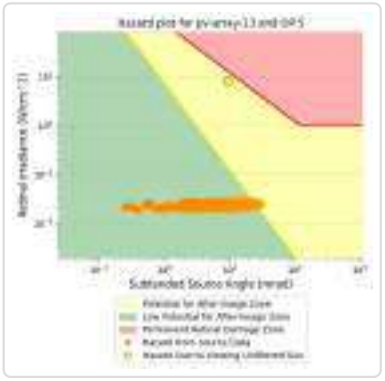

PV array 12: OP 5

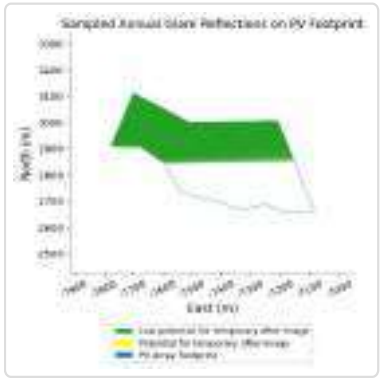

PV array is expected to produce the following glare for this receptor:

- 1,590 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

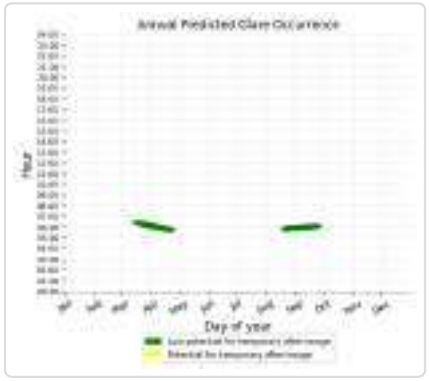

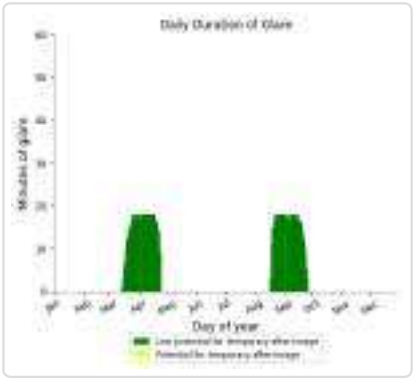

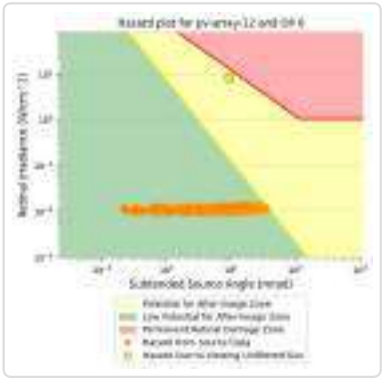

PV array 12: OP 6

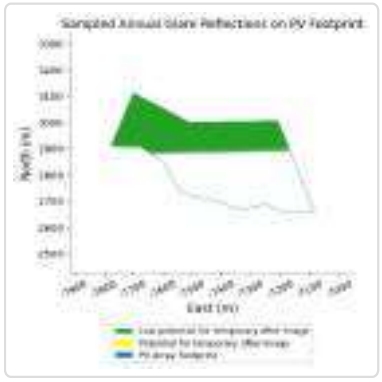

PV array is expected to produce the following glare for this receptor:

- 1,286 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

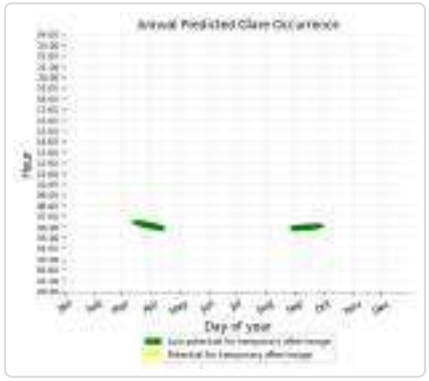

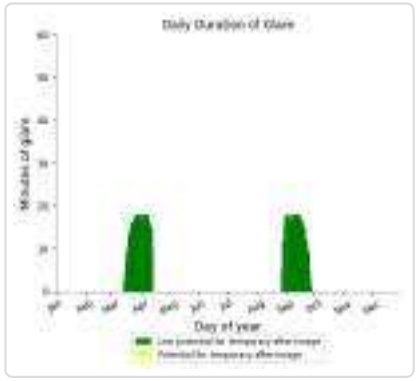

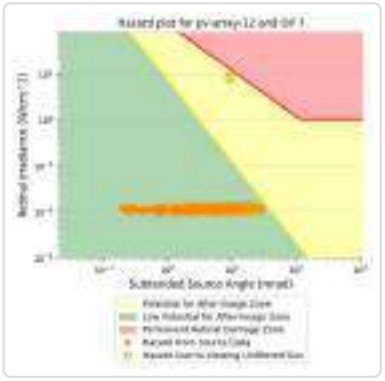

PV array 12: OP 7

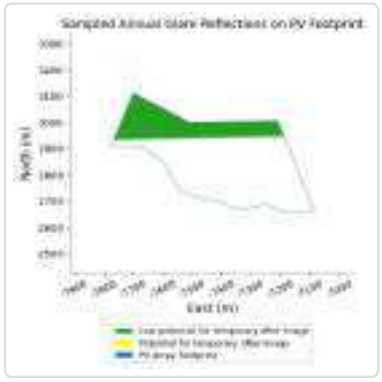

PV array is expected to produce the following glare for this receptor:

- 963 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

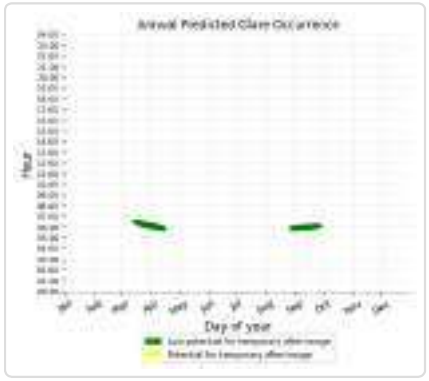

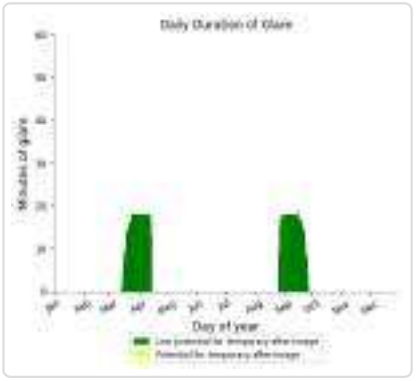

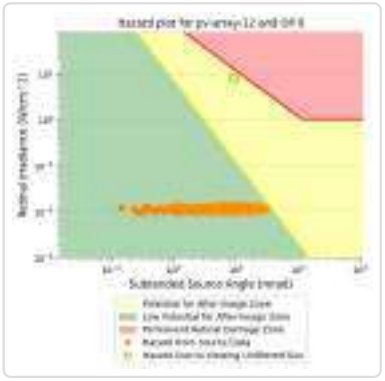

PV array 12: OP 8

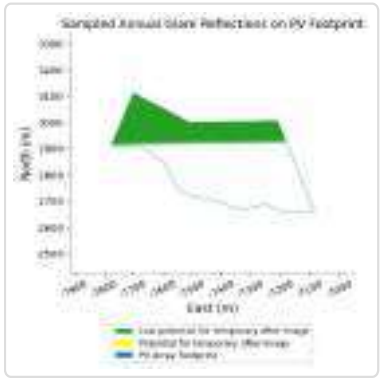

PV array is expected to produce the following glare for this receptor:

- 1,022 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

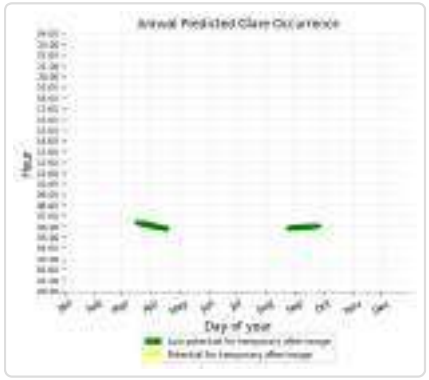

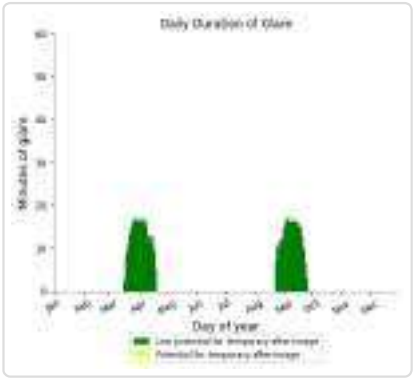

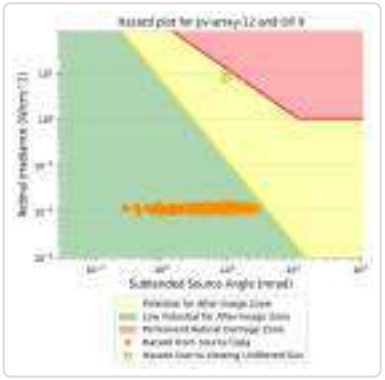

PV array 12: OP 9

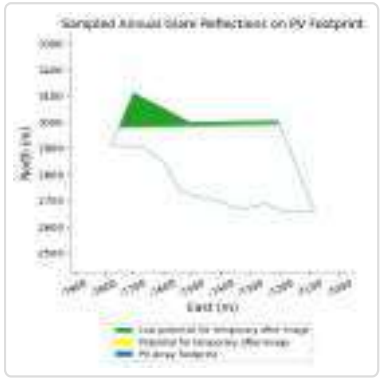

PV array is expected to produce the following glare for this receptor:

- 916 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 12: OP 10

PV array 12: OP 14

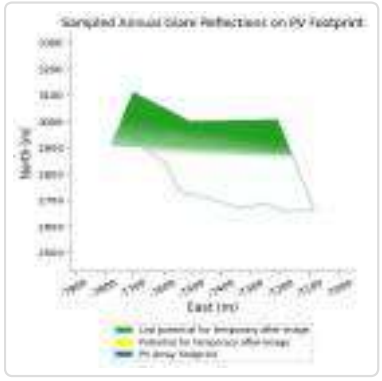

PV array is expected to produce the following glare for this receptor:

- 278 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

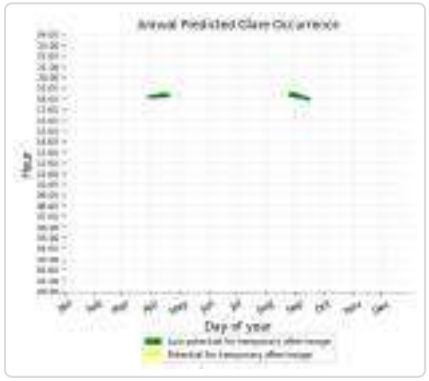

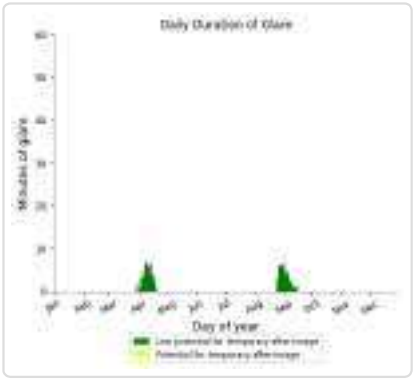

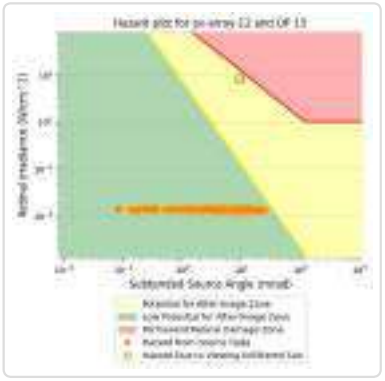

PV array 12: OP 15

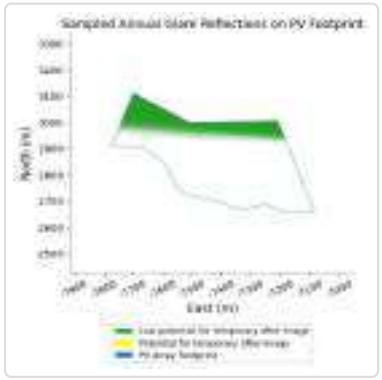

PV array is expected to produce the following glare for this receptor:

- 160 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

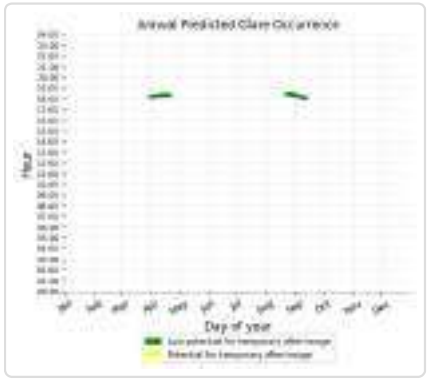

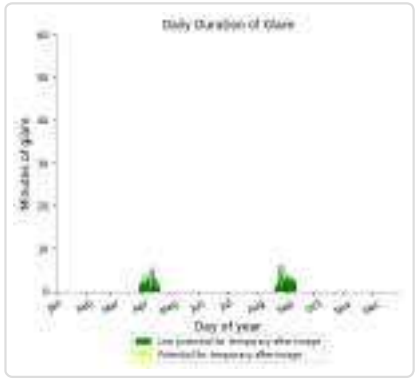

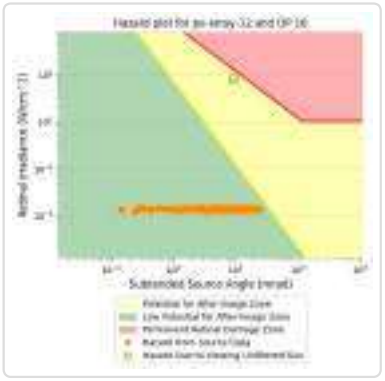

PV array 12: OP 16

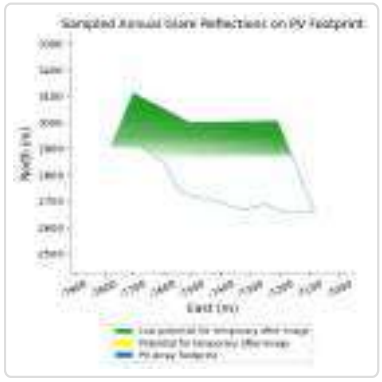

PV array is expected to produce the following glare for this receptor:

- 122 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

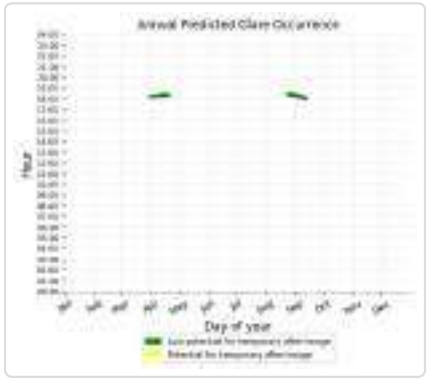

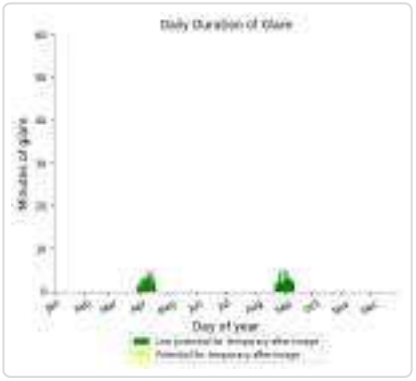

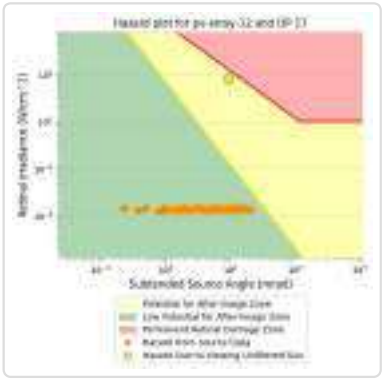

PV array 12: OP 17

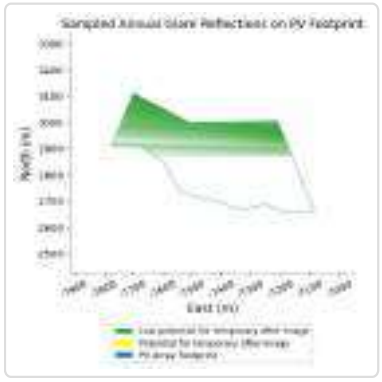

PV array is expected to produce the following glare for this receptor:

- 110 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

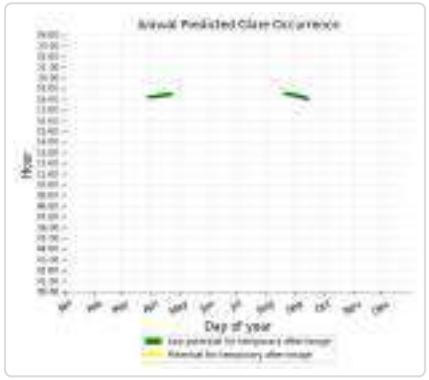

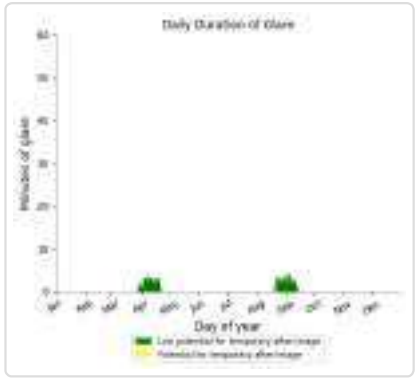

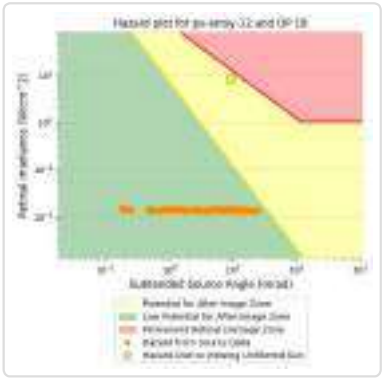

PV array 12: OP 18

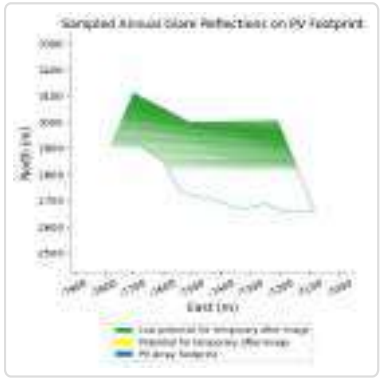

PV array is expected to produce the following glare for this receptor:

- 123 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 12: OP 19

No glare found

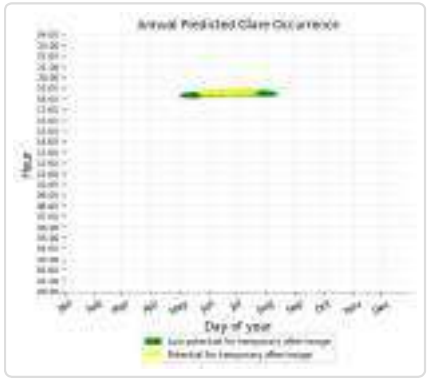

PV array 12: OP 20

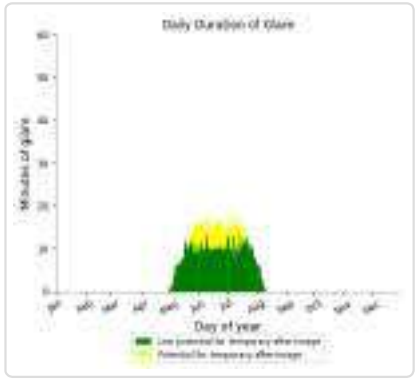

No glare found

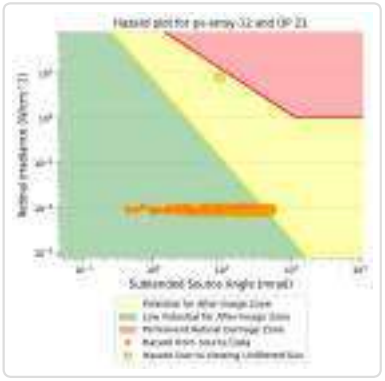

PV array 12: OP 21

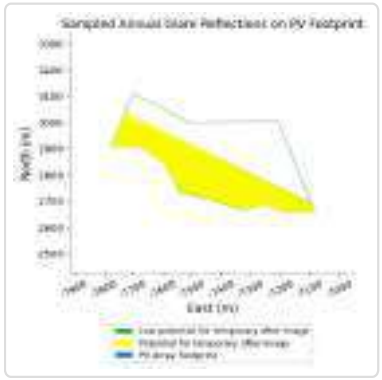

PV array is expected to produce the following glare for this receptor:

- 914 minutes of "green" glare with low potential to cause temporary after-image.
- 275 minutes of "yellow" glare with potential to cause temporary after-image.

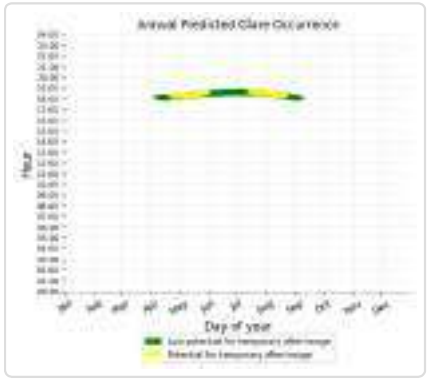

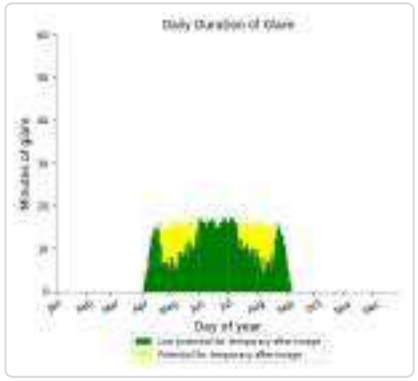

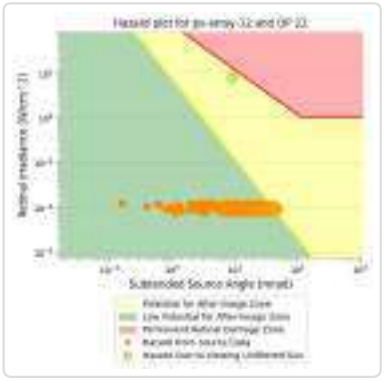

PV array 12: OP 22

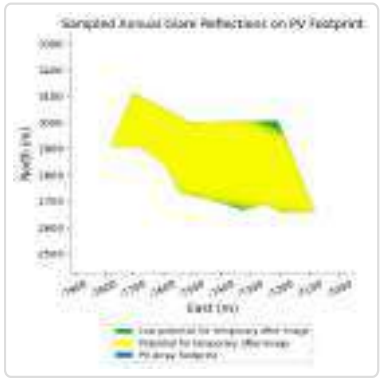

PV array is expected to produce the following glare for this receptor:

- 1,734 minutes of "green" glare with low potential to cause temporary after-image.
- 534 minutes of "yellow" glare with potential to cause temporary after-image.

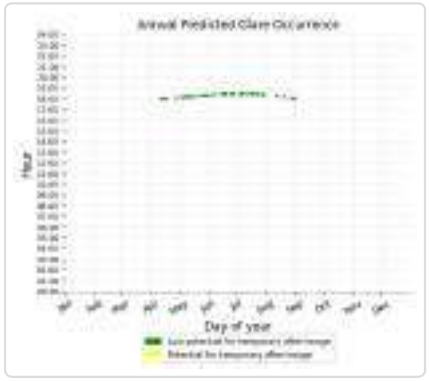

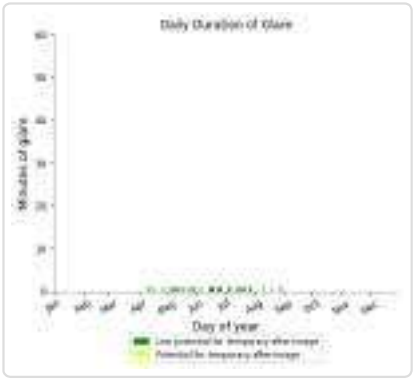

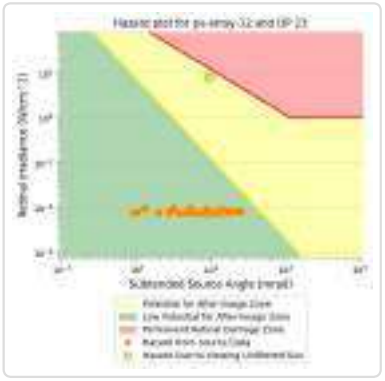

PV array 12: OP 23

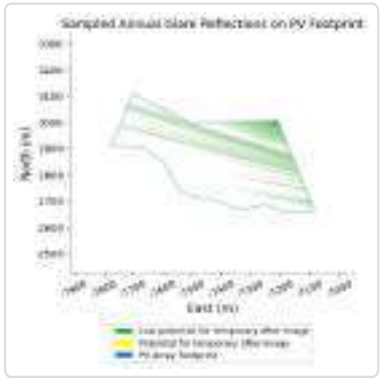

PV array is expected to produce the following glare for this receptor:

- 38 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

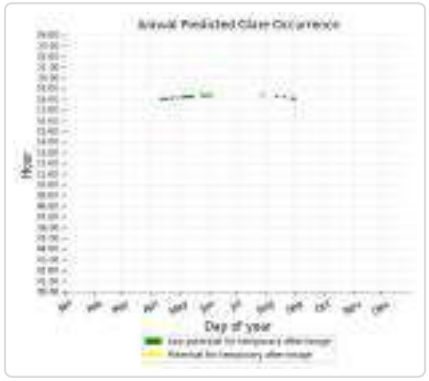

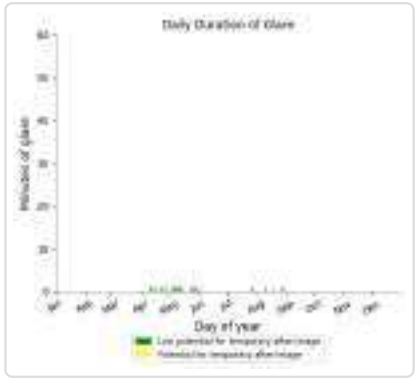

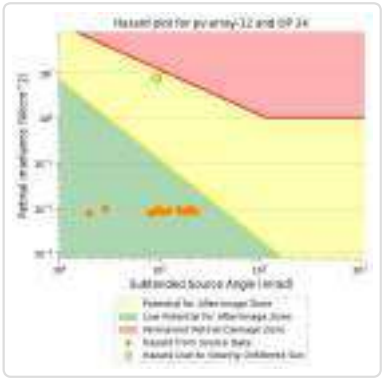

PV array 12: OP 24

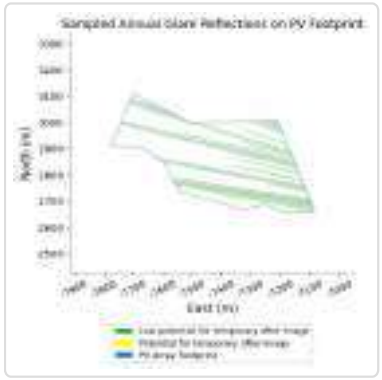

PV array is expected to produce the following glare for this receptor:

- 20 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

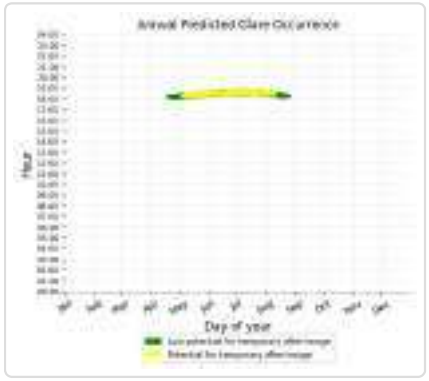

PV array 12: OP 25

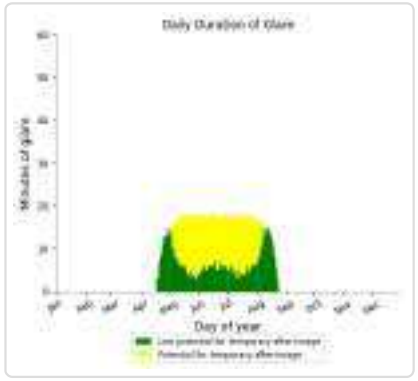

No glare found

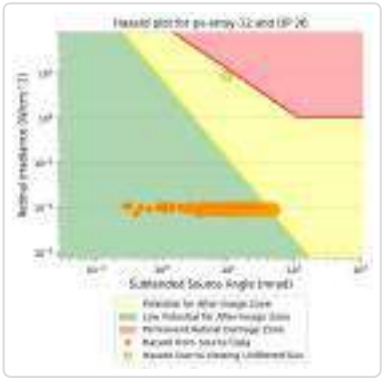

PV array 12: OP 26

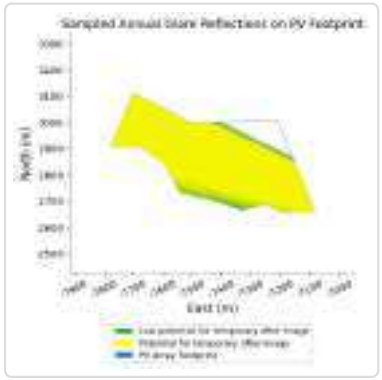

PV array is expected to produce the following glare for this receptor:

- 892 minutes of "green" glare with low potential to cause temporary after-image.
- 1,141 minutes of "yellow" glare with potential to cause temporary after-image.

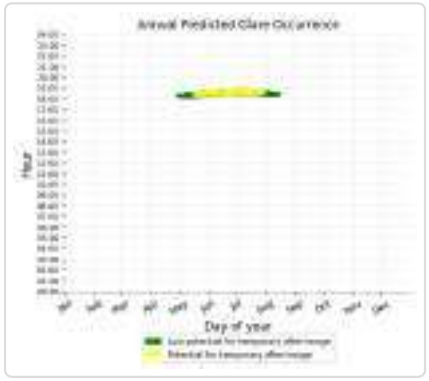

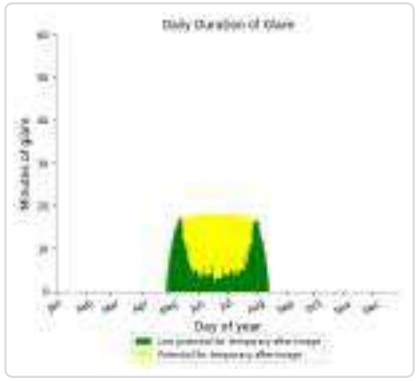

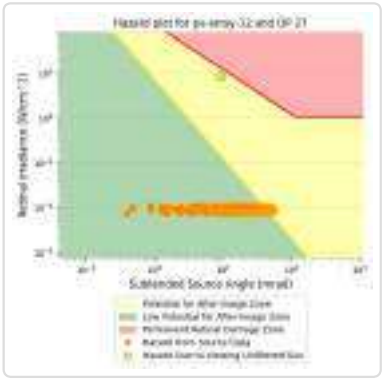

PV array 12: OP 27

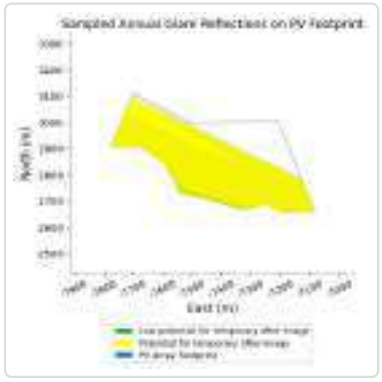

PV array is expected to produce the following glare for this receptor:

- 818 minutes of "green" glare with low potential to cause temporary after-image.
- 906 minutes of "yellow" glare with potential to cause temporary after-image.

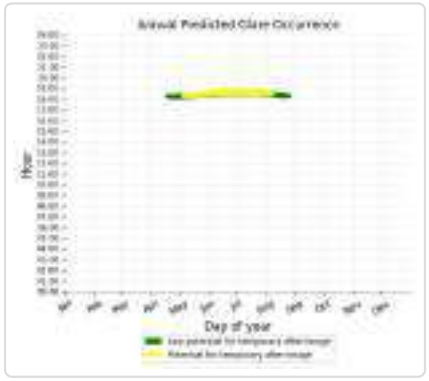

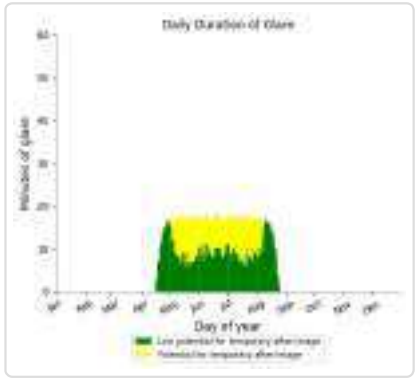

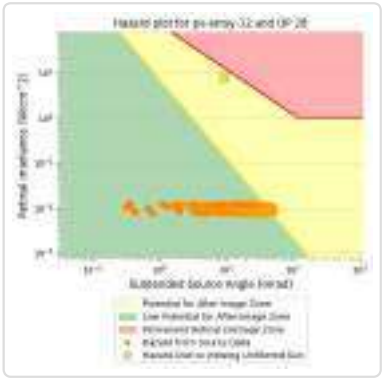

PV array 12: OP 28

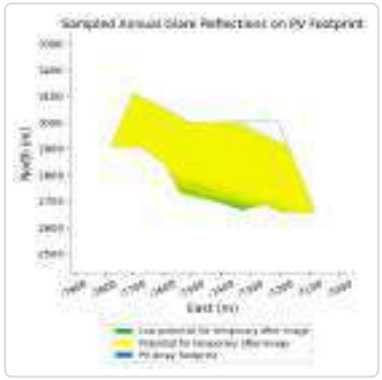

PV array is expected to produce the following glare for this receptor:

- 1,267 minutes of "green" glare with low potential to cause temporary after-image.
- 833 minutes of "yellow" glare with potential to cause temporary after-image.

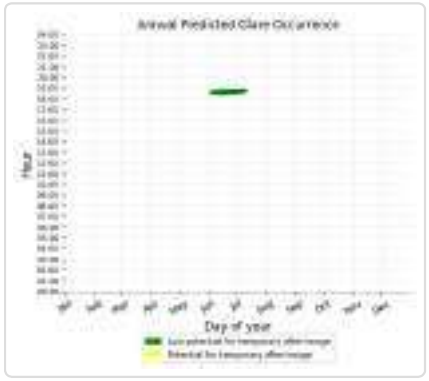

PV array 12: OP 29

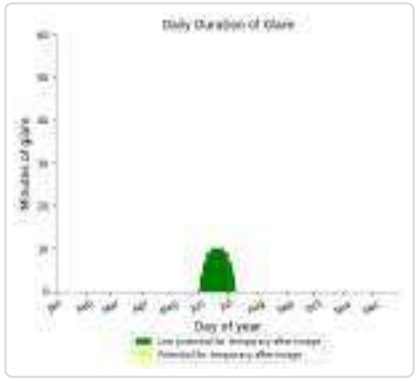

No glare found

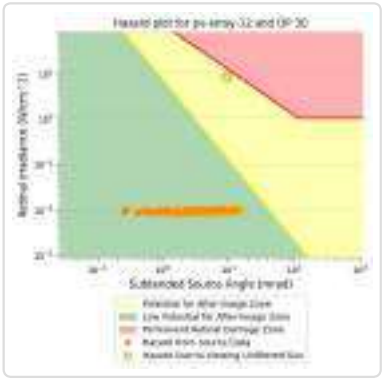

PV array 12: OP 30

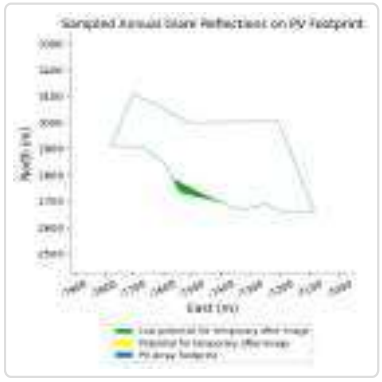

PV array is expected to produce the following glare for this receptor:

- 302 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

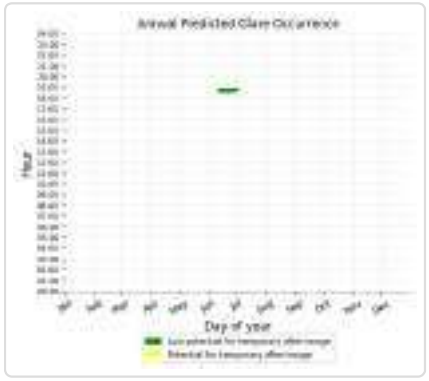

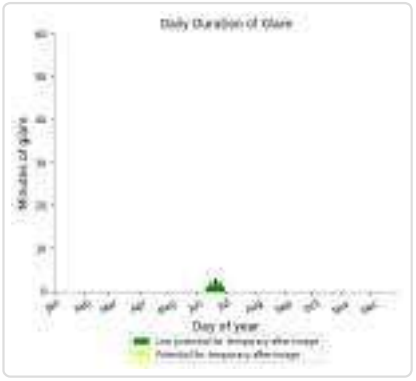

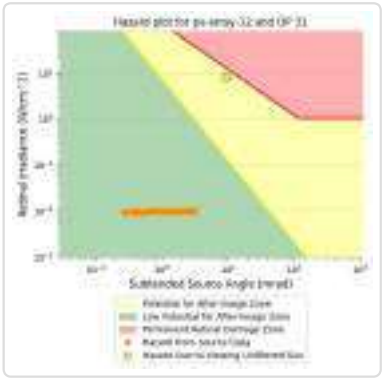

PV array 12: OP 31

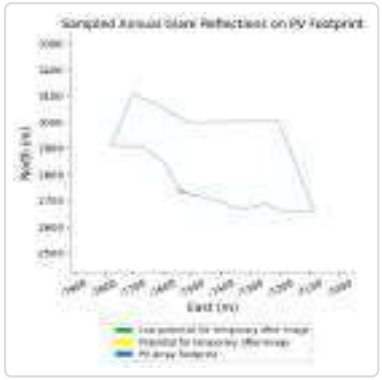

PV array is expected to produce the following glare for this receptor:

- 35 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 3: OP 51

No glare found

PV array 3: OP 52

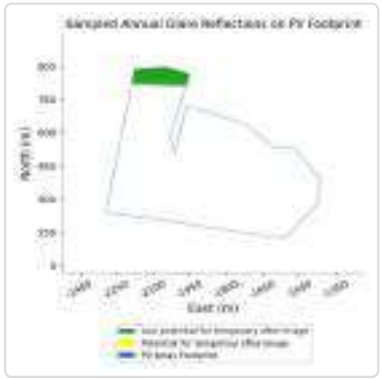

PV array is expected to produce the following glare for this receptor:

- 36 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

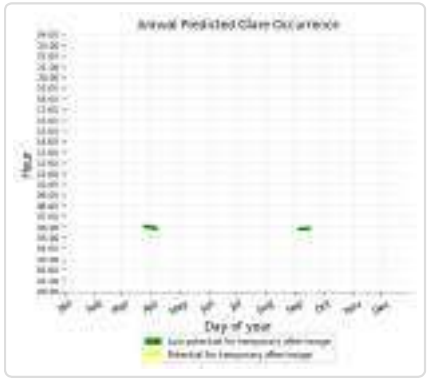

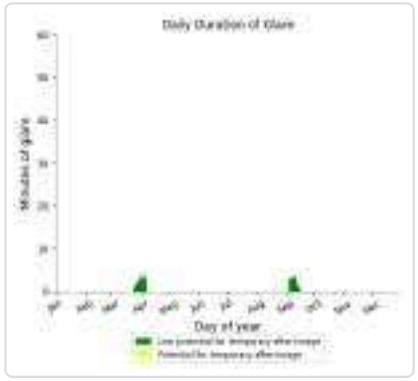

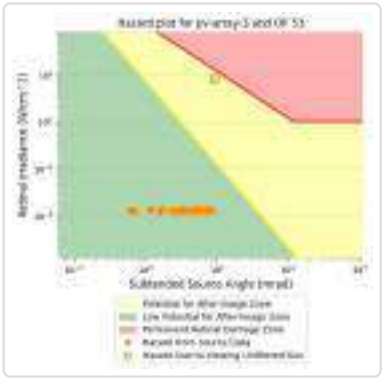

PV array 3: OP 53

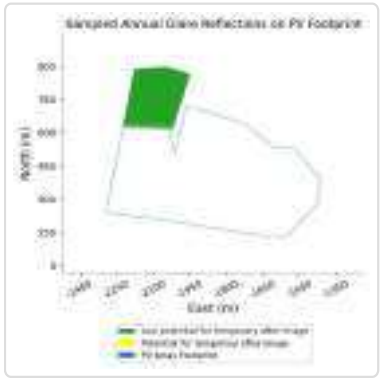

PV array is expected to produce the following glare for this receptor:

- 65 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

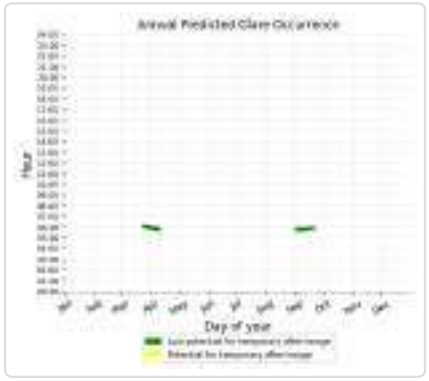

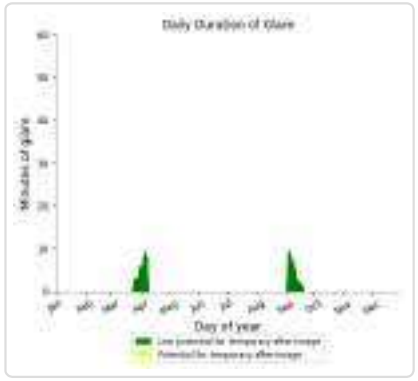

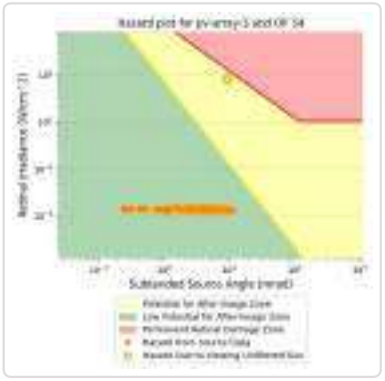

PV array 3: OP 54

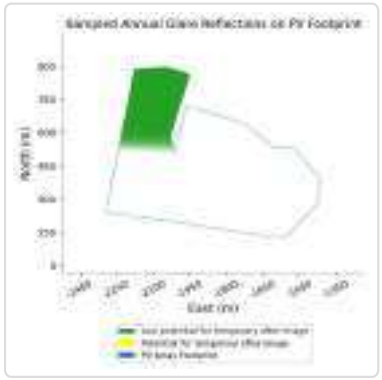

PV array is expected to produce the following glare for this receptor:

- 189 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

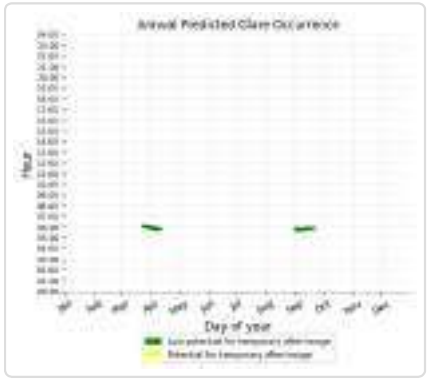

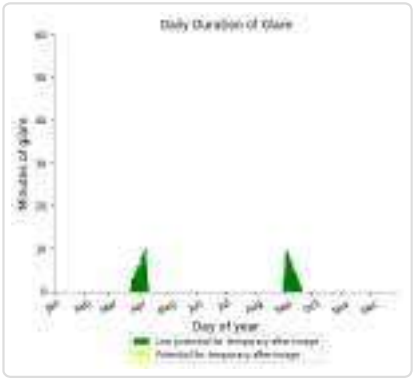

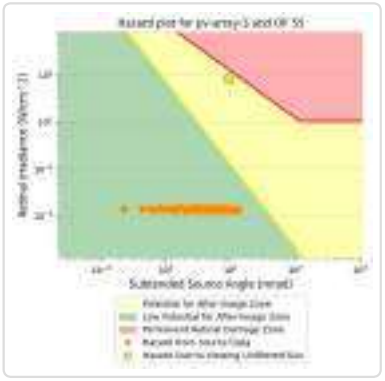

PV array 3: OP 55

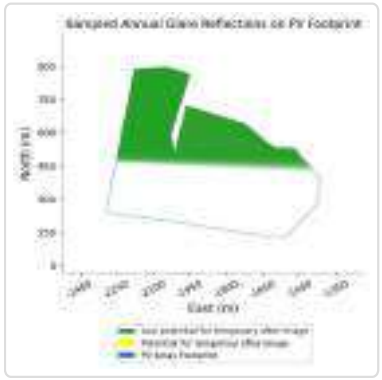

PV array is expected to produce the following glare for this receptor:

- 216 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

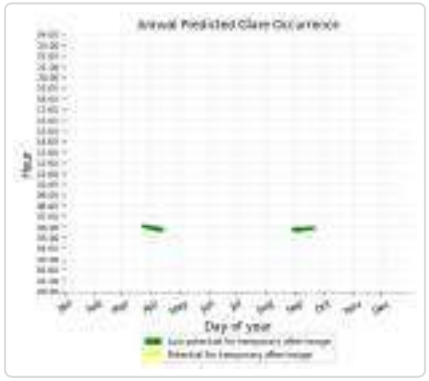

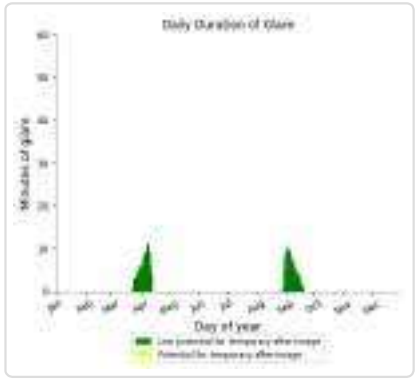

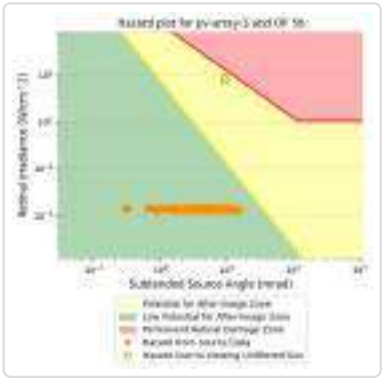

PV array 3: OP 56

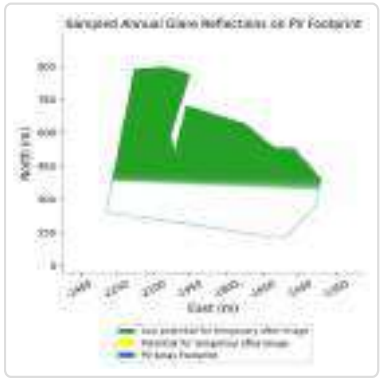

PV array is expected to produce the following glare for this receptor:

- 275 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

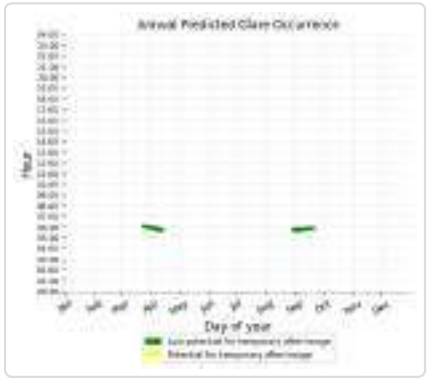

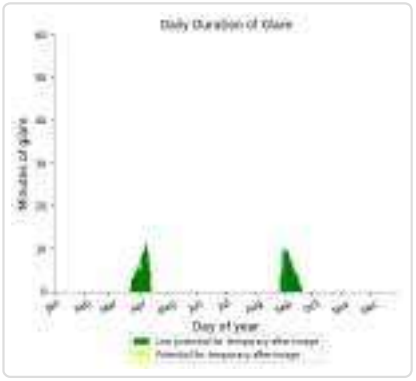

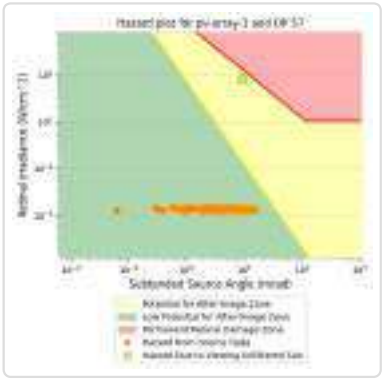

PV array 3: OP 57

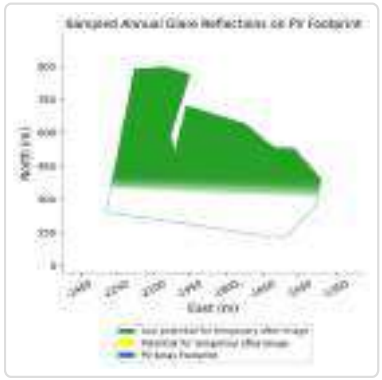

PV array is expected to produce the following glare for this receptor:

- 277 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

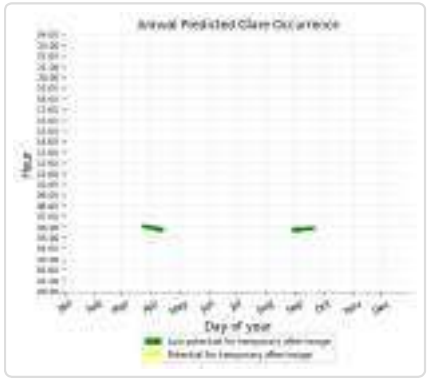

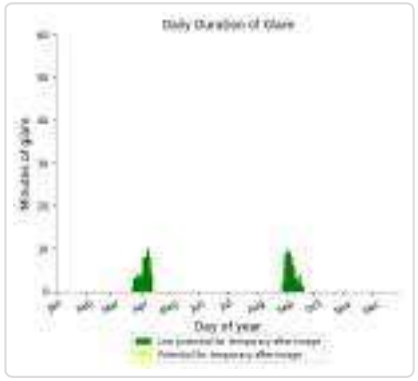

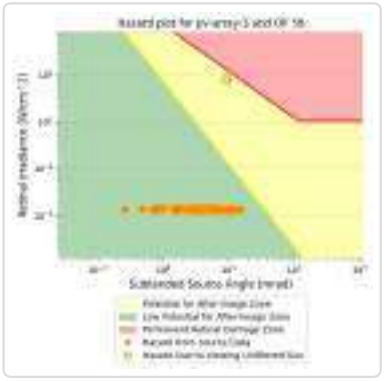

PV array 3: OP 58

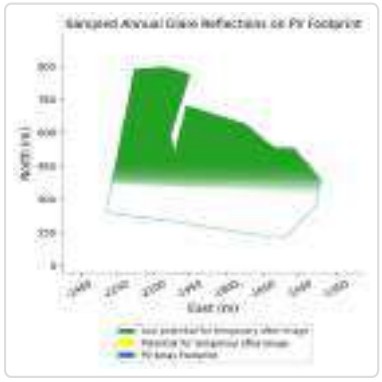

PV array is expected to produce the following glare for this receptor:

- 244 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

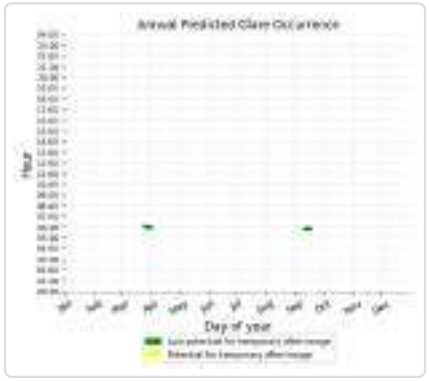

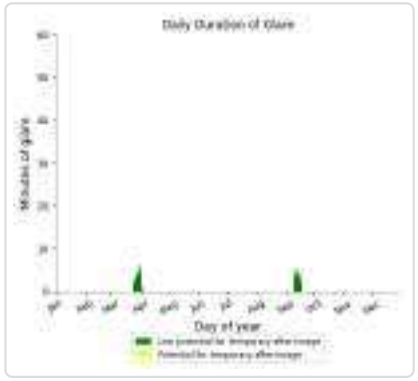

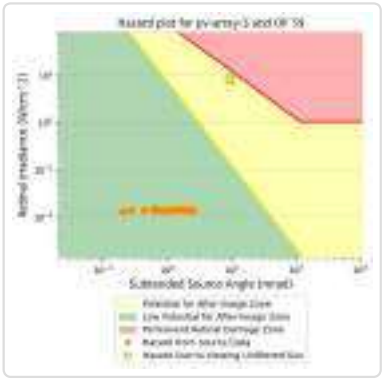

PV array 3: OP 59

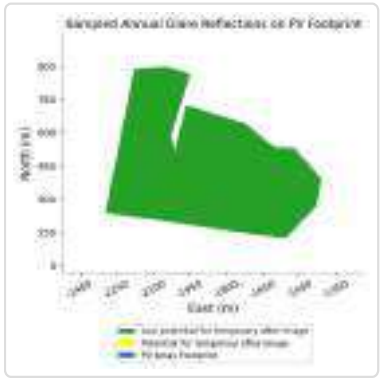

PV array is expected to produce the following glare for this receptor:

- 64 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

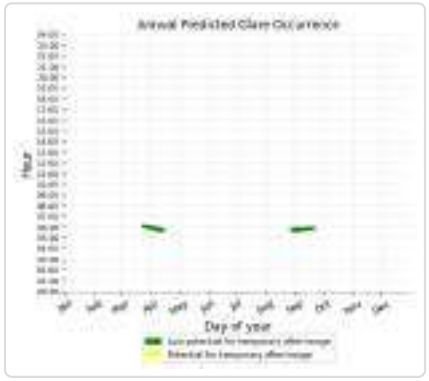

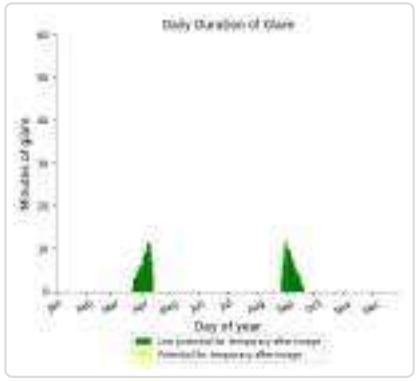

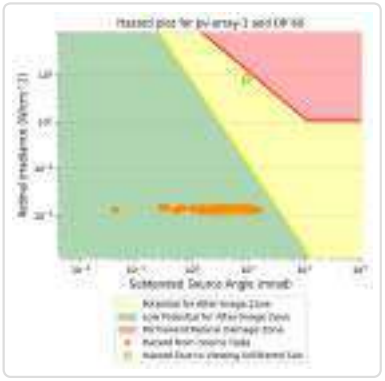

PV array 3: OP 60

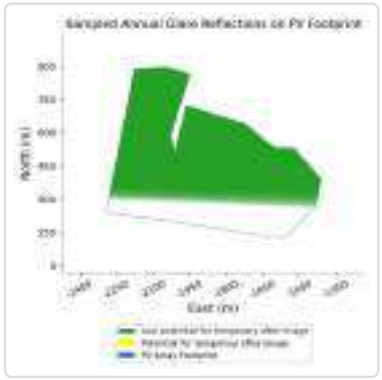

PV array is expected to produce the following glare for this receptor:

- 305 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

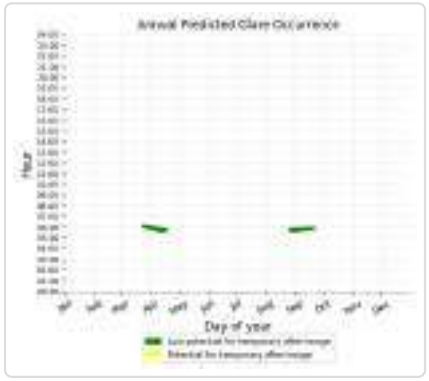

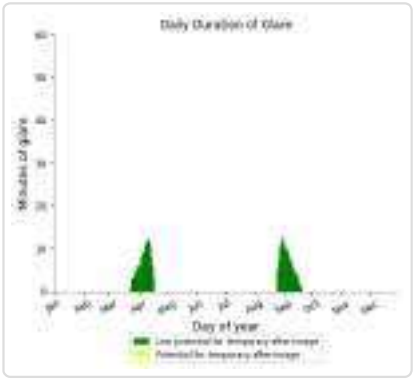

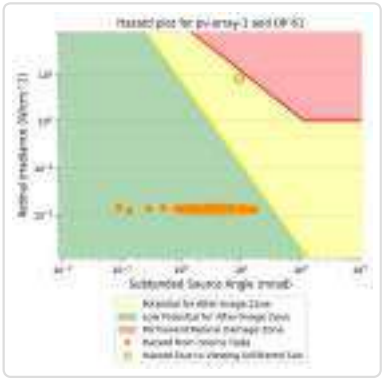

PV array 3: OP 61

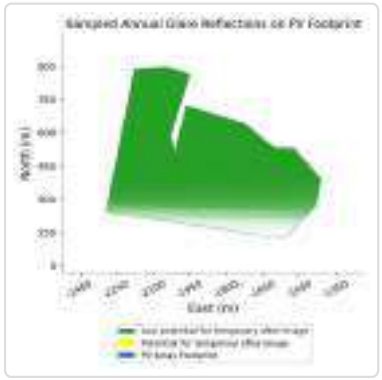

PV array is expected to produce the following glare for this receptor:

- 368 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

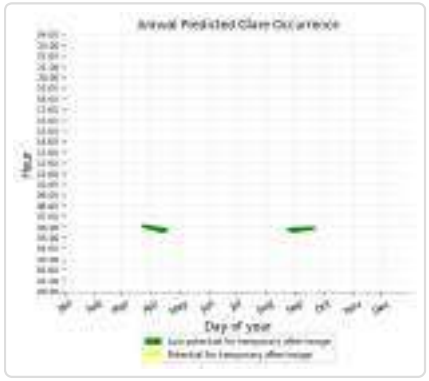

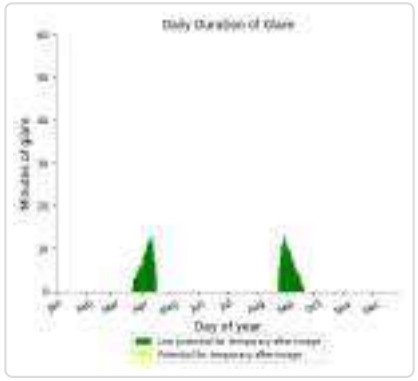

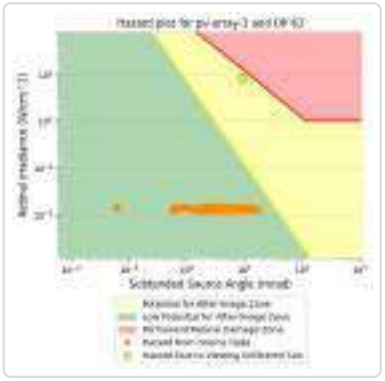

PV array 3: OP 62

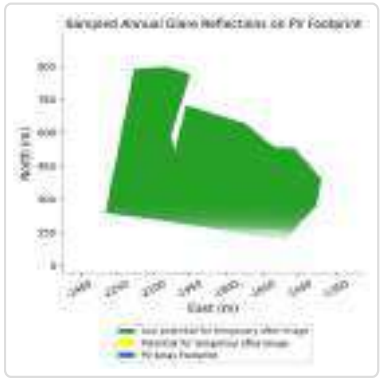

PV array is expected to produce the following glare for this receptor:

- 379 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

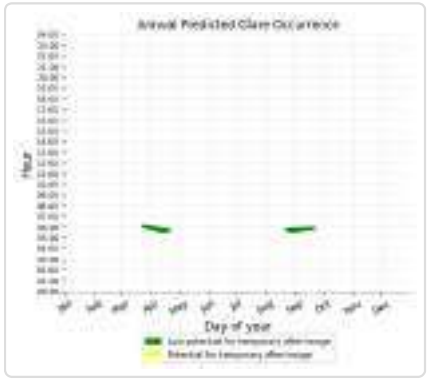

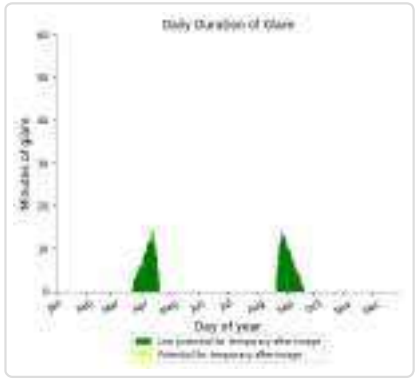

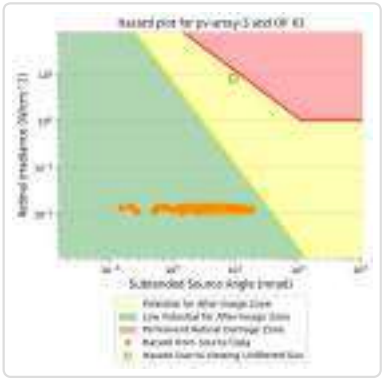

PV array 3: OP 63

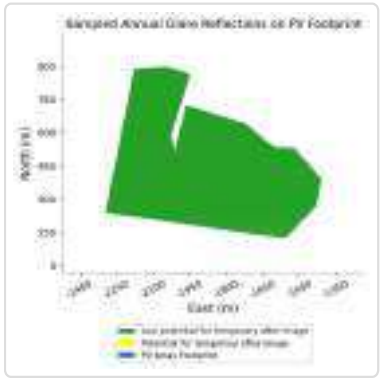

PV array is expected to produce the following glare for this receptor:

- 439 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

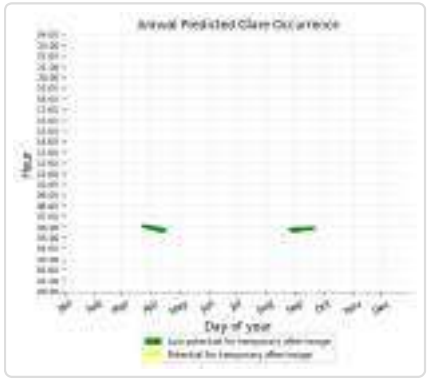

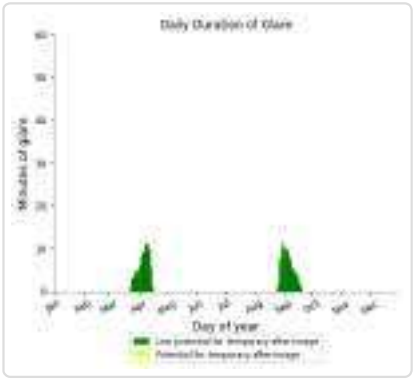

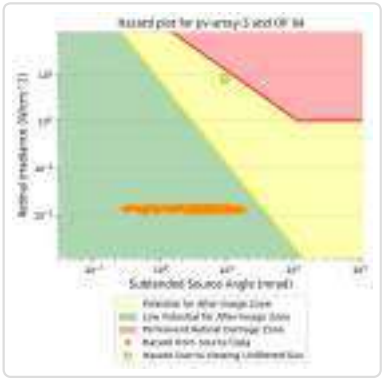

PV array 3: OP 64

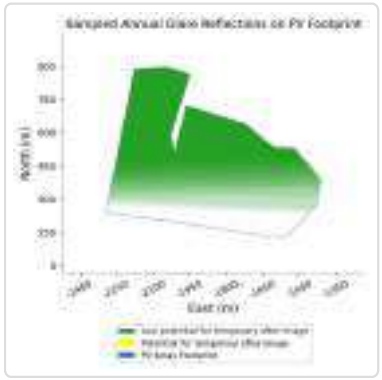

PV array is expected to produce the following glare for this receptor:

- 320 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

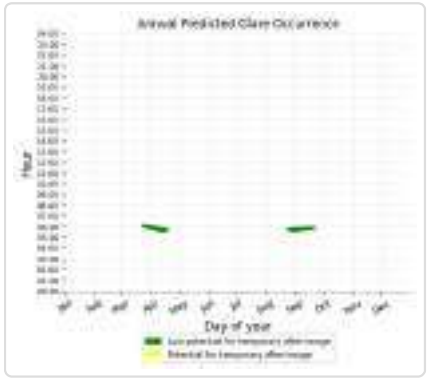

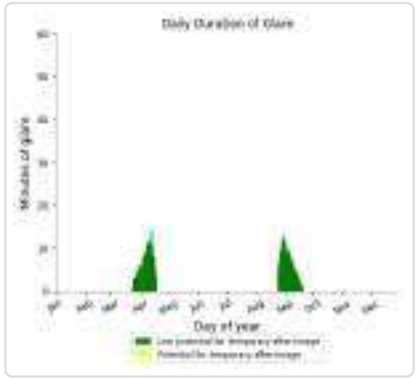

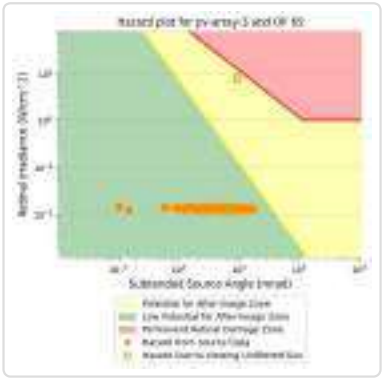

PV array 3: OP 65

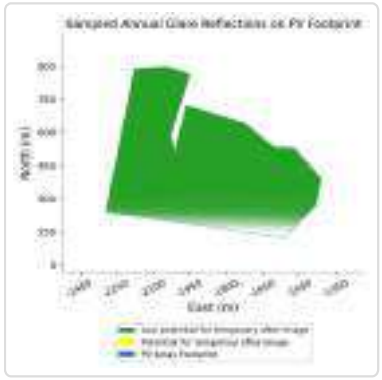

PV array is expected to produce the following glare for this receptor:

- 385 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 4: OP 47

No glare found

PV array 4: OP 48

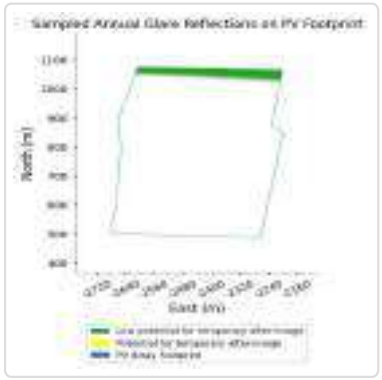

PV array is expected to produce the following glare for this receptor:

- 38 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

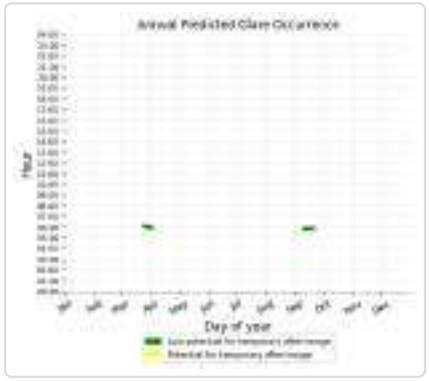

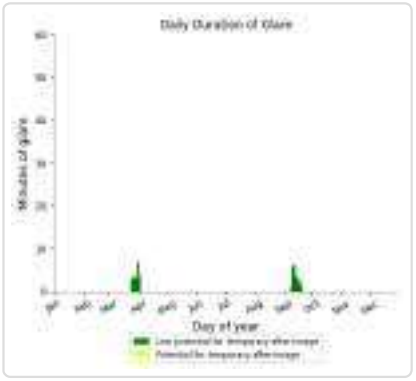

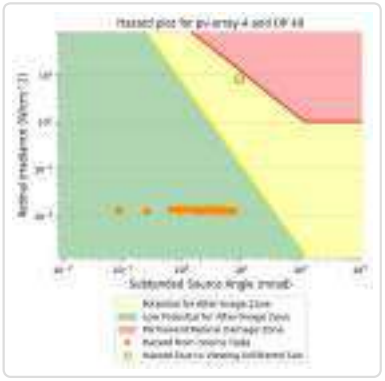

PV array 4: OP 49

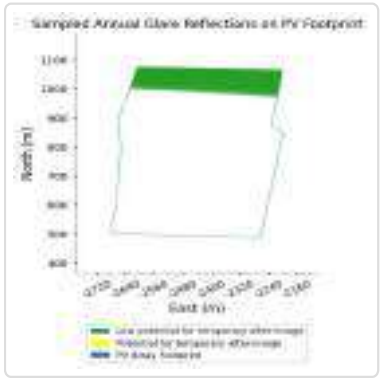

PV array is expected to produce the following glare for this receptor:

- 83 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

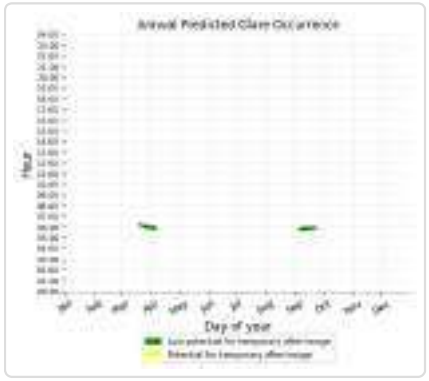

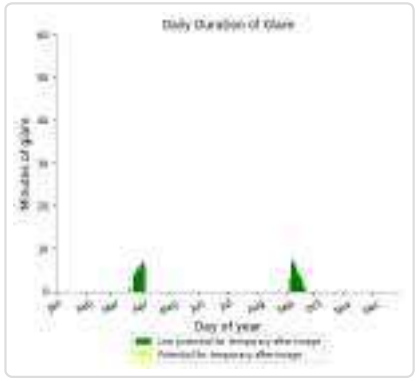

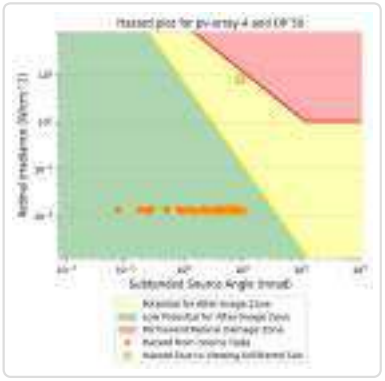

PV array 4: OP 50

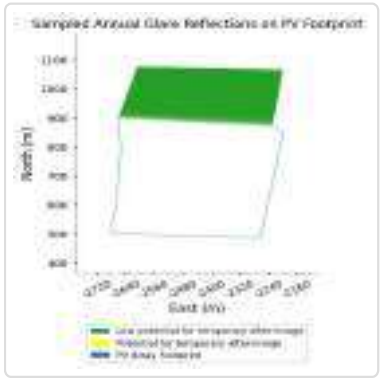

PV array is expected to produce the following glare for this receptor:

- 141 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

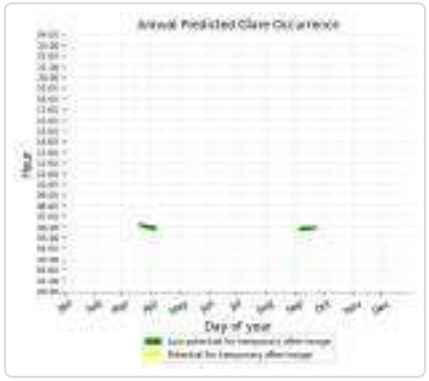

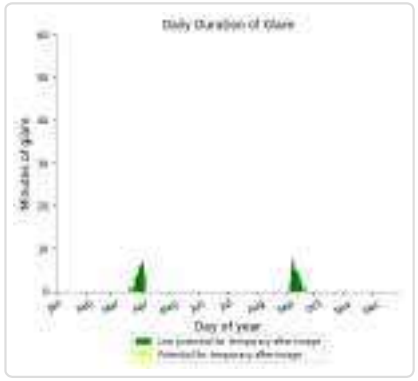

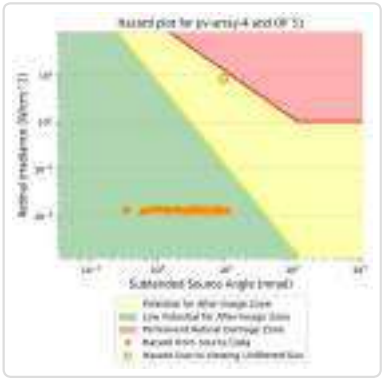

PV array 4: OP 51

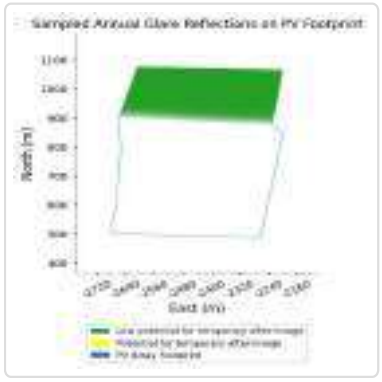

PV array is expected to produce the following glare for this receptor:

- 122 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

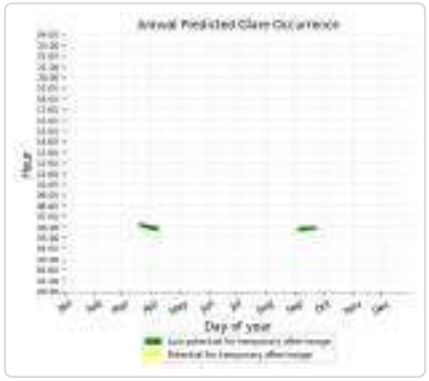

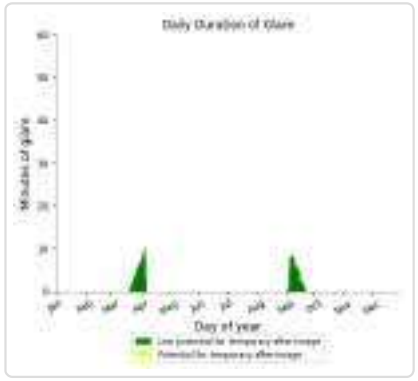

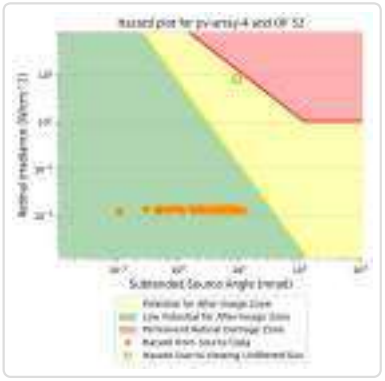

PV array 4: OP 52

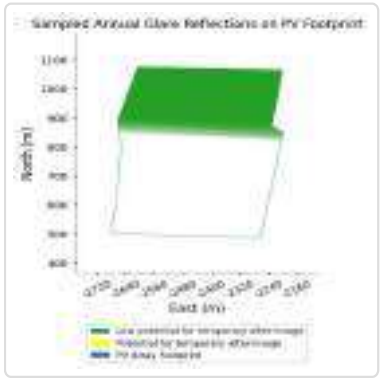

PV array is expected to produce the following glare for this receptor:

- 184 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

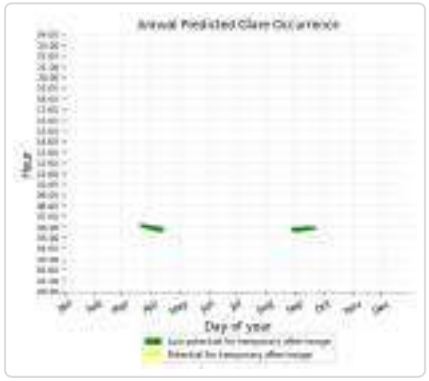

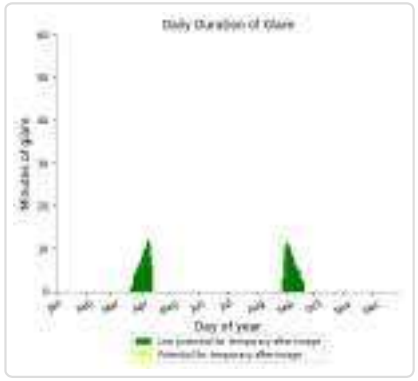

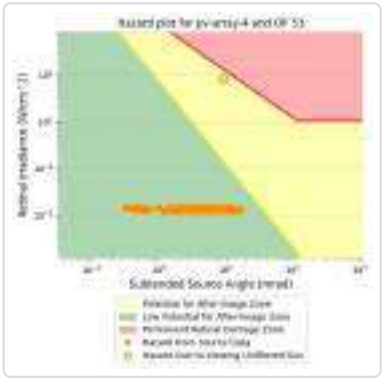

PV array 4: OP 53

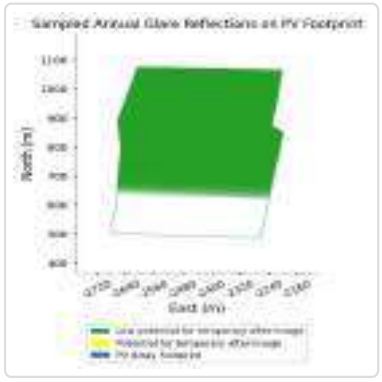

PV array is expected to produce the following glare for this receptor:

- 329 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

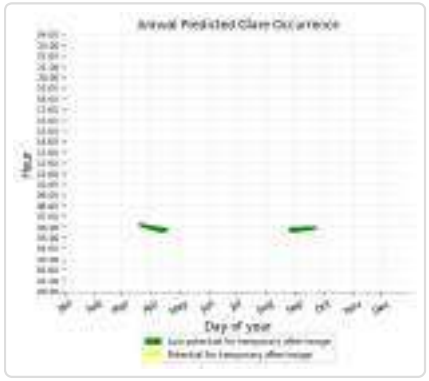

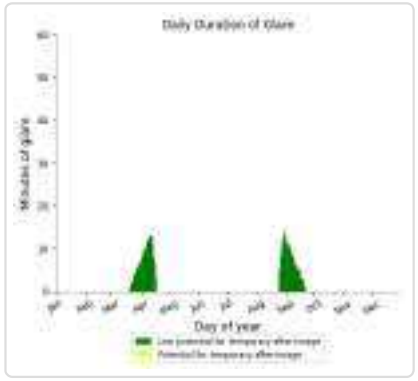

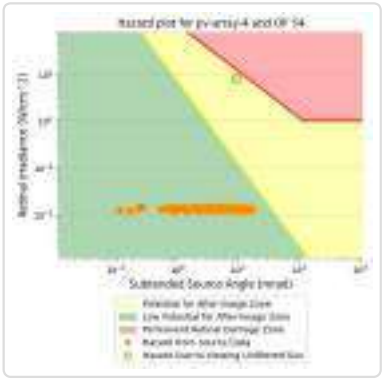

PV array 4: OP 54

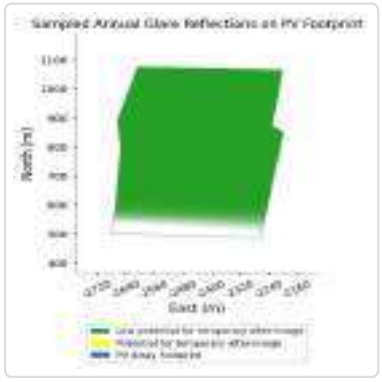

PV array is expected to produce the following glare for this receptor:

- 423 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

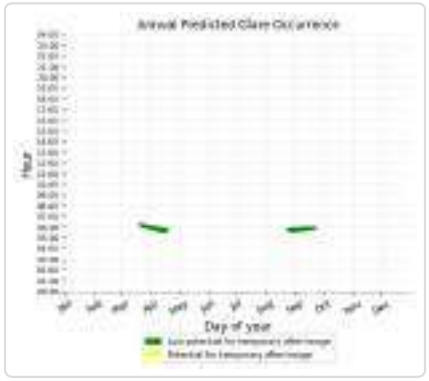

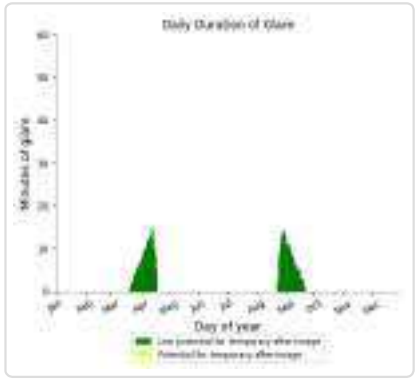

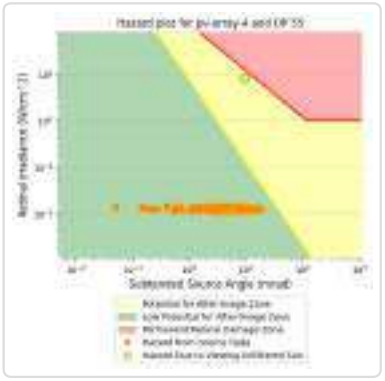

PV array 4: OP 55

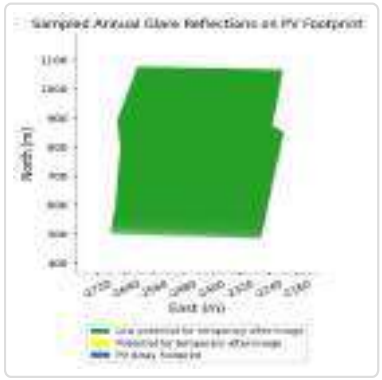

PV array is expected to produce the following glare for this receptor:

- 466 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

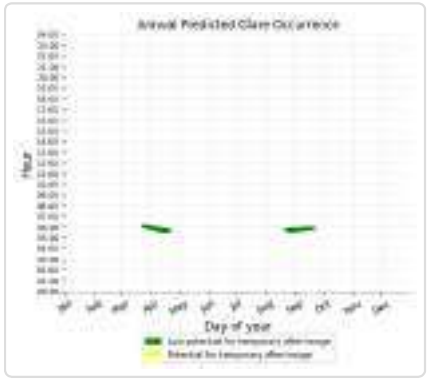

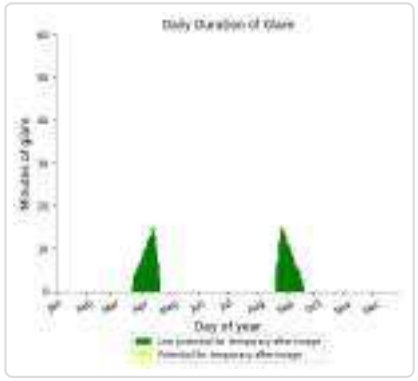

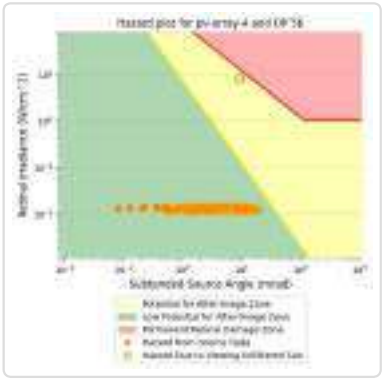

PV array 4: OP 56

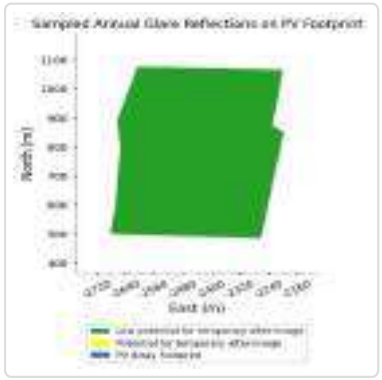

PV array is expected to produce the following glare for this receptor:

- 516 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

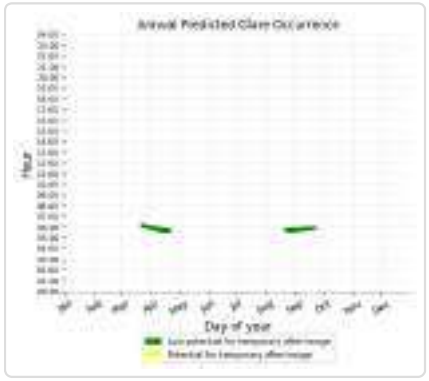

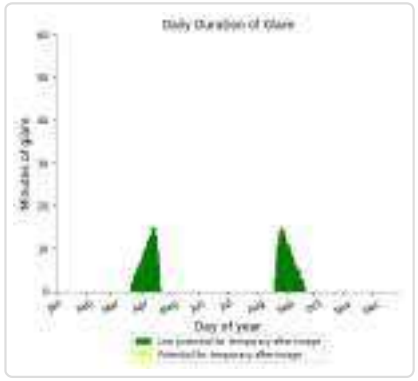

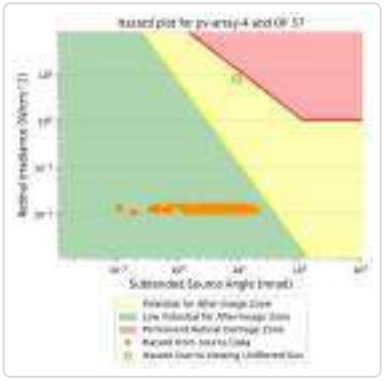

PV array 4: OP 57

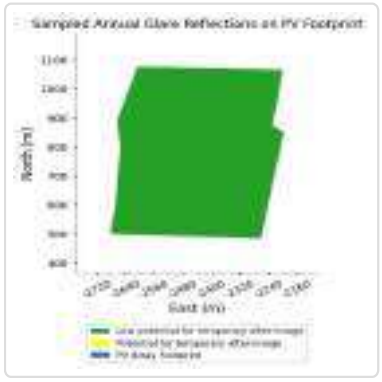

PV array is expected to produce the following glare for this receptor:

- 557 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

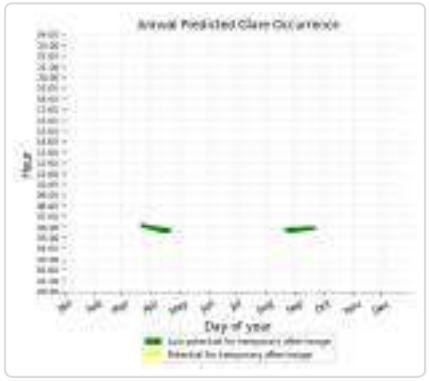

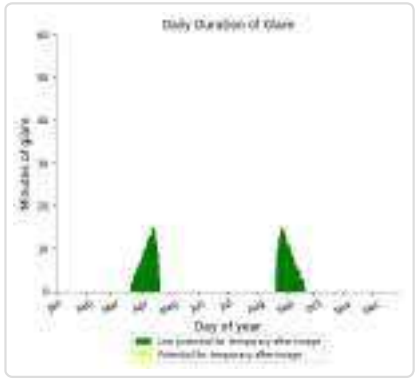

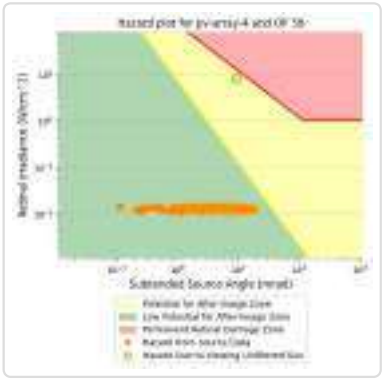

PV array 4: OP 58

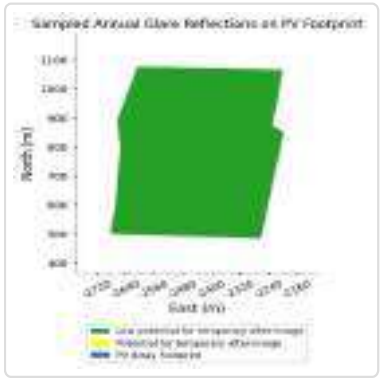

PV array is expected to produce the following glare for this receptor:

- 535 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

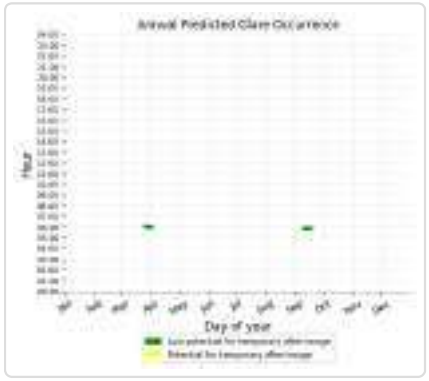

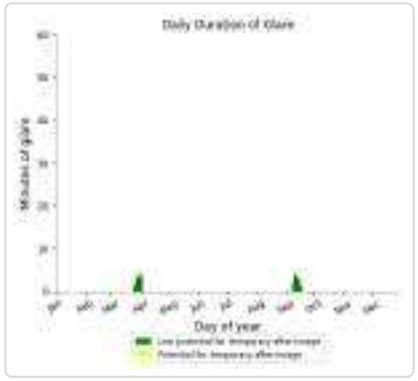

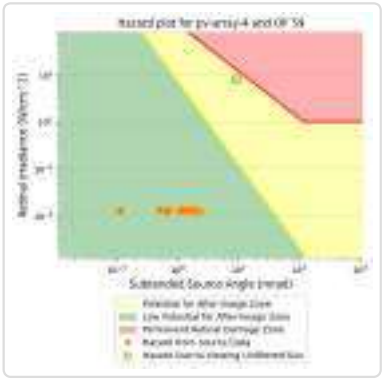

PV array 4: OP 59

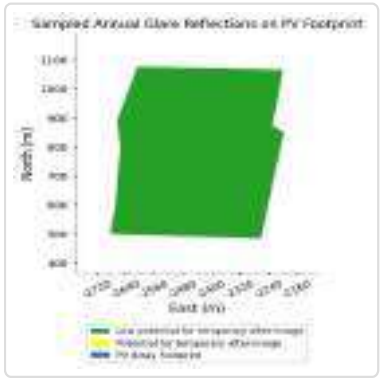

PV array is expected to produce the following glare for this receptor:

- 55 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

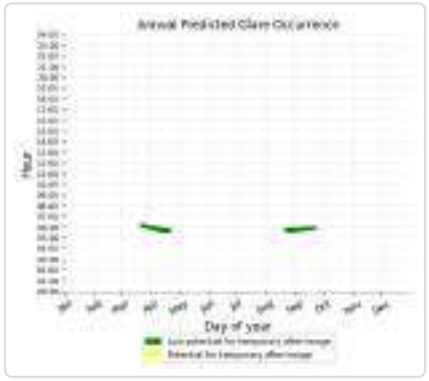

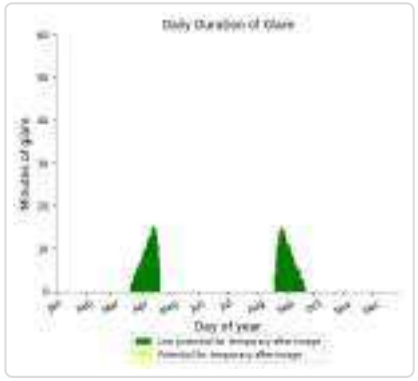

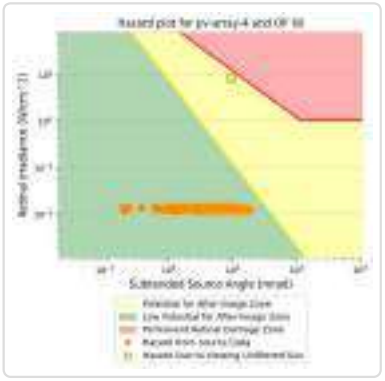

PV array 4: OP 60

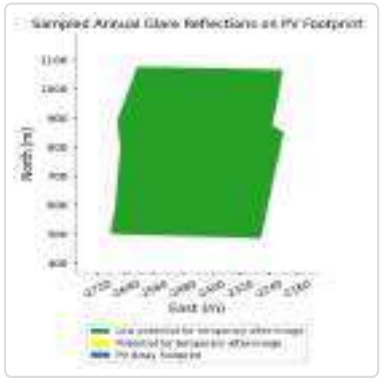

PV array is expected to produce the following glare for this receptor:

- 560 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

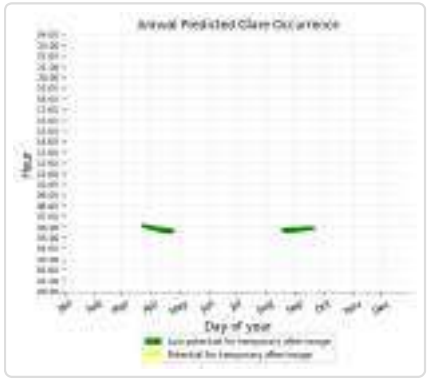

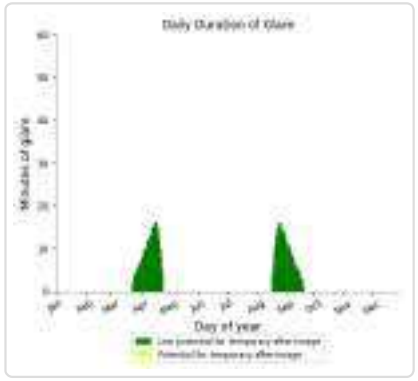

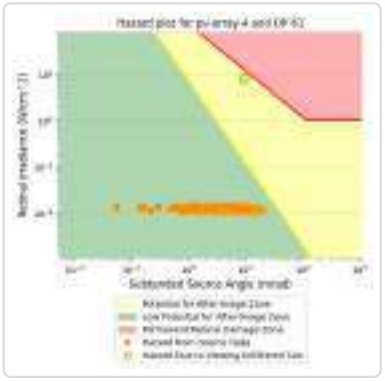

PV array 4: OP 61

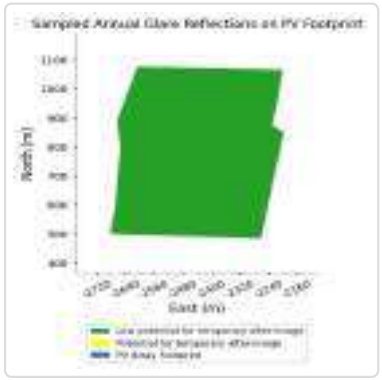

PV array is expected to produce the following glare for this receptor:

- 644 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

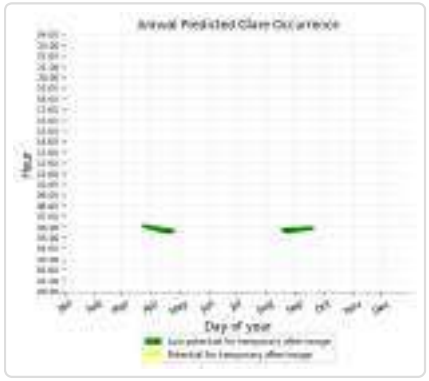

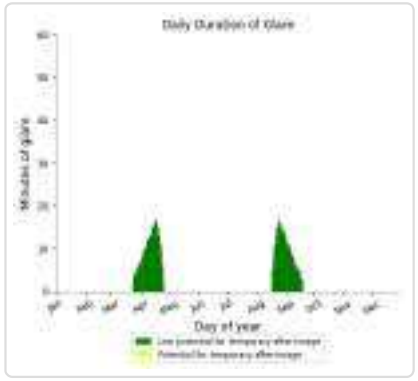

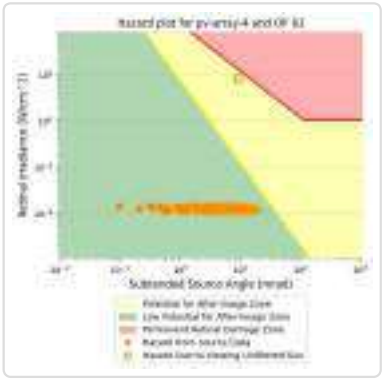

PV array 4: OP 62

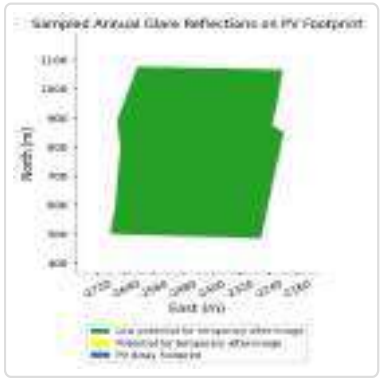

PV array is expected to produce the following glare for this receptor:

- 652 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

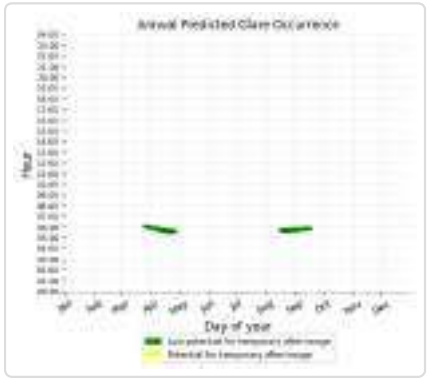

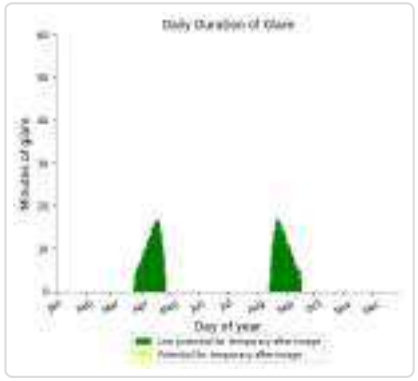

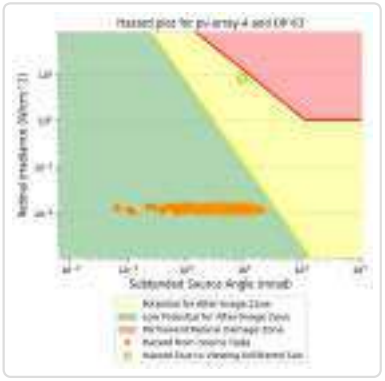

PV array 4: OP 63

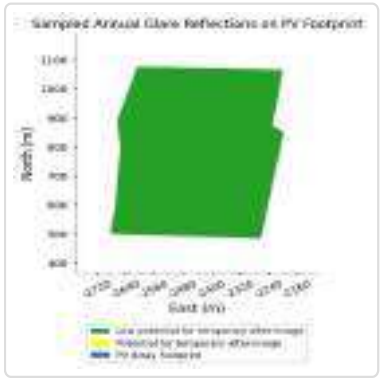

PV array is expected to produce the following glare for this receptor:

- 722 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

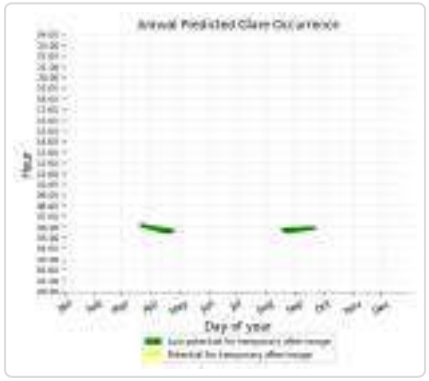

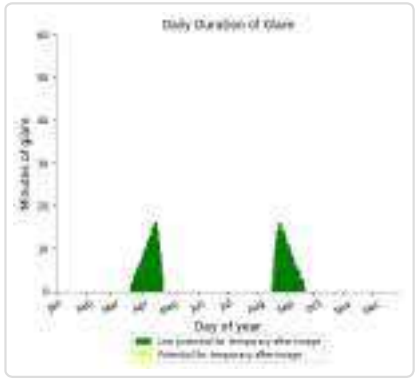

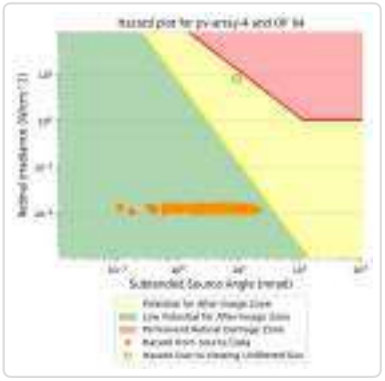

PV array 4: OP 64

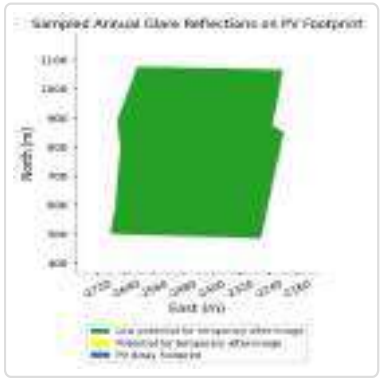

PV array is expected to produce the following glare for this receptor:

- 636 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

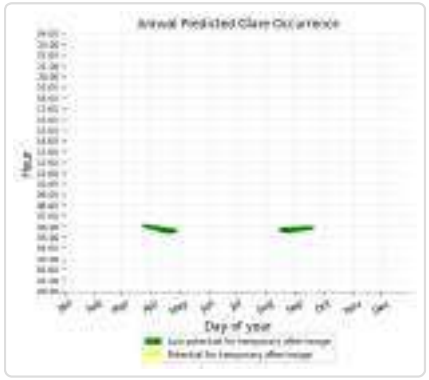

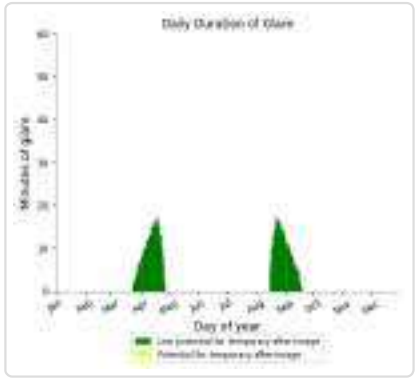

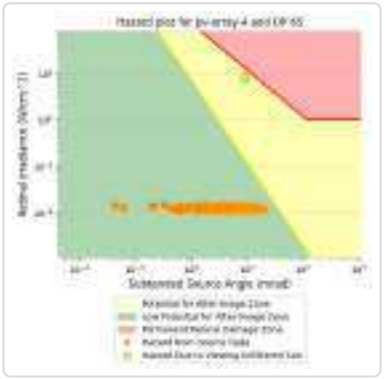

PV array 4: OP 65

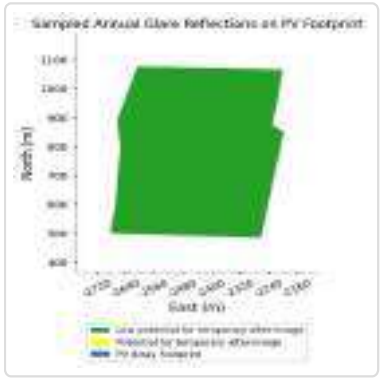

PV array is expected to produce the following glare for this receptor:

- 703 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 5 low potential for temporary after-image

PV array is expected to produce the following glare for this receptor:

- 107 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

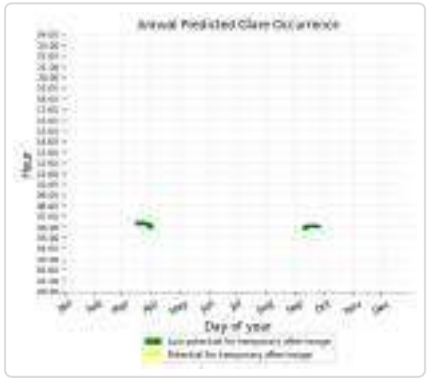

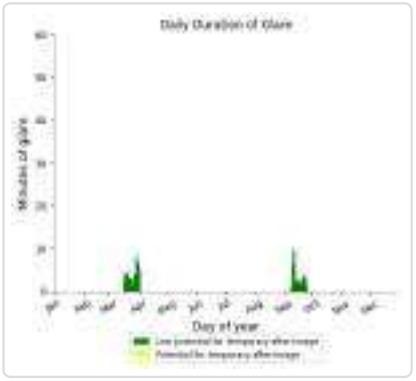

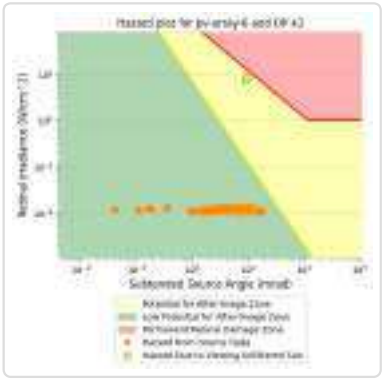

PV array 6: OP 42

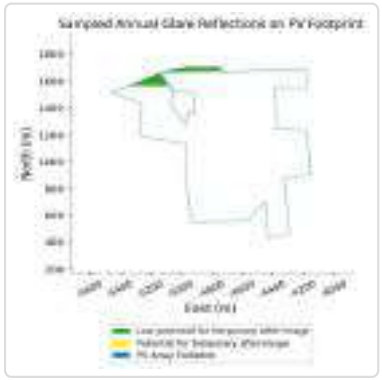

PV array is expected to produce the following glare for this receptor:

- 145 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

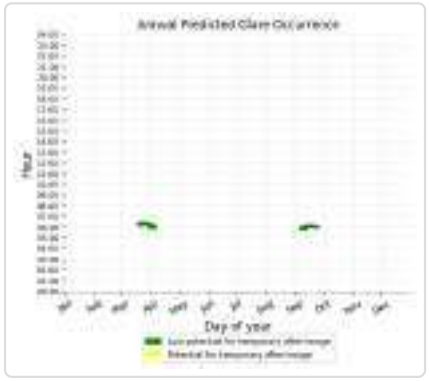

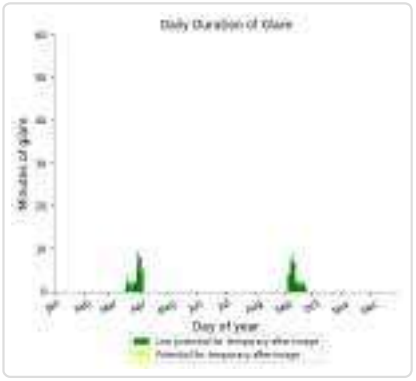

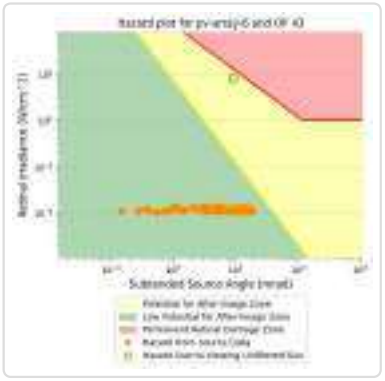

PV array 6: OP 43

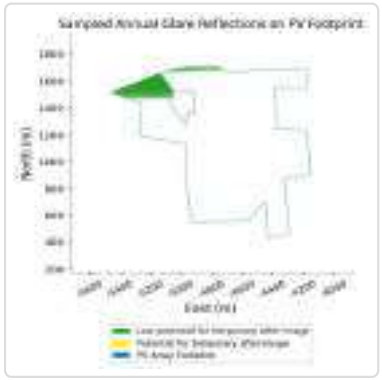

PV array is expected to produce the following glare for this receptor:

- 139 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

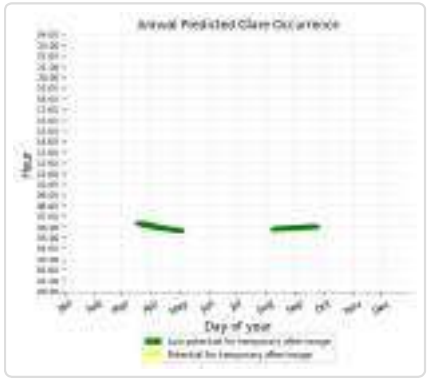

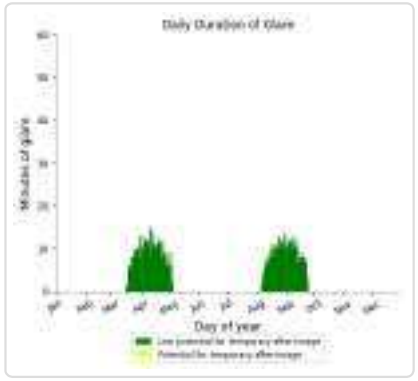

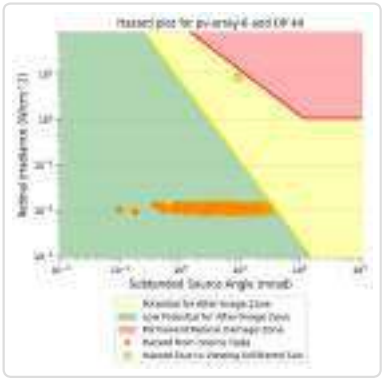

PV array 6: OP 44

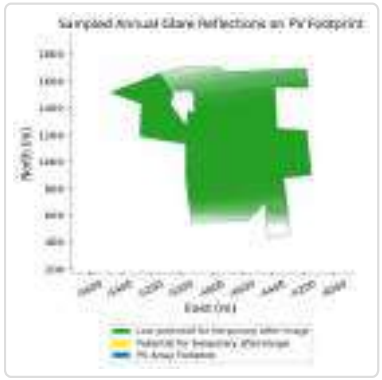

PV array is expected to produce the following glare for this receptor:

- 943 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

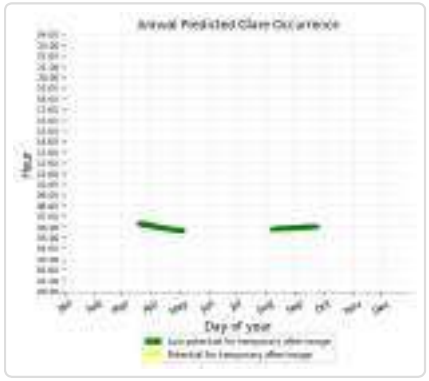

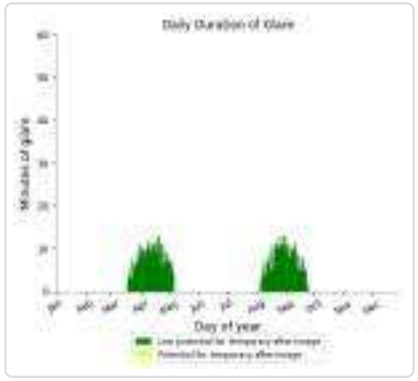

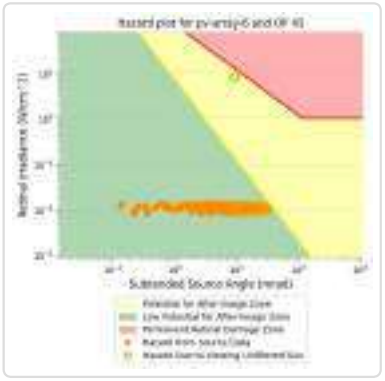

PV array 6: OP 45

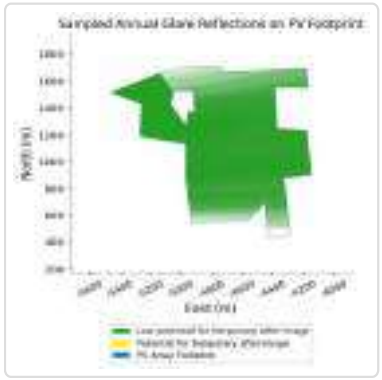

PV array is expected to produce the following glare for this receptor:

- 827 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

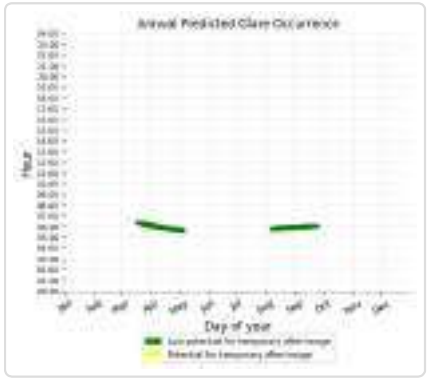

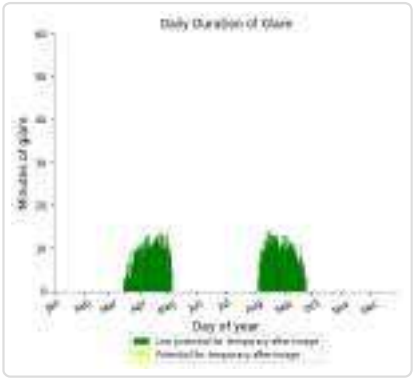

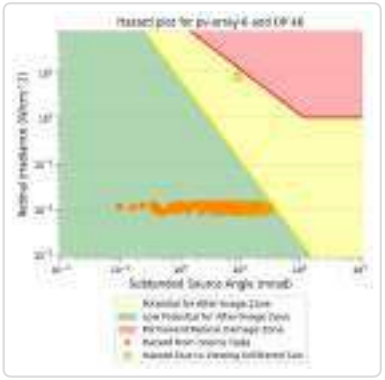

PV array 6: OP 46

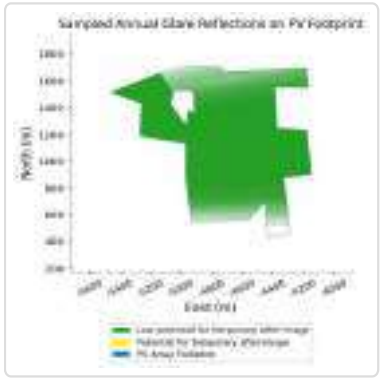

PV array is expected to produce the following glare for this receptor:

- 1,018 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

- 15 minutes of "yellow" glare with potential to cause temporary after-image.

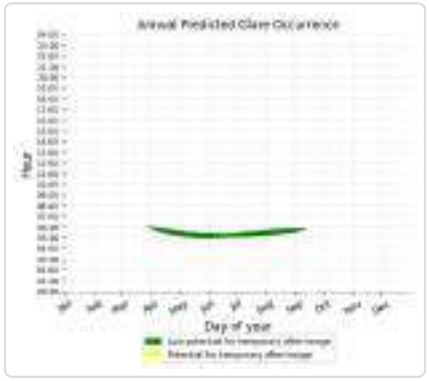

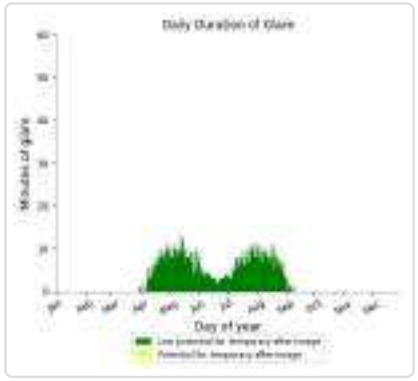

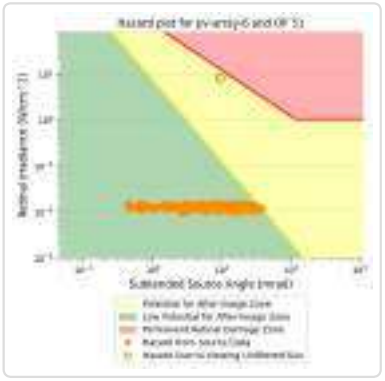

PV array 6: OP 51

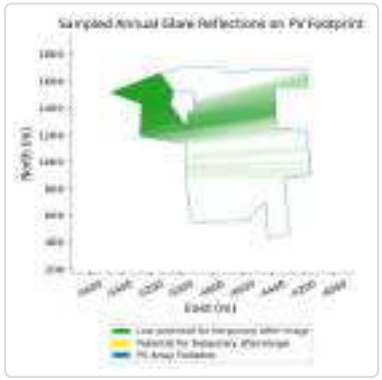

PV array is expected to produce the following glare for this receptor:

- 1,025 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

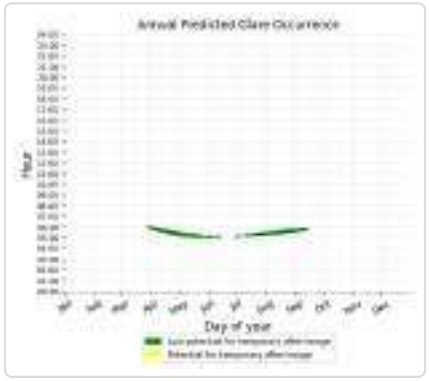

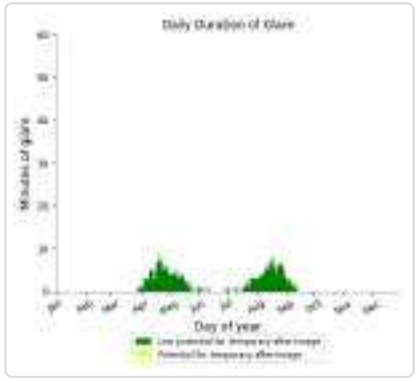

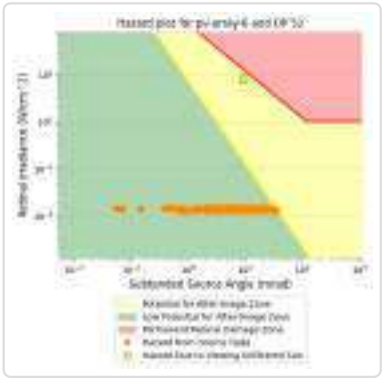

PV array 6: OP 52

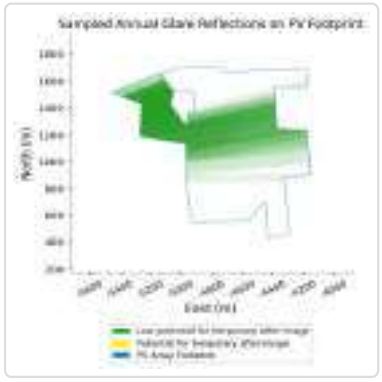

PV array is expected to produce the following glare for this receptor:

- 441 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

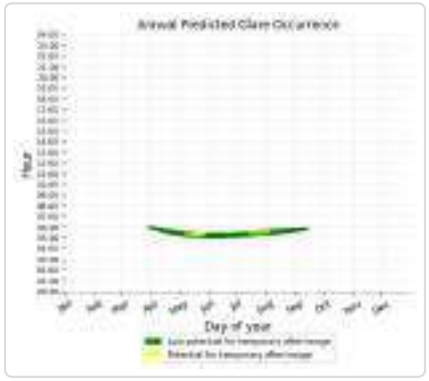

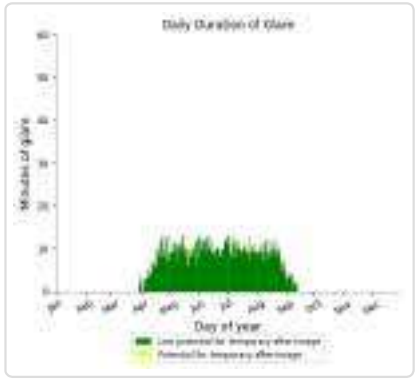

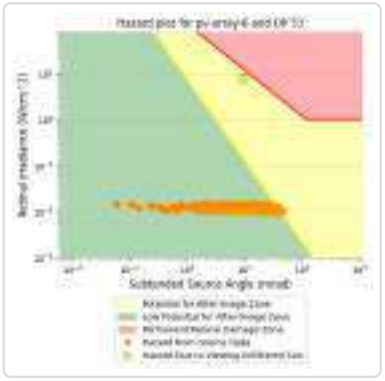

PV array 6: OP 53

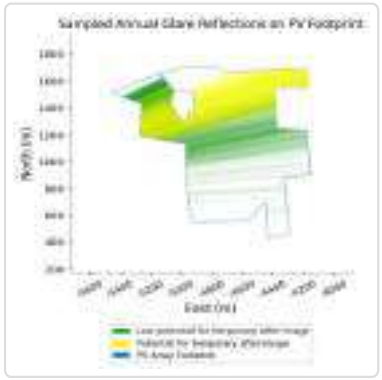

PV array is expected to produce the following glare for this receptor:

- 1,441 minutes of "green" glare with low potential to cause temporary after-image.
- 21 minutes of "yellow" glare with potential to cause temporary after-image.

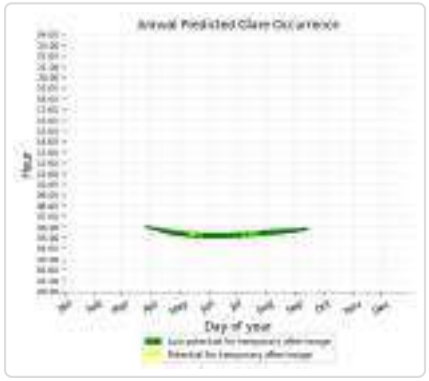

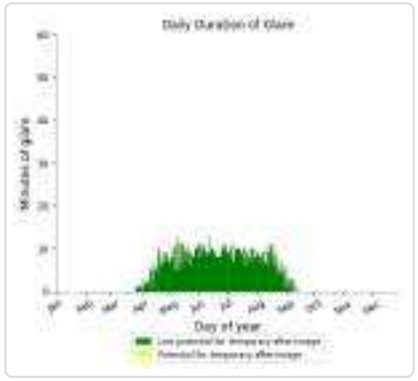

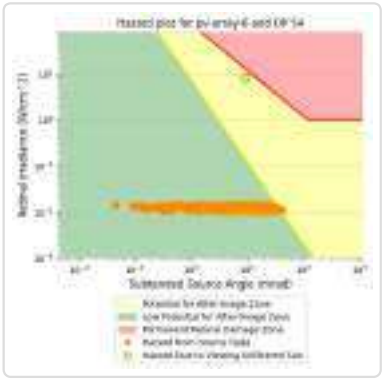

PV array 6: OP 54

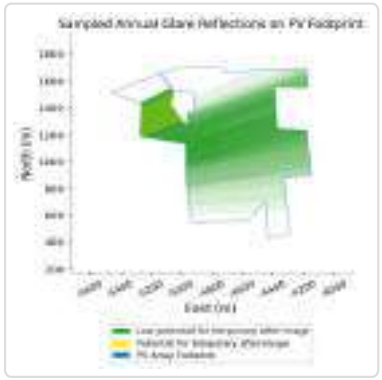

PV array is expected to produce the following glare for this receptor:

- 1,233 minutes of "green" glare with low potential to cause temporary after-image.
- 8 minutes of "yellow" glare with potential to cause temporary after-image.

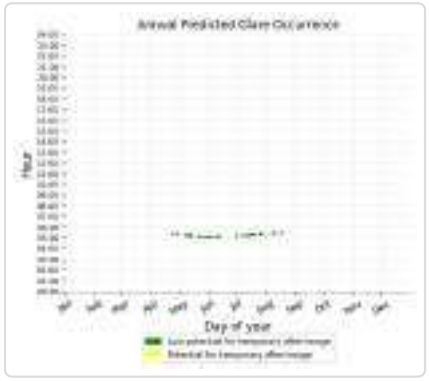

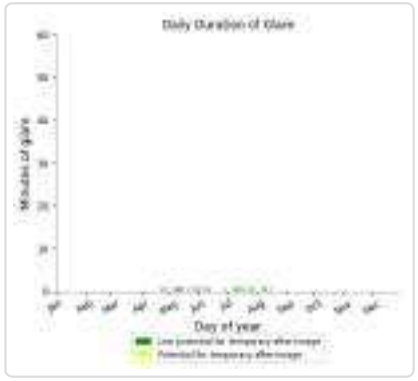

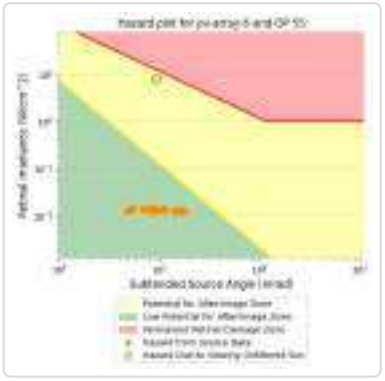

PV array 6: OP 55

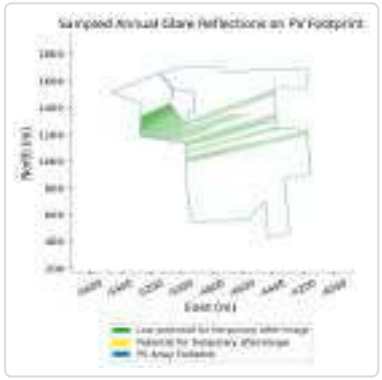

PV array is expected to produce the following glare for this receptor:

- 24 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 6: OP 56

No glare found

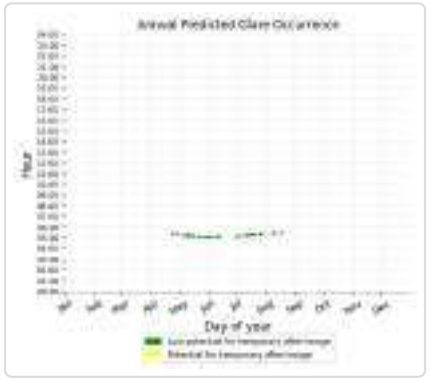

PV array 6: OP 57

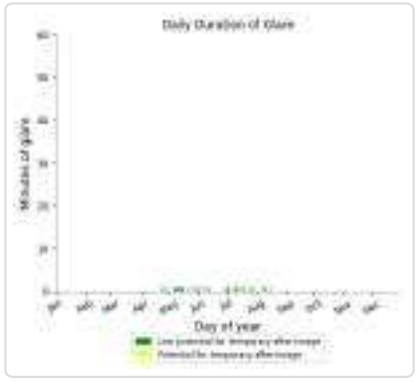

No glare found

PV array is expected to produce the following glare for this receptor:

- 27 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

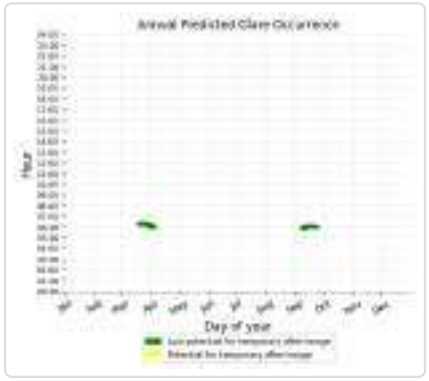

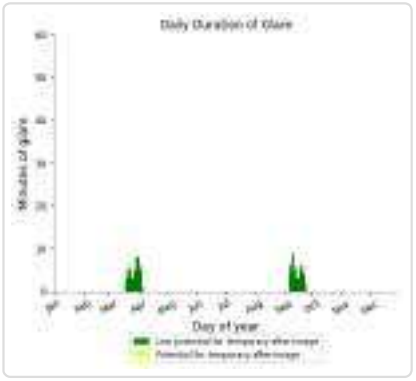

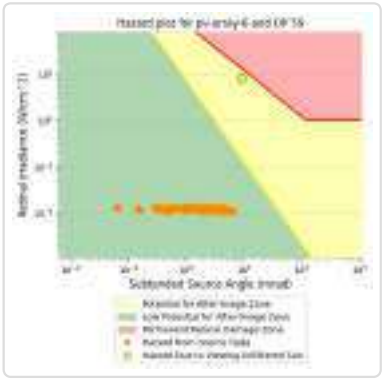

PV array 6: OP 59

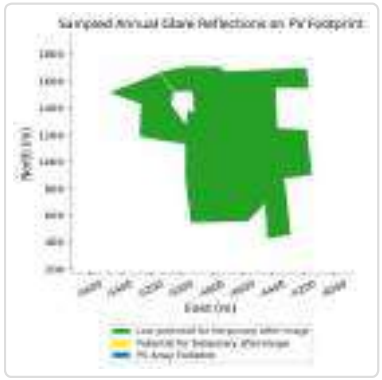

PV array is expected to produce the following glare for this receptor:

- 188 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

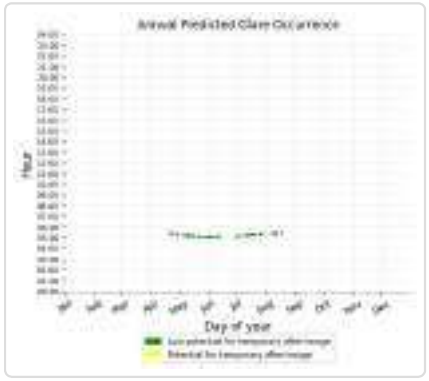

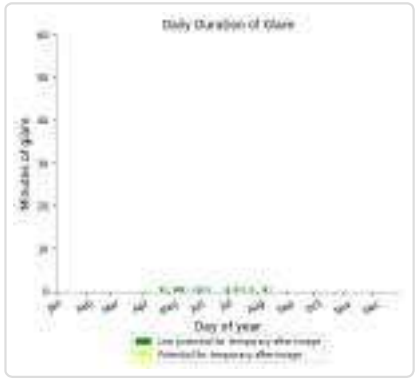

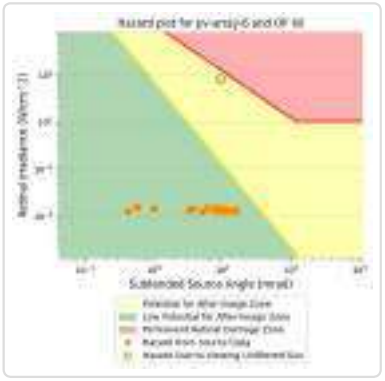

PV array 6: OP 60

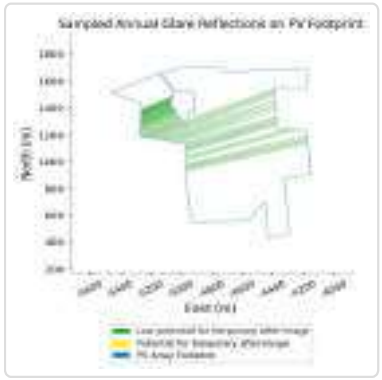

PV array is expected to produce the following glare for this receptor:

- 30 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

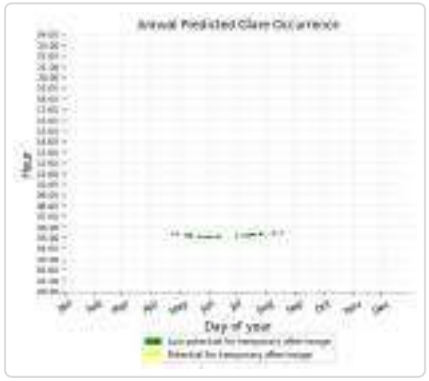

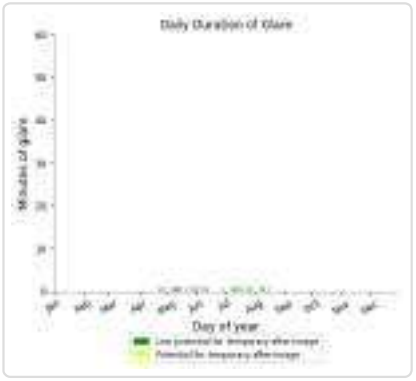

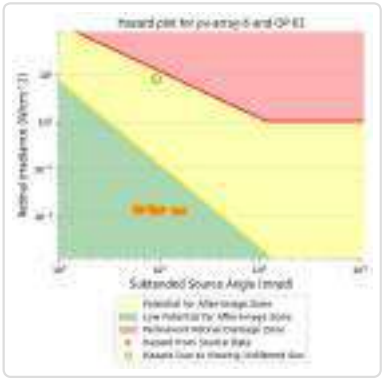

PV array 6: OP 61

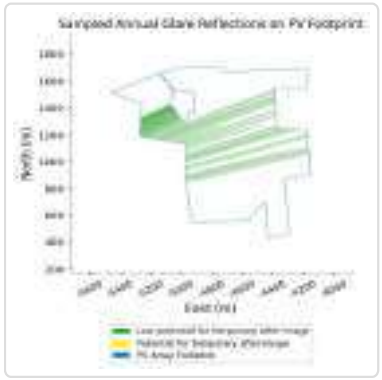

PV array is expected to produce the following glare for this receptor:

- 24 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

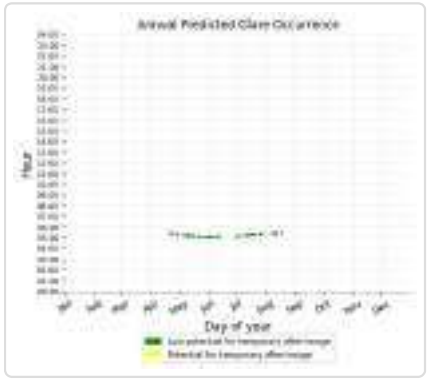

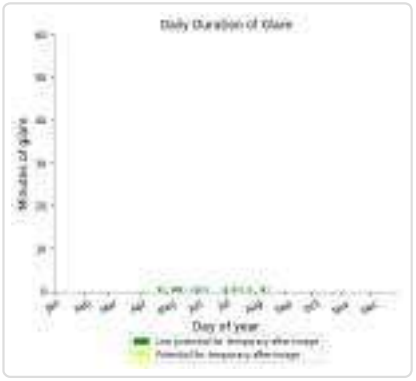

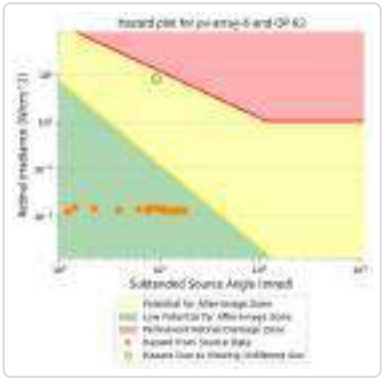

PV array 6: OP 62

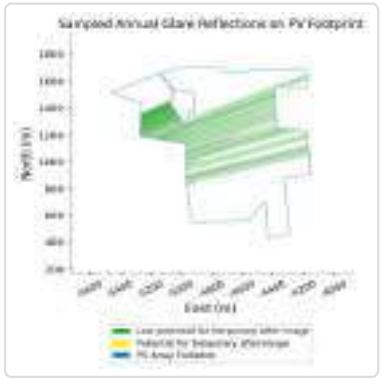

PV array is expected to produce the following glare for this receptor:

- 30 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

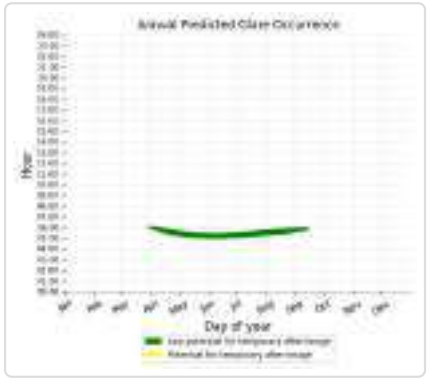

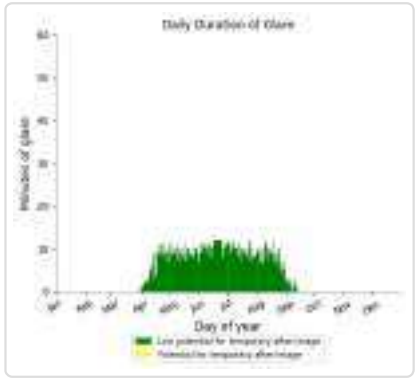

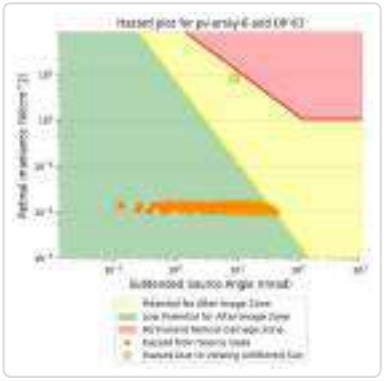

PV array 6: OP 63

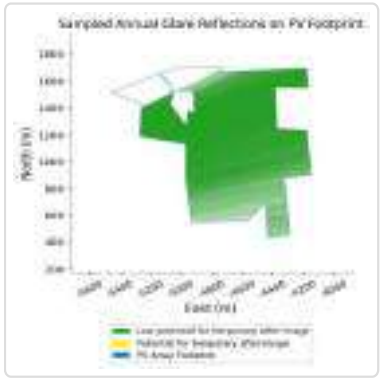

PV array is expected to produce the following glare for this receptor:

- 1,349 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

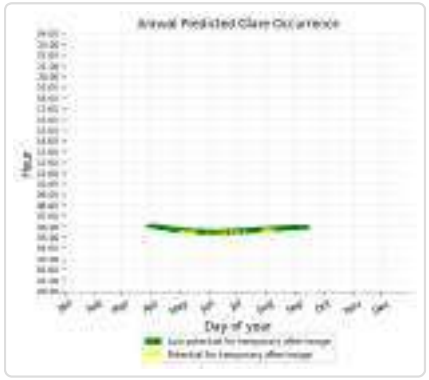

PV array 6: OP 64

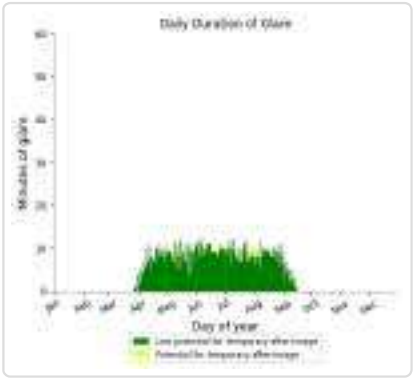

No glare found

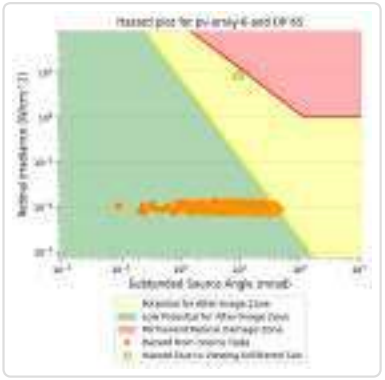

PV array 6: OP 65

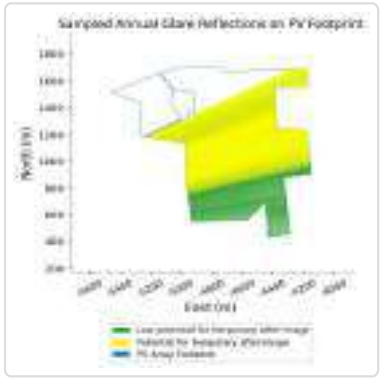

PV array is expected to produce the following glare for this receptor:

- 1,401 minutes of "green" glare with low potential to cause temporary after-image.
- 37 minutes of "yellow" glare with potential to cause temporary after-image.

- 0 minutes of "yellow" glare with potential to cause temporary after-image.

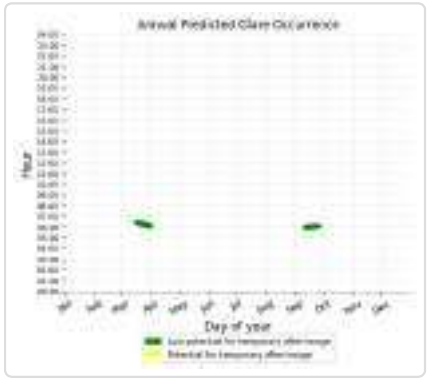

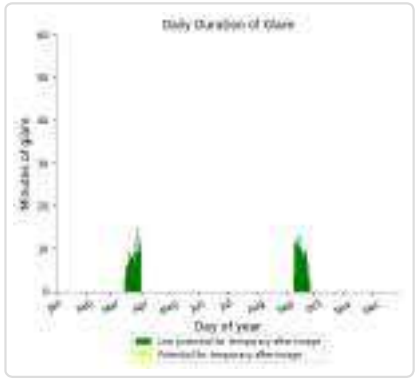

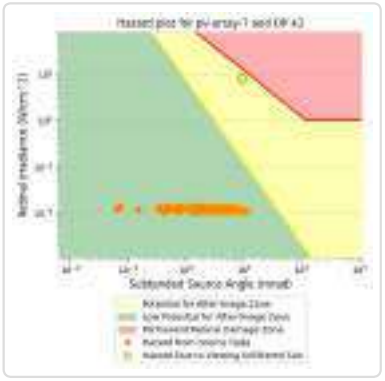

PV array 7: OP 42

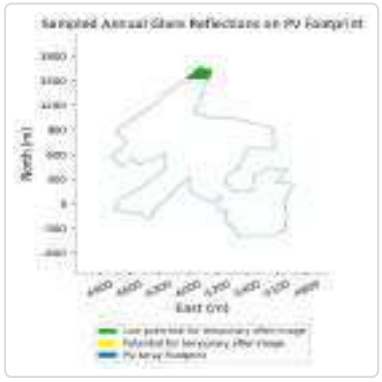

PV array is expected to produce the following glare for this receptor:

- 306 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

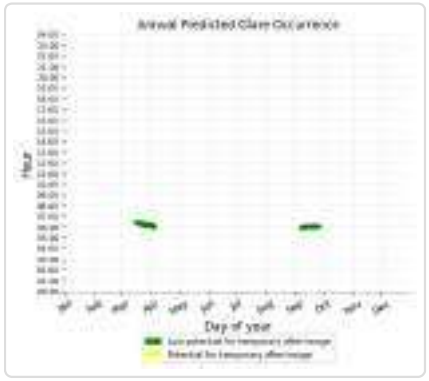

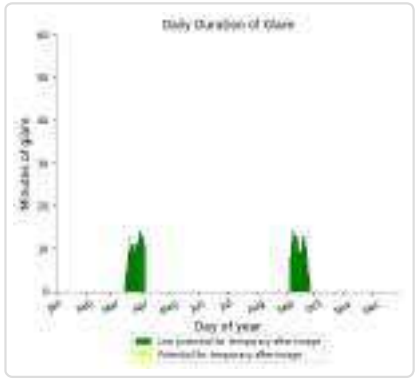

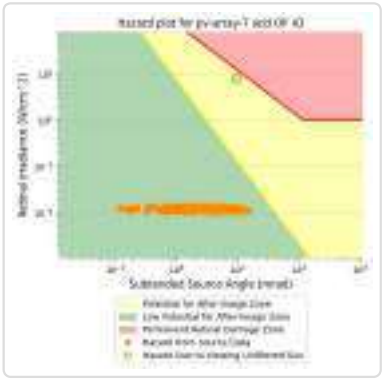

PV array 7: OP 43

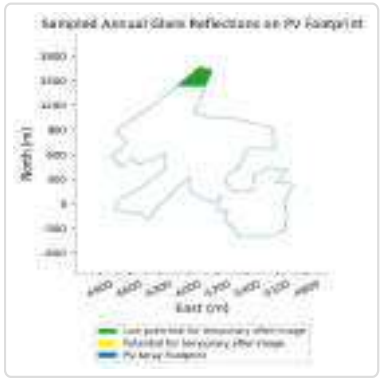

PV array is expected to produce the following glare for this receptor:

- 455 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

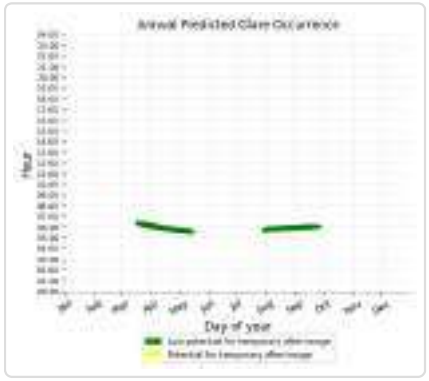

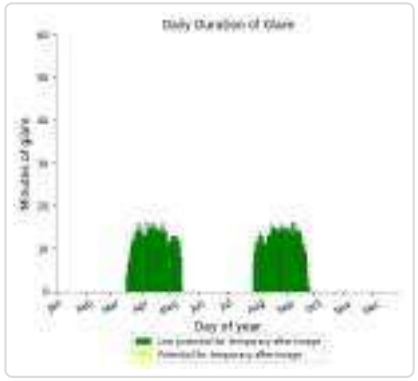

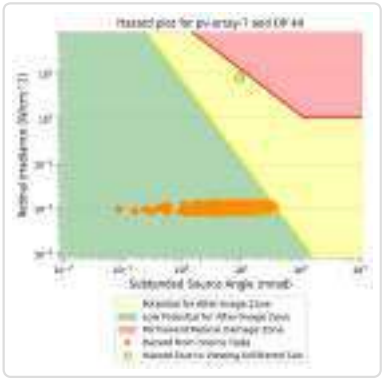

PV array 7: OP 44

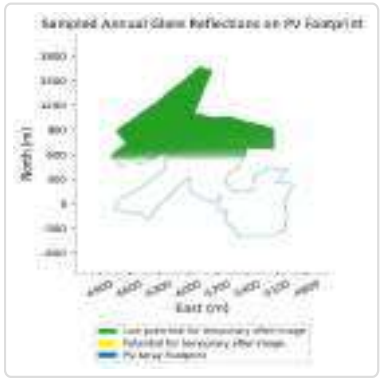

PV array is expected to produce the following glare for this receptor:

- 1,547 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

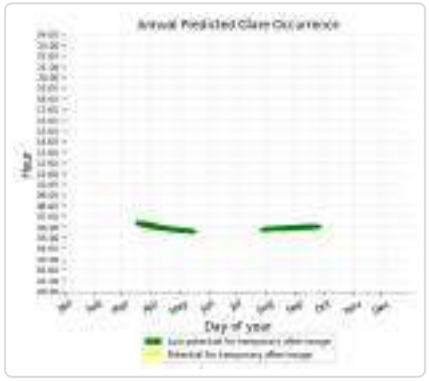

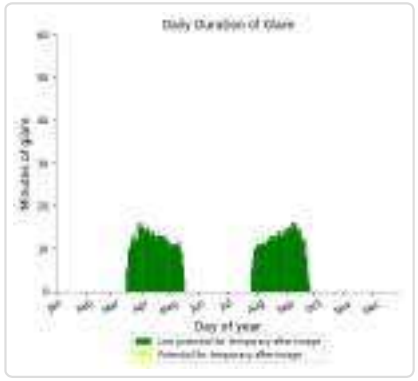

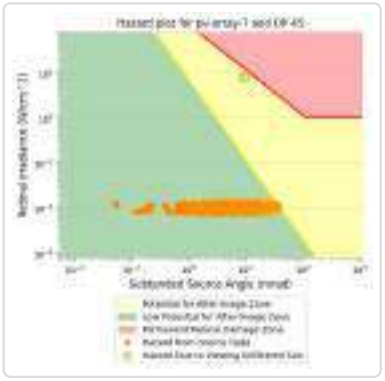

PV array 7: OP 45

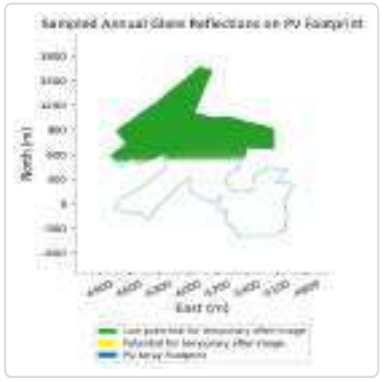

PV array is expected to produce the following glare for this receptor:

- 1,509 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

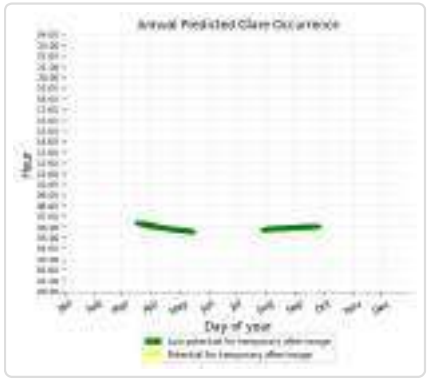

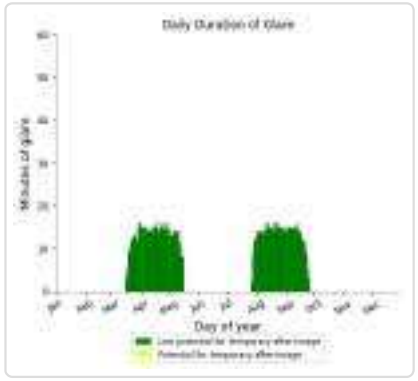

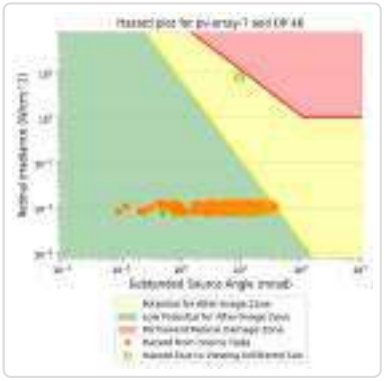

PV array 7: OP 46

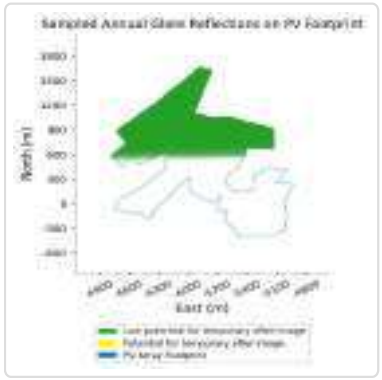

PV array is expected to produce the following glare for this receptor:

- 1,654 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

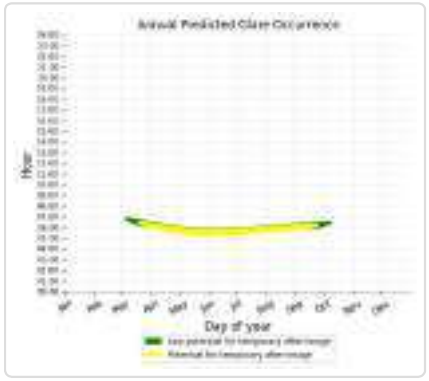

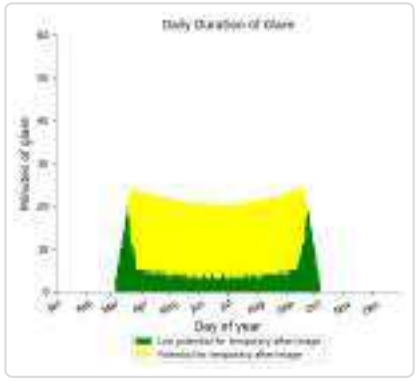

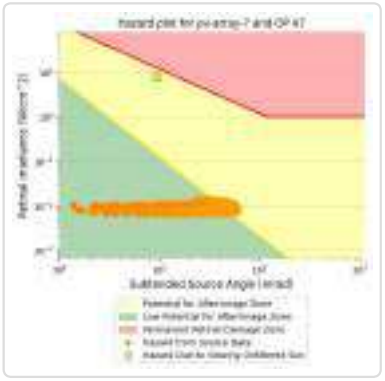

PV array 7: OP 47

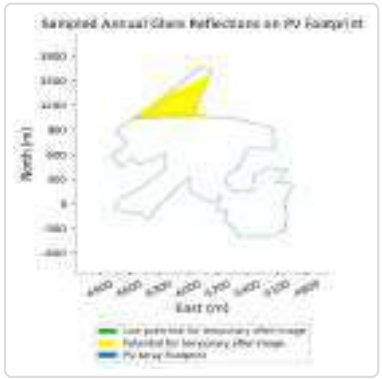

PV array is expected to produce the following glare for this receptor:

- 1,171 minutes of "green" glare with low potential to cause temporary after-image.
- 3,206 minutes of "yellow" glare with potential to cause temporary after-image.

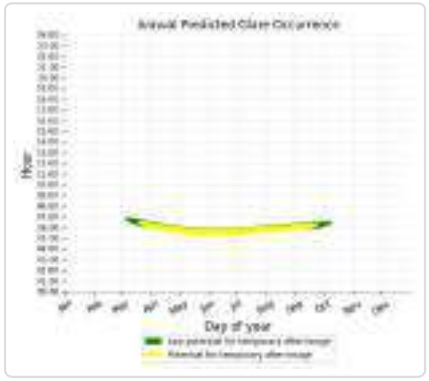

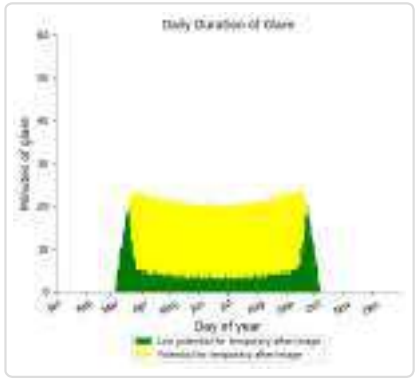

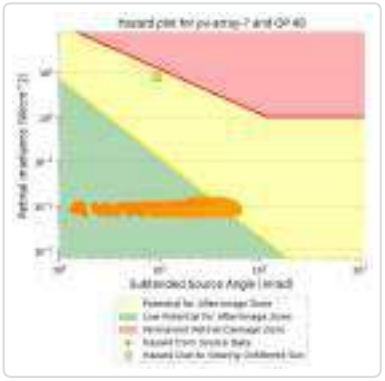

PV array 7: OP 48

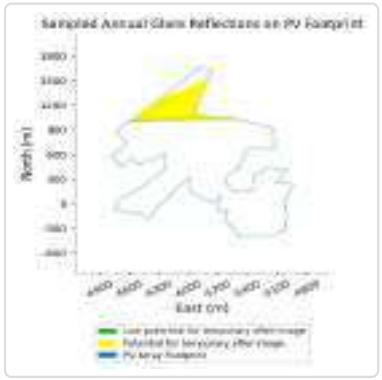

PV array is expected to produce the following glare for this receptor:

- 1,136 minutes of "green" glare with low potential to cause temporary after-image.
- 3,172 minutes of "yellow" glare with potential to cause temporary after-image.

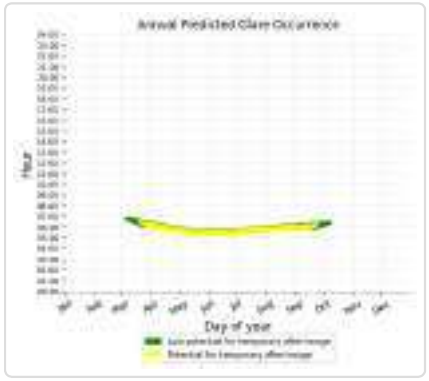

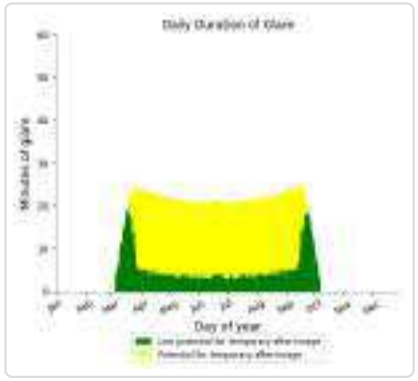

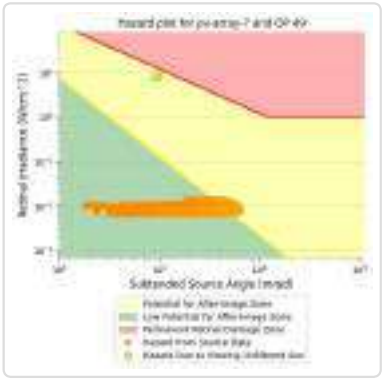

PV array 7: OP 49

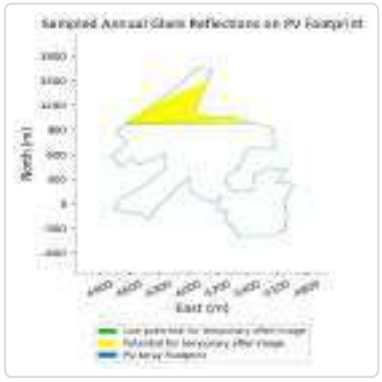

PV array is expected to produce the following glare for this receptor:

- 1,265 minutes of "green" glare with low potential to cause temporary after-image.
- 3,202 minutes of "yellow" glare with potential to cause temporary after-image.

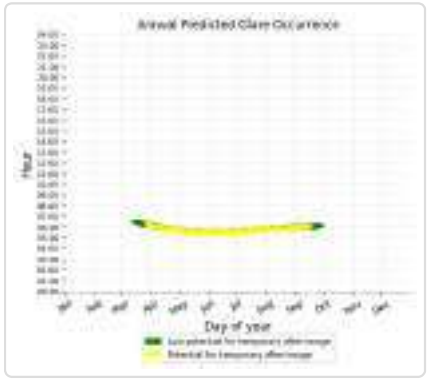

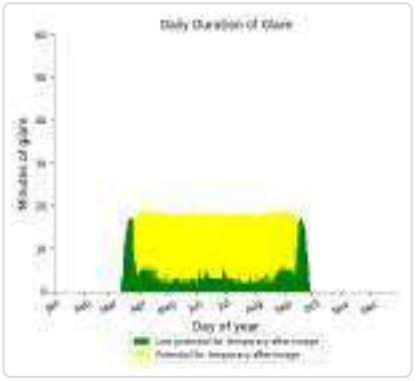

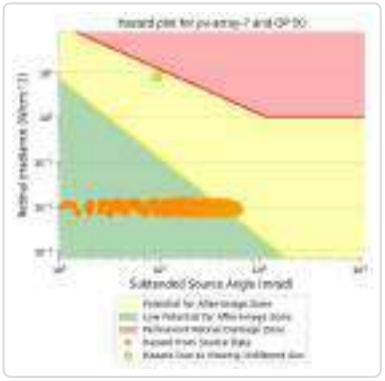

PV array 7: OP 50

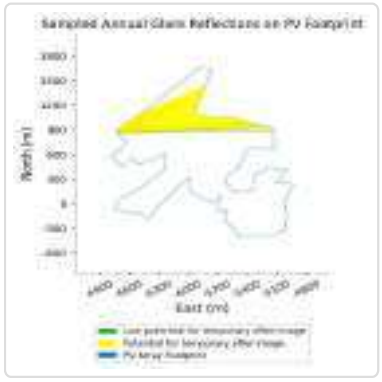

PV array is expected to produce the following glare for this receptor:

- 939 minutes of "green" glare with low potential to cause temporary after-image.
- 2,542 minutes of "yellow" glare with potential to cause temporary after-image.

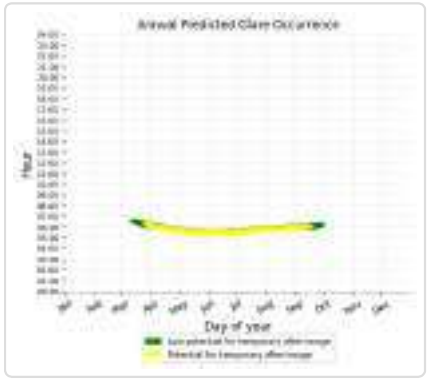

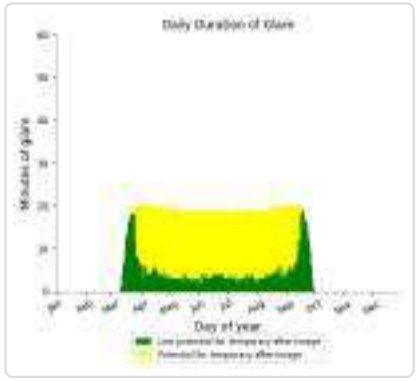

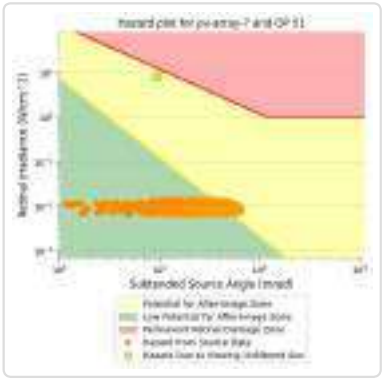

PV array 7: OP 51

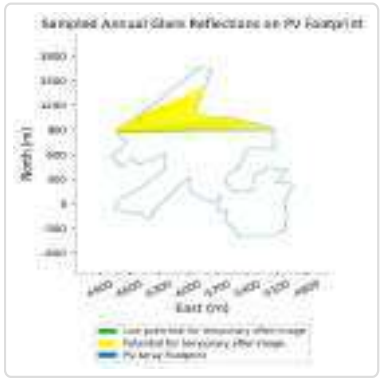

PV array is expected to produce the following glare for this receptor:

- 1,105 minutes of "green" glare with low potential to cause temporary after-image.
- 2,669 minutes of "yellow" glare with potential to cause temporary after-image.

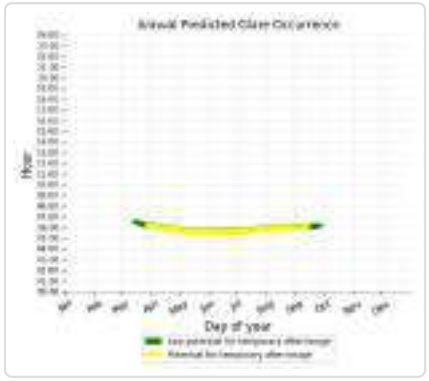

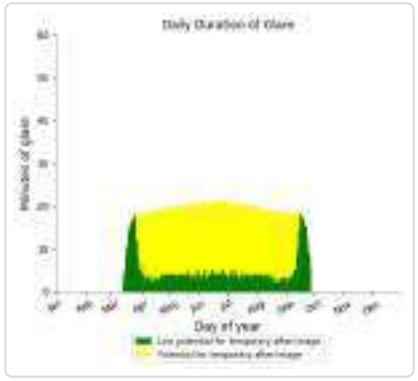

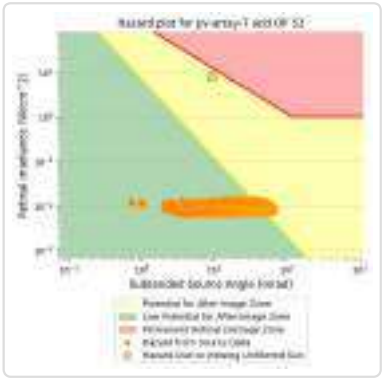

PV array 7: OP 52

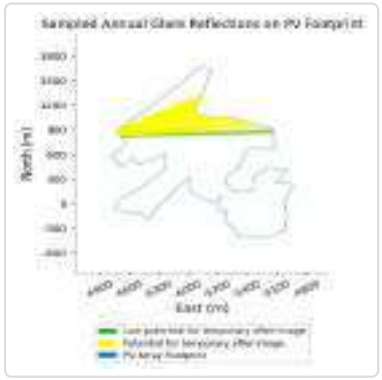

PV array is expected to produce the following glare for this receptor:

- 1,049 minutes of "green" glare with low potential to cause temporary after-image.
- 2,688 minutes of "yellow" glare with potential to cause temporary after-image.

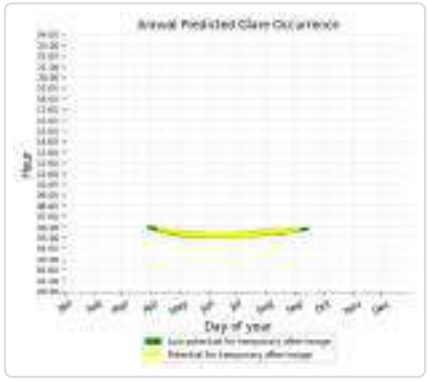

PV array 7: OP 53

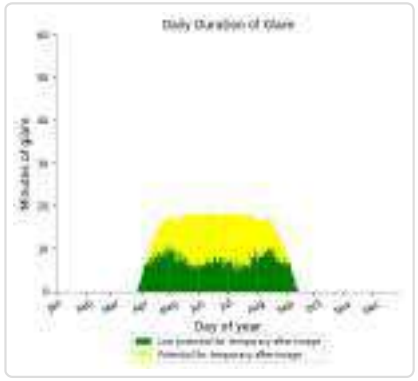

No glare found

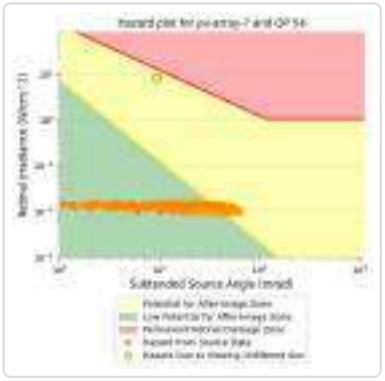

PV array 7: OP 54

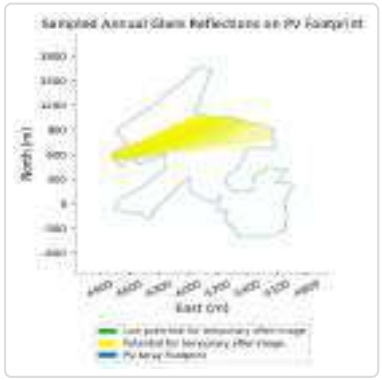

PV array is expected to produce the following glare for this receptor:

- 1,195 minutes of "green" glare with low potential to cause temporary after-image.
- 1,327 minutes of "yellow" glare with potential to cause temporary after-image.

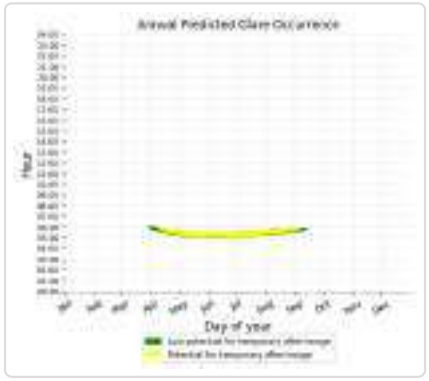

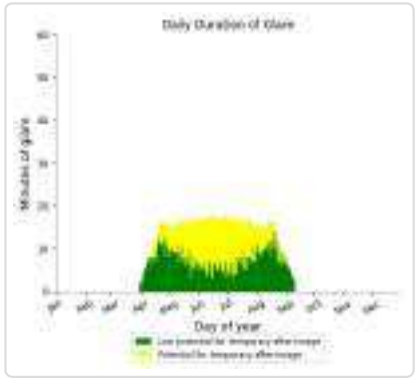

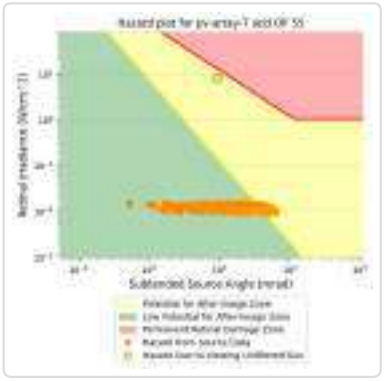

PV array 7: OP 55

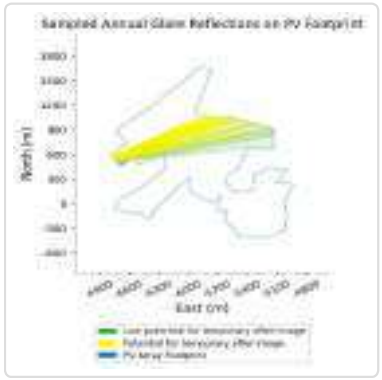

PV array is expected to produce the following glare for this receptor:

- 1,197 minutes of "green" glare with low potential to cause temporary after-image.
- 1,127 minutes of "yellow" glare with potential to cause temporary after-image.

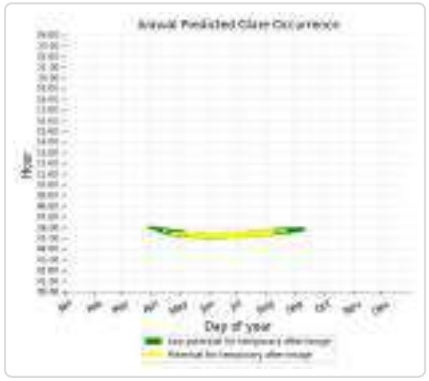

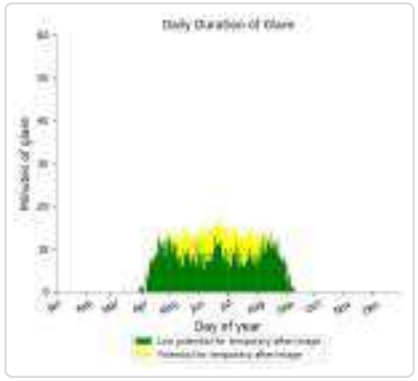

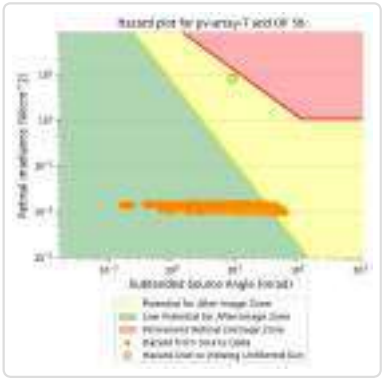

PV array 7: OP 56

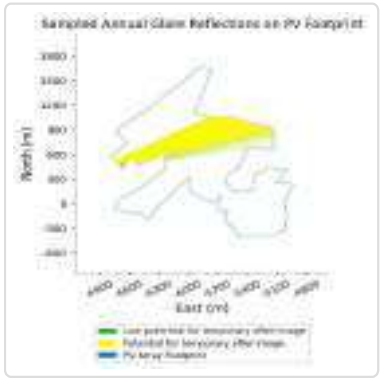

PV array is expected to produce the following glare for this receptor:

- 1,330 minutes of "green" glare with low potential to cause temporary after-image.
- 511 minutes of "yellow" glare with potential to cause temporary after-image.

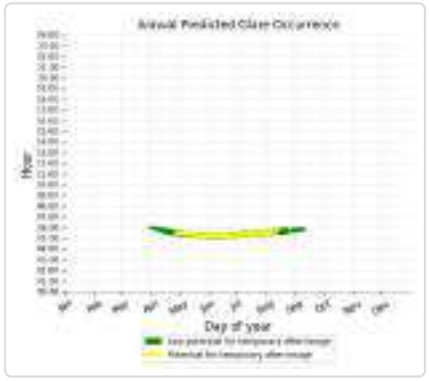

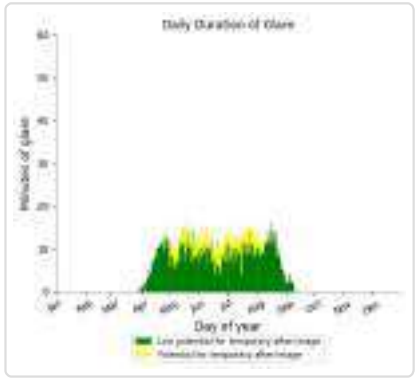

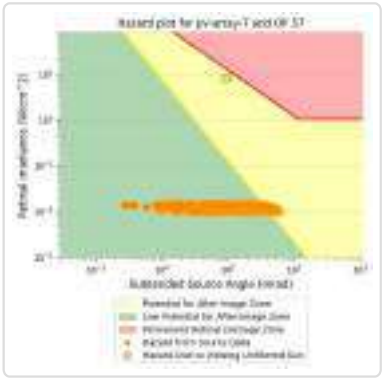

PV array 7: OP 57

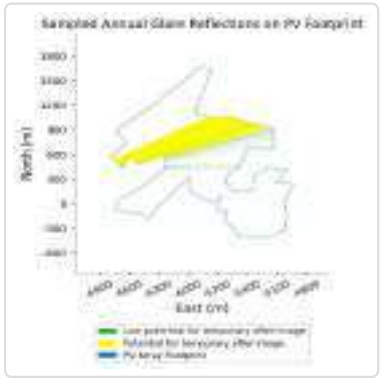

PV array is expected to produce the following glare for this receptor:

- 1,340 minutes of "green" glare with low potential to cause temporary after-image.
- 353 minutes of "yellow" glare with potential to cause temporary after-image.

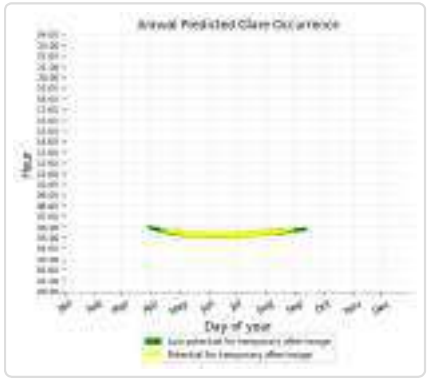

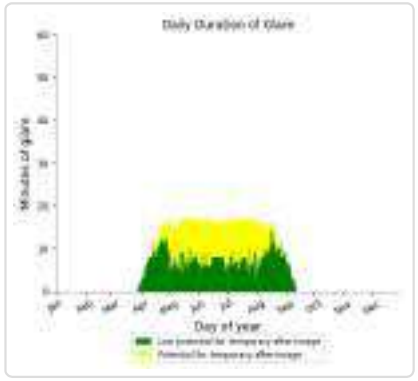

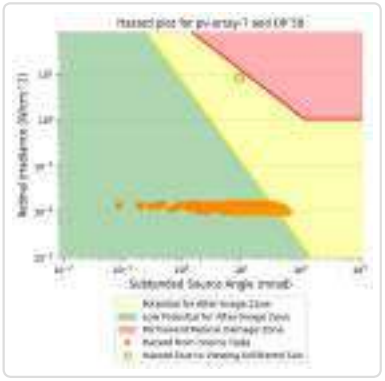

PV array 7: OP 58

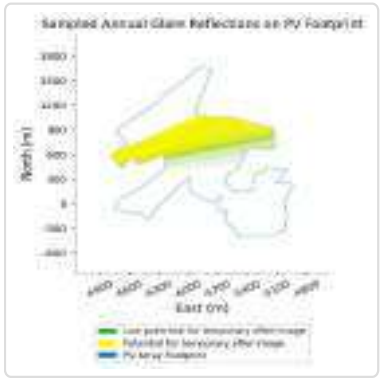

PV array is expected to produce the following glare for this receptor:

- 1,260 minutes of "green" glare with low potential to cause temporary after-image.
- 1,062 minutes of "yellow" glare with potential to cause temporary after-image.

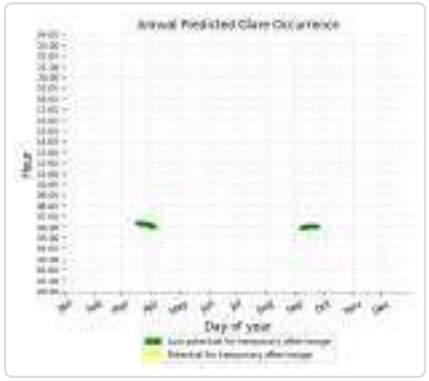

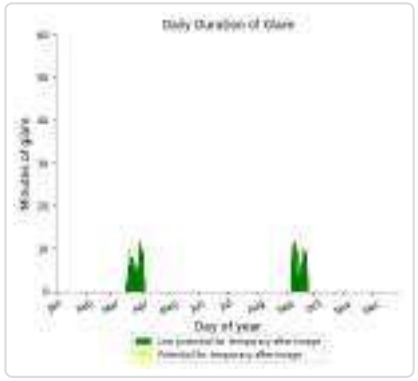

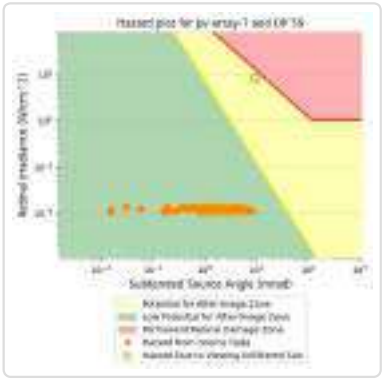

PV array 7: OP 59

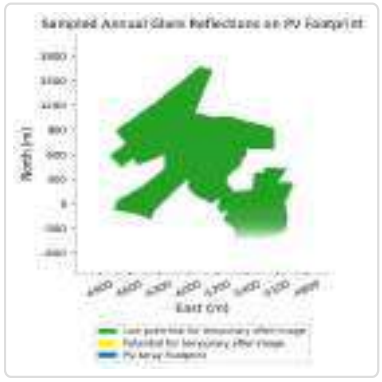

PV array is expected to produce the following glare for this receptor:

- 307 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

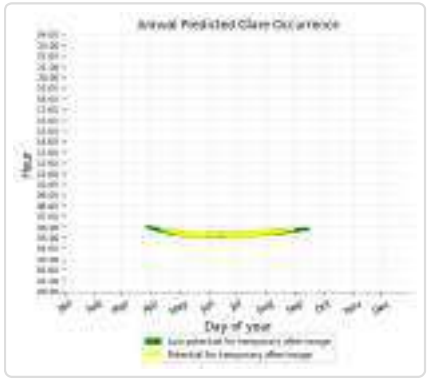

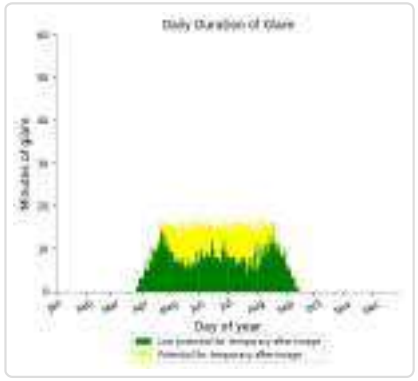

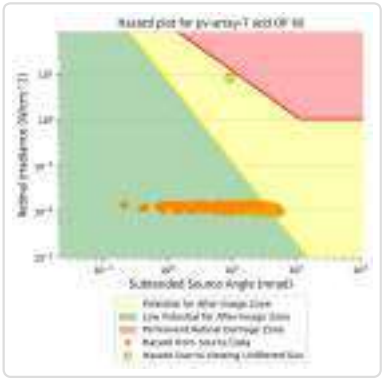

PV array 7: OP 60

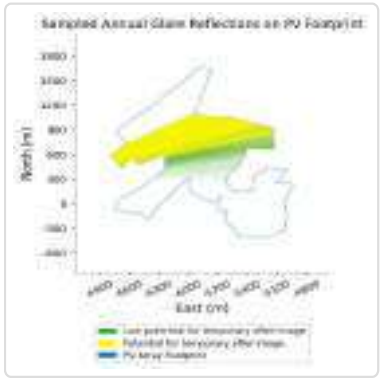

PV array is expected to produce the following glare for this receptor:

- 1,345 minutes of "green" glare with low potential to cause temporary after-image.
- 849 minutes of "yellow" glare with potential to cause temporary after-image.

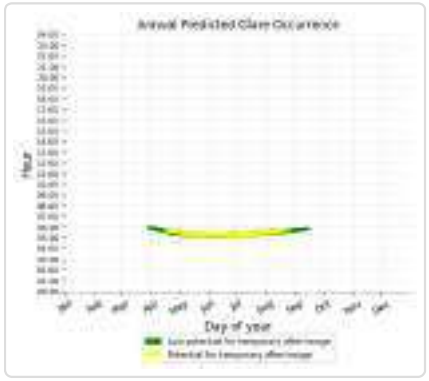

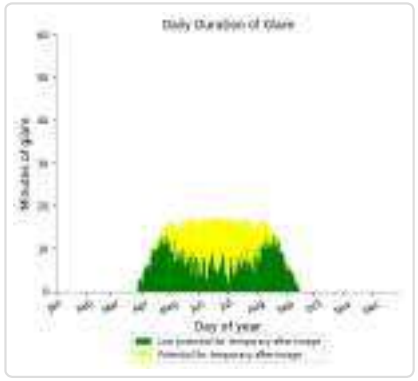

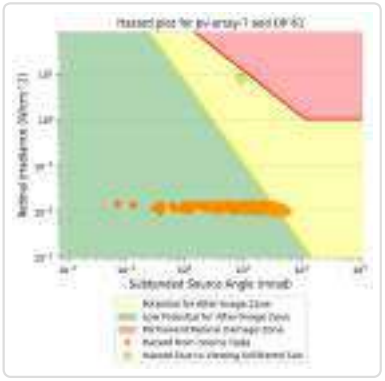

PV array 7: OP 61

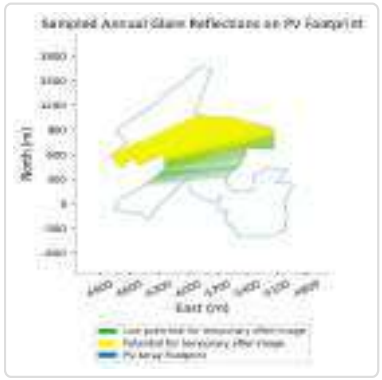

PV array is expected to produce the following glare for this receptor:

- 1,266 minutes of "green" glare with low potential to cause temporary after-image.
- 995 minutes of "yellow" glare with potential to cause temporary after-image.

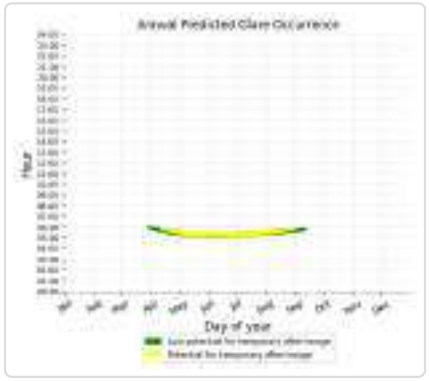

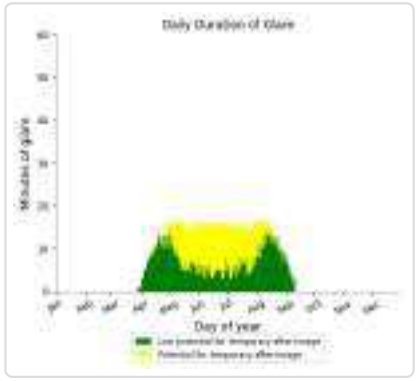

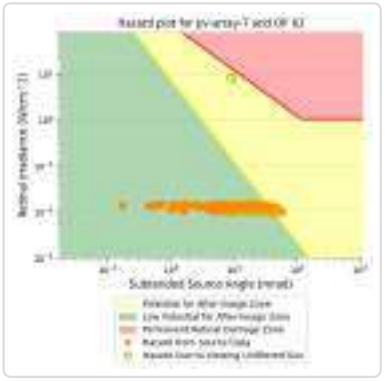

PV array 7: OP 62

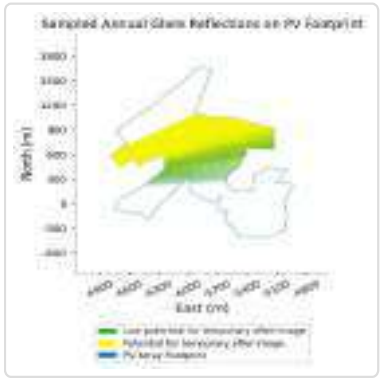

PV array is expected to produce the following glare for this receptor:

- 1,177 minutes of "green" glare with low potential to cause temporary after-image.
- 1,034 minutes of "yellow" glare with potential to cause temporary after-image.

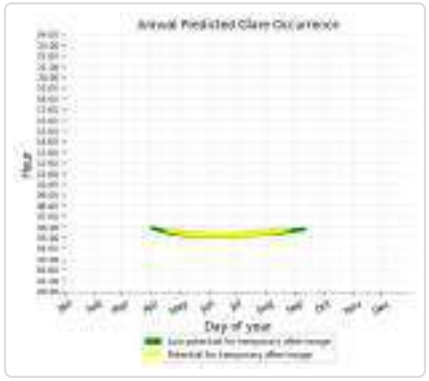

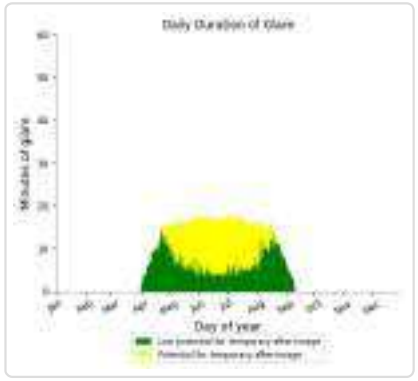

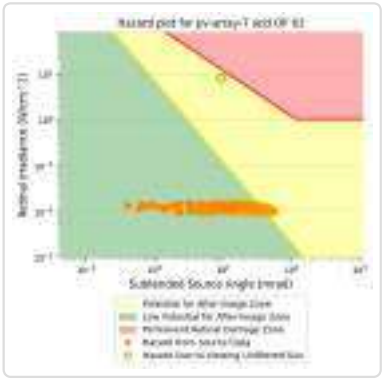

PV array 7: OP 63

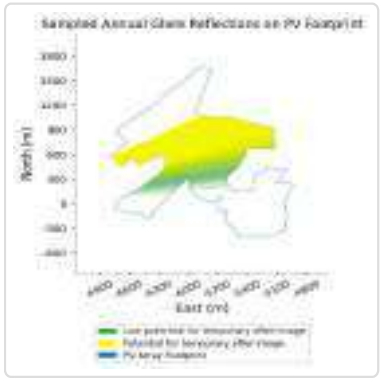

PV array is expected to produce the following glare for this receptor:

- 1,087 minutes of "green" glare with low potential to cause temporary after-image.
- 1,187 minutes of "yellow" glare with potential to cause temporary after-image.

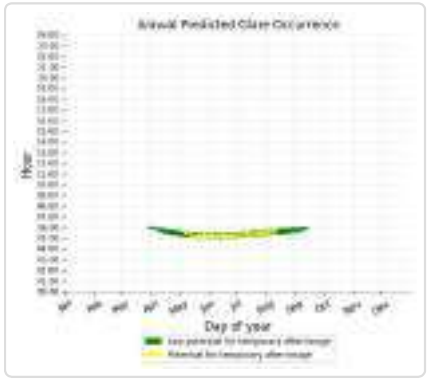

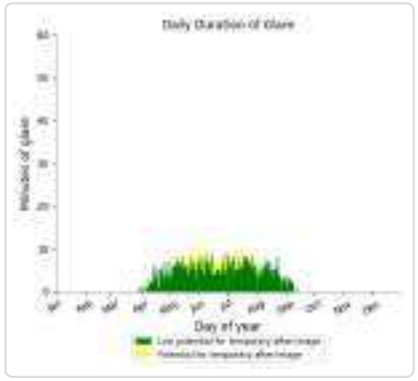

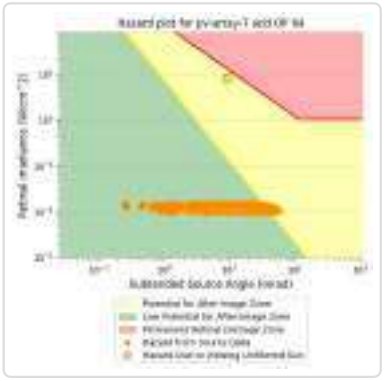

PV array 7: OP 64

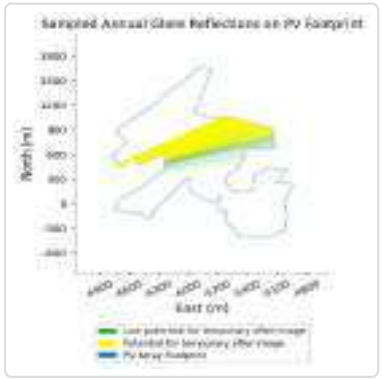

PV array is expected to produce the following glare for this receptor:

- 818 minutes of "green" glare with low potential to cause temporary after-image.
- 123 minutes of "yellow" glare with potential to cause temporary after-image.

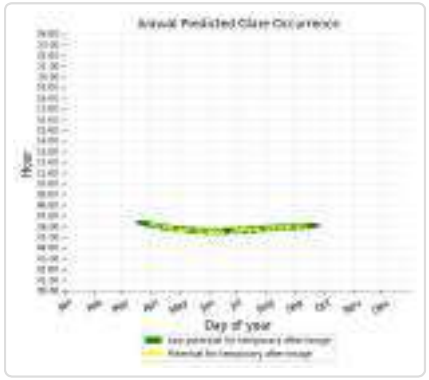

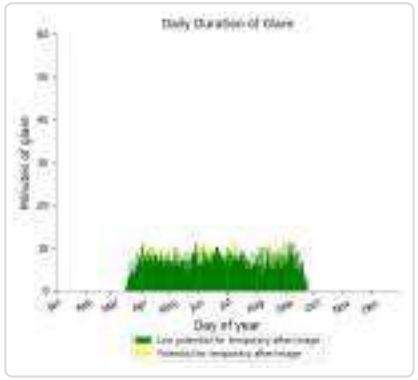

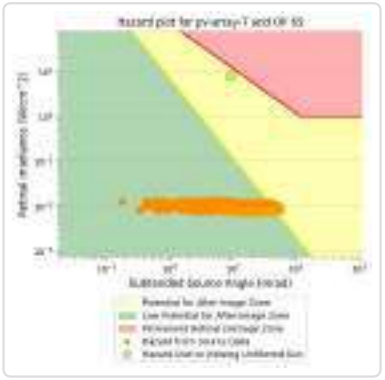

PV array 7: OP 65

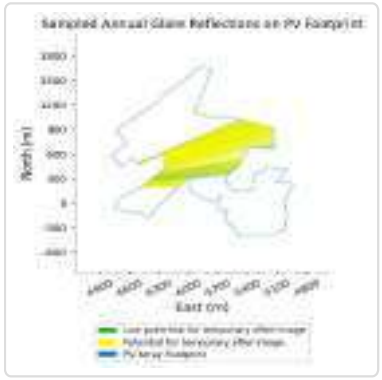

PV array is expected to produce the following glare for this receptor:

- 1,429 minutes of "green" glare with low potential to cause temporary after-image.
- 102 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 8 potential temporary after-image

PV array is expected to produce the following glare for this receptor:

- 66 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

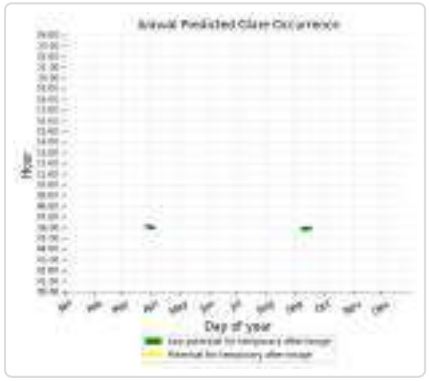

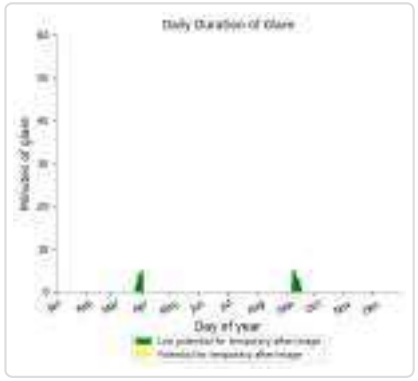

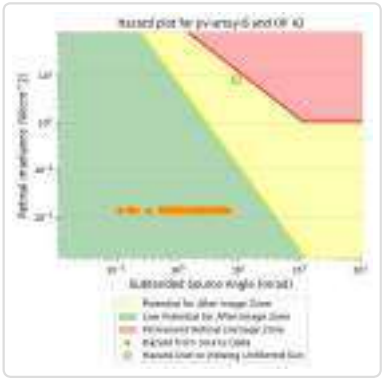

PV array 8: OP 42

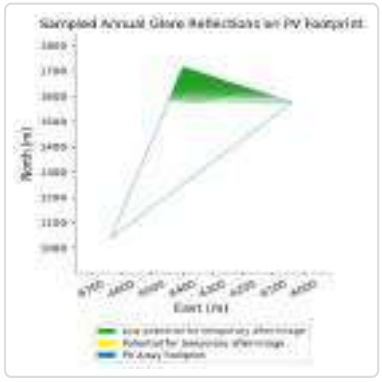

PV array is expected to produce the following glare for this receptor:

- 63 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

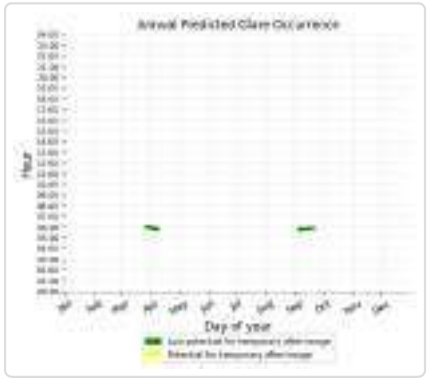

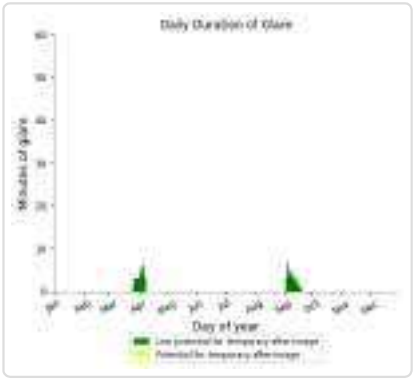

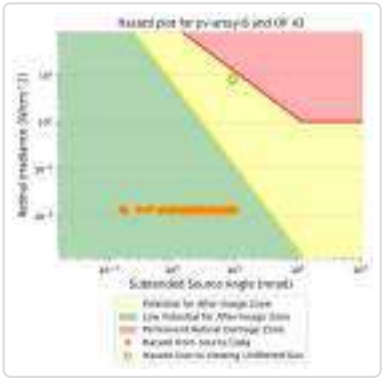

PV array 8: OP 43

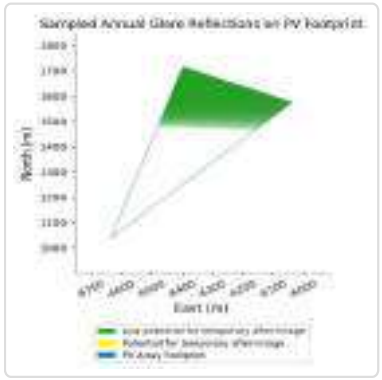

PV array is expected to produce the following glare for this receptor:

- 105 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

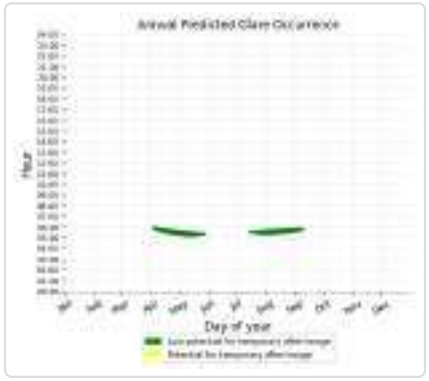

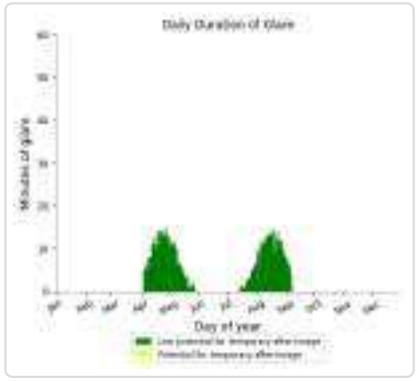

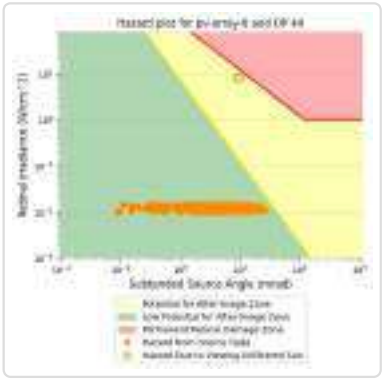

PV array 8: OP 44

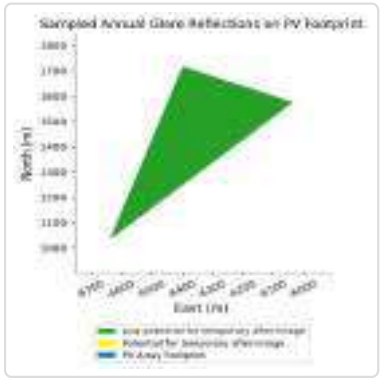

PV array is expected to produce the following glare for this receptor:

- 914 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

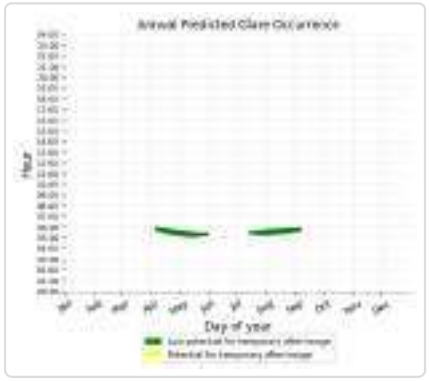

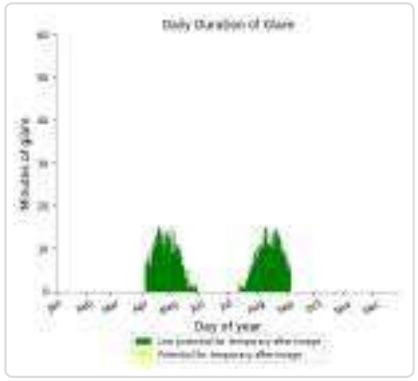

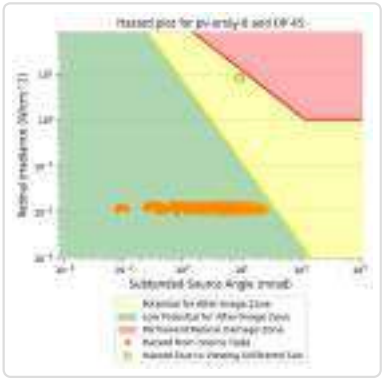

PV array 8: OP 45

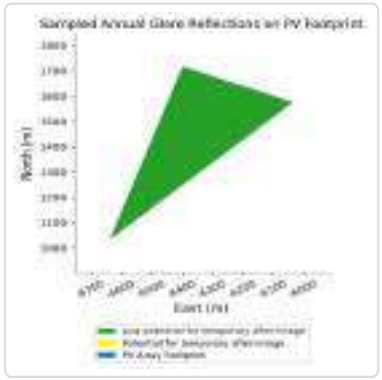

PV array is expected to produce the following glare for this receptor:

- 944 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

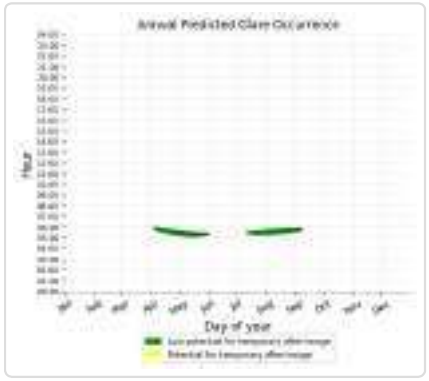

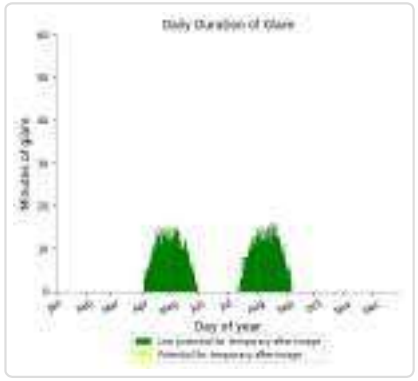

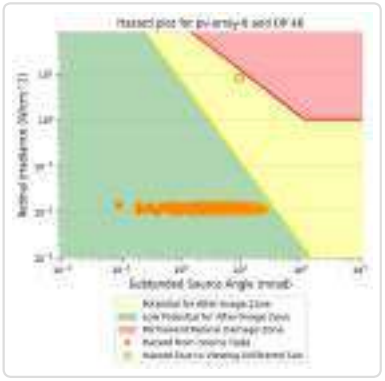

PV array 8: OP 46

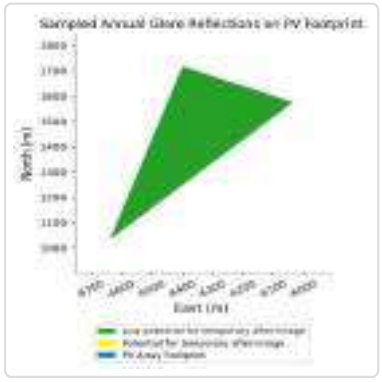

PV array is expected to produce the following glare for this receptor:

- 1,150 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

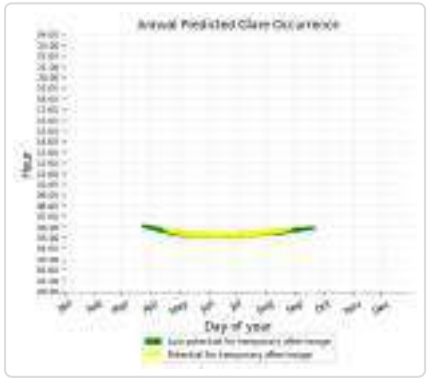

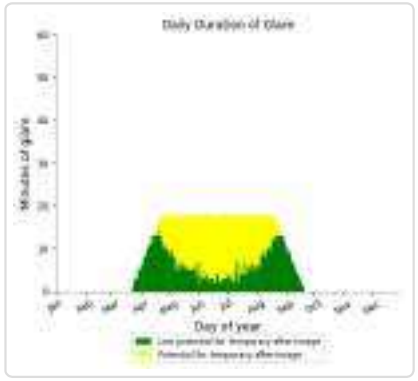

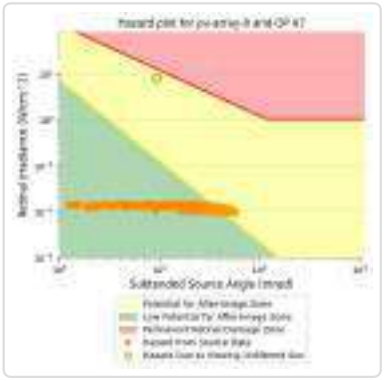

PV array 8: OP 47

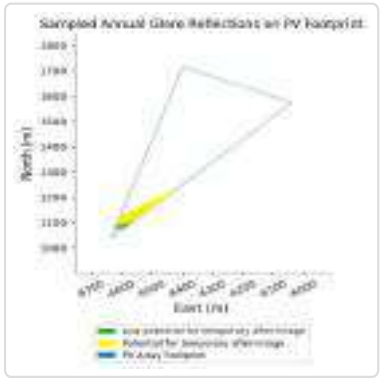

PV array is expected to produce the following glare for this receptor:

- 1,203 minutes of "green" glare with low potential to cause temporary after-image.
- 1,475 minutes of "yellow" glare with potential to cause temporary after-image.

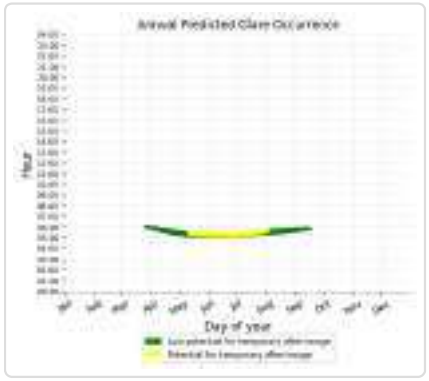

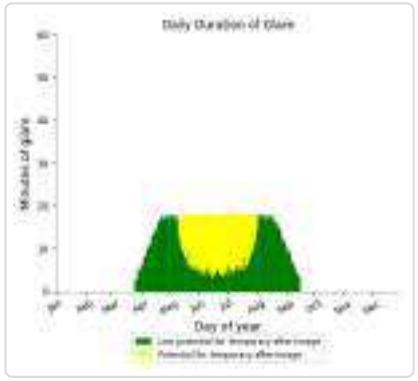

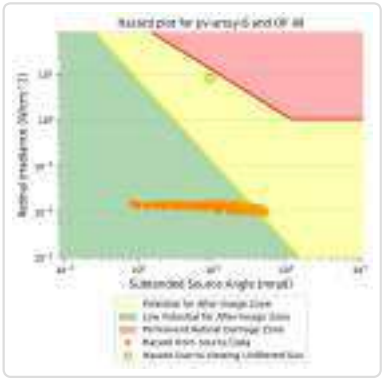

PV array 8: OP 48

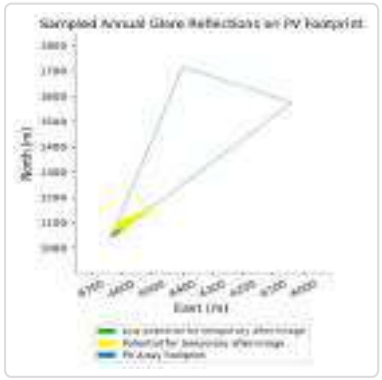

PV array is expected to produce the following glare for this receptor:

- 1,682 minutes of "green" glare with low potential to cause temporary after-image.
- 1,000 minutes of "yellow" glare with potential to cause temporary after-image.

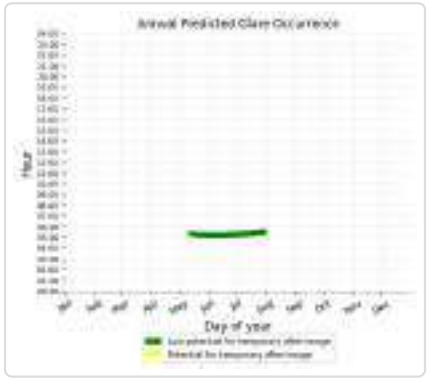

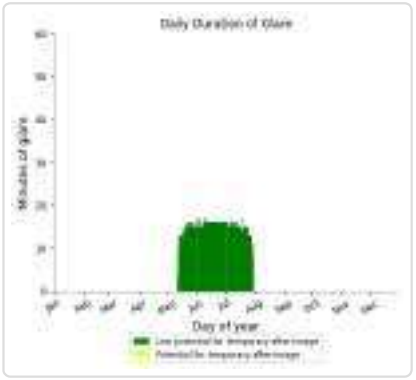

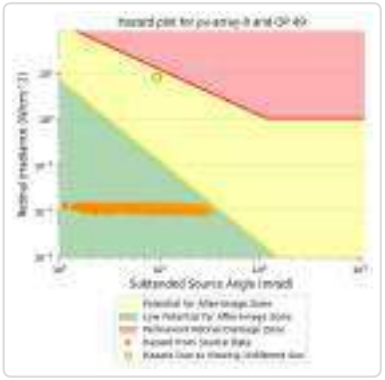

PV array 8: OP 49

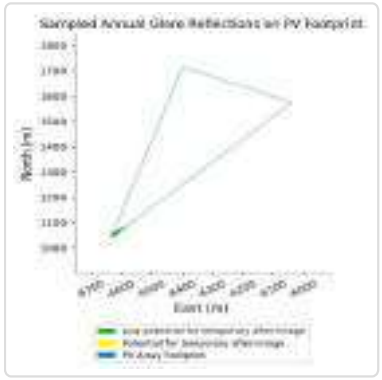

PV array is expected to produce the following glare for this receptor:

- 1,214 minutes of "green" glare with low potential to cause temporary after-image.

Summary of Vertical Surface Glare Analysis

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provi additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Appendix C: Residential Receptor Glare Results (1-65) (25 Deg)

ForgeSolar

East Park Solar

Residential Receptors 1 - 65 25 Deg

Client: Axis

Created Jun 12, 2024
Updated Sep 01, 2025
Time-step 1 minute
Timezone offset UTC0
Minimum sun altitude 0.0 deg
Site ID 121500.20781

Project type Advanced
Project status: active
Category 100 MW to 1 GW

Misc. Analysis Settings

DNI: **varies (1,000.0 W/m^2 peak)**
Ocular transmission coefficient: **0.5**
Pupil diameter: **0.002 m**
Eye focal length: **0.017 m**
Sun subtended angle: **9.3 mrad**

PV Analysis Methodology: **Version 2**
Enhanced subtended angle calculation: **On**

Summary of Results Glare with potential for temporary after-image predicted

Name: PV array 12
Footprint area: 165,528 m^2
Axis tracking: Fixed (no rotation)
Tilt: 25.0 deg
Orientation: 180.0 deg

Rated power: -
Panel material: Light textured glass with AR coating
Vary reflectivity with sun position? Yes
Correlate slope error with surface type? Yes
Slope error: 9.16 mrad

PV array is expected to produce the following glare for this receptor:

- 24 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

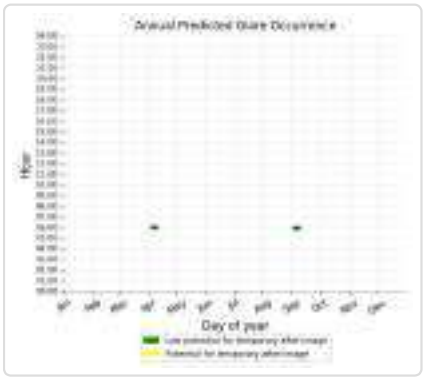

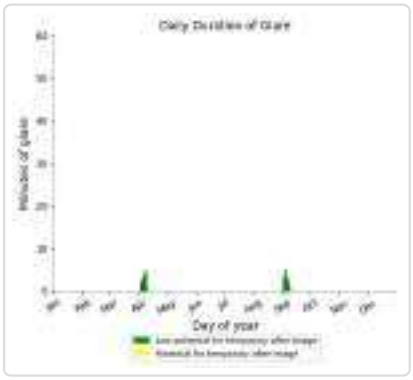

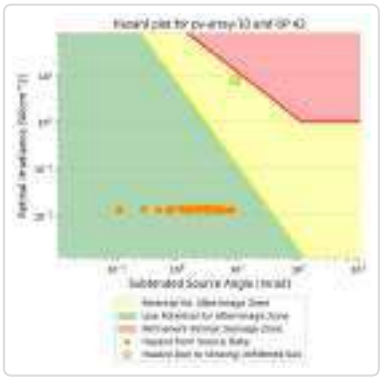

PV array 10: OP 42

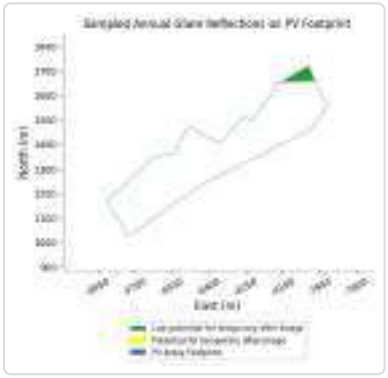

PV array is expected to produce the following glare for this receptor:

- 50 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

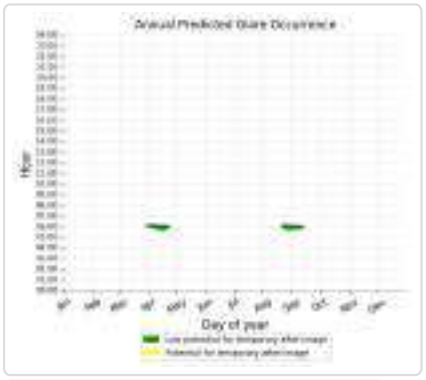

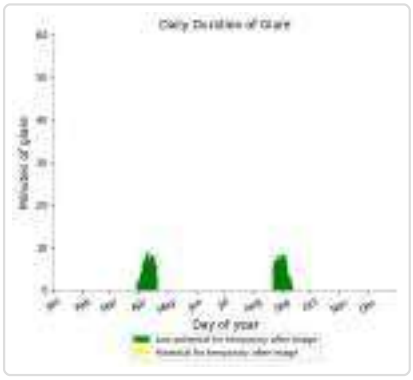

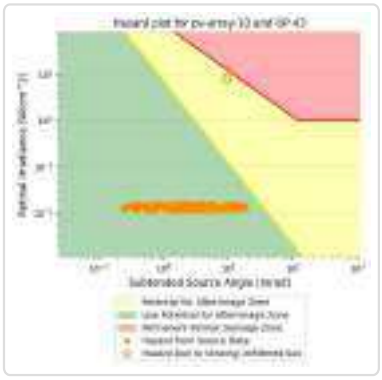

PV array 10: OP 43

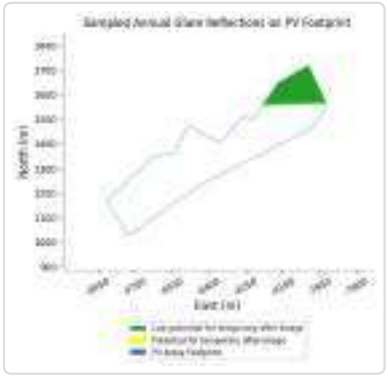

PV array is expected to produce the following glare for this receptor:

- 275 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array is expected to produce the following glare for this receptor:

- 3,504 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

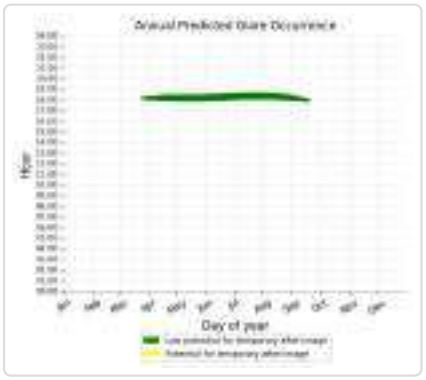

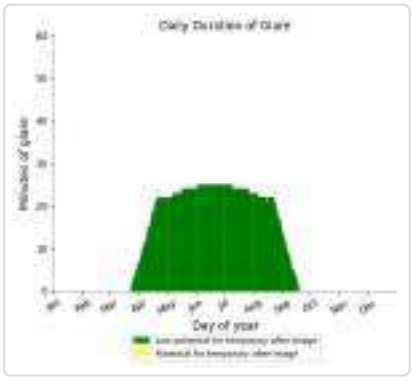

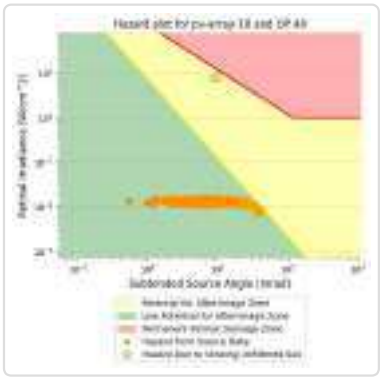

PV array 10: OP 48

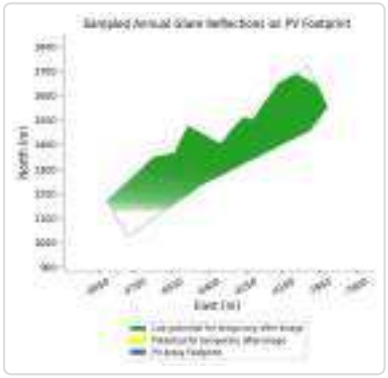

PV array is expected to produce the following glare for this receptor:

- 3,539 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

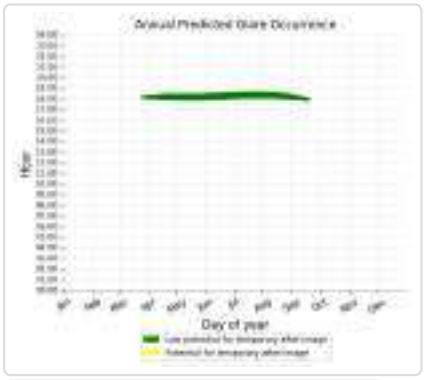

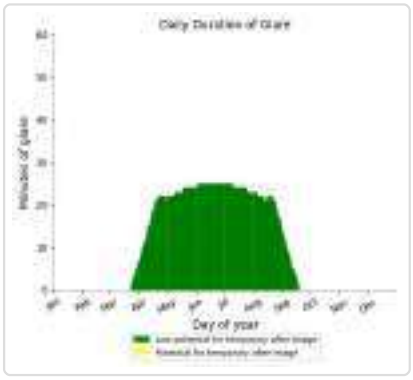

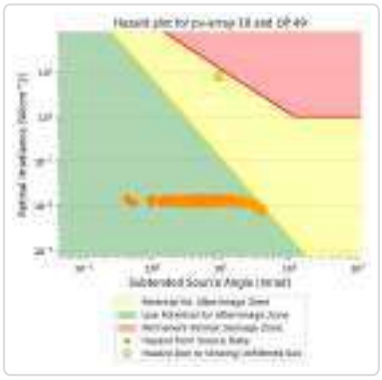

PV array 10: OP 49

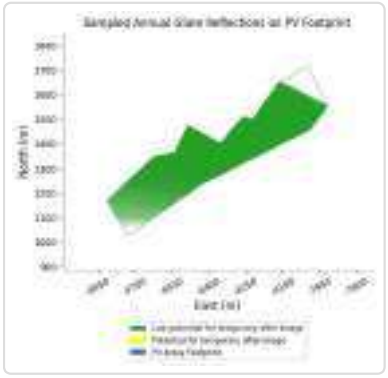

PV array is expected to produce the following glare for this receptor:

- 3,527 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

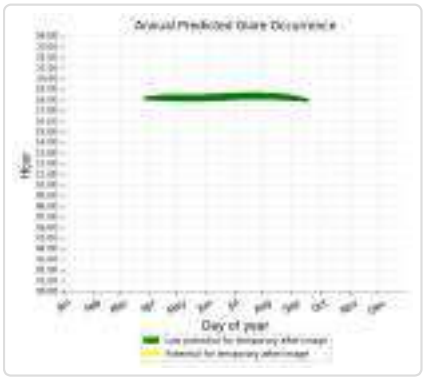

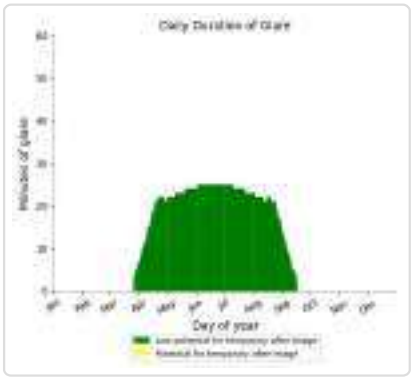

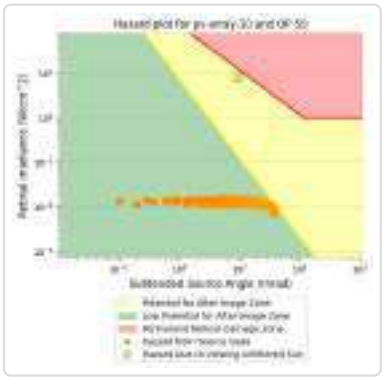

PV array 10: OP 50

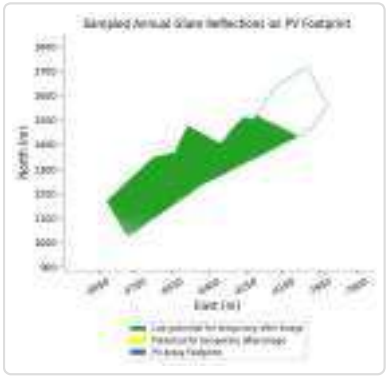

PV array is expected to produce the following glare for this receptor:

- 3,508 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

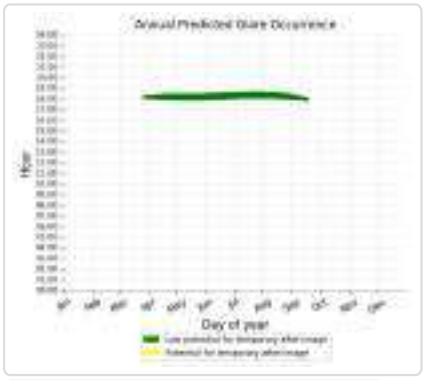

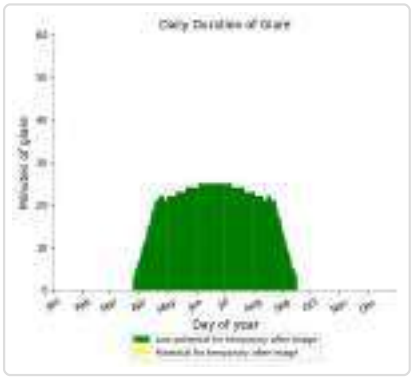

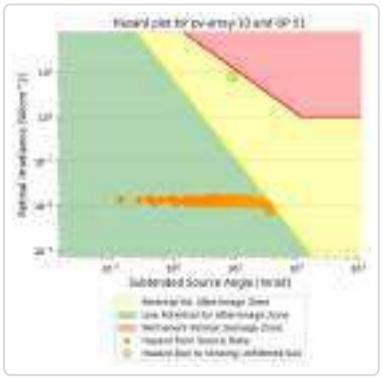

PV array 10: OP 51

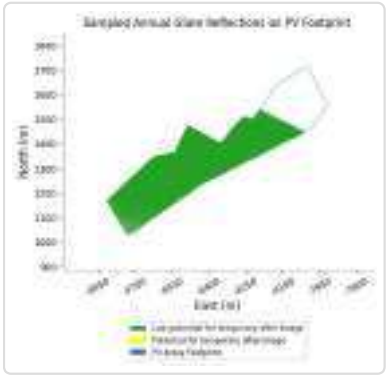

PV array is expected to produce the following glare for this receptor:

- 3,504 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

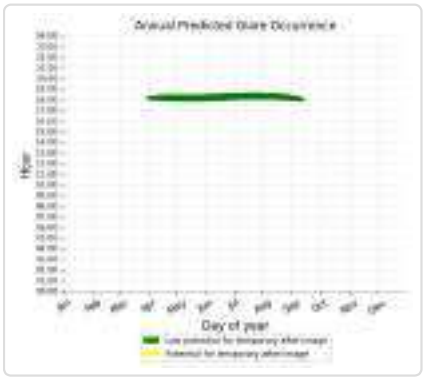

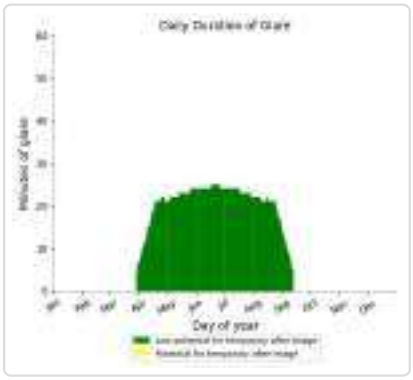

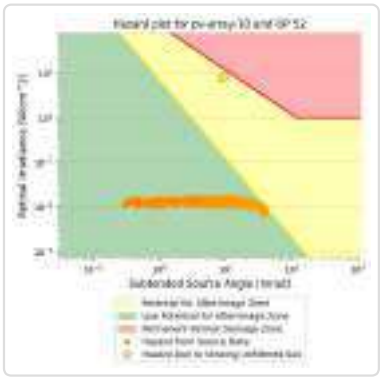

PV array 10: OP 52

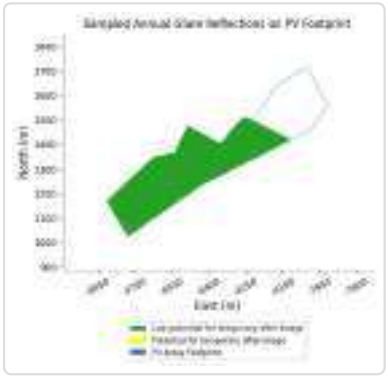

PV array is expected to produce the following glare for this receptor:

- 3,419 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

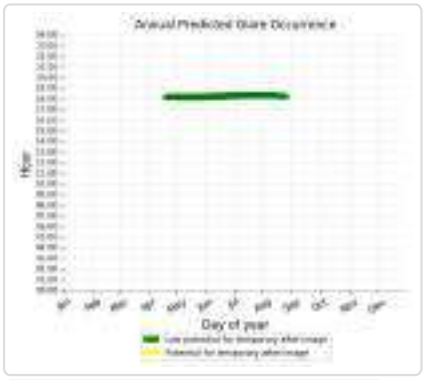

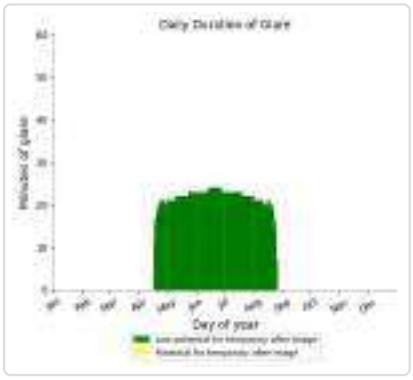

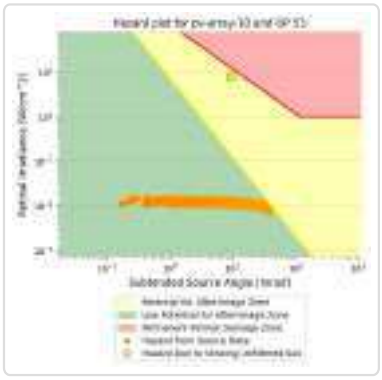

PV array 10: OP 53

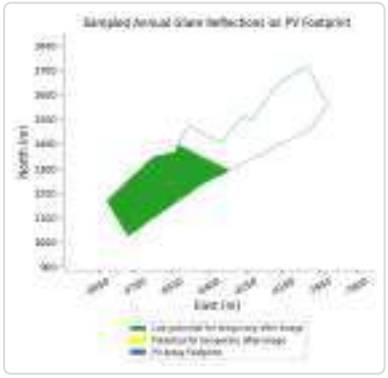

PV array is expected to produce the following glare for this receptor:

- 2,863 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

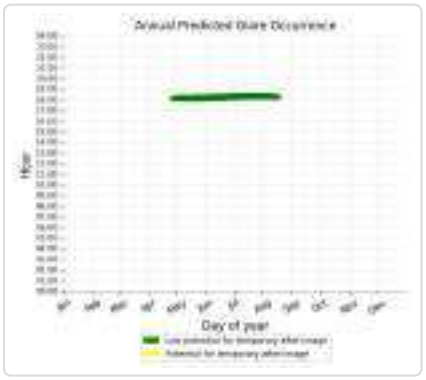

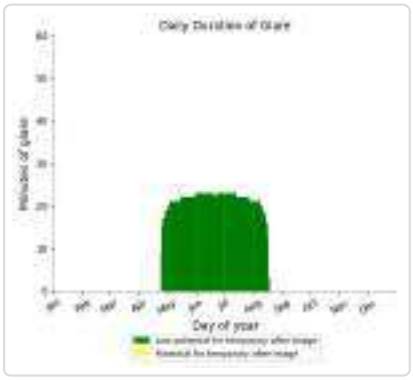

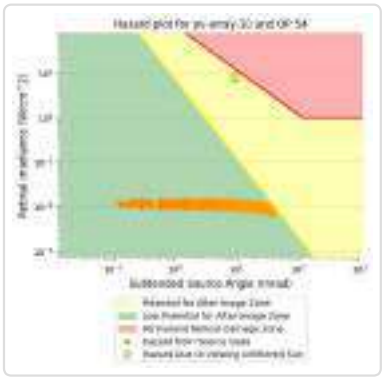

PV array 10: OP 54

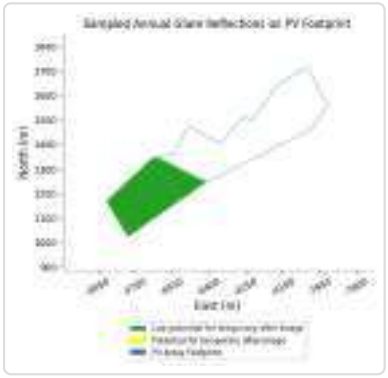

PV array is expected to produce the following glare for this receptor:

- 2,468 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

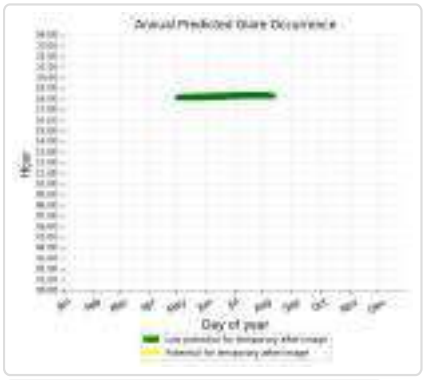

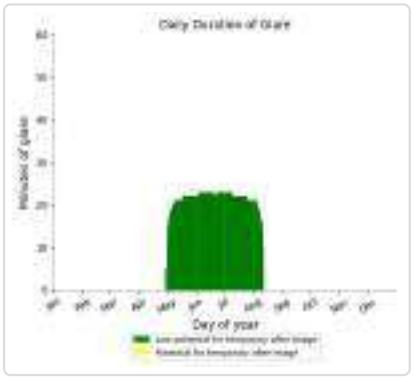

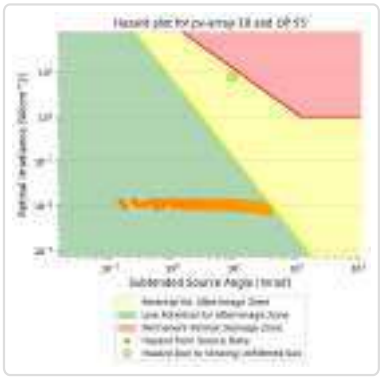

PV array 10: OP 55

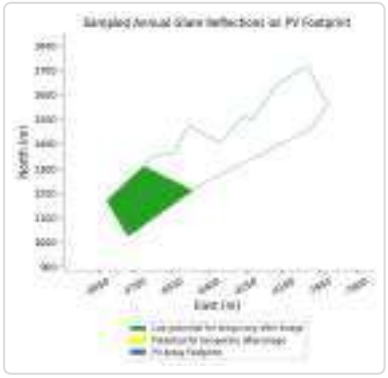

PV array is expected to produce the following glare for this receptor:

- 2,231 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

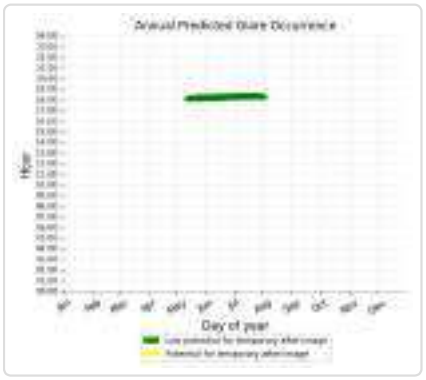

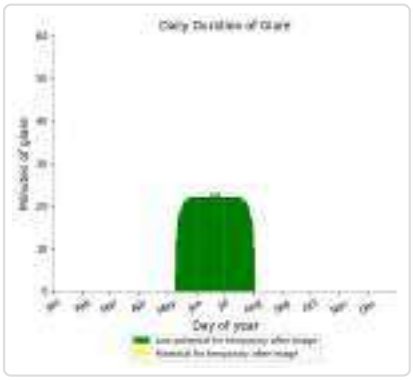

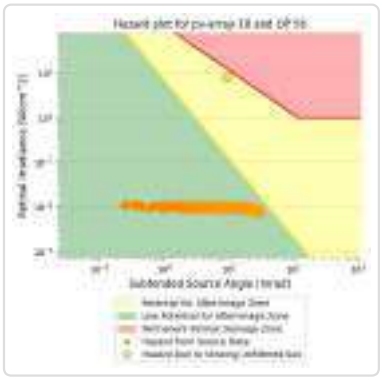

PV array 10: OP 56

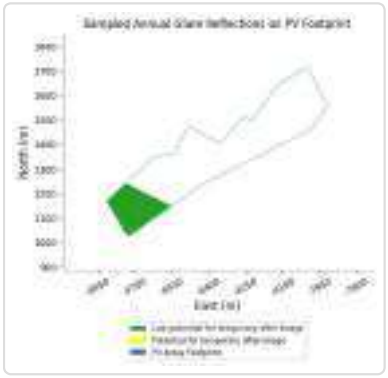

PV array is expected to produce the following glare for this receptor:

- 1,772 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

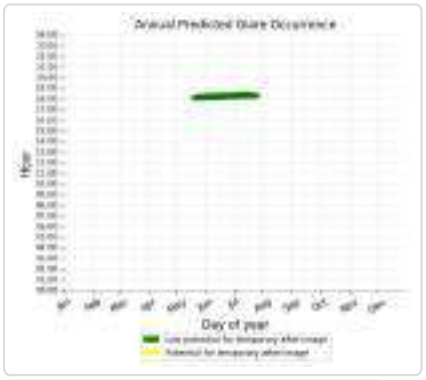

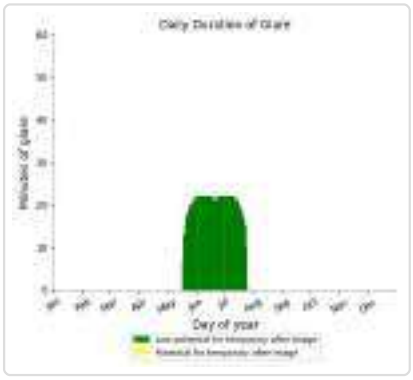

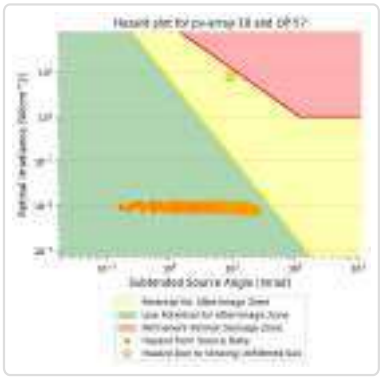

PV array 10: OP 57

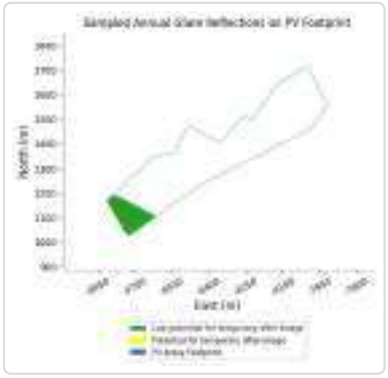

PV array is expected to produce the following glare for this receptor:

- 1,411 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

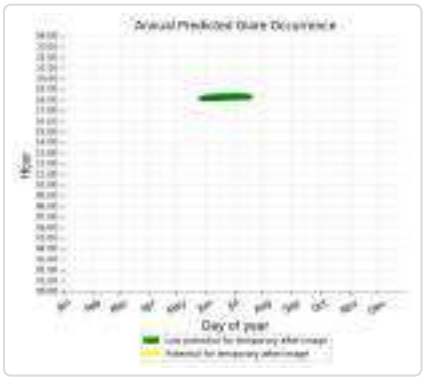

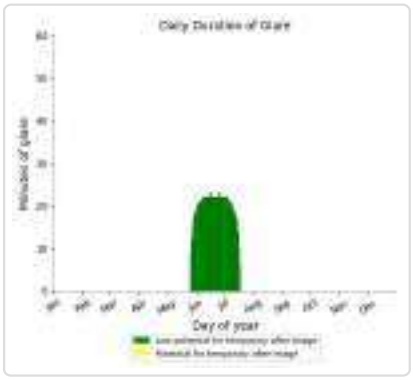

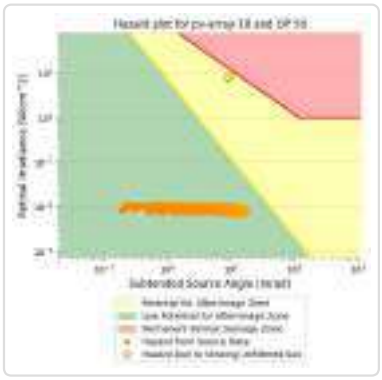

PV array 10: OP 58

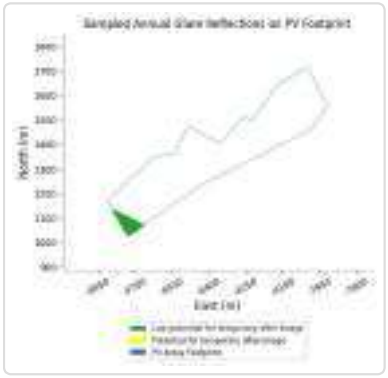

PV array is expected to produce the following glare for this receptor:

- 1,078 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

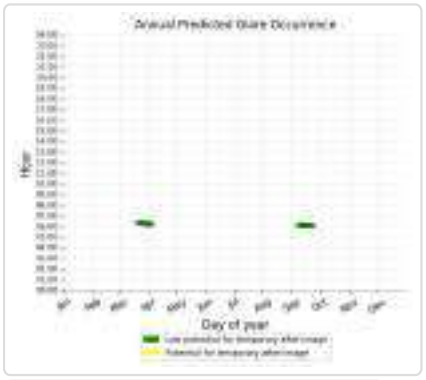

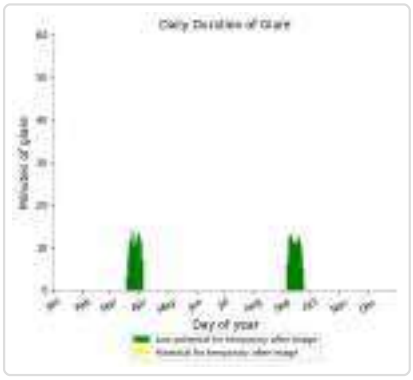

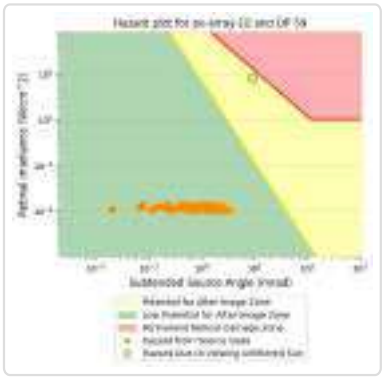

PV array 10: OP 59

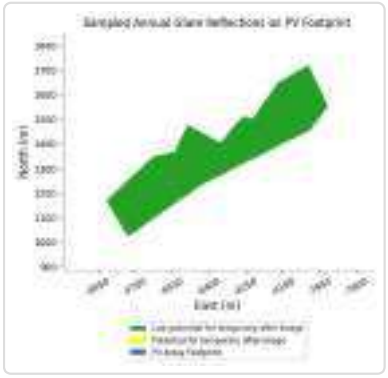

PV array is expected to produce the following glare for this receptor:

- 388 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

- 521 minutes of "yellow" glare with potential to cause temporary after-image.

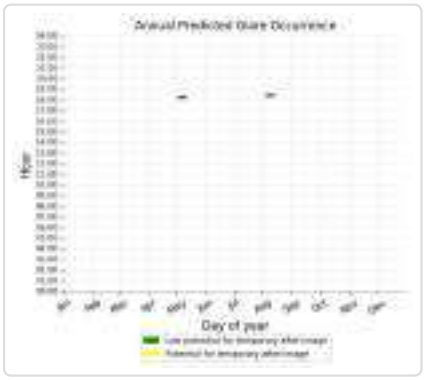

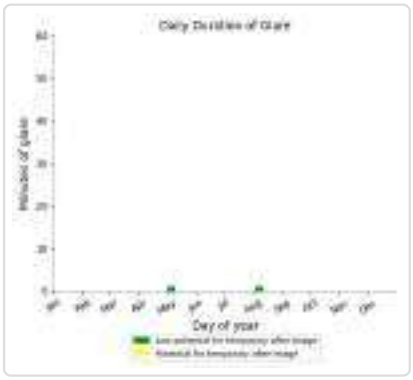

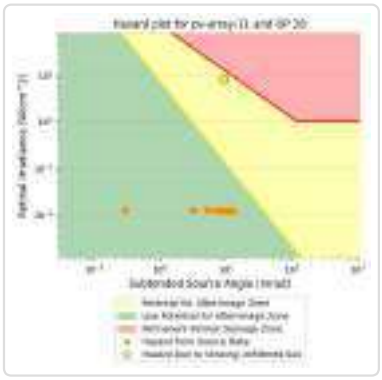

PV array 11: OP 28

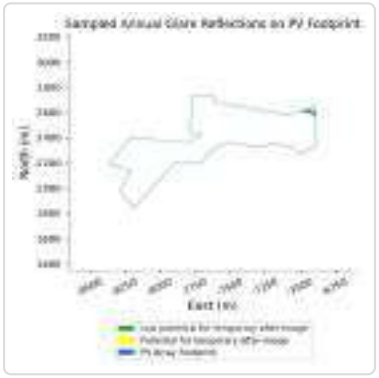

PV array is expected to produce the following glare for this receptor:

- 16 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

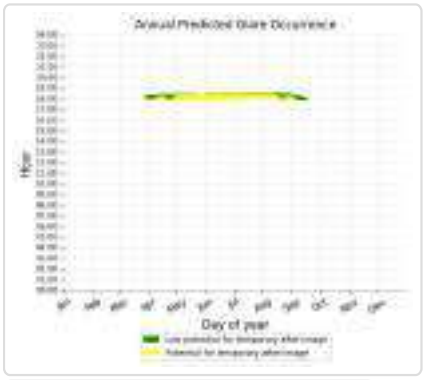

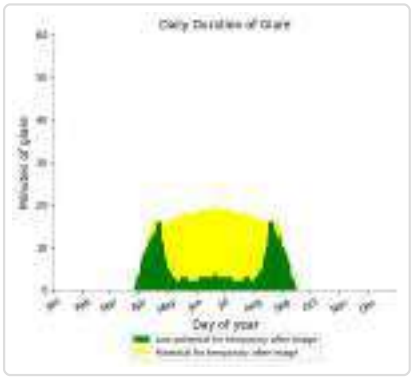

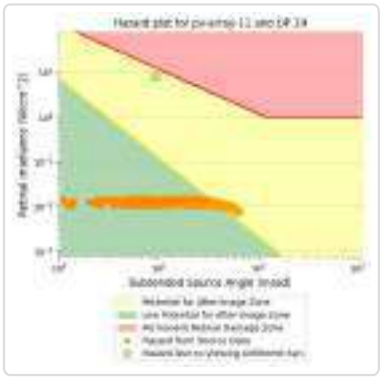

PV array 11: OP 29

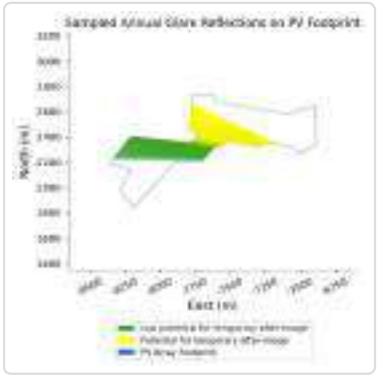

PV array is expected to produce the following glare for this receptor:

- 983 minutes of "green" glare with low potential to cause temporary after-image.
- 1,680 minutes of "yellow" glare with potential to cause temporary after-image.

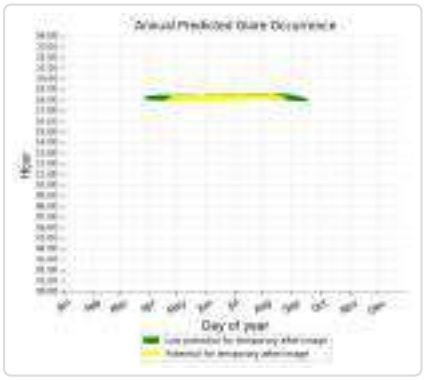

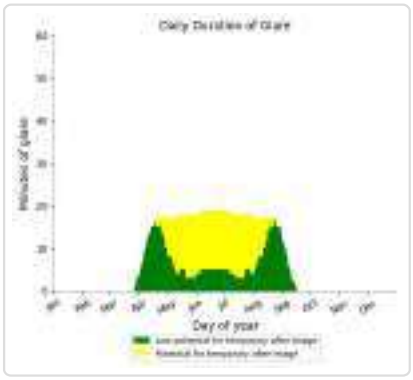

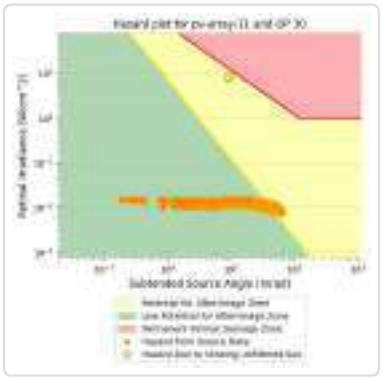

PV array 11: OP 30

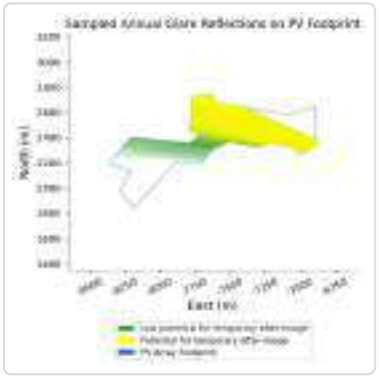

PV array is expected to produce the following glare for this receptor:

- 1,236 minutes of "green" glare with low potential to cause temporary after-image.
- 1,453 minutes of "yellow" glare with potential to cause temporary after-image.

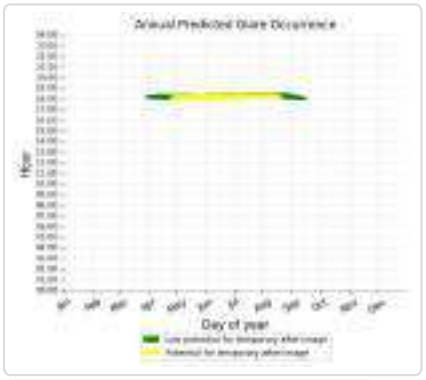

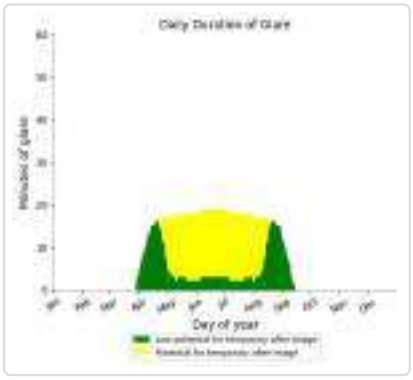

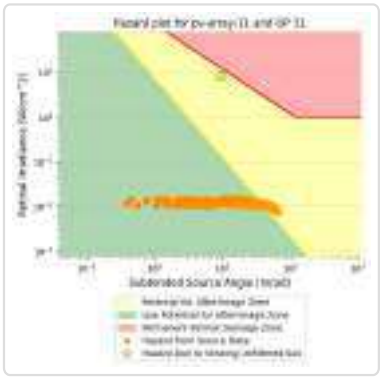

PV array 11: OP 31

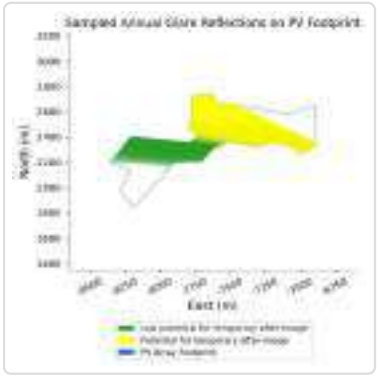

PV array is expected to produce the following glare for this receptor:

- 1,000 minutes of "green" glare with low potential to cause temporary after-image.
- 1,669 minutes of "yellow" glare with potential to cause temporary after-image.

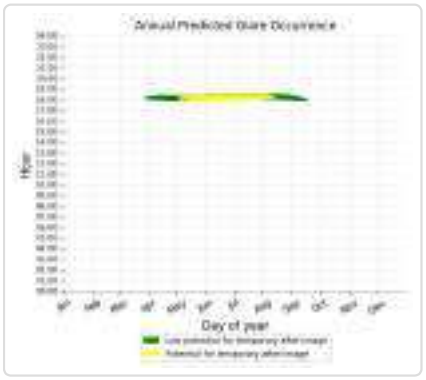

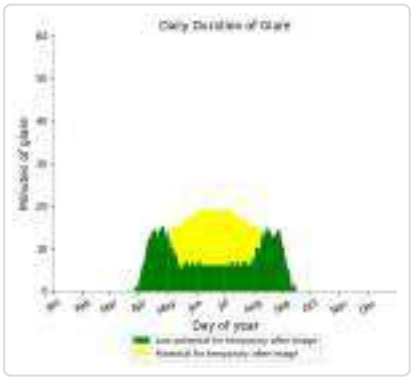

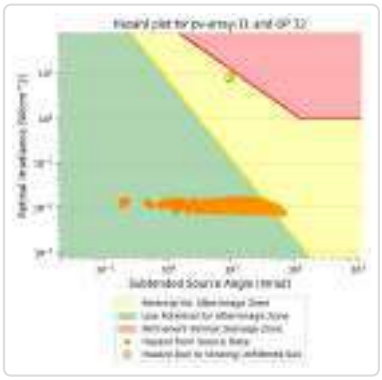

PV array 11: OP 32

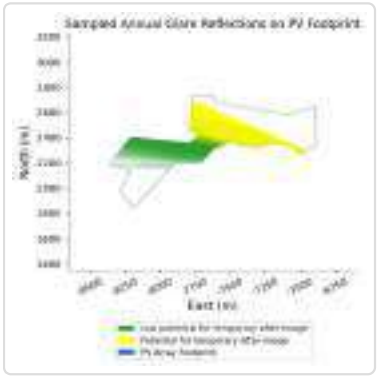

PV array is expected to produce the following glare for this receptor:

- 1,428 minutes of "green" glare with low potential to cause temporary after-image.
- 1,020 minutes of "yellow" glare with potential to cause temporary after-image.

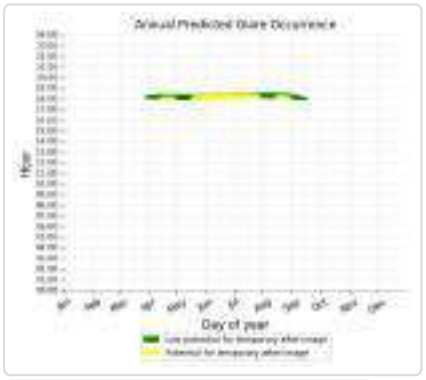

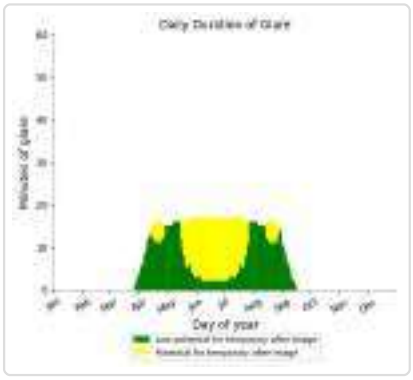

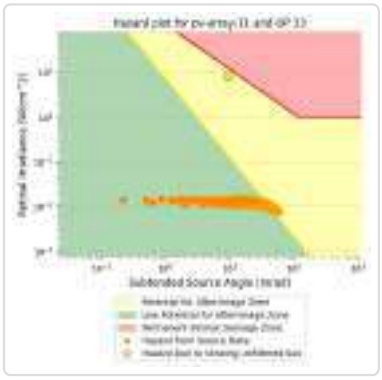

PV array 11: OP 33

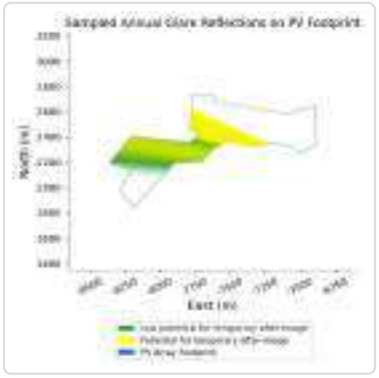

PV array is expected to produce the following glare for this receptor:

- 1,407 minutes of "green" glare with low potential to cause temporary after-image.
- 1,062 minutes of "yellow" glare with potential to cause temporary after-image.

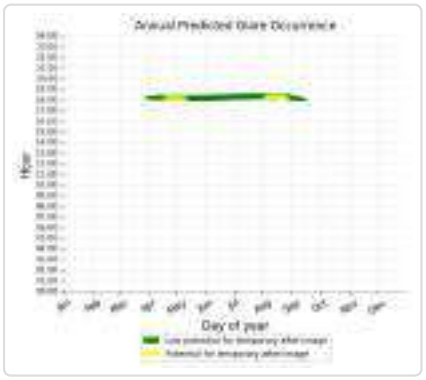

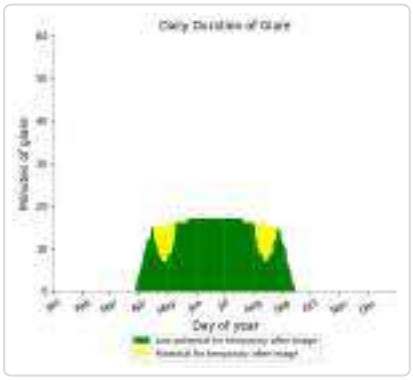

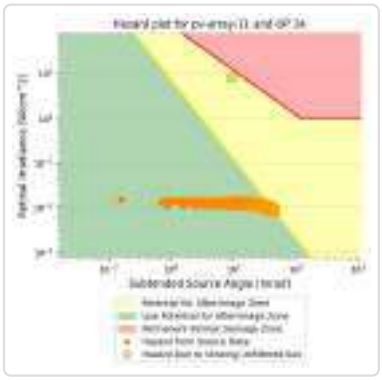

PV array 11: OP 34

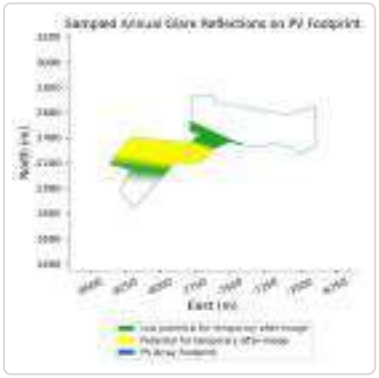

PV array is expected to produce the following glare for this receptor:

- 2,172 minutes of "green" glare with low potential to cause temporary after-image.
- 290 minutes of "yellow" glare with potential to cause temporary after-image.

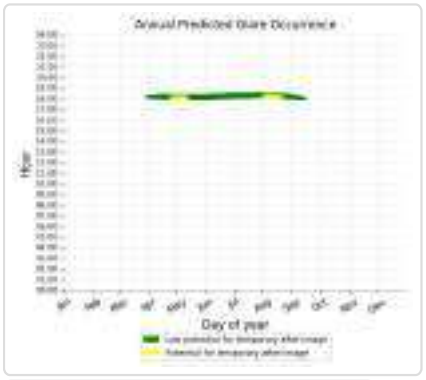

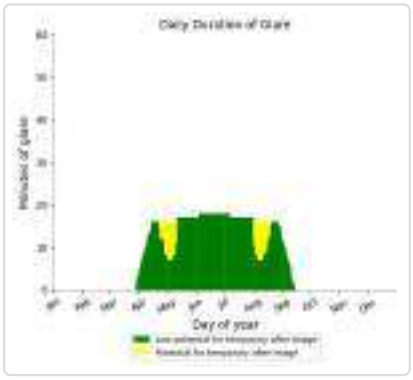

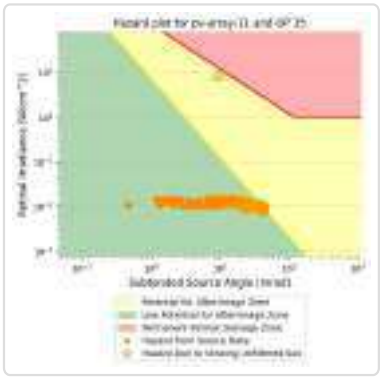

PV array 11: OP 35

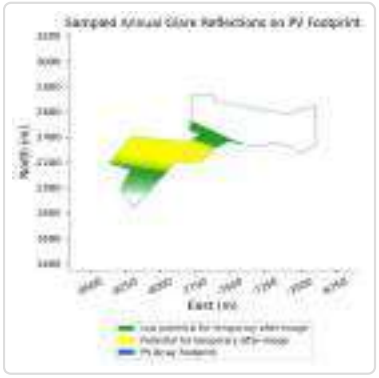

PV array is expected to produce the following glare for this receptor:

- 2,298 minutes of "green" glare with low potential to cause temporary after-image.
- 267 minutes of "yellow" glare with potential to cause temporary after-image.

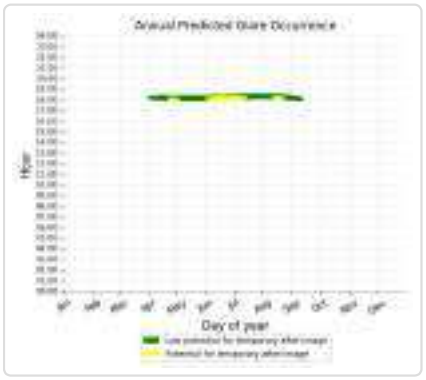

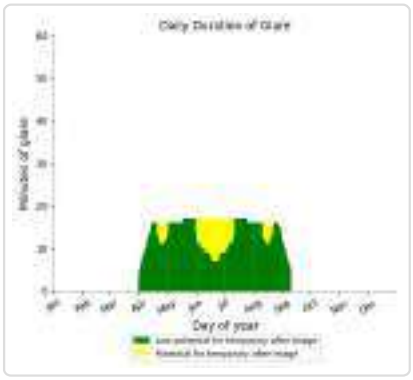

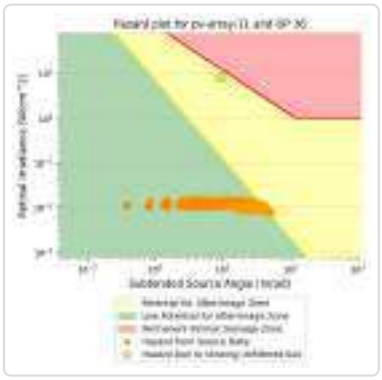

PV array 11: OP 36

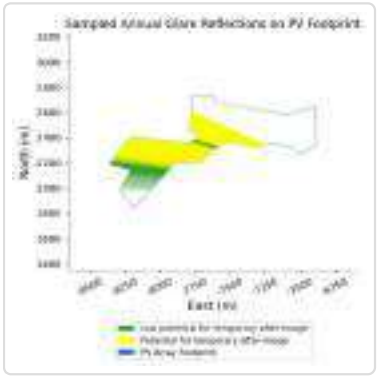

PV array is expected to produce the following glare for this receptor:

- 2,102 minutes of "green" glare with low potential to cause temporary after-image.
- 396 minutes of "yellow" glare with potential to cause temporary after-image.

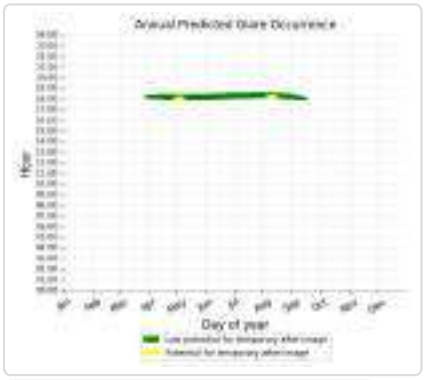

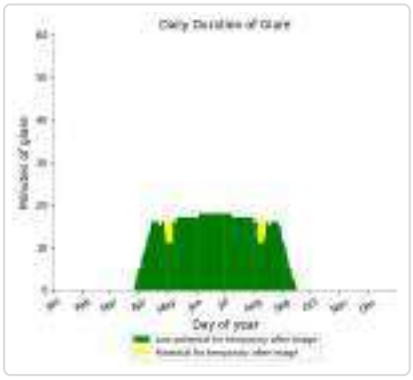

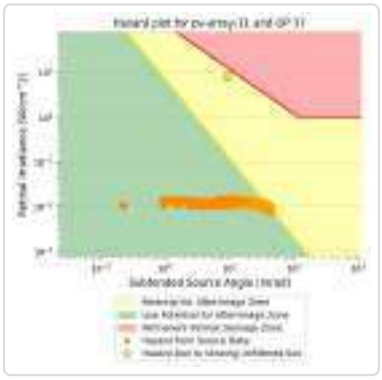

PV array 11: OP 37

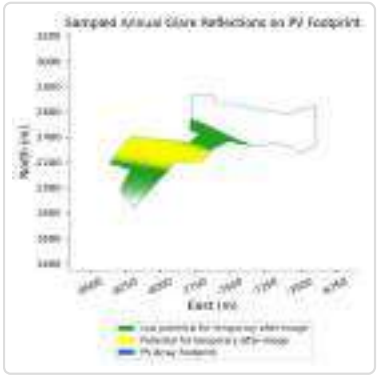

PV array is expected to produce the following glare for this receptor:

- 2,477 minutes of "green" glare with low potential to cause temporary after-image.
- 91 minutes of "yellow" glare with potential to cause temporary after-image.

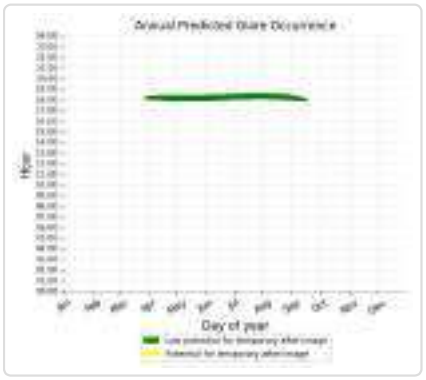

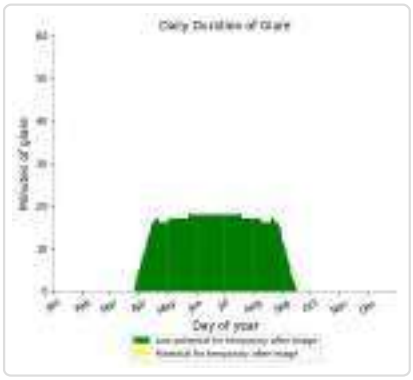

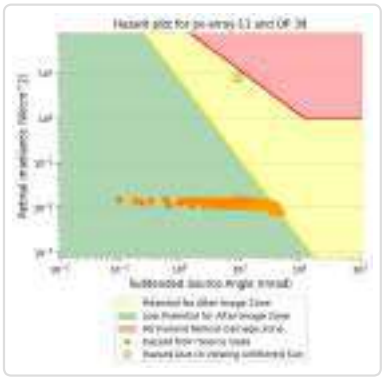

PV array 11: OP 38

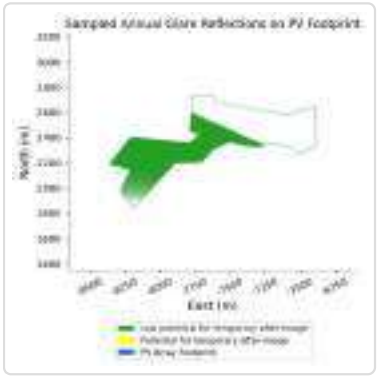

PV array is expected to produce the following glare for this receptor:

- 2,624 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

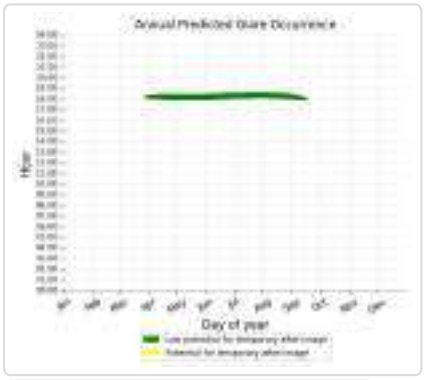

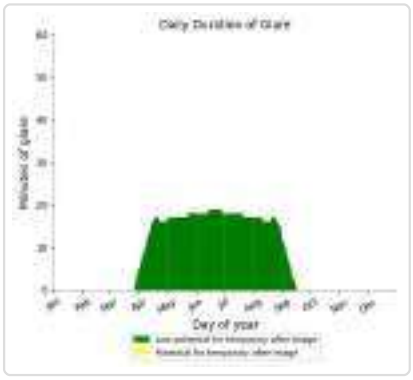

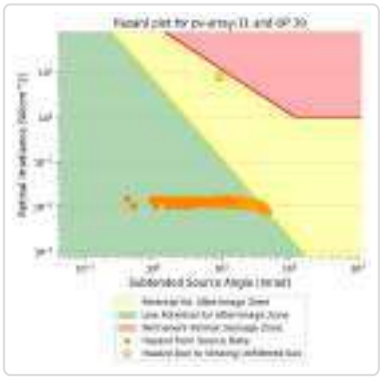

PV array 11: OP 39

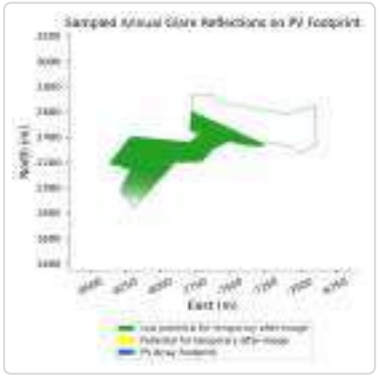

PV array is expected to produce the following glare for this receptor:

- 2,646 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

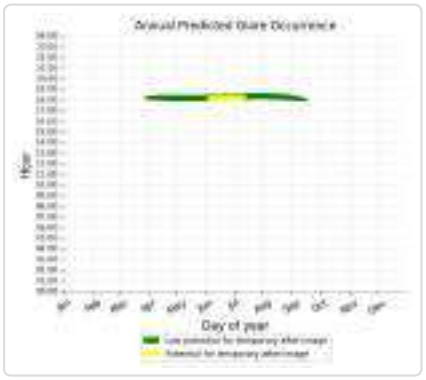

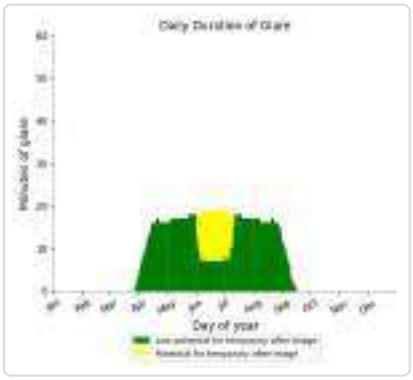

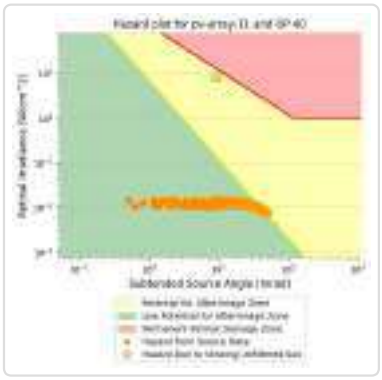

PV array 11: OP 40

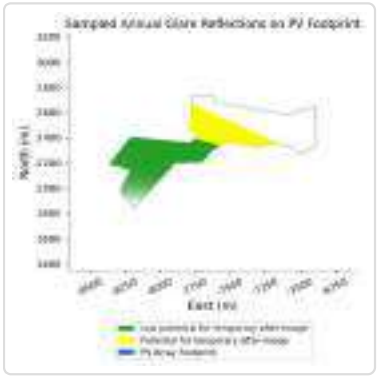

PV array is expected to produce the following glare for this receptor:

- 2,212 minutes of "green" glare with low potential to cause temporary after-image.
- 428 minutes of "yellow" glare with potential to cause temporary after-image.

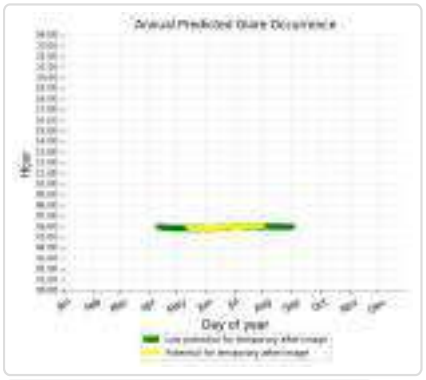

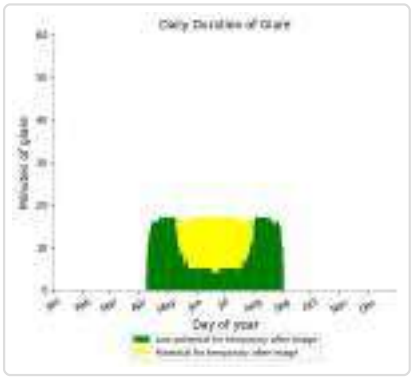

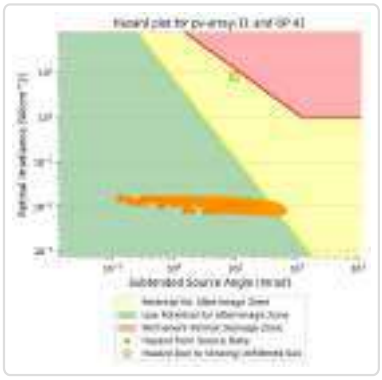

PV array 11: OP 41

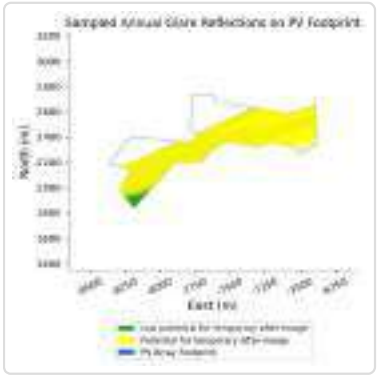

PV array is expected to produce the following glare for this receptor:

- 1,499 minutes of "green" glare with low potential to cause temporary after-image.
- 893 minutes of "yellow" glare with potential to cause temporary after-image.

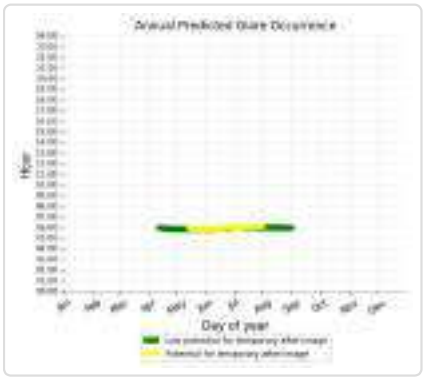

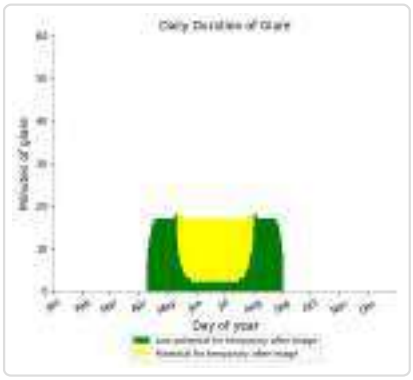

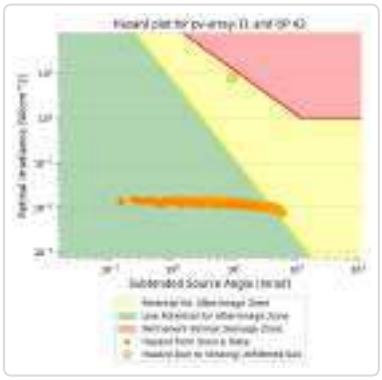

PV array 11: OP 42

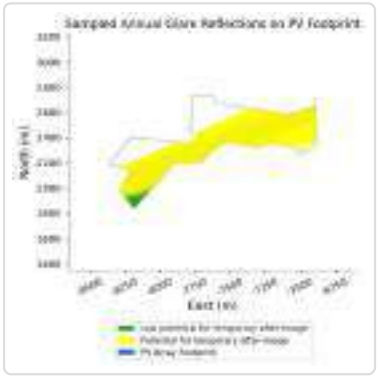

PV array is expected to produce the following glare for this receptor:

- 1,292 minutes of "green" glare with low potential to cause temporary after-image.
- 1,133 minutes of "yellow" glare with potential to cause temporary after-image.

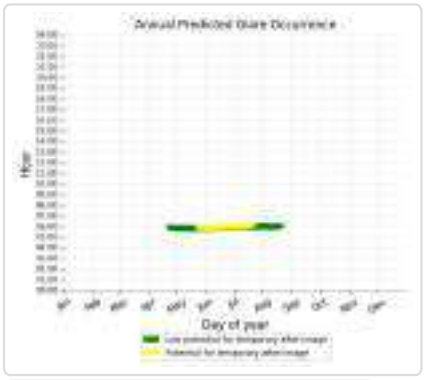

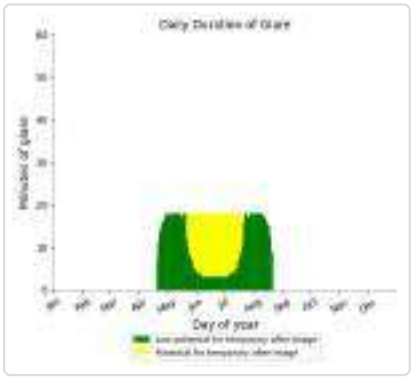

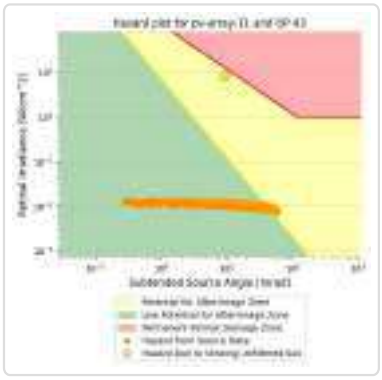

PV array 11: OP 43

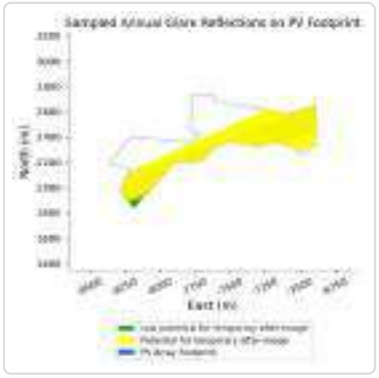

PV array is expected to produce the following glare for this receptor:

PV array 12: OP 1

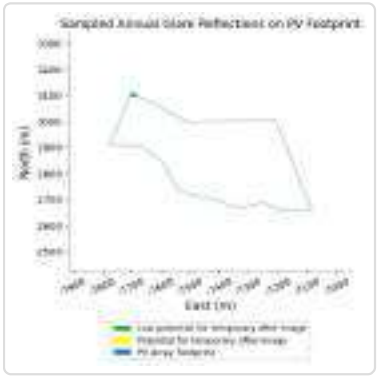

PV array is expected to produce the following glare for this receptor:

- 108 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

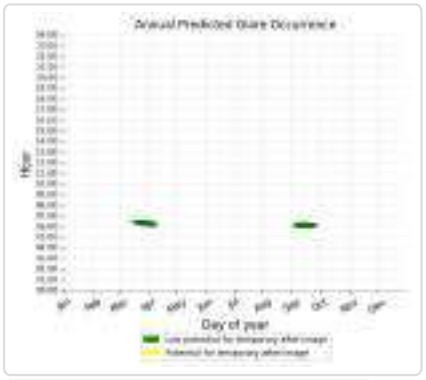

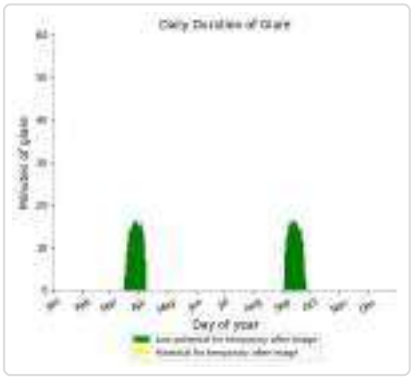

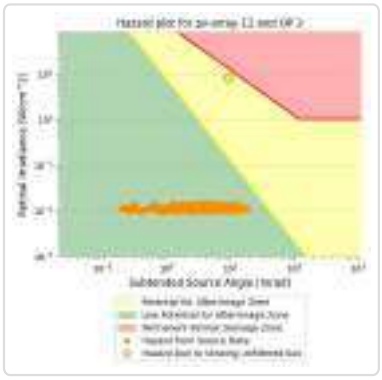

PV array 12: OP 2

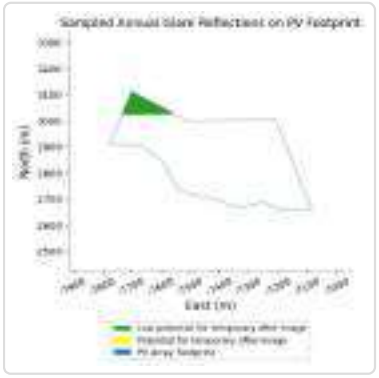

PV array is expected to produce the following glare for this receptor:

- 602 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

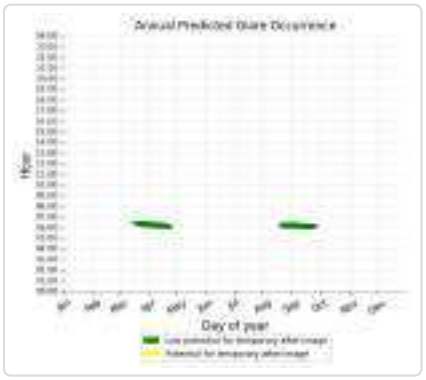

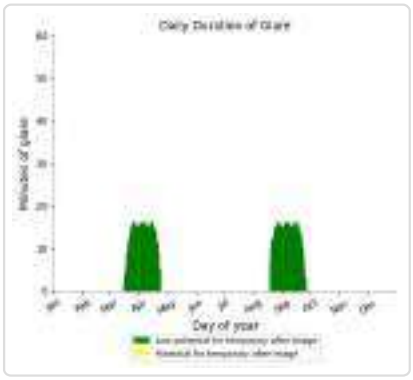

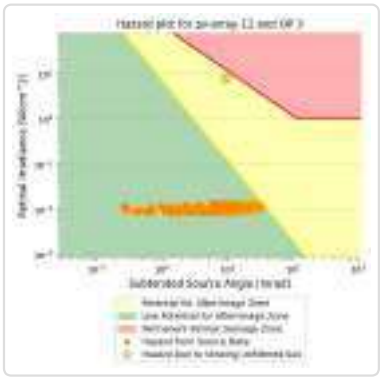

PV array 12: OP 3

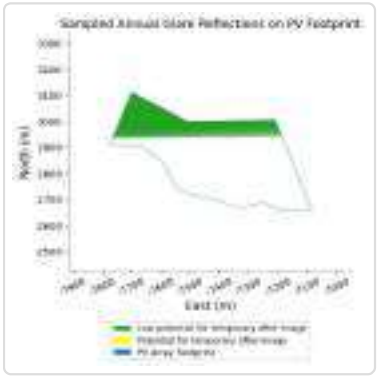

PV array is expected to produce the following glare for this receptor:

- 1,084 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

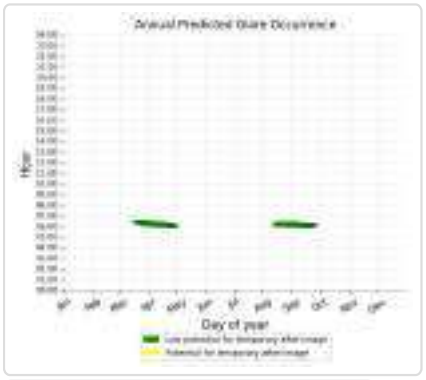

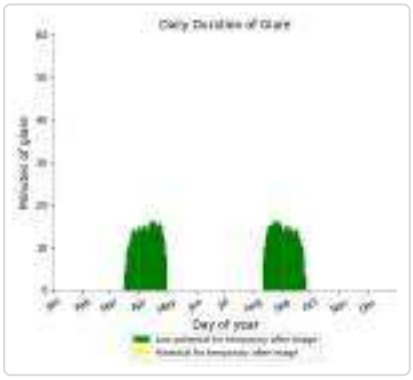

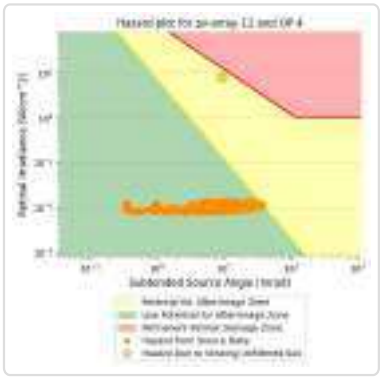

PV array 12: OP 4

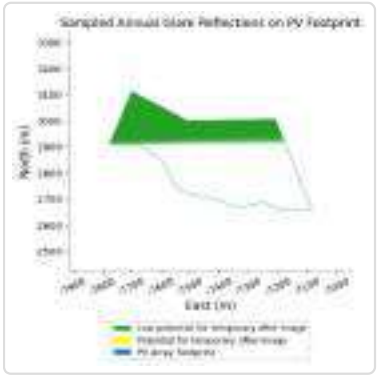

PV array is expected to produce the following glare for this receptor:

- 1,225 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

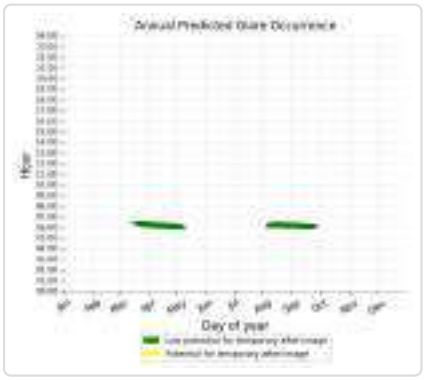

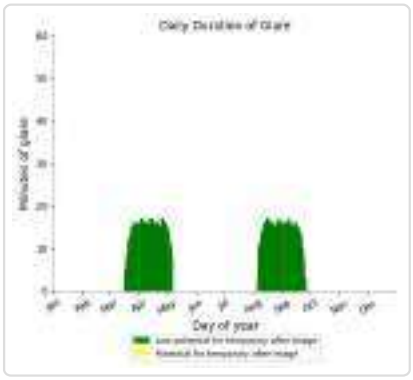

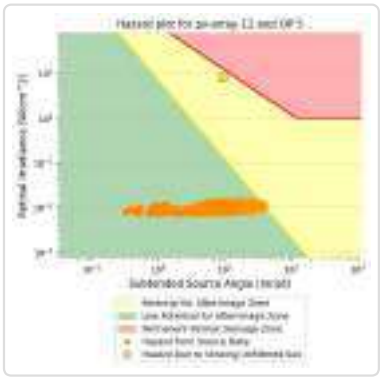

PV array 12: OP 5

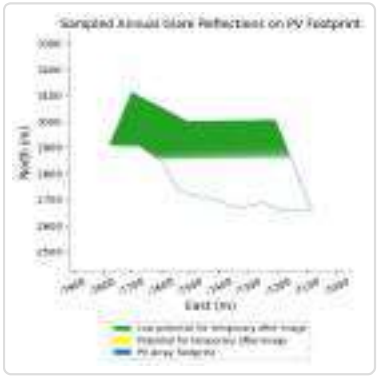

PV array is expected to produce the following glare for this receptor:

- 1,547 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

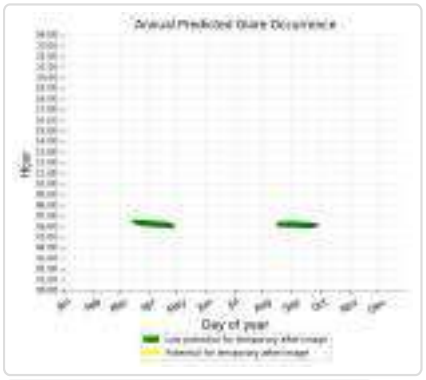

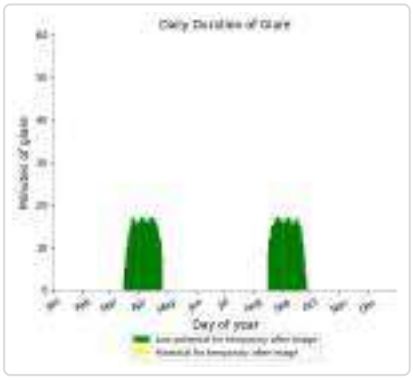

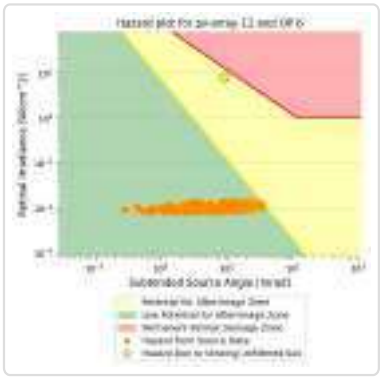

PV array 12: OP 6

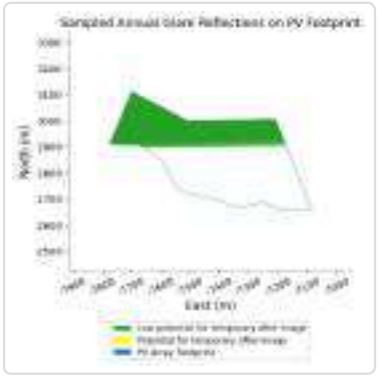

PV array is expected to produce the following glare for this receptor:

- 1,220 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

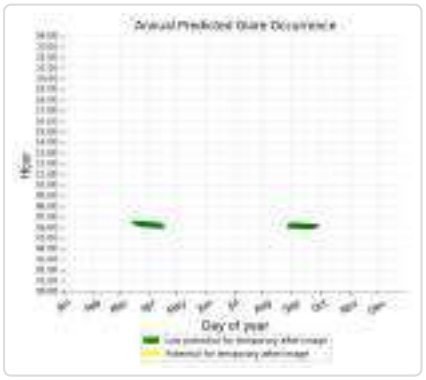

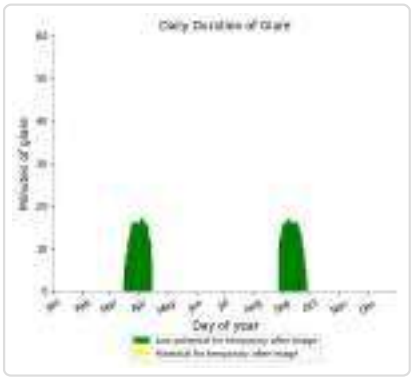

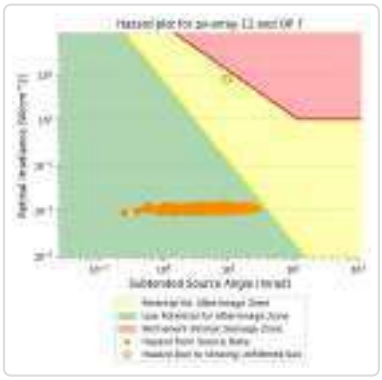

PV array 12: OP 7

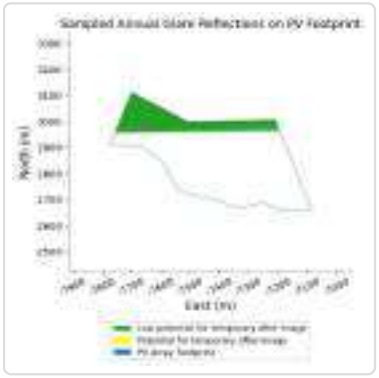

PV array is expected to produce the following glare for this receptor:

- 847 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

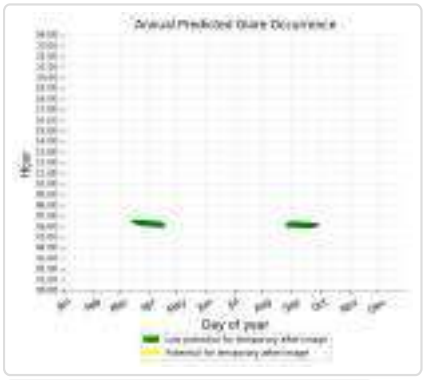

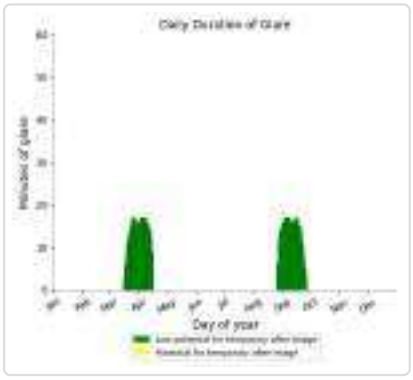

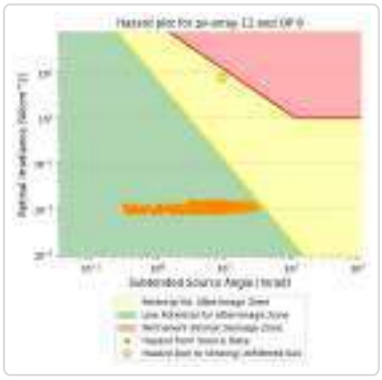

PV array 12: OP 8

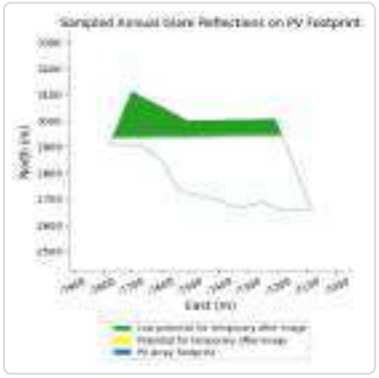

PV array is expected to produce the following glare for this receptor:

- 924 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

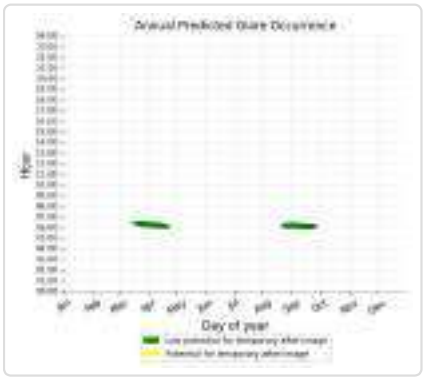

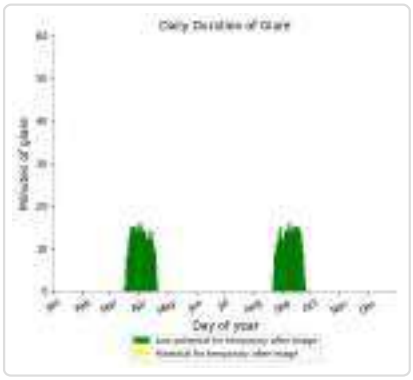

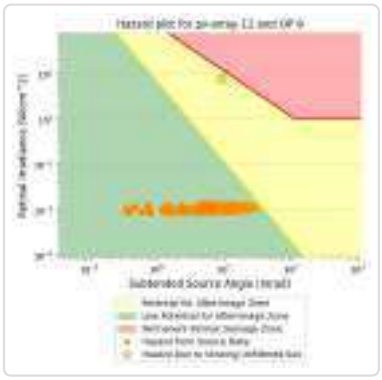

PV array 12: OP 9

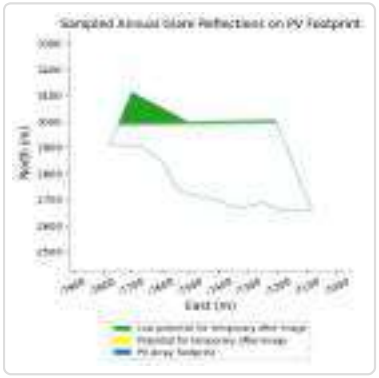

PV array is expected to produce the following glare for this receptor:

- 883 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

- 0 minutes of "yellow" glare with potential to cause temporary after-image.

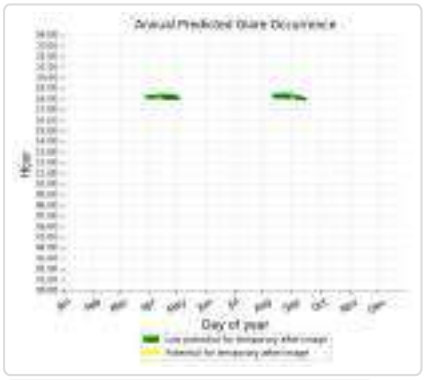

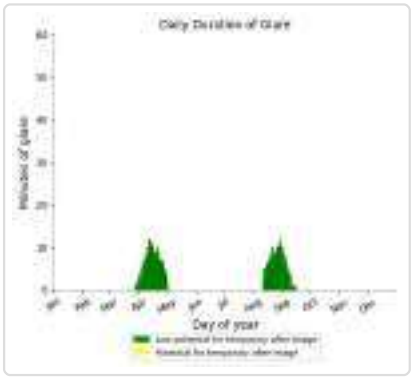

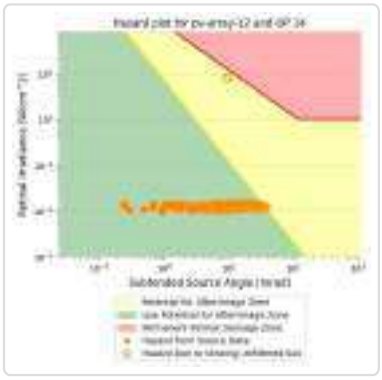

PV array 12: OP 14

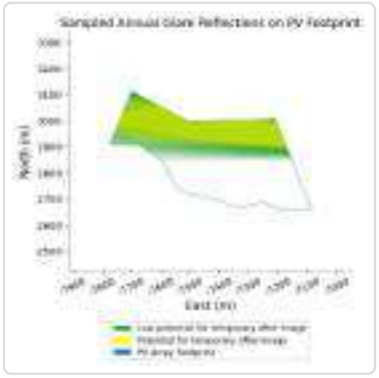

PV array is expected to produce the following glare for this receptor:

- 478 minutes of "green" glare with low potential to cause temporary after-image.
- 6 minutes of "yellow" glare with potential to cause temporary after-image.

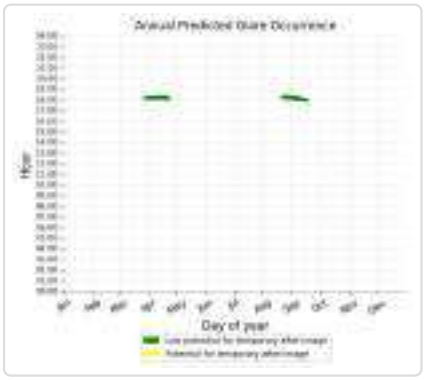

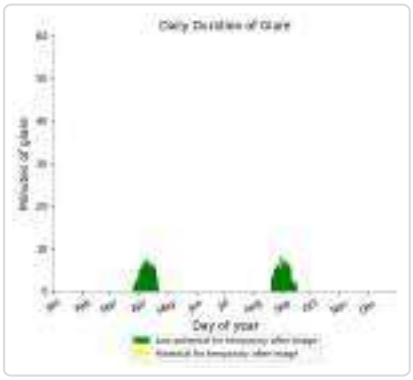

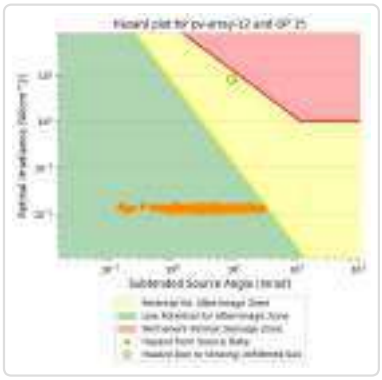

PV array 12: OP 15

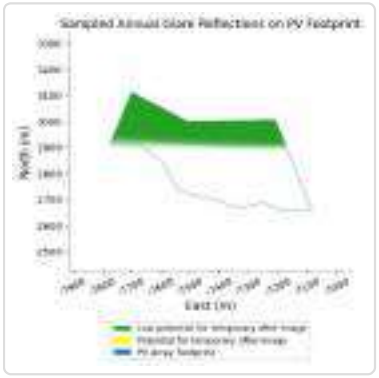

PV array is expected to produce the following glare for this receptor:

- 273 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

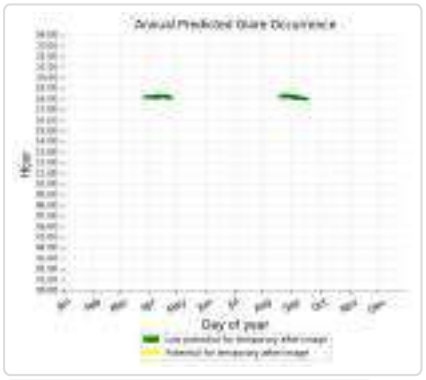

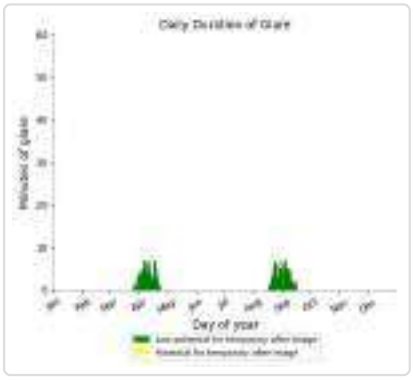

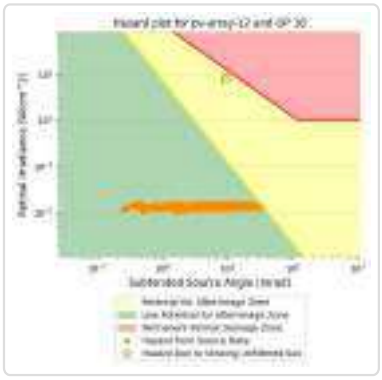

PV array 12: OP 16

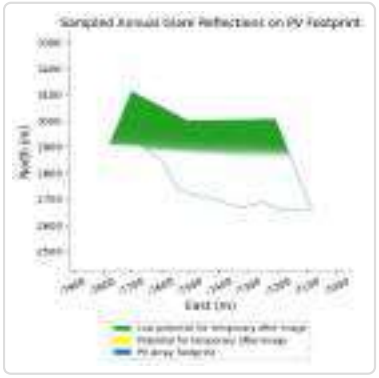

PV array is expected to produce the following glare for this receptor:

- 246 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

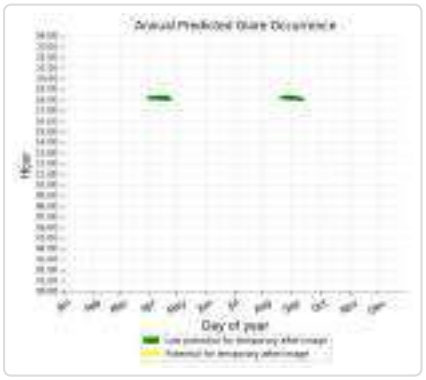

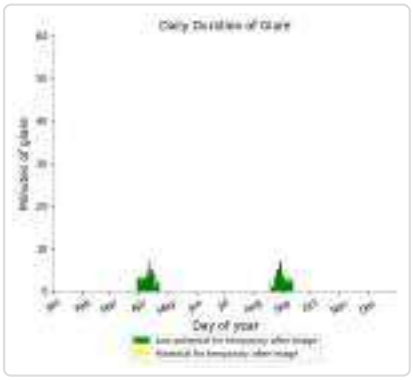

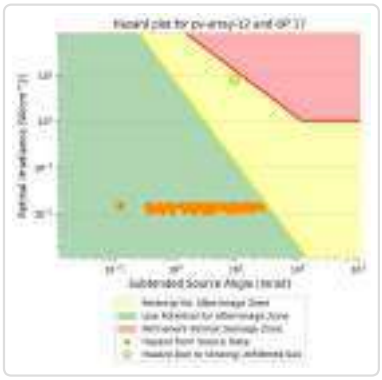

PV array 12: OP 17

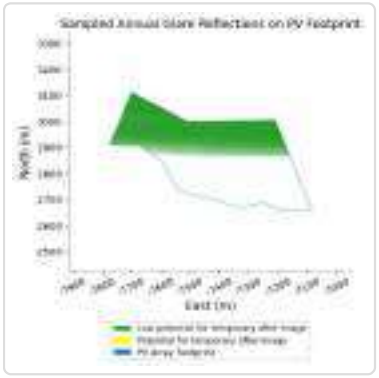

PV array is expected to produce the following glare for this receptor:

- 159 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

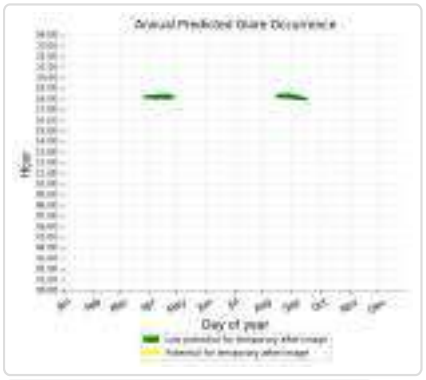

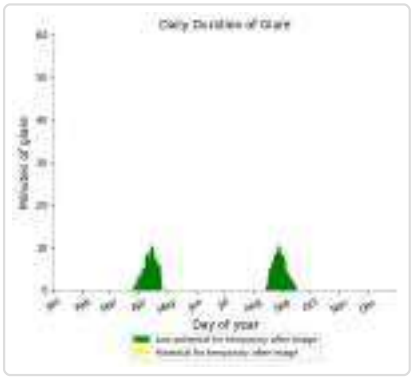

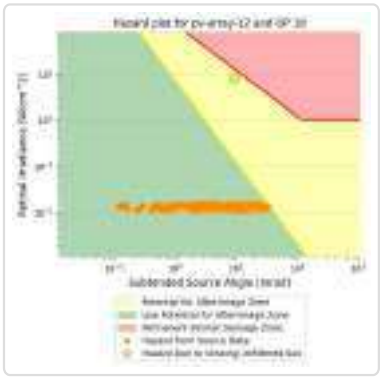

PV array 12: OP 18

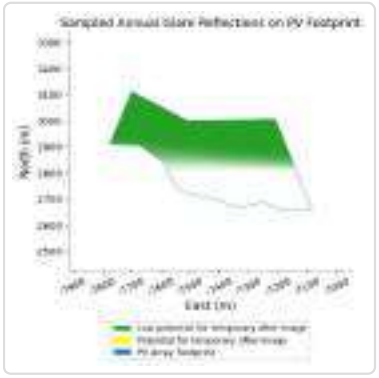

PV array is expected to produce the following glare for this receptor:

- 352 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

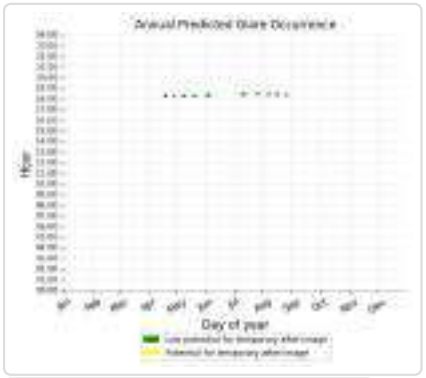

PV array 12: OP 19

PV array 3: OP 44

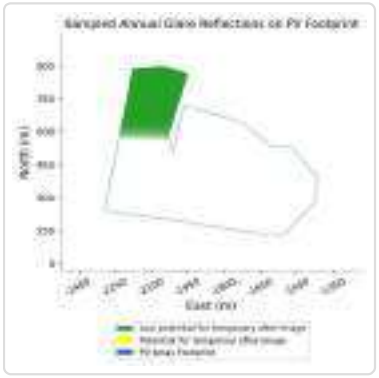

PV array is expected to produce the following glare for this receptor:

- 124 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

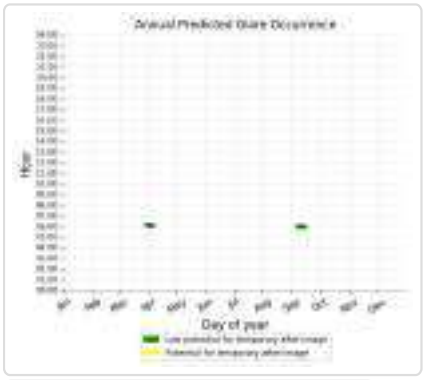

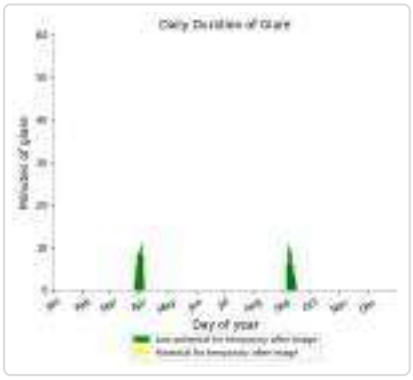

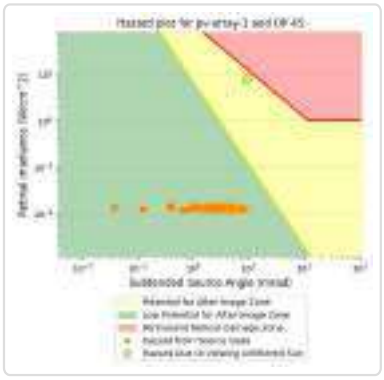

PV array 3: OP 45

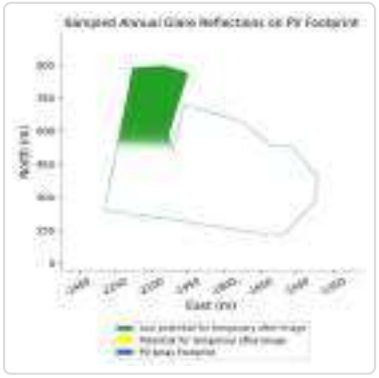

PV array is expected to produce the following glare for this receptor:

- 138 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

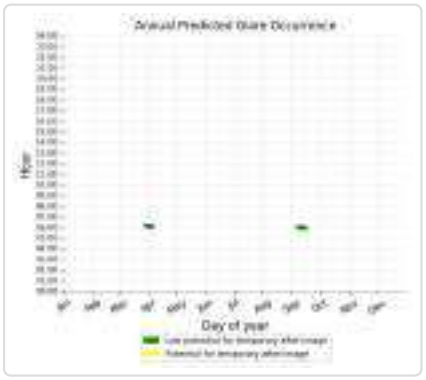

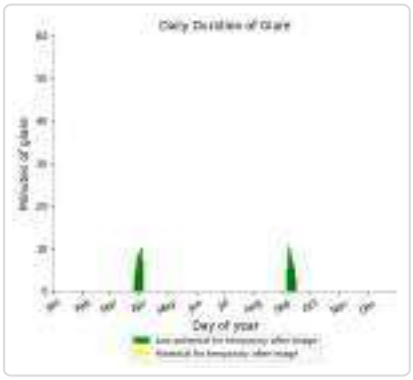

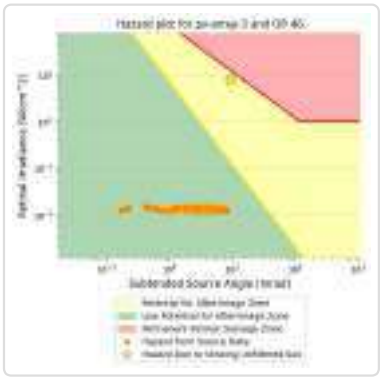

PV array 3: OP 46

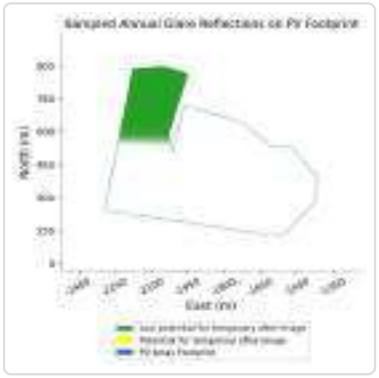

PV array is expected to produce the following glare for this receptor:

- 143 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 3: OP 47

No glare found

PV array 3: OP 48

No glare found

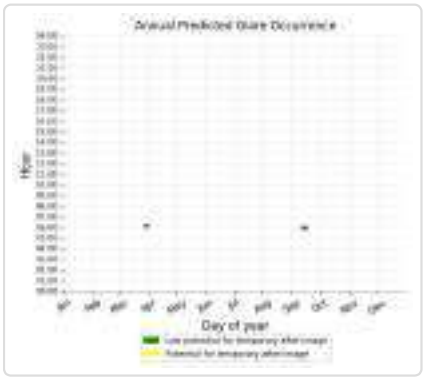

PV array 3: OP 49

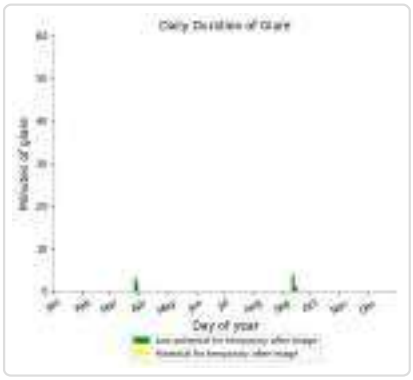

No glare found

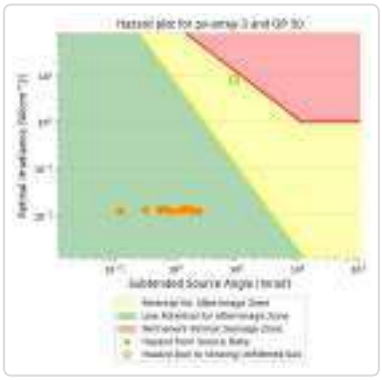

PV array 3: OP 50

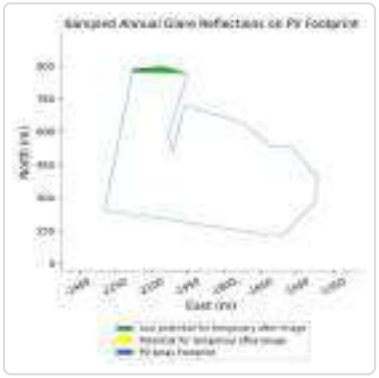

PV array is expected to produce the following glare for this receptor:

- 19 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

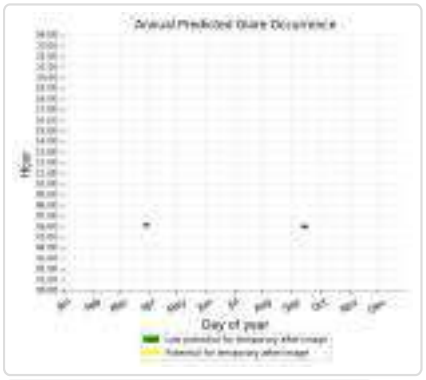

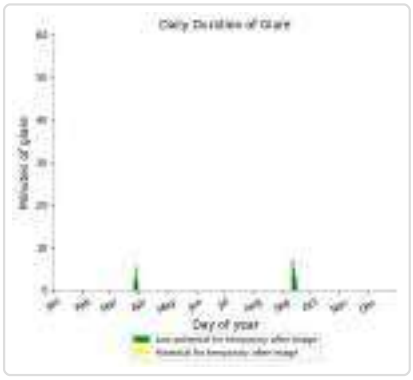

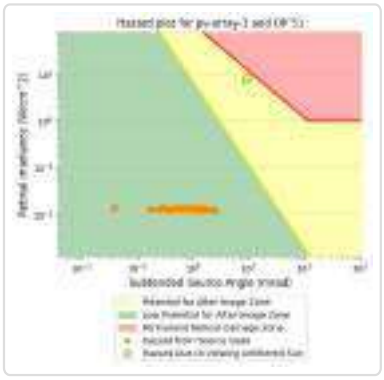

PV array 3: OP 51

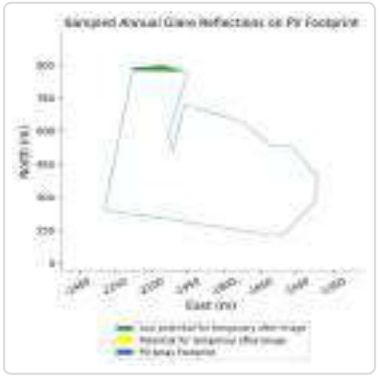

PV array is expected to produce the following glare for this receptor:

- 36 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

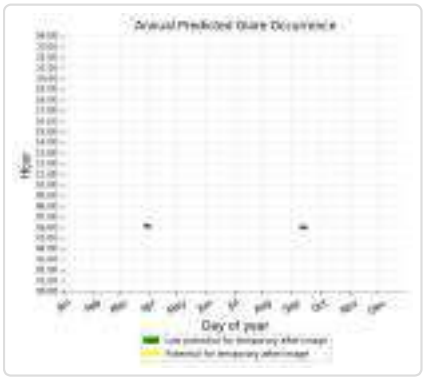

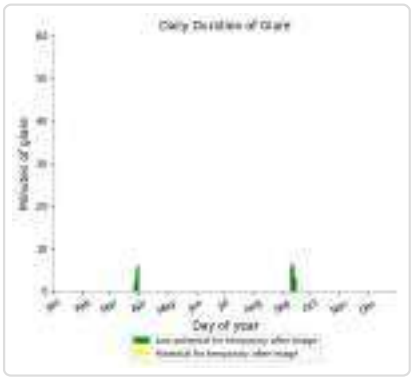

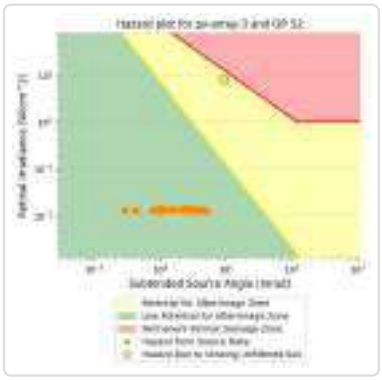

PV array 3: OP 52

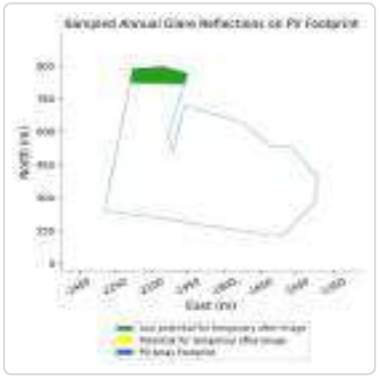

PV array is expected to produce the following glare for this receptor:

- 54 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

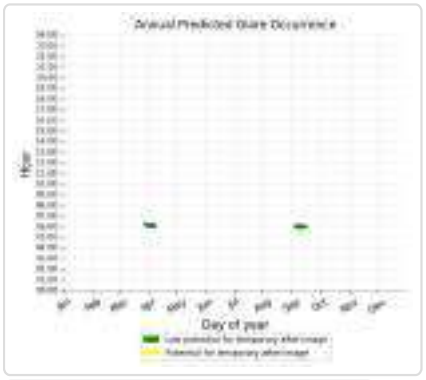

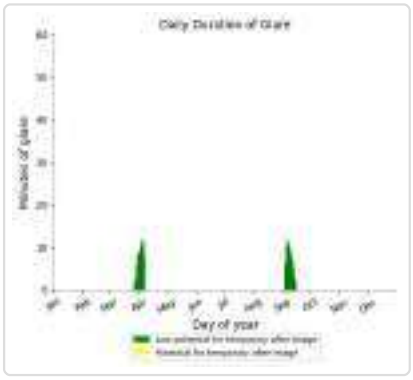

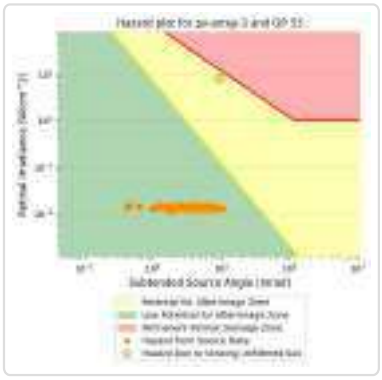

PV array 3: OP 53

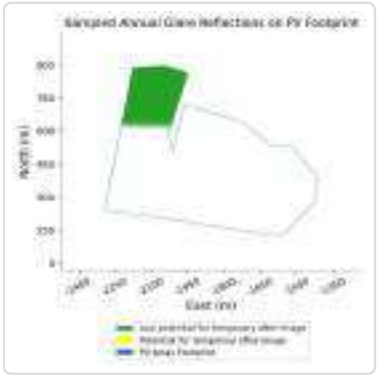

PV array is expected to produce the following glare for this receptor:

- 184 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

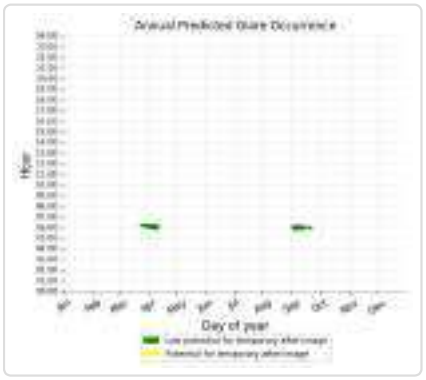

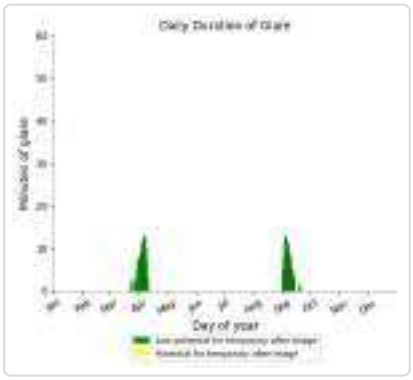

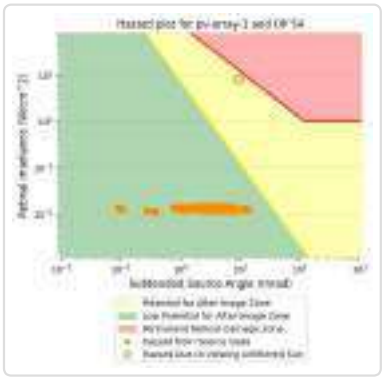

PV array 3: OP 54

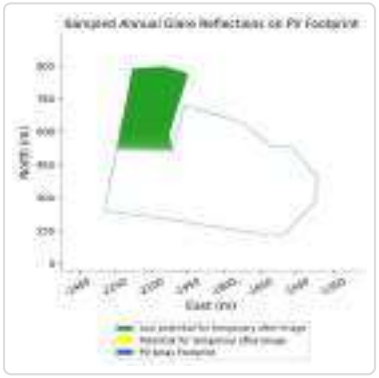

PV array is expected to produce the following glare for this receptor:

- 254 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

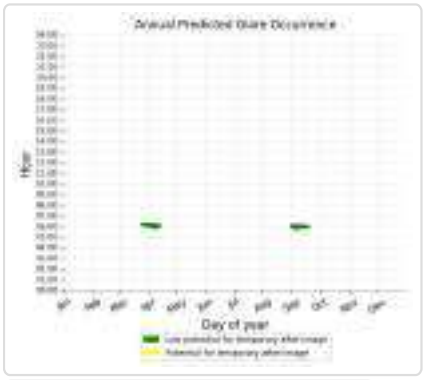

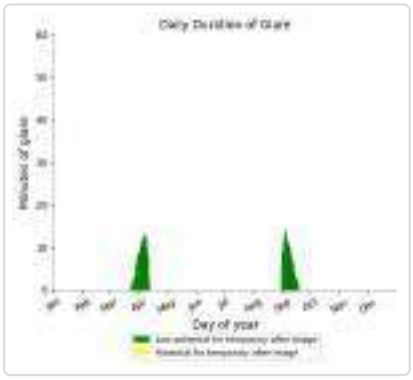

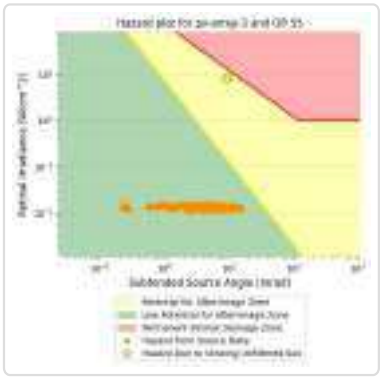

PV array 3: OP 55

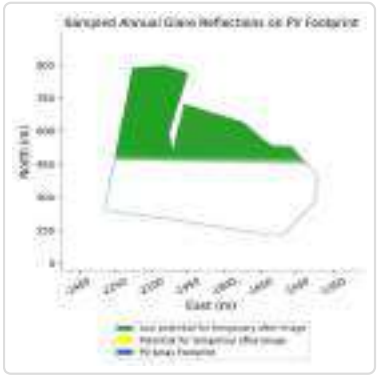

PV array is expected to produce the following glare for this receptor:

- 305 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

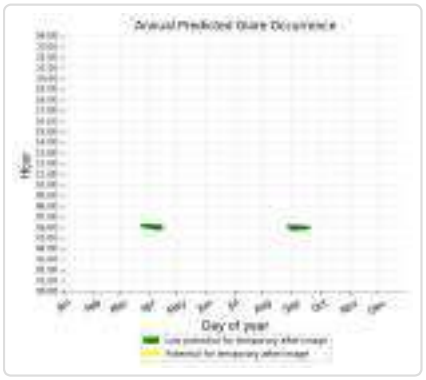

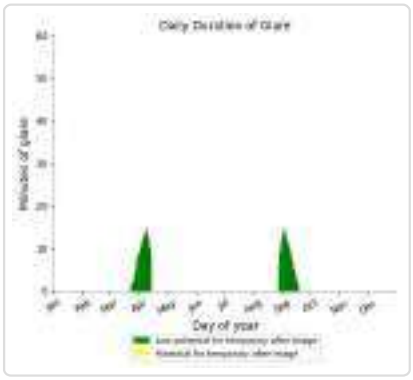

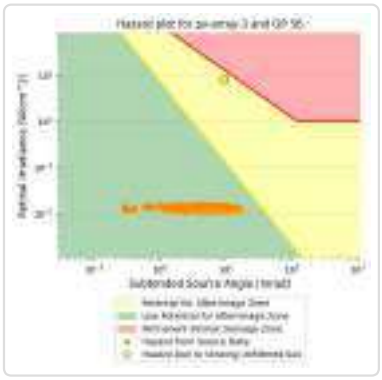

PV array 3: OP 56

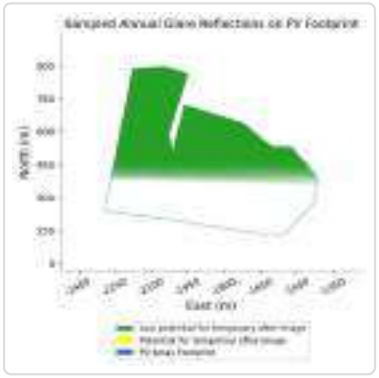

PV array is expected to produce the following glare for this receptor:

- 388 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

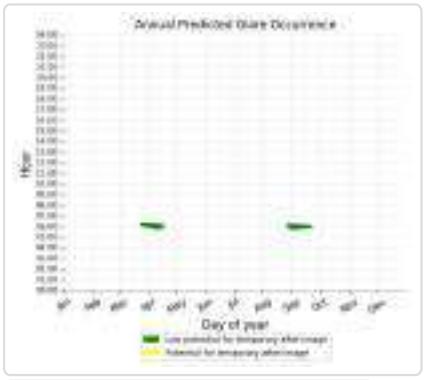

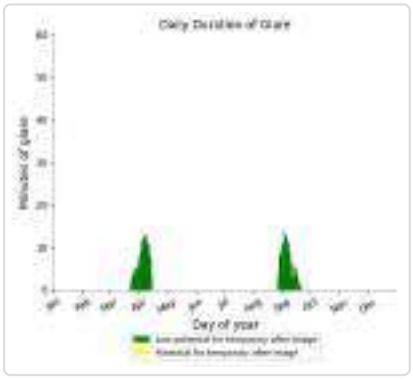

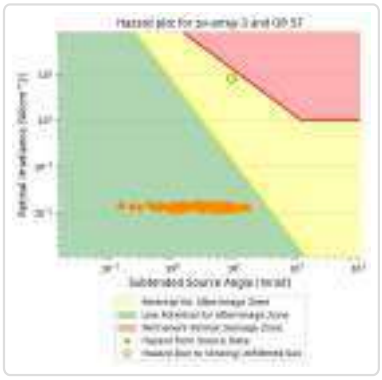

PV array 3: OP 57

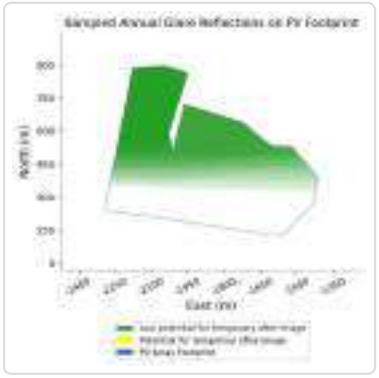

PV array is expected to produce the following glare for this receptor:

- 365 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

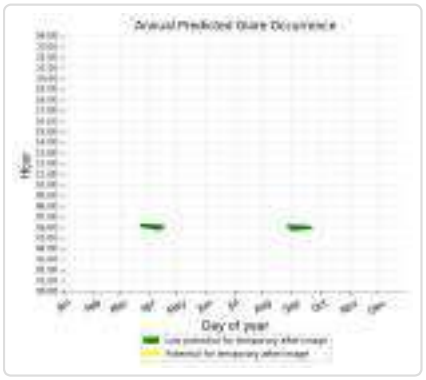

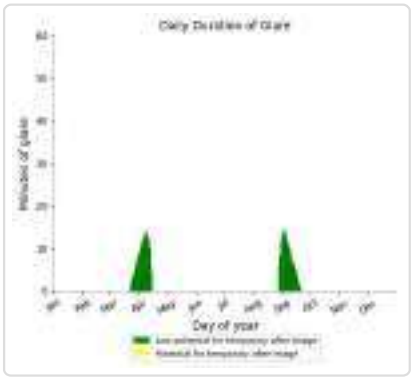

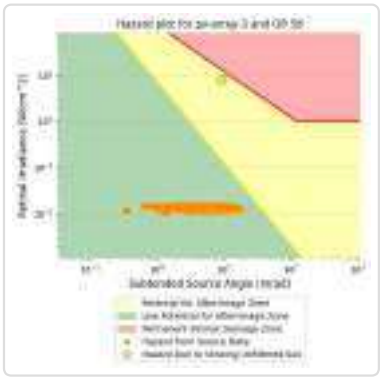

PV array 3: OP 58

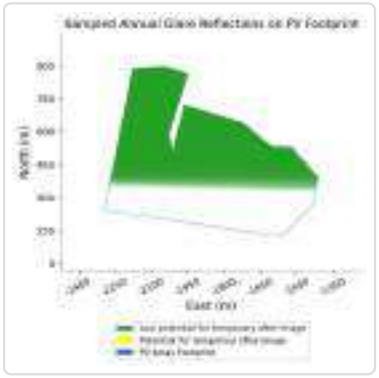

PV array is expected to produce the following glare for this receptor:

- 405 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

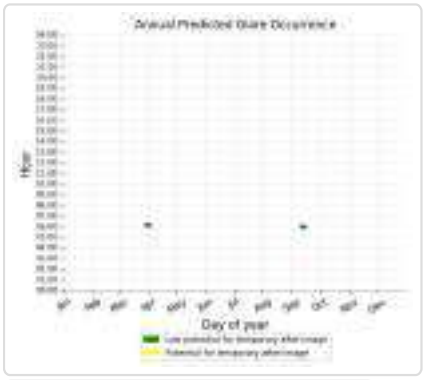

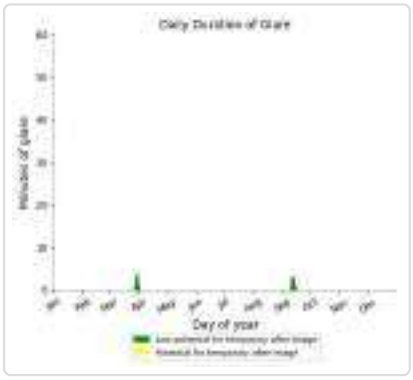

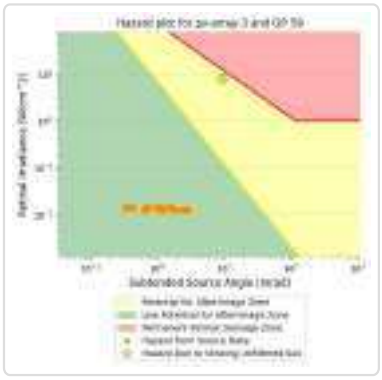

PV array 3: OP 59

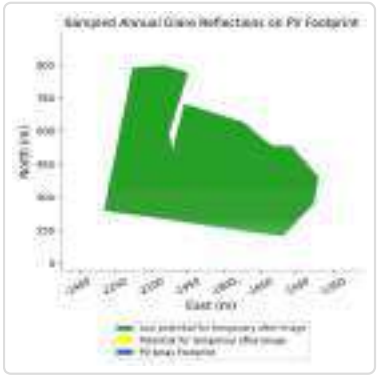

PV array is expected to produce the following glare for this receptor:

- 28 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

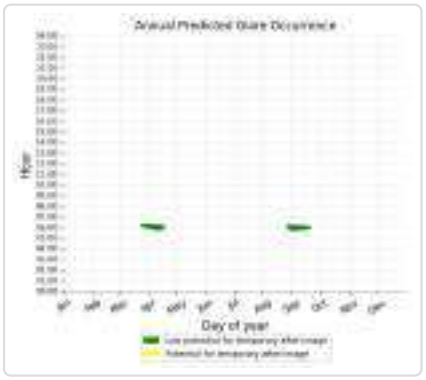

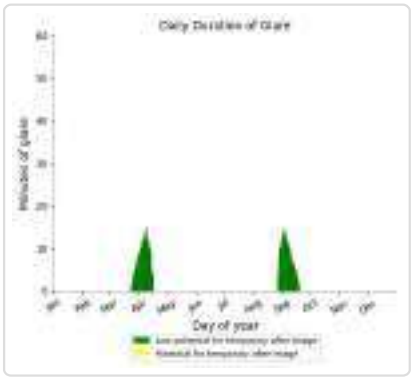

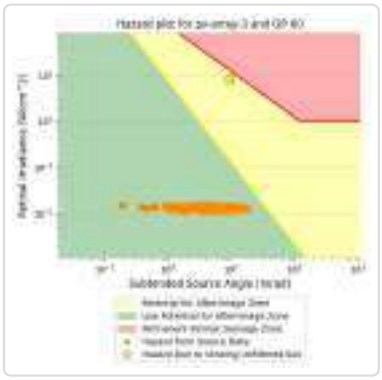

PV array 3: OP 60

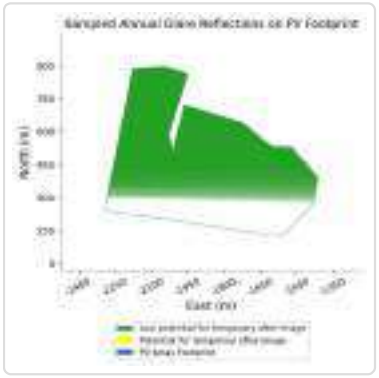

PV array is expected to produce the following glare for this receptor:

- 416 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

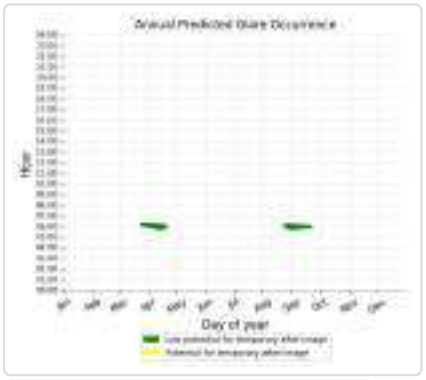

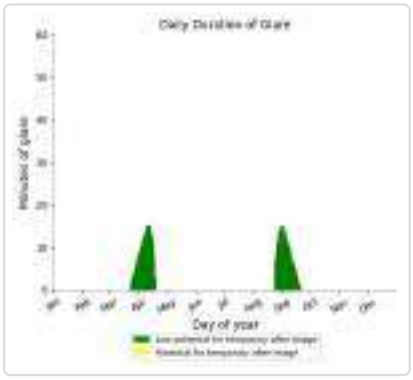

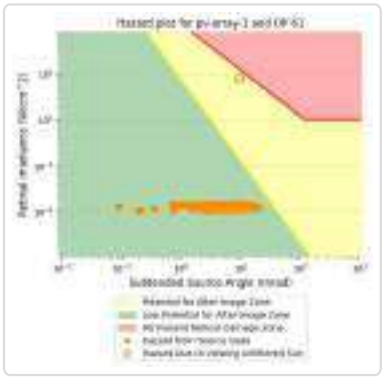

PV array 3: OP 61

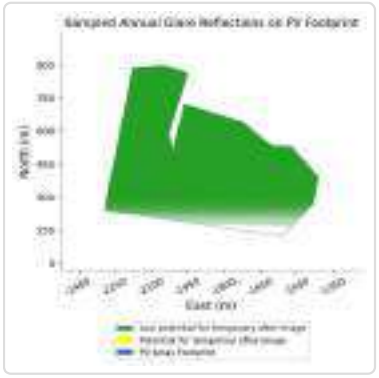

PV array is expected to produce the following glare for this receptor:

- 532 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

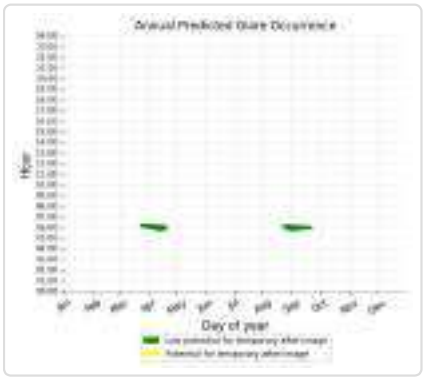

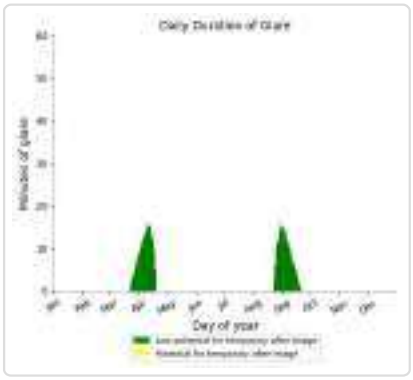

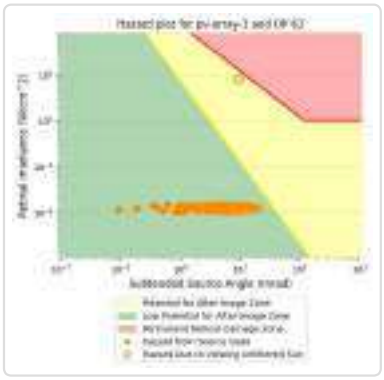

PV array 3: OP 62

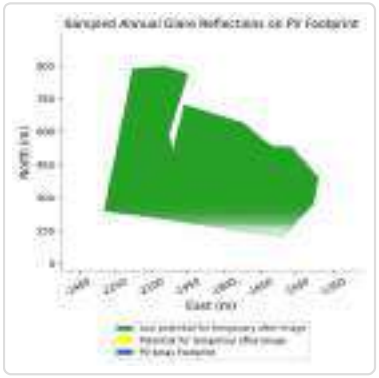

PV array is expected to produce the following glare for this receptor:

- 535 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

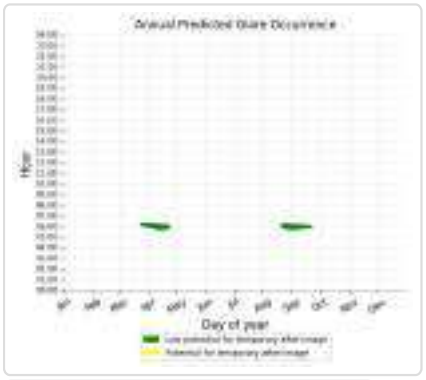

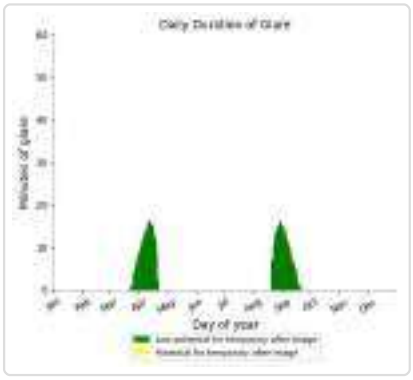

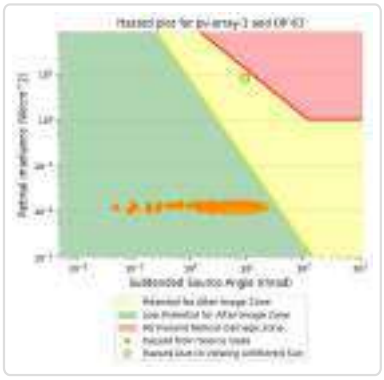

PV array 3: OP 63

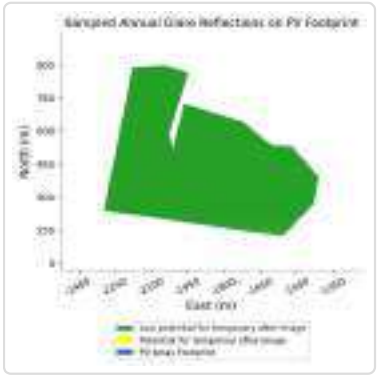

PV array is expected to produce the following glare for this receptor:

- 623 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

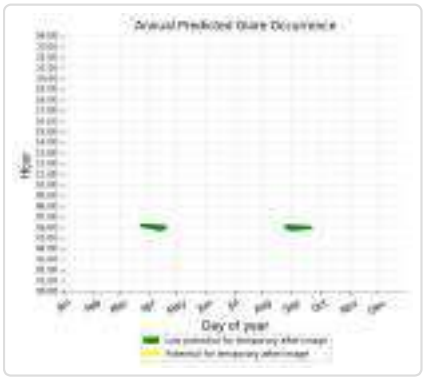

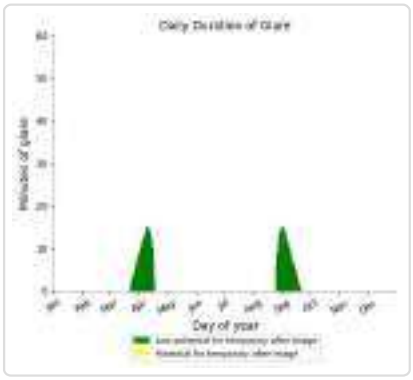

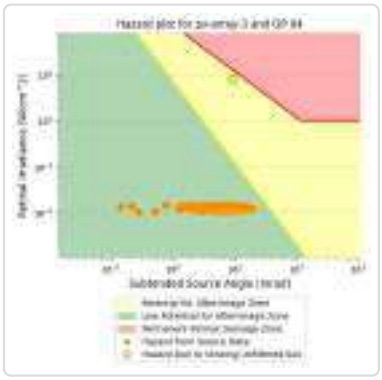

PV array 3: OP 64

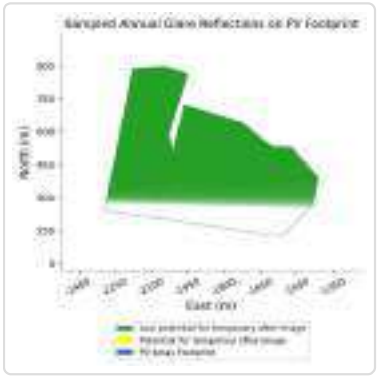

PV array is expected to produce the following glare for this receptor:

- 499 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

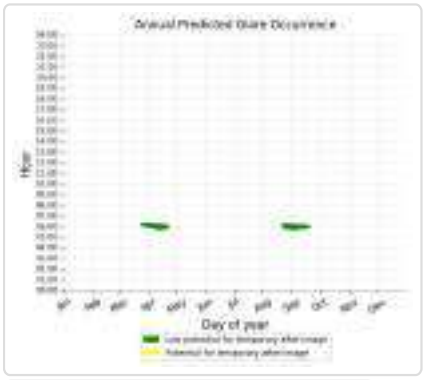

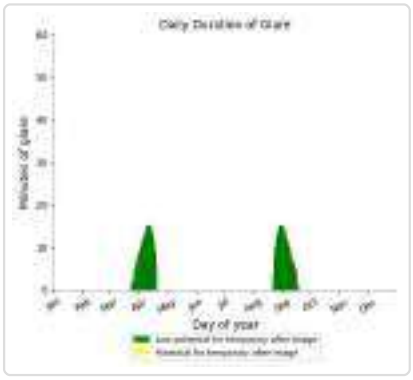

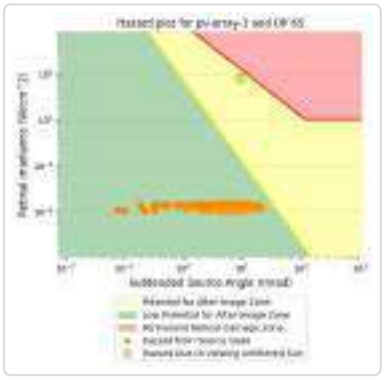

PV array 3: OP 65

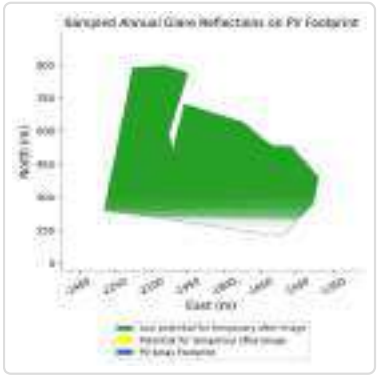

PV array is expected to produce the following glare for this receptor:

- 564 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

- 273 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

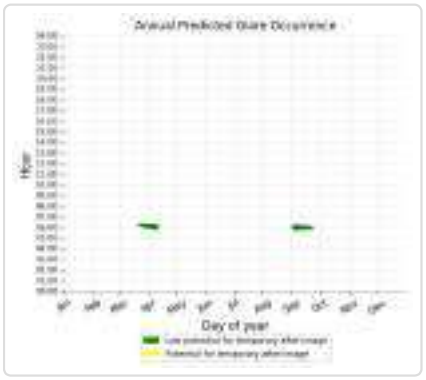

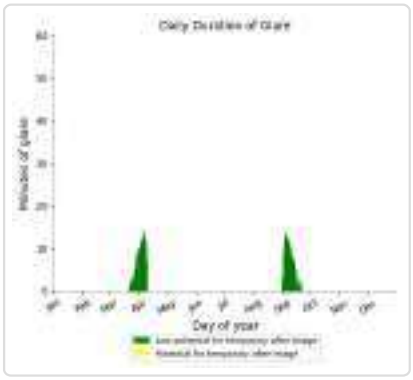

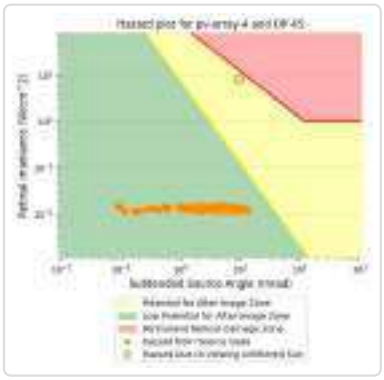

PV array 4: OP 45

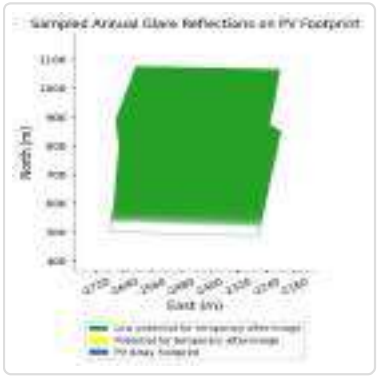

PV array is expected to produce the following glare for this receptor:

- 313 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

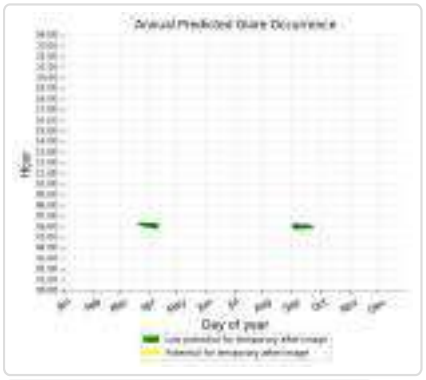

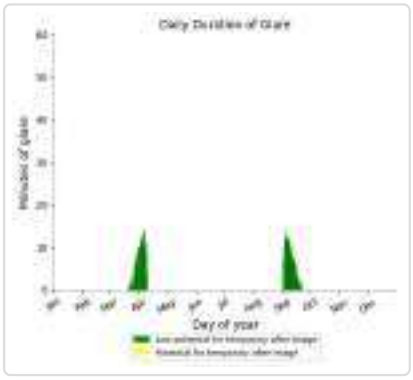

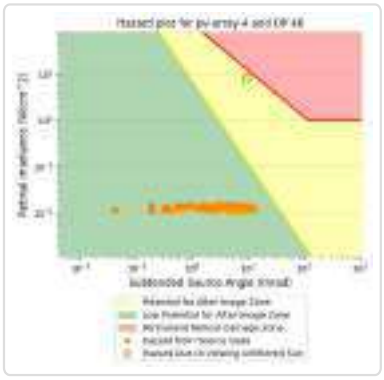

PV array 4: OP 46

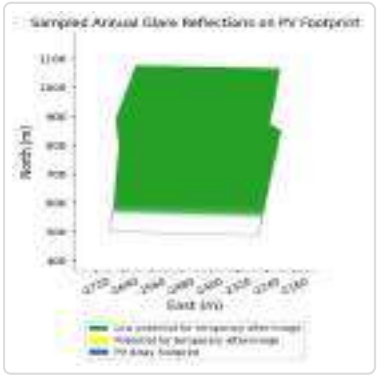

PV array is expected to produce the following glare for this receptor:

- 303 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

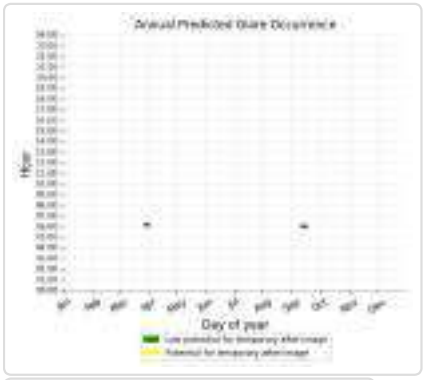

PV array 4: OP 47

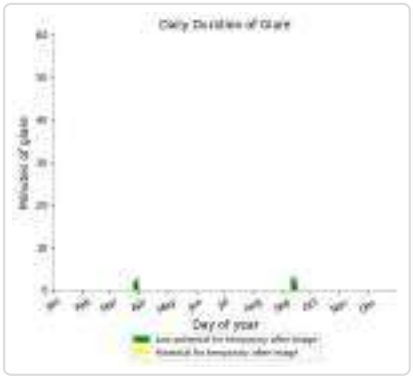

No glare found

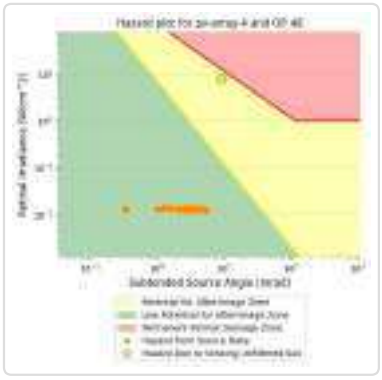

PV array 4: OP 48

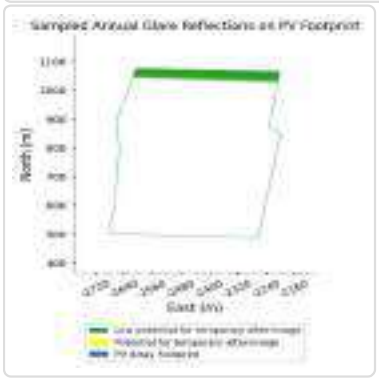

PV array is expected to produce the following glare for this receptor:

- 26 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

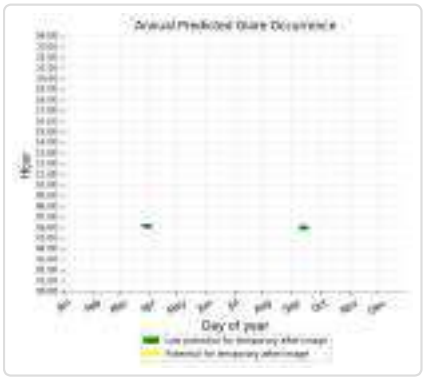

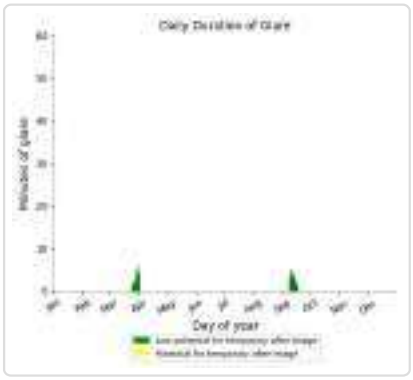

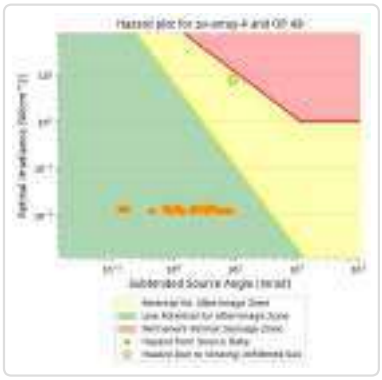

PV array 4: OP 49

PV array is expected to produce the following glare for this receptor:

- 58 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

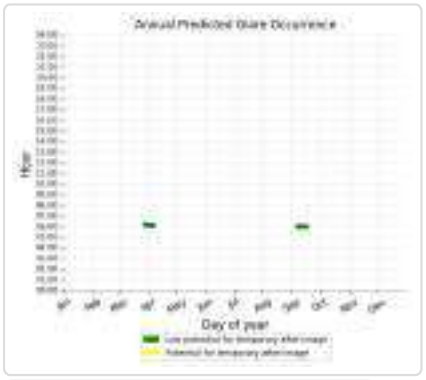

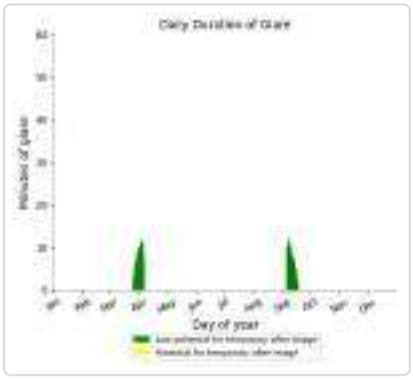

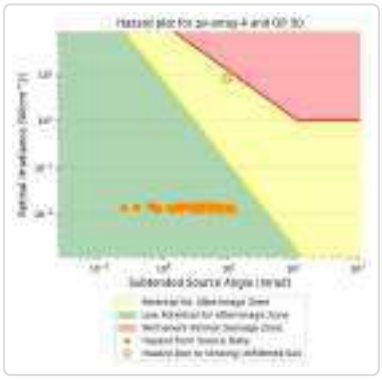

PV array 4: OP 50

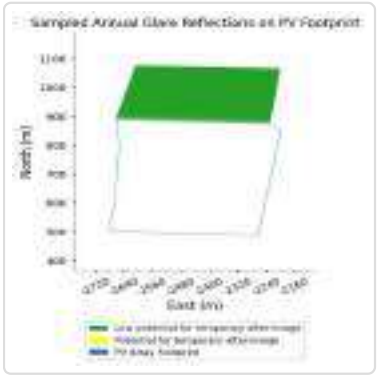

PV array is expected to produce the following glare for this receptor:

- 196 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

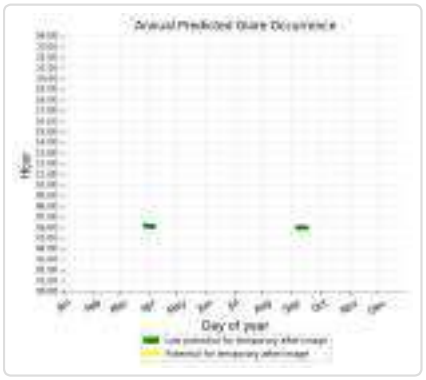

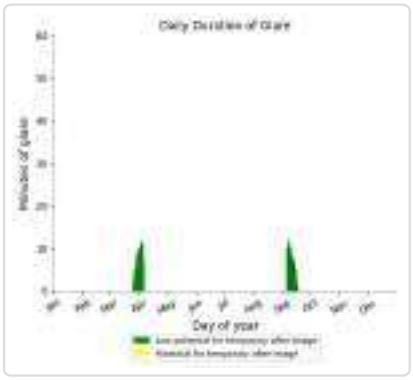

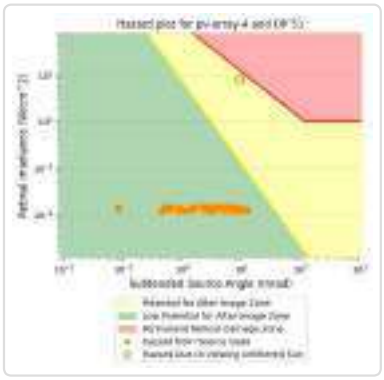

PV array 4: OP 51

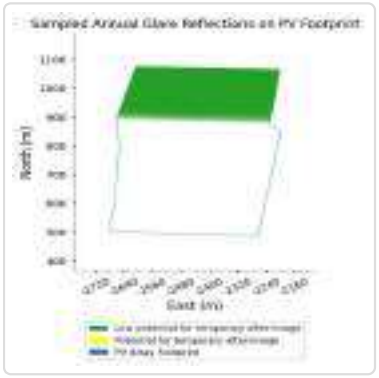

PV array is expected to produce the following glare for this receptor:

- 191 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

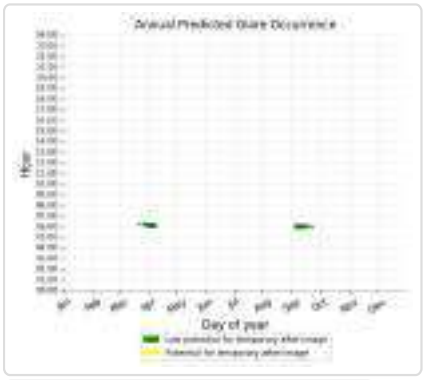

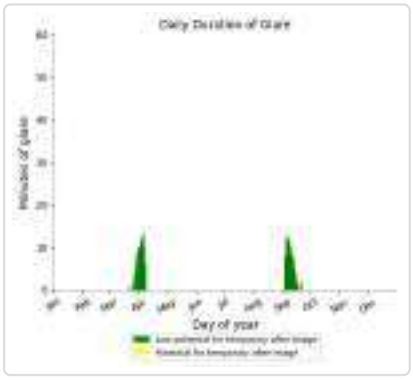

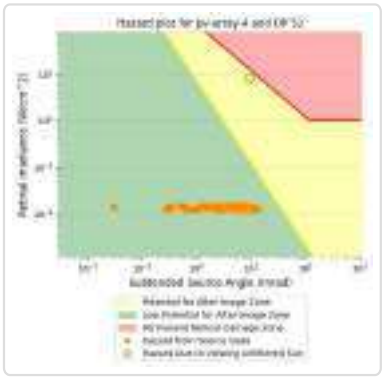

PV array 4: OP 52

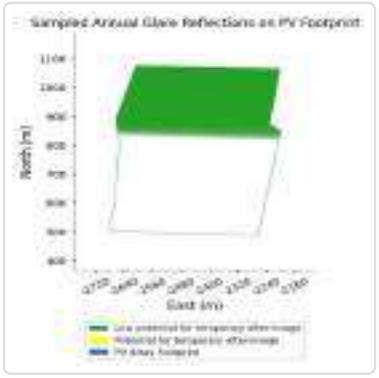

PV array is expected to produce the following glare for this receptor:

- 233 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

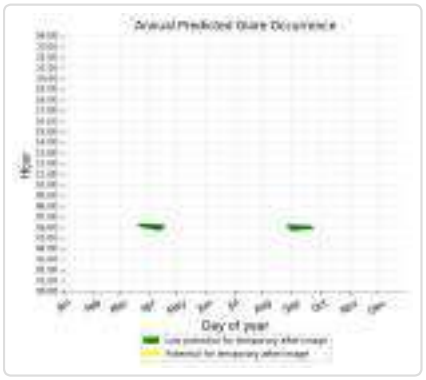

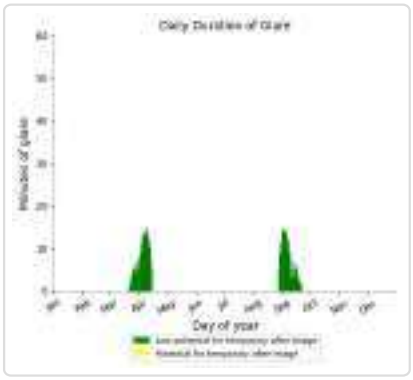

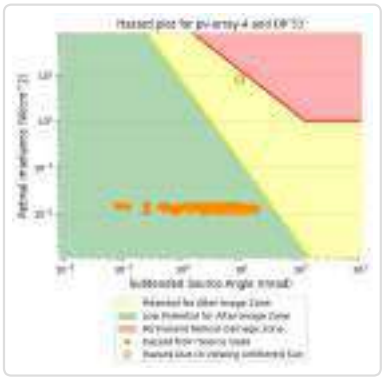

PV array 4: OP 53

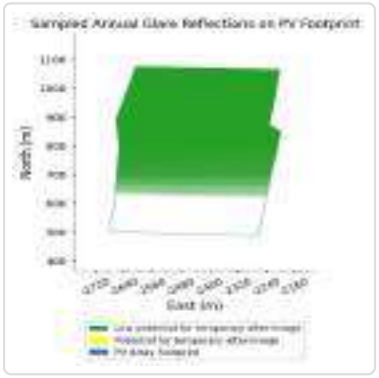

PV array is expected to produce the following glare for this receptor:

- 410 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

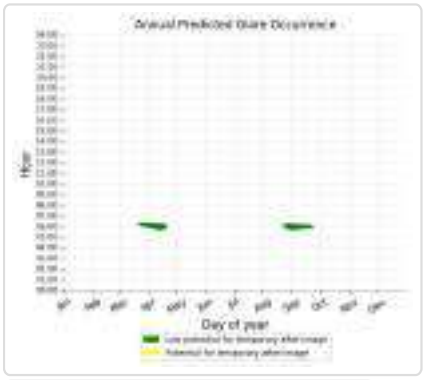

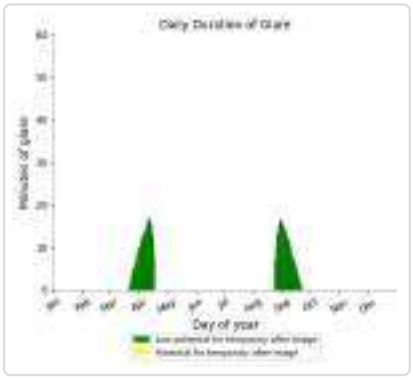

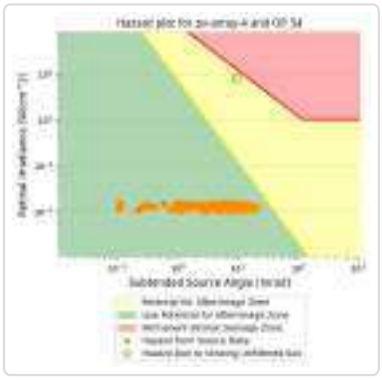

PV array 4: OP 54

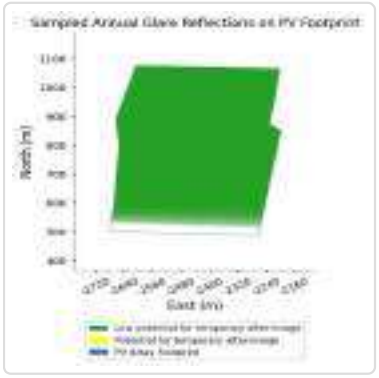

PV array is expected to produce the following glare for this receptor:

- 585 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

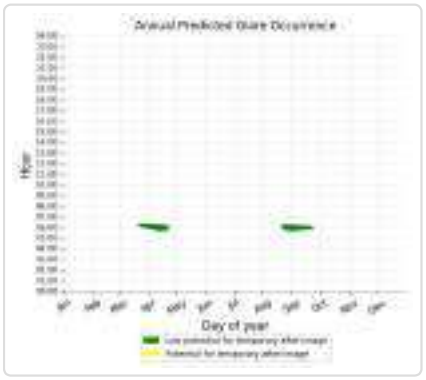

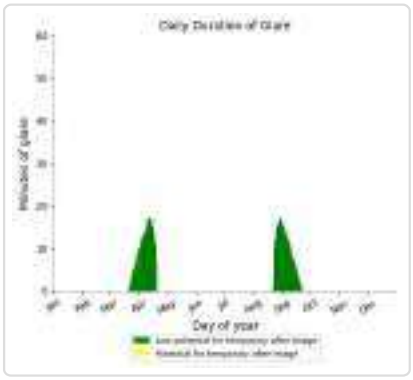

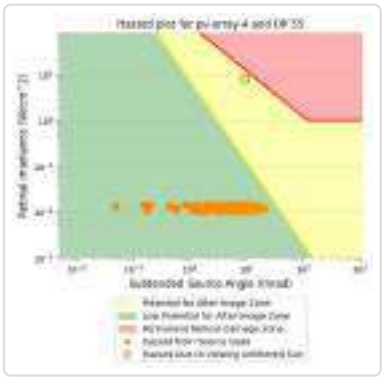

PV array 4: OP 55

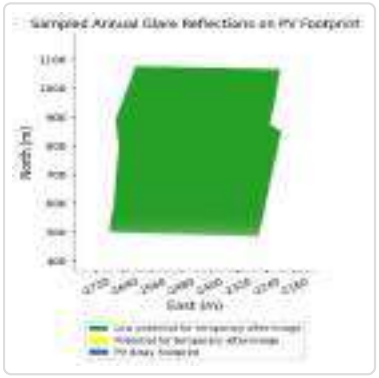

PV array is expected to produce the following glare for this receptor:

- 643 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

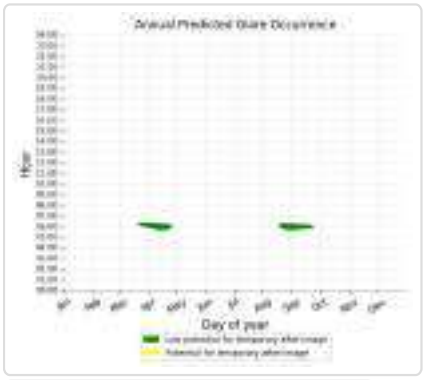

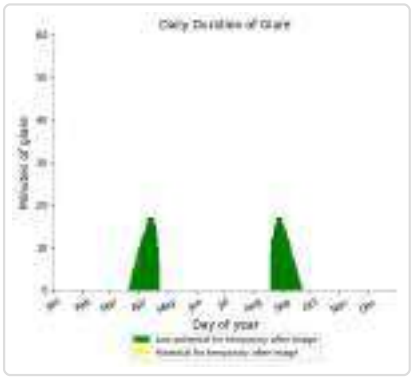

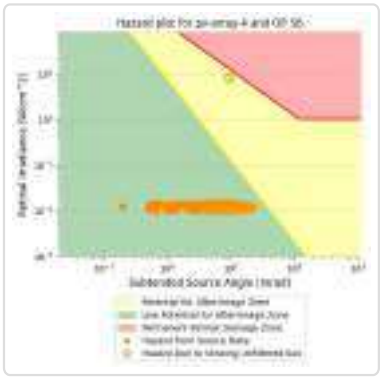

PV array 4: OP 56

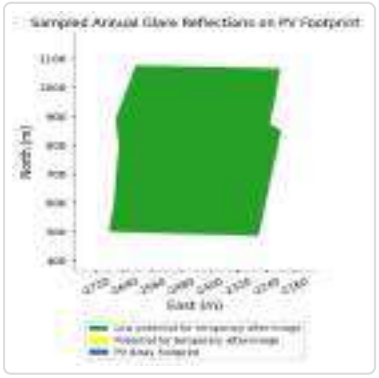

PV array is expected to produce the following glare for this receptor:

- 737 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

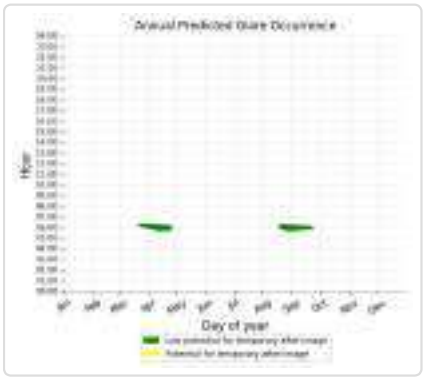

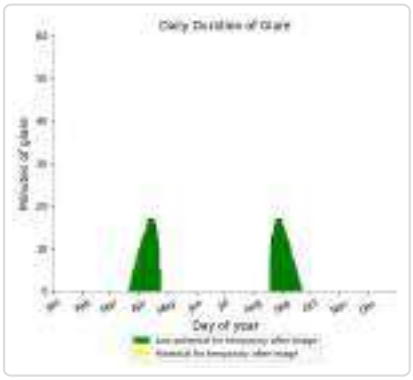

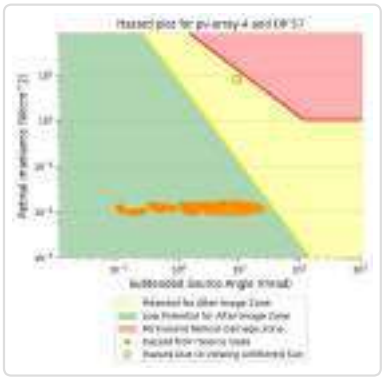

PV array 4: OP 57

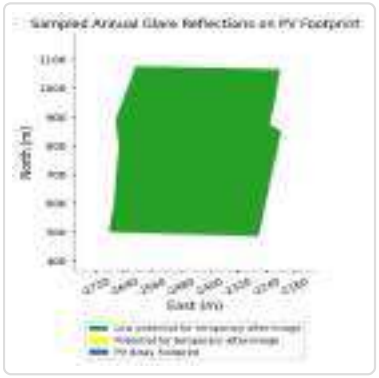

PV array is expected to produce the following glare for this receptor:

- 767 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

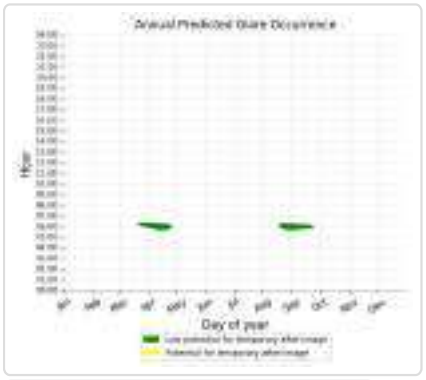

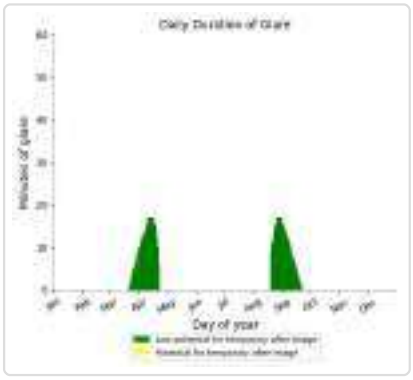

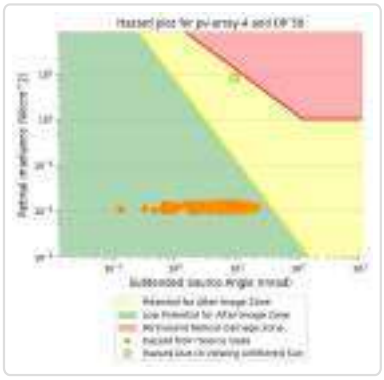

PV array 4: OP 58

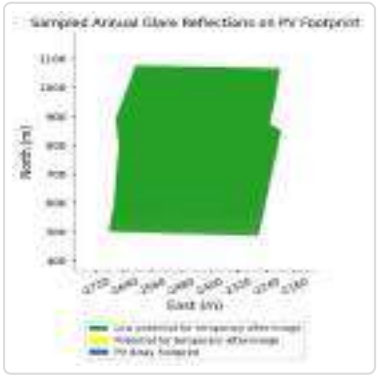

PV array is expected to produce the following glare for this receptor:

- 735 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

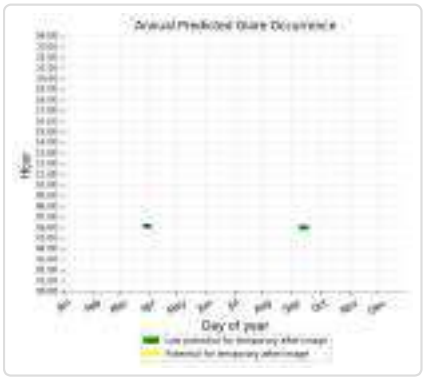

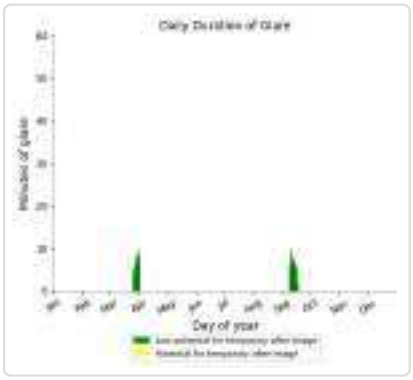

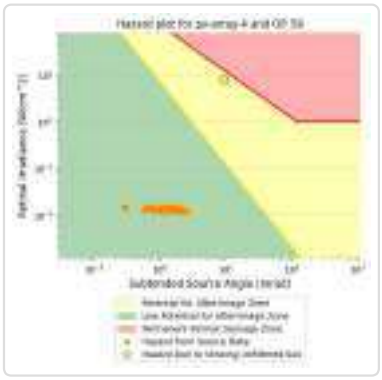

PV array 4: OP 59

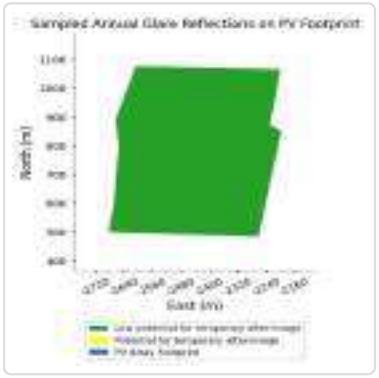

PV array is expected to produce the following glare for this receptor:

- 117 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

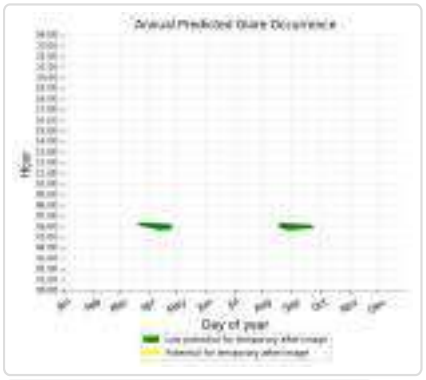

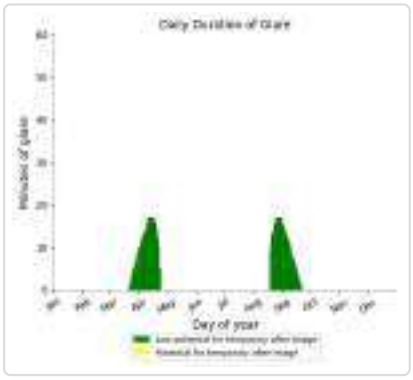

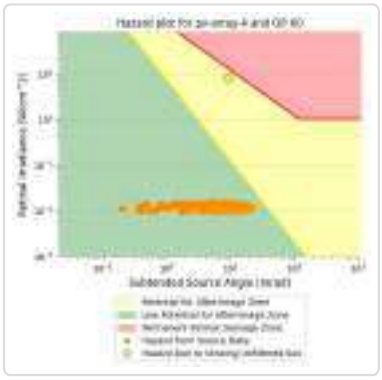

PV array 4: OP 60

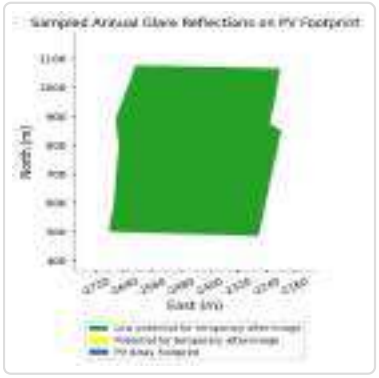

PV array is expected to produce the following glare for this receptor:

- 768 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

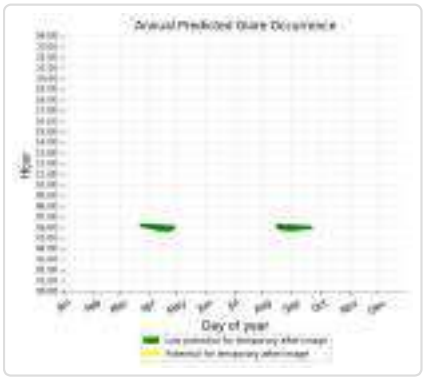

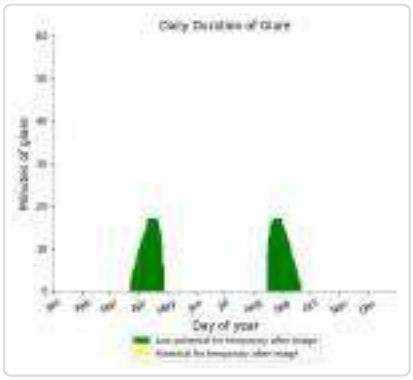

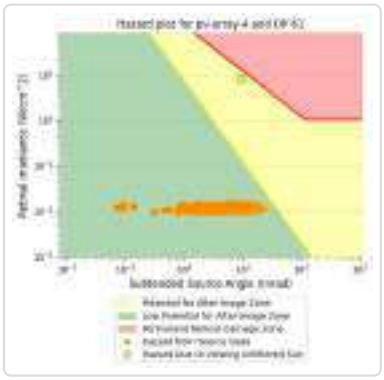

PV array 4: OP 61

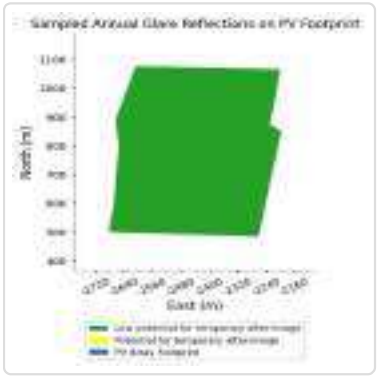

PV array is expected to produce the following glare for this receptor:

- 875 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

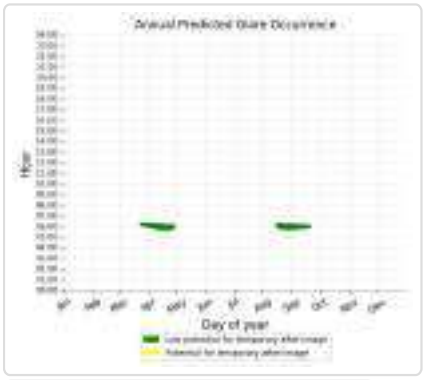

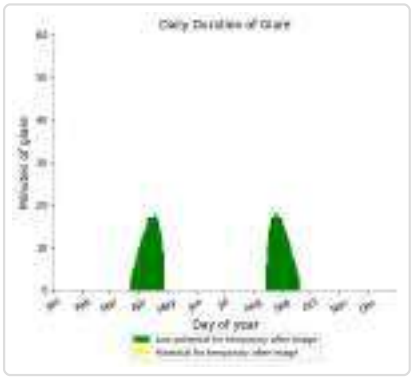

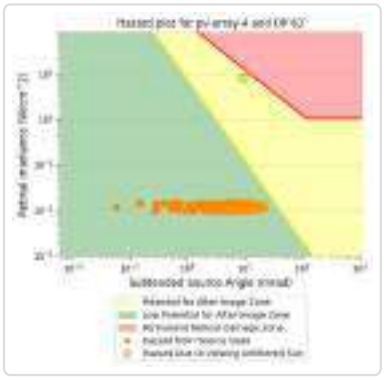

PV array 4: OP 62

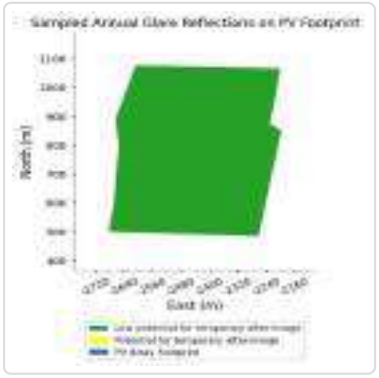

PV array is expected to produce the following glare for this receptor:

- 891 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

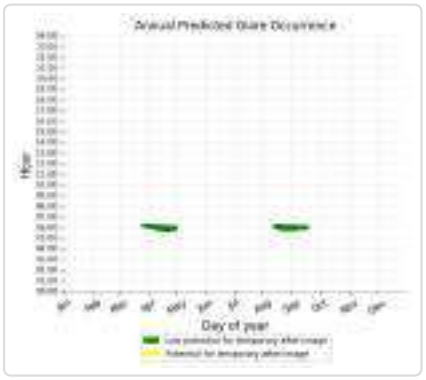

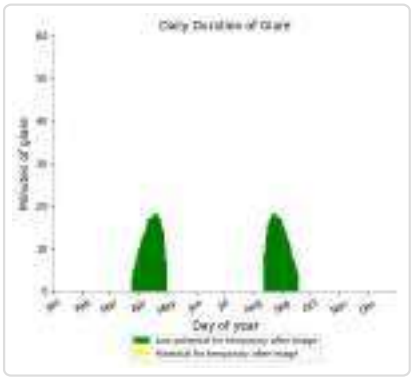

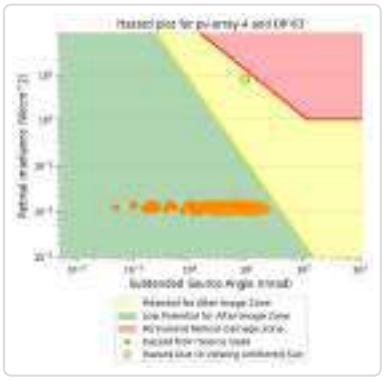

PV array 4: OP 63

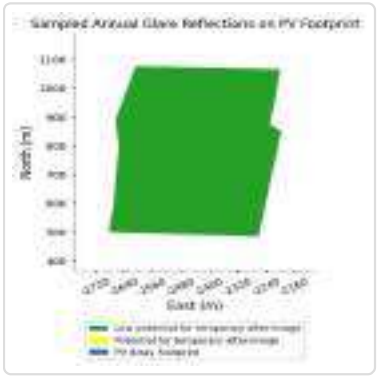

PV array is expected to produce the following glare for this receptor:

- 975 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

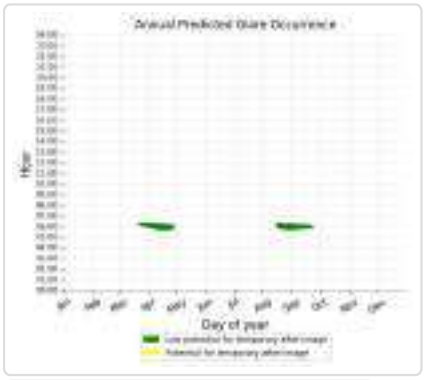

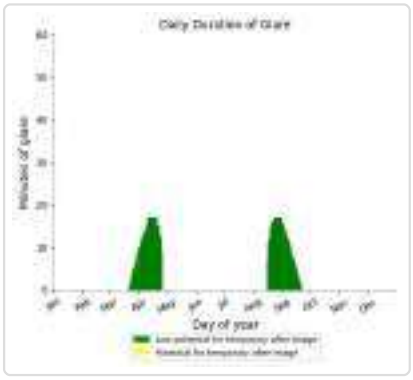

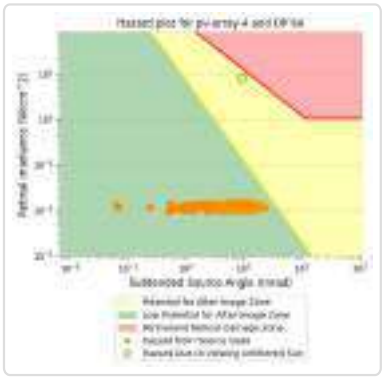

PV array 4: OP 64

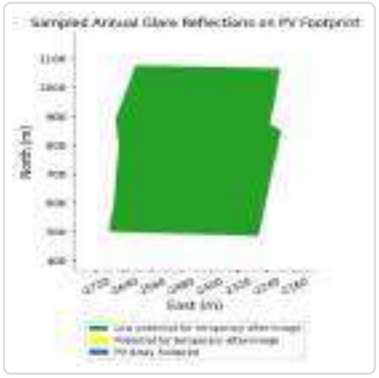

PV array is expected to produce the following glare for this receptor:

- 858 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

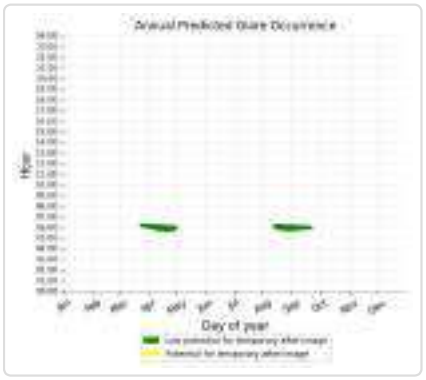

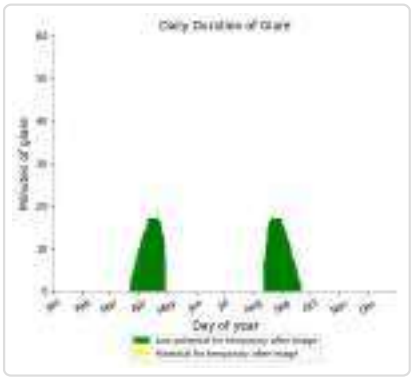

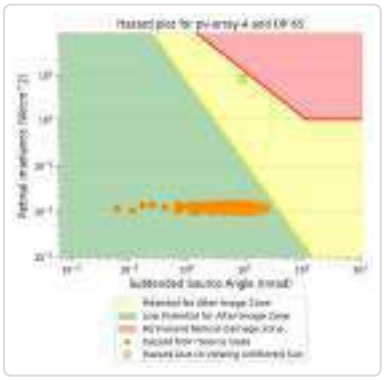

PV array 4: OP 65

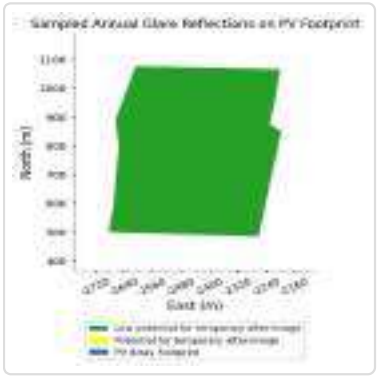

PV array is expected to produce the following glare for this receptor:

- 952 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 5: OP 65

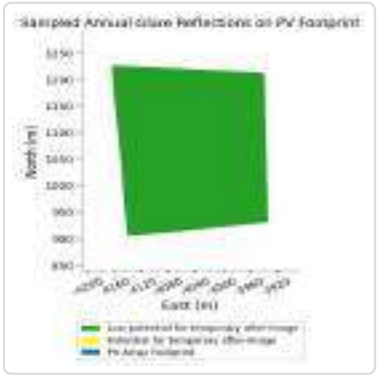

PV array is expected to produce the following glare for this receptor:

- 1,000 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array is expected to produce the following glare for this receptor:

- 85 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

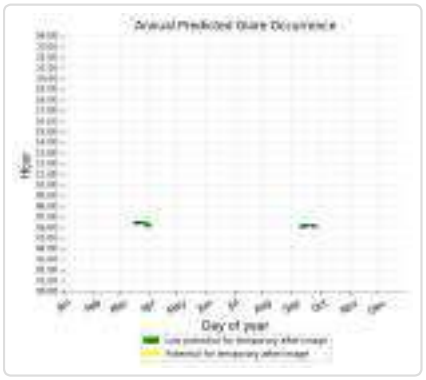

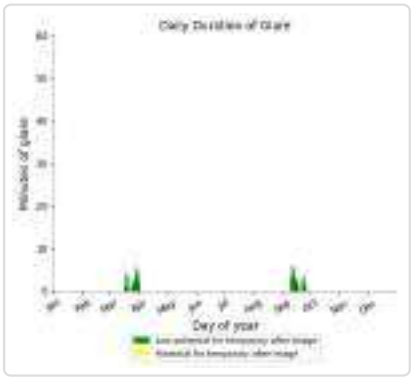

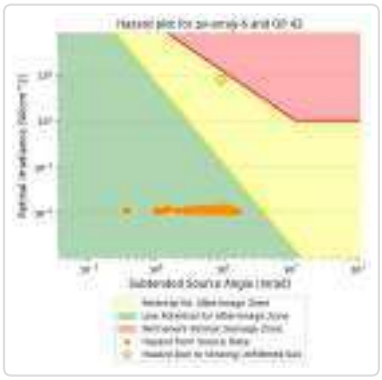

PV array 6: OP 42

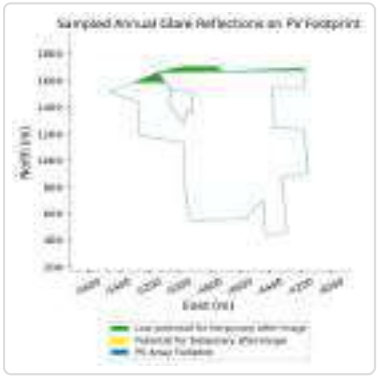

PV array is expected to produce the following glare for this receptor:

- 84 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

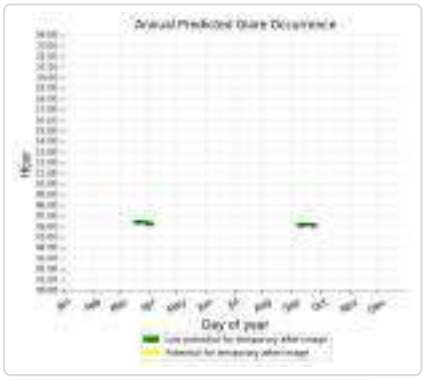

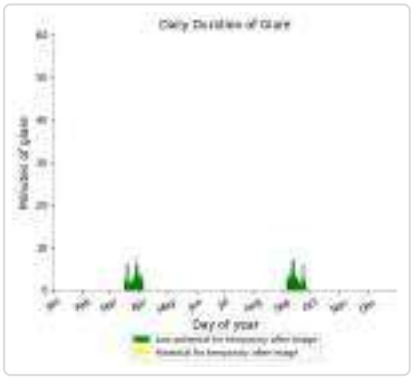

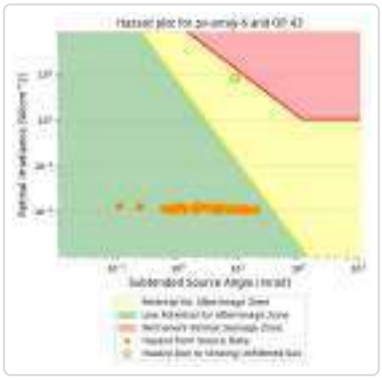

PV array 6: OP 43

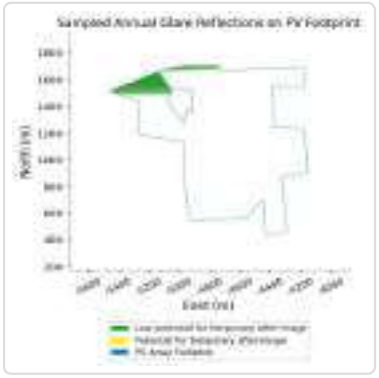

PV array is expected to produce the following glare for this receptor:

- 137 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

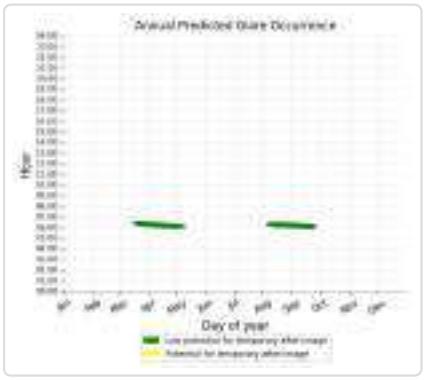

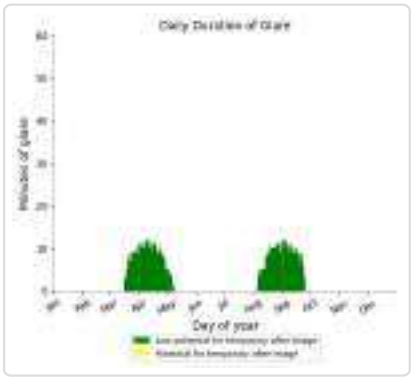

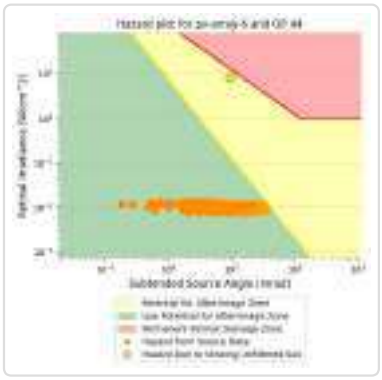

PV array 6: OP 44

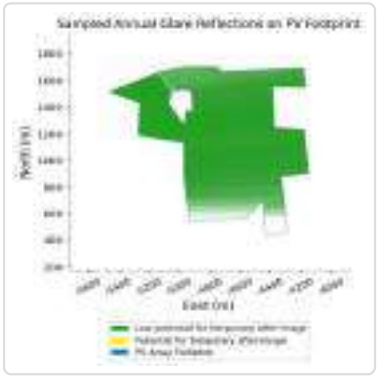

PV array is expected to produce the following glare for this receptor:

- 891 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

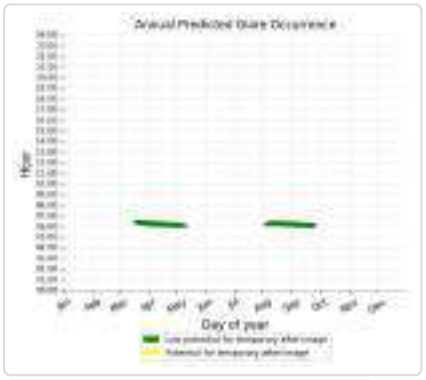

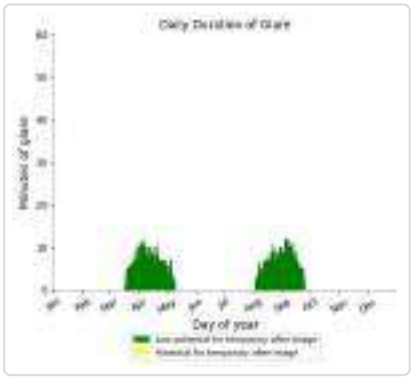

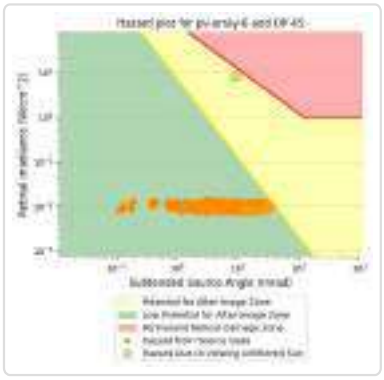

PV array 6: OP 45

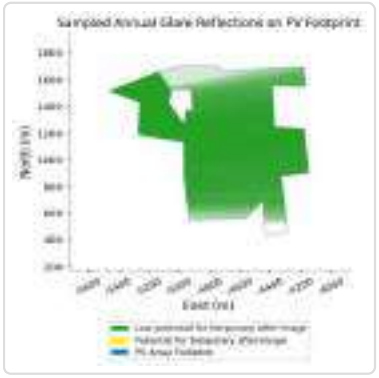

PV array is expected to produce the following glare for this receptor:

- 824 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

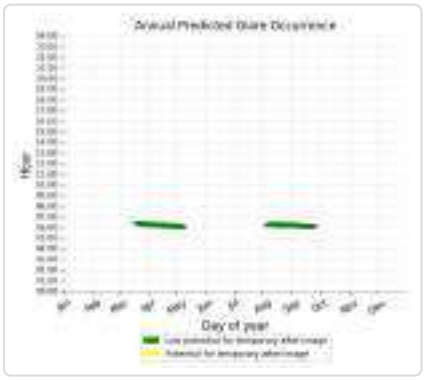

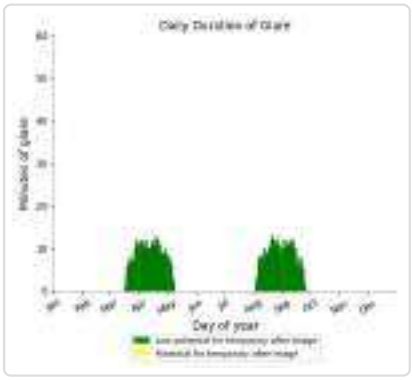

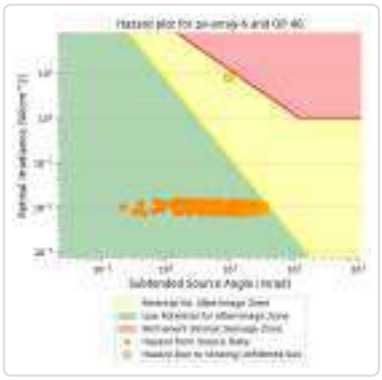

PV array 6: OP 46

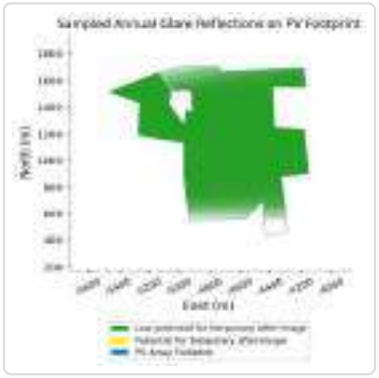

PV array is expected to produce the following glare for this receptor:

- 1,004 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 6: OP 50

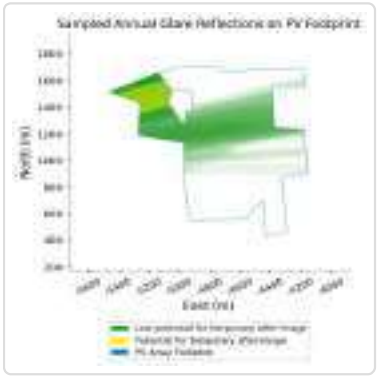

PV array is expected to produce the following glare for this receptor:

- 1,143 minutes of "green" glare with low potential to cause temporary after-image.
- 21 minutes of "yellow" glare with potential to cause temporary after-image.

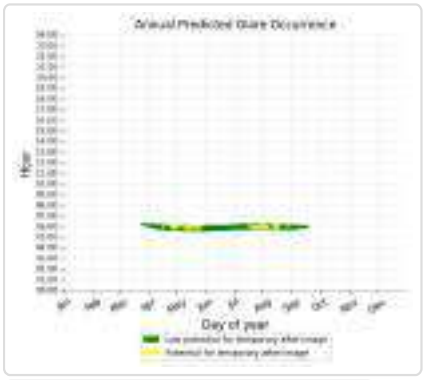

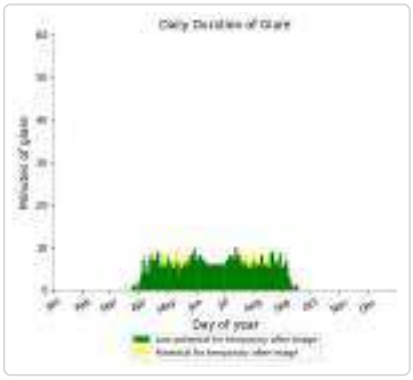

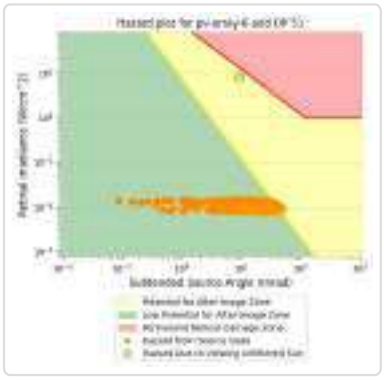

PV array 6: OP 51

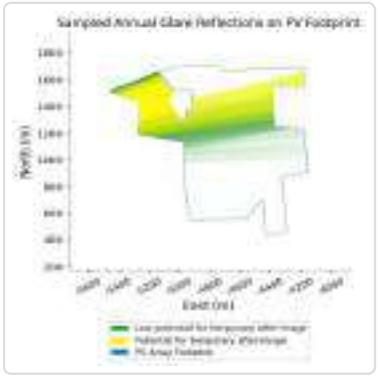

PV array is expected to produce the following glare for this receptor:

- 1,081 minutes of "green" glare with low potential to cause temporary after-image.
- 86 minutes of "yellow" glare with potential to cause temporary after-image.

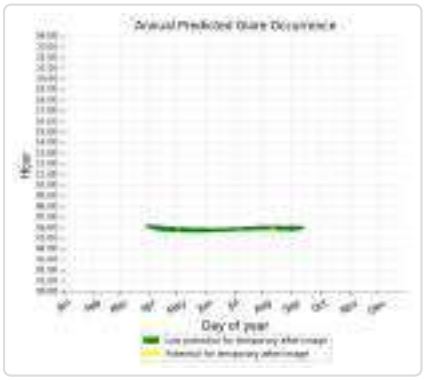

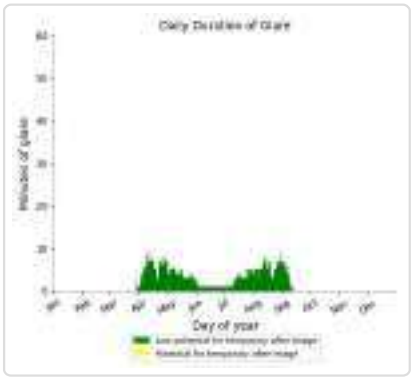

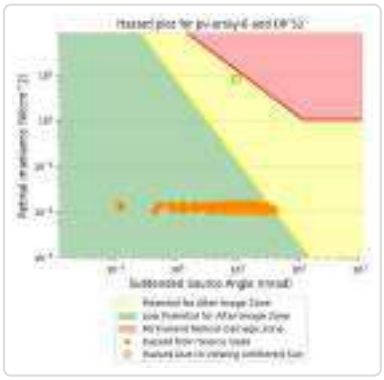

PV array 6: OP 52

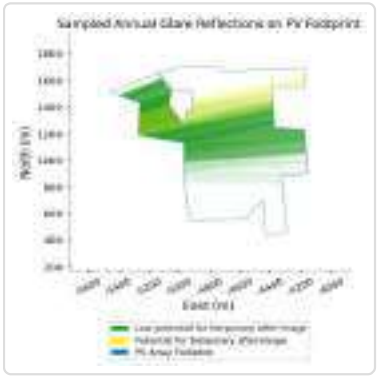

PV array is expected to produce the following glare for this receptor:

- 635 minutes of "green" glare with low potential to cause temporary after-image.
- 2 minutes of "yellow" glare with potential to cause temporary after-image.

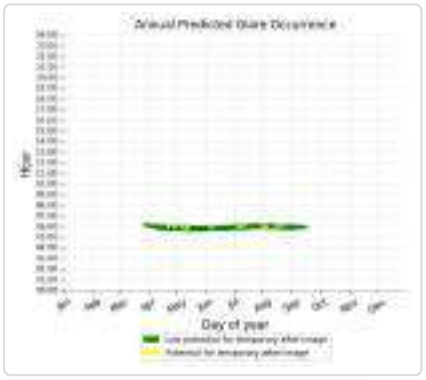

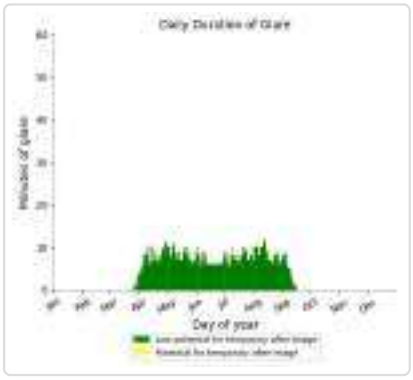

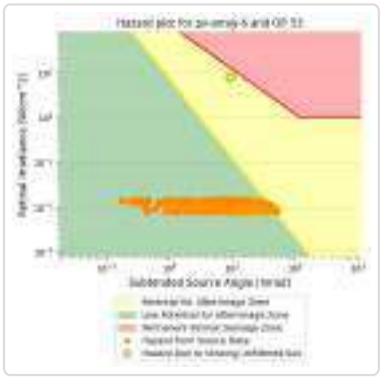

PV array 6: OP 53

PV array is expected to produce the following glare for this receptor:

- 1,274 minutes of "green" glare with low potential to cause temporary after-image.
- 27 minutes of "yellow" glare with potential to cause temporary after-image.

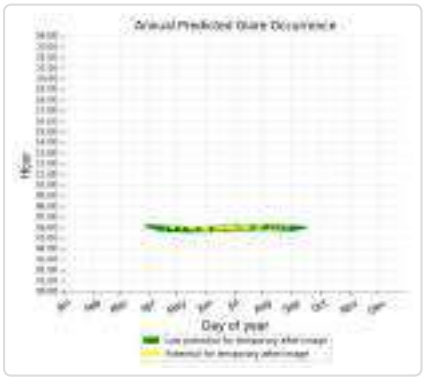

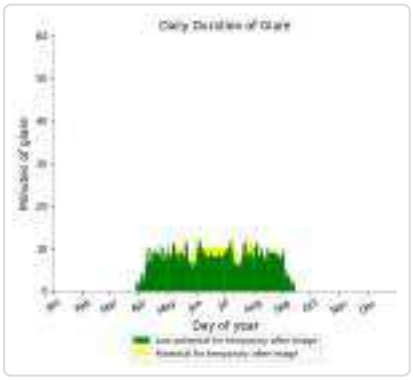

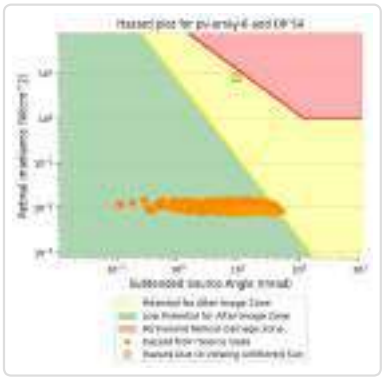

PV array 6: OP 54

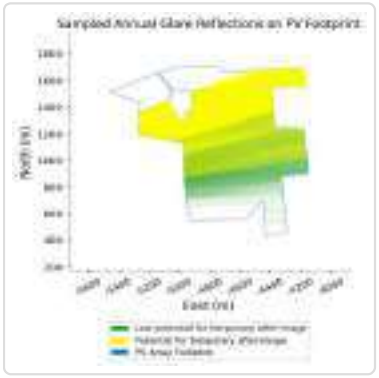

PV array is expected to produce the following glare for this receptor:

- 1,349 minutes of "green" glare with low potential to cause temporary after-image.
- 123 minutes of "yellow" glare with potential to cause temporary after-image.

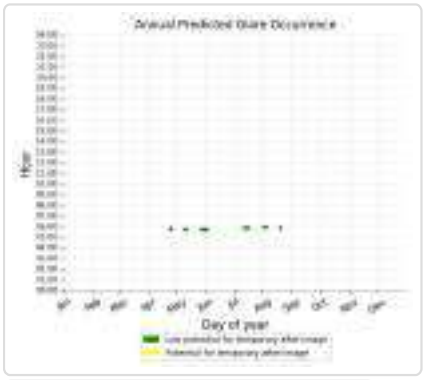

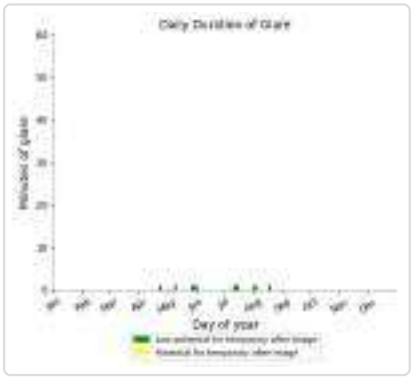

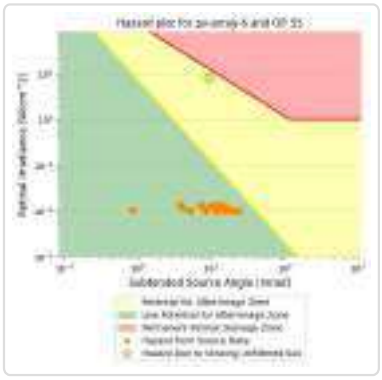

PV array 6: OP 55

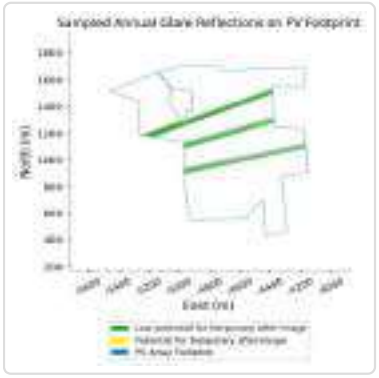

PV array is expected to produce the following glare for this receptor:

- 26 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 6: OP 56

No glare found

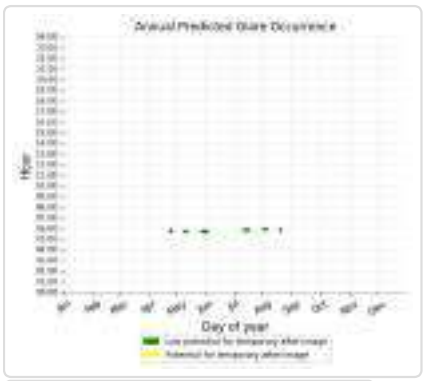

PV array 6: OP 57

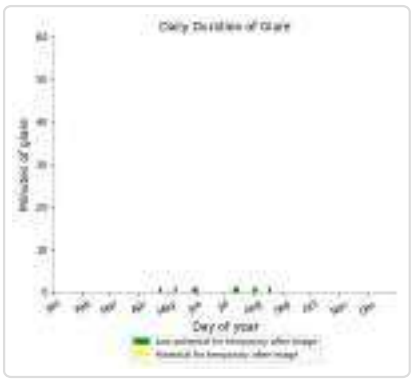

No glare found

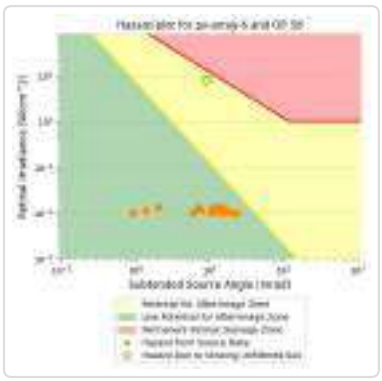

PV array 6: OP 58

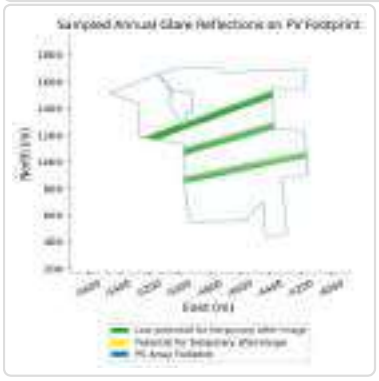

PV array is expected to produce the following glare for this receptor:

- 25 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

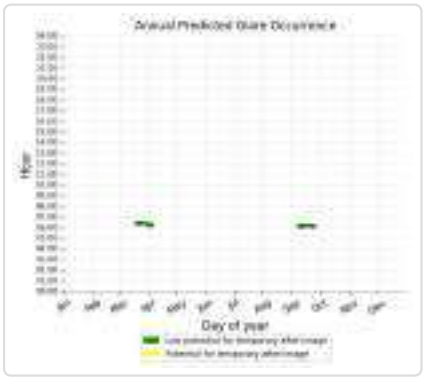

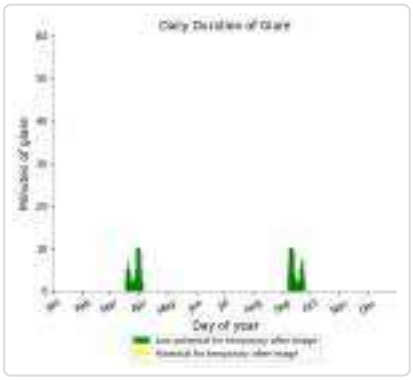

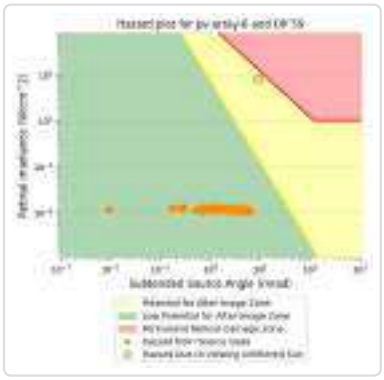

PV array 6: OP 59

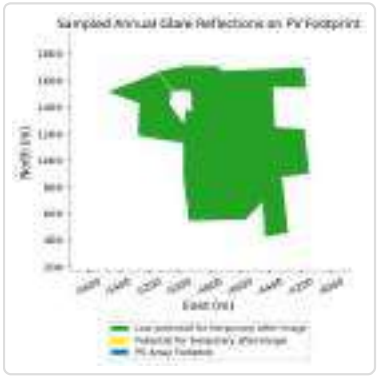

PV array is expected to produce the following glare for this receptor:

- 213 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

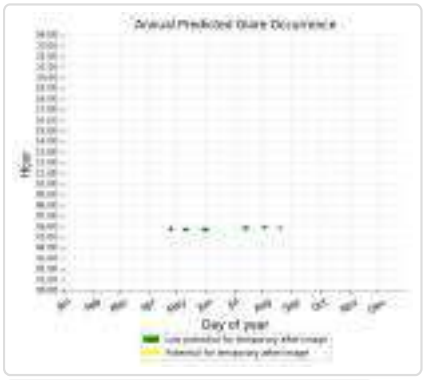

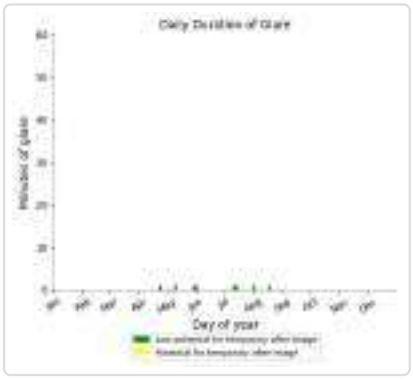

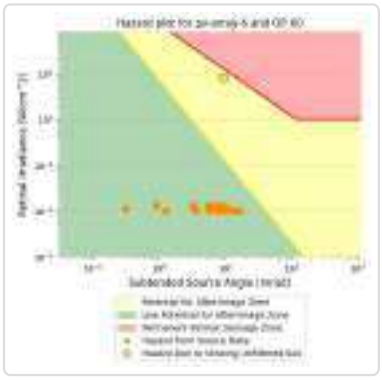

PV array 6: OP 60

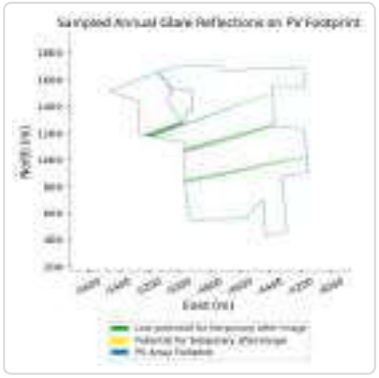

PV array is expected to produce the following glare for this receptor:

- 21 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

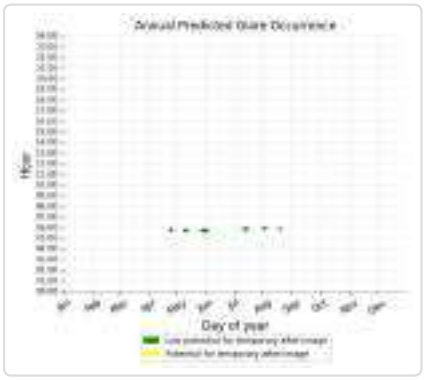

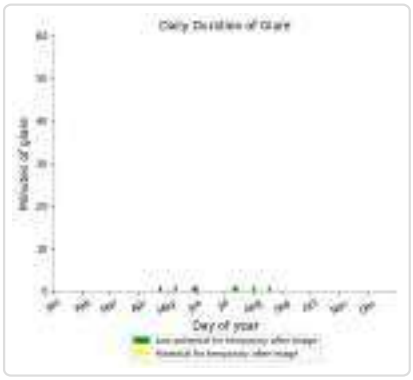

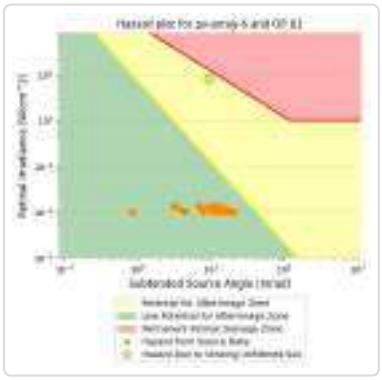

PV array 6: OP 61

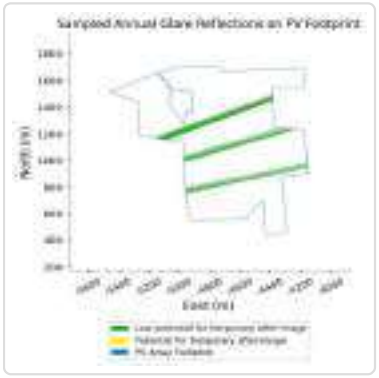

PV array is expected to produce the following glare for this receptor:

- 22 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

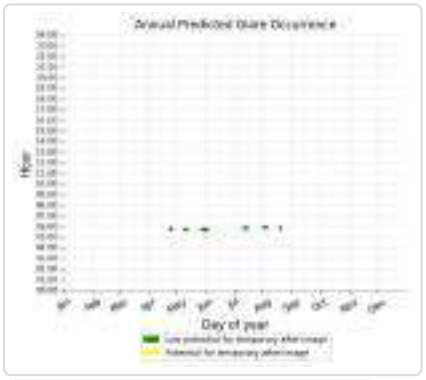

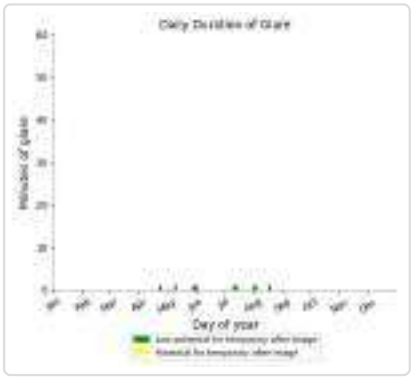

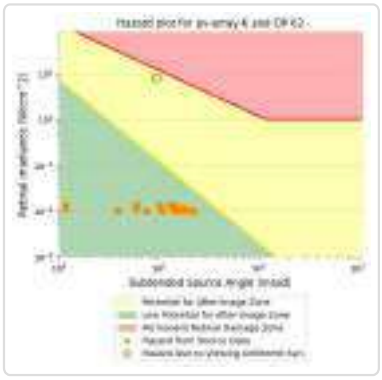

PV array 6: OP 62

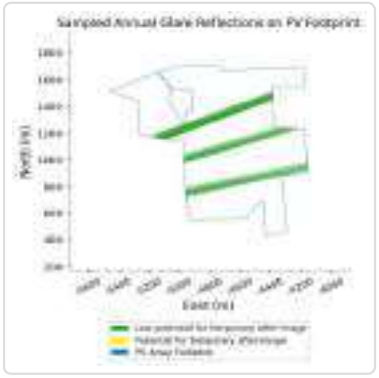

PV array is expected to produce the following glare for this receptor:

- 24 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

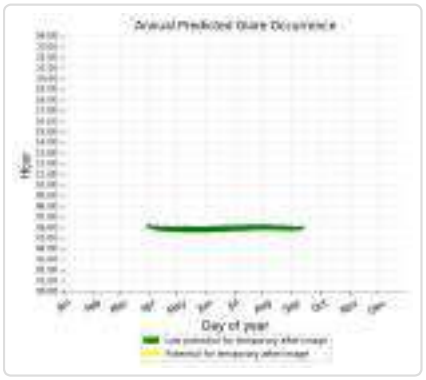

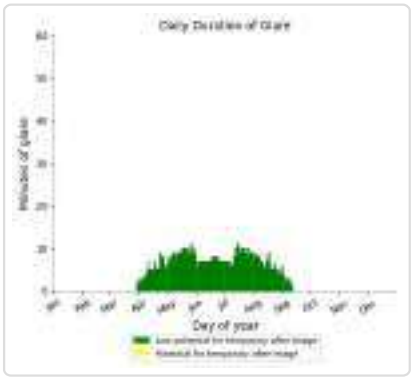

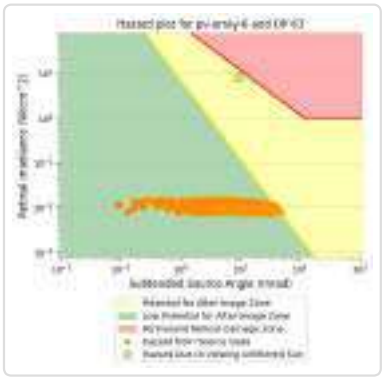

PV array 6: OP 63

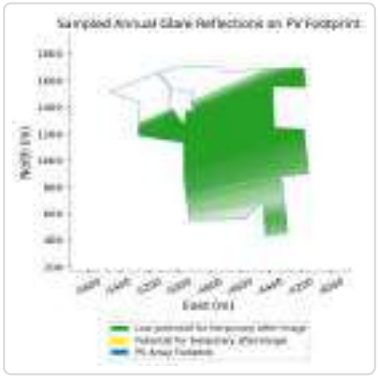

PV array is expected to produce the following glare for this receptor:

- 1,168 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

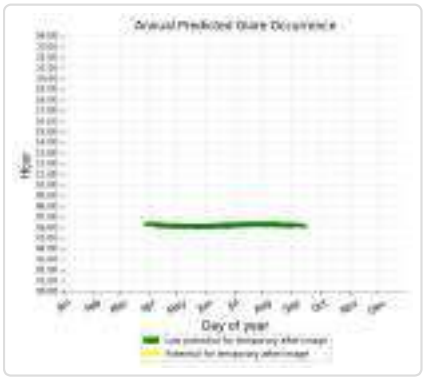

PV array 6: OP 64

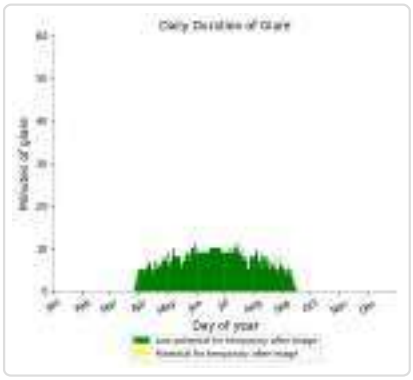

No glare found

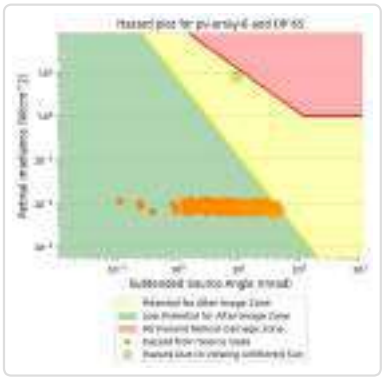

PV array 6: OP 65

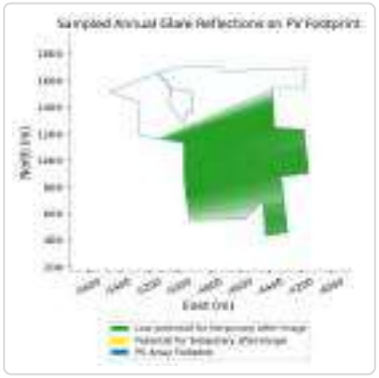

PV array is expected to produce the following glare for this receptor:

- 1,262 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array is expected to produce the following glare for this receptor:

- 188 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

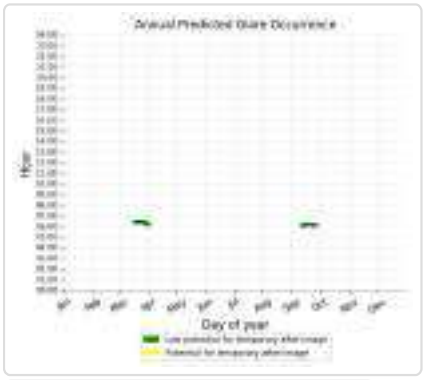

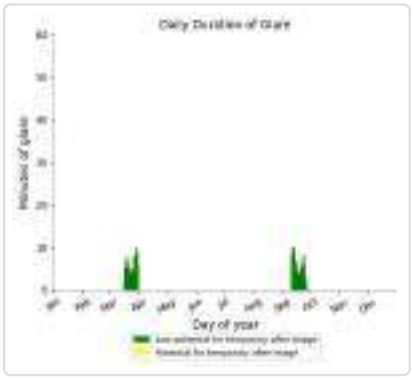

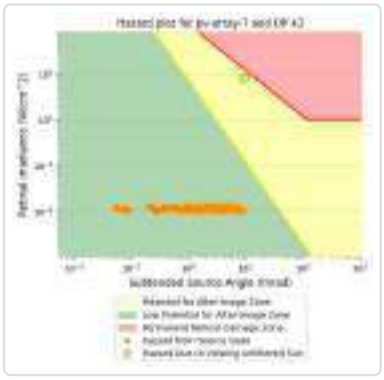

PV array 7: OP 42

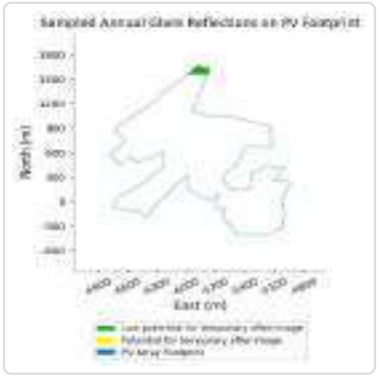

PV array is expected to produce the following glare for this receptor:

- 214 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

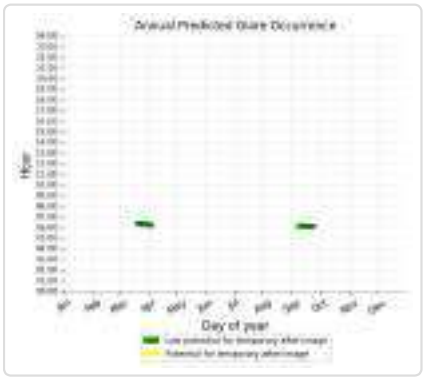

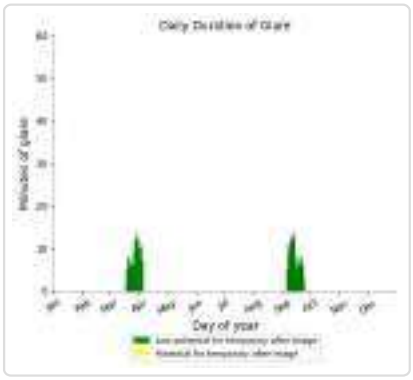

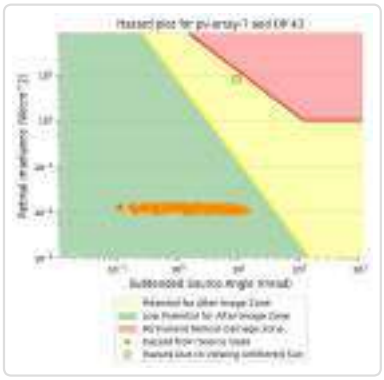

PV array 7: OP 43

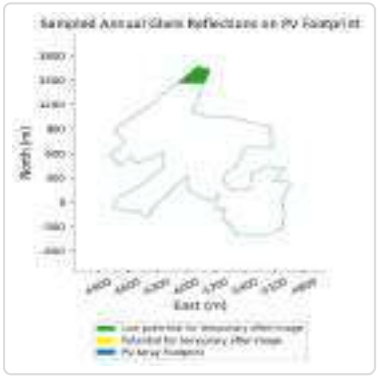

PV array is expected to produce the following glare for this receptor:

- 330 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

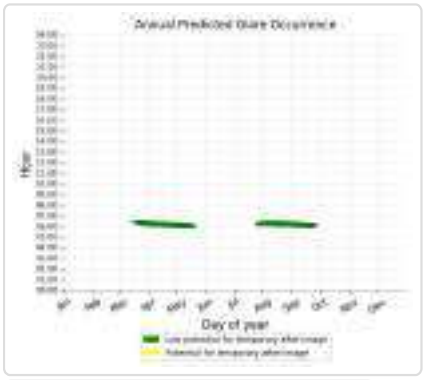

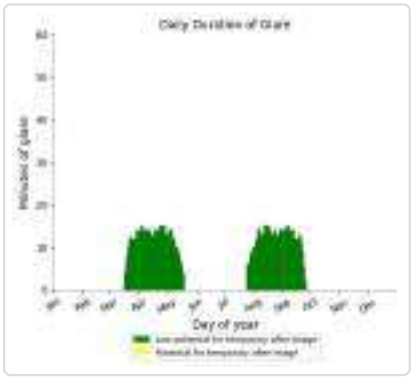

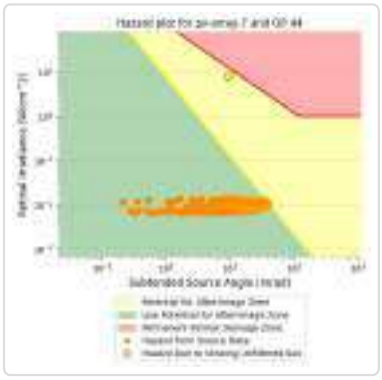

PV array 7: OP 44

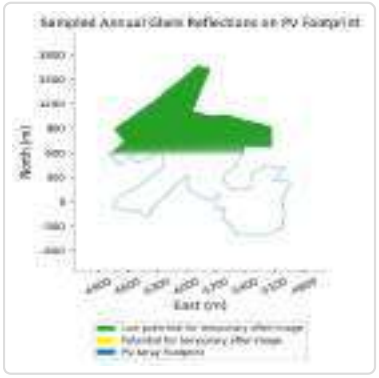

PV array is expected to produce the following glare for this receptor:

- 1,581 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

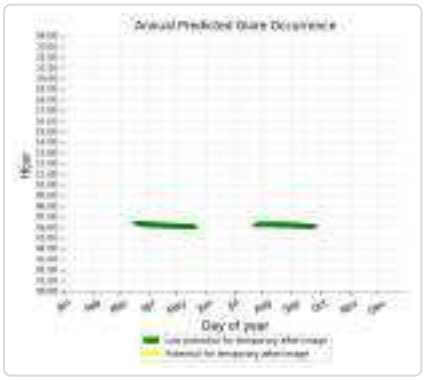

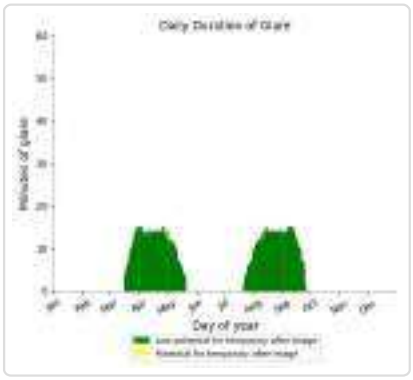

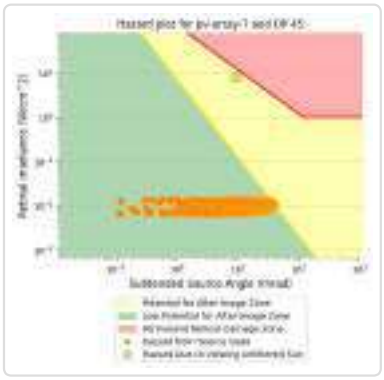

PV array 7: OP 45

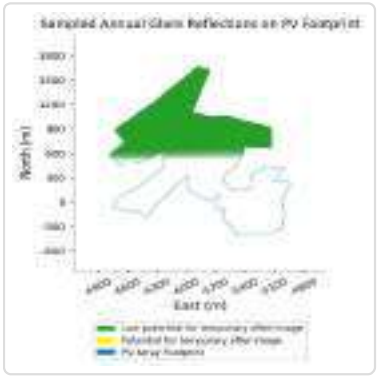

PV array is expected to produce the following glare for this receptor:

- 1,530 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

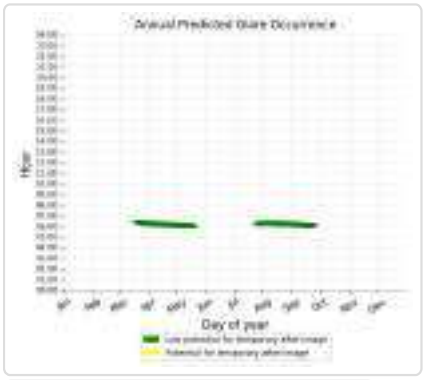

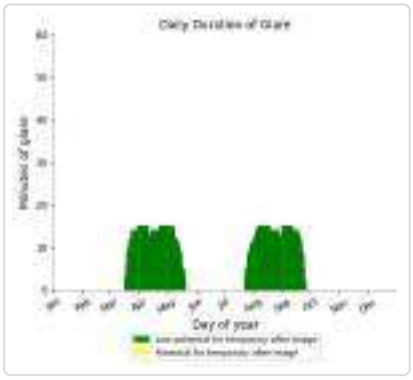

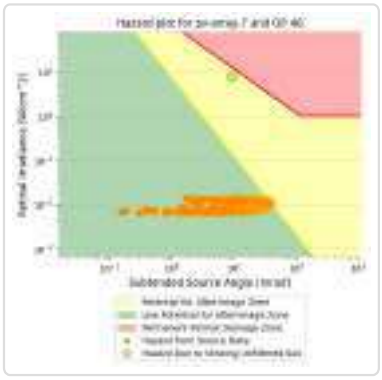

PV array 7: OP 46

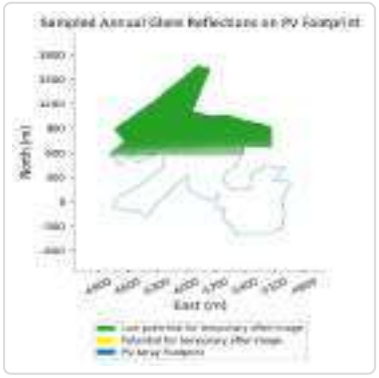

PV array is expected to produce the following glare for this receptor:

- 1,711 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

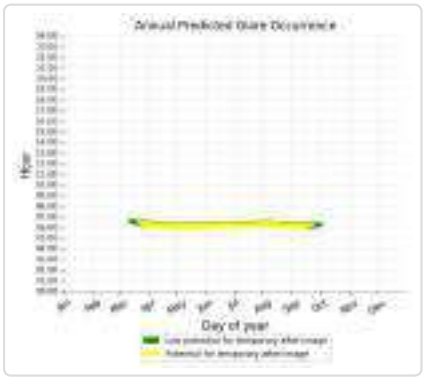

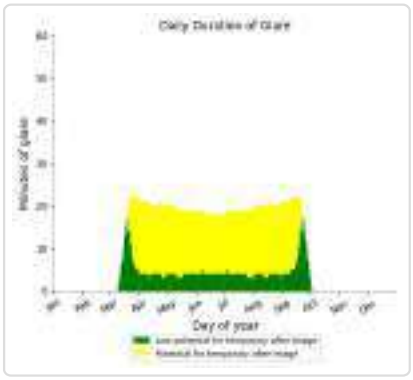

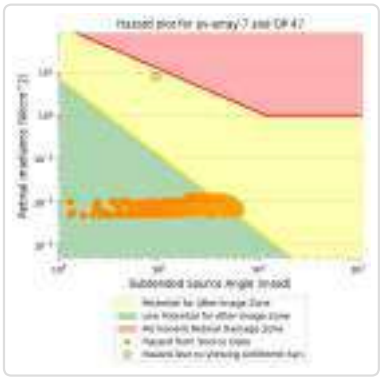

PV array 7: OP 47

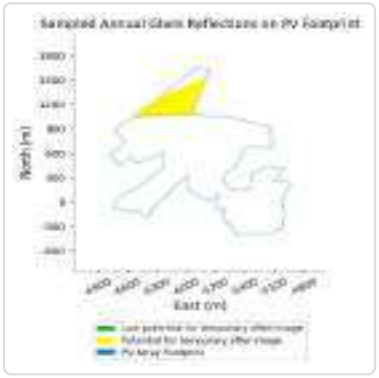

PV array is expected to produce the following glare for this receptor:

- 1,022 minutes of "green" glare with low potential to cause temporary after-image.
- 2,858 minutes of "yellow" glare with potential to cause temporary after-image.

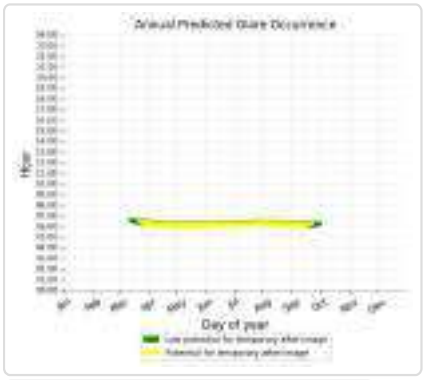

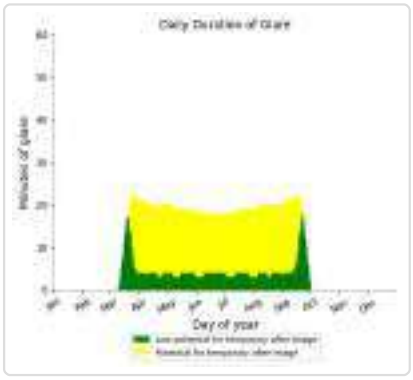

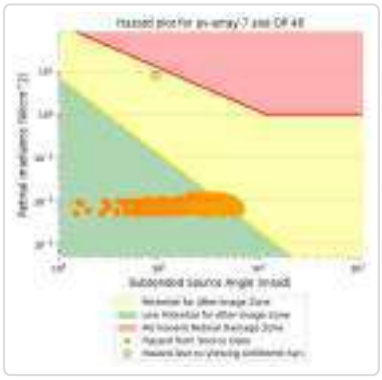

PV array 7: OP 48

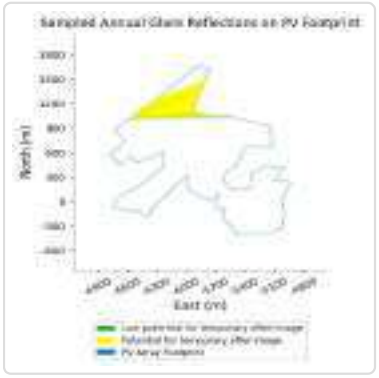

PV array is expected to produce the following glare for this receptor:

- 1,005 minutes of "green" glare with low potential to cause temporary after-image.
- 2,816 minutes of "yellow" glare with potential to cause temporary after-image.

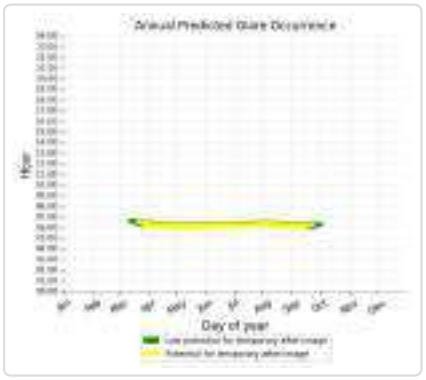

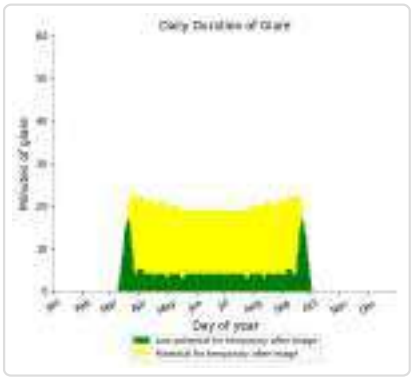

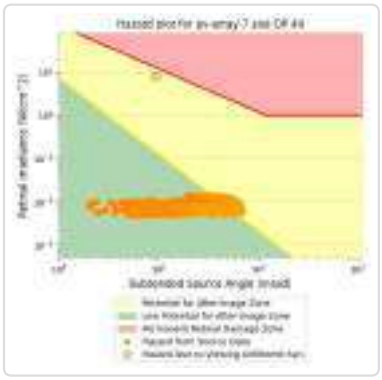

PV array 7: OP 49

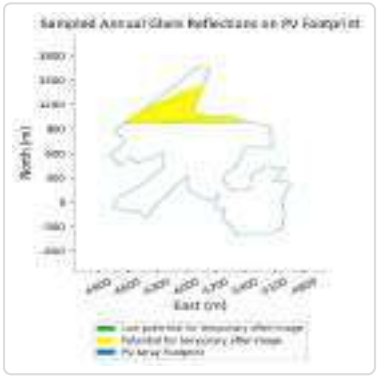

PV array is expected to produce the following glare for this receptor:

- 1,056 minutes of "green" glare with low potential to cause temporary after-image.
- 2,898 minutes of "yellow" glare with potential to cause temporary after-image.

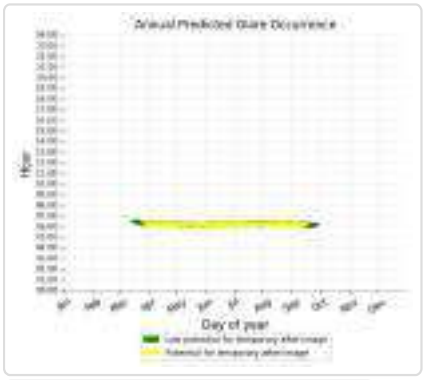

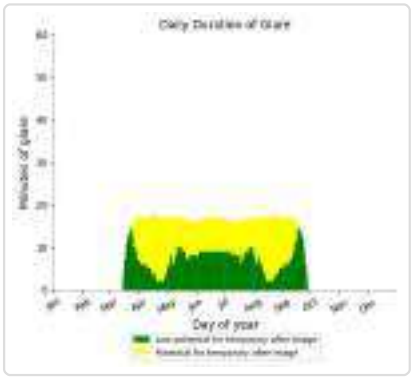

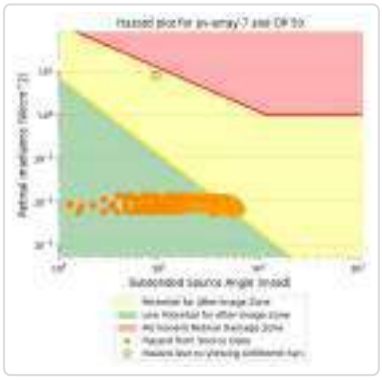

PV array 7: OP 50

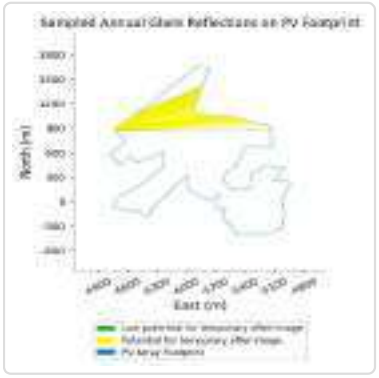

PV array is expected to produce the following glare for this receptor:

- 1,455 minutes of "green" glare with low potential to cause temporary after-image.
- 1,721 minutes of "yellow" glare with potential to cause temporary after-image.

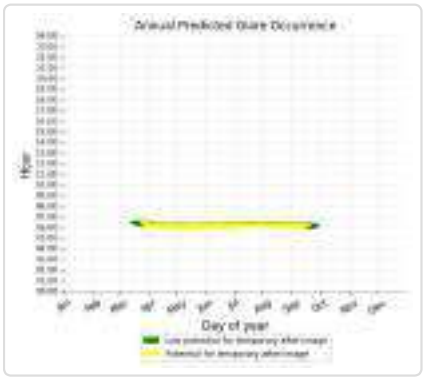

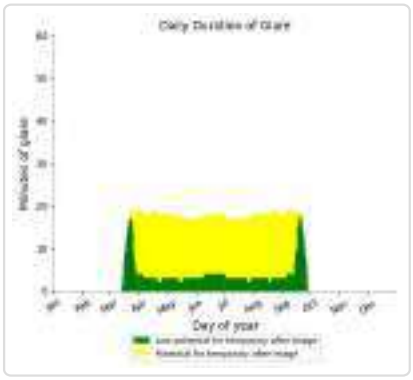

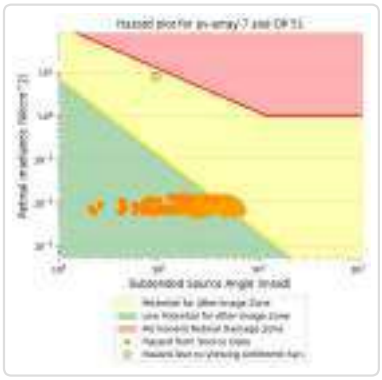

PV array 7: OP 51

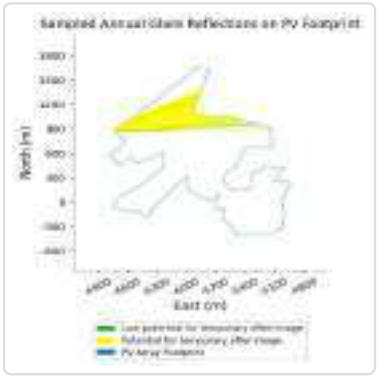

PV array is expected to produce the following glare for this receptor:

- 883 minutes of "green" glare with low potential to cause temporary after-image.
- 2,555 minutes of "yellow" glare with potential to cause temporary after-image.

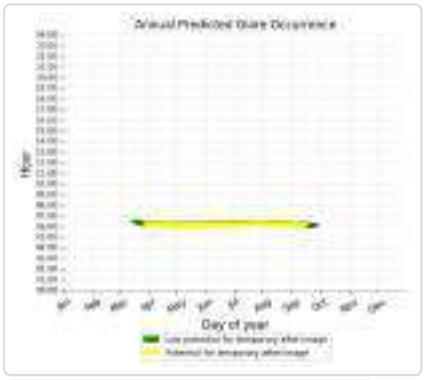

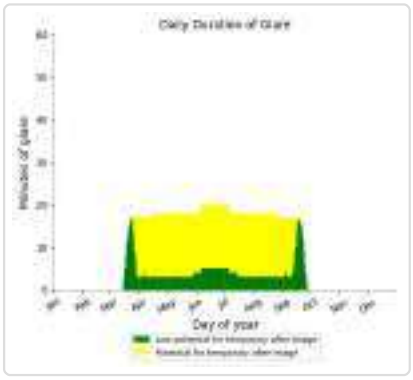

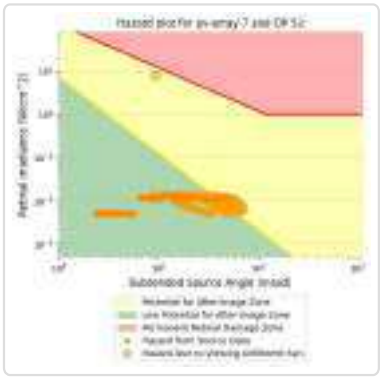

PV array 7: OP 52

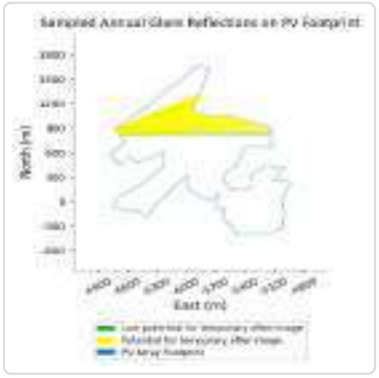

PV array is expected to produce the following glare for this receptor:

- 913 minutes of "green" glare with low potential to cause temporary after-image.
- 2,505 minutes of "yellow" glare with potential to cause temporary after-image.

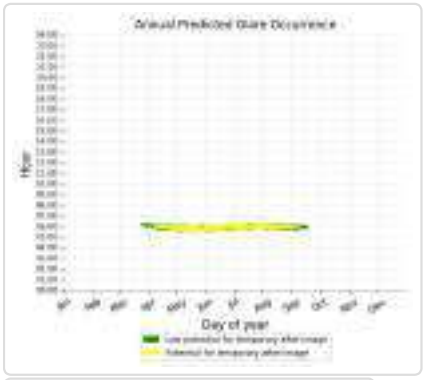

PV array 7: OP 53

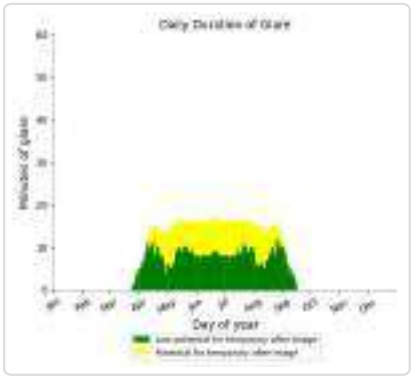

No glare found

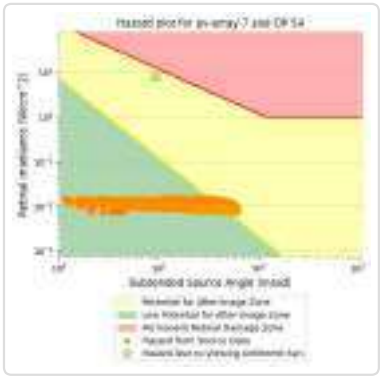

PV array 7: OP 54

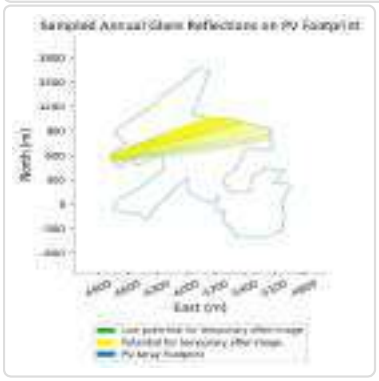

PV array is expected to produce the following glare for this receptor:

- 1,382 minutes of "green" glare with low potential to cause temporary after-image.
- 1,014 minutes of "yellow" glare with potential to cause temporary after-image.

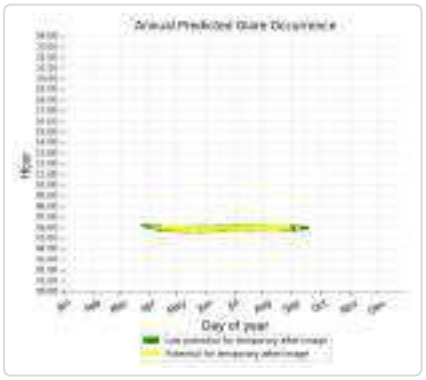

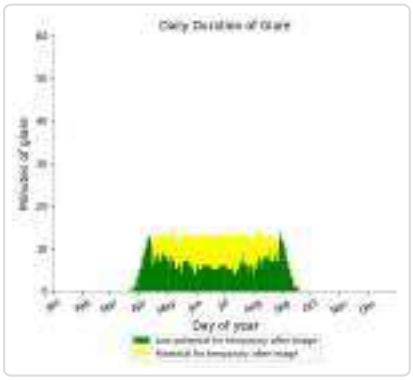

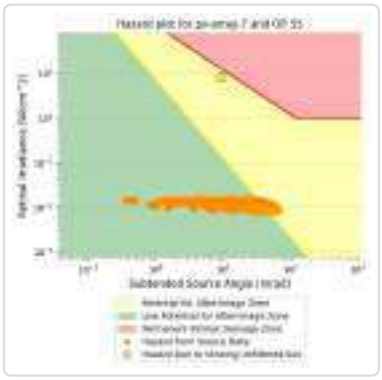

PV array 7: OP 55

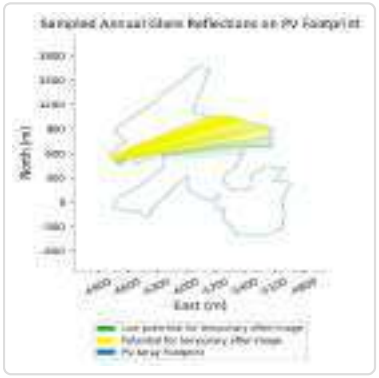

PV array is expected to produce the following glare for this receptor:

- 1,126 minutes of "green" glare with low potential to cause temporary after-image.
- 905 minutes of "yellow" glare with potential to cause temporary after-image.

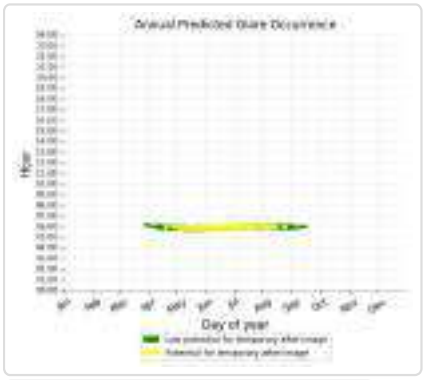

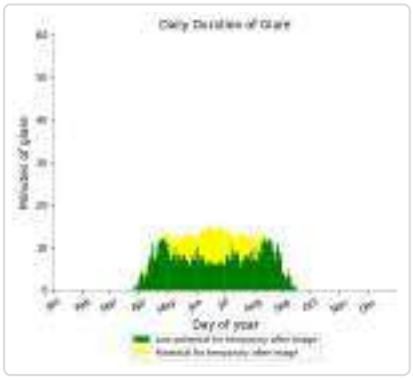

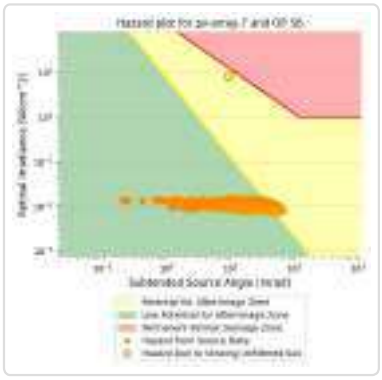

PV array 7: OP 56

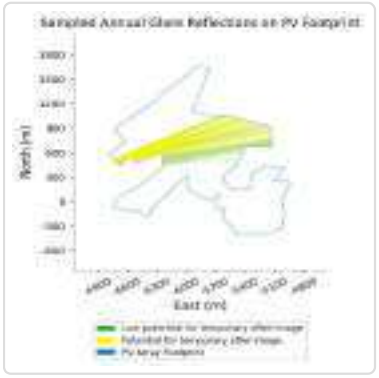

PV array is expected to produce the following glare for this receptor:

- 1,255 minutes of "green" glare with low potential to cause temporary after-image.
- 582 minutes of "yellow" glare with potential to cause temporary after-image.

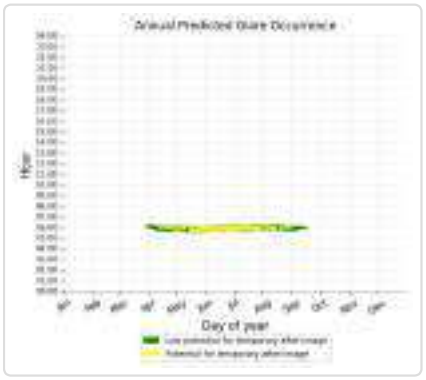

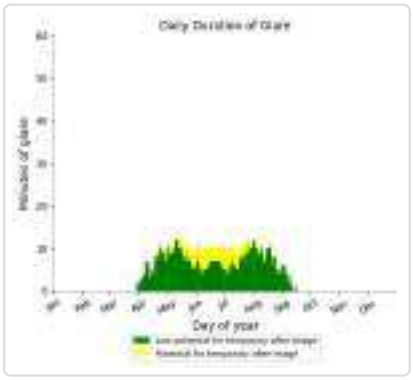

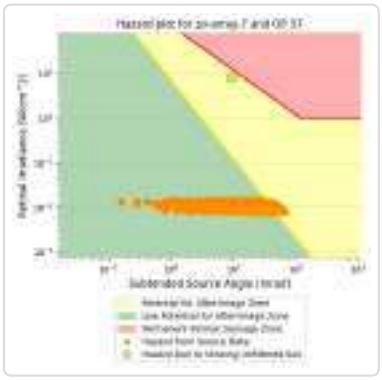

PV array 7: OP 57

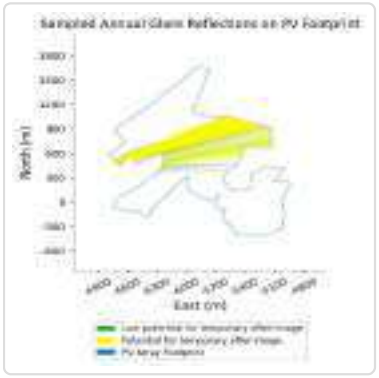

PV array is expected to produce the following glare for this receptor:

- 1,151 minutes of "green" glare with low potential to cause temporary after-image.
- 322 minutes of "yellow" glare with potential to cause temporary after-image.

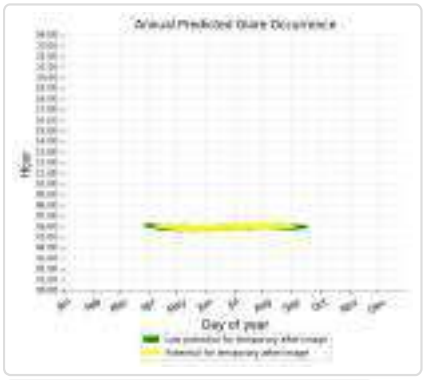

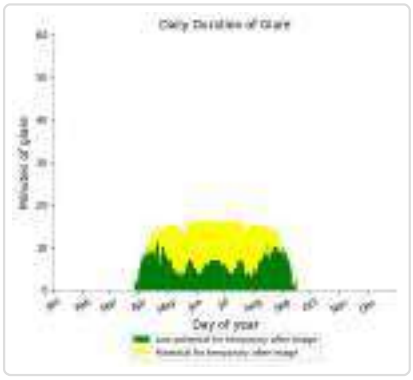

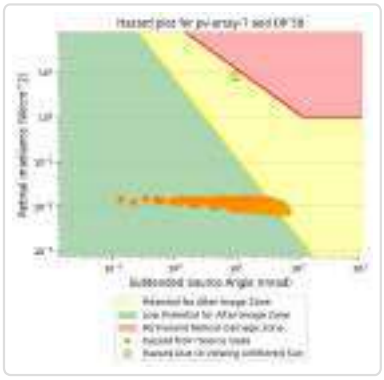

PV array 7: OP 58

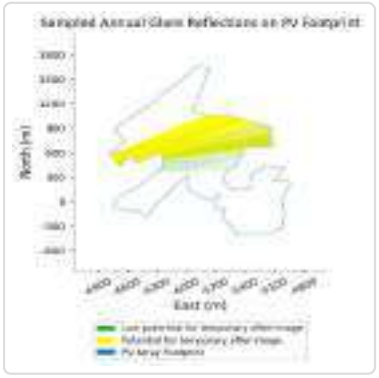

PV array is expected to produce the following glare for this receptor:

- 1,086 minutes of "green" glare with low potential to cause temporary after-image.
- 1,216 minutes of "yellow" glare with potential to cause temporary after-image.

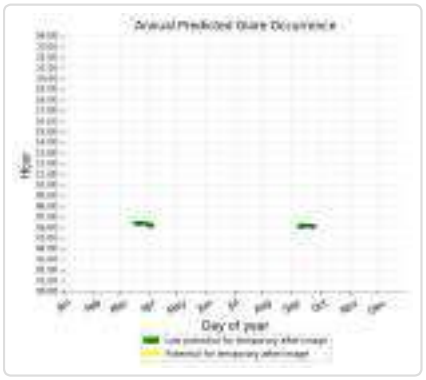

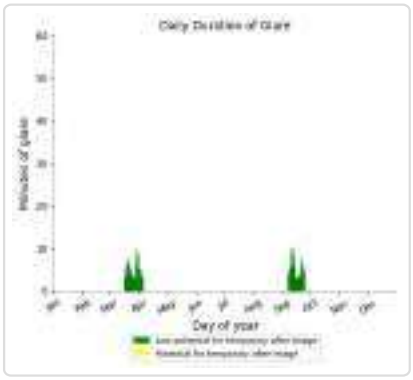

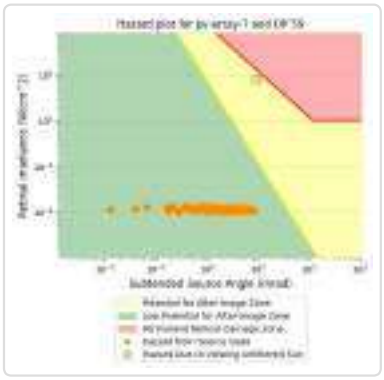

PV array 7: OP 59

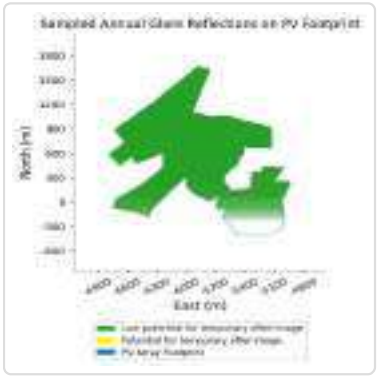

PV array is expected to produce the following glare for this receptor:

- 209 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

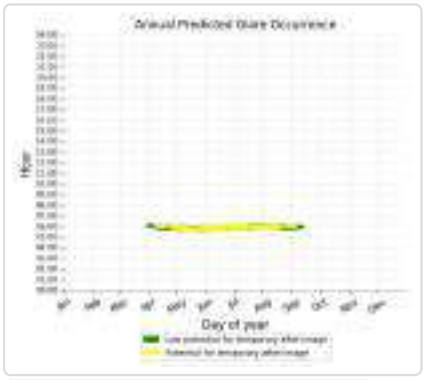

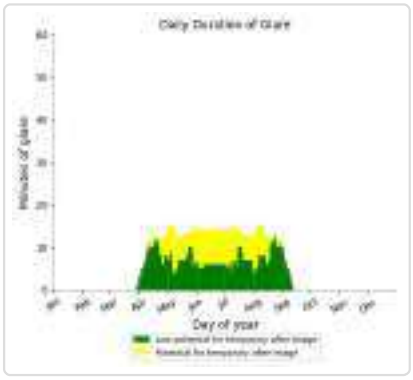

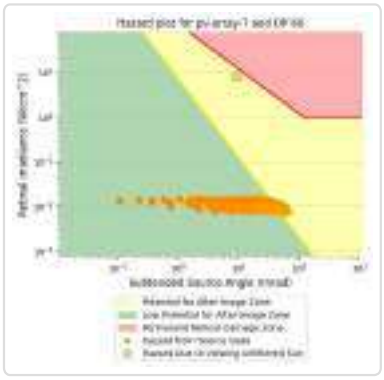

PV array 7: OP 60

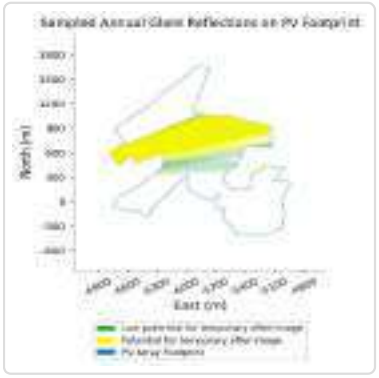

PV array is expected to produce the following glare for this receptor:

- 1,185 minutes of "green" glare with low potential to cause temporary after-image.
- 871 minutes of "yellow" glare with potential to cause temporary after-image.

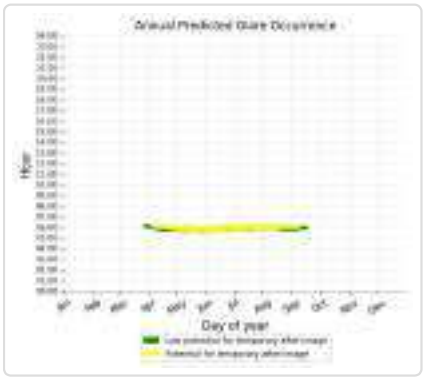

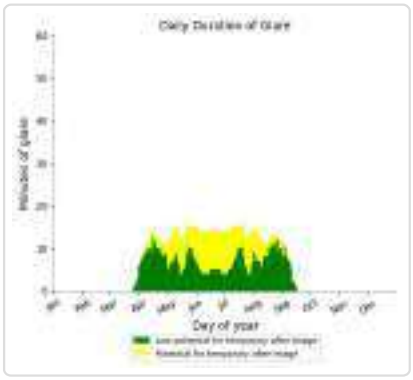

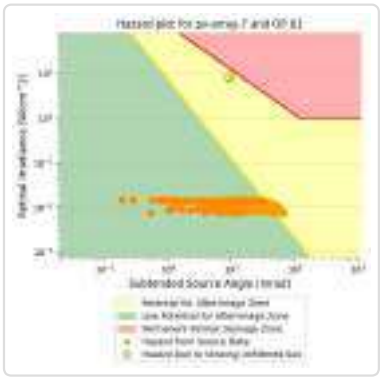

PV array 7: OP 61

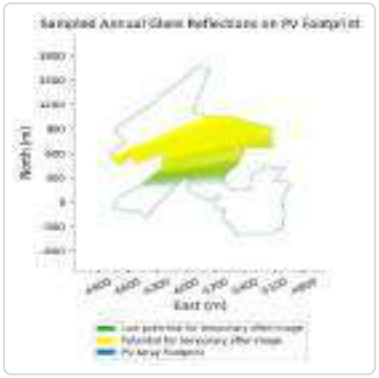

PV array is expected to produce the following glare for this receptor:

- 1,224 minutes of "green" glare with low potential to cause temporary after-image.
- 914 minutes of "yellow" glare with potential to cause temporary after-image.

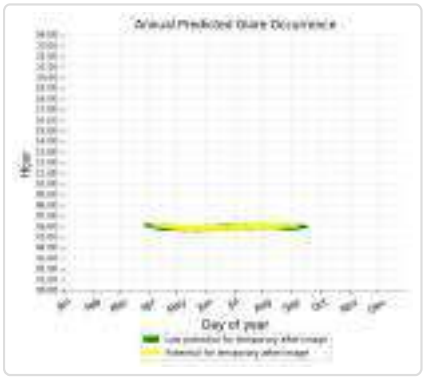

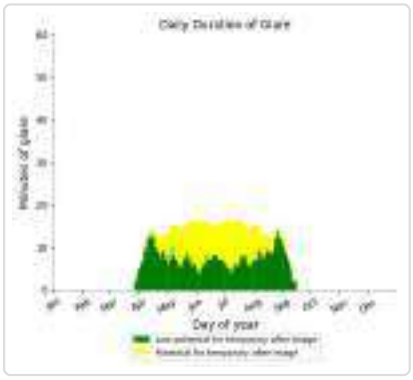

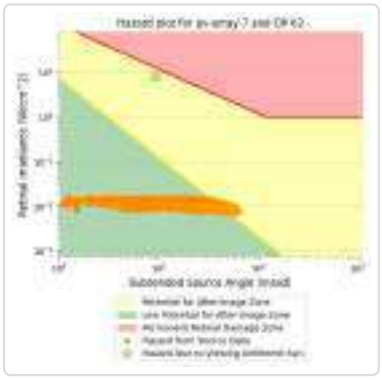

PV array 7: OP 62

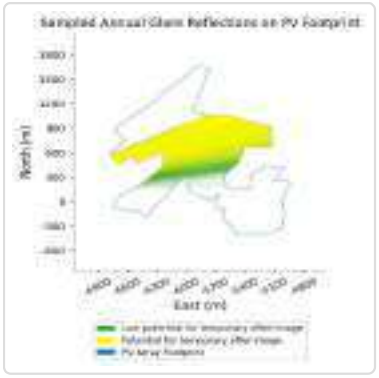

PV array is expected to produce the following glare for this receptor:

- 1,282 minutes of "green" glare with low potential to cause temporary after-image.
- 1,016 minutes of "yellow" glare with potential to cause temporary after-image.

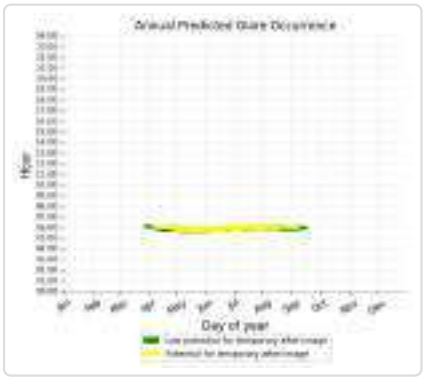

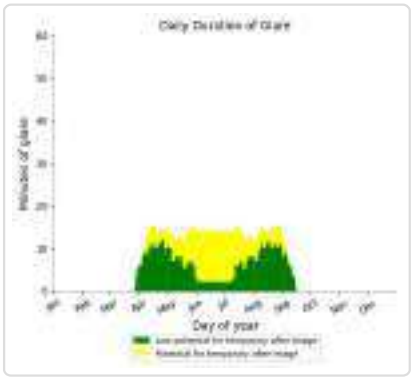

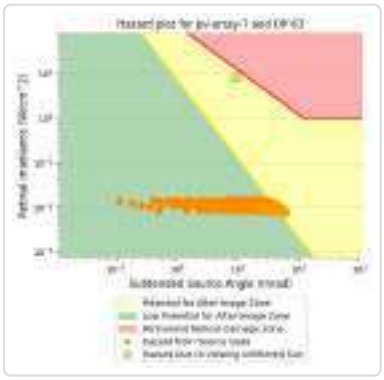

PV array 7: OP 63

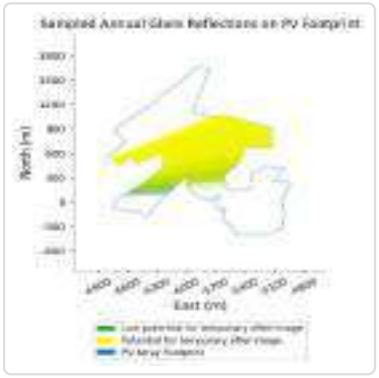

PV array is expected to produce the following glare for this receptor:

- 1,143 minutes of "green" glare with low potential to cause temporary after-image.
- 1,051 minutes of "yellow" glare with potential to cause temporary after-image.

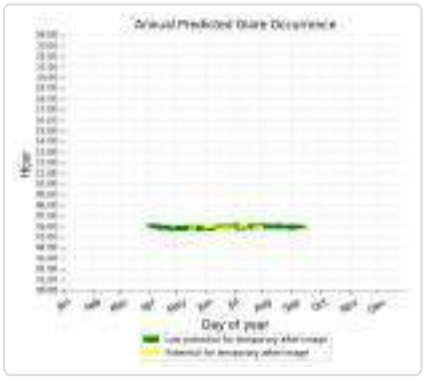

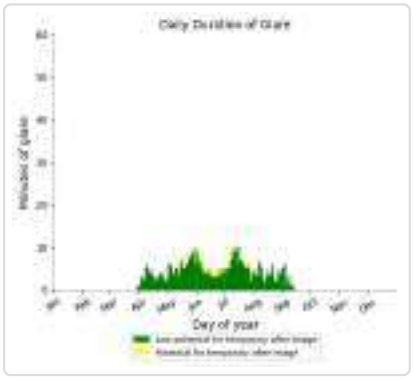

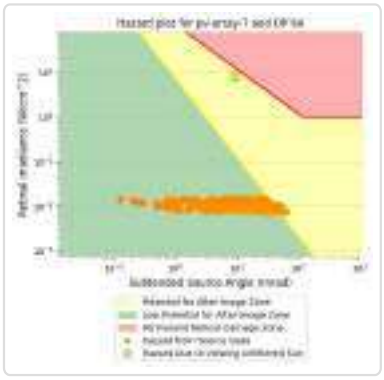

PV array 7: OP 64

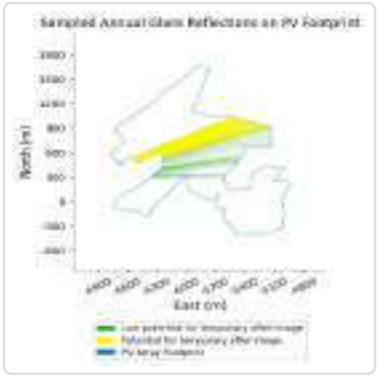

PV array is expected to produce the following glare for this receptor:

- 759 minutes of "green" glare with low potential to cause temporary after-image.
- 64 minutes of "yellow" glare with potential to cause temporary after-image.

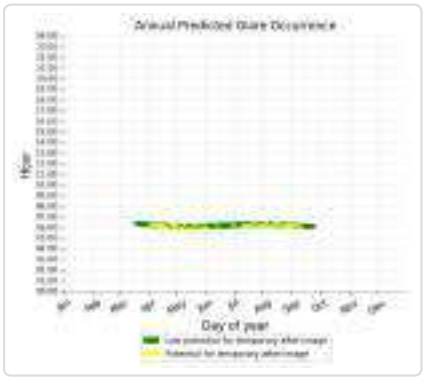

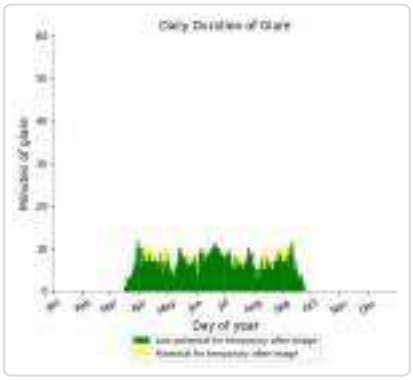

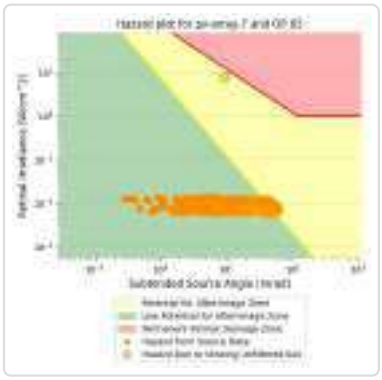

PV array 7: OP 65

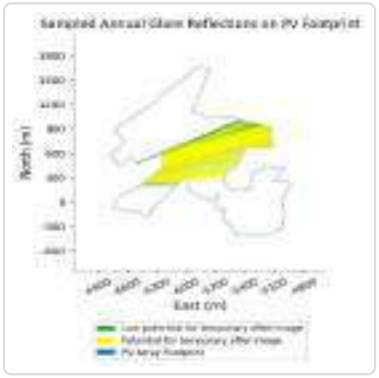

PV array is expected to produce the following glare for this receptor:

- 1,353 minutes of "green" glare with low potential to cause temporary after-image.
- 145 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 8: OP 47

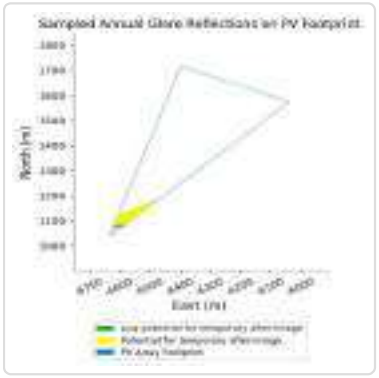

PV array is expected to produce the following glare for this receptor:

- 1,121 minutes of "green" glare with low potential to cause temporary after-image.
- 1,533 minutes of "yellow" glare with potential to cause temporary after-image.

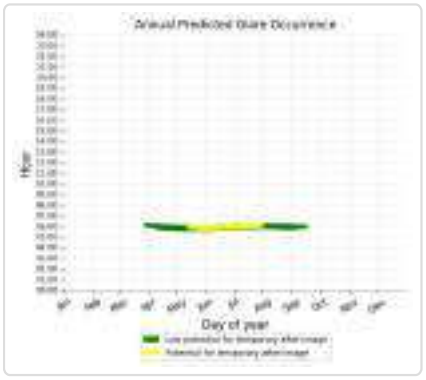

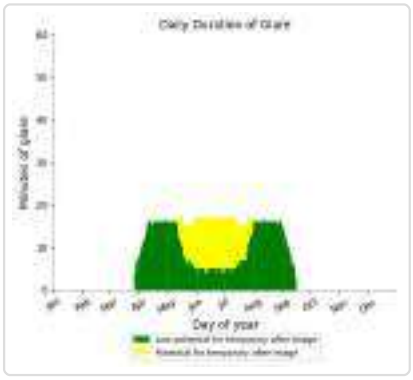

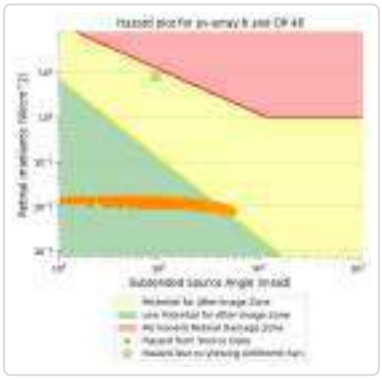

PV array 8: OP 48

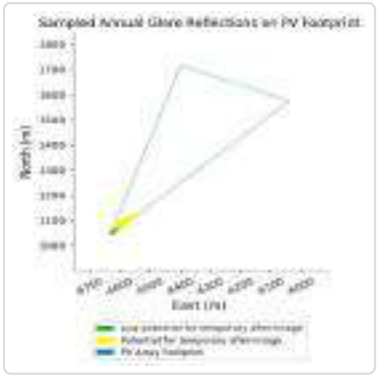

PV array is expected to produce the following glare for this receptor:

- 1,796 minutes of "green" glare with low potential to cause temporary after-image.
- 807 minutes of "yellow" glare with potential to cause temporary after-image.

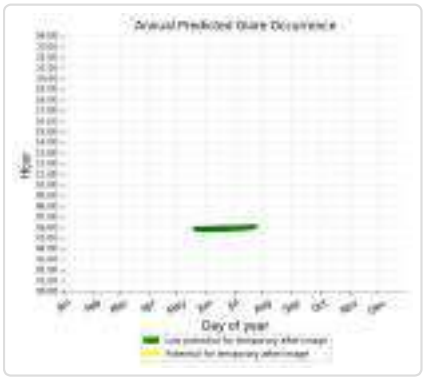

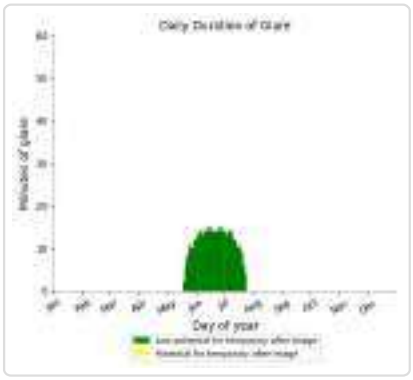

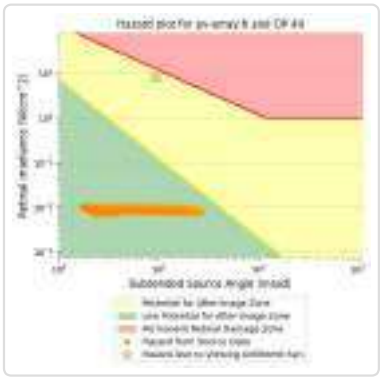

PV array 8: OP 49

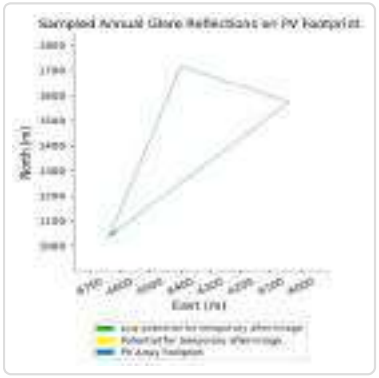

PV array is expected to produce the following glare for this receptor:

- 805 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

Summary of Vertical Surface Glare Analysis

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographi obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for larg PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, no discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Appendix D: Residential Receptor Glare Results (66-123) (15 Deg)

ForgeSolar

East Park Solar

Residential Receptors 66 - 123 15 Deg

Client: Axis

Created Jun 12, 2024
Updated Sep 01, 2025
Time-step 1 minute
Timezone offset UTC0
Minimum sun altitude 0.0 deg
Site ID 121534.20781

Project type Advanced
Project status: active
Category 100 MW to 1 GW

Misc. Analysis Settings

DNI: **varies (1,000.0 W/m^2 peak)**
Ocular transmission coefficient: **0.5**
Pupil diameter: **0.002 m**
Eye focal length: **0.017 m**
Sun subtended angle: **9.3 mrad**

PV Analysis Methodology: **Version 2**
Enhanced subtended angle calculation: **On**

Summary of Results Glare with potential for temporary after-image predicted

PV Name	Tilt	Orientation	"Green" Glare	"Yellow" Glare	Energy Produced

Name: PV array 5
Footprint area: 65,372 m^2
Axis tracking: Fixed (no rotation)
Tilt: 15.0 deg
Orientation: 180.0 deg

Rated power: -
Panel material: Light textured glass with AR coating
Vary reflectivity with sun position? Yes
Correlate slope error with surface type? Yes
Slope error: 9.16 mrad

Vertex	Latitude	Longitude	Ground elevation	Height above ground	Total elevation

PV array 1: OP 1

No glare found

PV array 1: OP 2

No glare found

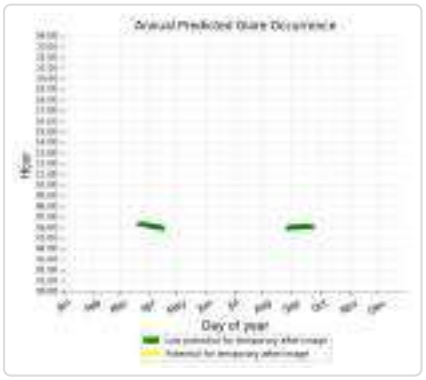

PV array 1: OP 3

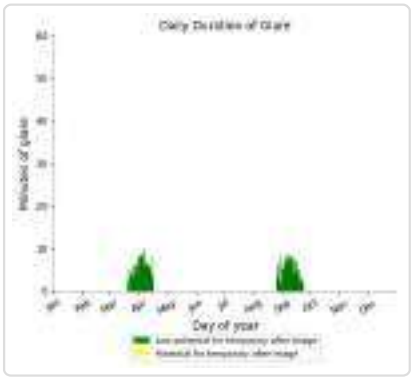

No glare found

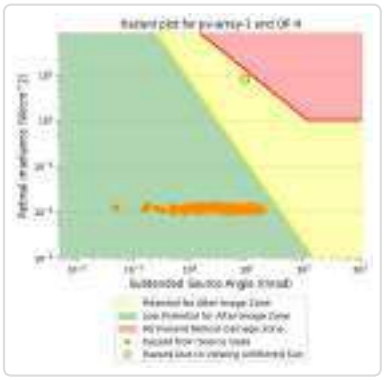

PV array 1: OP 4

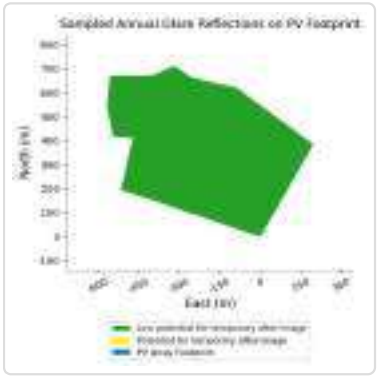

PV array is expected to produce the following glare for this receptor:

- 326 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

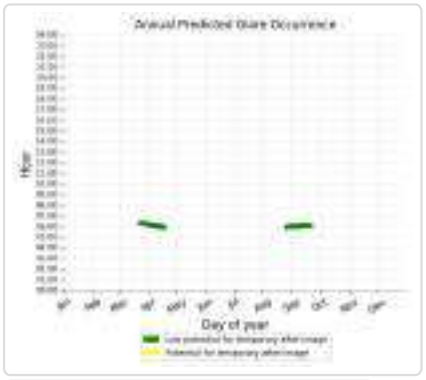

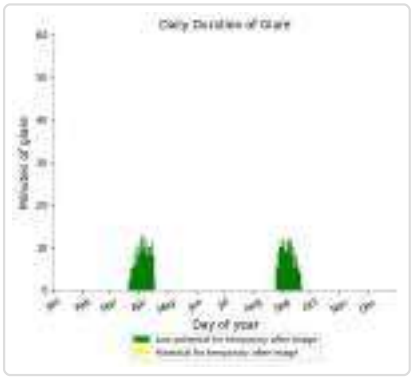

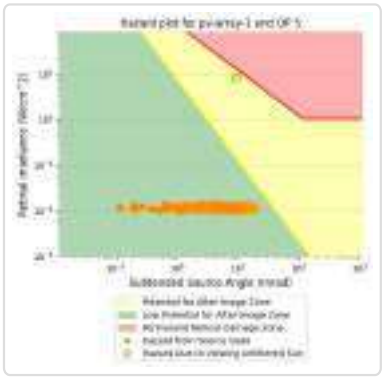

PV array 1: OP 5

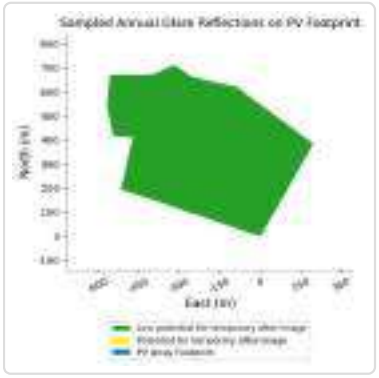

PV array is expected to produce the following glare for this receptor:

- 469 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

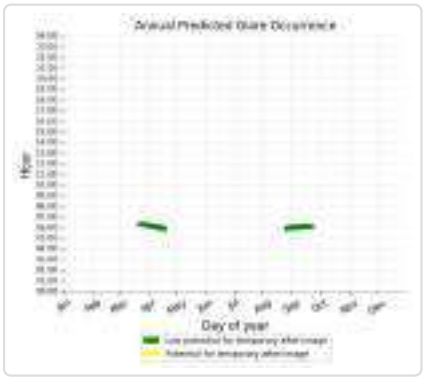

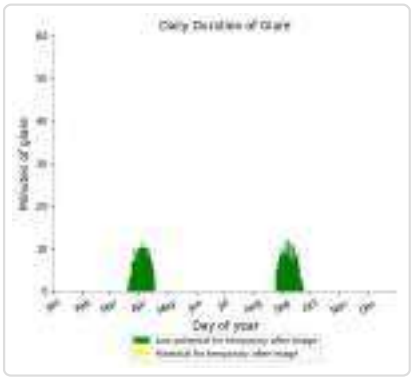

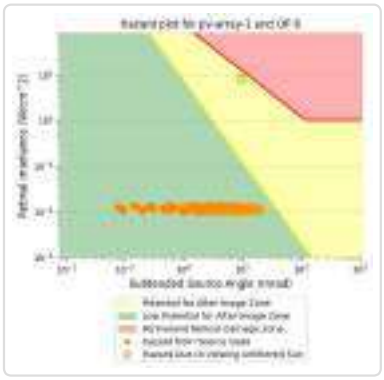

PV array 1: OP 6

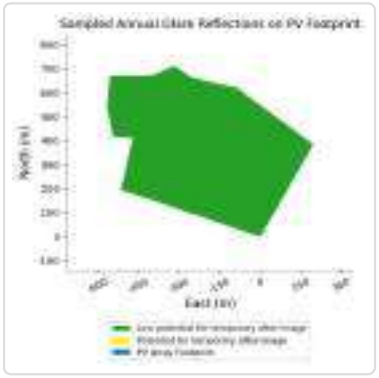

PV array is expected to produce the following glare for this receptor:

- 456 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

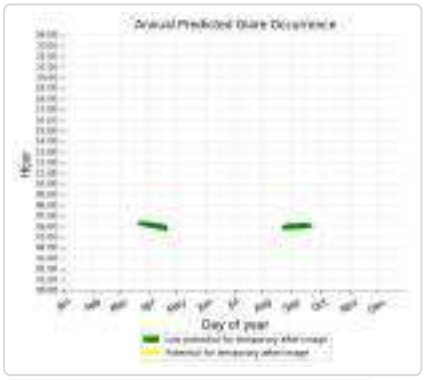

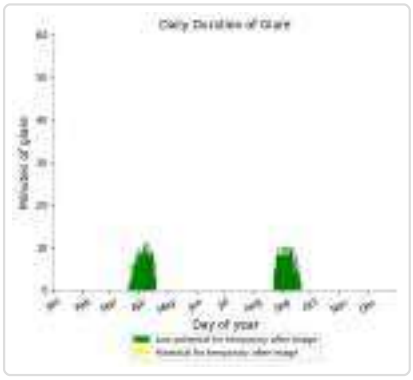

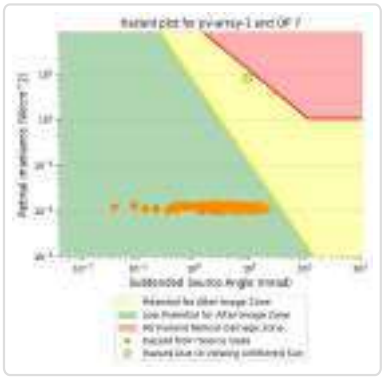

PV array 1: OP 7

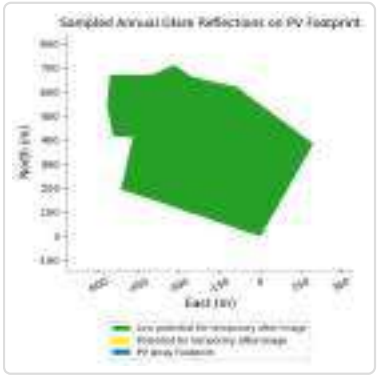

PV array is expected to produce the following glare for this receptor:

- 435 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

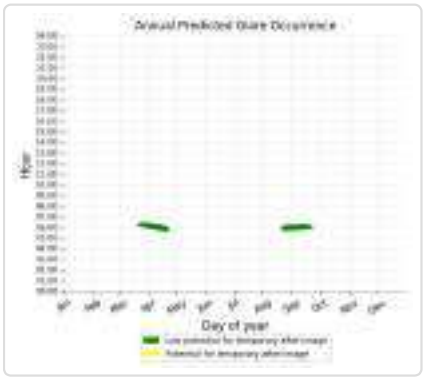

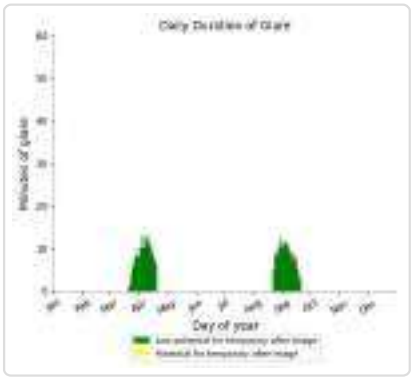

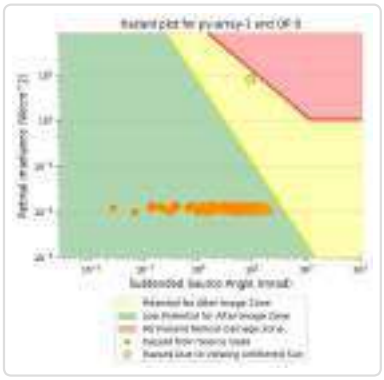

PV array 1: OP 8

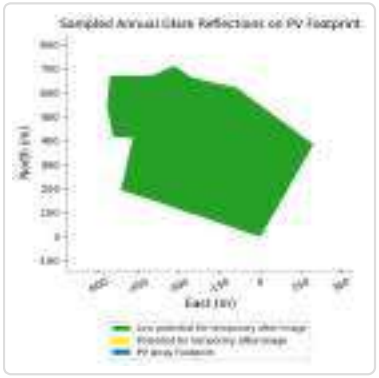

PV array is expected to produce the following glare for this receptor:

- 511 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

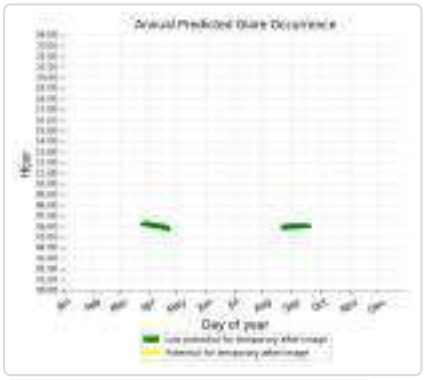

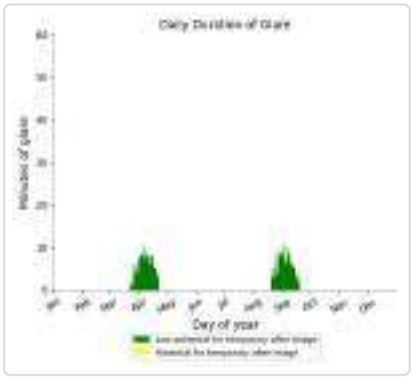

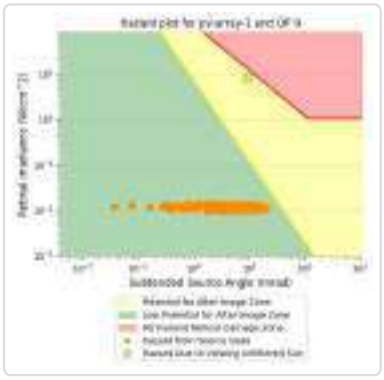

PV array 1: OP 9

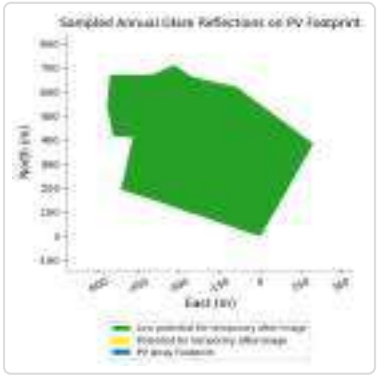

PV array is expected to produce the following glare for this receptor:

- 366 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

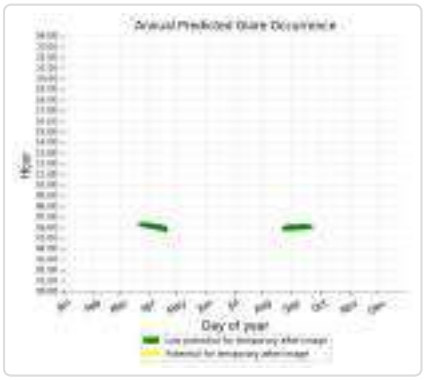

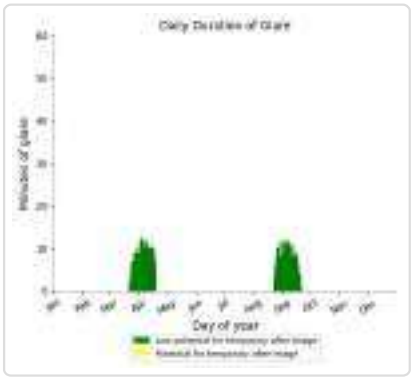

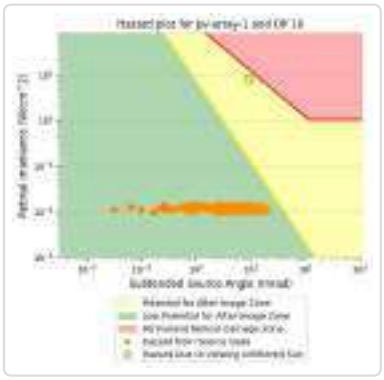

PV array 1: OP 10

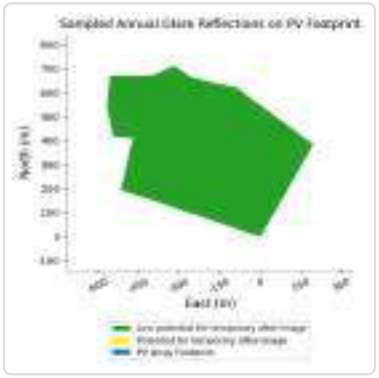

PV array is expected to produce the following glare for this receptor:

- 540 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

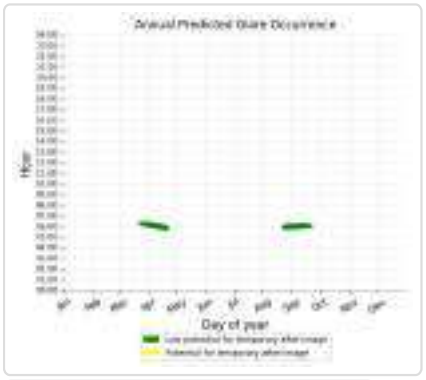

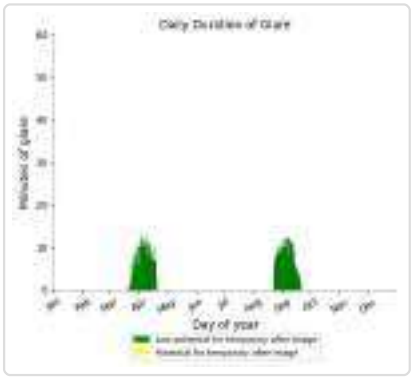

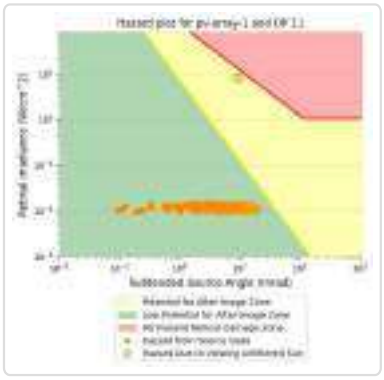

PV array 1: OP 11

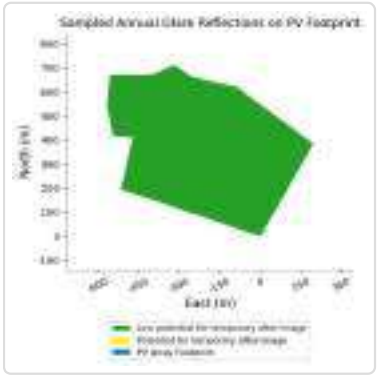

PV array is expected to produce the following glare for this receptor:

- 499 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

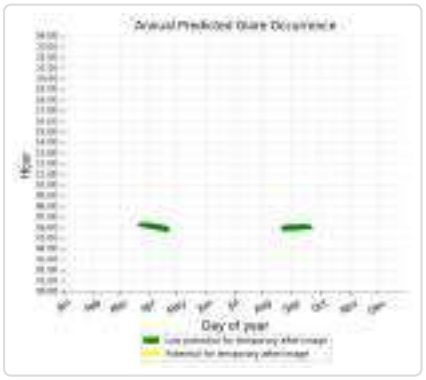

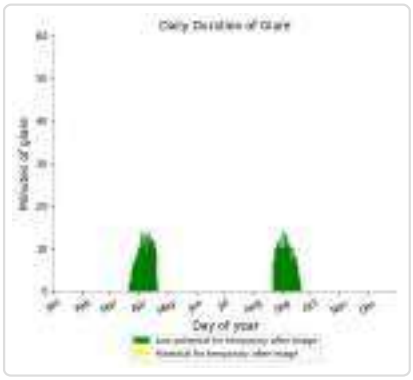

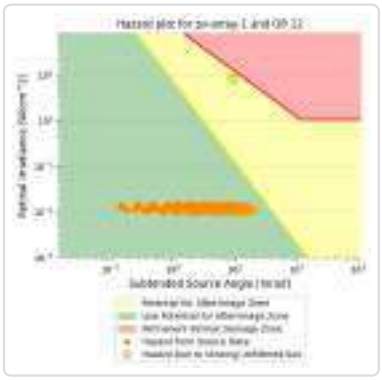

PV array 1: OP 12

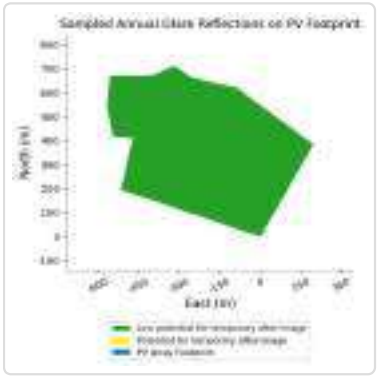

PV array is expected to produce the following glare for this receptor:

- 578 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

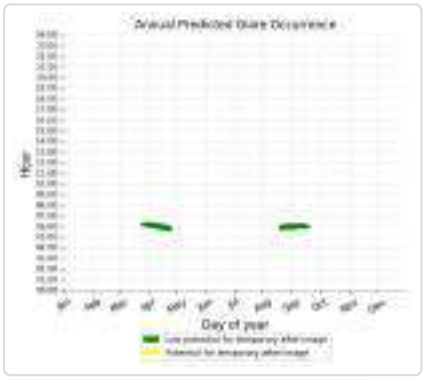

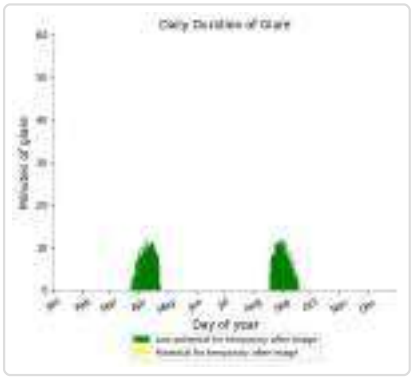

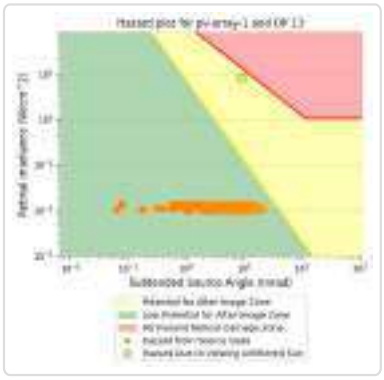

PV array 1: OP 13

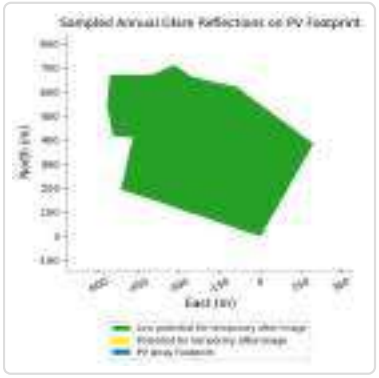

PV array is expected to produce the following glare for this receptor:

- 498 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 1: OP 14

No glare found

PV array 1: OP 15

No glare found

PV array 1: OP 16

No glare found

PV array 1: OP 17

No glare found

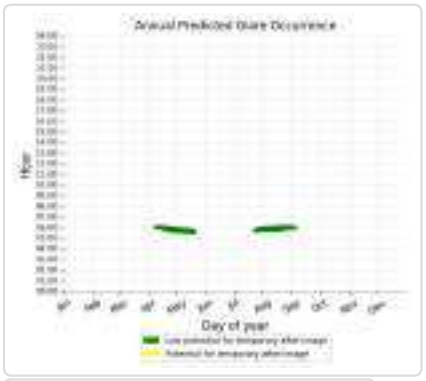

PV array 1: OP 18

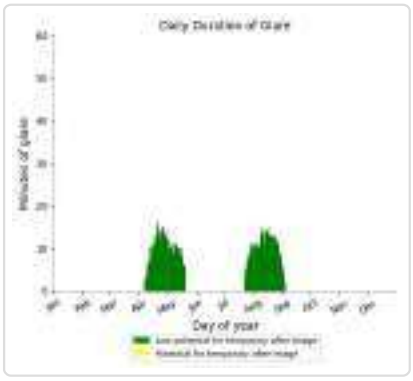

No glare found

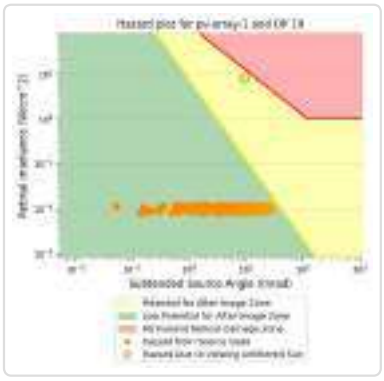

PV array 1: OP 19

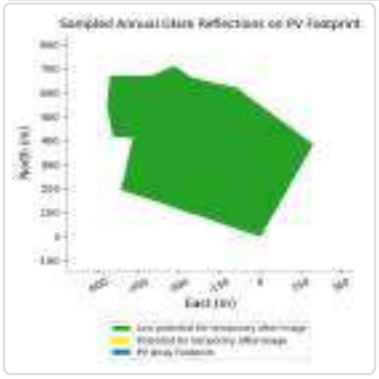

PV array is expected to produce the following glare for this receptor:

- 911 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

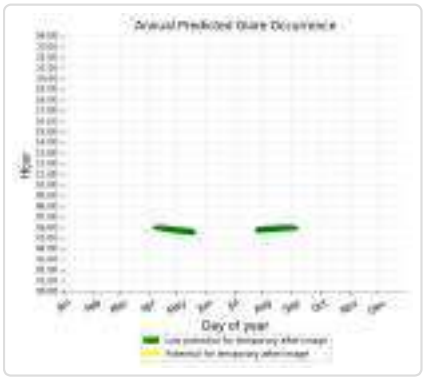

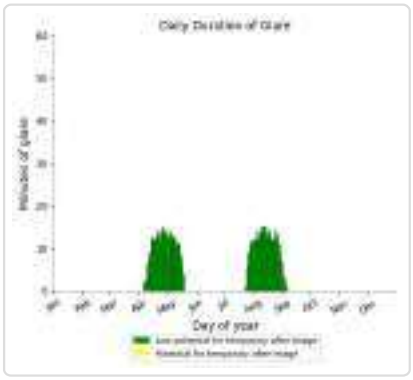

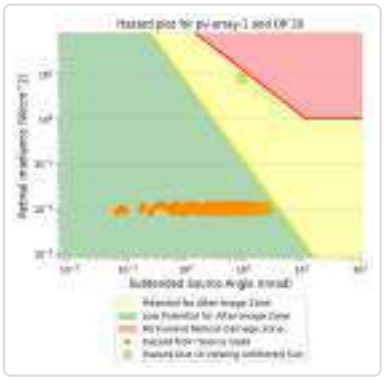

PV array 1: OP 20

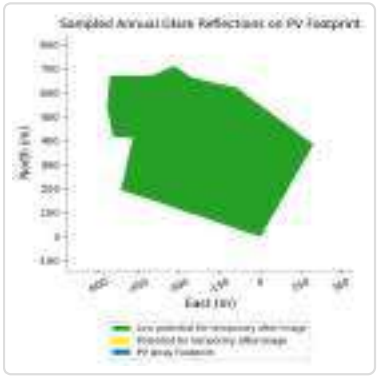

PV array is expected to produce the following glare for this receptor:

- 963 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

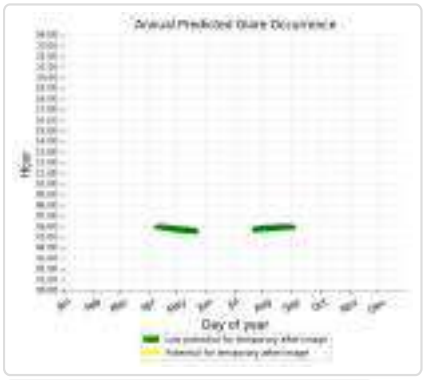

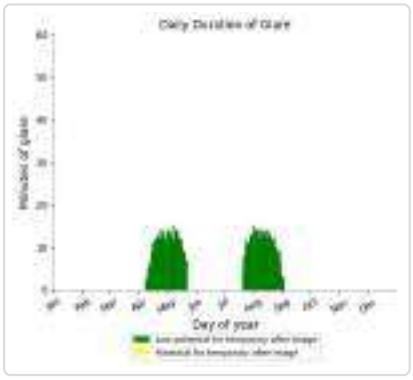

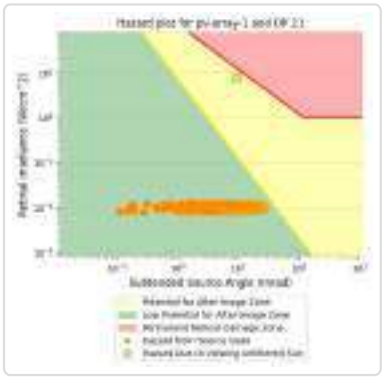

PV array 1: OP 21

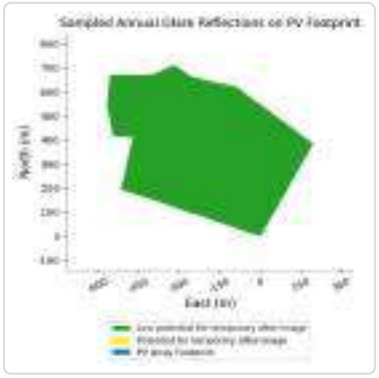

PV array is expected to produce the following glare for this receptor:

- 1,005 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

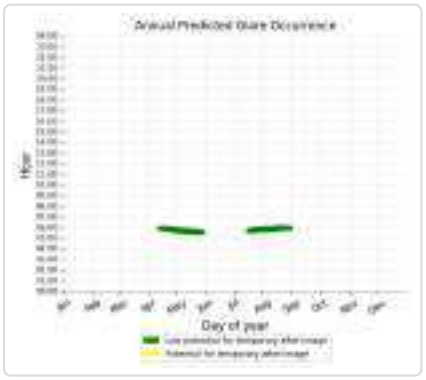

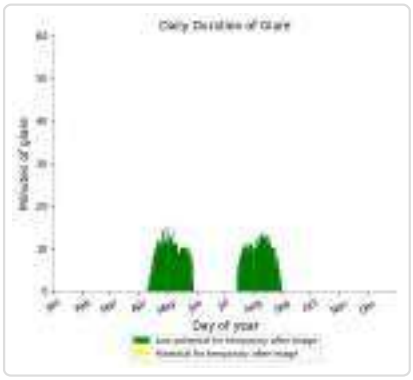

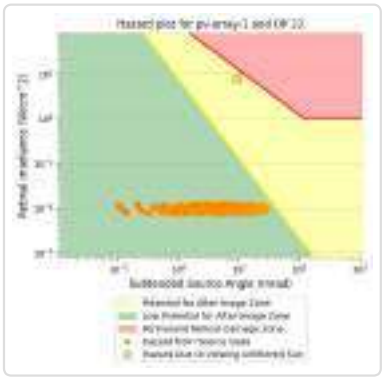

PV array 1: OP 22

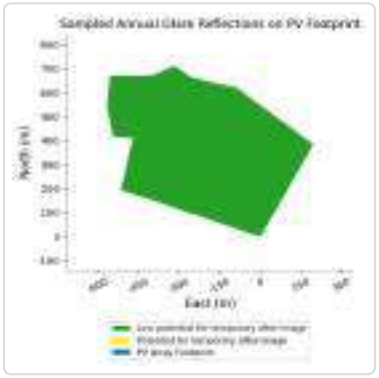

PV array is expected to produce the following glare for this receptor:

- 946 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

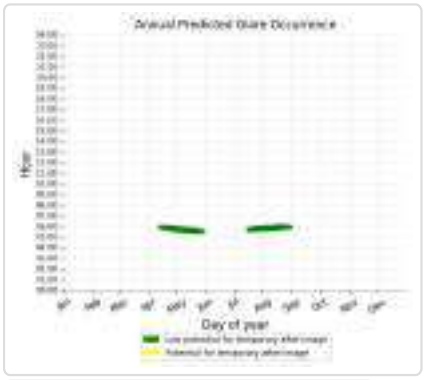

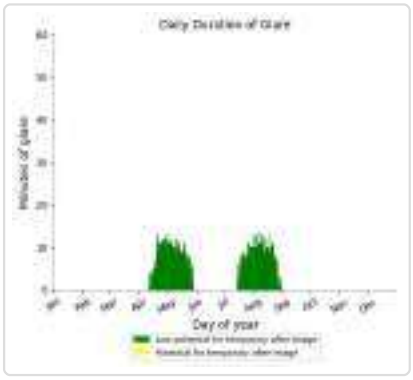

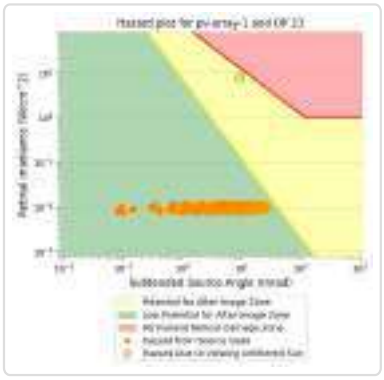

PV array 1: OP 23

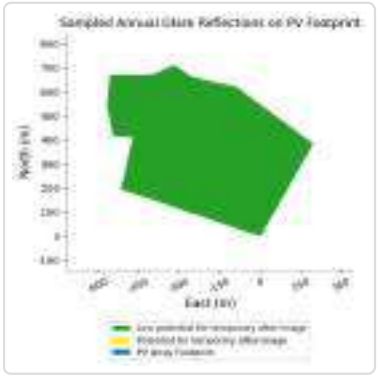

PV array is expected to produce the following glare for this receptor:

- 847 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

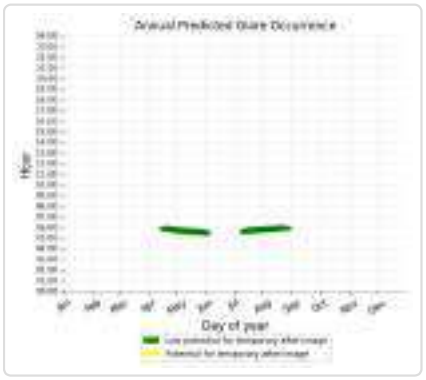

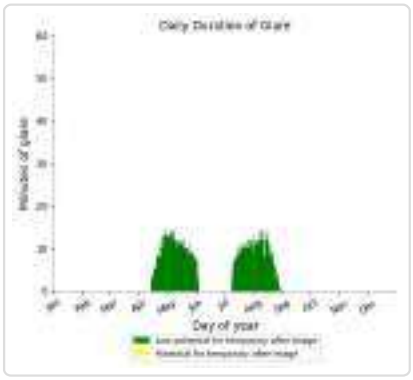

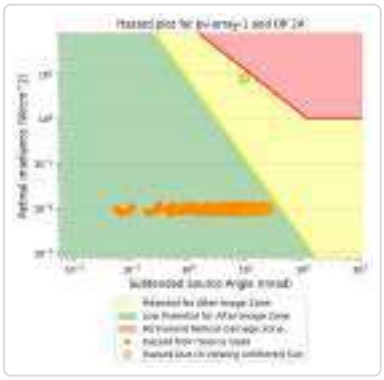

PV array 1: OP 24

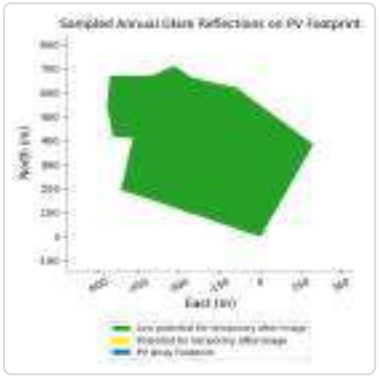

PV array is expected to produce the following glare for this receptor:

- 993 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

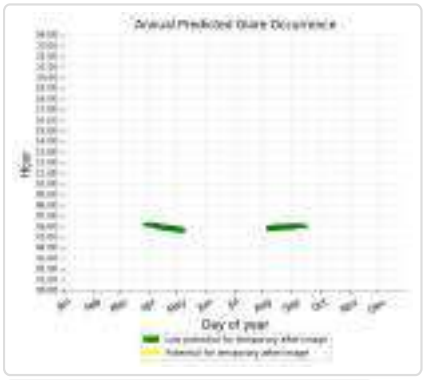

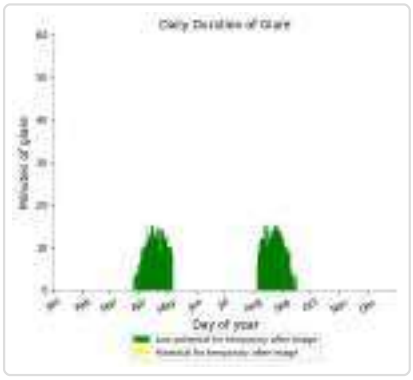

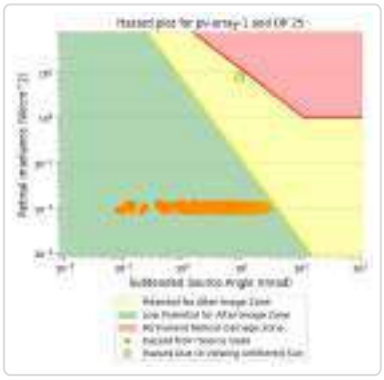

PV array 1: OP 25

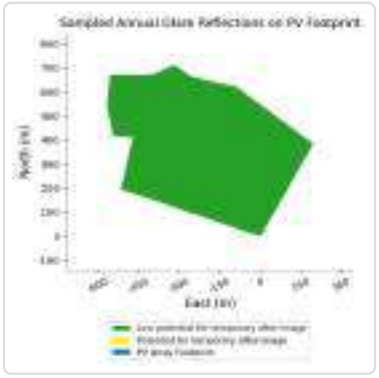

PV array is expected to produce the following glare for this receptor:

- 897 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

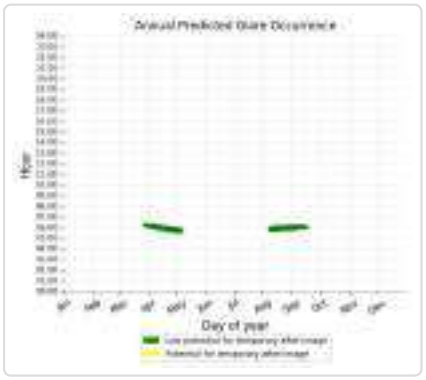

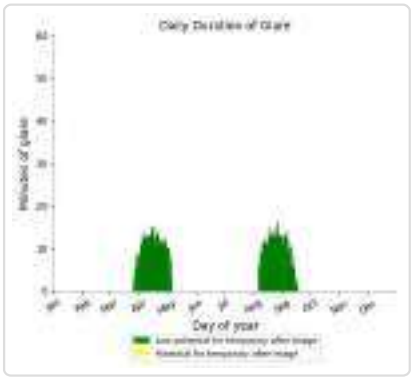

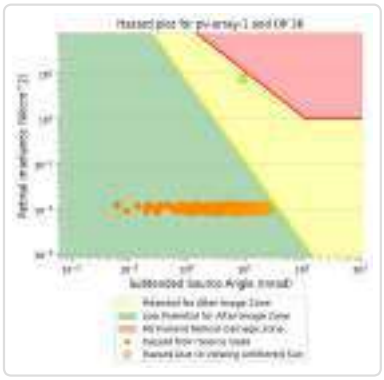

PV array 1: OP 26

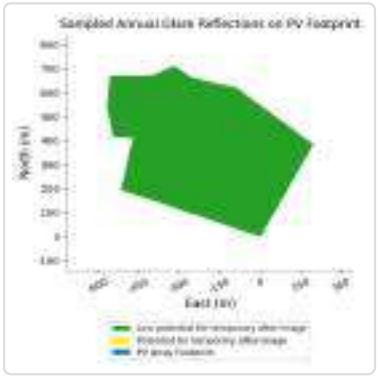

PV array is expected to produce the following glare for this receptor:

- 914 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

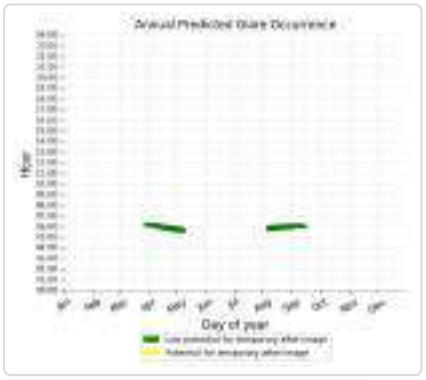

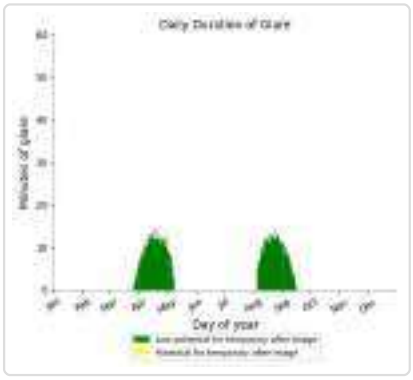

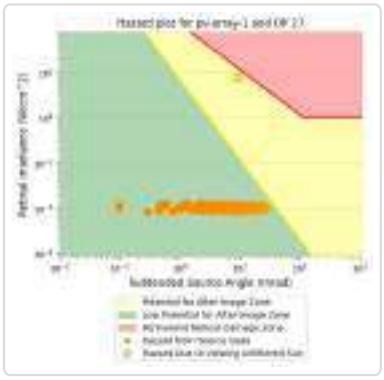

PV array 1: OP 27

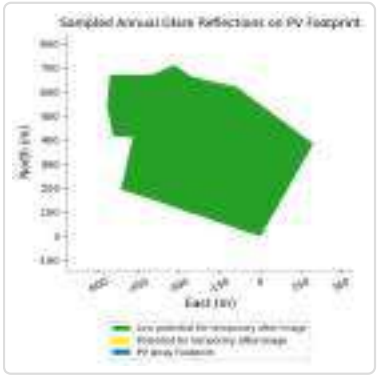

PV array is expected to produce the following glare for this receptor:

- 797 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

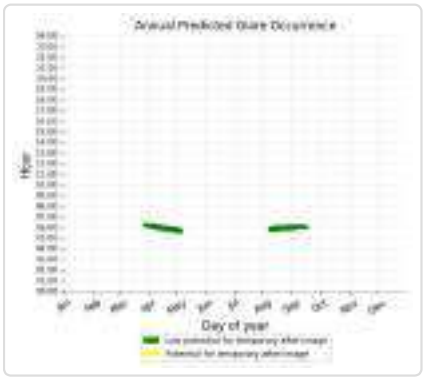

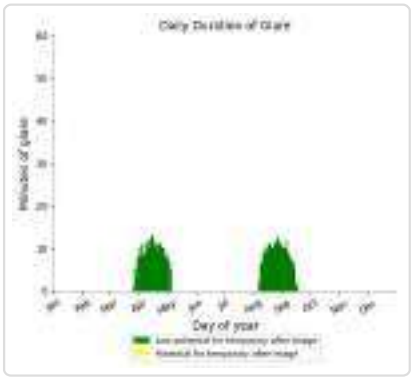

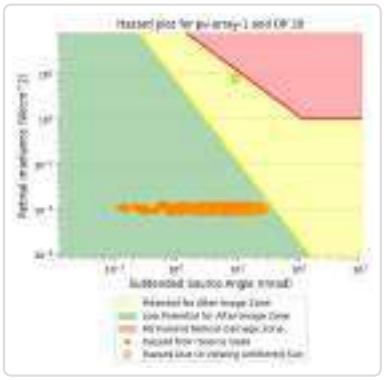

PV array 1: OP 28

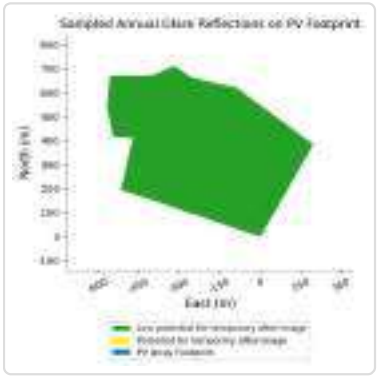

PV array is expected to produce the following glare for this receptor:

- 749 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

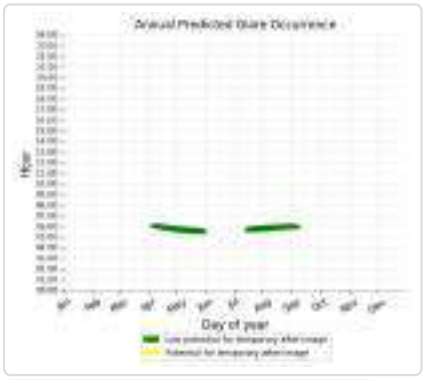

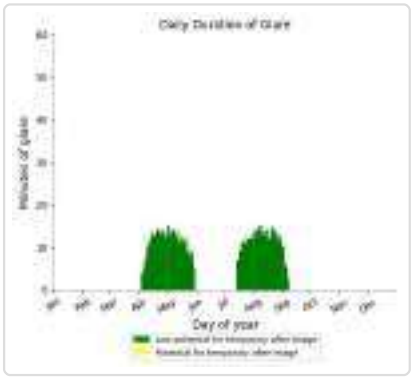

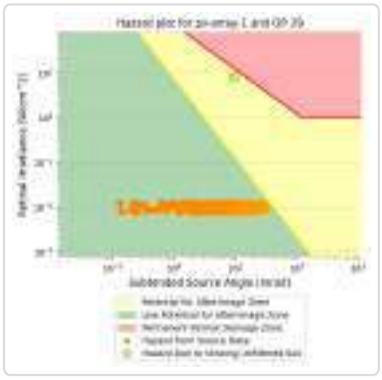

PV array 1: OP 29

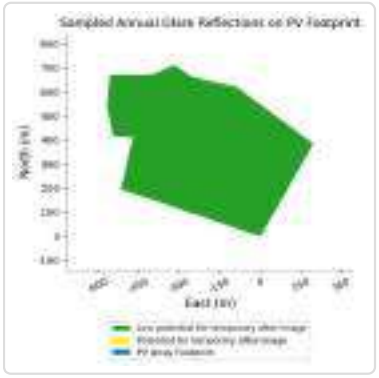

PV array is expected to produce the following glare for this receptor:

- 1,318 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

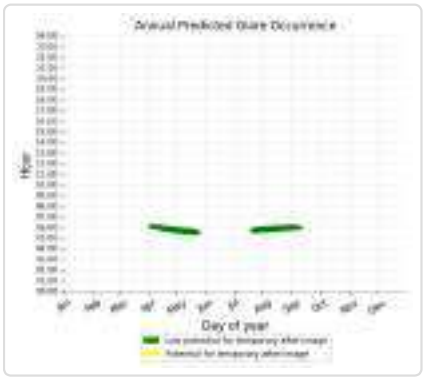

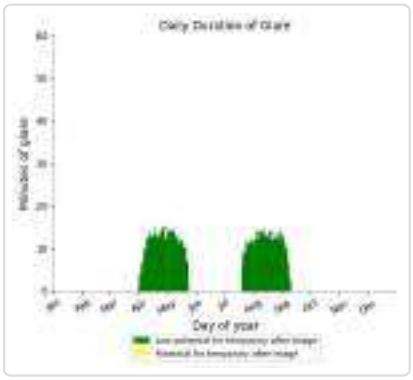

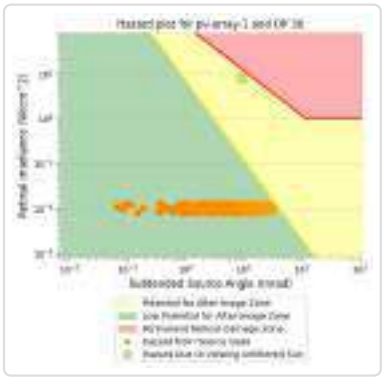

PV array 1: OP 30

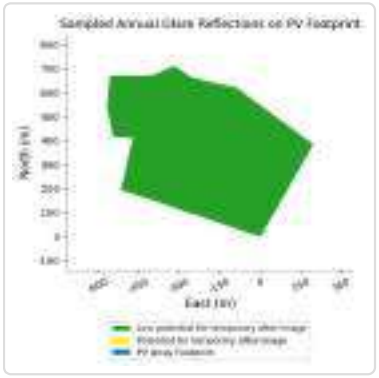

PV array is expected to produce the following glare for this receptor:

- 1,242 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

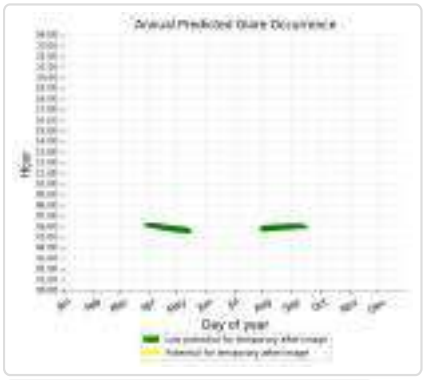

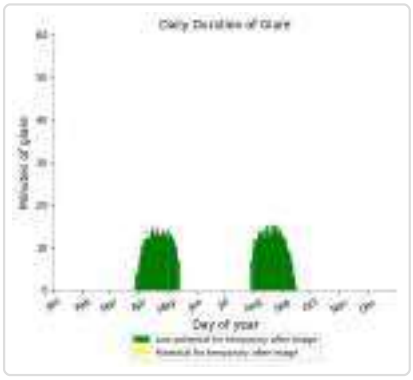

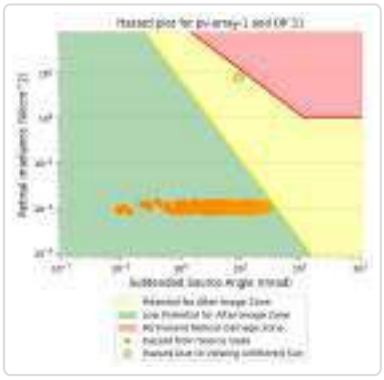

PV array 1: OP 31

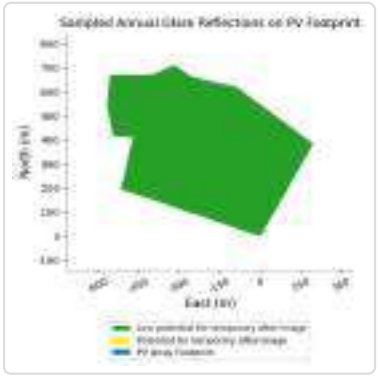

PV array is expected to produce the following glare for this receptor:

- 1,104 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

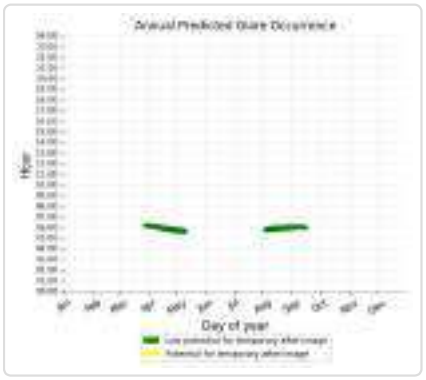

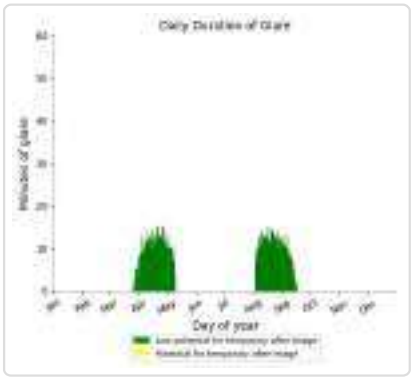

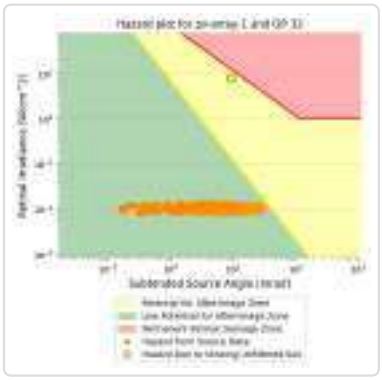

PV array 1: OP 32

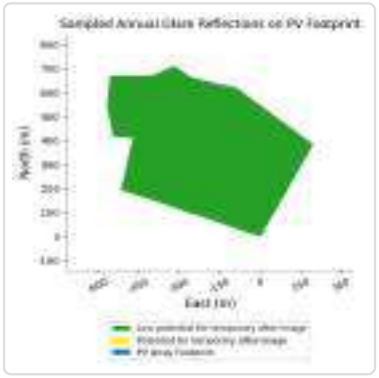

PV array is expected to produce the following glare for this receptor:

- 959 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

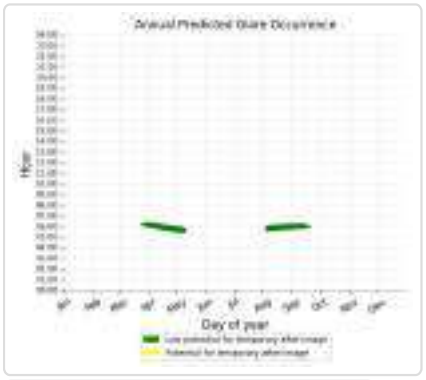

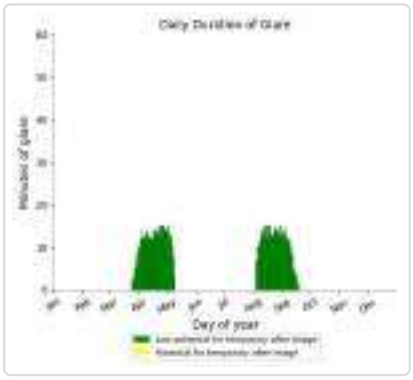

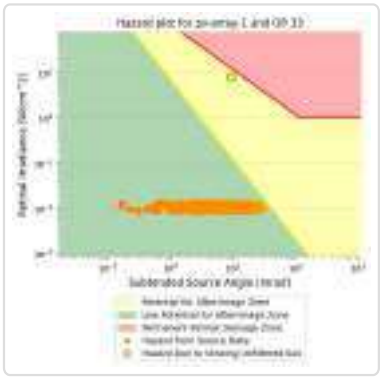

PV array 1: OP 33

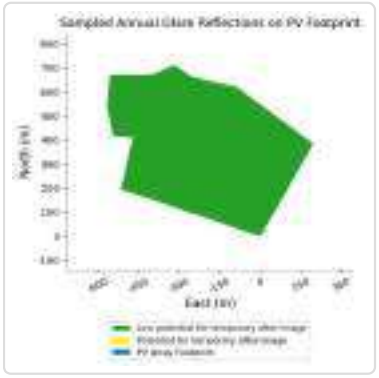

PV array is expected to produce the following glare for this receptor:

- 1,062 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

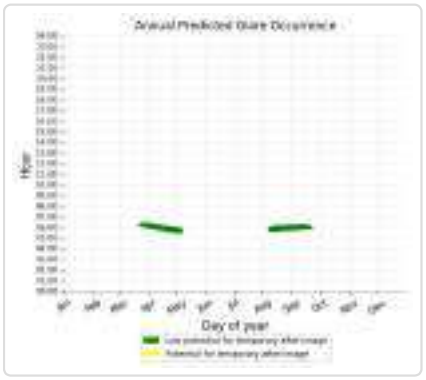

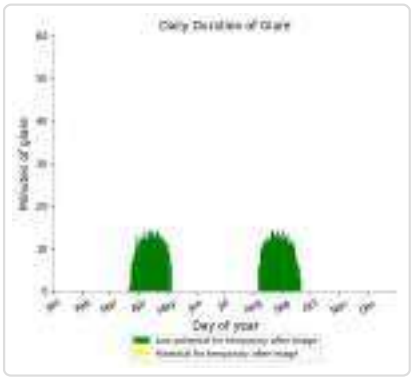

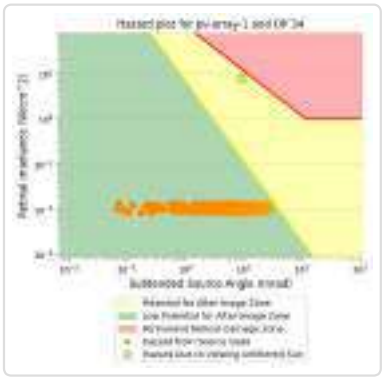

PV array 1: OP 34

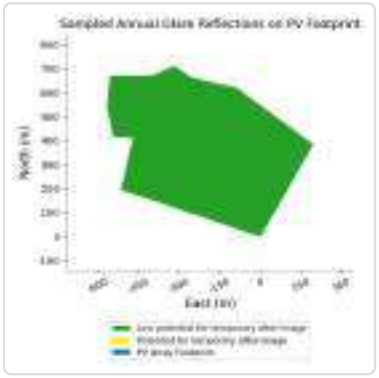

PV array is expected to produce the following glare for this receptor:

- 1,002 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

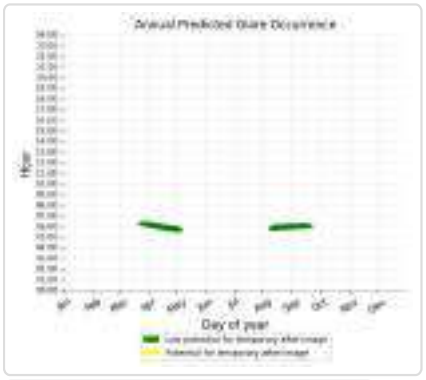

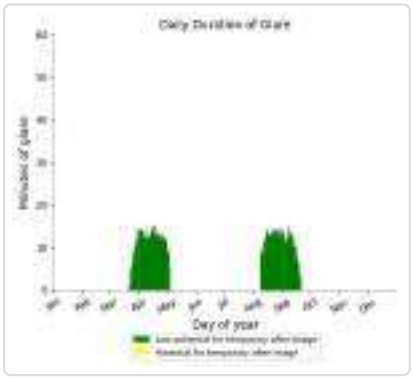

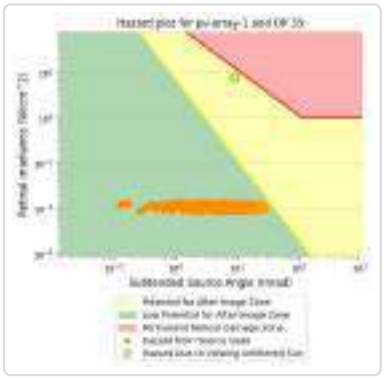

PV array 1: OP 35

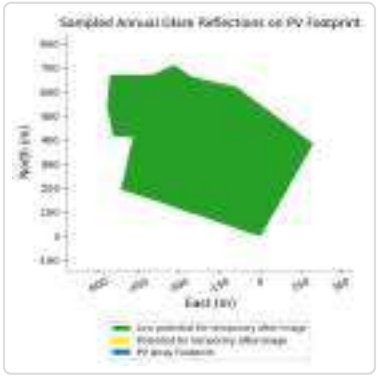

PV array is expected to produce the following glare for this receptor:

- 1,013 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

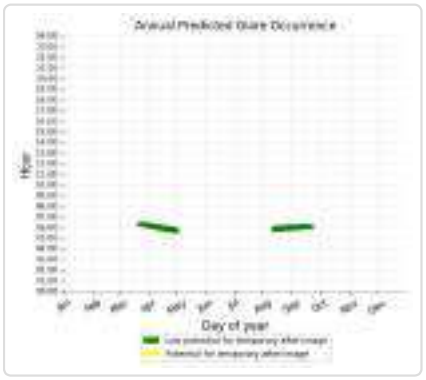

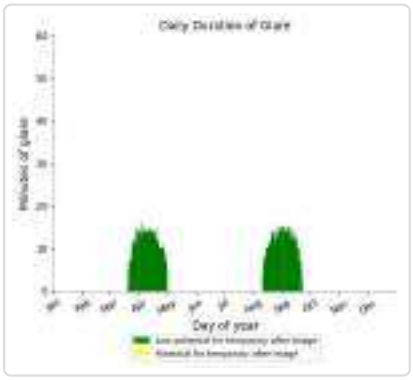

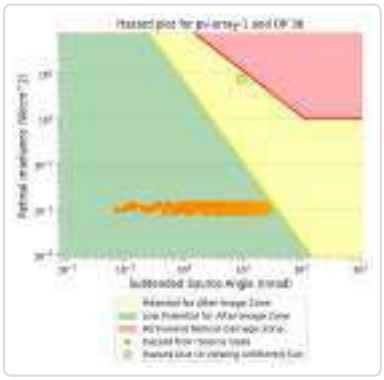

PV array 1: OP 36

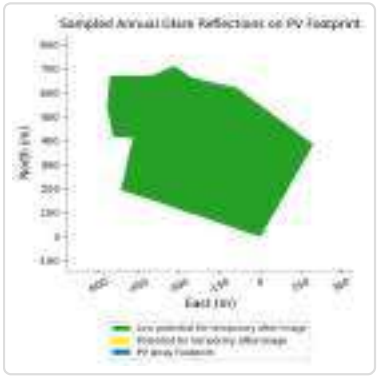

PV array is expected to produce the following glare for this receptor:

- 1,006 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

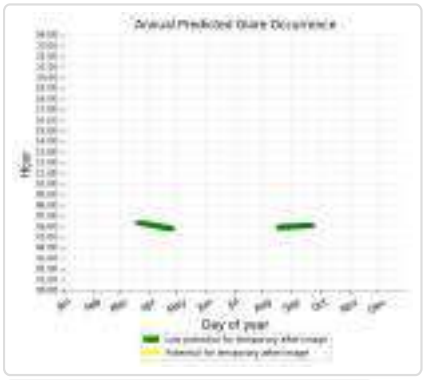

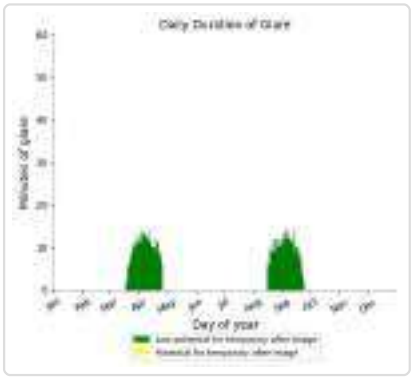

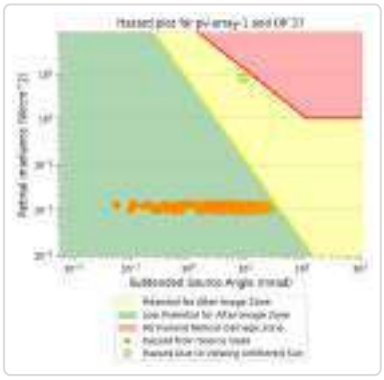

PV array 1: OP 37

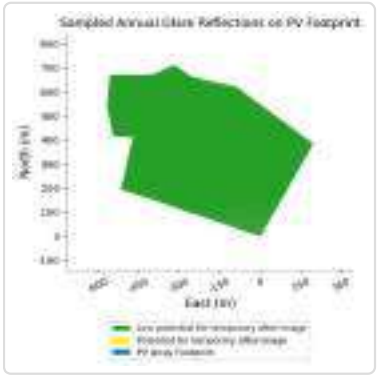

PV array is expected to produce the following glare for this receptor:

- 788 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

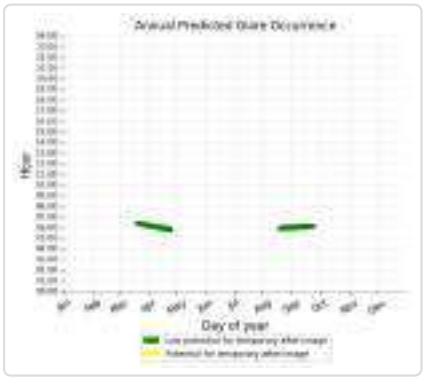

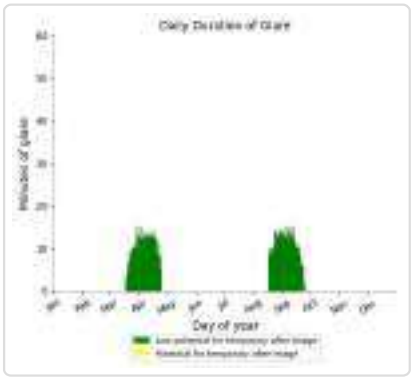

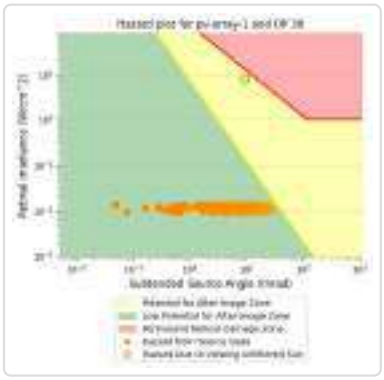

PV array 1: OP 38

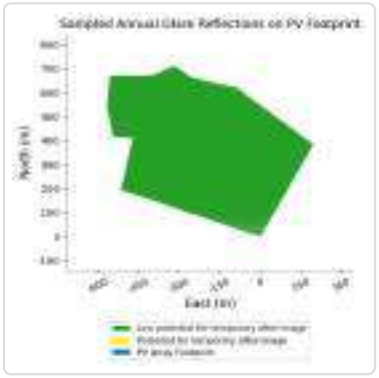

PV array is expected to produce the following glare for this receptor:

- 869 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

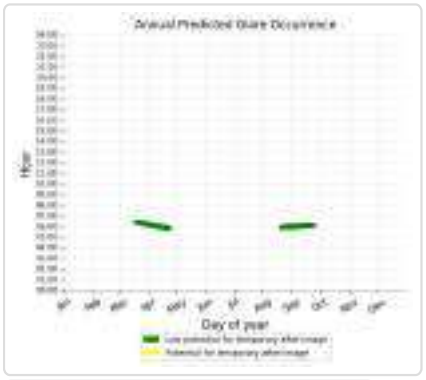

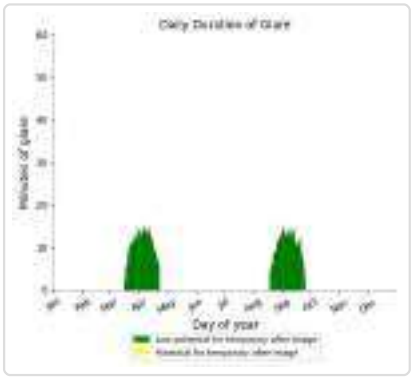

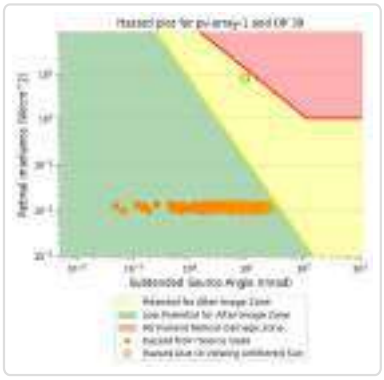

PV array 1: OP 39

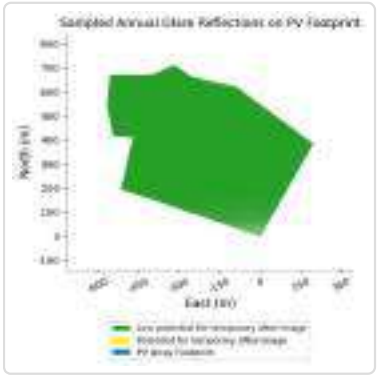

PV array is expected to produce the following glare for this receptor:

- 831 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

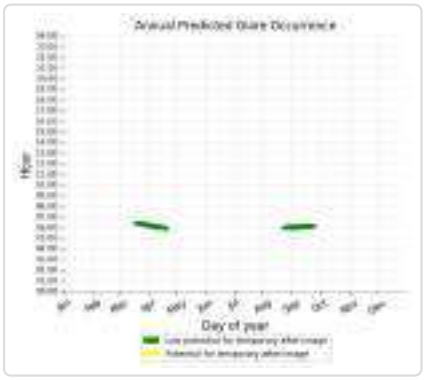

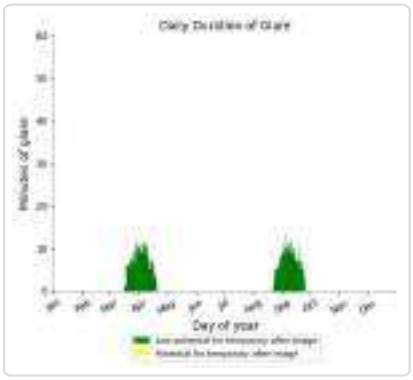

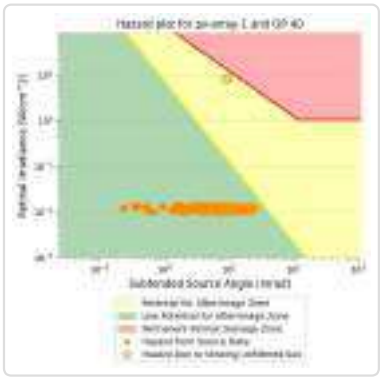

PV array 1: OP 40

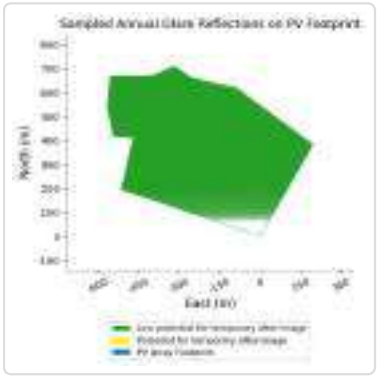

PV array is expected to produce the following glare for this receptor:

- 516 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array is expected to produce the following glare for this receptor:

- 2,006 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

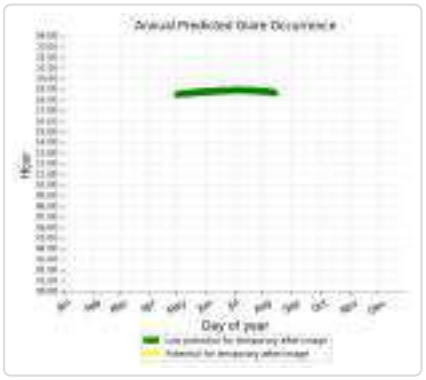

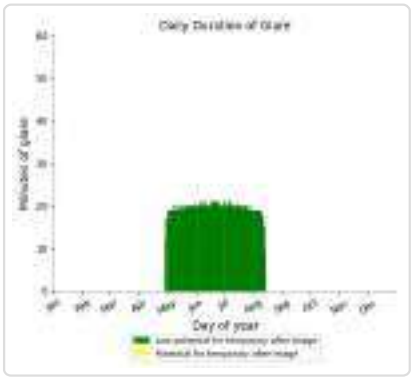

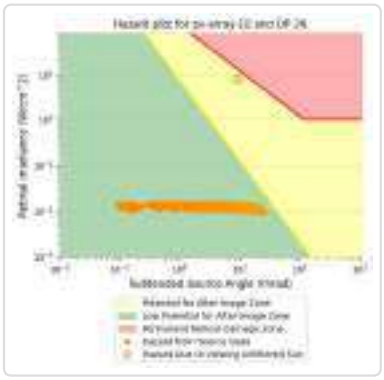

PV array 10: OP 26

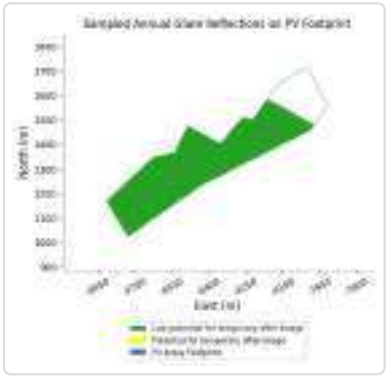

PV array is expected to produce the following glare for this receptor:

- 2,117 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

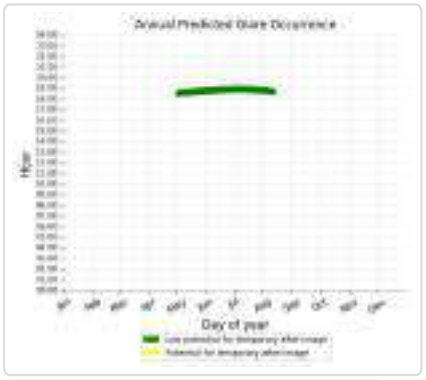

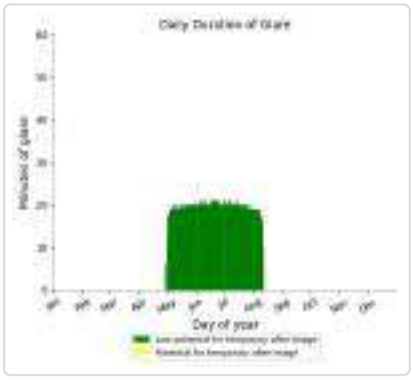

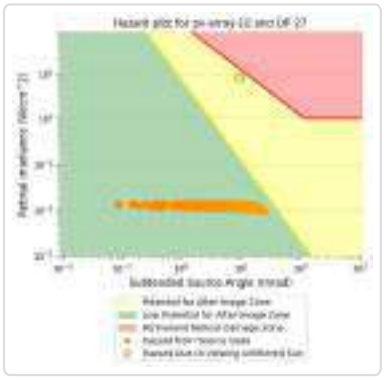

PV array 10: OP 27

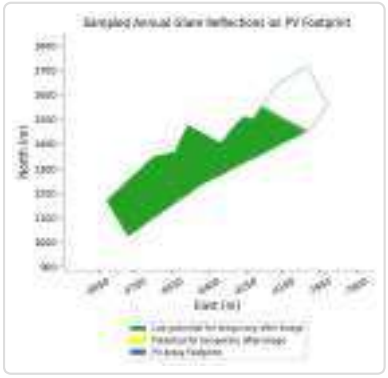

PV array is expected to produce the following glare for this receptor:

- 2,051 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

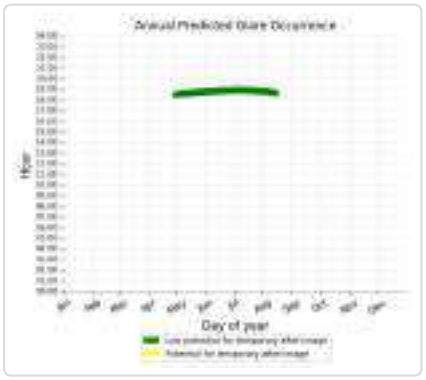

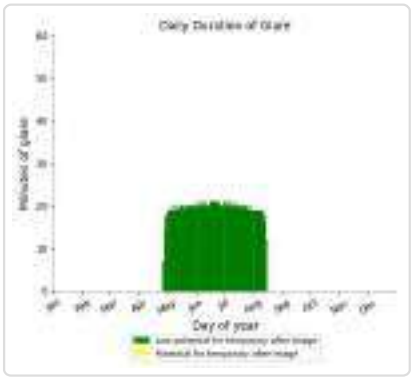

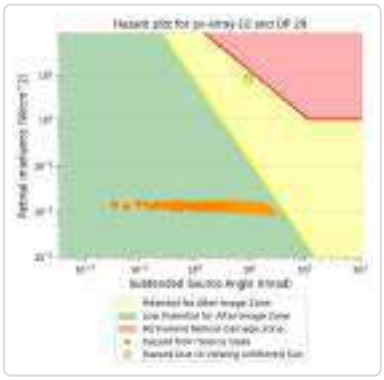

PV array 10: OP 28

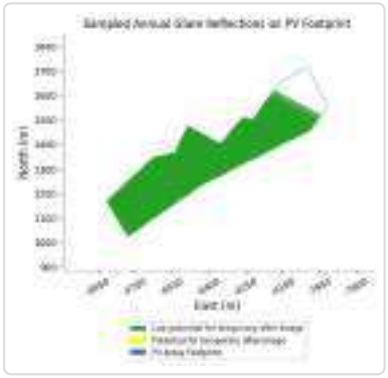

PV array is expected to produce the following glare for this receptor:

- 2,177 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

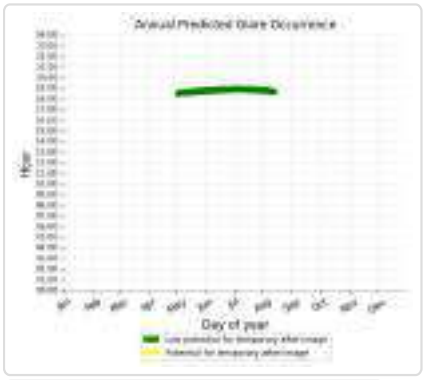

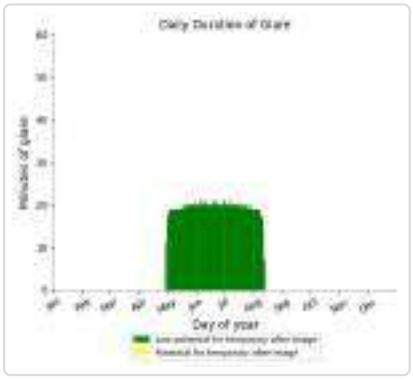

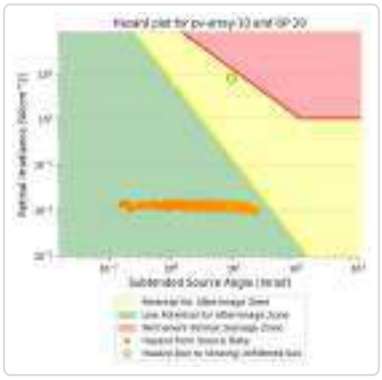

PV array 10: OP 29

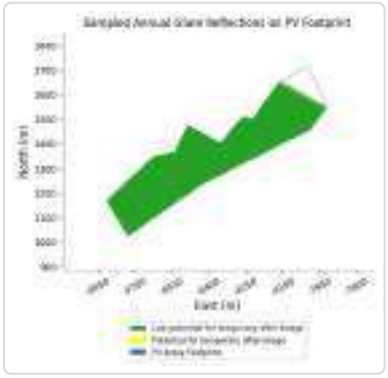

PV array is expected to produce the following glare for this receptor:

- 2,054 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

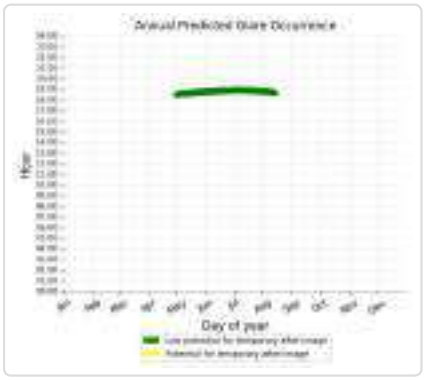

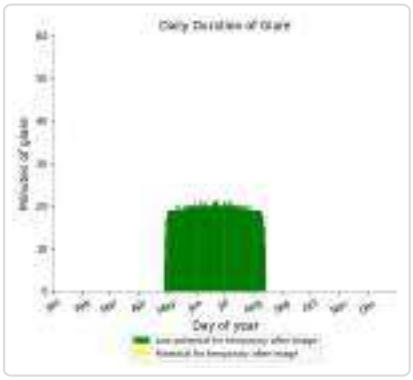

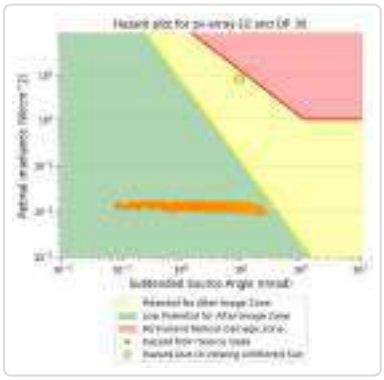

PV array 10: OP 30

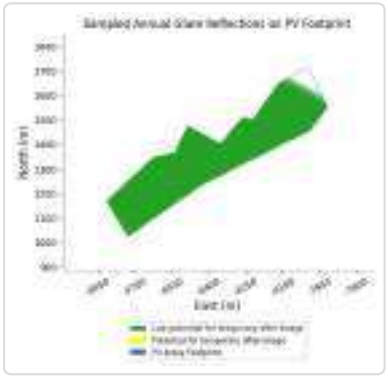

PV array is expected to produce the following glare for this receptor:

- 2,118 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

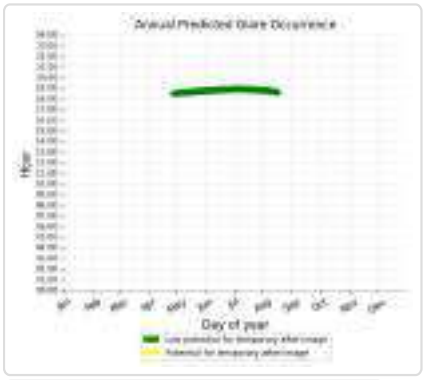

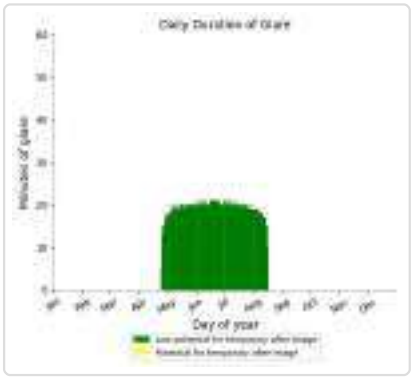

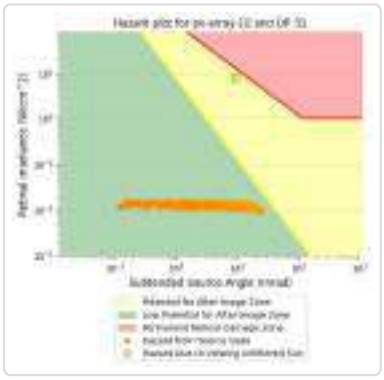

PV array 10: OP 31

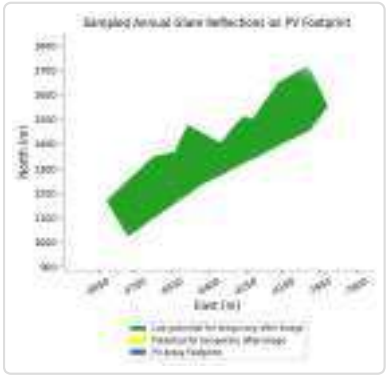

PV array is expected to produce the following glare for this receptor:

- 2,224 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

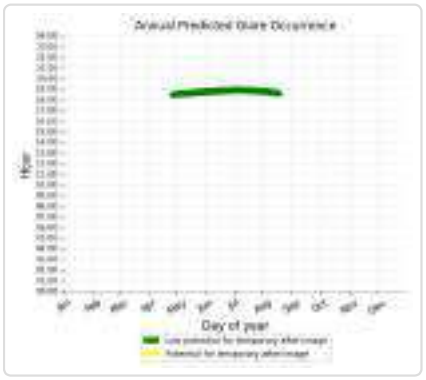

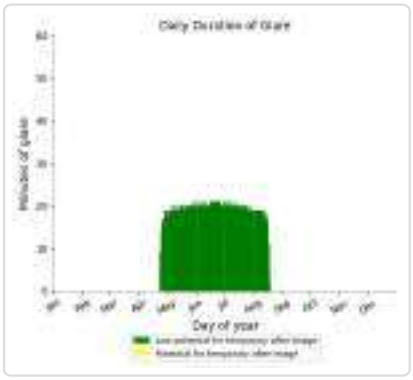

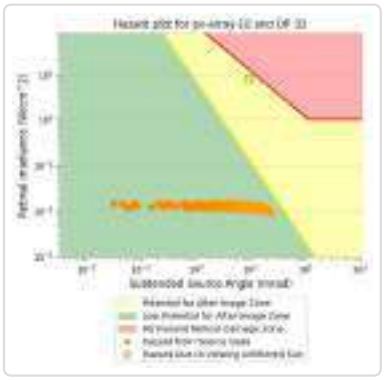

PV array 10: OP 32

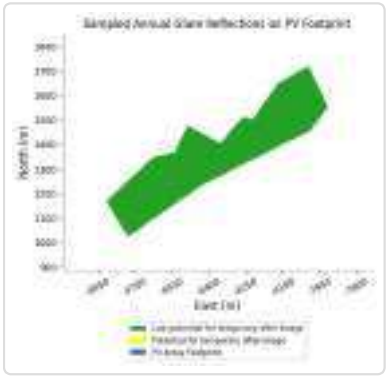

PV array is expected to produce the following glare for this receptor:

- 2,290 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

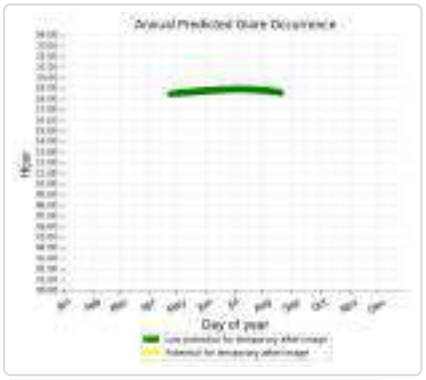

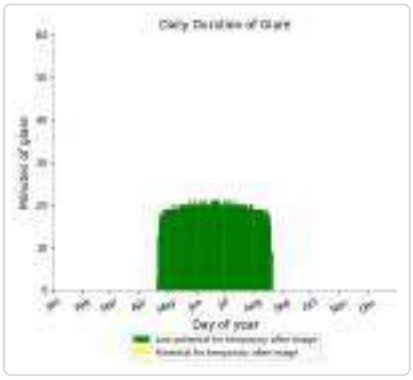

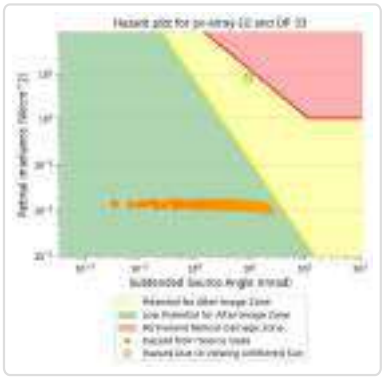

PV array 10: OP 33

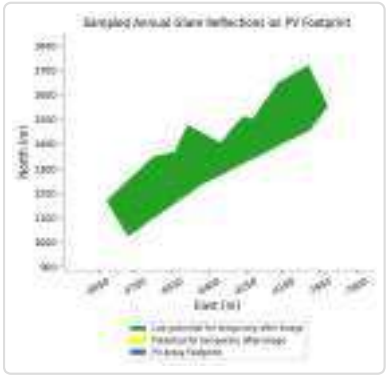

PV array is expected to produce the following glare for this receptor:

- 2,395 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

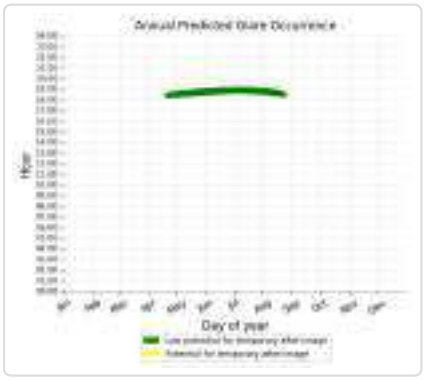

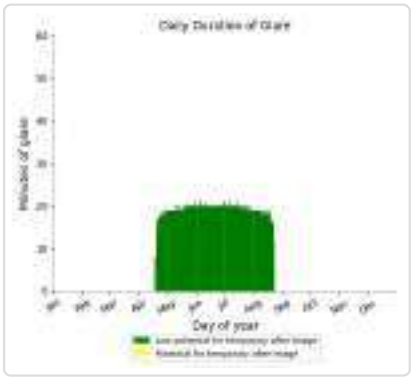

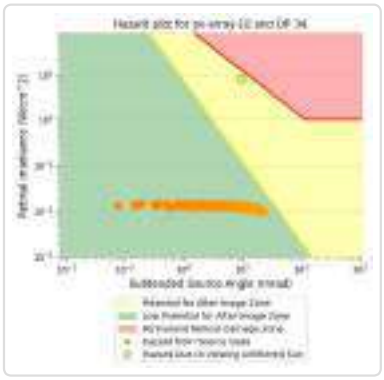

PV array 10: OP 34

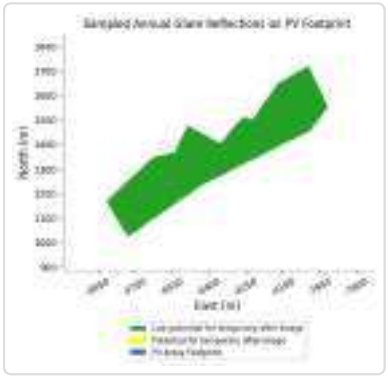

PV array is expected to produce the following glare for this receptor:

- 2,443 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

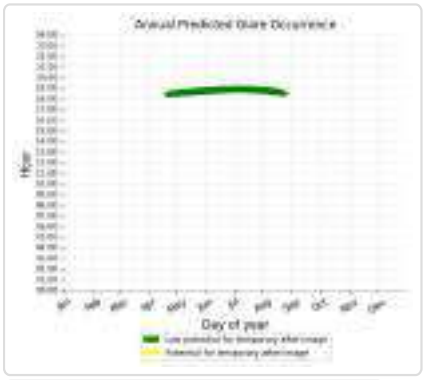

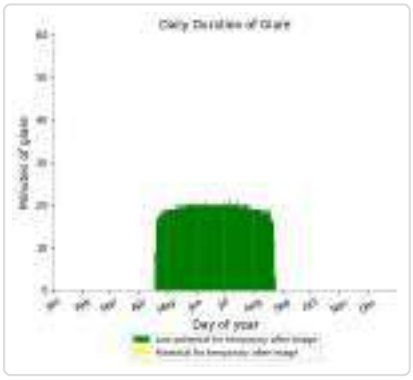

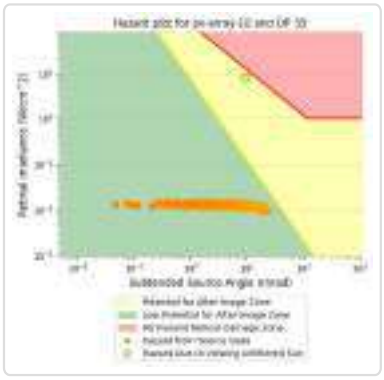

PV array 10: OP 35

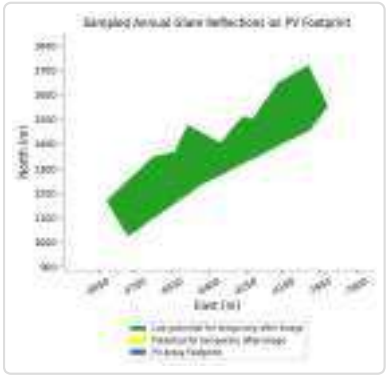

PV array is expected to produce the following glare for this receptor:

- 2,448 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

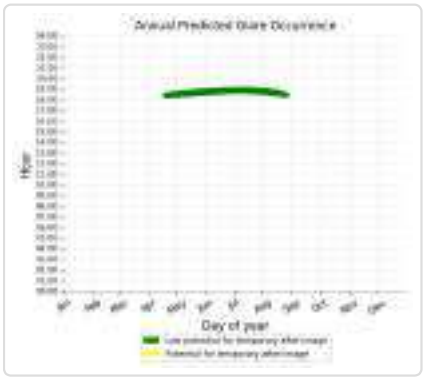

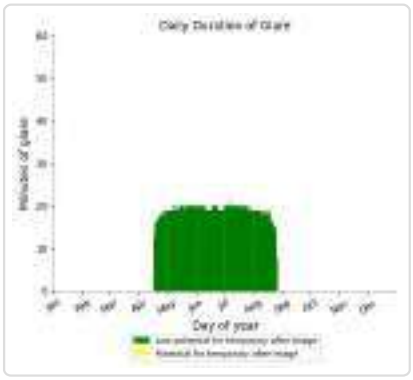

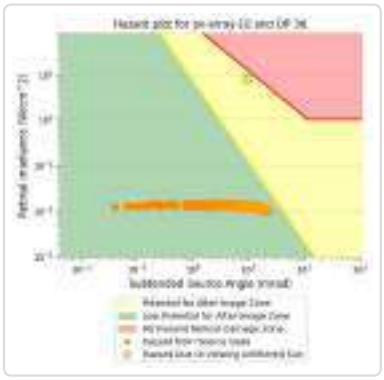

PV array 10: OP 36

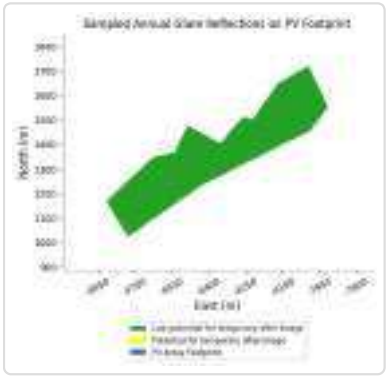

PV array is expected to produce the following glare for this receptor:

- 2,506 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

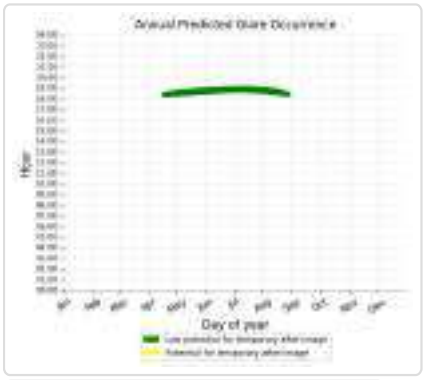

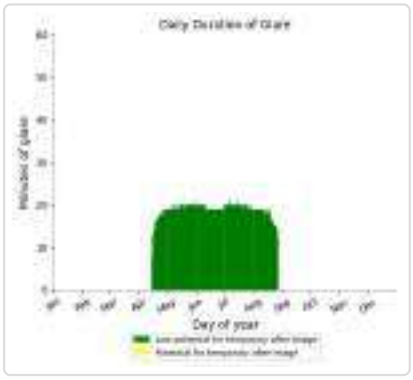

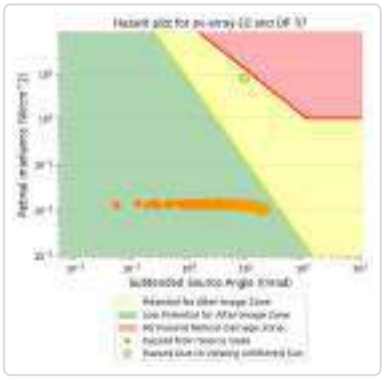

PV array 10: OP 37

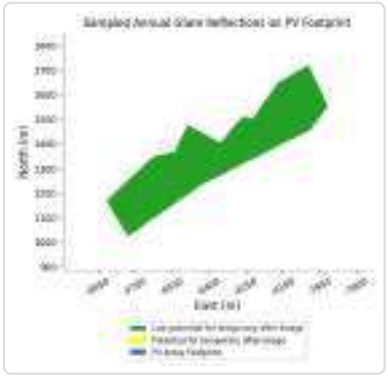

PV array is expected to produce the following glare for this receptor:

- 2,546 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

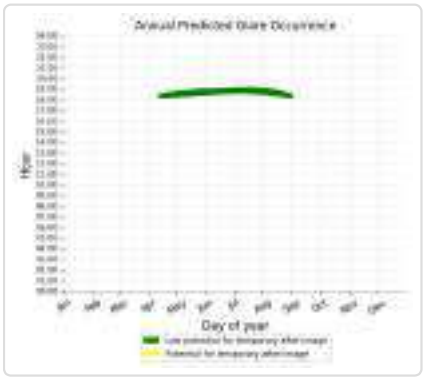

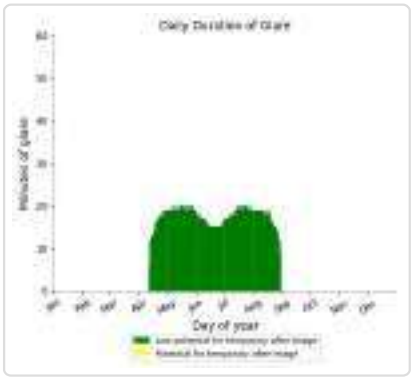

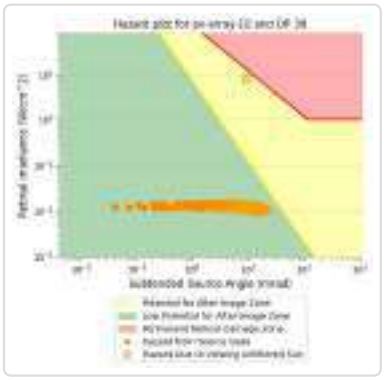

PV array 10: OP 38

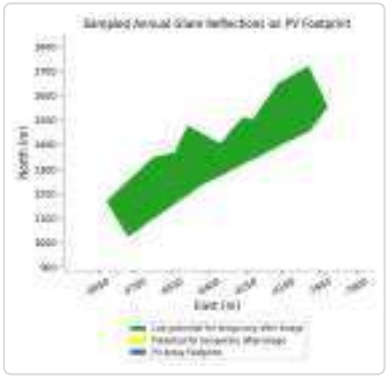

PV array is expected to produce the following glare for this receptor:

- 2,479 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

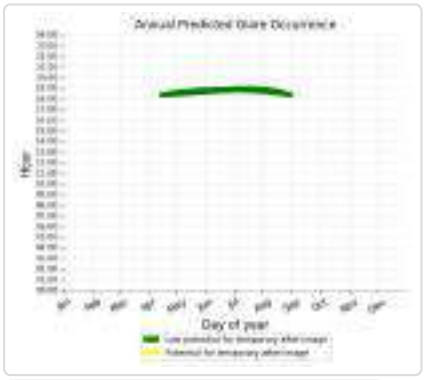

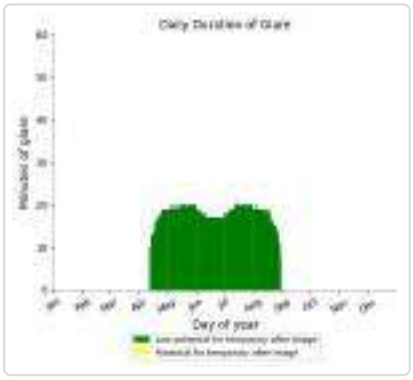

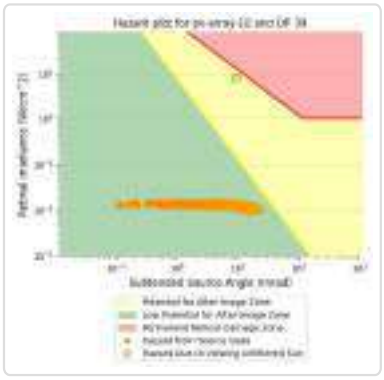

PV array 10: OP 39

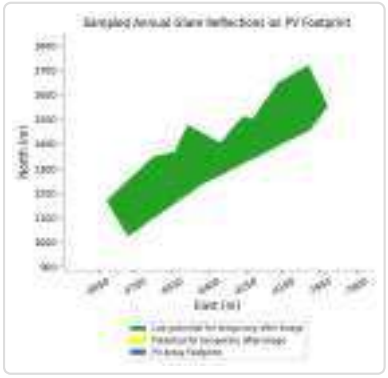

PV array is expected to produce the following glare for this receptor:

- 2,545 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

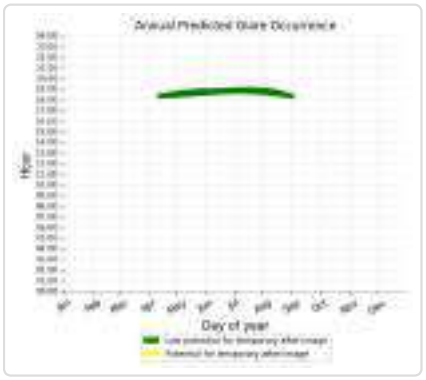

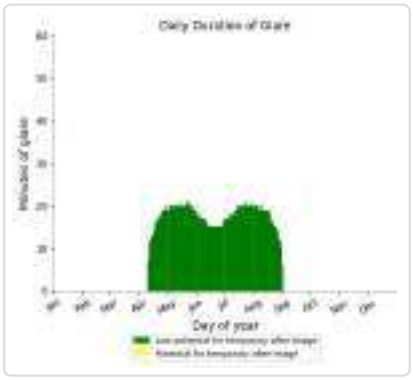

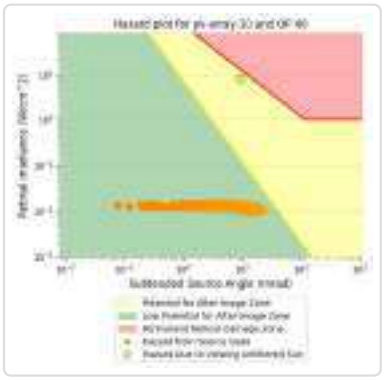

PV array 10: OP 40

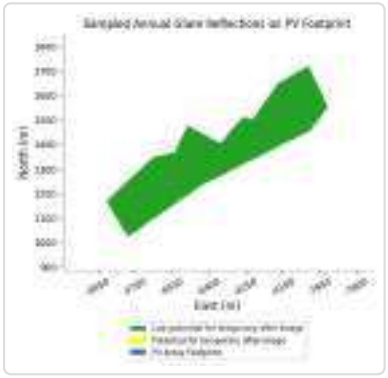

PV array is expected to produce the following glare for this receptor:

- 2,544 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

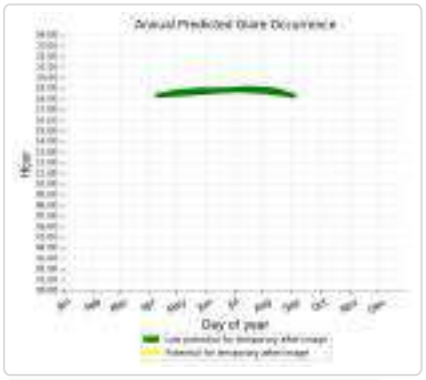

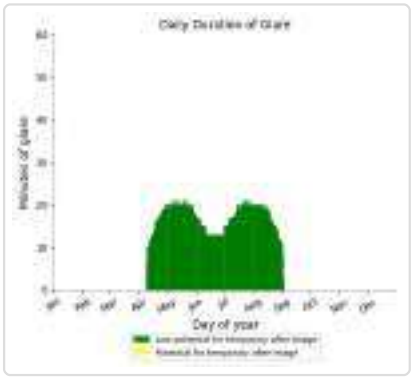

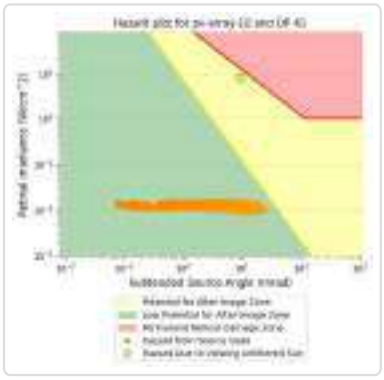

PV array 10: OP 41

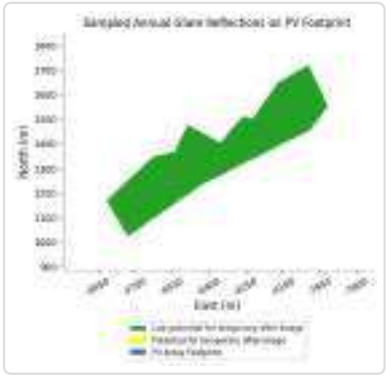

PV array is expected to produce the following glare for this receptor:

- 2,518 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

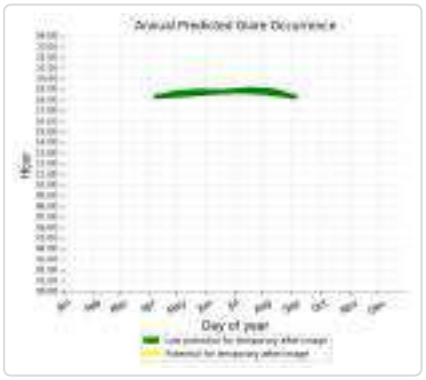

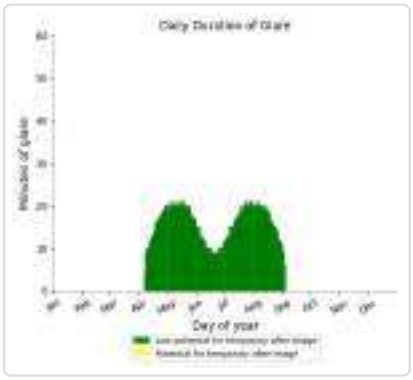

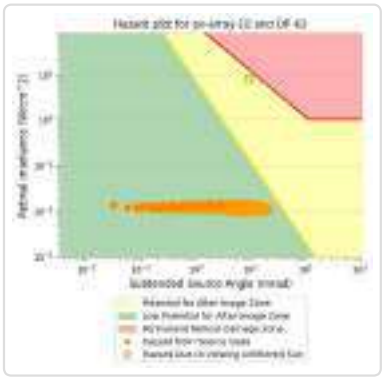

PV array 10: OP 42

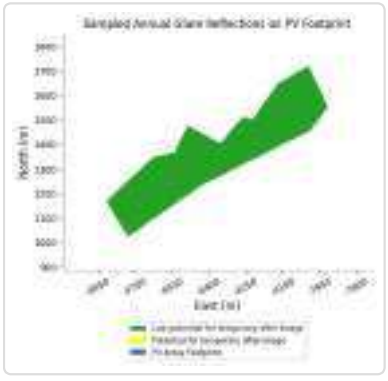

PV array is expected to produce the following glare for this receptor:

- 2,424 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

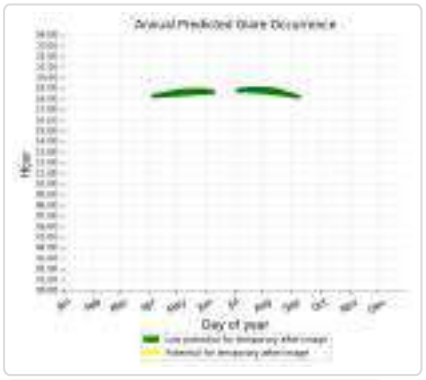

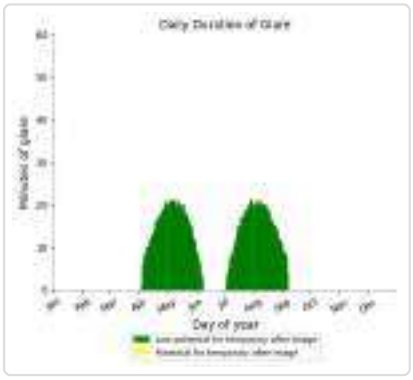

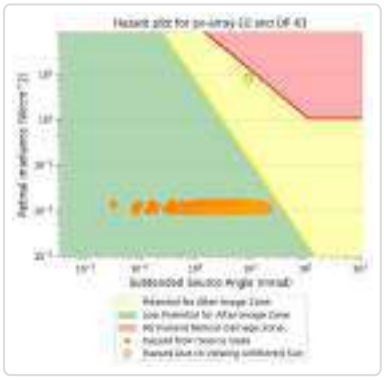

PV array 10: OP 43

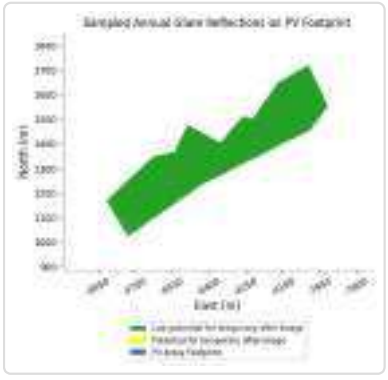

PV array is expected to produce the following glare for this receptor:

- 2,007 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

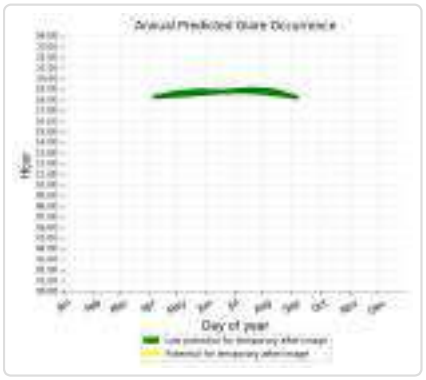

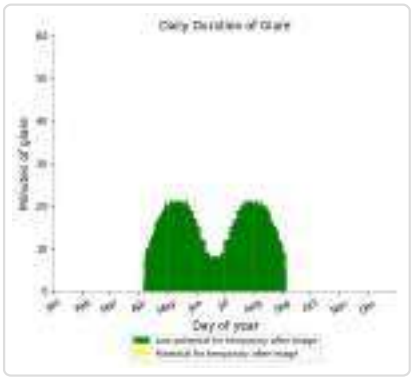

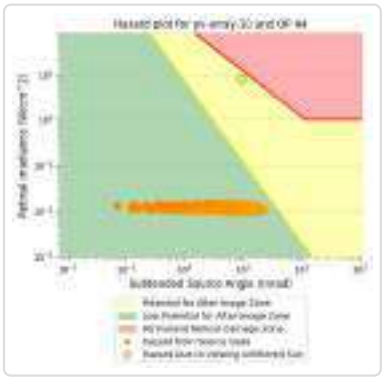

PV array 10: OP 44

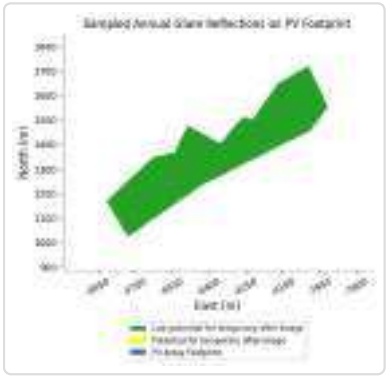

PV array is expected to produce the following glare for this receptor:

- 2,432 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

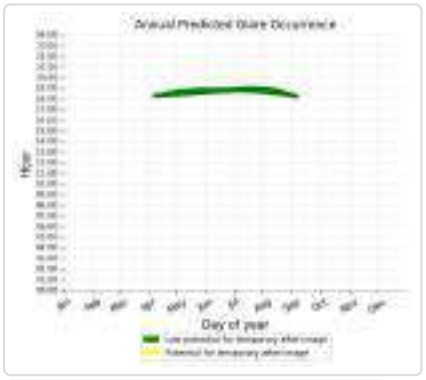

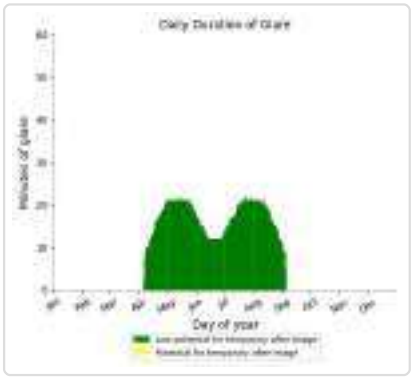

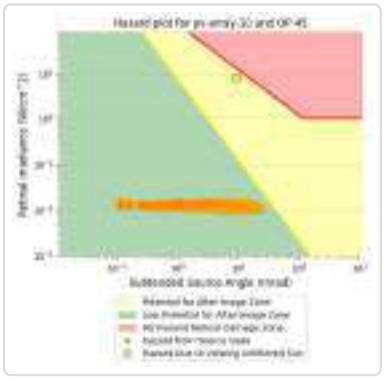

PV array 10: OP 45

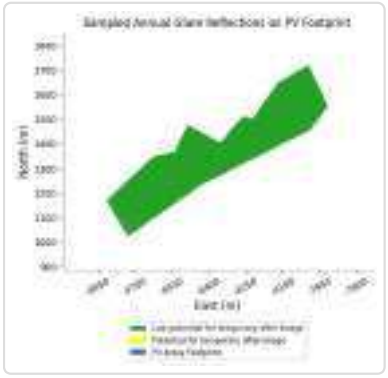

PV array is expected to produce the following glare for this receptor:

- 2,582 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

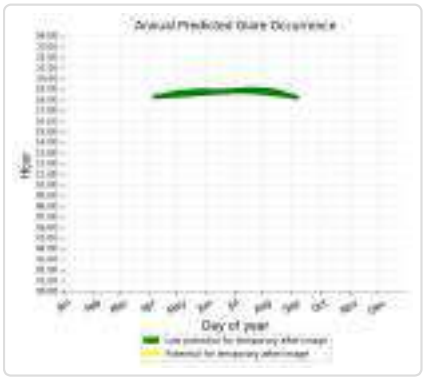

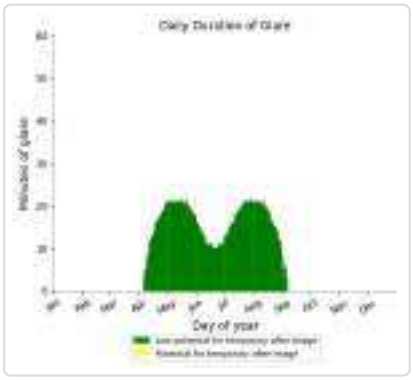

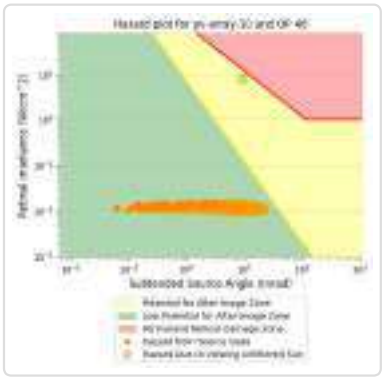

PV array 10: OP 46

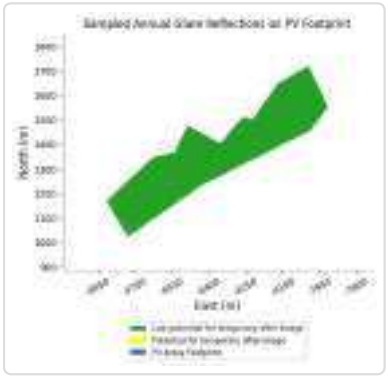

PV array is expected to produce the following glare for this receptor:

- 2,490 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

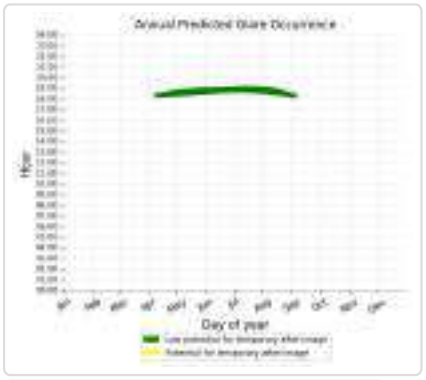

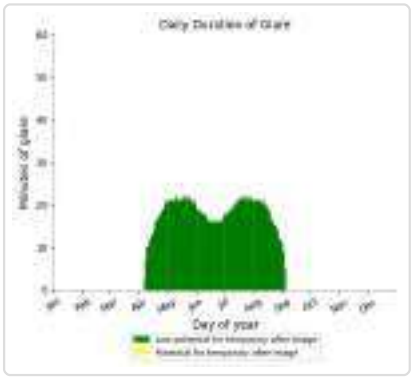

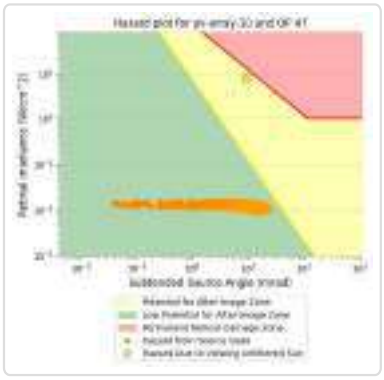

PV array 10: OP 47

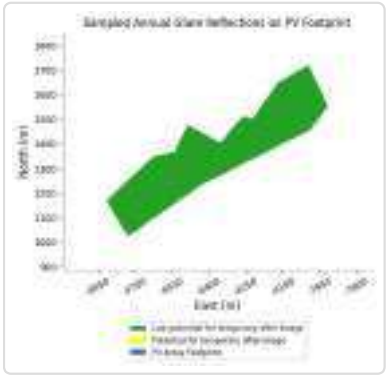

PV array is expected to produce the following glare for this receptor:

- 2,729 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

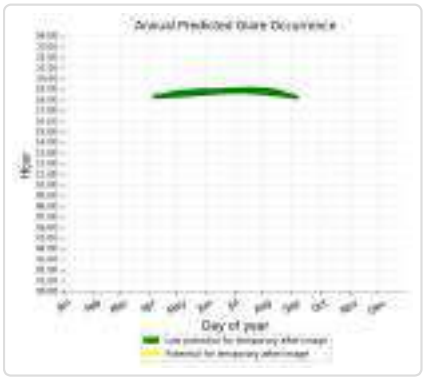

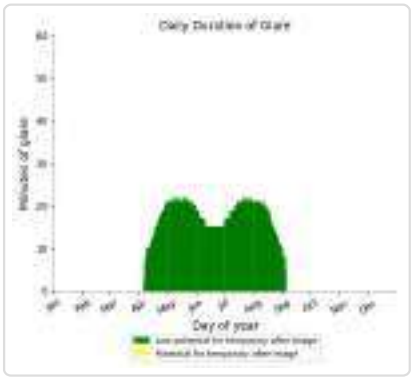

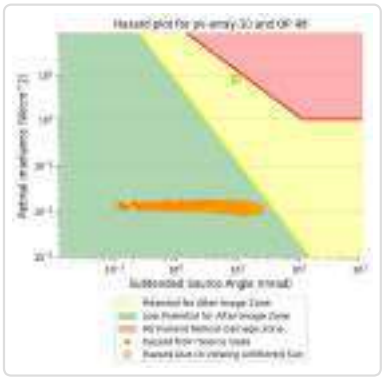

PV array 10: OP 48

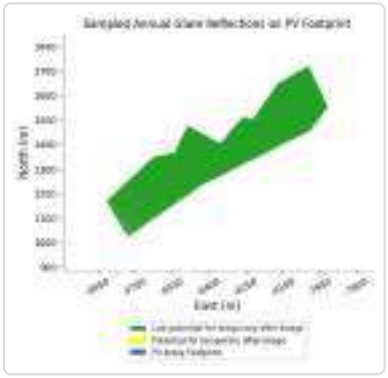

PV array is expected to produce the following glare for this receptor:

- 2,684 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

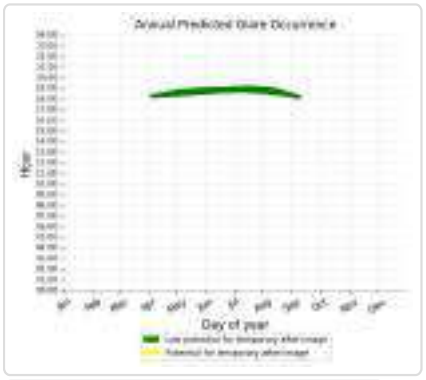

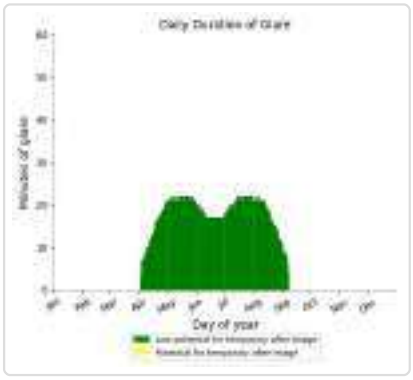

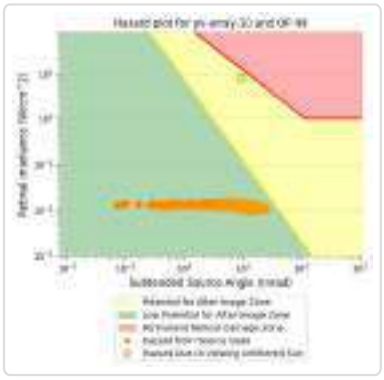

PV array 10: OP 49

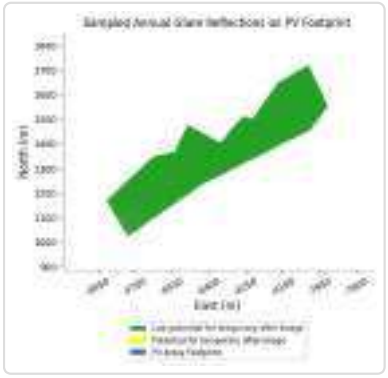

PV array is expected to produce the following glare for this receptor:

- 2,853 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

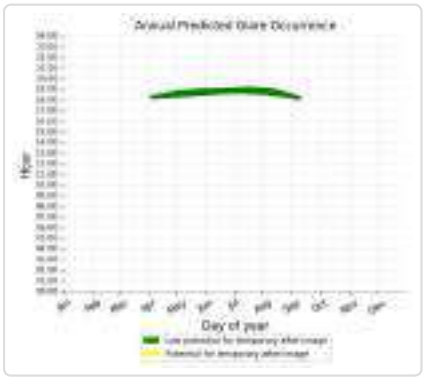

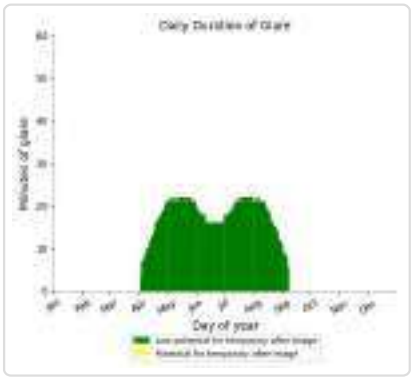

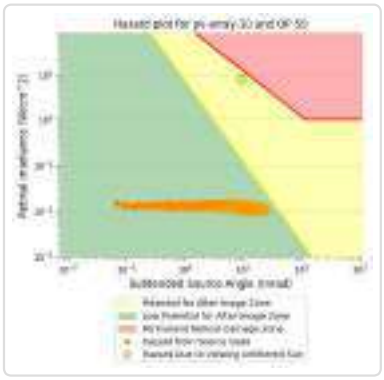

PV array 10: OP 50

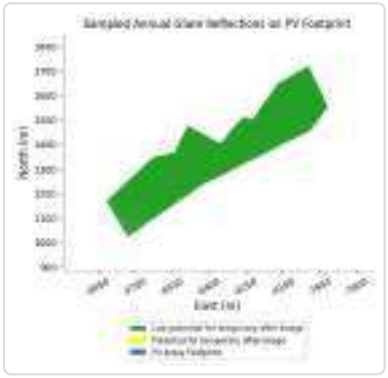

PV array is expected to produce the following glare for this receptor:

- 2,819 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

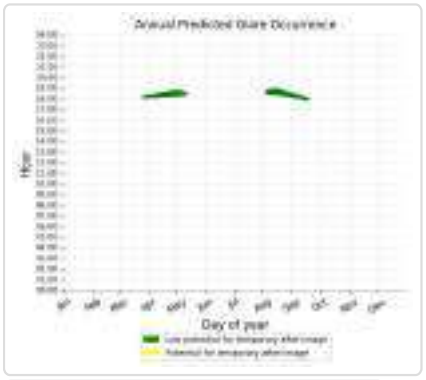

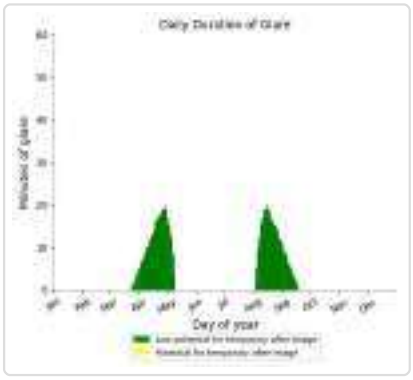

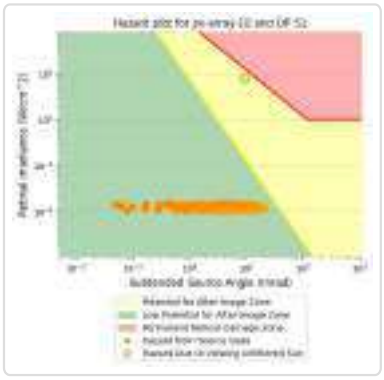

PV array 10: OP 51

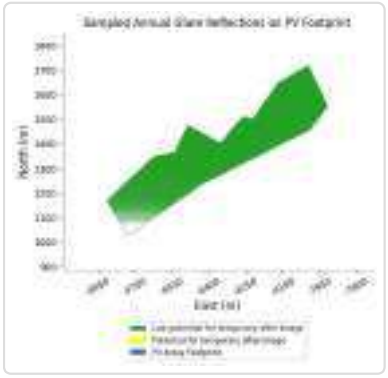

PV array is expected to produce the following glare for this receptor:

- 1,031 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

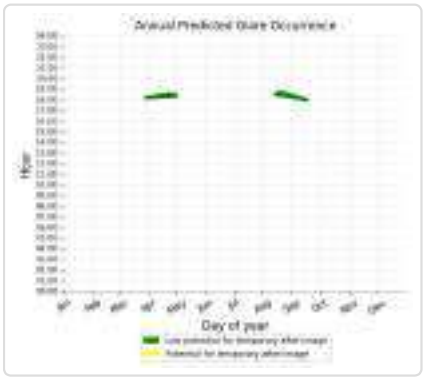

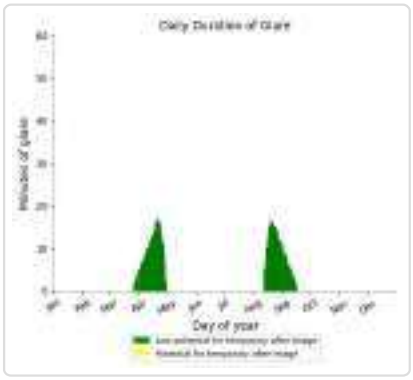

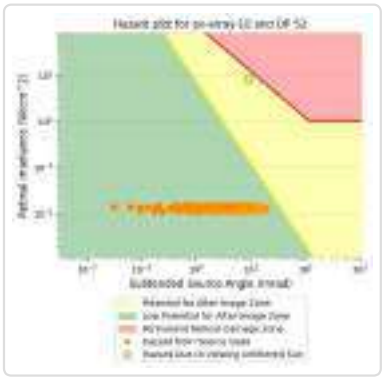

PV array 10: OP 52

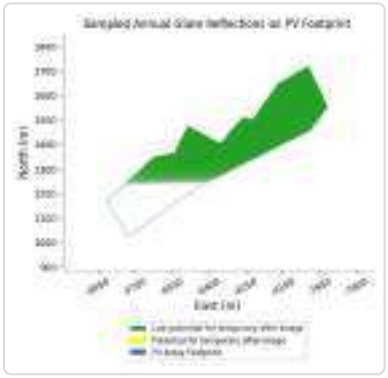

PV array is expected to produce the following glare for this receptor:

- 686 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

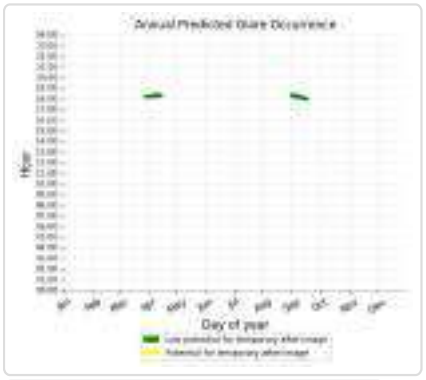

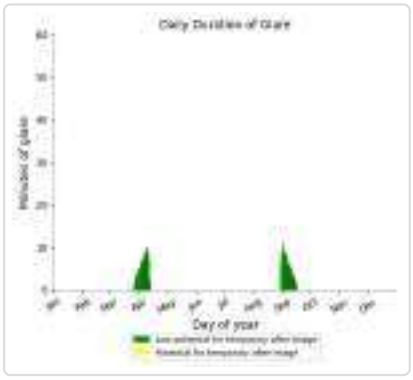

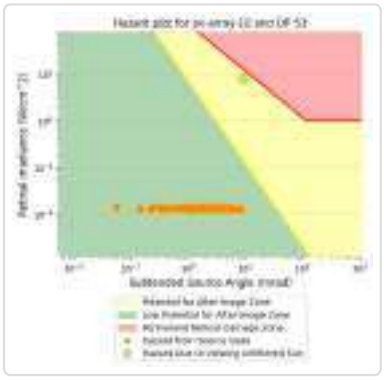

PV array 10: OP 53

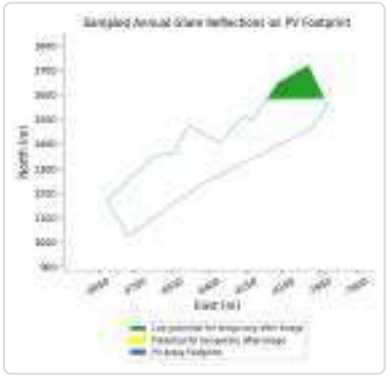

PV array is expected to produce the following glare for this receptor:

- 217 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 11: OP 33

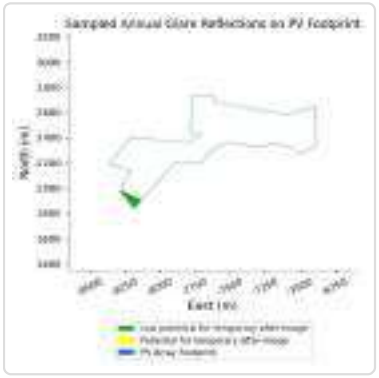

PV array is expected to produce the following glare for this receptor:

- 428 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

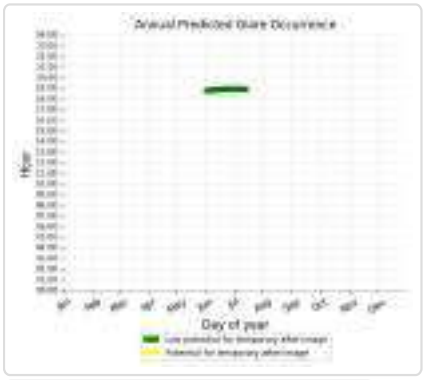

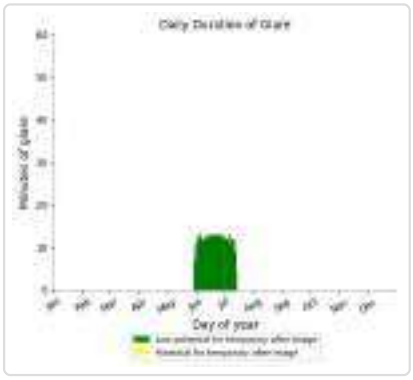

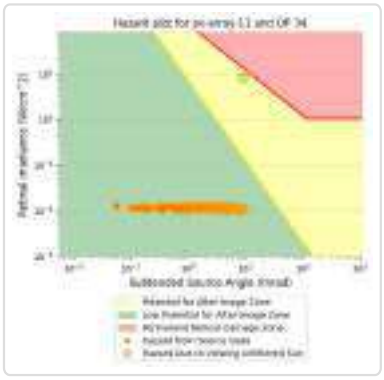

PV array 11: OP 34

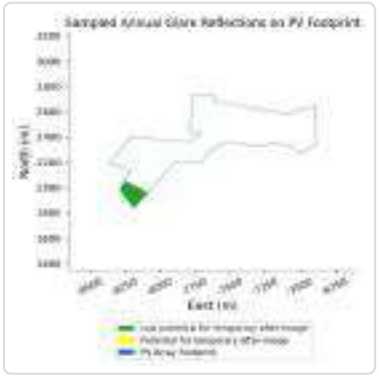

PV array is expected to produce the following glare for this receptor:

- 552 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

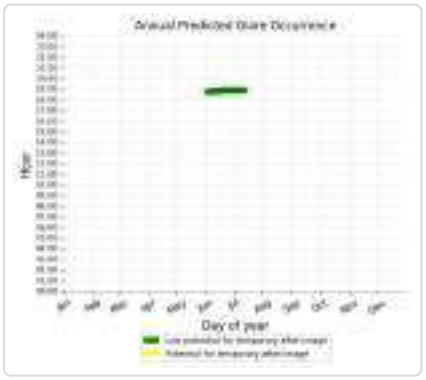

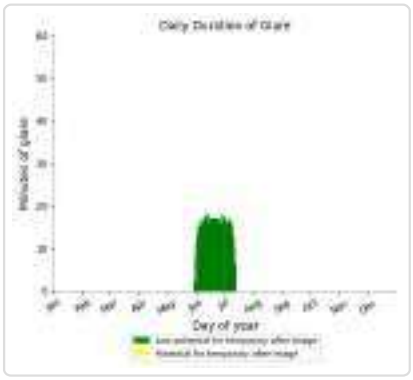

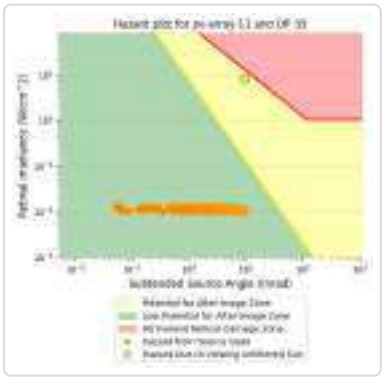

PV array 11: OP 35

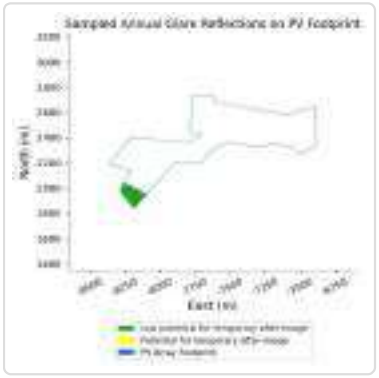

PV array is expected to produce the following glare for this receptor:

- 700 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

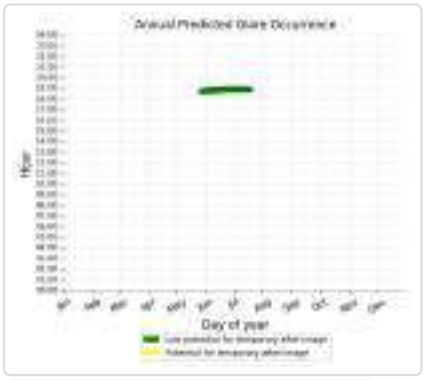

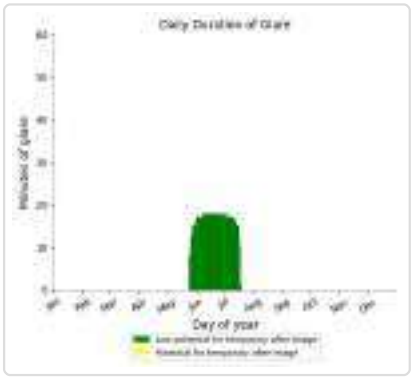

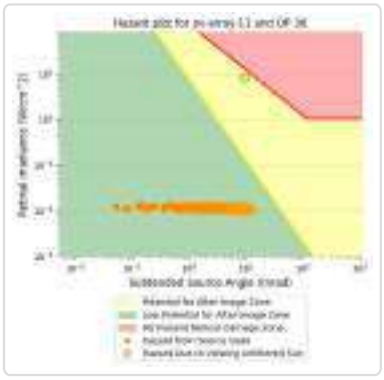

PV array 11: OP 36

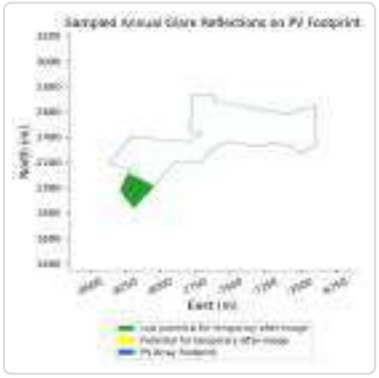

PV array is expected to produce the following glare for this receptor:

- 919 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

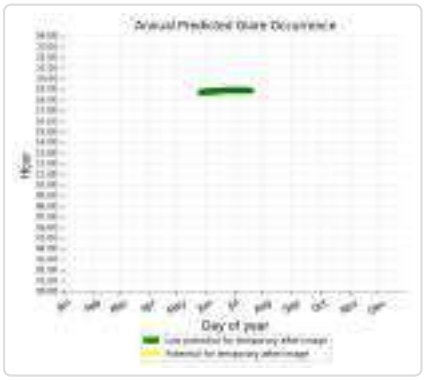

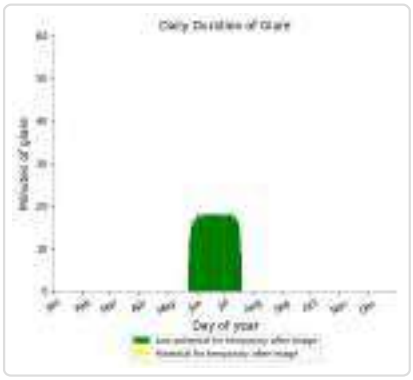

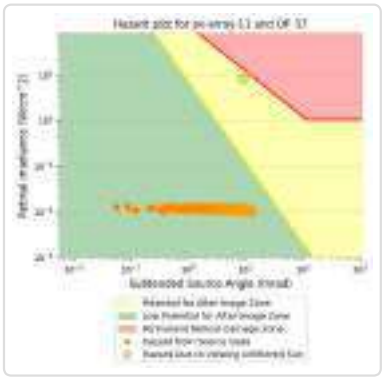

PV array 11: OP 37

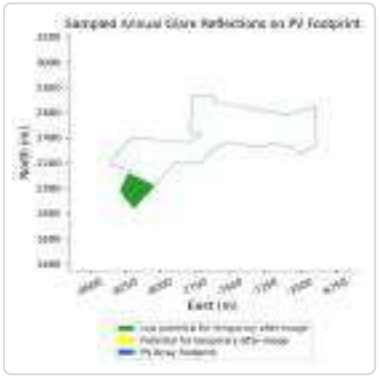

PV array is expected to produce the following glare for this receptor:

- 967 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

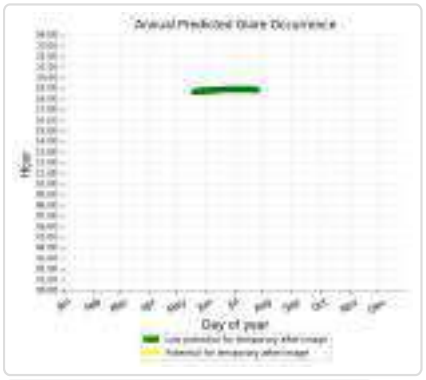

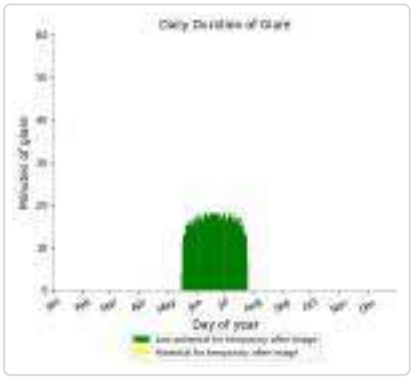

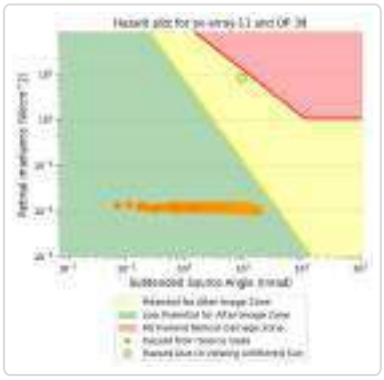

PV array 11: OP 38

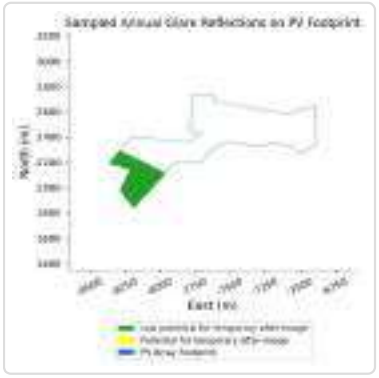

PV array is expected to produce the following glare for this receptor:

- 1,152 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

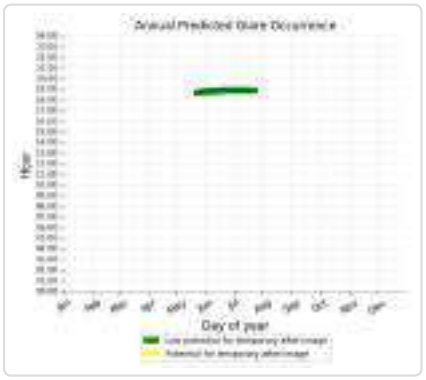

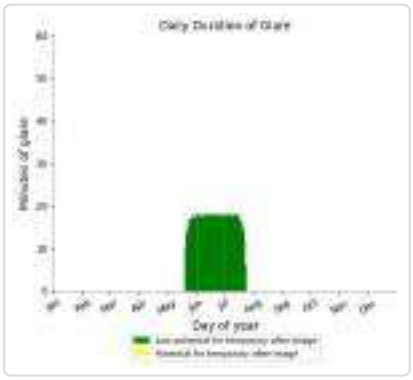

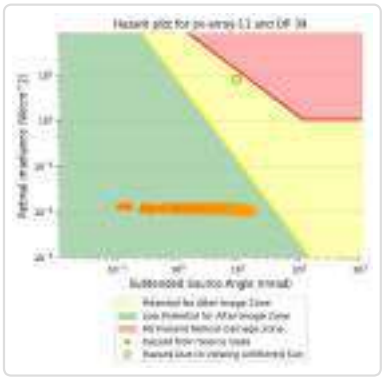

PV array 11: OP 39

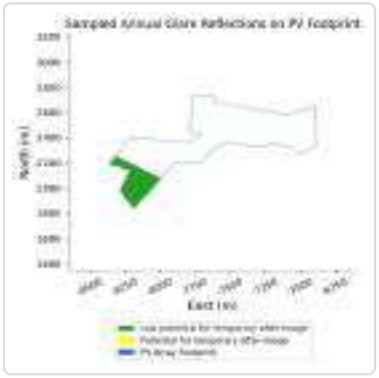

PV array is expected to produce the following glare for this receptor:

- 1,128 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

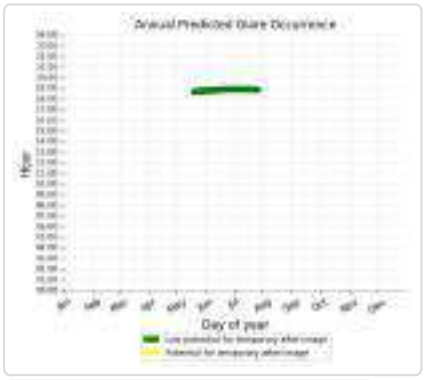

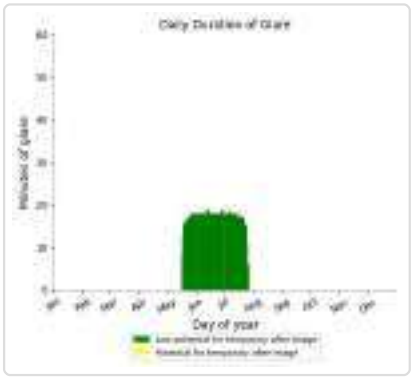

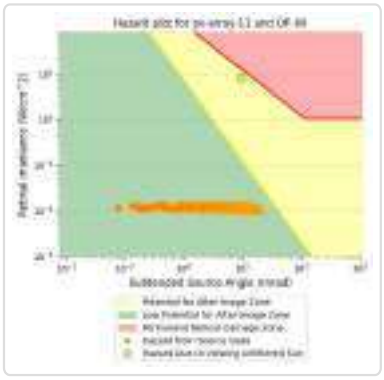

PV array 11: OP 40

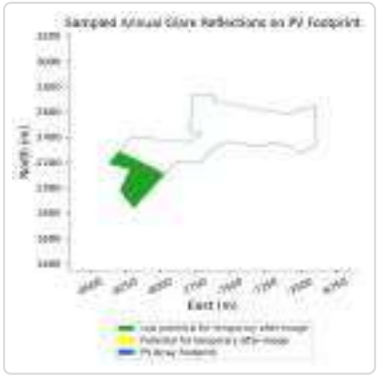

PV array is expected to produce the following glare for this receptor:

- 1,243 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

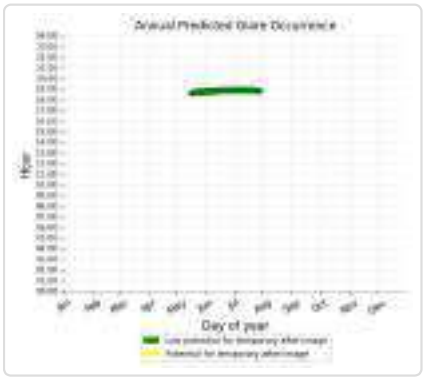

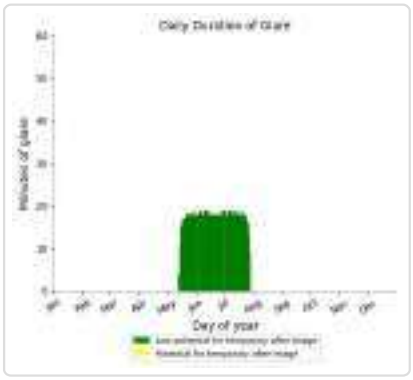

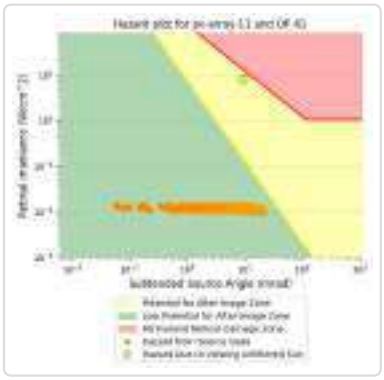

PV array 11: OP 41

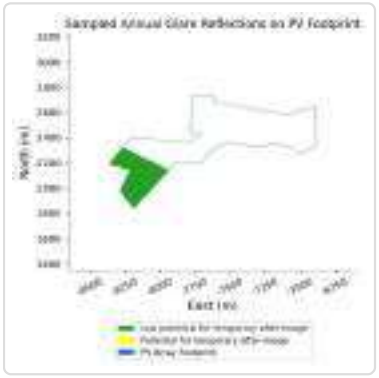

PV array is expected to produce the following glare for this receptor:

- 1,359 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

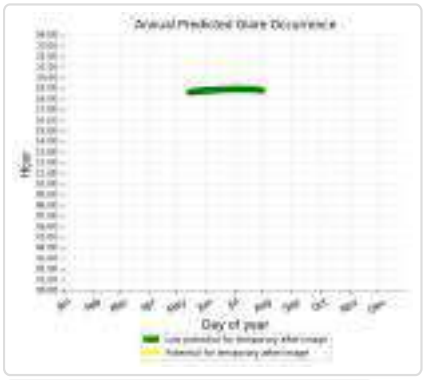

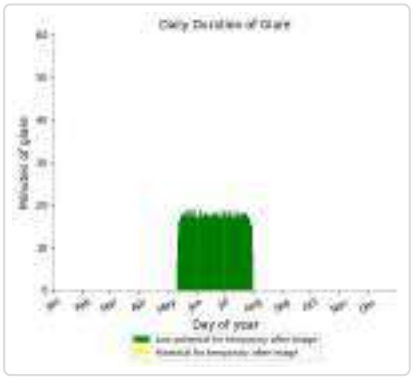

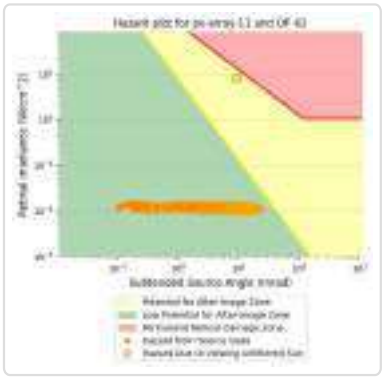

PV array 11: OP 42

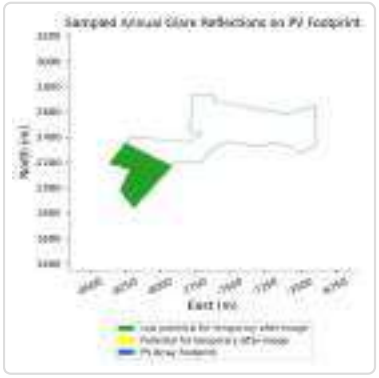

PV array is expected to produce the following glare for this receptor:

- 1,412 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

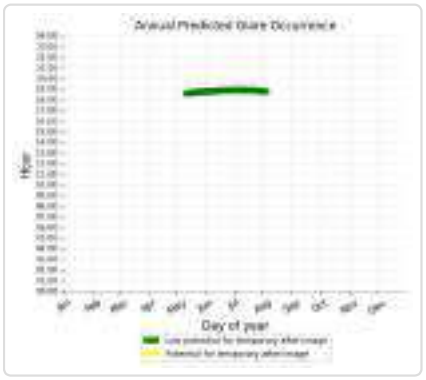

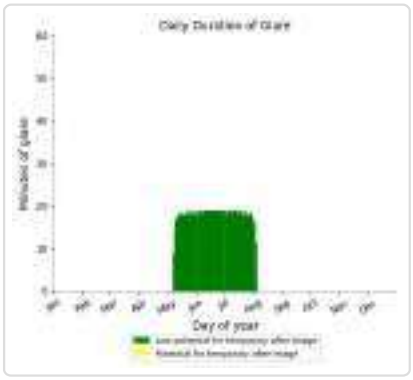

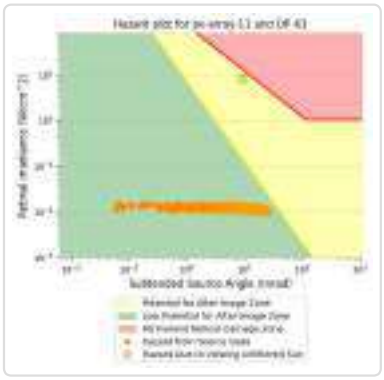

PV array 11: OP 43

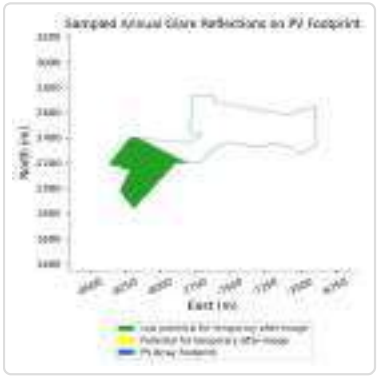

PV array is expected to produce the following glare for this receptor:

- 1,625 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

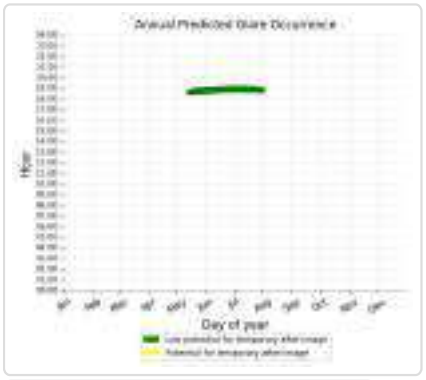

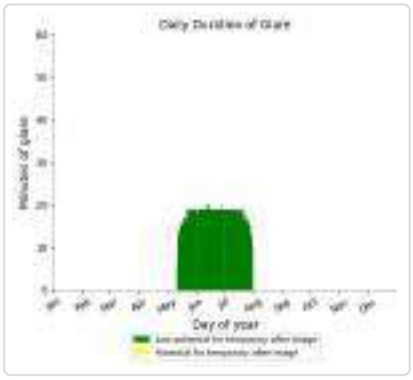

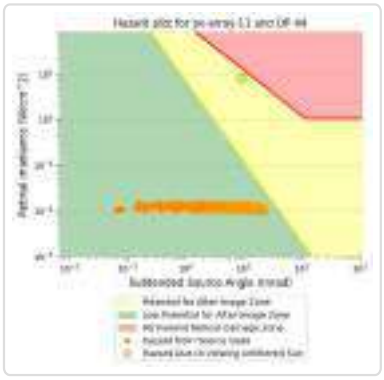

PV array 11: OP 44

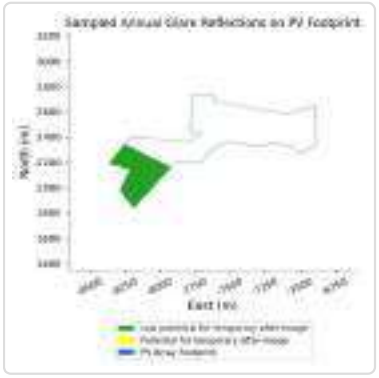

PV array is expected to produce the following glare for this receptor:

- 1,450 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

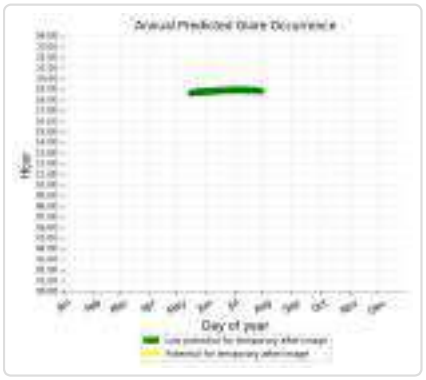

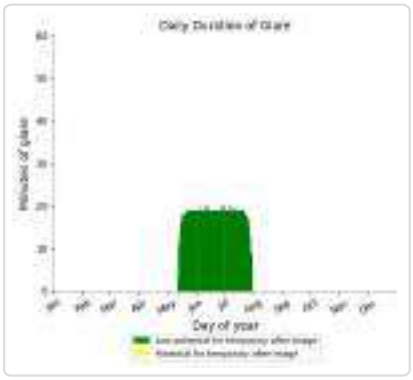

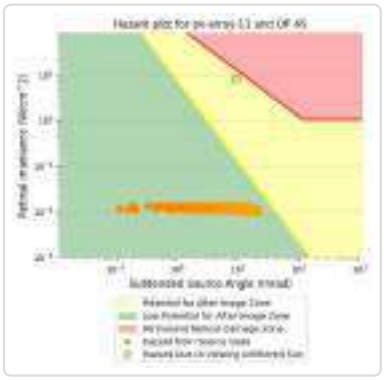

PV array 11: OP 45

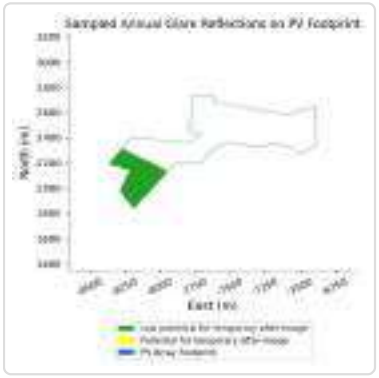

PV array is expected to produce the following glare for this receptor:

- 1,445 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

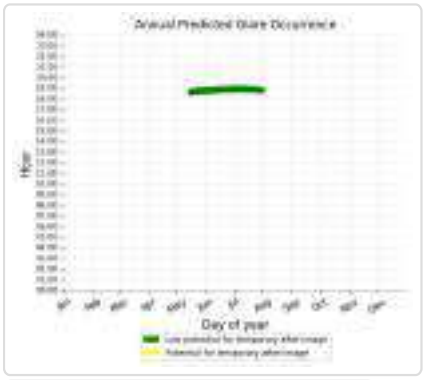

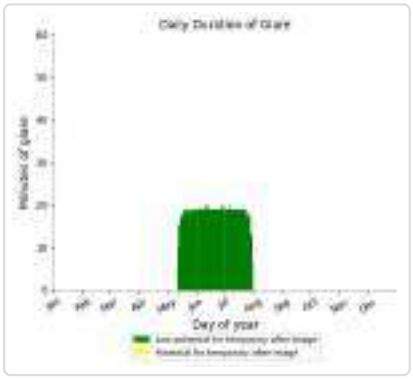

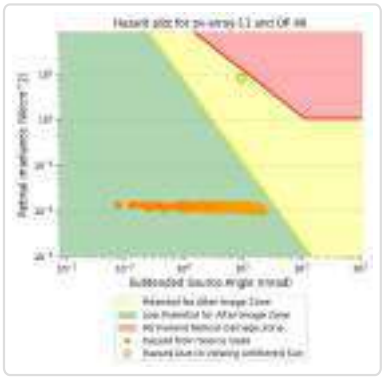

PV array 11: OP 46

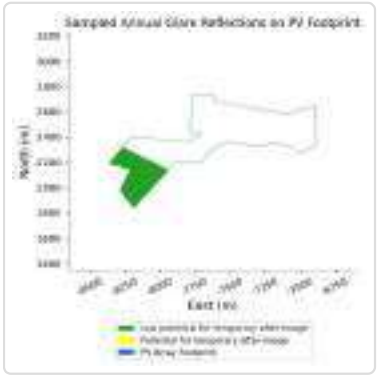

PV array is expected to produce the following glare for this receptor:

- 1,476 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

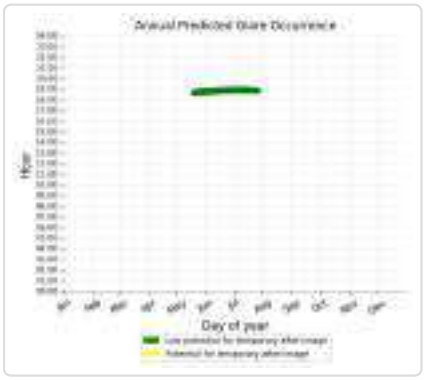

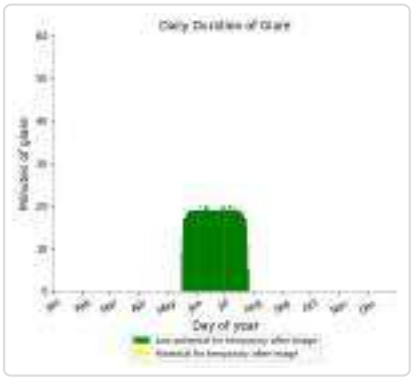

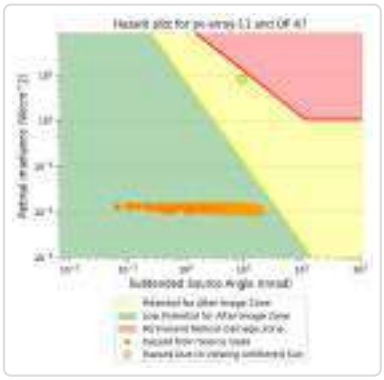

PV array 11: OP 47

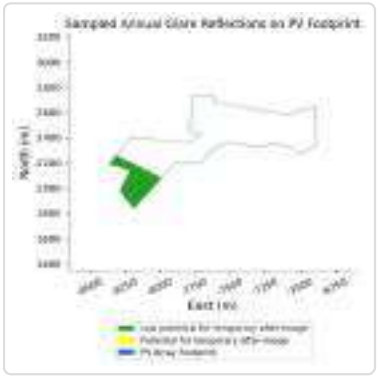

PV array is expected to produce the following glare for this receptor:

- 1,321 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

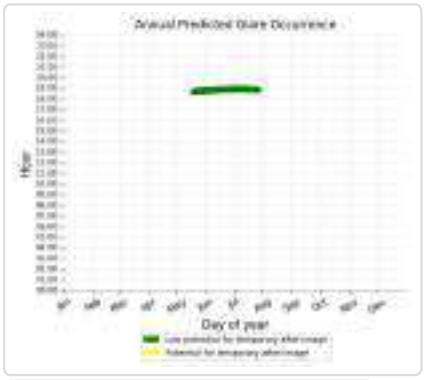

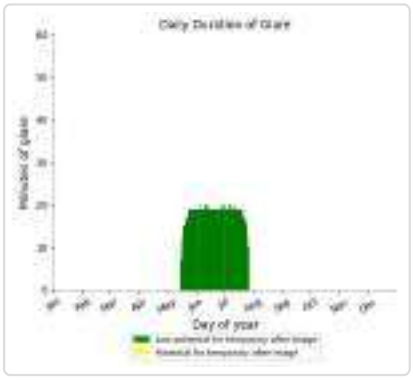

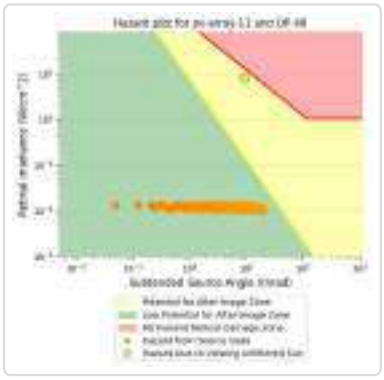

PV array 11: OP 48

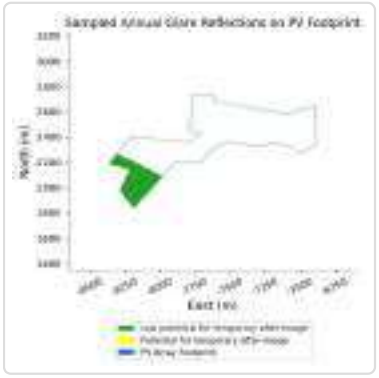

PV array is expected to produce the following glare for this receptor:

- 1,329 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

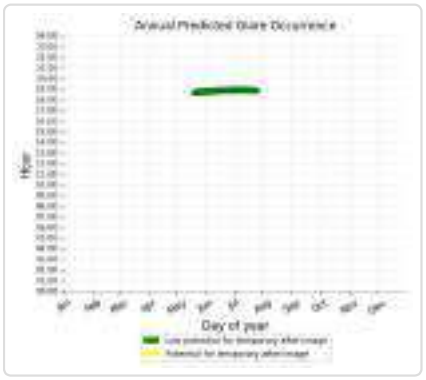

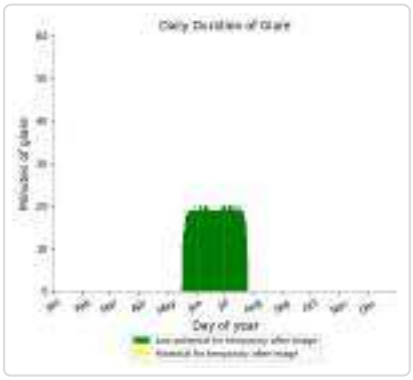

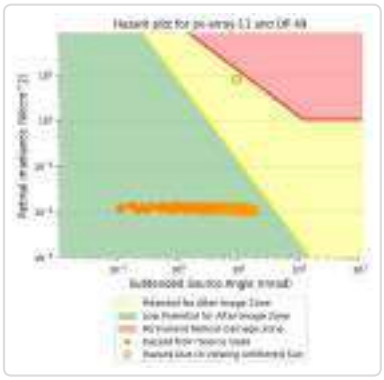

PV array 11: OP 49

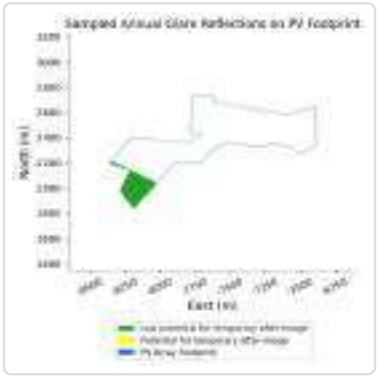

PV array is expected to produce the following glare for this receptor:

- 1,308 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

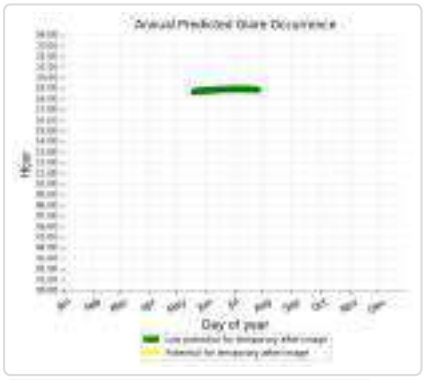

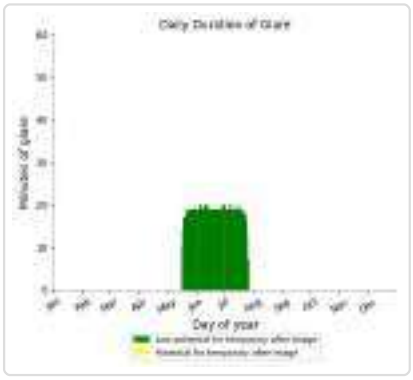

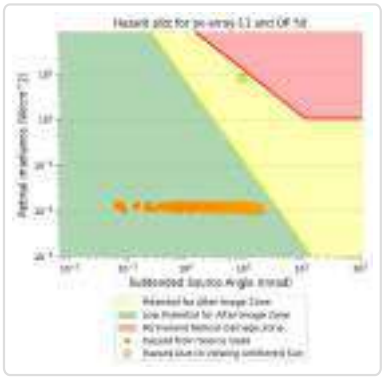

PV array 11: OP 50

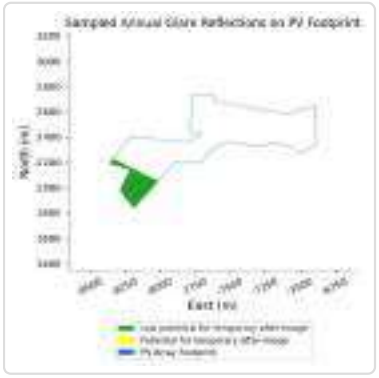

PV array is expected to produce the following glare for this receptor:

- 1,340 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

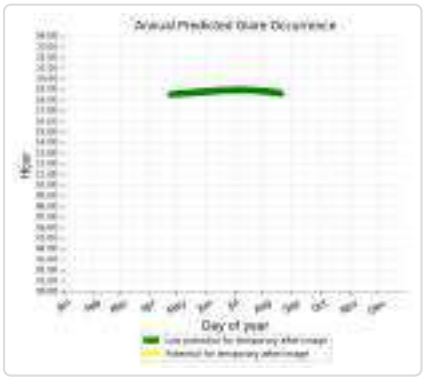

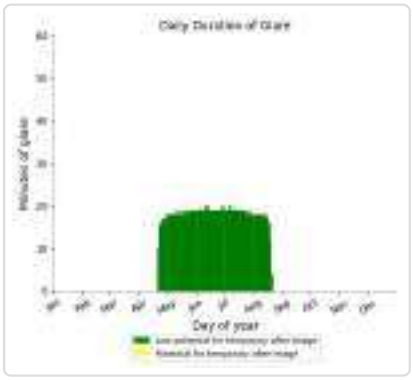

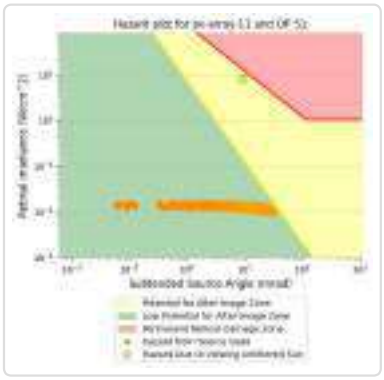

PV array 11: OP 51

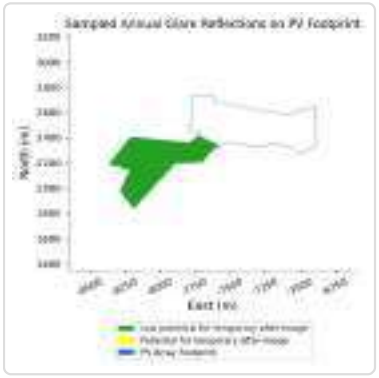

PV array is expected to produce the following glare for this receptor:

- 2,231 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

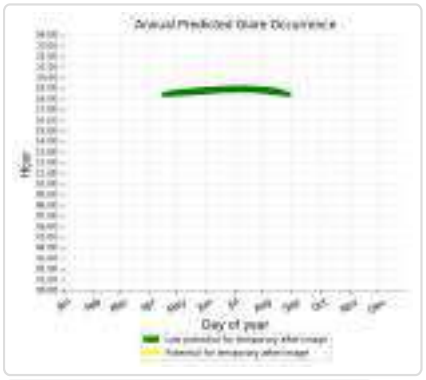

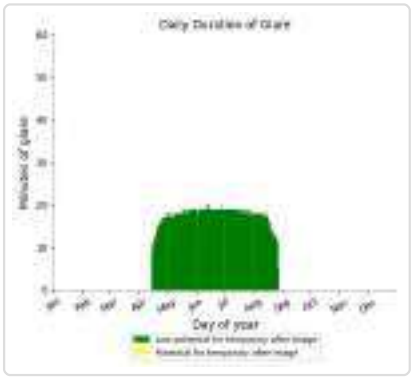

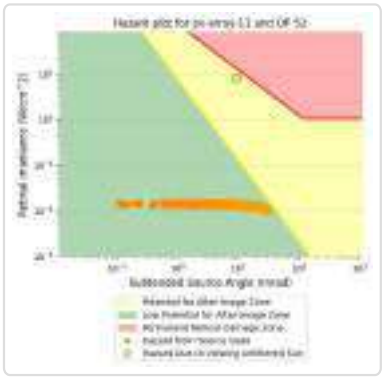

PV array 11: OP 52

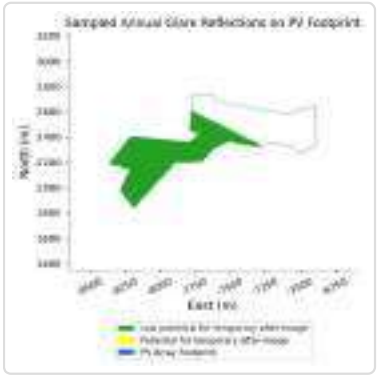

PV array is expected to produce the following glare for this receptor:

- 2,388 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

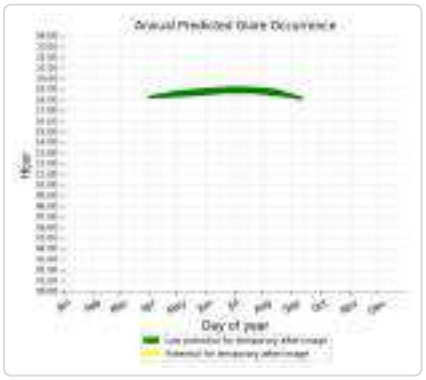

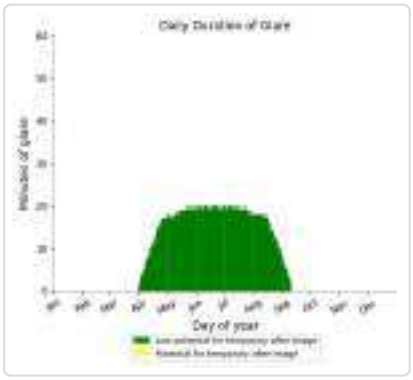

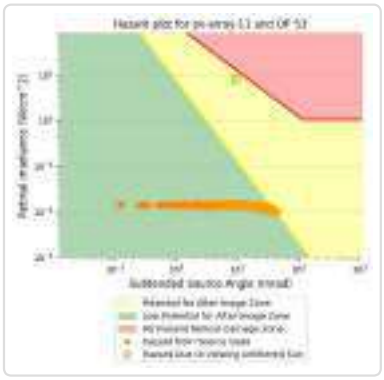

PV array 11: OP 53

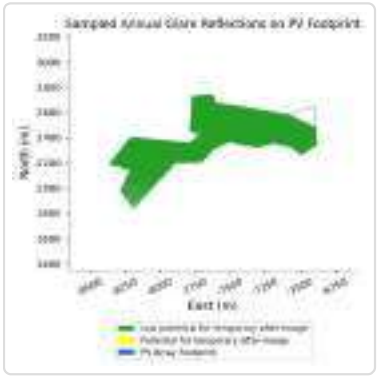

PV array is expected to produce the following glare for this receptor:

- 2,610 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

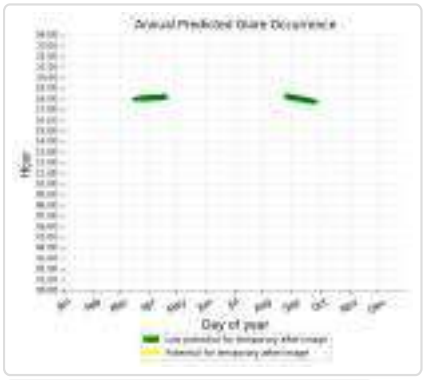

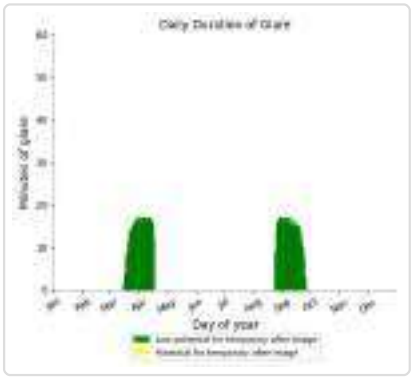

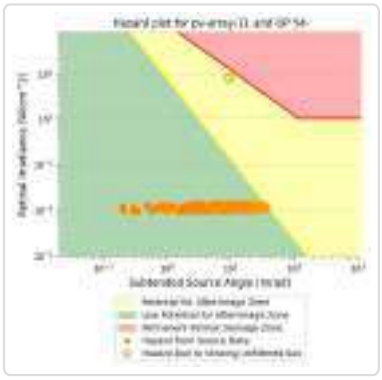

PV array 11: OP 54

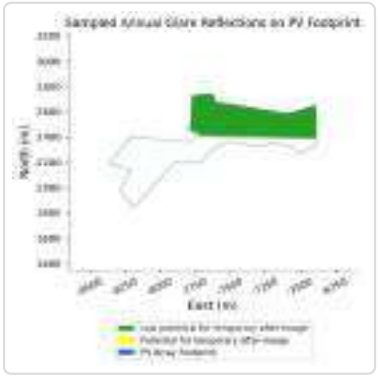

PV array is expected to produce the following glare for this receptor:

- 993 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

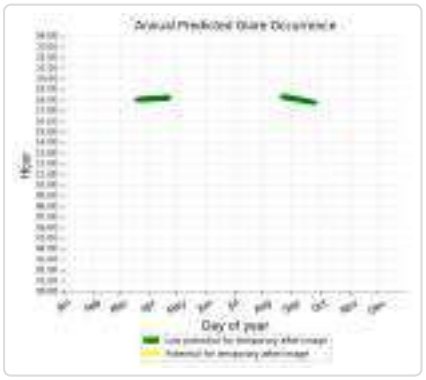

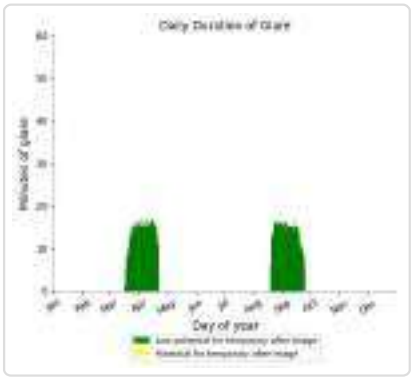

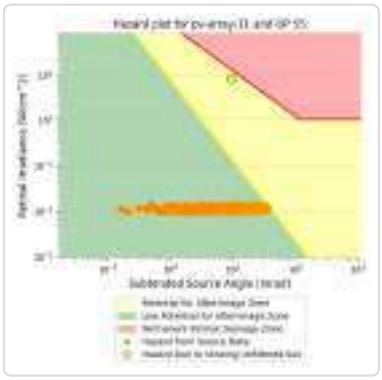

PV array 11: OP 55

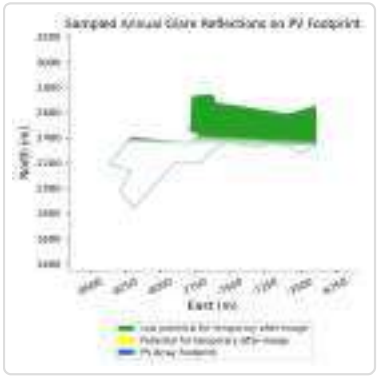

PV array is expected to produce the following glare for this receptor:

- 1,032 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

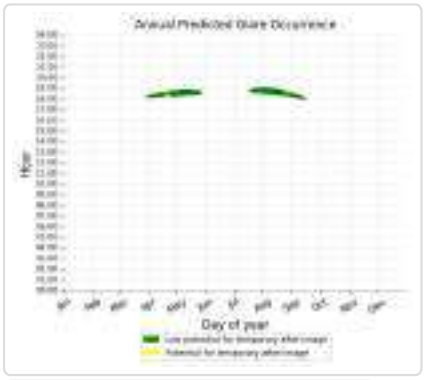

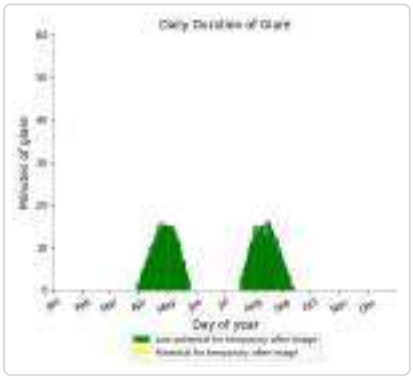

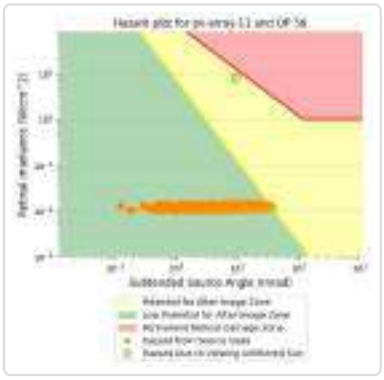

PV array 11: OP 56

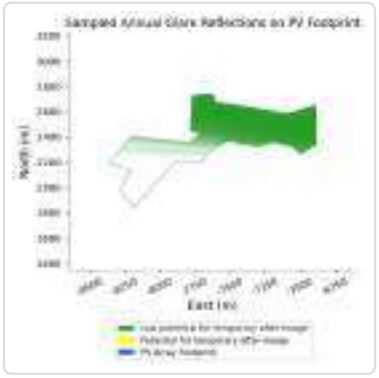

PV array is expected to produce the following glare for this receptor:

- 1,152 minutes of "green" glare with low potential to cause temporary after-image.
- 4 minutes of "yellow" glare with potential to cause temporary after-image.

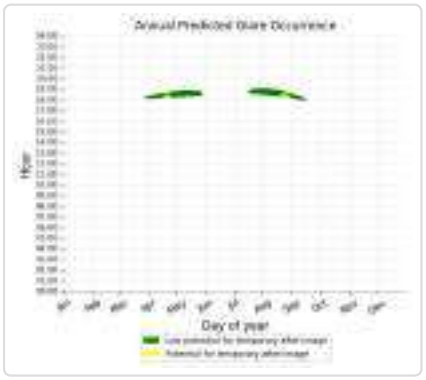

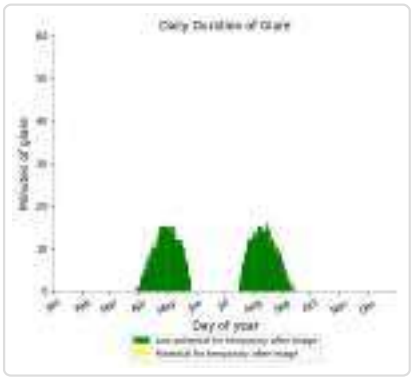

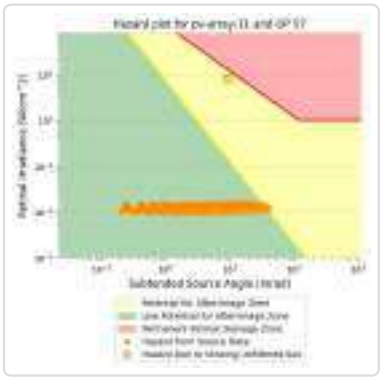

PV array 11: OP 57

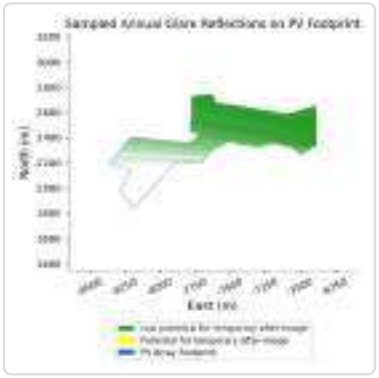

PV array is expected to produce the following glare for this receptor:

- 1,132 minutes of "green" glare with low potential to cause temporary after-image.
- 15 minutes of "yellow" glare with potential to cause temporary after-image.

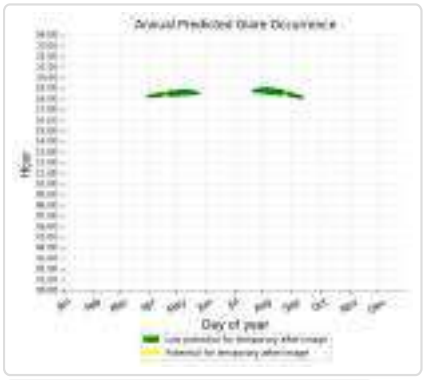

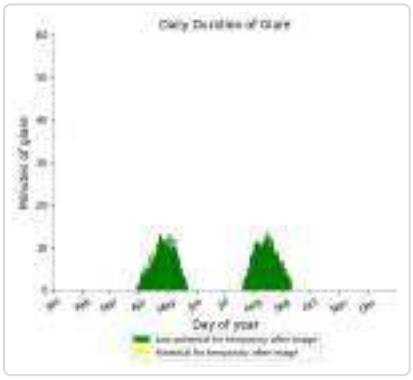

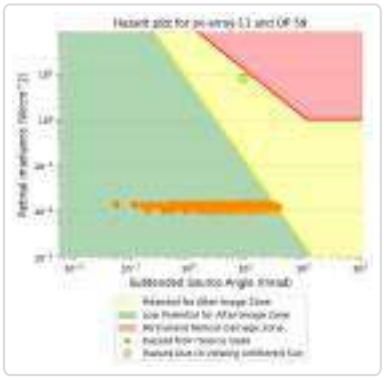

PV array 11: OP 58

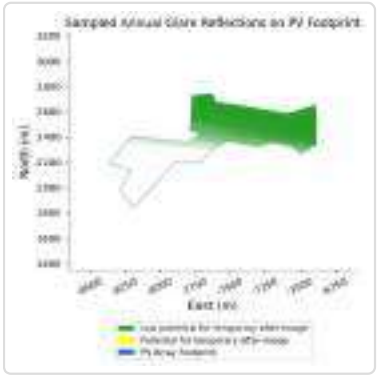

PV array is expected to produce the following glare for this receptor:

- 830 minutes of "green" glare with low potential to cause temporary after-image.
- 5 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 2: OP 1

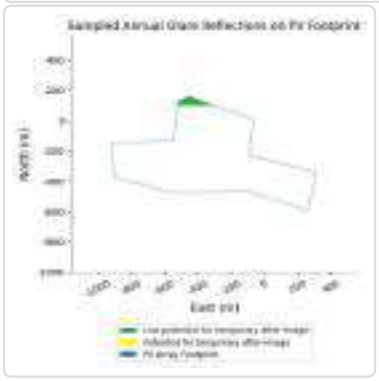

PV array is expected to produce the following glare for this receptor:

- 17 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

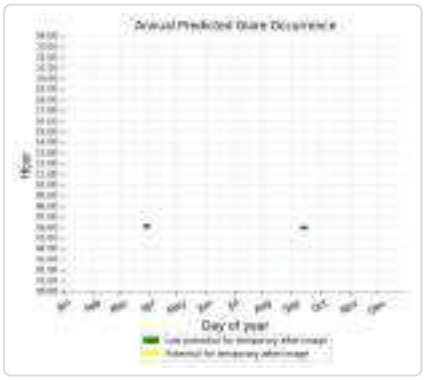

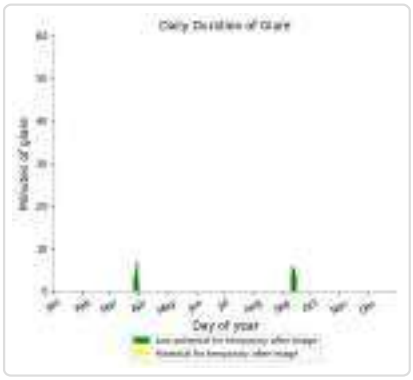

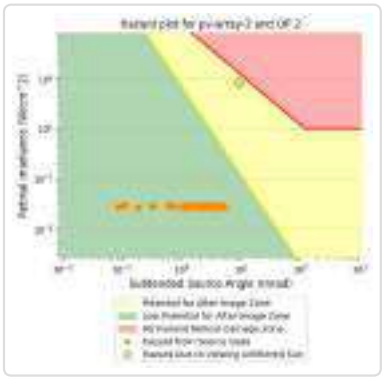

PV array 2: OP 2

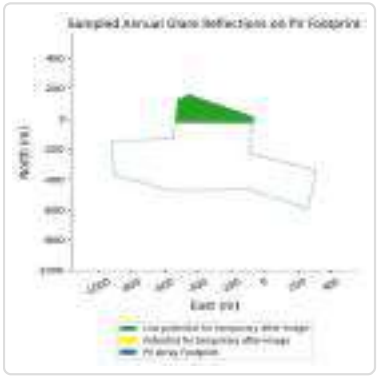

PV array is expected to produce the following glare for this receptor:

- 51 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

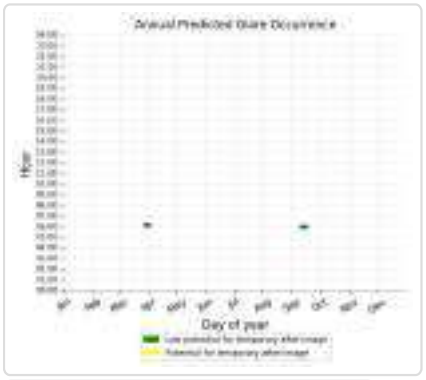

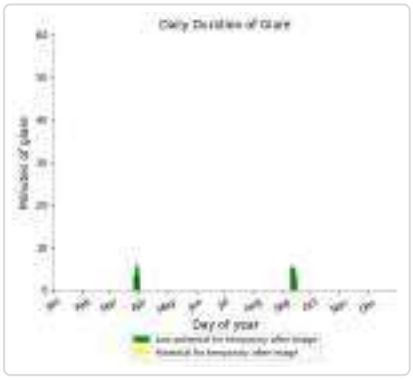

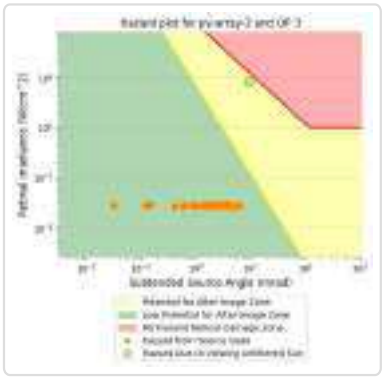

PV array 2: OP 3

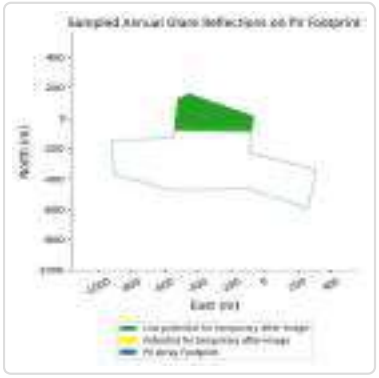

PV array is expected to produce the following glare for this receptor:

- 64 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

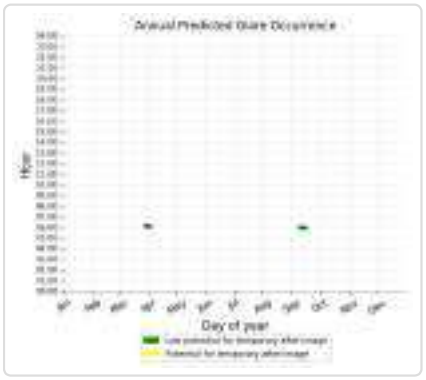

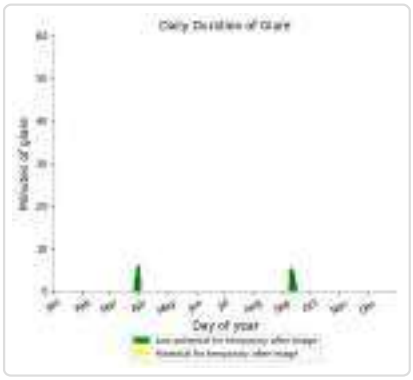

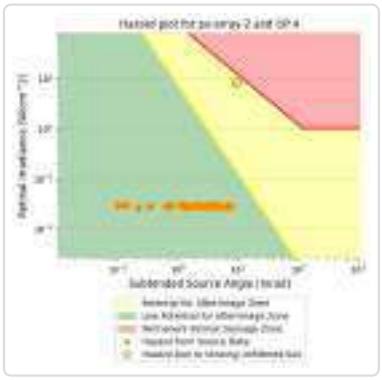

PV array 2: OP 4

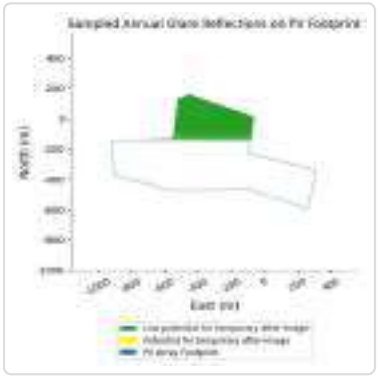

PV array is expected to produce the following glare for this receptor:

- 67 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

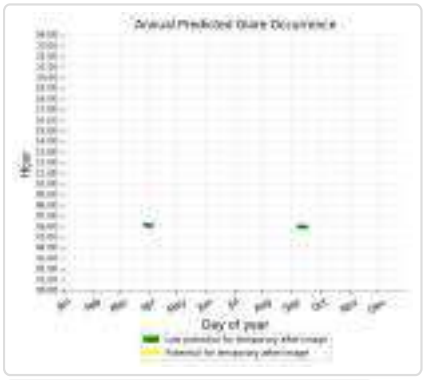

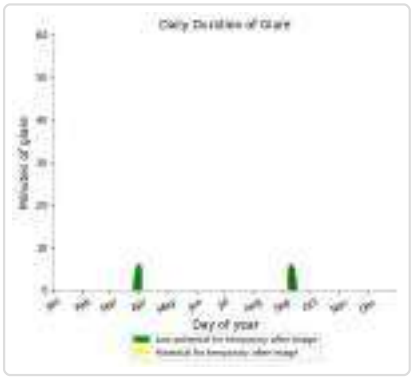

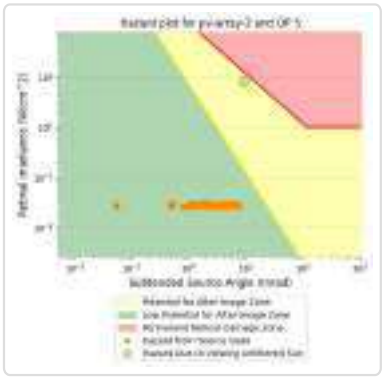

PV array 2: OP 5

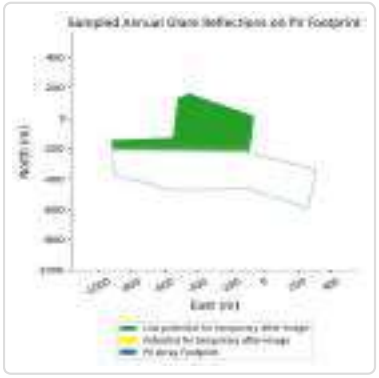

PV array is expected to produce the following glare for this receptor:

- 94 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

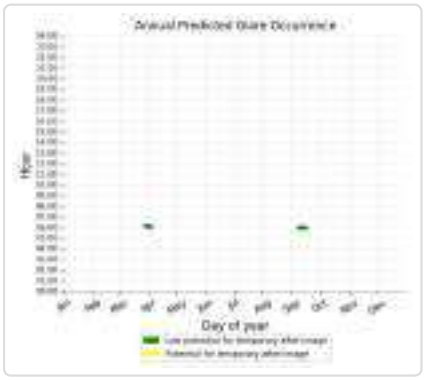

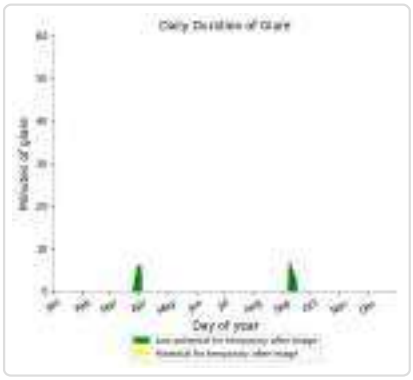

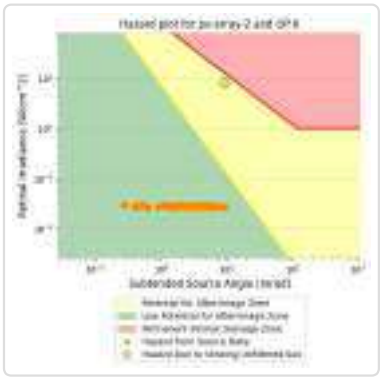

PV array 2: OP 6

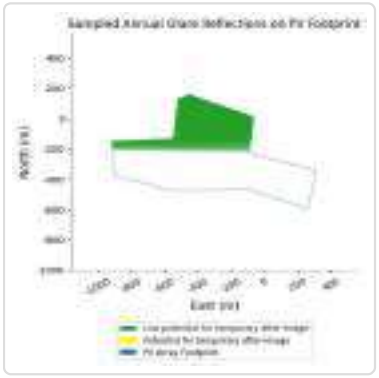

PV array is expected to produce the following glare for this receptor:

- 85 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

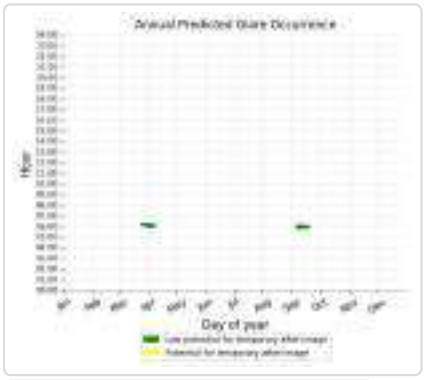

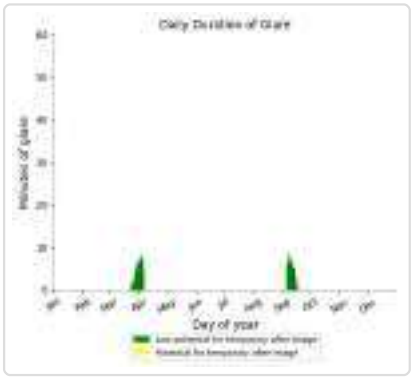

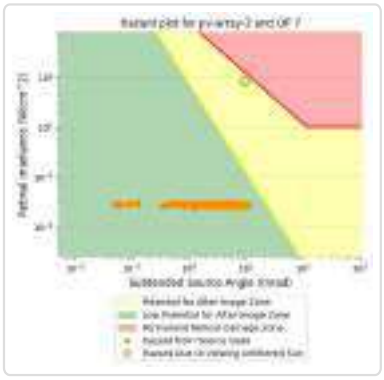

PV array 2: OP 7

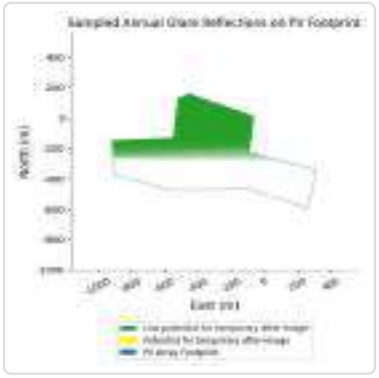

PV array is expected to produce the following glare for this receptor:

- 133 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

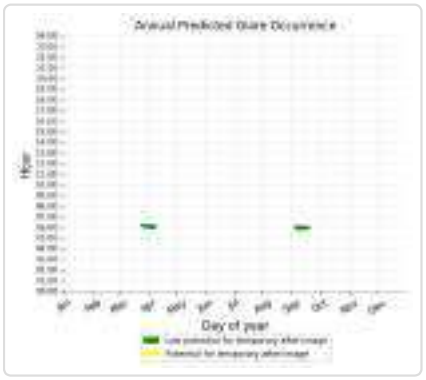

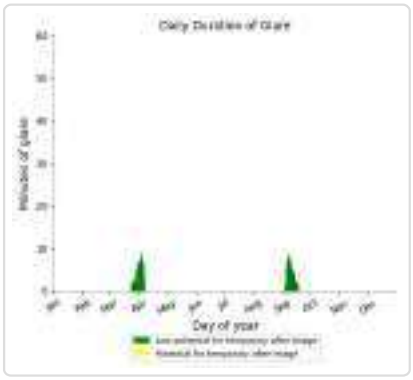

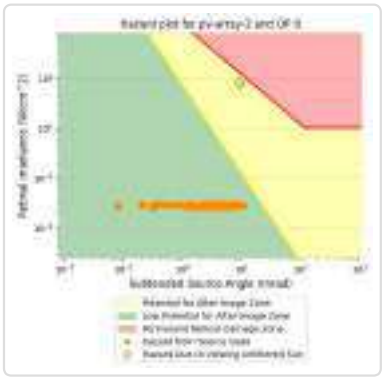

PV array 2: OP 8

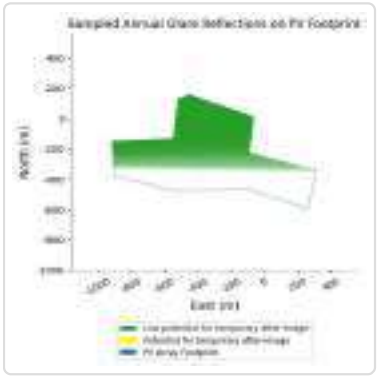

PV array is expected to produce the following glare for this receptor:

- 143 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

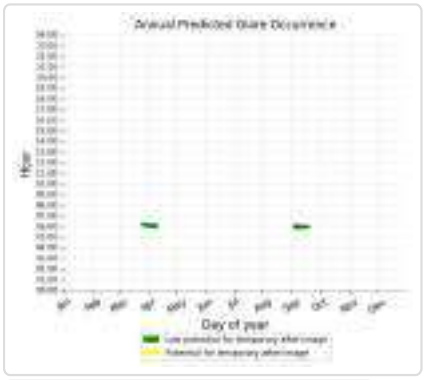

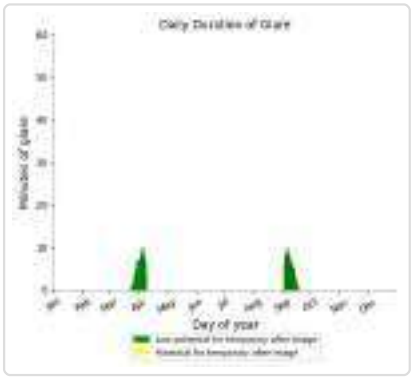

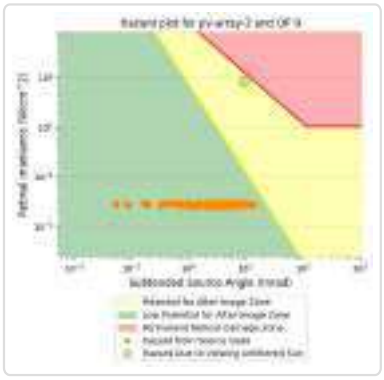

PV array 2: OP 9

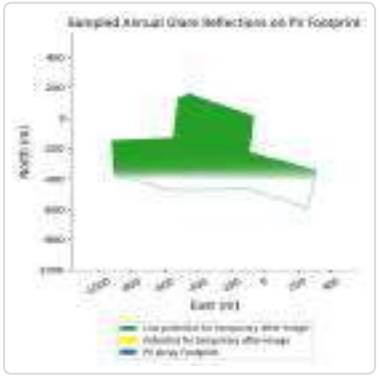

PV array is expected to produce the following glare for this receptor:

- 193 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

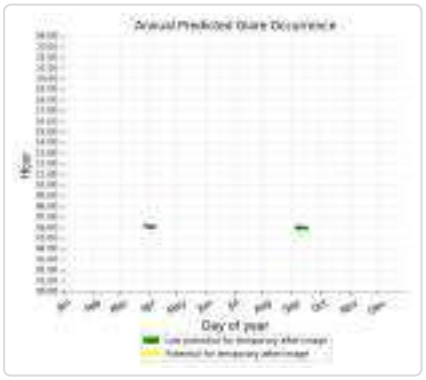

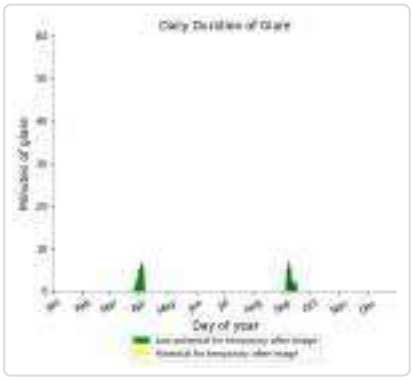

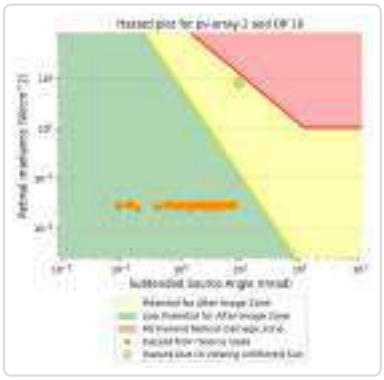

PV array 2: OP 10

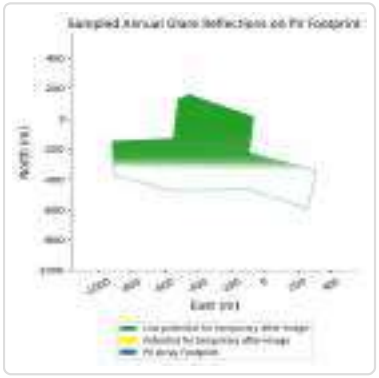

PV array is expected to produce the following glare for this receptor:

- 87 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

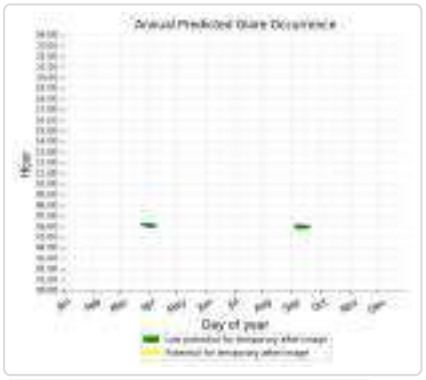

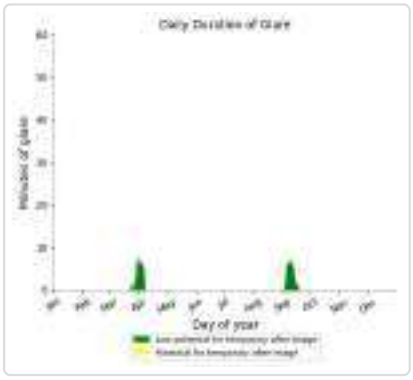

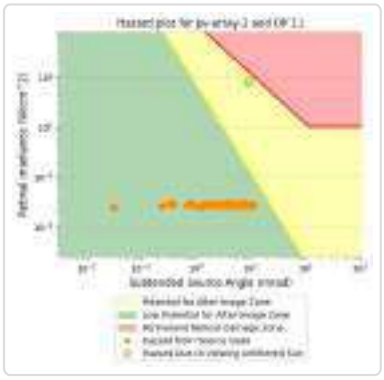

PV array 2: OP 11

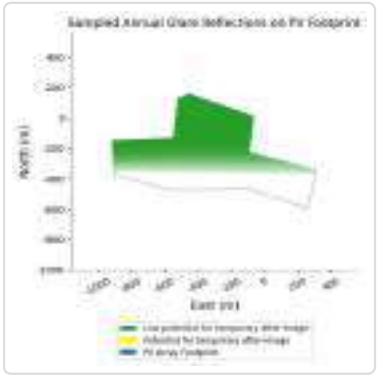

PV array is expected to produce the following glare for this receptor:

- 125 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

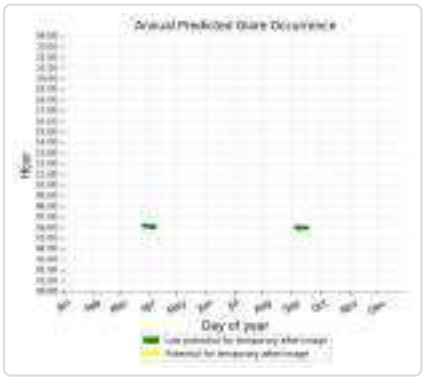

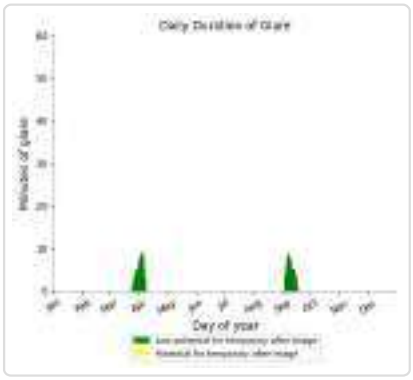

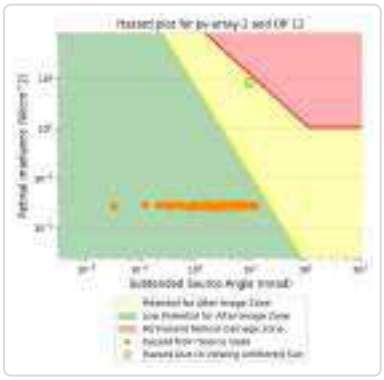

PV array 2: OP 12

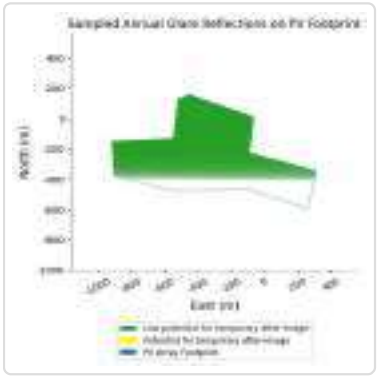

PV array is expected to produce the following glare for this receptor:

- 163 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

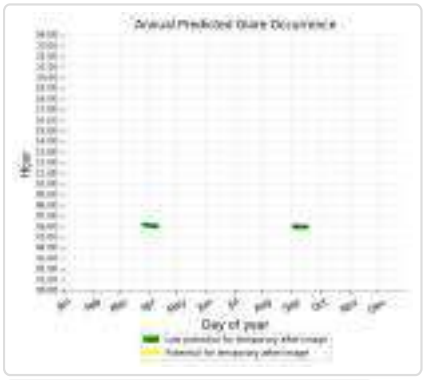

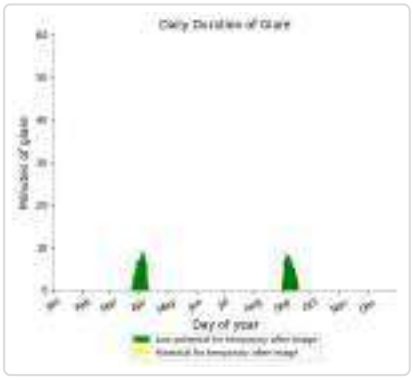

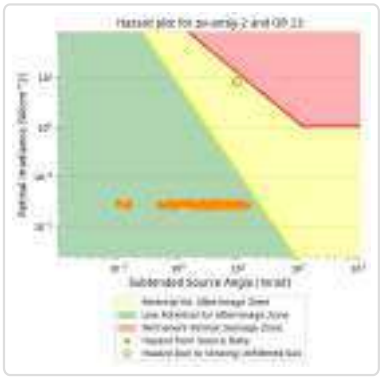

PV array 2: OP 13

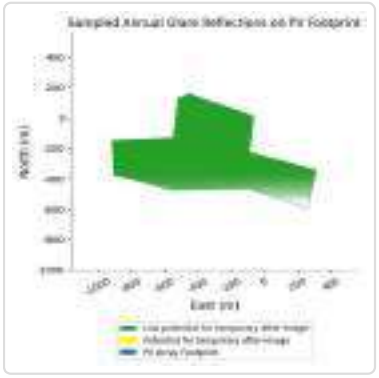

PV array is expected to produce the following glare for this receptor:

- 202 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

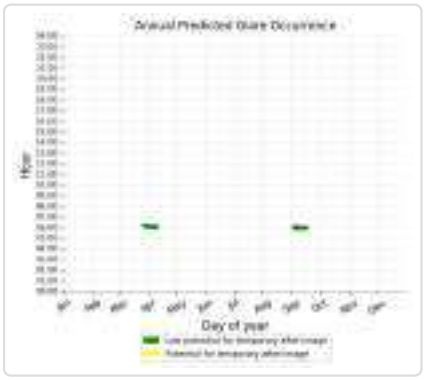

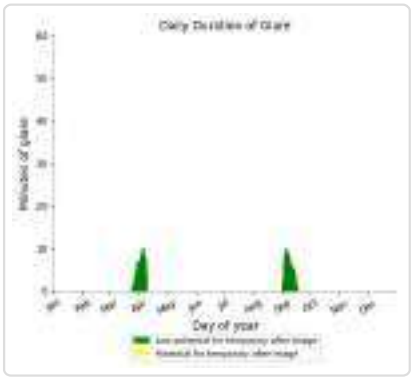

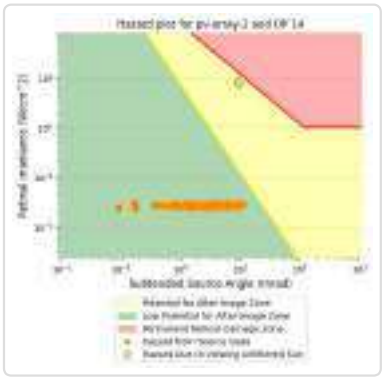

PV array 2: OP 14

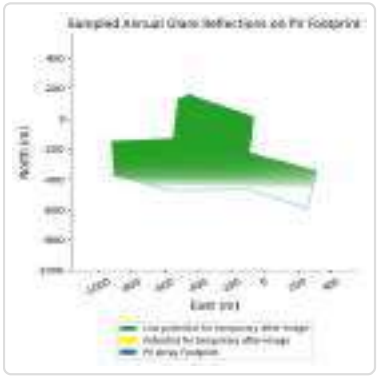

PV array is expected to produce the following glare for this receptor:

- 213 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

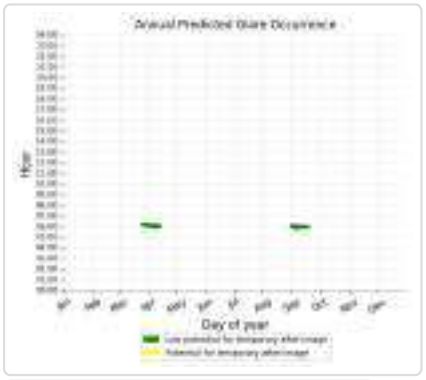

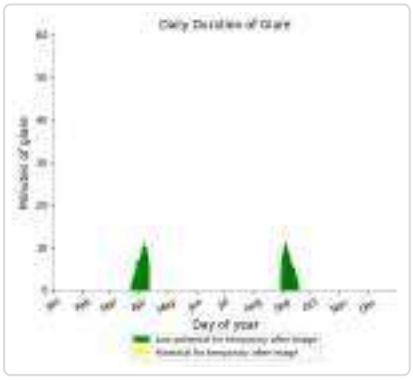

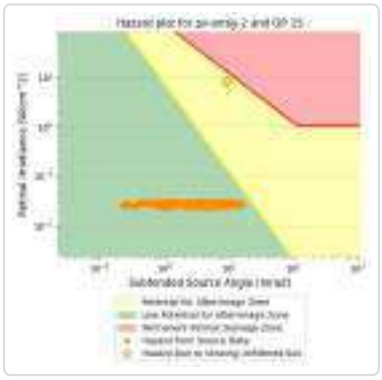

PV array 2: OP 15

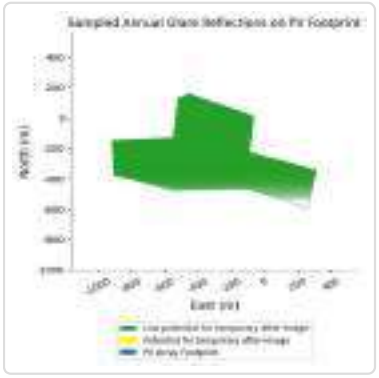

PV array is expected to produce the following glare for this receptor:

- 272 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

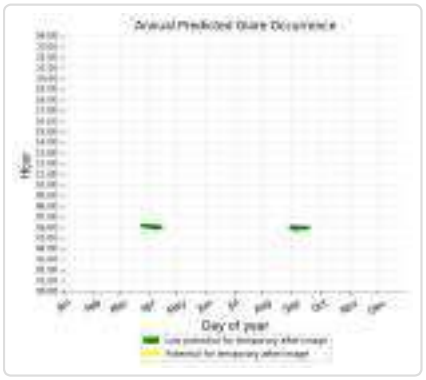

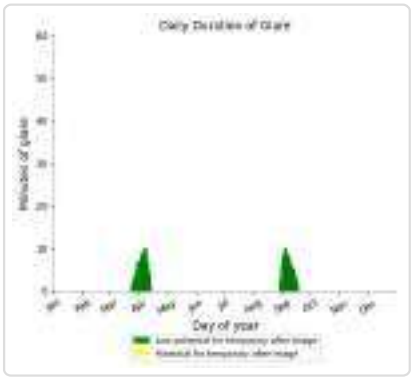

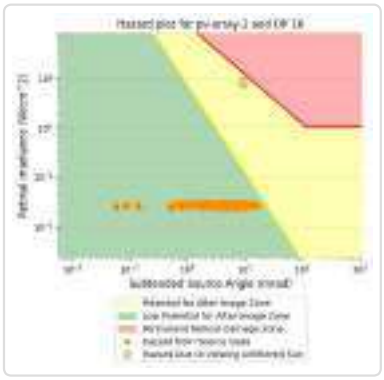

PV array 2: OP 16

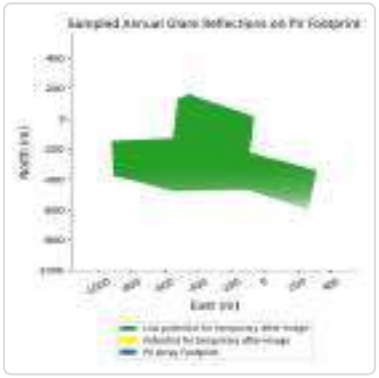

PV array is expected to produce the following glare for this receptor:

- 271 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

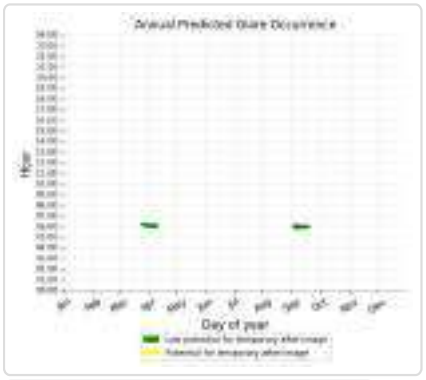

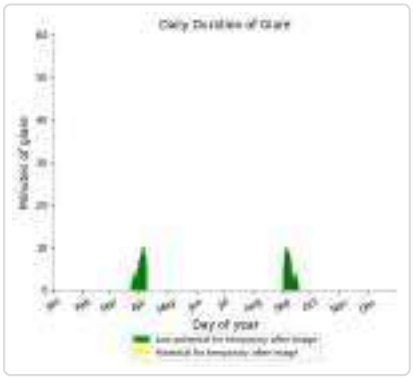

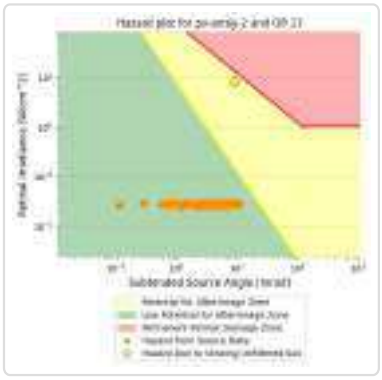

PV array 2: OP 17

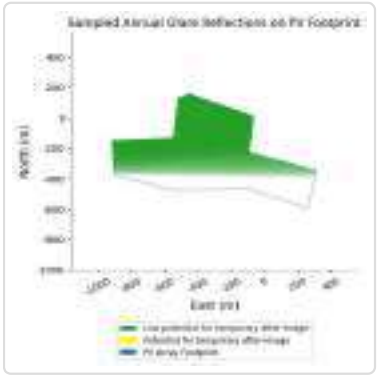

PV array is expected to produce the following glare for this receptor:

- 199 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

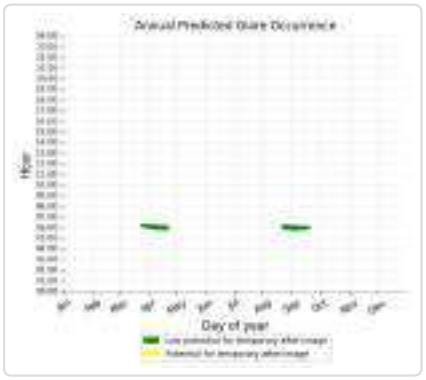

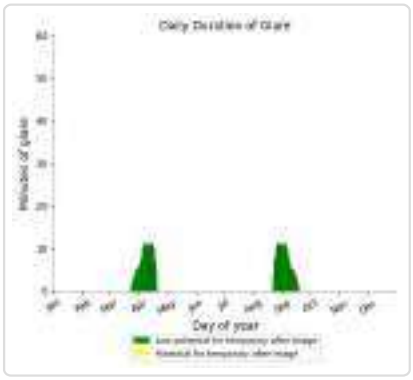

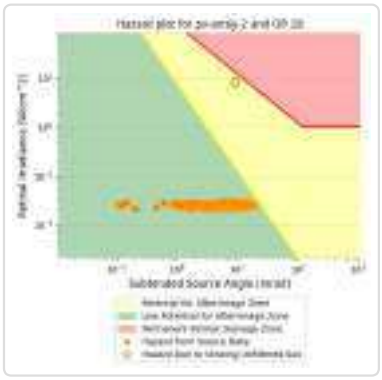

PV array 2: OP 18

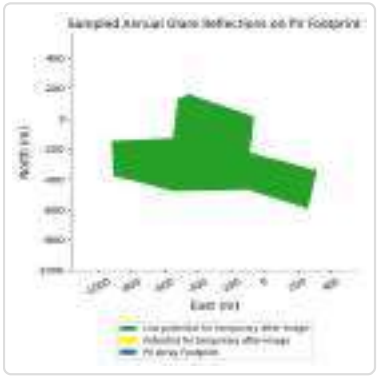

PV array is expected to produce the following glare for this receptor:

- 438 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

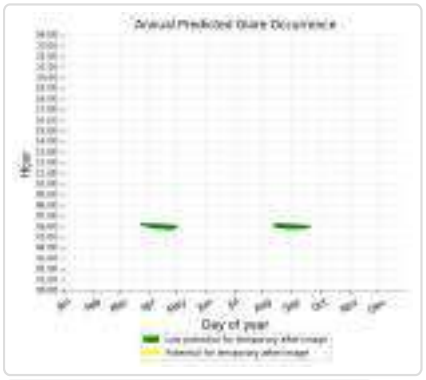

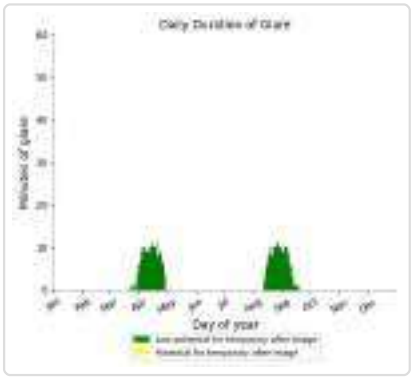

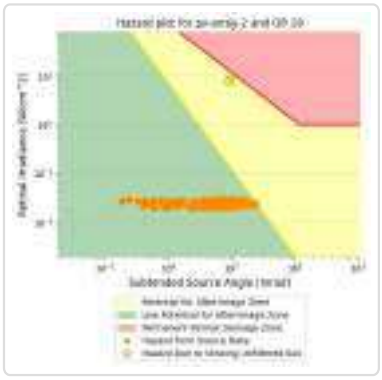

PV array 2: OP 19

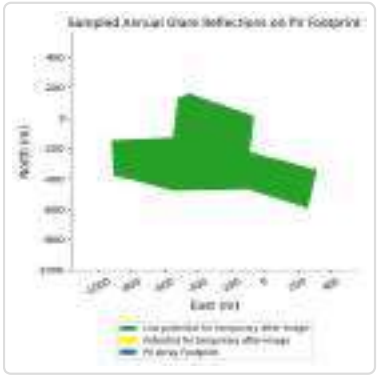

PV array is expected to produce the following glare for this receptor:

- 519 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

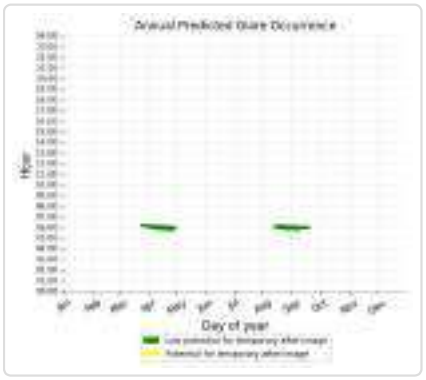

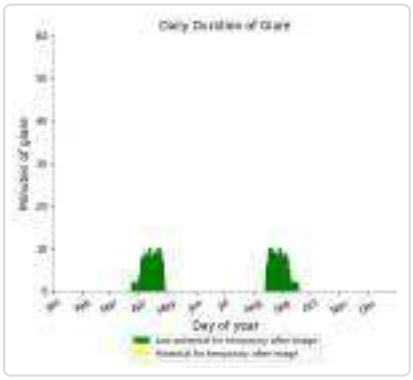

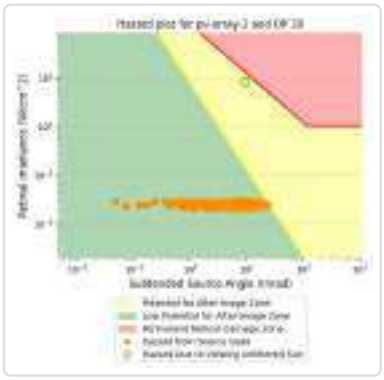

PV array 2: OP 20

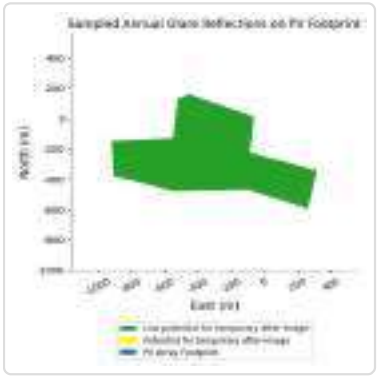

PV array is expected to produce the following glare for this receptor:

- 496 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

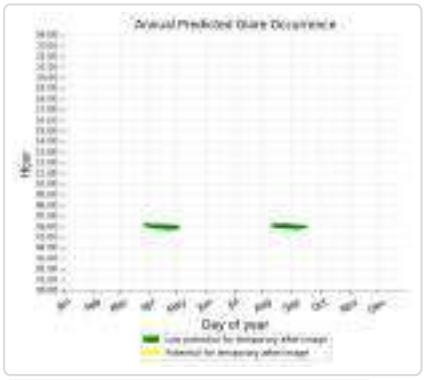

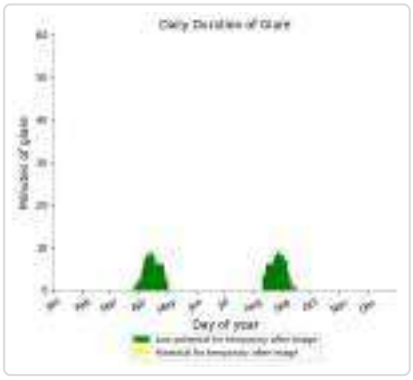

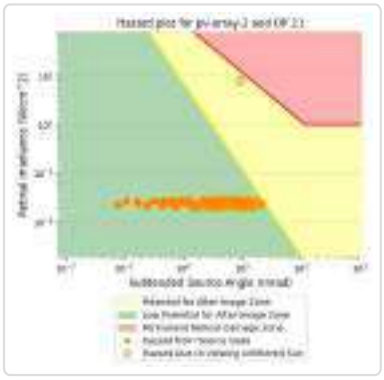

PV array 2: OP 21

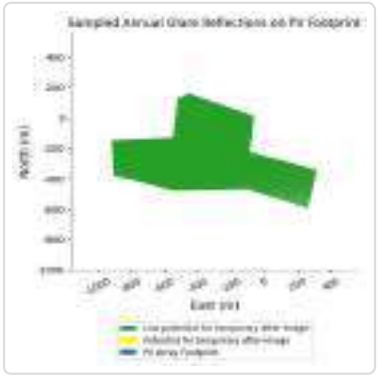

PV array is expected to produce the following glare for this receptor:

- 394 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

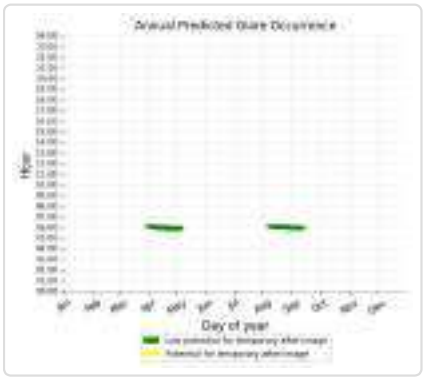

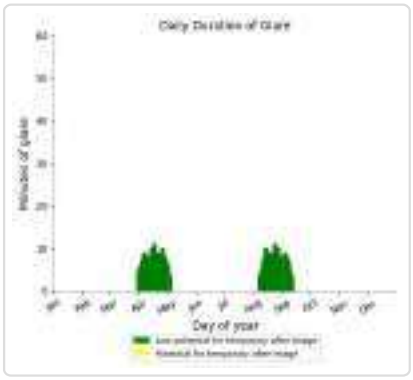

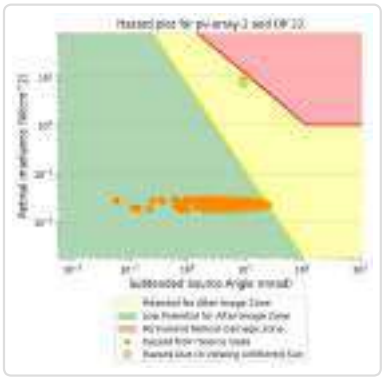

PV array 2: OP 22

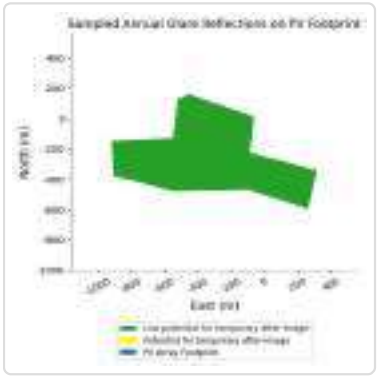

PV array is expected to produce the following glare for this receptor:

- 638 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

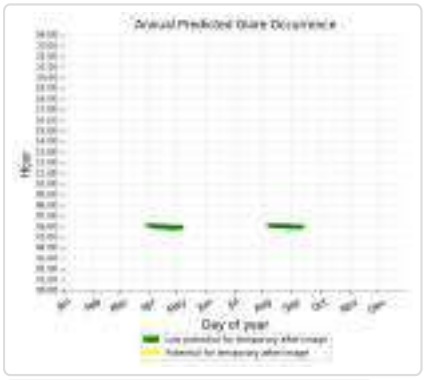

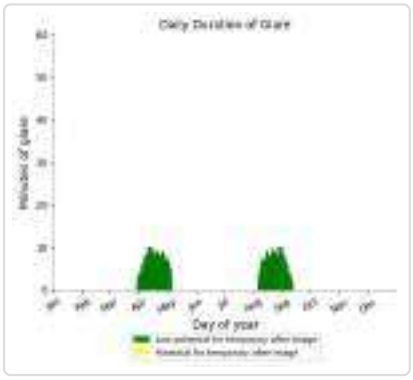

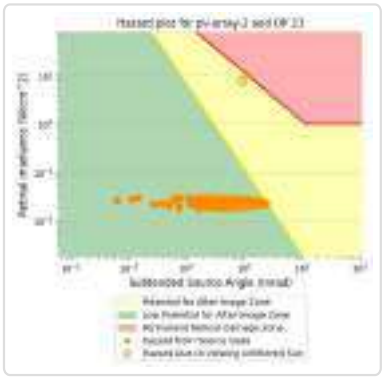

PV array 2: OP 23

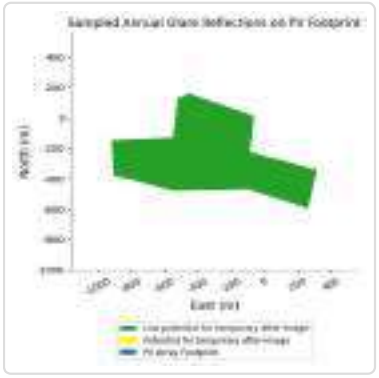

PV array is expected to produce the following glare for this receptor:

- 559 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

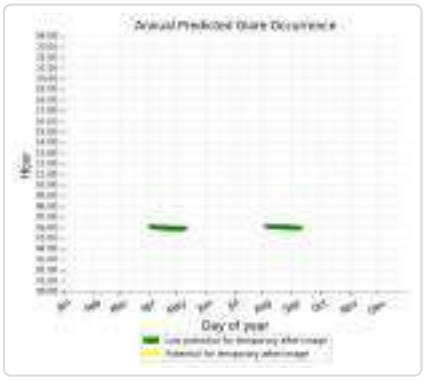

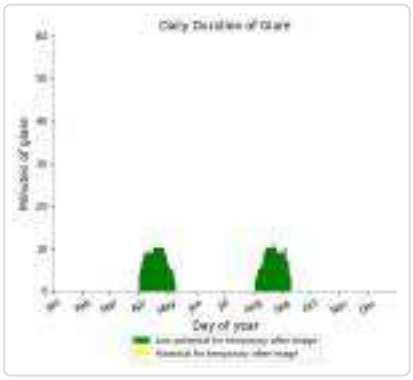

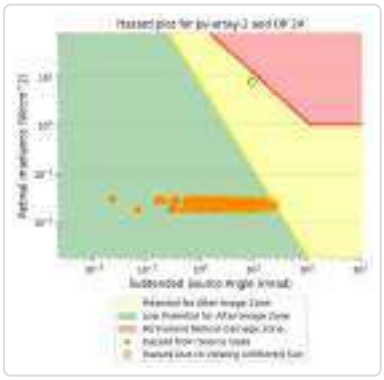

PV array 2: OP 24

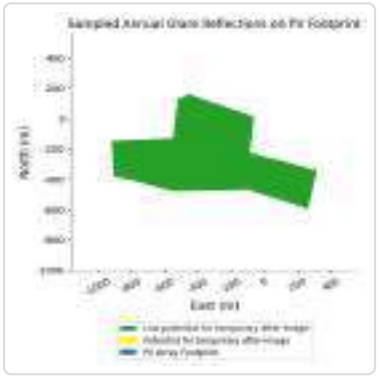

PV array is expected to produce the following glare for this receptor:

- 610 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

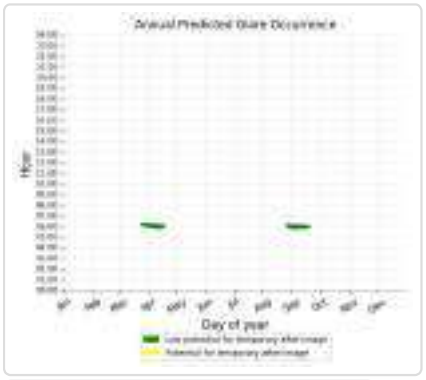

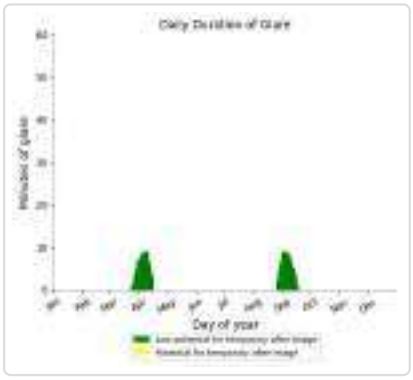

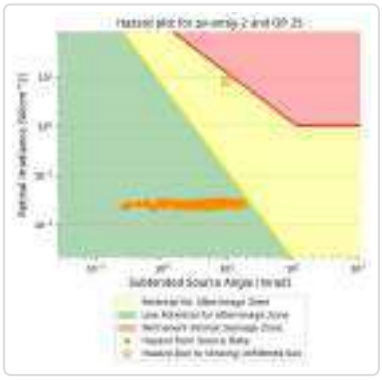

PV array 2: OP 25

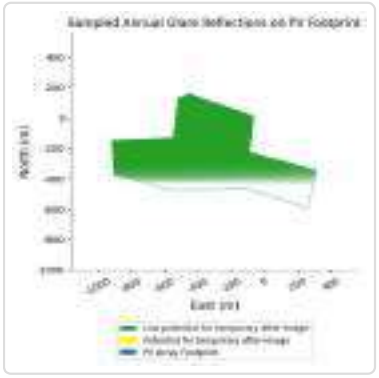

PV array is expected to produce the following glare for this receptor:

- 299 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

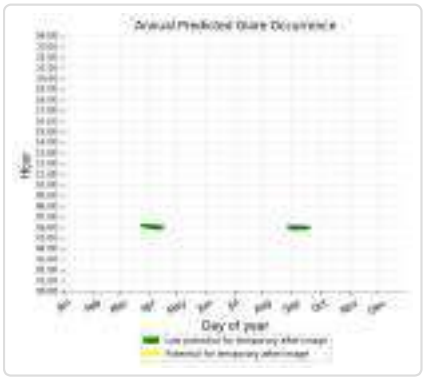

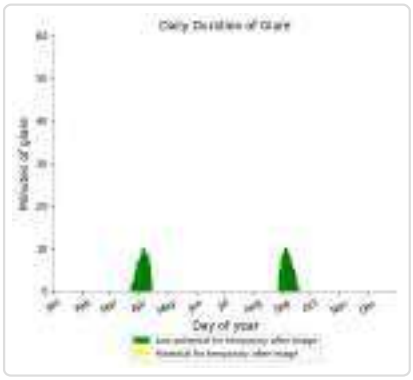

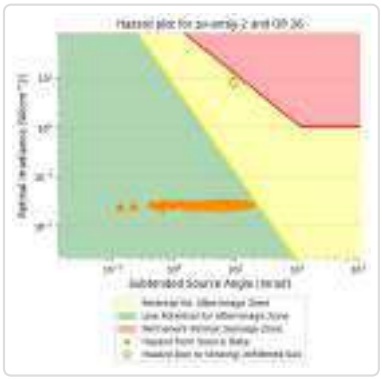

PV array 2: OP 26

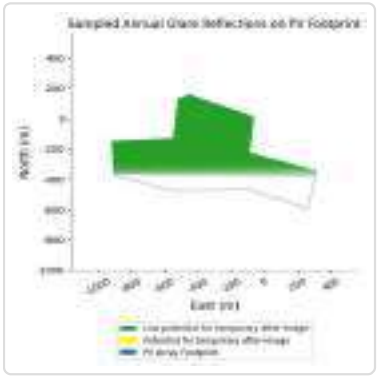

PV array is expected to produce the following glare for this receptor:

- 290 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

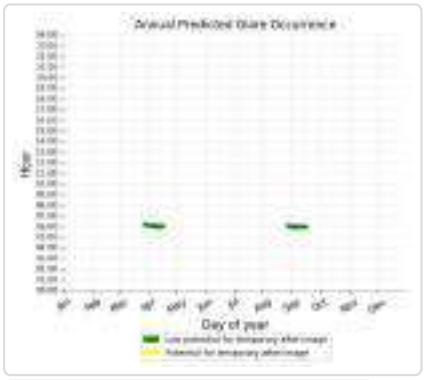

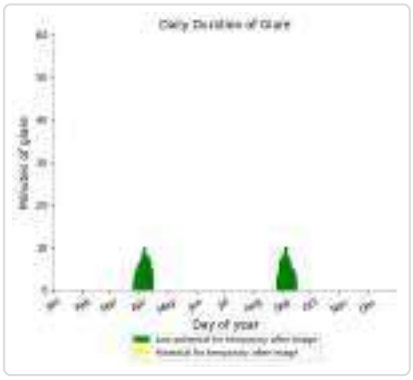

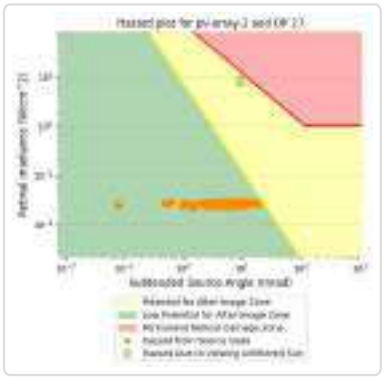

PV array 2: OP 27

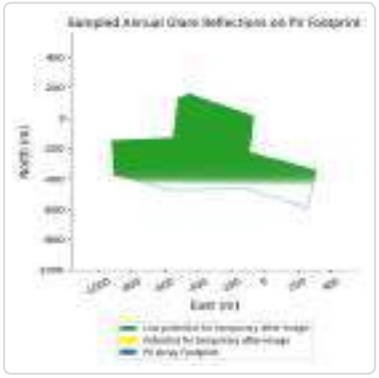

PV array is expected to produce the following glare for this receptor:

- 290 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

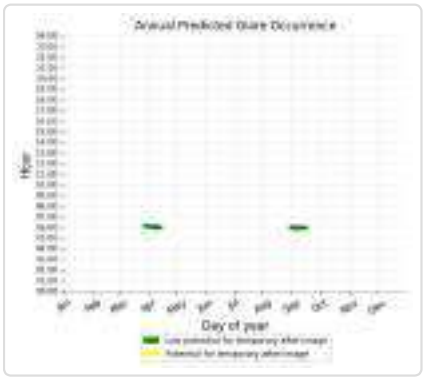

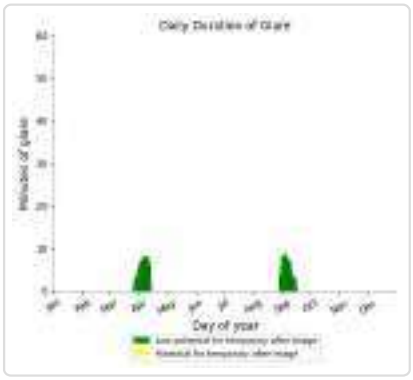

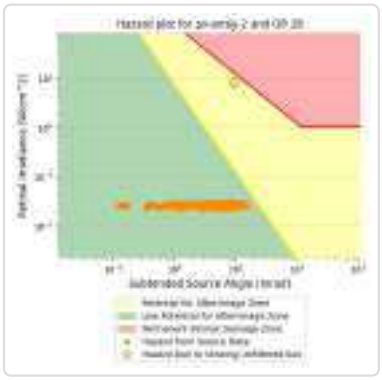

PV array 2: OP 28

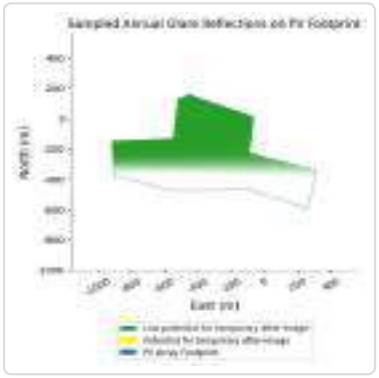

PV array is expected to produce the following glare for this receptor:

- 232 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

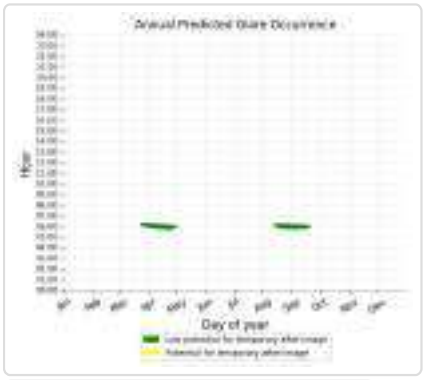

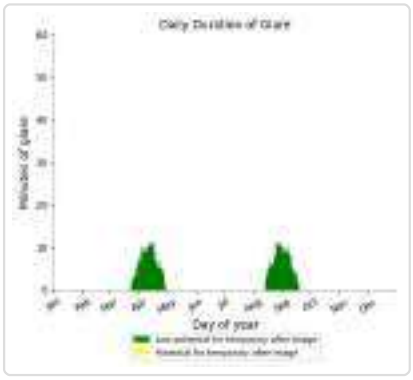

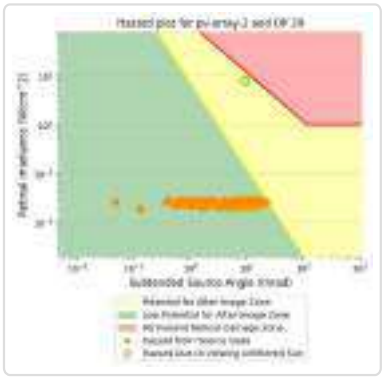

PV array 2: OP 29

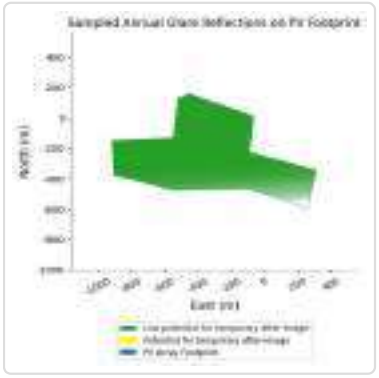

PV array is expected to produce the following glare for this receptor:

- 503 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

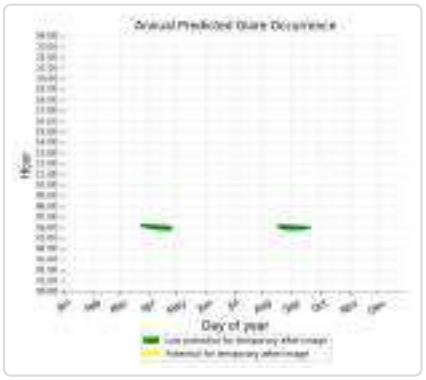

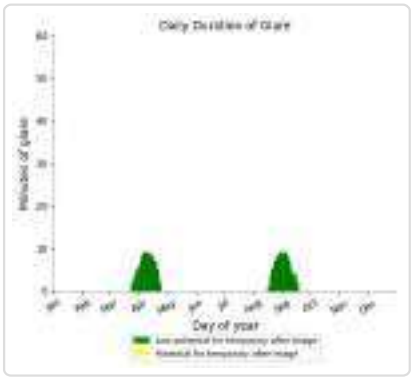

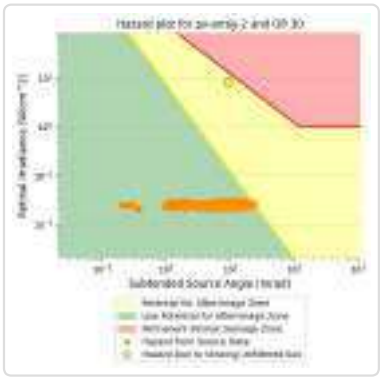

PV array 2: OP 30

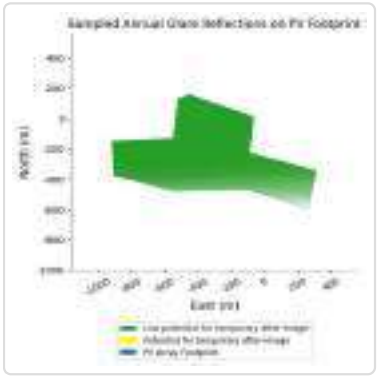

PV array is expected to produce the following glare for this receptor:

- 407 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

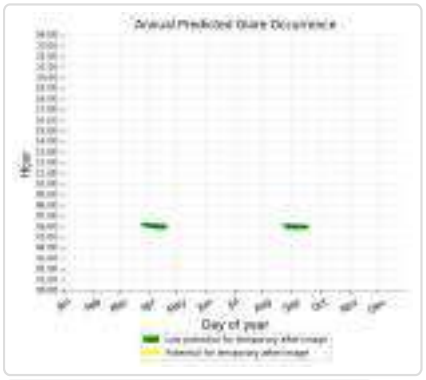

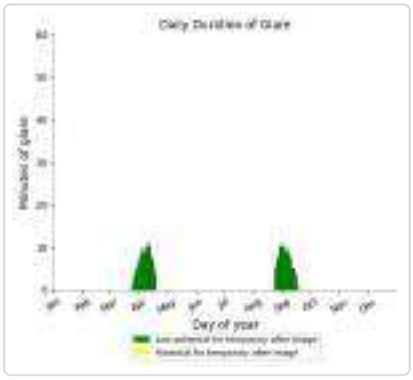

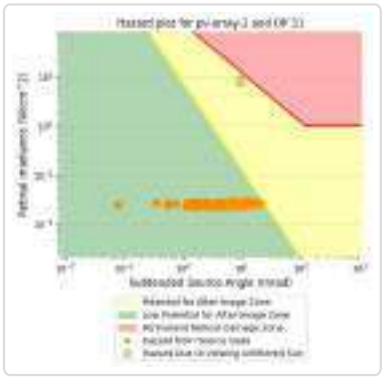

PV array 2: OP 31

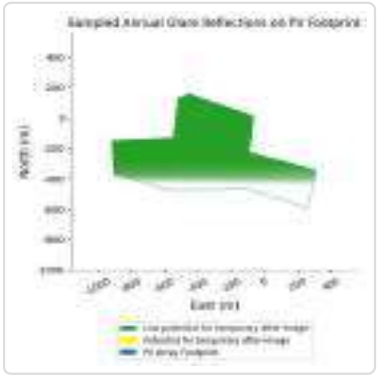

PV array is expected to produce the following glare for this receptor:

- 373 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

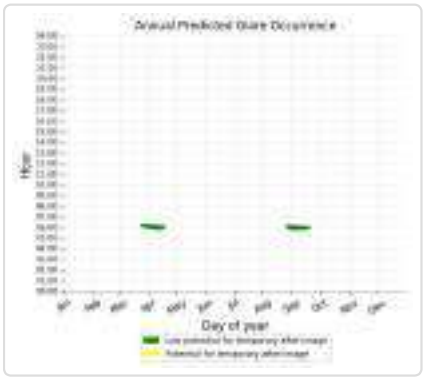

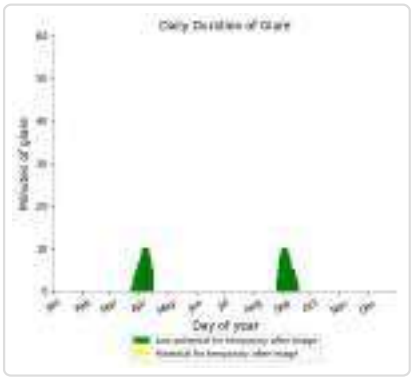

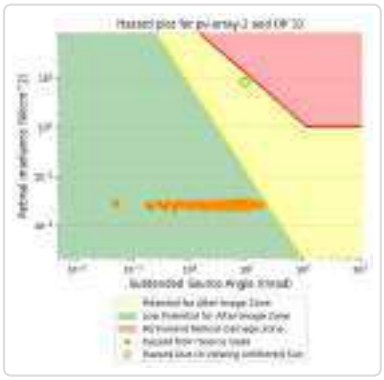

PV array 2: OP 32

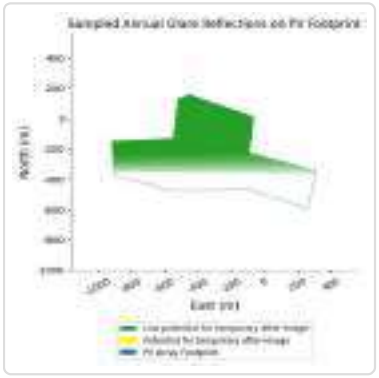

PV array is expected to produce the following glare for this receptor:

- 330 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

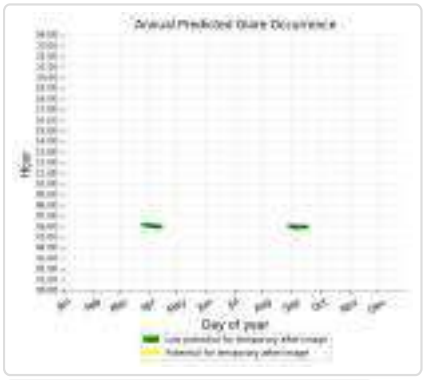

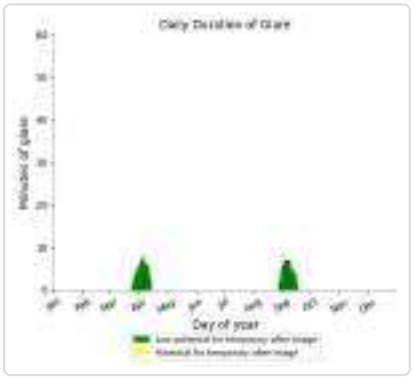

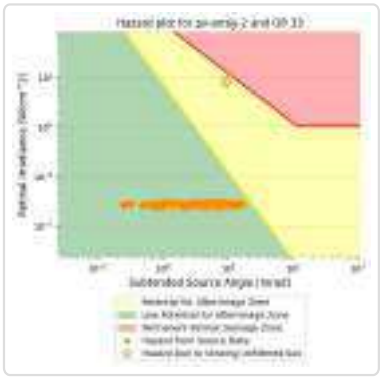

PV array 2: OP 33

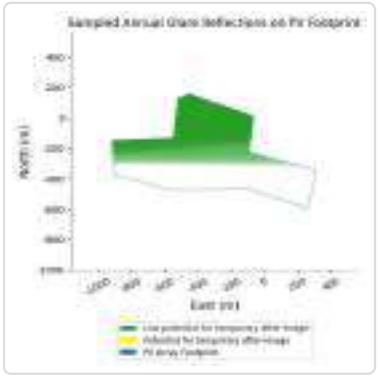

PV array is expected to produce the following glare for this receptor:

- 209 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

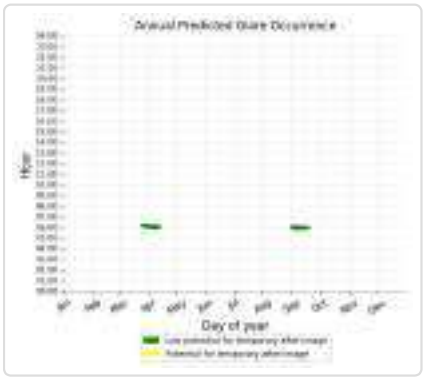

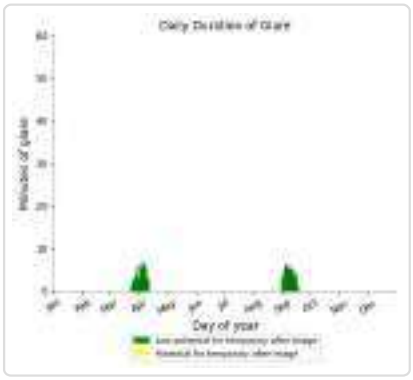

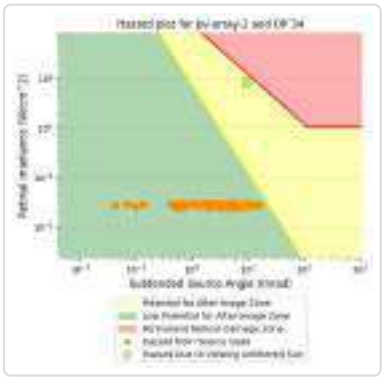

PV array 2: OP 34

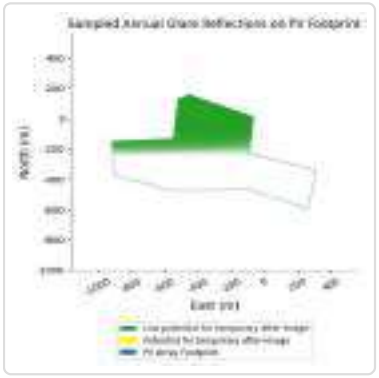

PV array is expected to produce the following glare for this receptor:

- 165 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

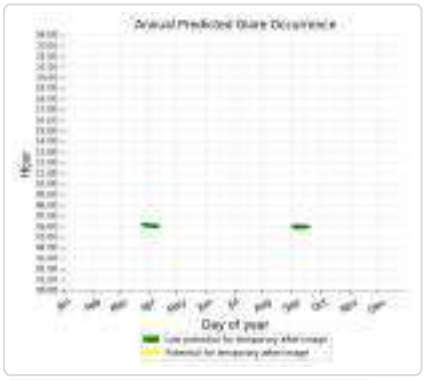

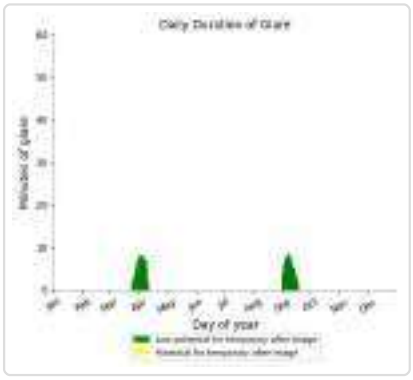

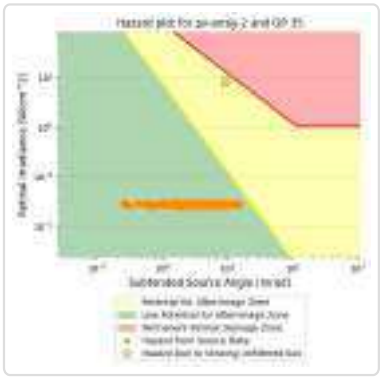

PV array 2: OP 35

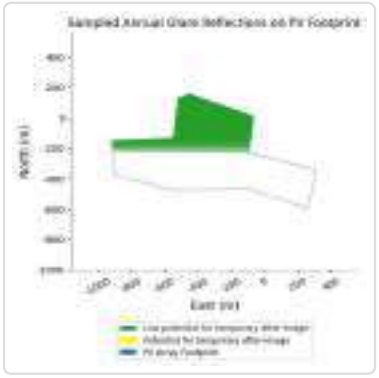

PV array is expected to produce the following glare for this receptor:

- 210 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

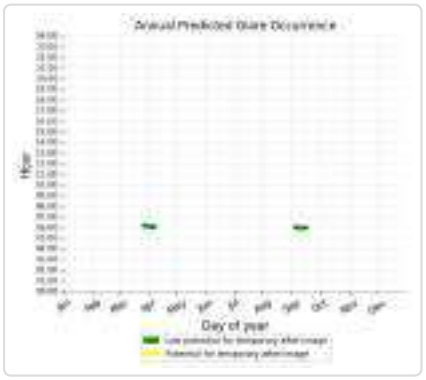

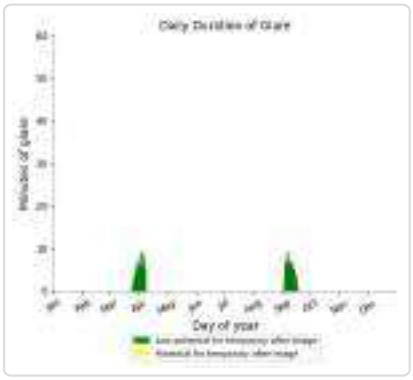

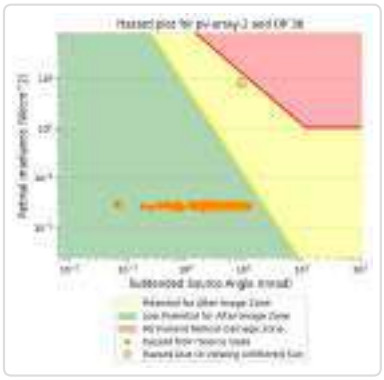

PV array 2: OP 36

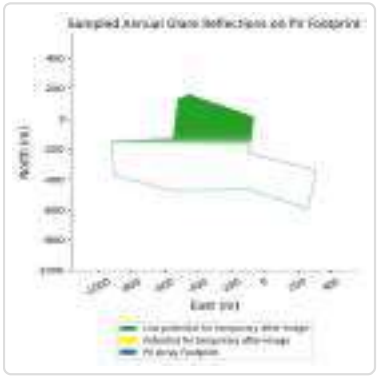

PV array is expected to produce the following glare for this receptor:

- 172 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

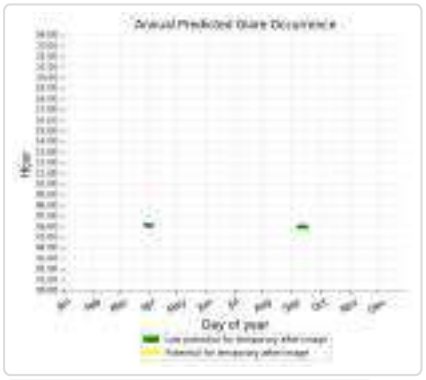

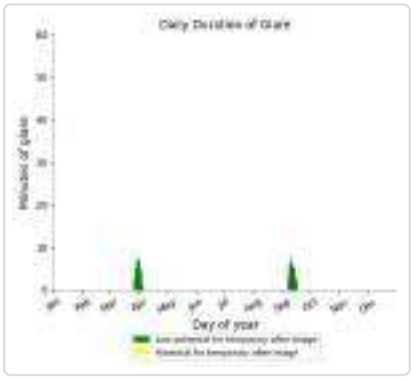

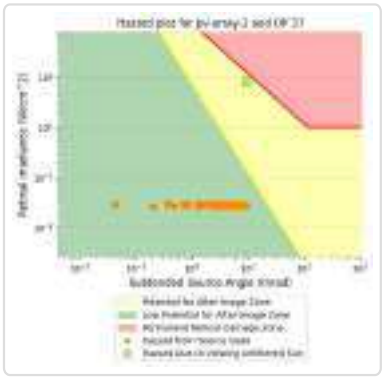

PV array 2: OP 37

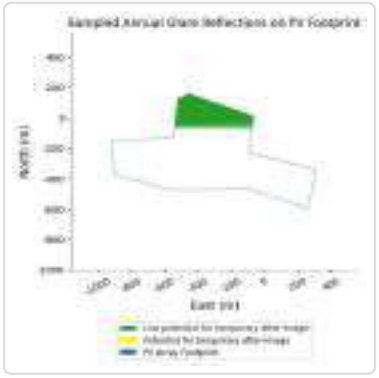

PV array is expected to produce the following glare for this receptor:

- 96 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

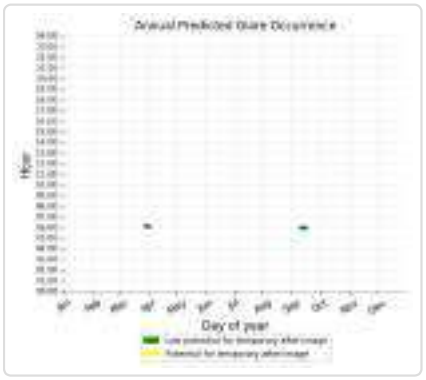

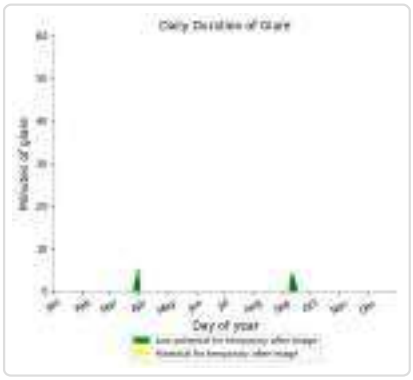

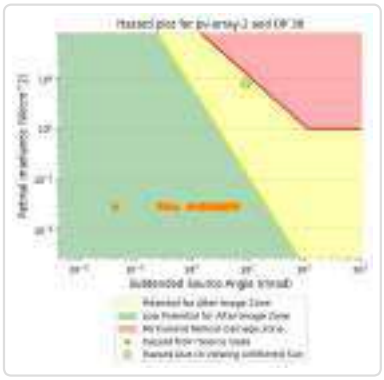

PV array 2: OP 38

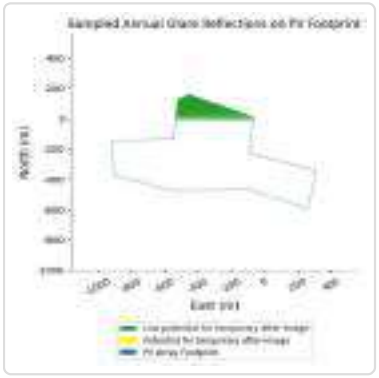

PV array is expected to produce the following glare for this receptor:

- 46 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

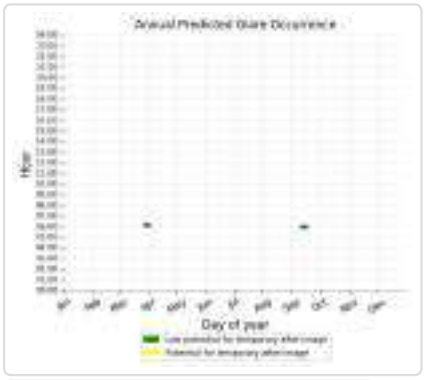

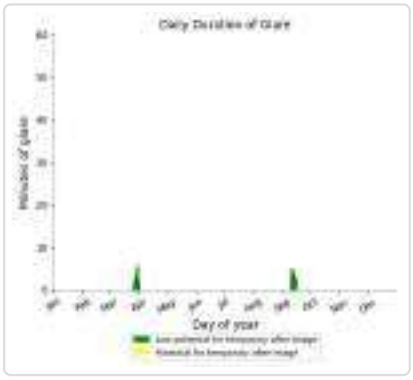

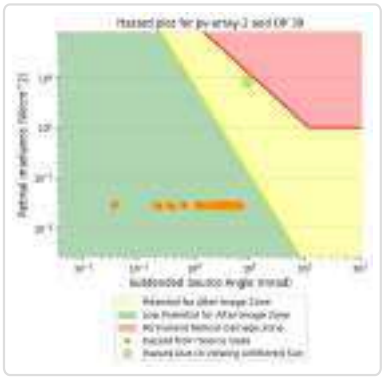

PV array 2: OP 39

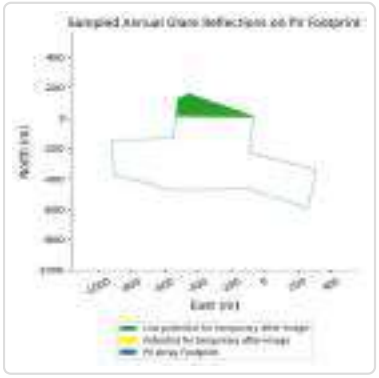

PV array is expected to produce the following glare for this receptor:

- 54 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

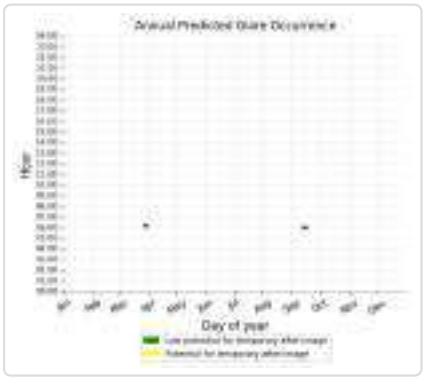

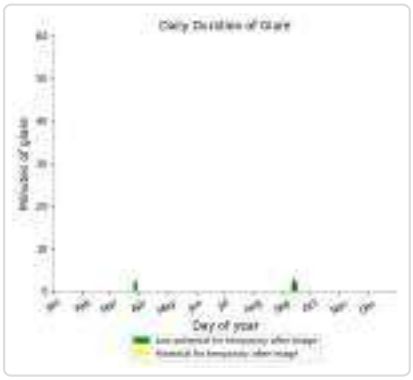

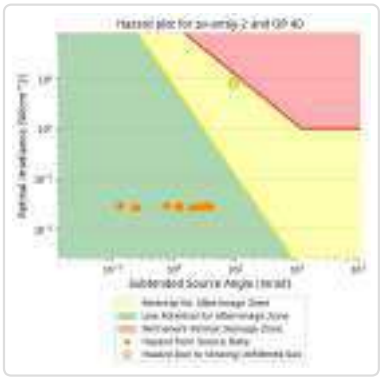

PV array 2: OP 40

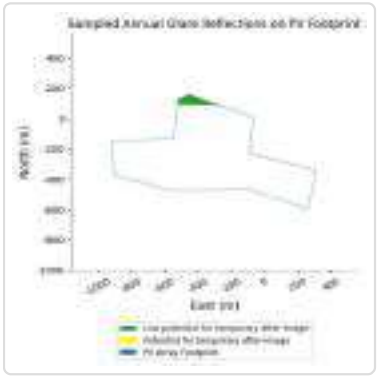

PV array is expected to produce the following glare for this receptor:

- 21 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 3: OP 1

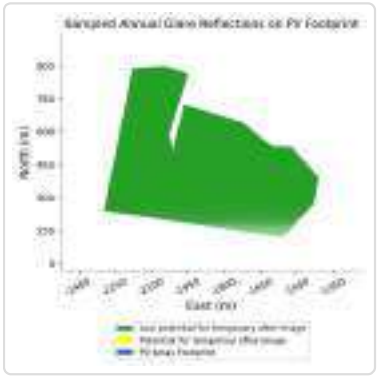

PV array is expected to produce the following glare for this receptor:

- 484 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

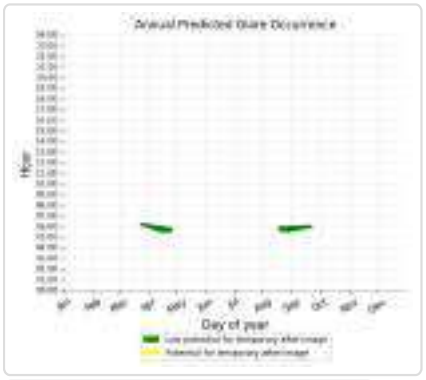

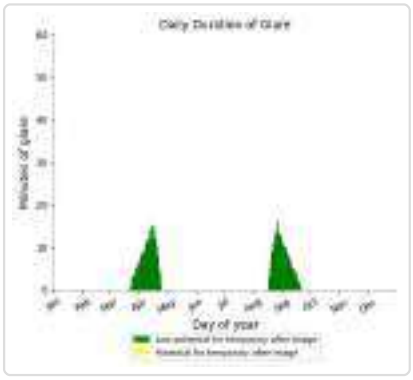

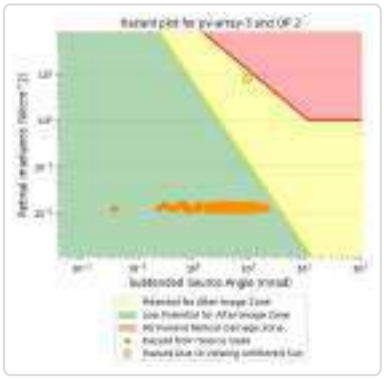

PV array 3: OP 2

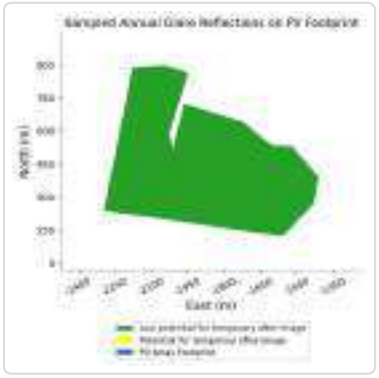

PV array is expected to produce the following glare for this receptor:

- 562 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

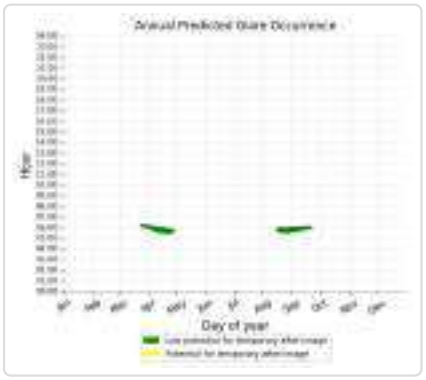

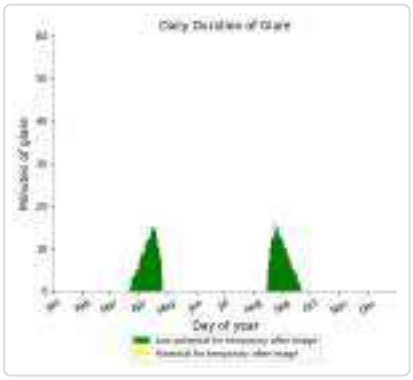

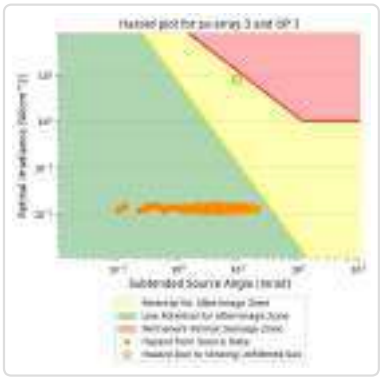

PV array 3: OP 3

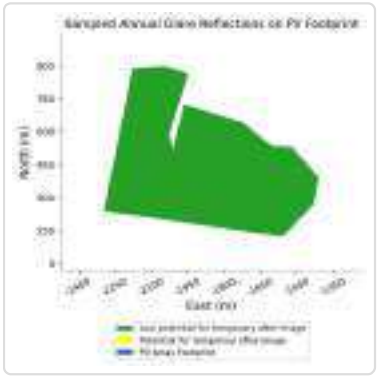

PV array is expected to produce the following glare for this receptor:

- 613 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

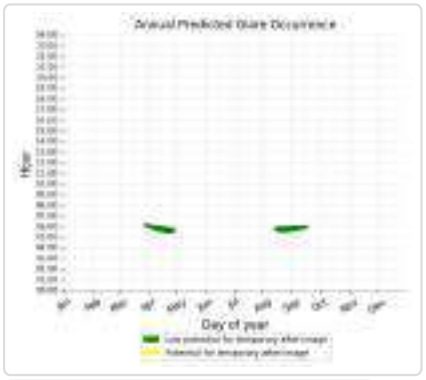

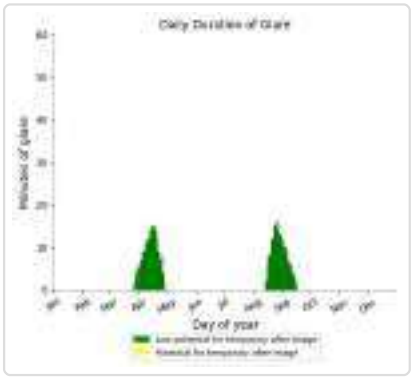

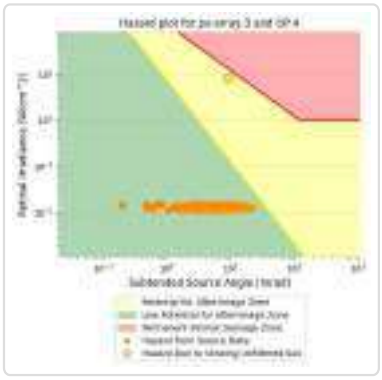

PV array 3: OP 4

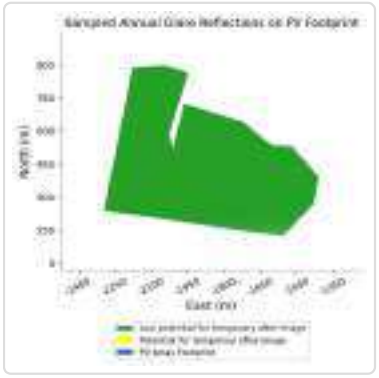

PV array is expected to produce the following glare for this receptor:

- 605 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

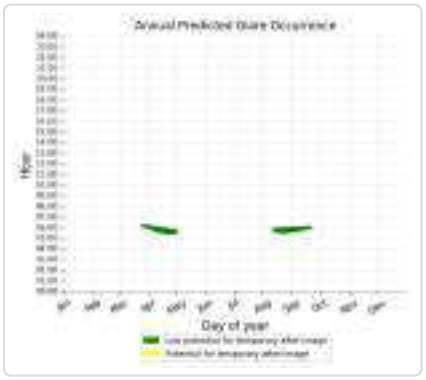

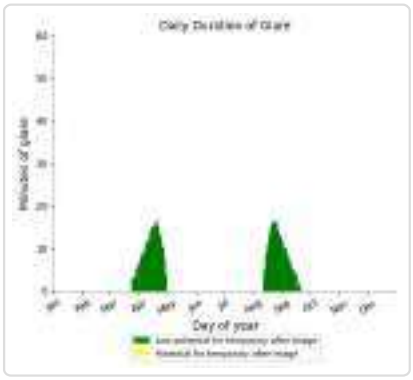

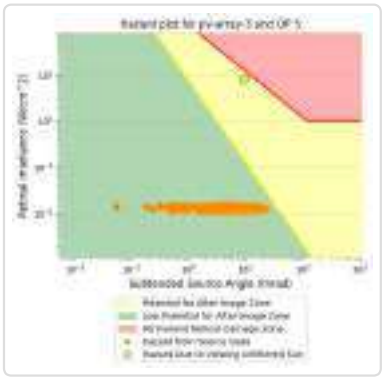

PV array 3: OP 5

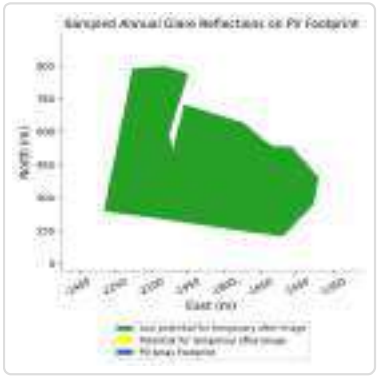

PV array is expected to produce the following glare for this receptor:

- 754 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

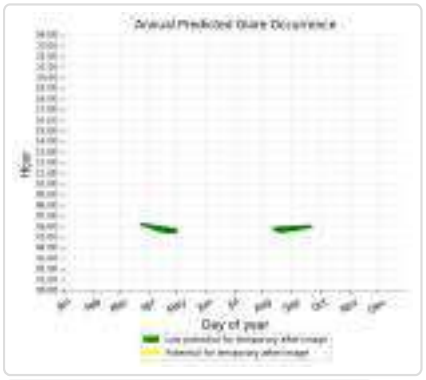

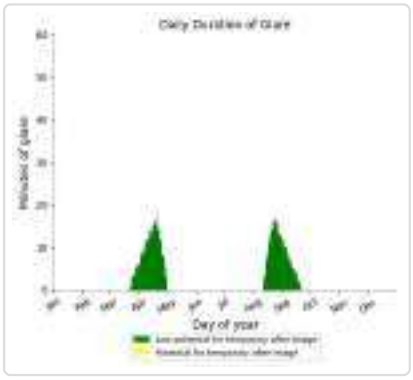

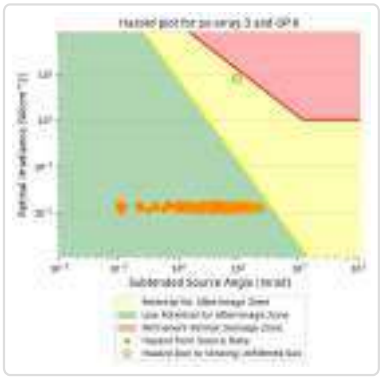

PV array 3: OP 6

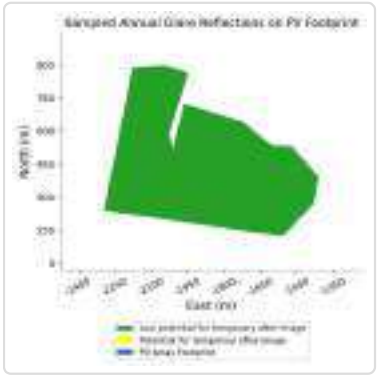

PV array is expected to produce the following glare for this receptor:

- 716 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

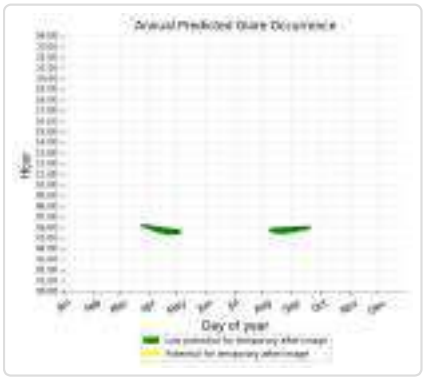

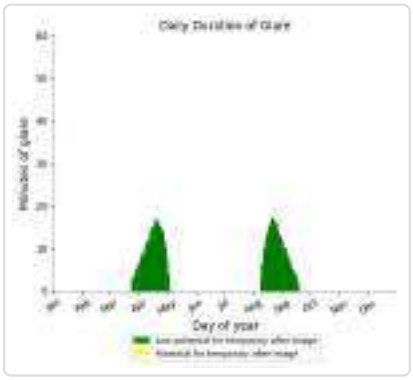

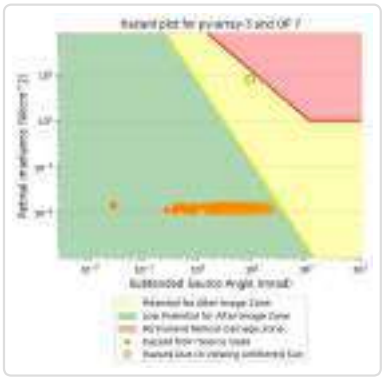

PV array 3: OP 7

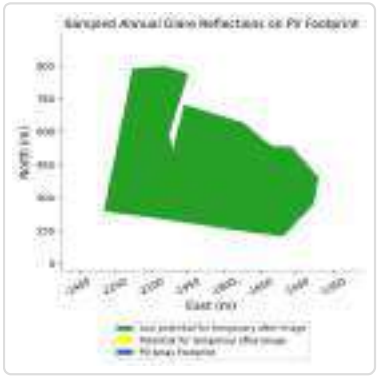

PV array is expected to produce the following glare for this receptor:

- 852 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

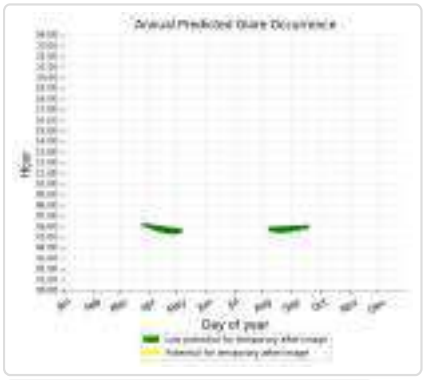

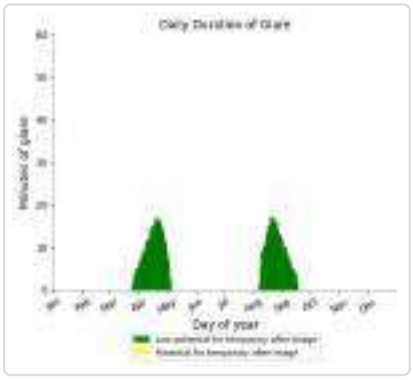

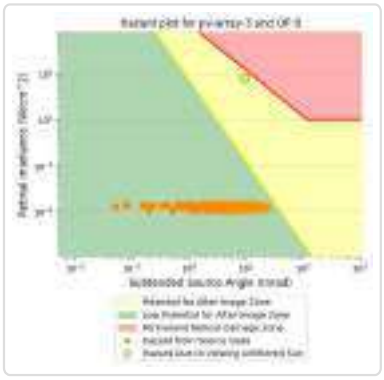

PV array 3: OP 8

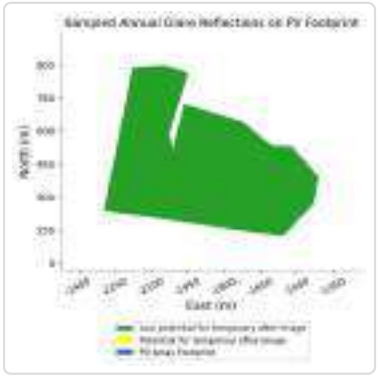

PV array is expected to produce the following glare for this receptor:

- 880 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

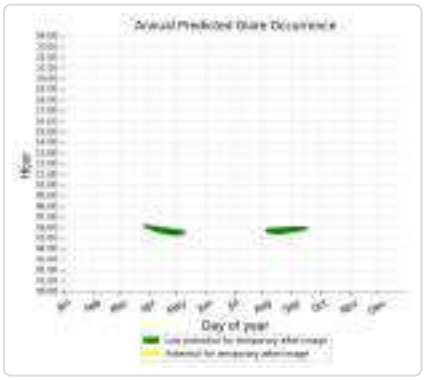

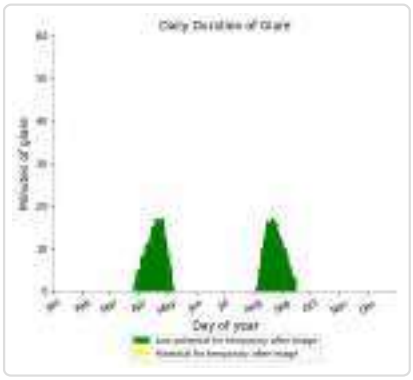

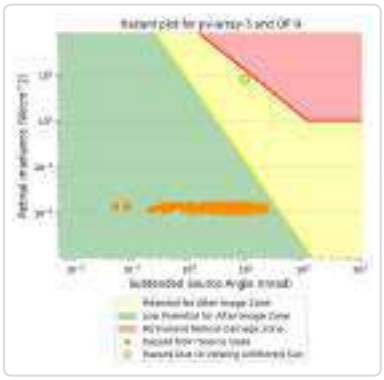

PV array 3: OP 9

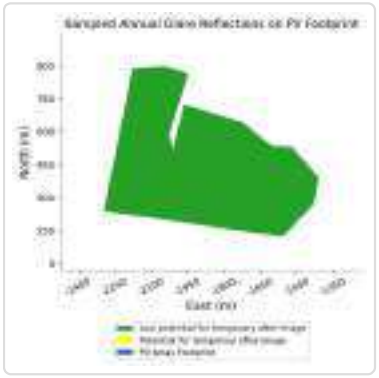

PV array is expected to produce the following glare for this receptor:

- 909 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

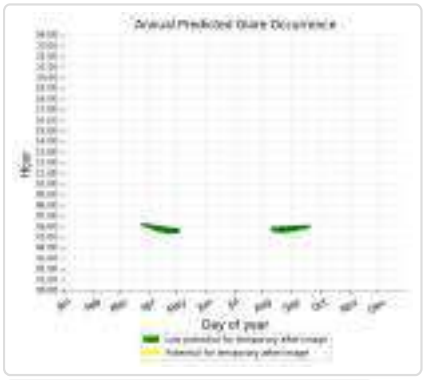

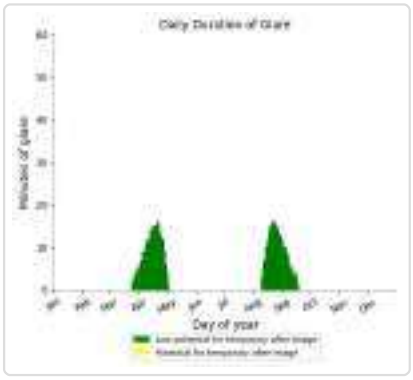

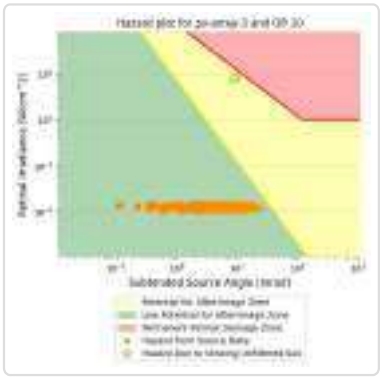

PV array 3: OP 10

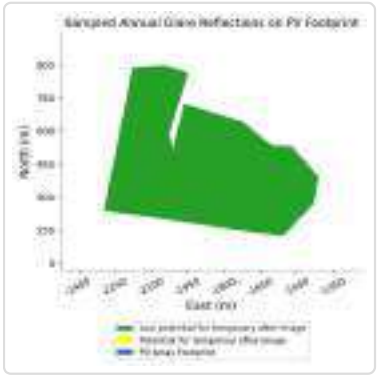

PV array is expected to produce the following glare for this receptor:

- 773 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

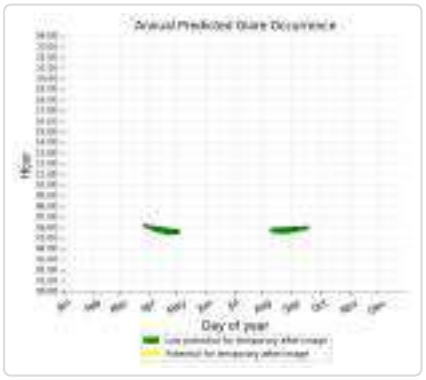

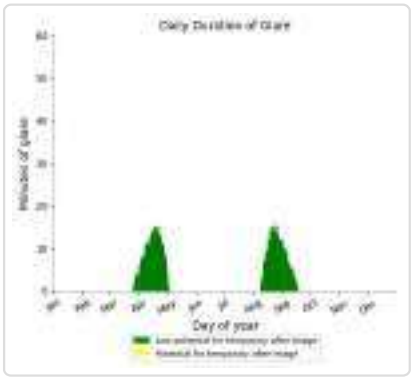

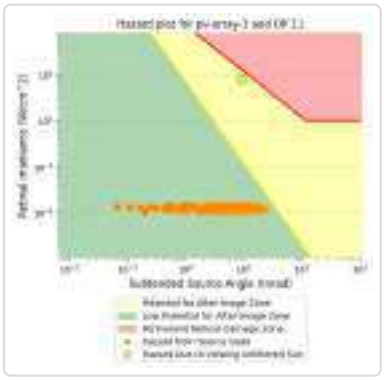

PV array 3: OP 11

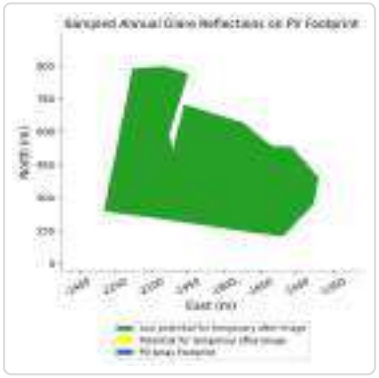

PV array is expected to produce the following glare for this receptor:

- 727 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

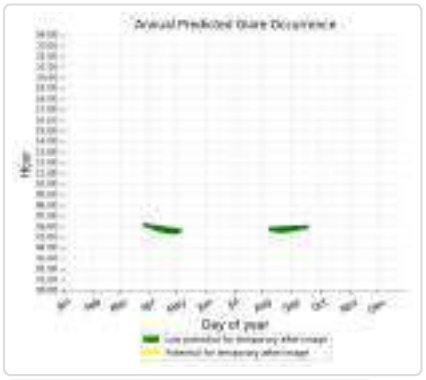

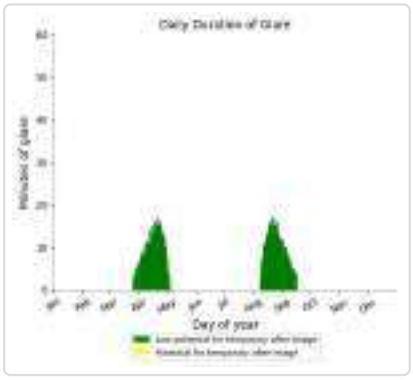

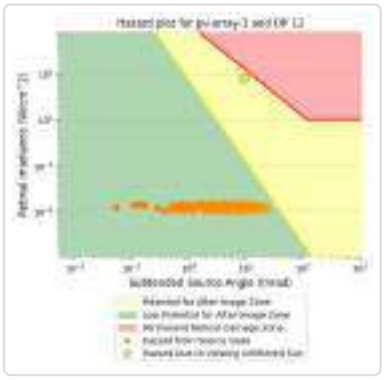

PV array 3: OP 12

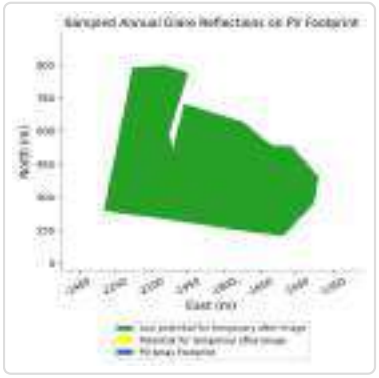

PV array is expected to produce the following glare for this receptor:

- 840 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

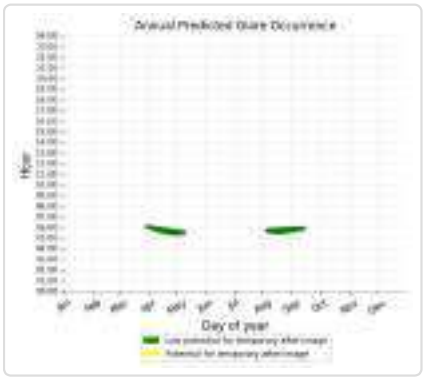

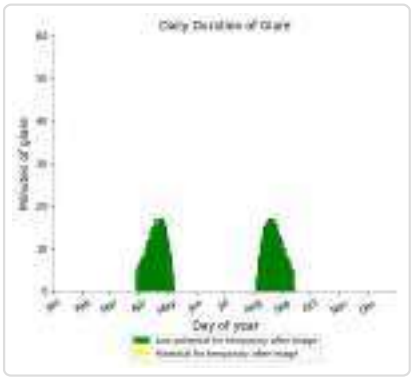

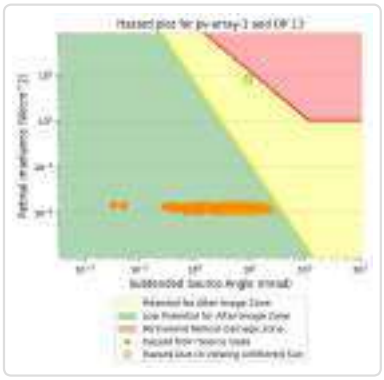

PV array 3: OP 13

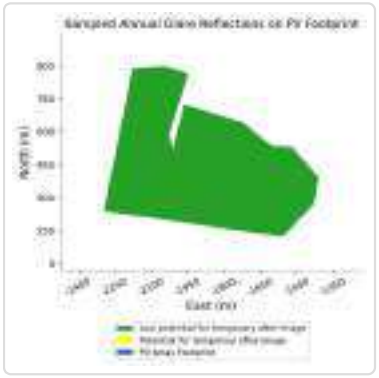

PV array is expected to produce the following glare for this receptor:

- 980 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

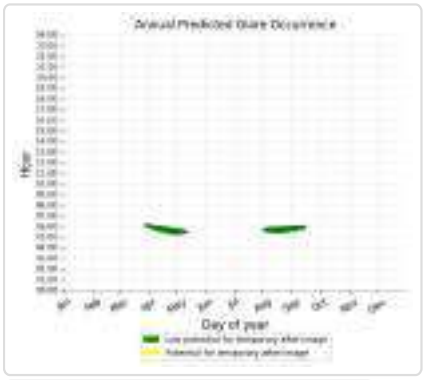

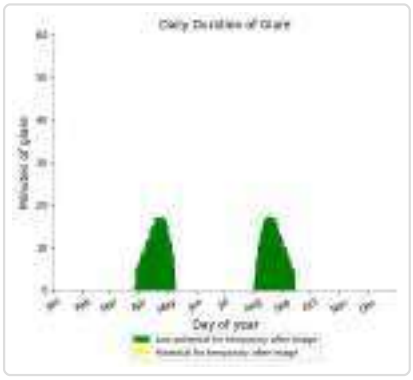

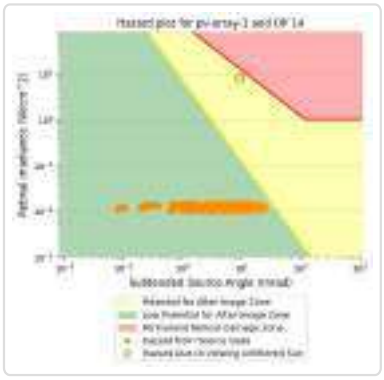

PV array 3: OP 14

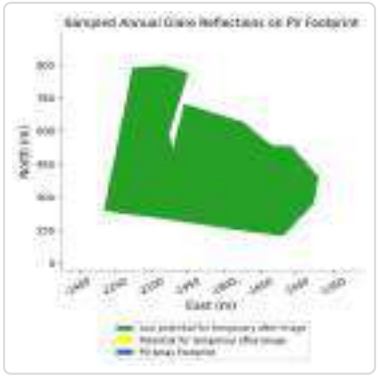

PV array is expected to produce the following glare for this receptor:

- 1,051 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

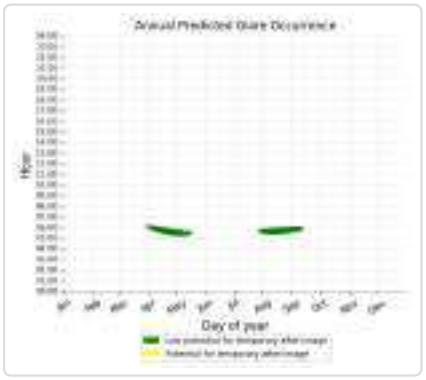

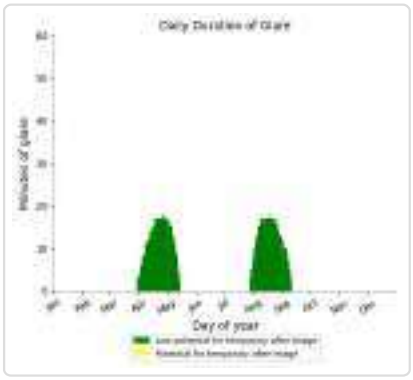

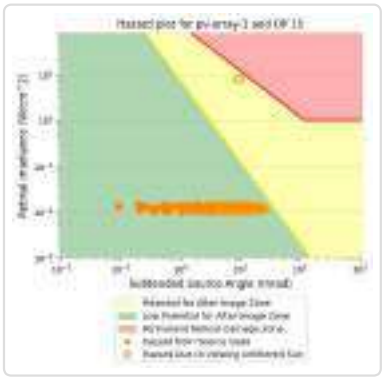

PV array 3: OP 15

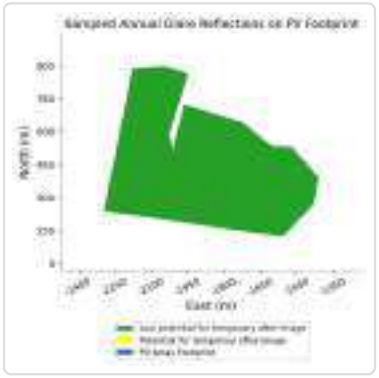

PV array is expected to produce the following glare for this receptor:

- 1,145 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

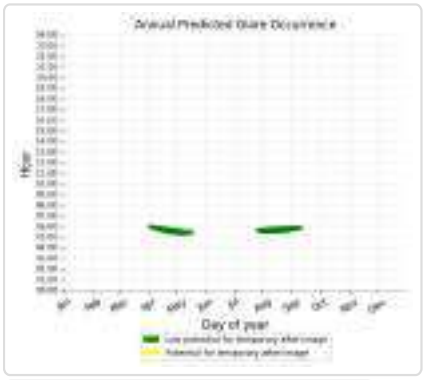

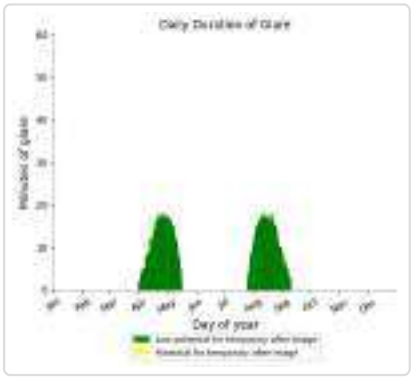

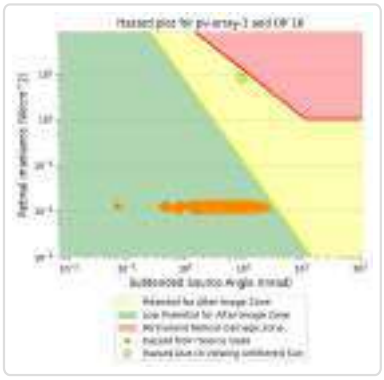

PV array 3: OP 16

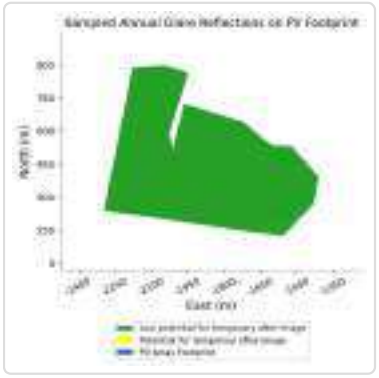

PV array is expected to produce the following glare for this receptor:

- 1,133 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

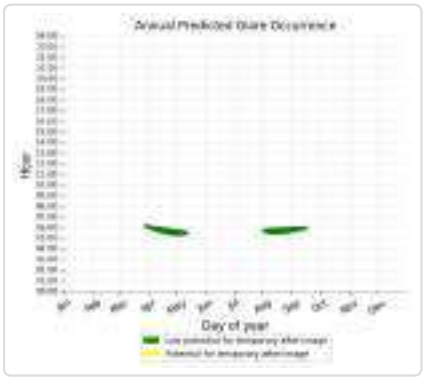

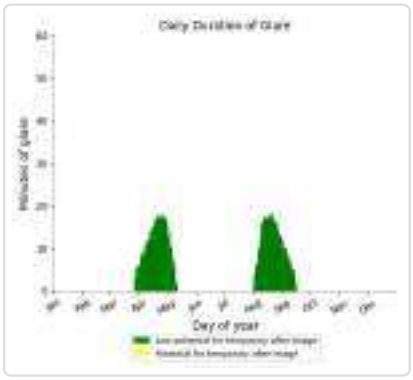

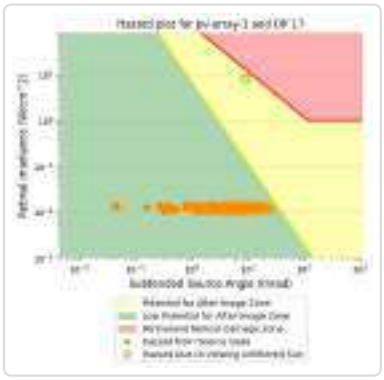

PV array 3: OP 17

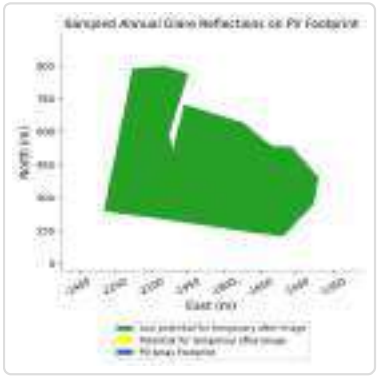

PV array is expected to produce the following glare for this receptor:

- 1,075 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

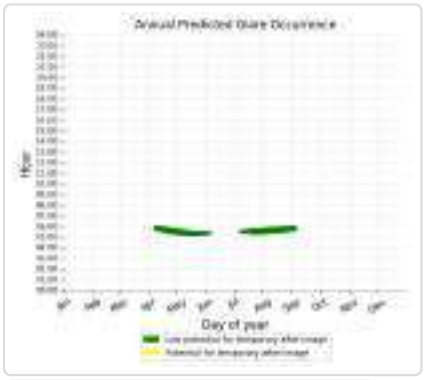

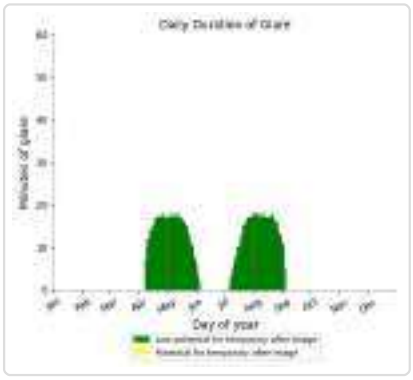

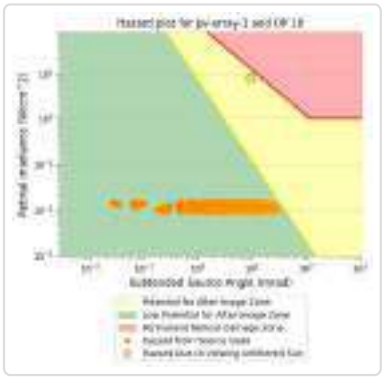

PV array 3: OP 18

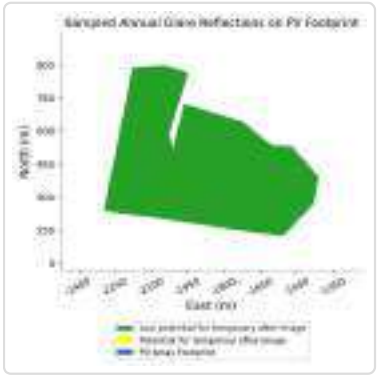

PV array is expected to produce the following glare for this receptor:

- 1,686 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

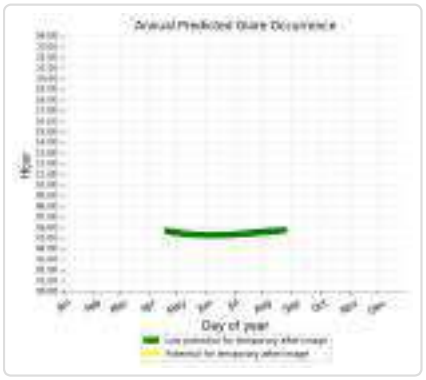

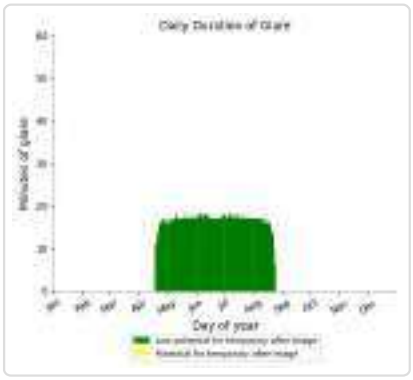

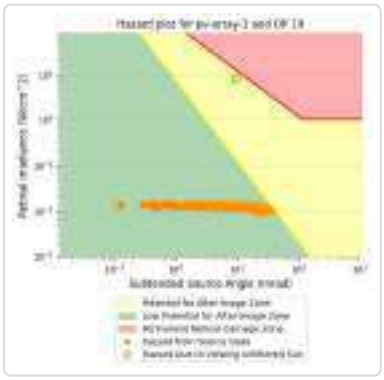

PV array 3: OP 19

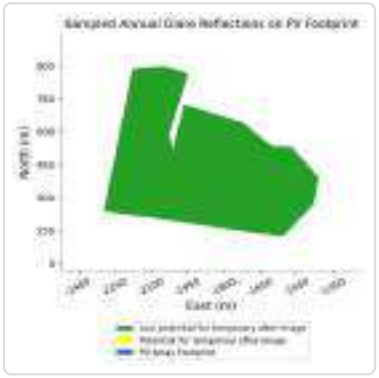

PV array is expected to produce the following glare for this receptor:

- 2,143 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

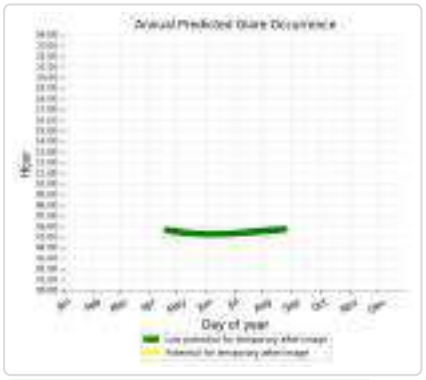

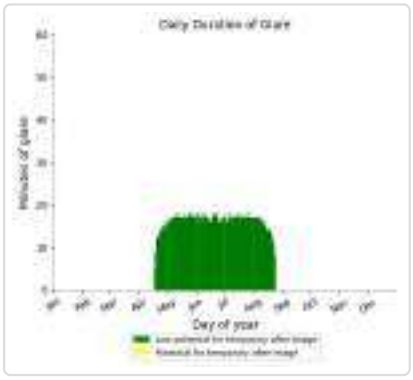

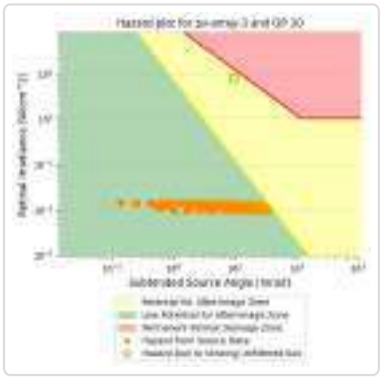

PV array 3: OP 20

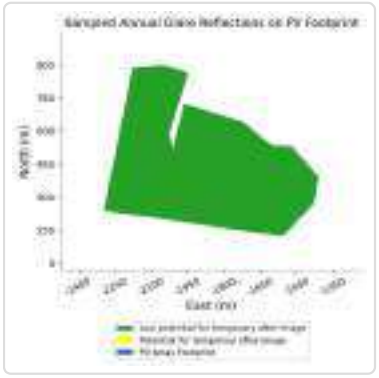

PV array is expected to produce the following glare for this receptor:

- 2,105 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

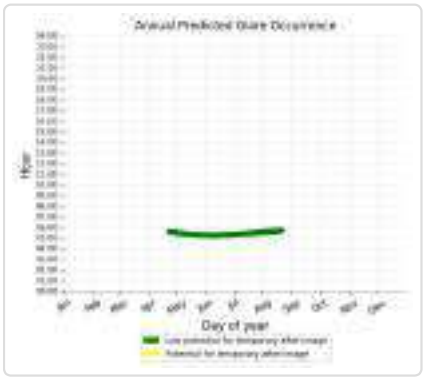

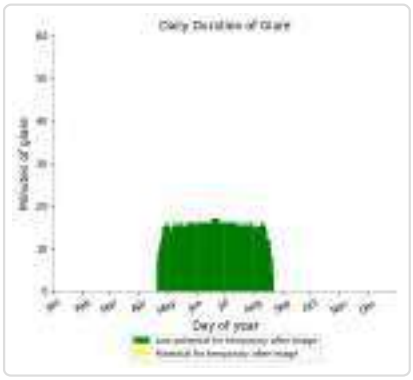

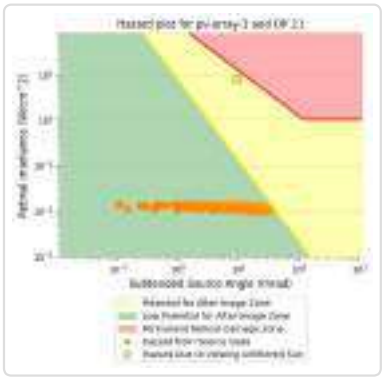

PV array 3: OP 21

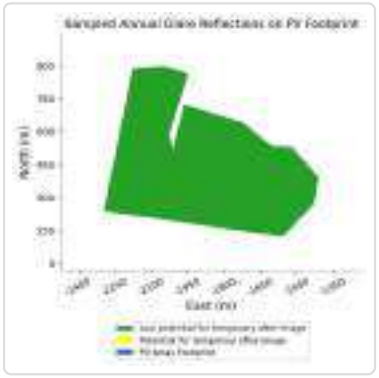

PV array is expected to produce the following glare for this receptor:

- 1,881 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

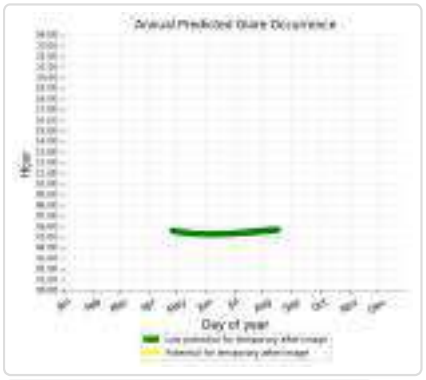

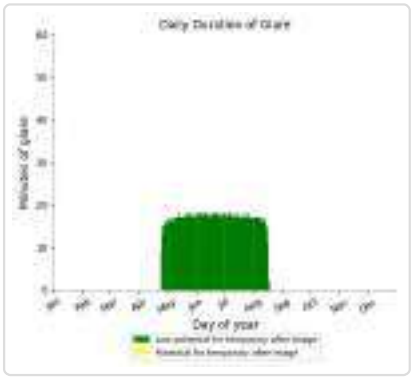

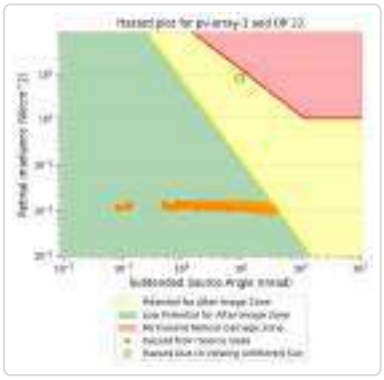

PV array 3: OP 22

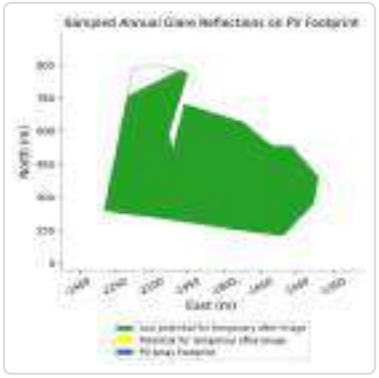

PV array is expected to produce the following glare for this receptor:

- 1,969 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

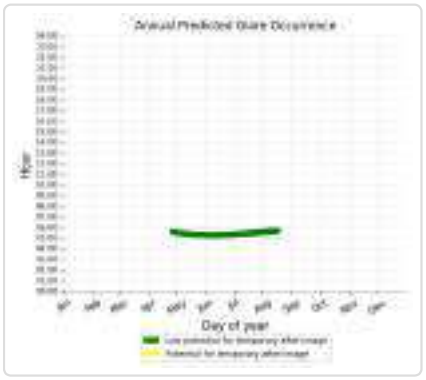

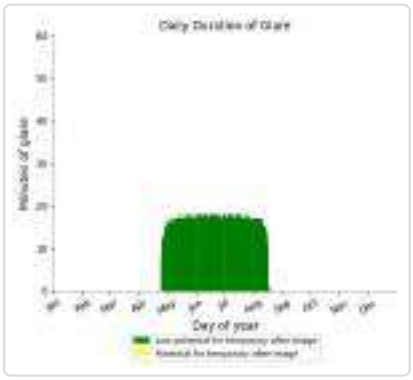

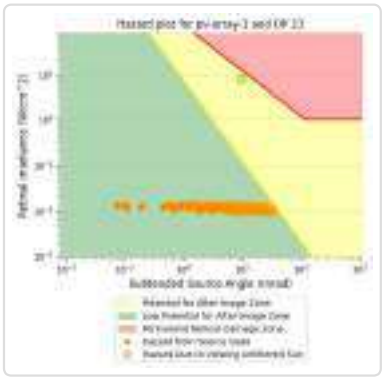

PV array 3: OP 23

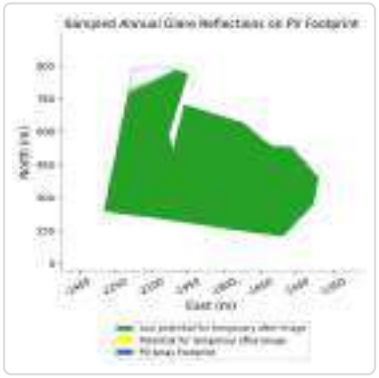

PV array is expected to produce the following glare for this receptor:

- 1,964 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

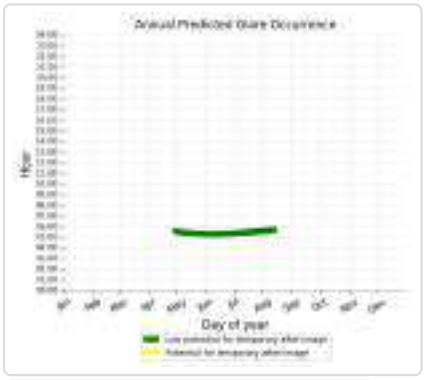

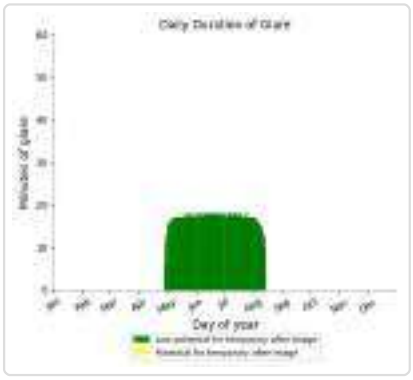

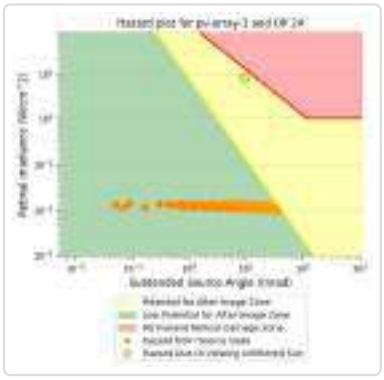

PV array 3: OP 24

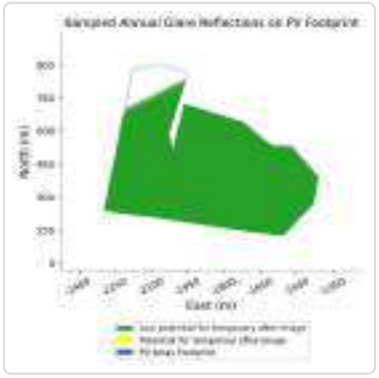

PV array is expected to produce the following glare for this receptor:

- 1,849 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

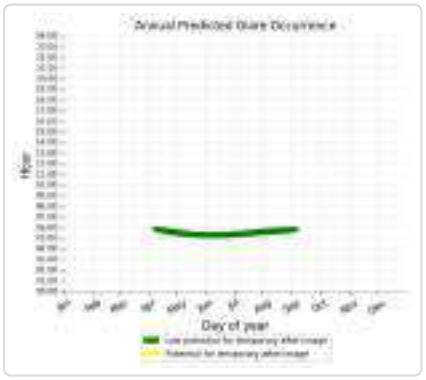

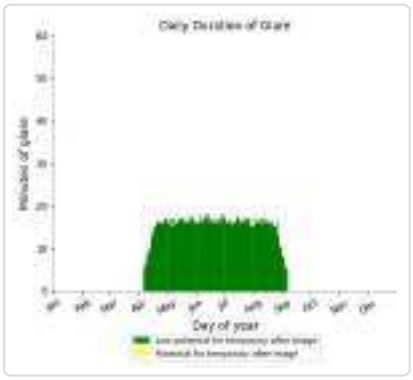

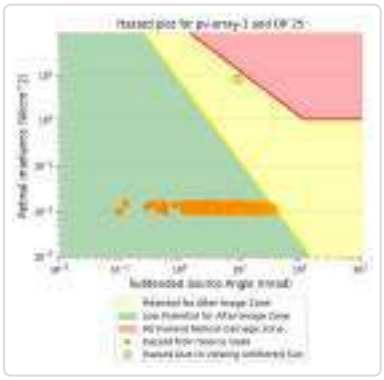

PV array 3: OP 25

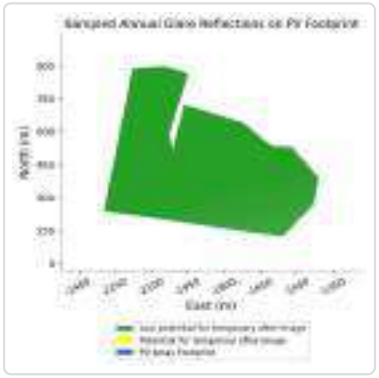

PV array is expected to produce the following glare for this receptor:

- 2,354 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

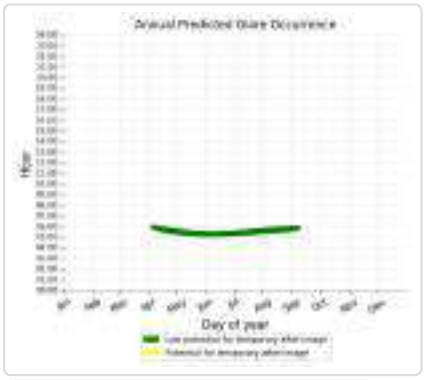

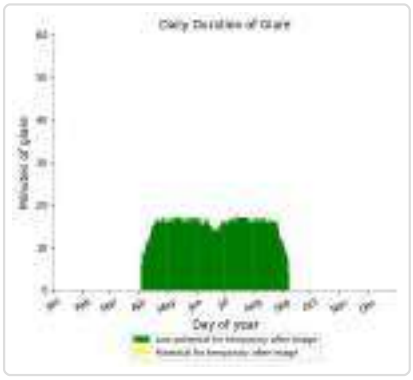

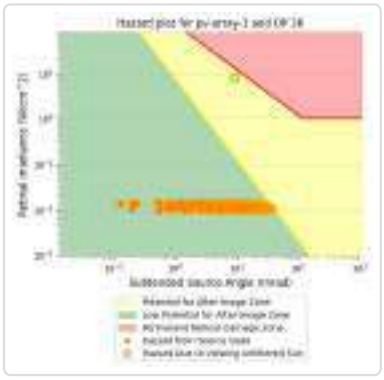

PV array 3: OP 26

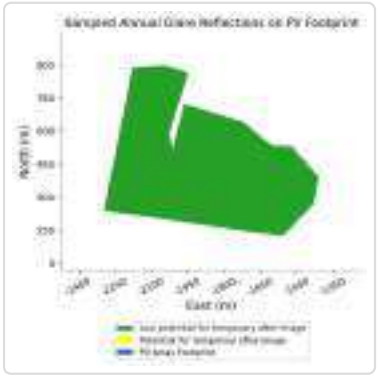

PV array is expected to produce the following glare for this receptor:

- 2,417 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

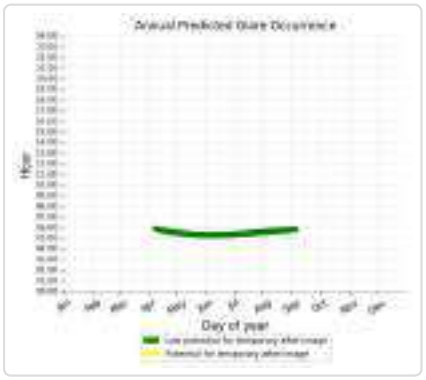

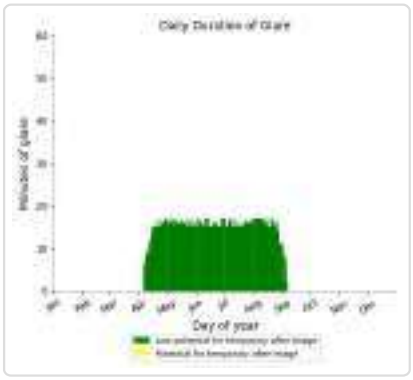

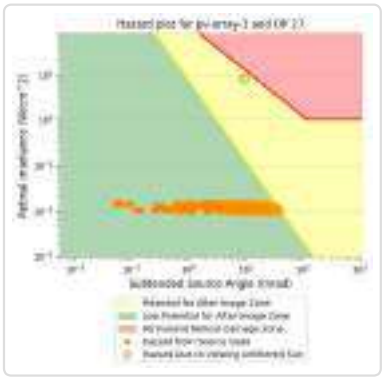

PV array 3: OP 27

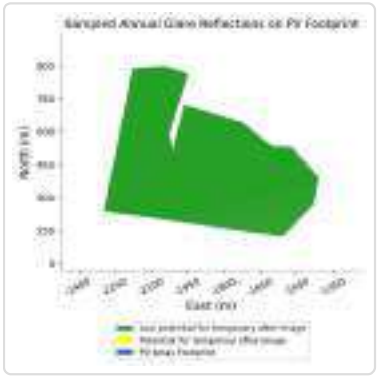

PV array is expected to produce the following glare for this receptor:

- 2,340 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

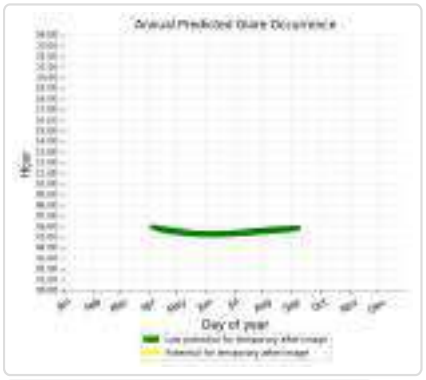

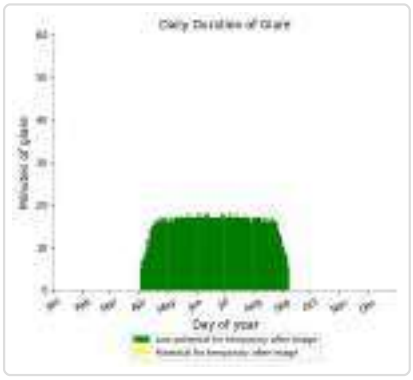

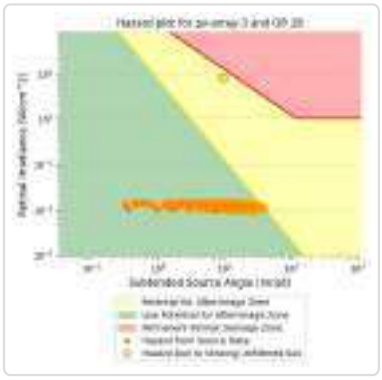

PV array 3: OP 28

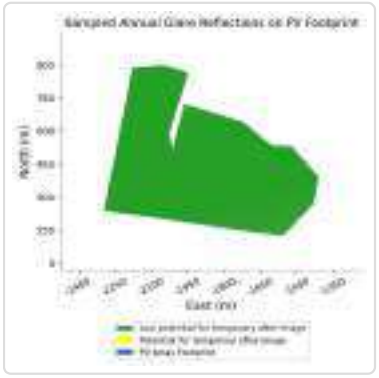

PV array is expected to produce the following glare for this receptor:

- 2,518 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

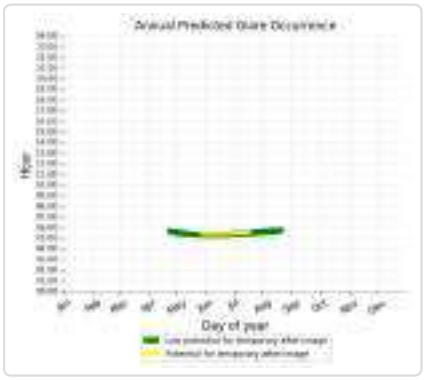

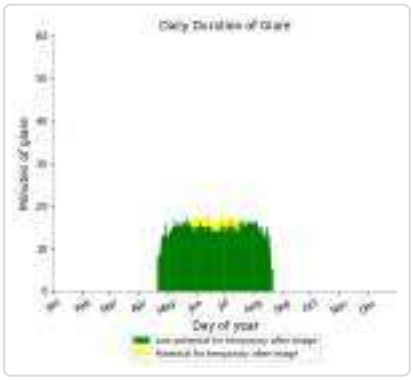

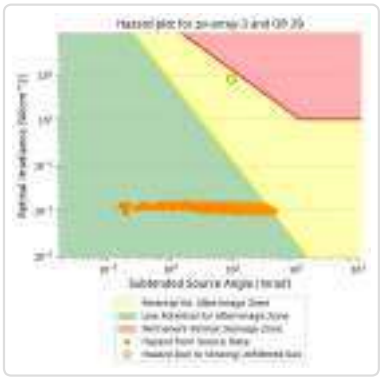

PV array 3: OP 29

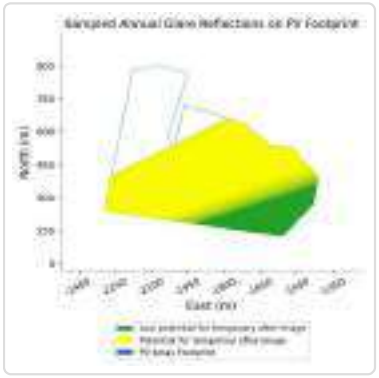

PV array is expected to produce the following glare for this receptor:

- 1,768 minutes of "green" glare with low potential to cause temporary after-image.
- 110 minutes of "yellow" glare with potential to cause temporary after-image.

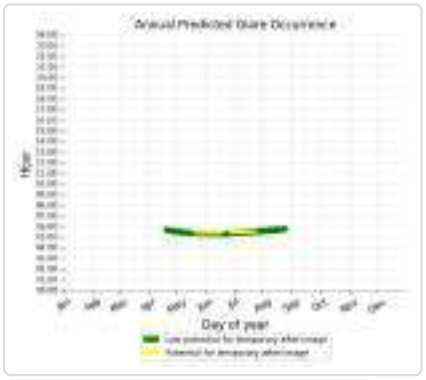

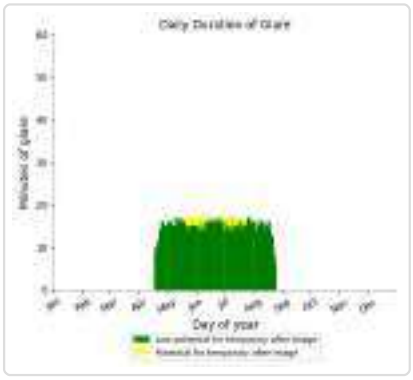

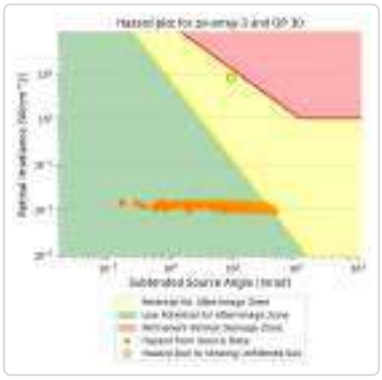

PV array 3: OP 30

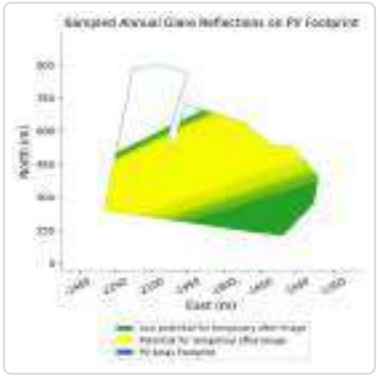

PV array is expected to produce the following glare for this receptor:

- 1,968 minutes of "green" glare with low potential to cause temporary after-image.
- 104 minutes of "yellow" glare with potential to cause temporary after-image.

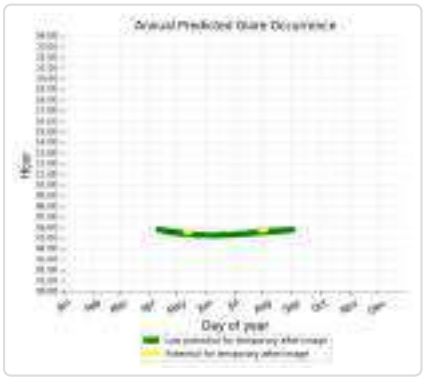

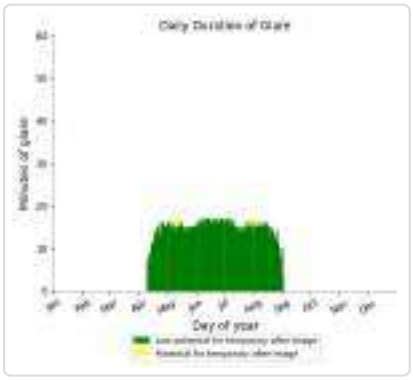

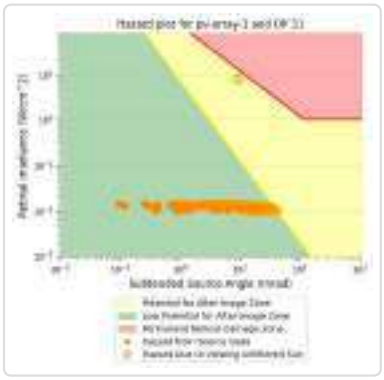

PV array 3: OP 31

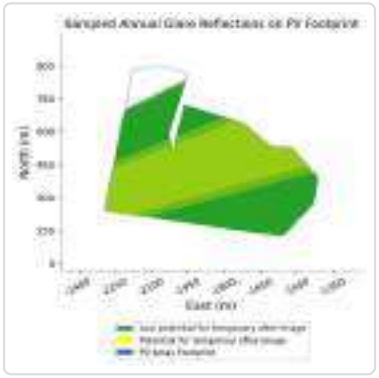

PV array is expected to produce the following glare for this receptor:

- 2,168 minutes of "green" glare with low potential to cause temporary after-image.
- 20 minutes of "yellow" glare with potential to cause temporary after-image.

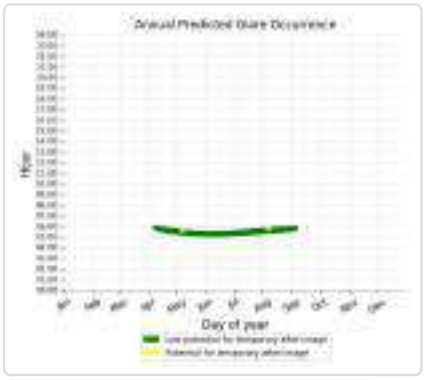

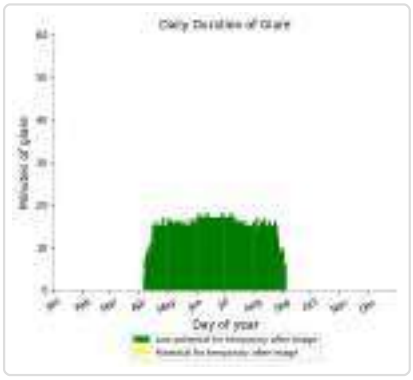

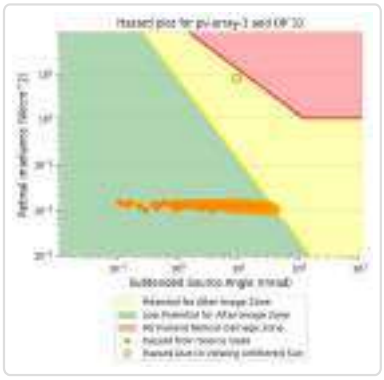

PV array 3: OP 32

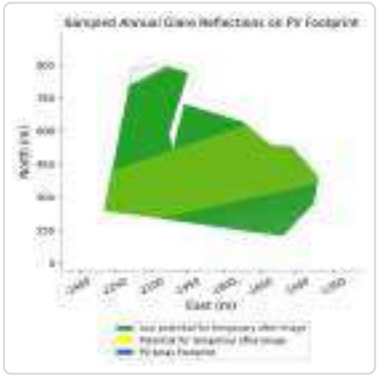

PV array is expected to produce the following glare for this receptor:

- 2,351 minutes of "green" glare with low potential to cause temporary after-image.
- 6 minutes of "yellow" glare with potential to cause temporary after-image.

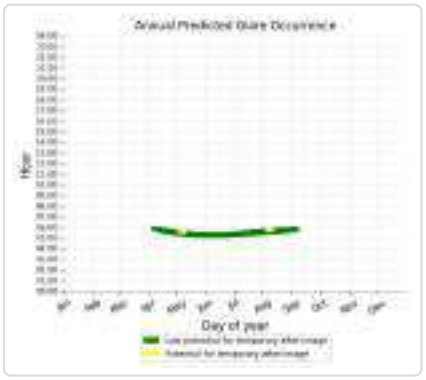

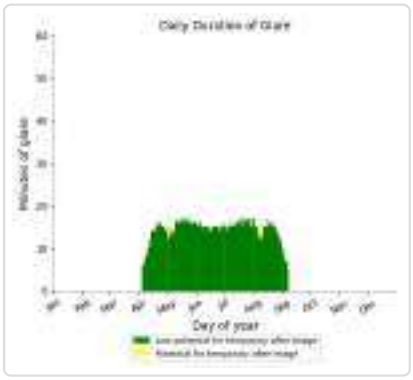

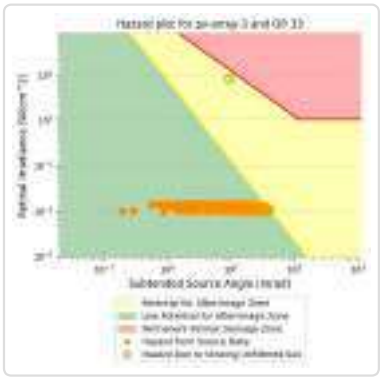

PV array 3: OP 33

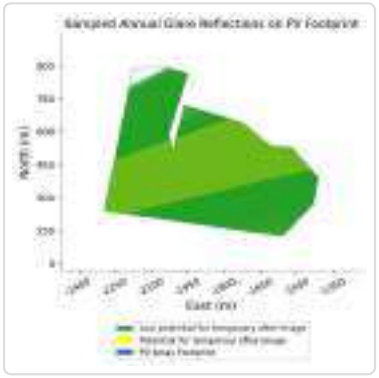

PV array is expected to produce the following glare for this receptor:

- 2,240 minutes of "green" glare with low potential to cause temporary after-image.
- 19 minutes of "yellow" glare with potential to cause temporary after-image.

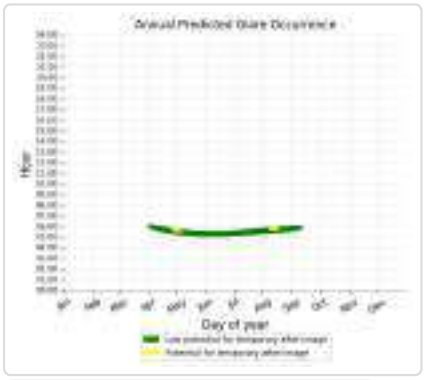

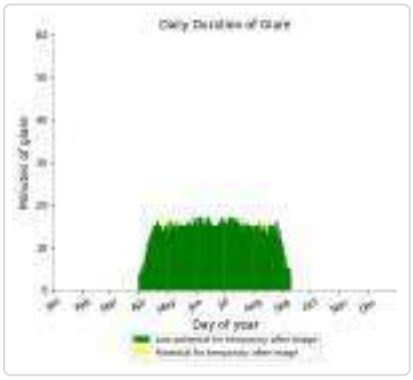

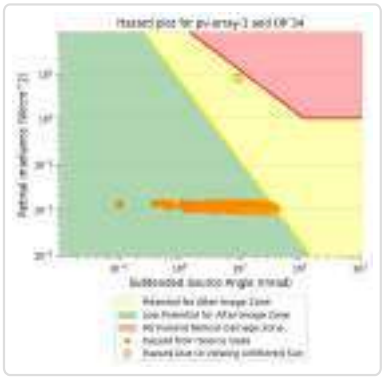

PV array 3: OP 34

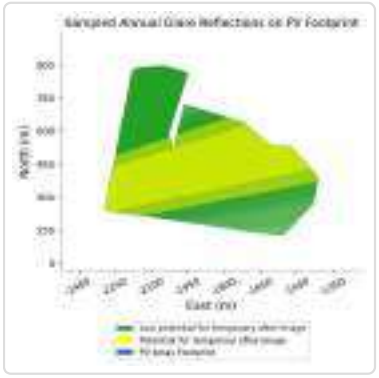

PV array is expected to produce the following glare for this receptor:

- 2,325 minutes of "green" glare with low potential to cause temporary after-image.
- 18 minutes of "yellow" glare with potential to cause temporary after-image.

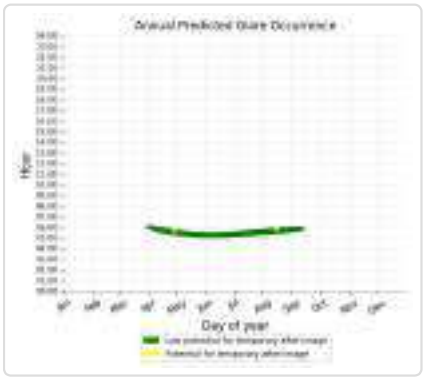

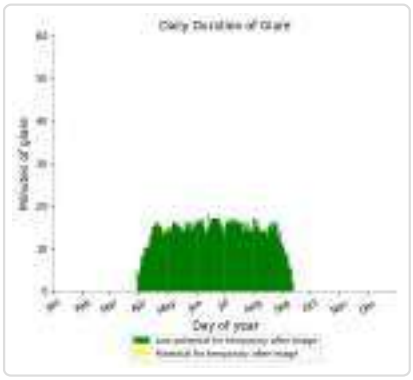

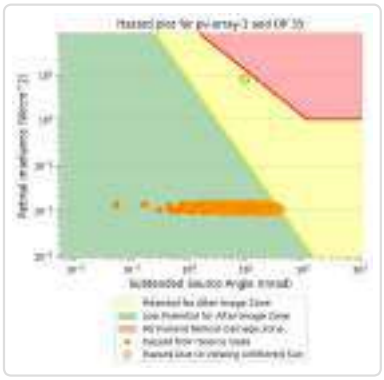

PV array 3: OP 35

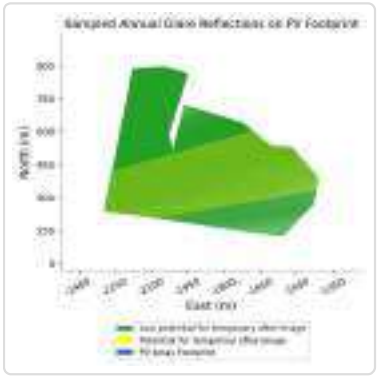

PV array is expected to produce the following glare for this receptor:

- 2,353 minutes of "green" glare with low potential to cause temporary after-image.
- 6 minutes of "yellow" glare with potential to cause temporary after-image.

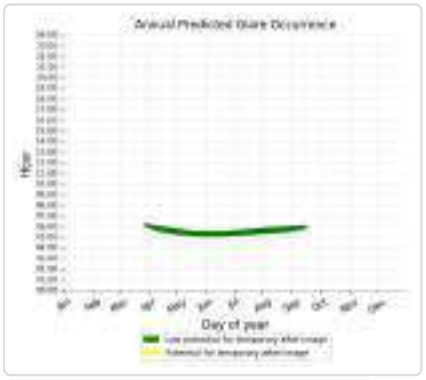

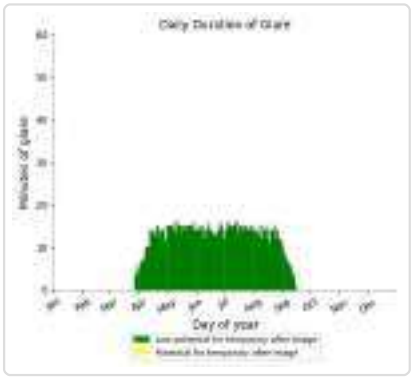

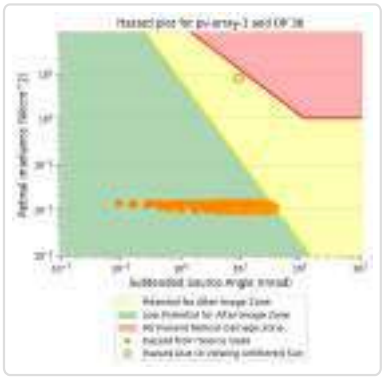

PV array 3: OP 36

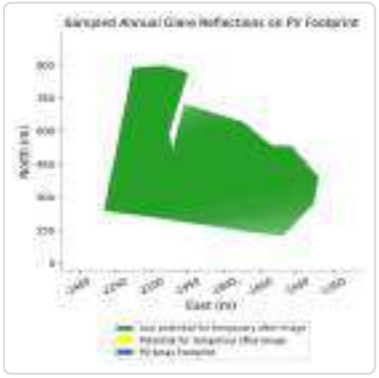

PV array is expected to produce the following glare for this receptor:

- 2,203 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

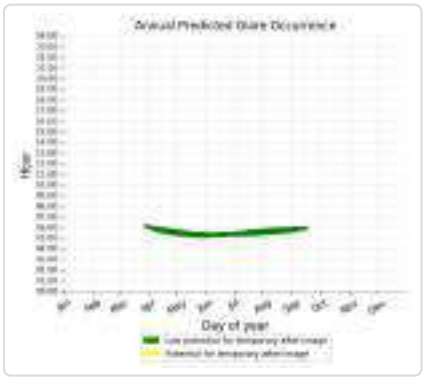

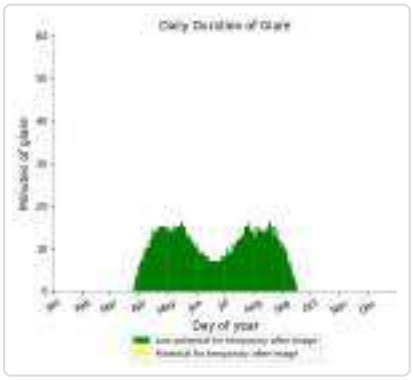

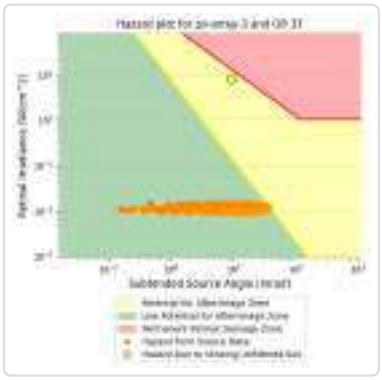

PV array 3: OP 37

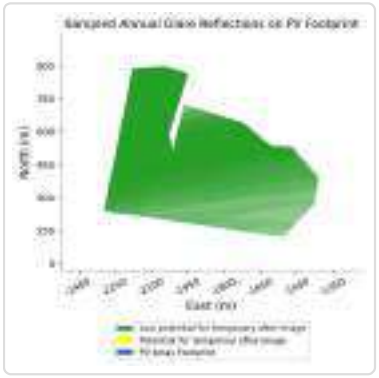

PV array is expected to produce the following glare for this receptor:

- 1,947 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

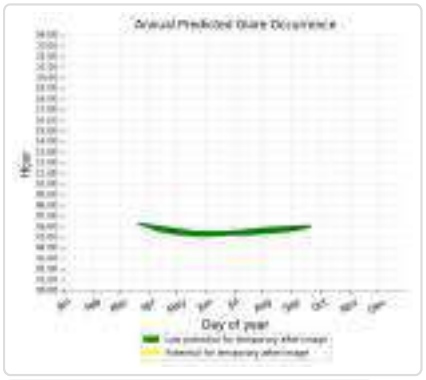

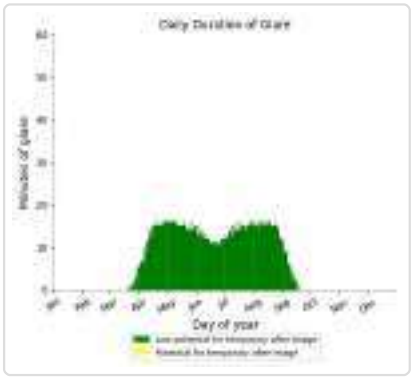

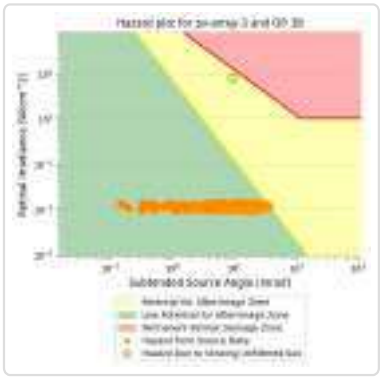

PV array 3: OP 38

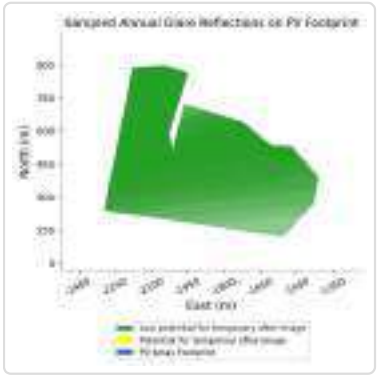

PV array is expected to produce the following glare for this receptor:

- 2,240 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

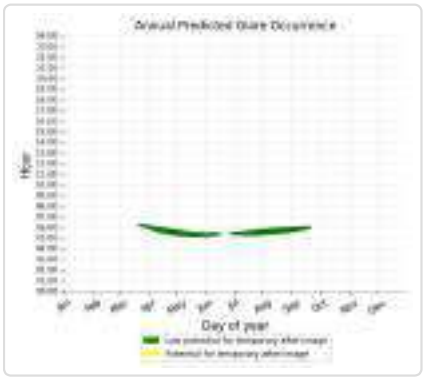

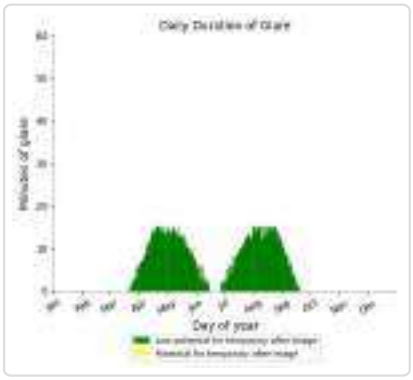

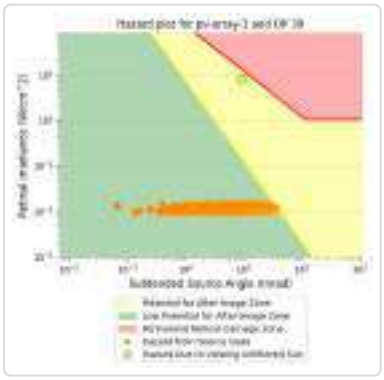

PV array 3: OP 39

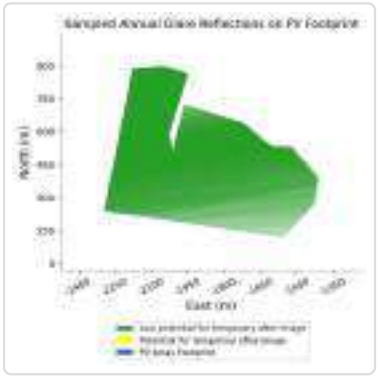

PV array is expected to produce the following glare for this receptor:

- 1,640 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

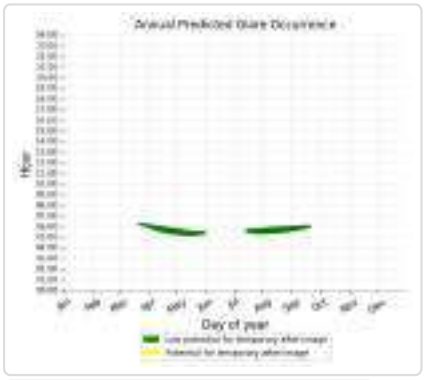

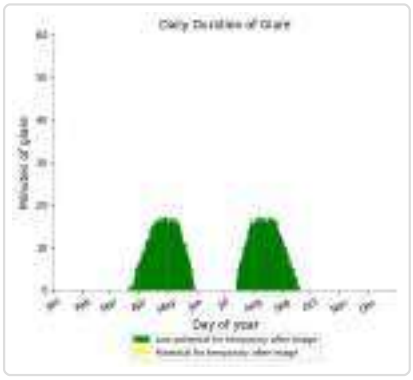

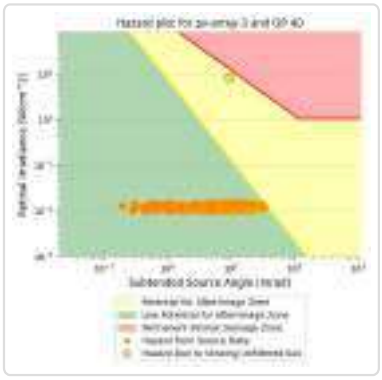

PV array 3: OP 40

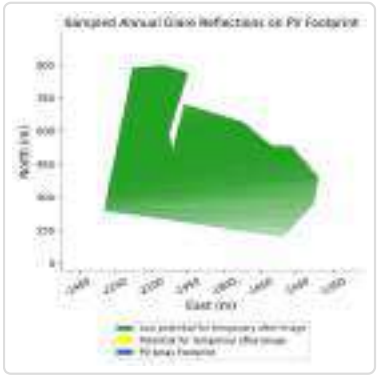

PV array is expected to produce the following glare for this receptor:

- 1,582 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

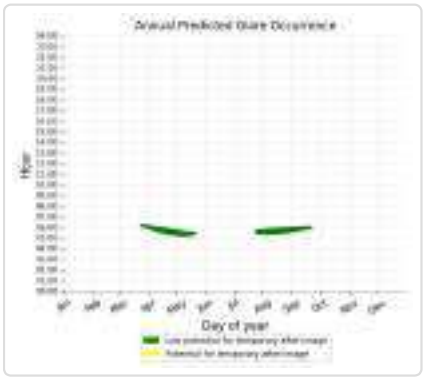

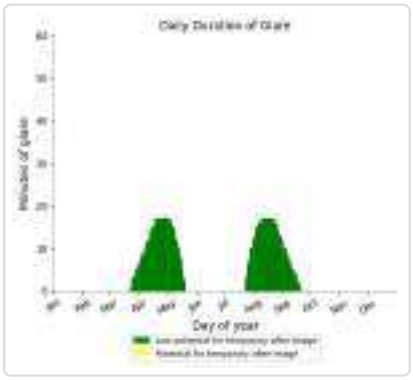

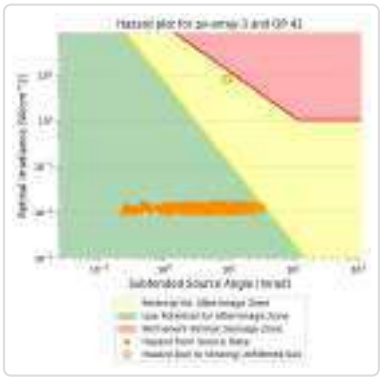

PV array 3: OP 41

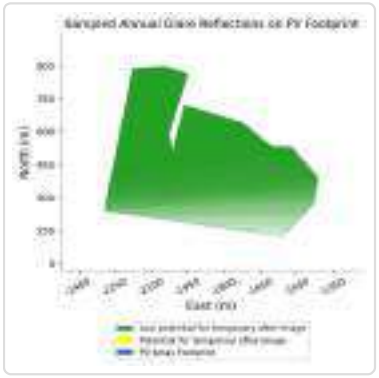

PV array is expected to produce the following glare for this receptor:

- 1,350 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

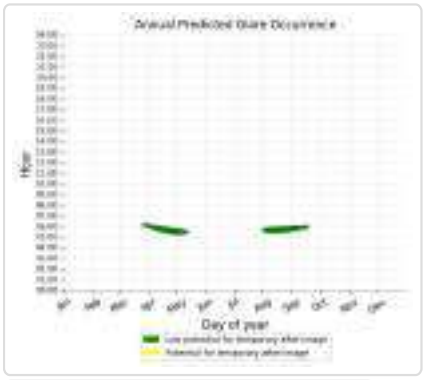

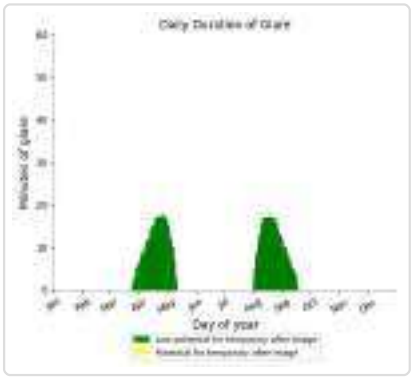

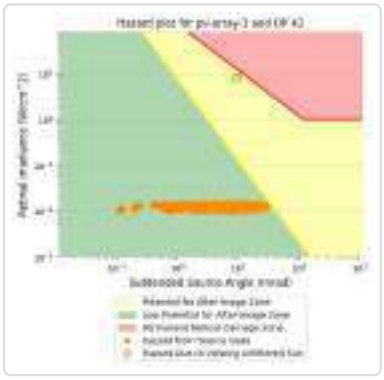

PV array 3: OP 42

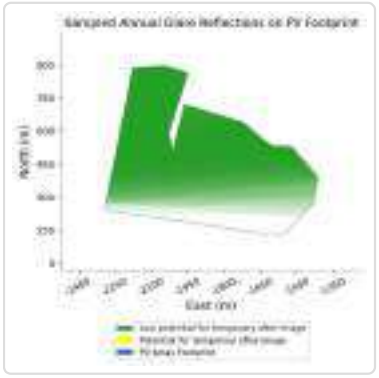

PV array is expected to produce the following glare for this receptor:

- 1,113 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

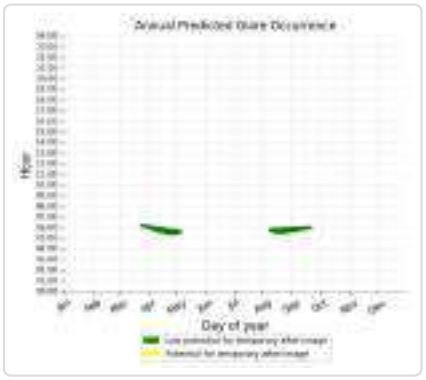

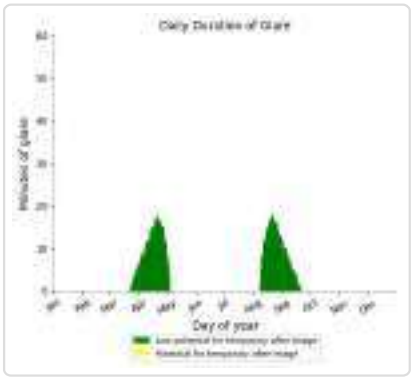

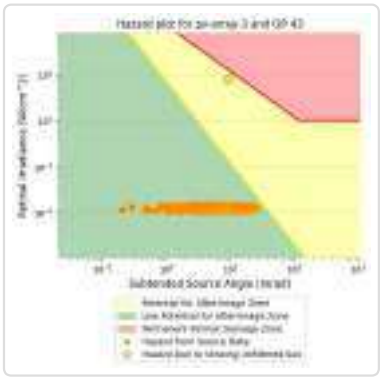

PV array 3: OP 43

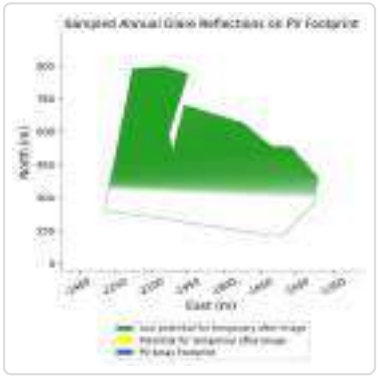

PV array is expected to produce the following glare for this receptor:

- 892 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

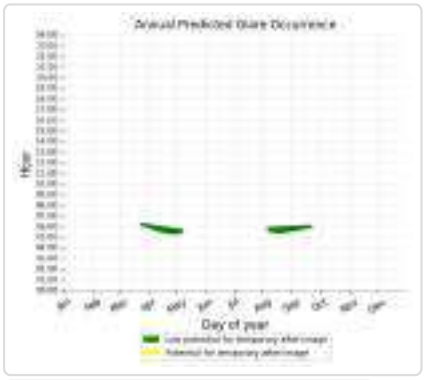

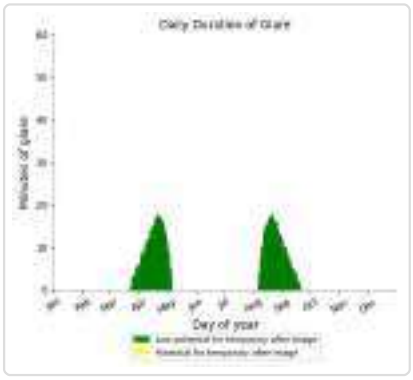

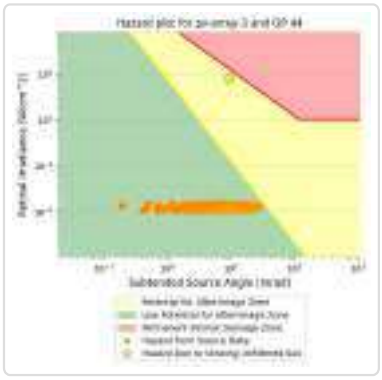

PV array 3: OP 44

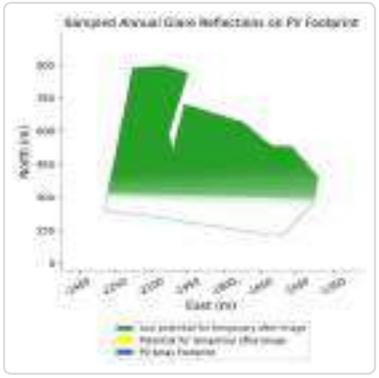

PV array is expected to produce the following glare for this receptor:

- 952 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

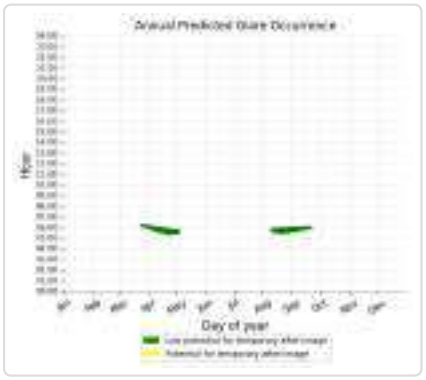

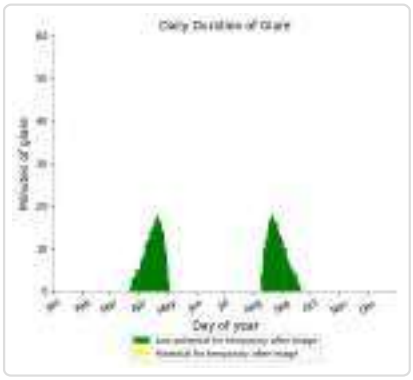

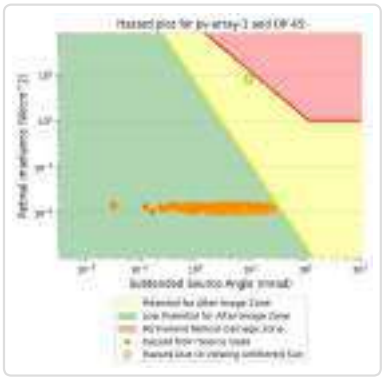

PV array 3: OP 45

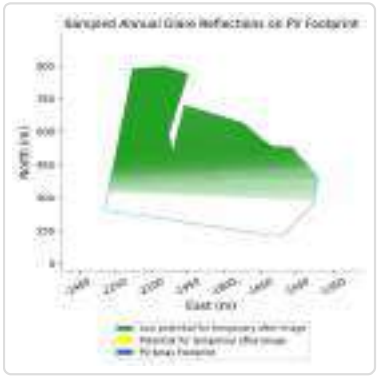

PV array is expected to produce the following glare for this receptor:

- 832 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

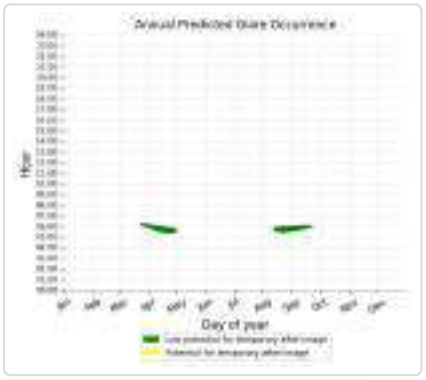

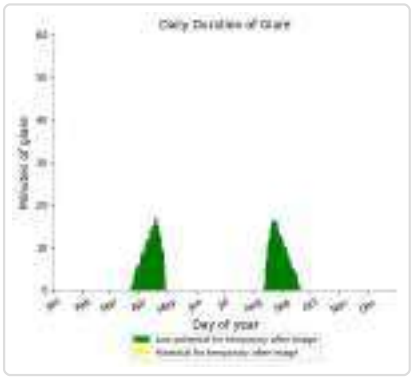

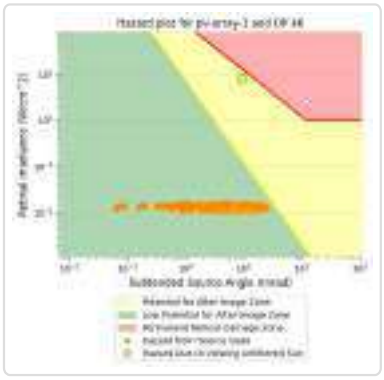

PV array 3: OP 46

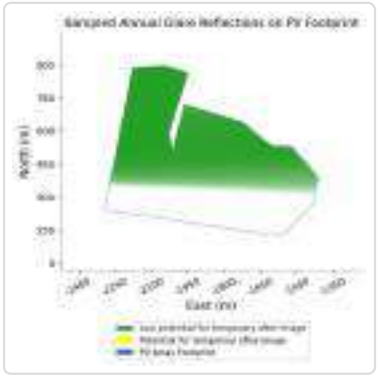

PV array is expected to produce the following glare for this receptor:

- 722 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

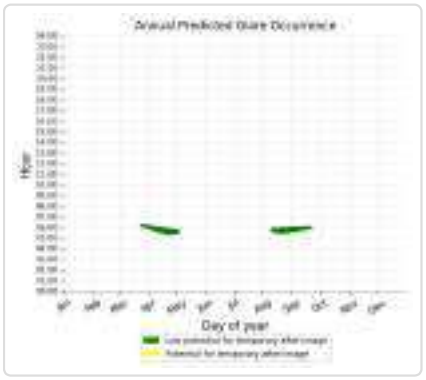

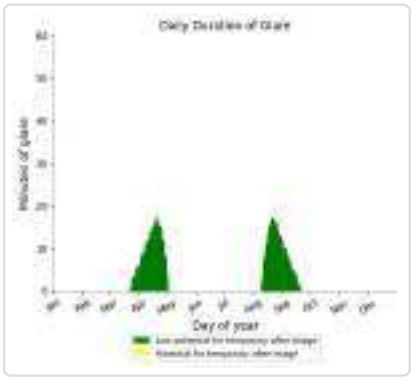

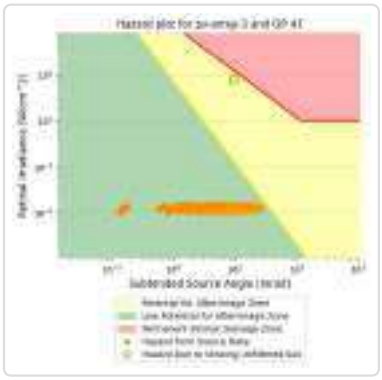

PV array 3: OP 47

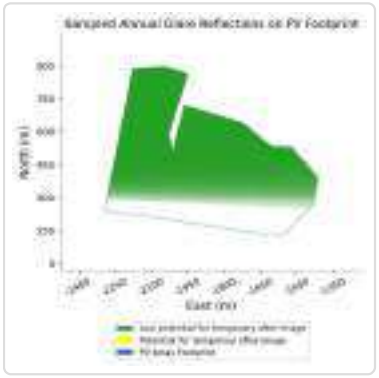

PV array is expected to produce the following glare for this receptor:

- 815 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

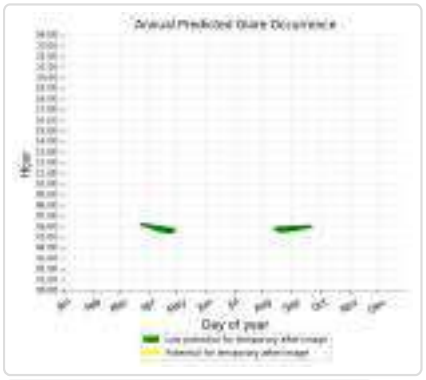

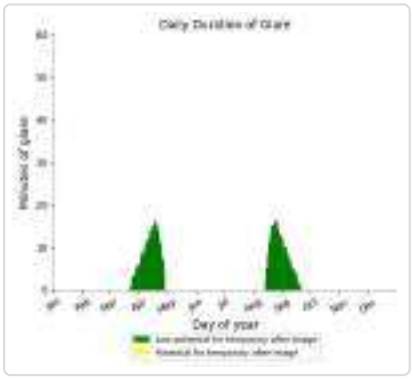

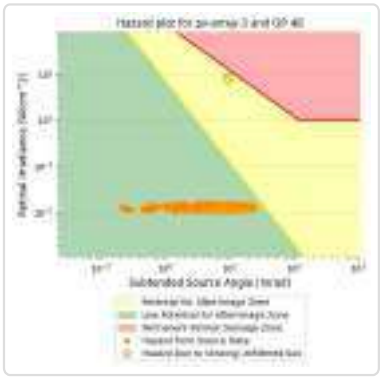

PV array 3: OP 48

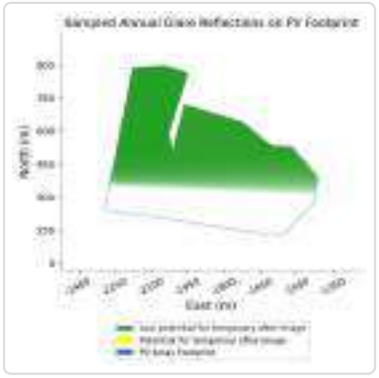

PV array is expected to produce the following glare for this receptor:

- 695 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

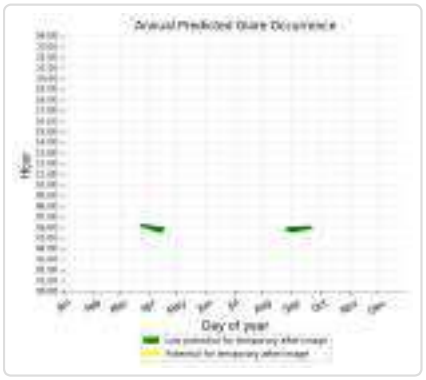

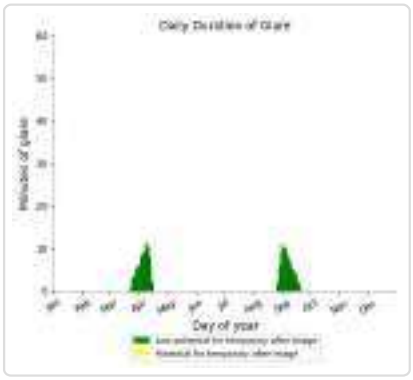

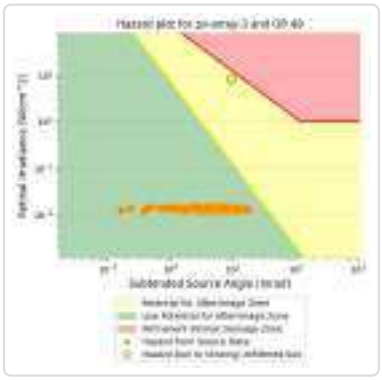

PV array 3: OP 49

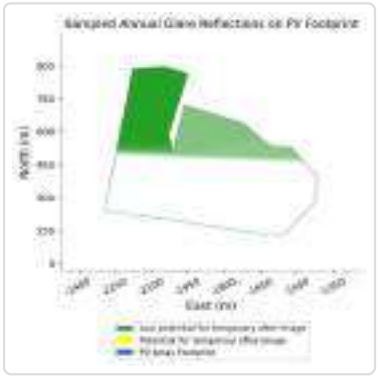

PV array is expected to produce the following glare for this receptor:

- 316 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

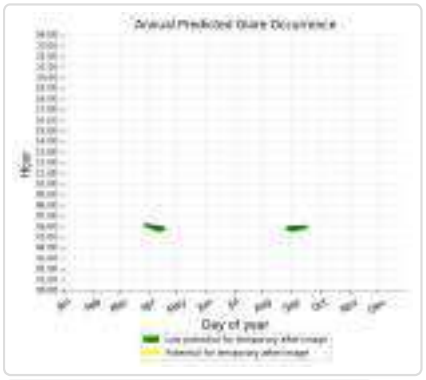

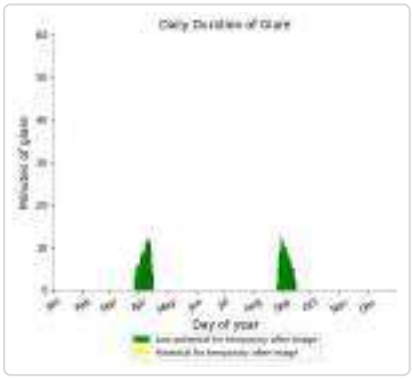

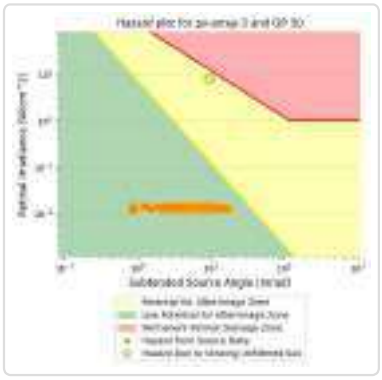

PV array 3: OP 50

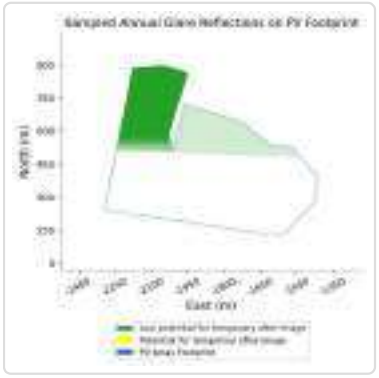

PV array is expected to produce the following glare for this receptor:

- 321 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 4: OP 1

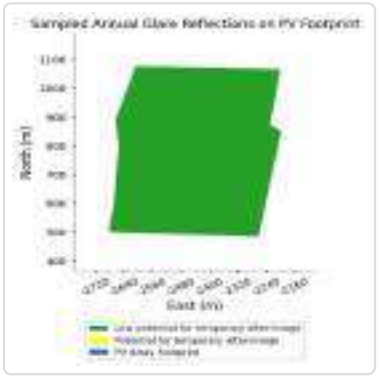

PV array is expected to produce the following glare for this receptor:

- 823 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

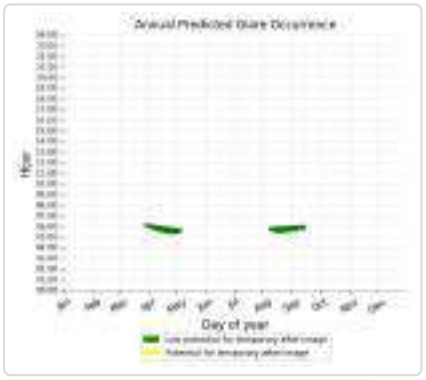

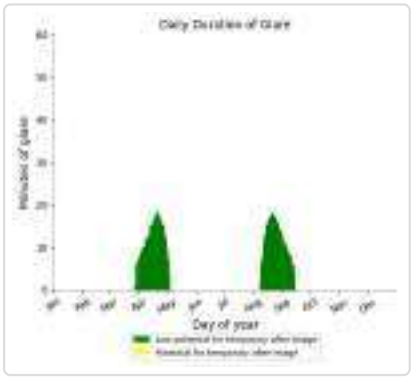

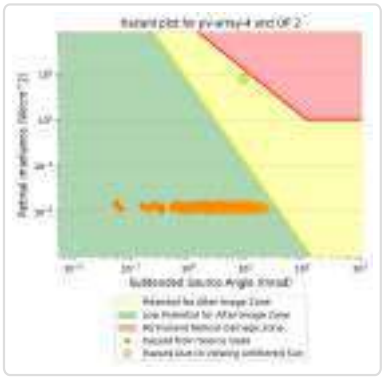

PV array 4: OP 2

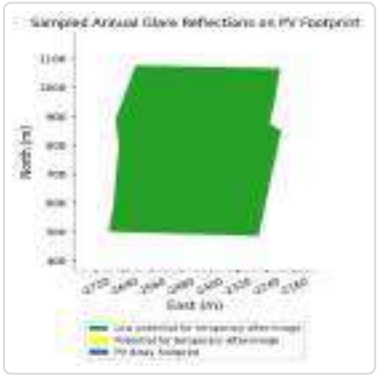

PV array is expected to produce the following glare for this receptor:

- 927 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

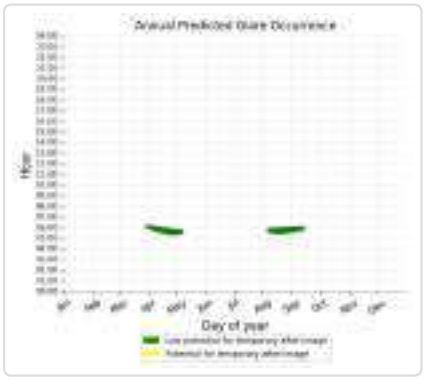

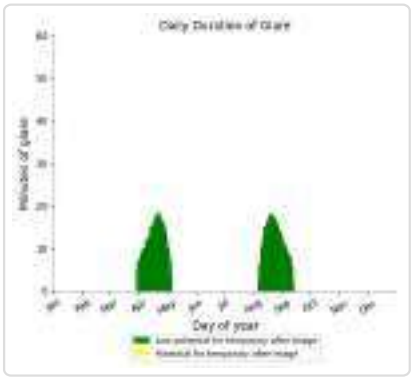

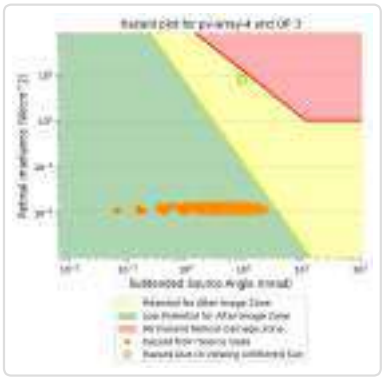

PV array 4: OP 3

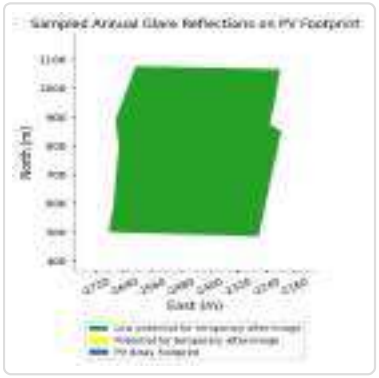

PV array is expected to produce the following glare for this receptor:

- 982 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

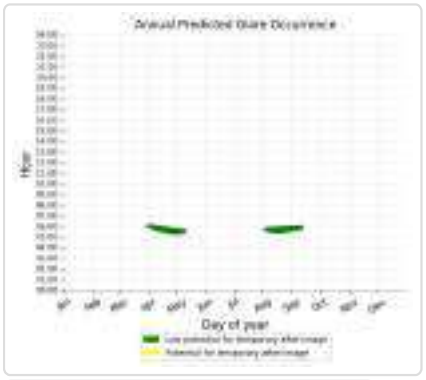

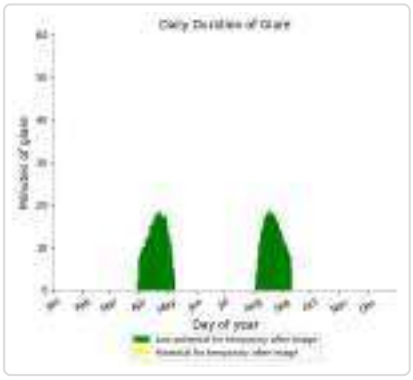

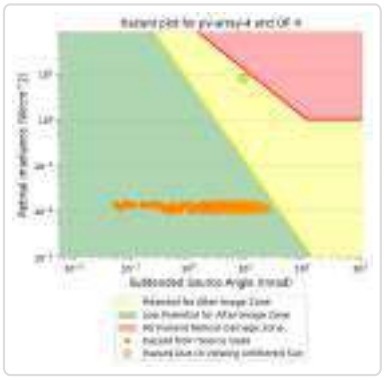

PV array 4: OP 4

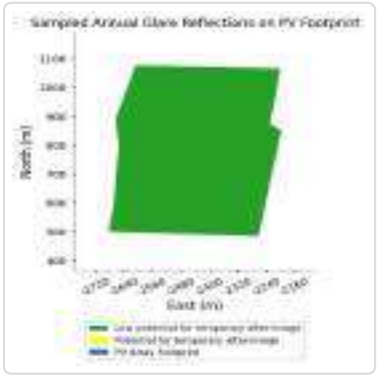

PV array is expected to produce the following glare for this receptor:

- 1,053 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

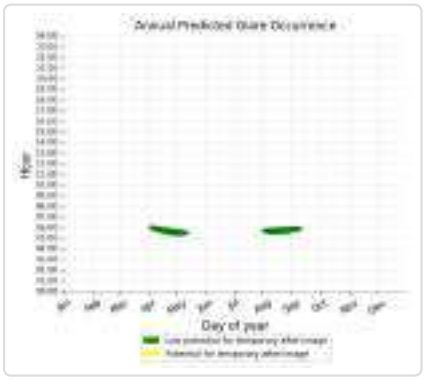

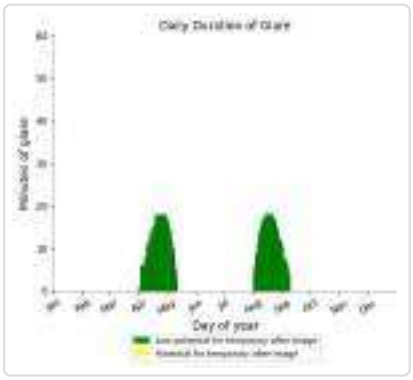

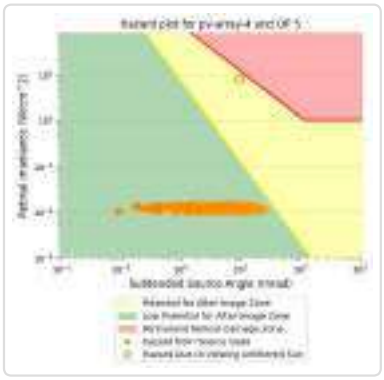

PV array 4: OP 5

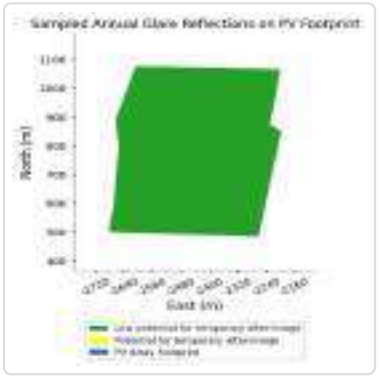

PV array is expected to produce the following glare for this receptor:

- 1,042 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

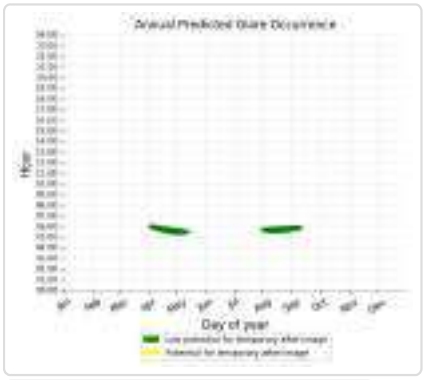

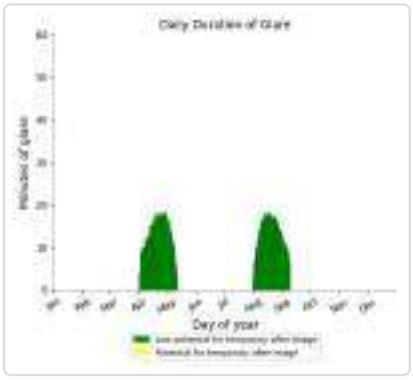

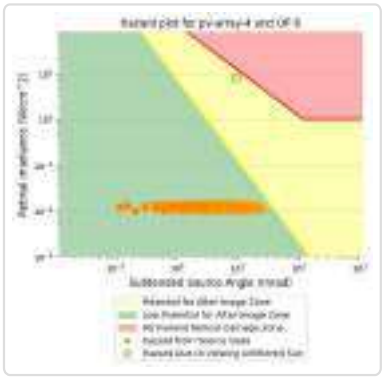

PV array 4: OP 6

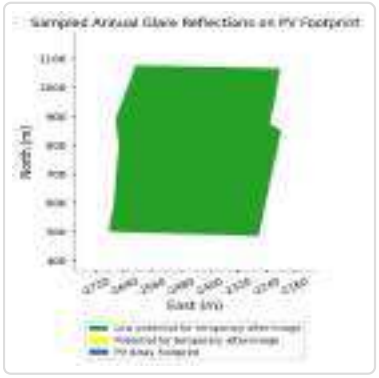

PV array is expected to produce the following glare for this receptor:

- 1,130 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

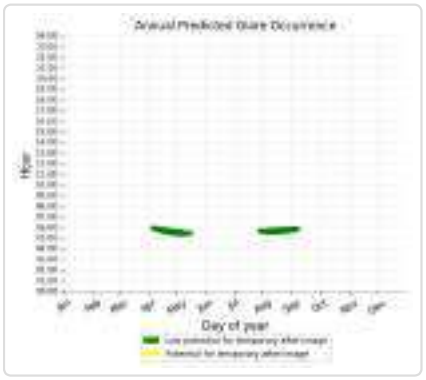

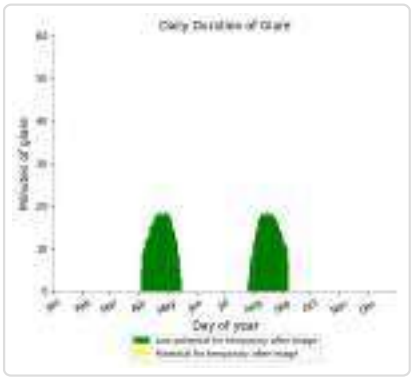

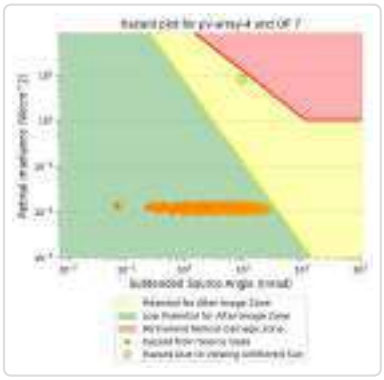

PV array 4: OP 7

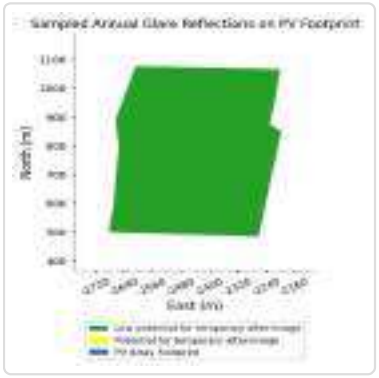

PV array is expected to produce the following glare for this receptor:

- 1,230 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

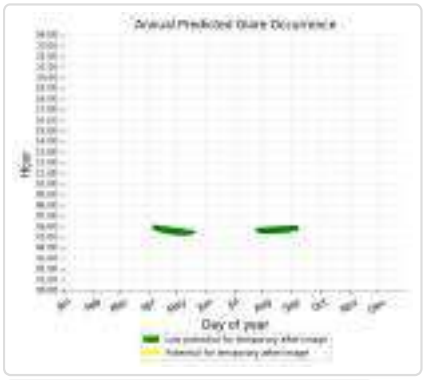

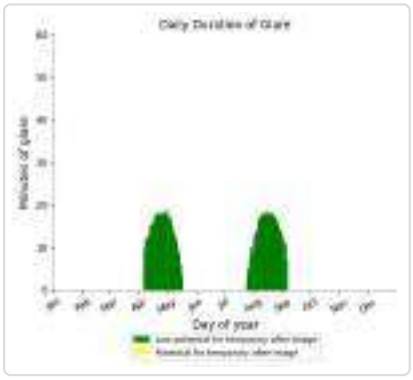

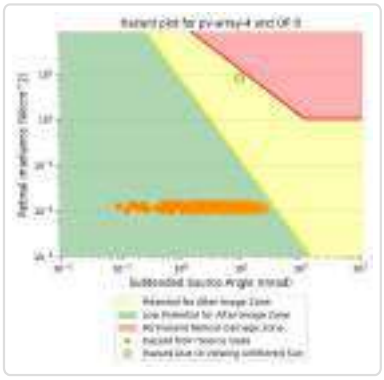

PV array 4: OP 8

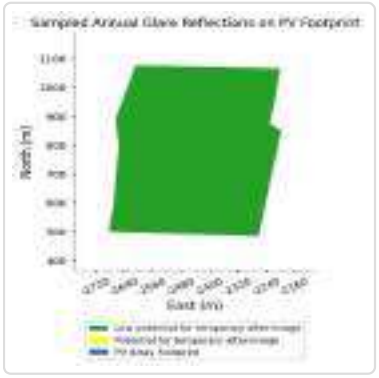

PV array is expected to produce the following glare for this receptor:

- 1,233 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

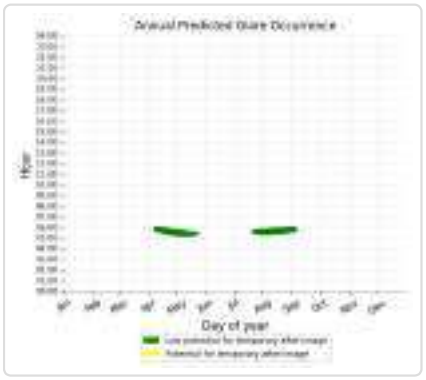

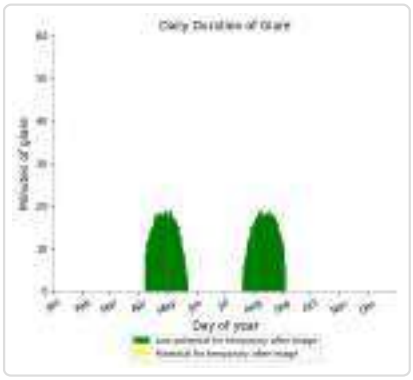

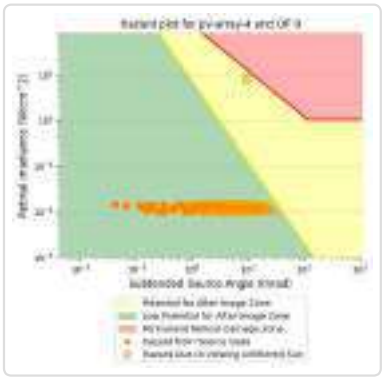

PV array 4: OP 9

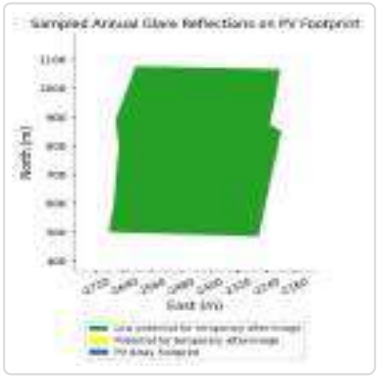

PV array is expected to produce the following glare for this receptor:

- 1,369 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

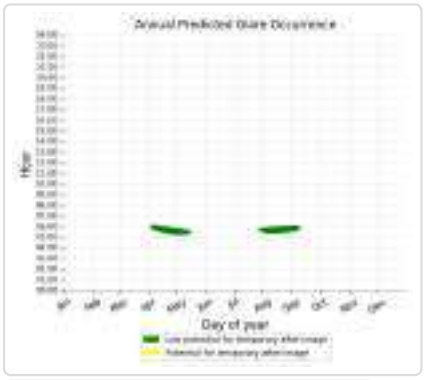

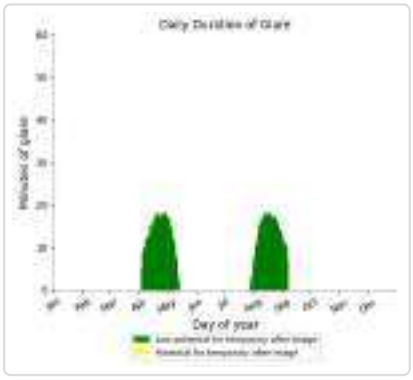

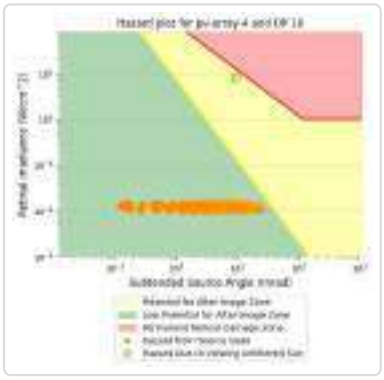

PV array 4: OP 10

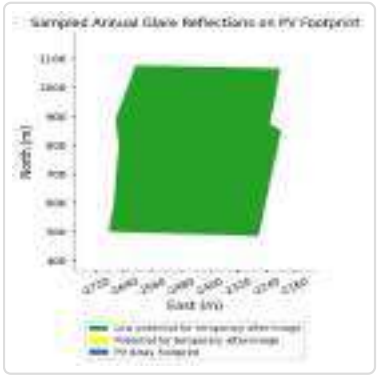

PV array is expected to produce the following glare for this receptor:

- 1,133 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

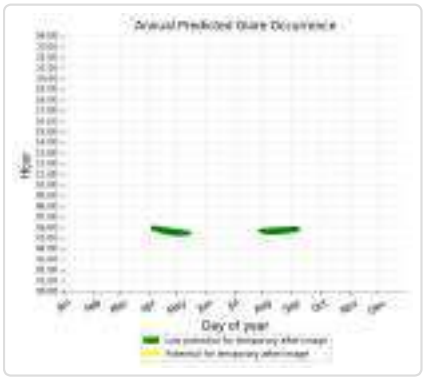

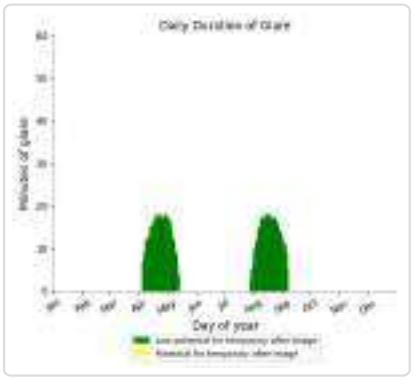

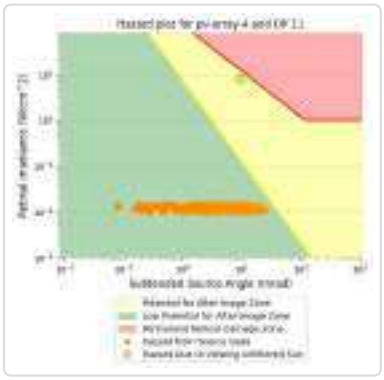

PV array 4: OP 11

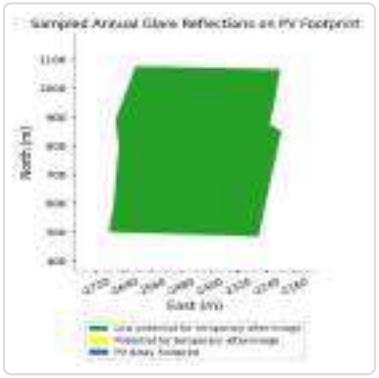

PV array is expected to produce the following glare for this receptor:

- 1,142 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

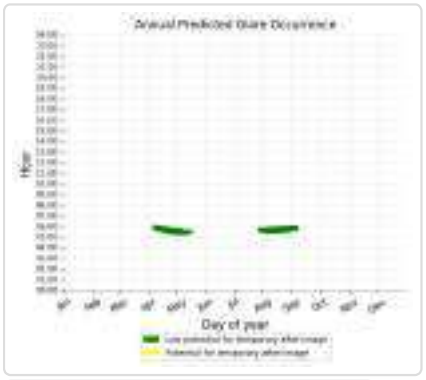

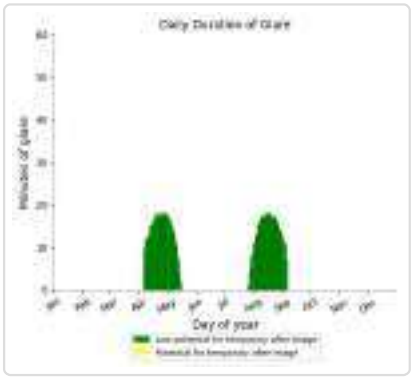

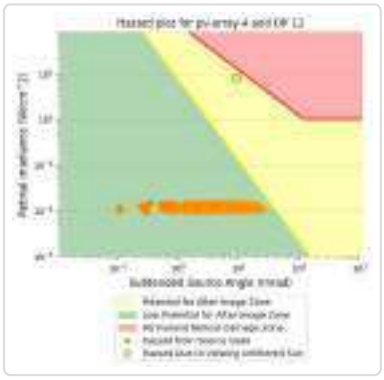

PV array 4: OP 12

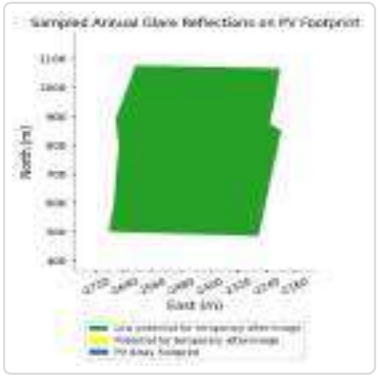

PV array is expected to produce the following glare for this receptor:

- 1,177 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

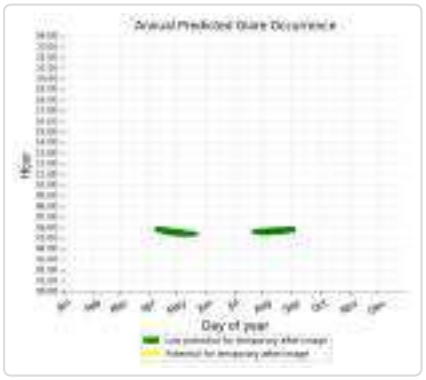

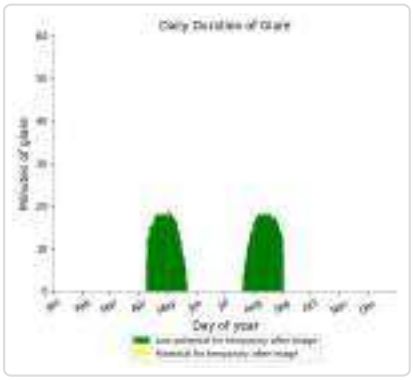

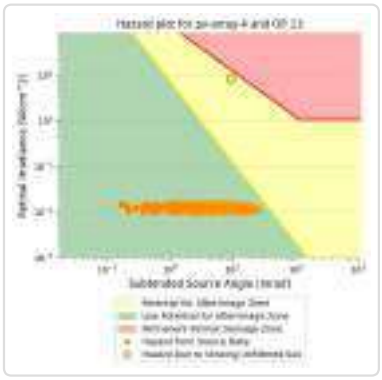

PV array 4: OP 13

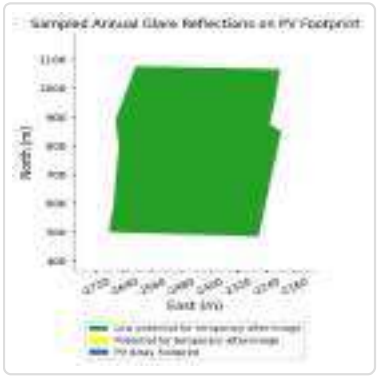

PV array is expected to produce the following glare for this receptor:

- 1,311 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

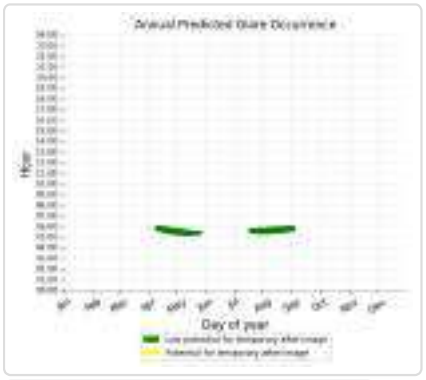

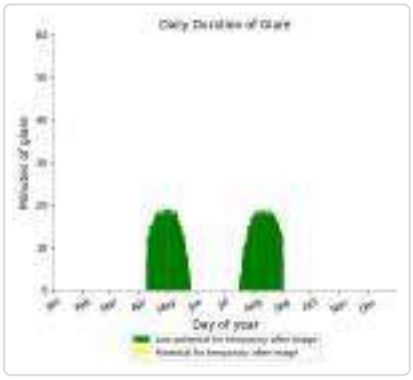

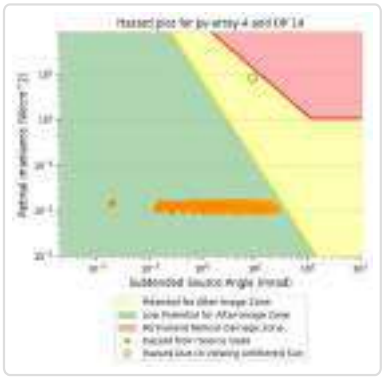

PV array 4: OP 14

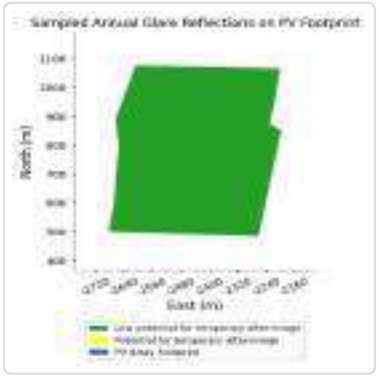

PV array is expected to produce the following glare for this receptor:

- 1,458 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

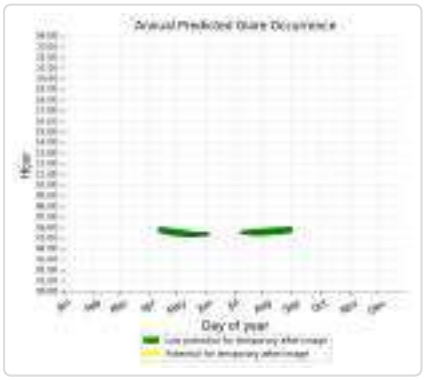

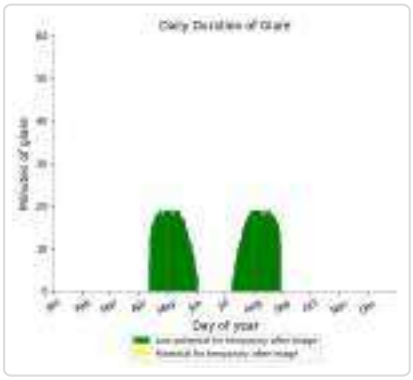

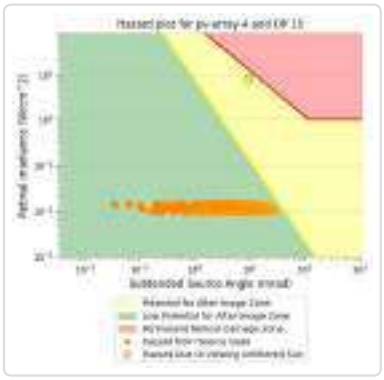

PV array 4: OP 15

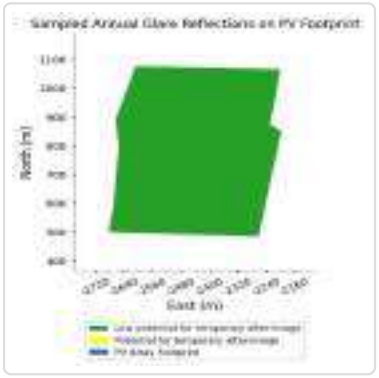

PV array is expected to produce the following glare for this receptor:

- 1,643 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

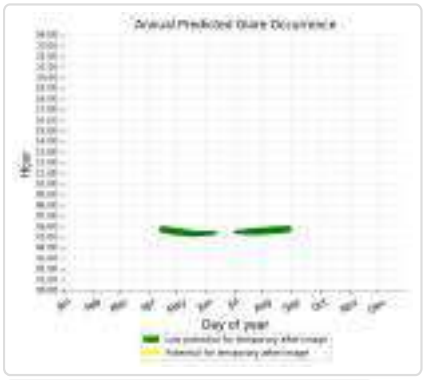

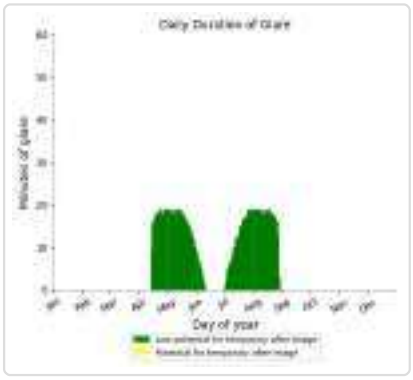

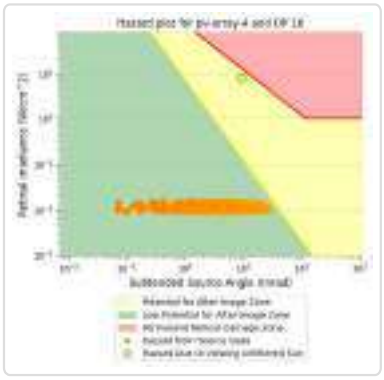

PV array 4: OP 16

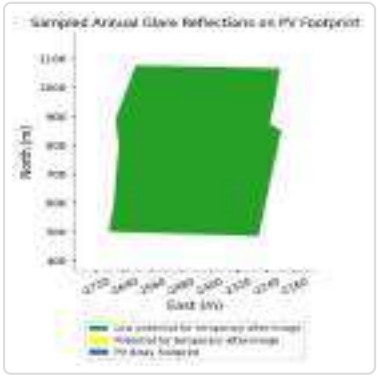

PV array is expected to produce the following glare for this receptor:

- 1,773 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

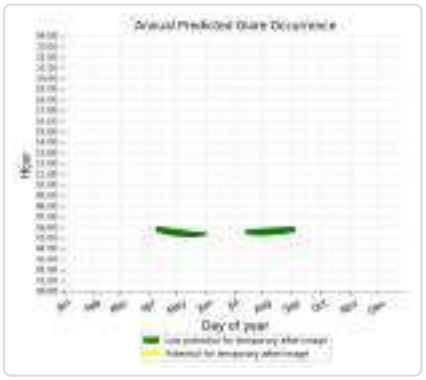

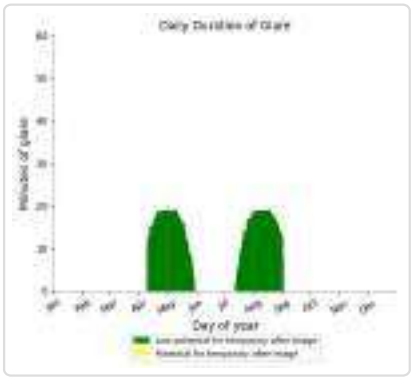

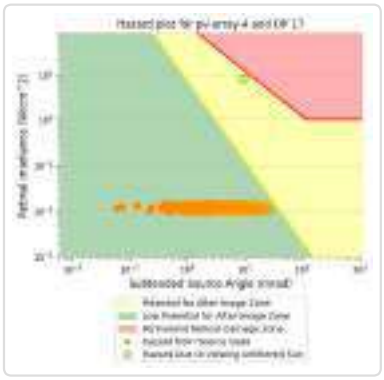

PV array 4: OP 17

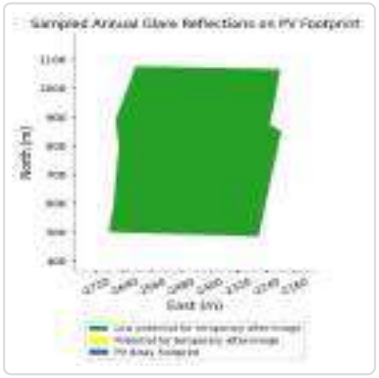

PV array is expected to produce the following glare for this receptor:

- 1,613 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

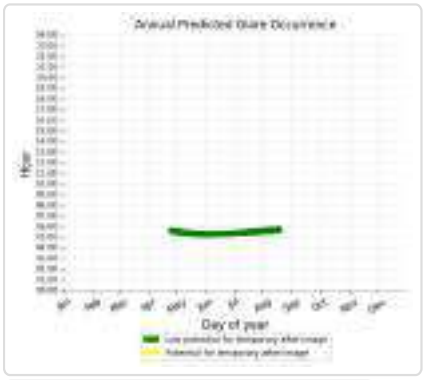

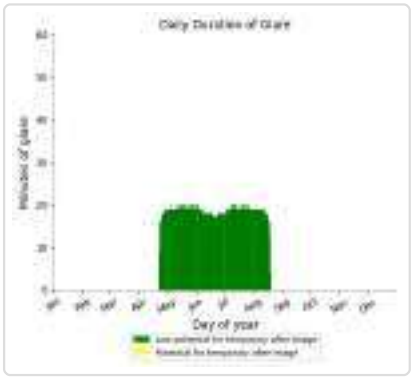

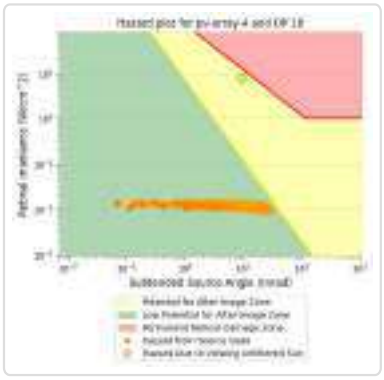

PV array 4: OP 18

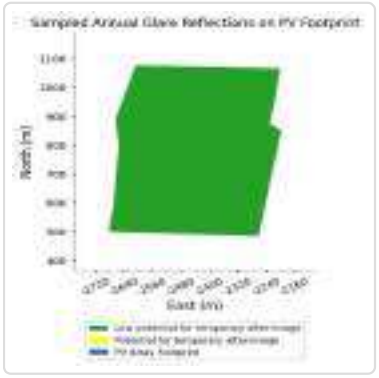

PV array is expected to produce the following glare for this receptor:

- 2,228 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

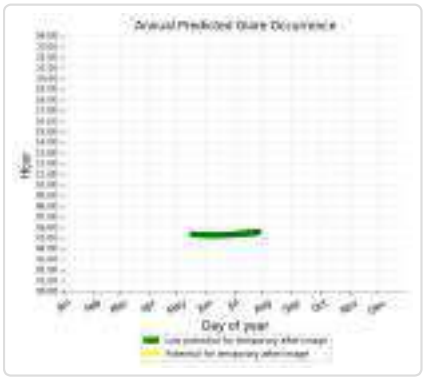

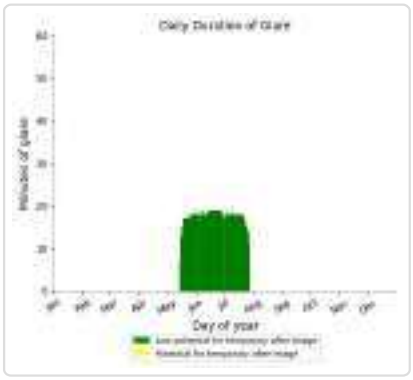

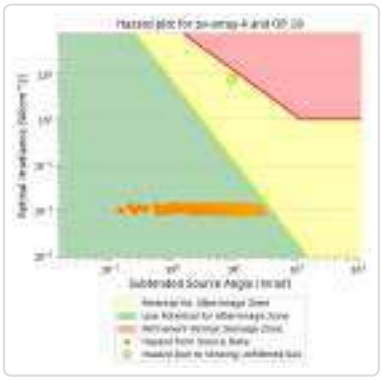

PV array 4: OP 19

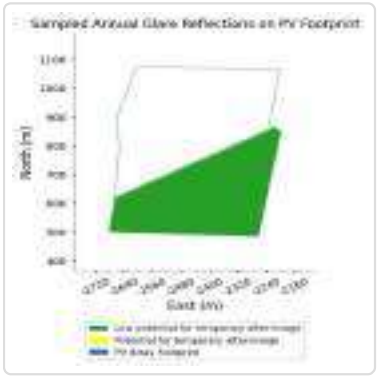

PV array is expected to produce the following glare for this receptor:

- 1,321 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

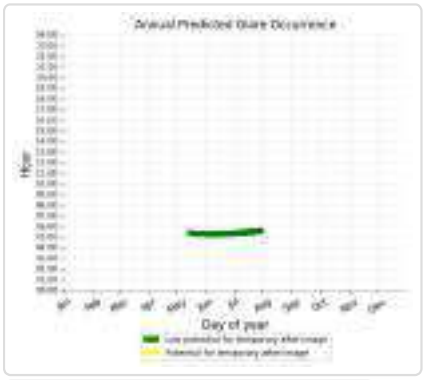

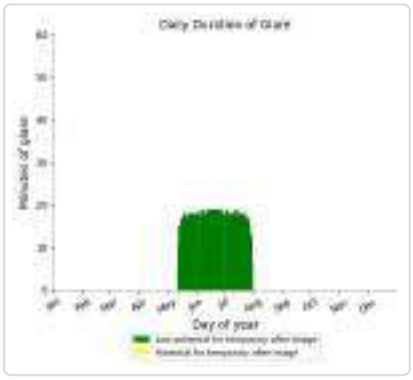

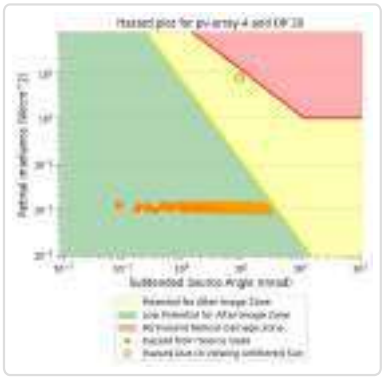

PV array 4: OP 20

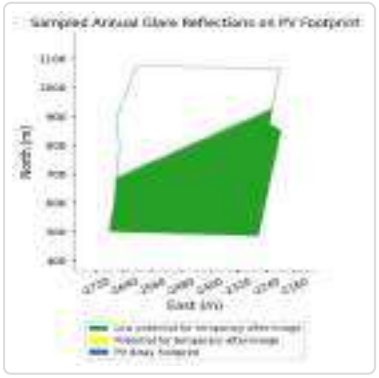

PV array is expected to produce the following glare for this receptor:

- 1,424 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

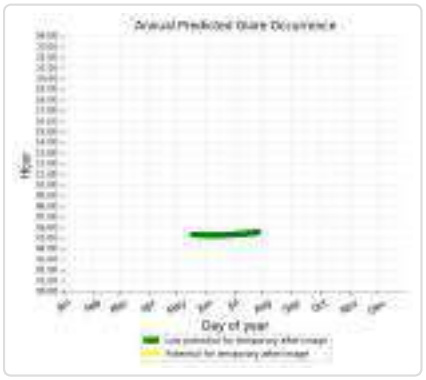

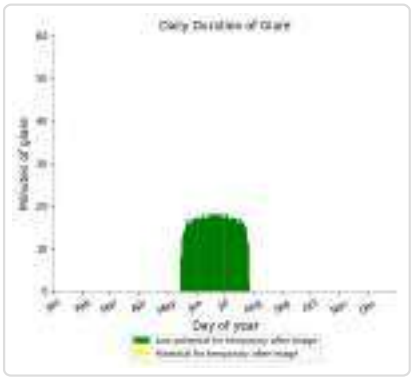

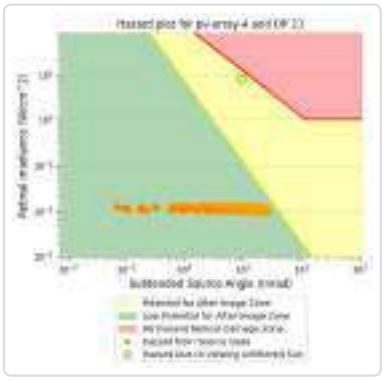

PV array 4: OP 21

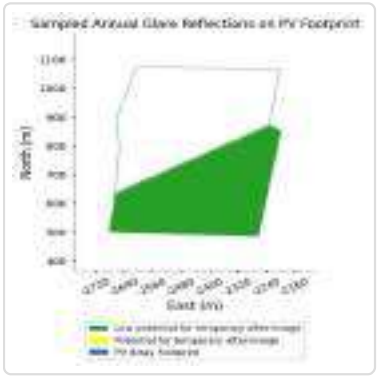

PV array is expected to produce the following glare for this receptor:

- 1,215 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

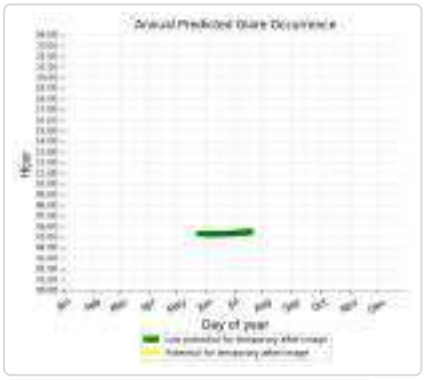

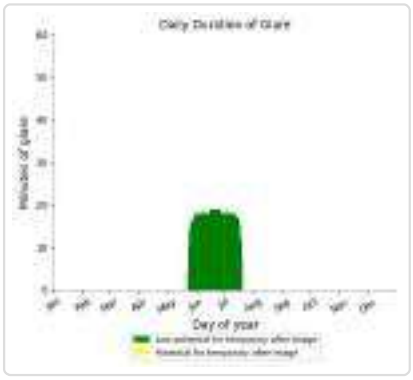

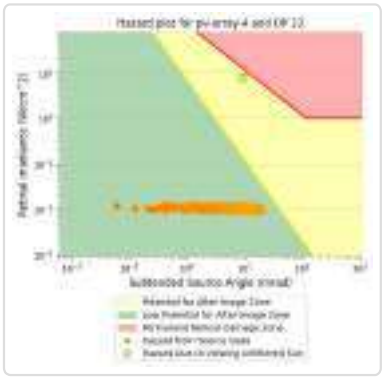

PV array 4: OP 22

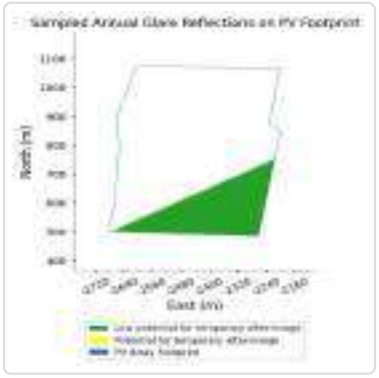

PV array is expected to produce the following glare for this receptor:

- 1,017 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

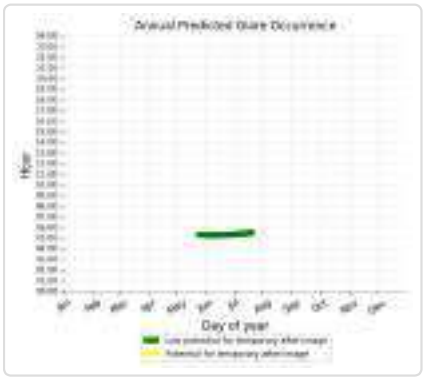

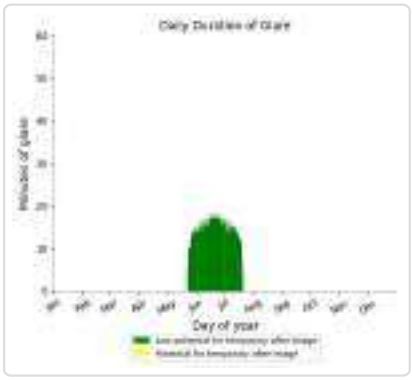

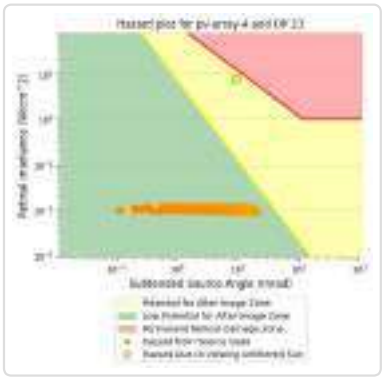

PV array 4: OP 23

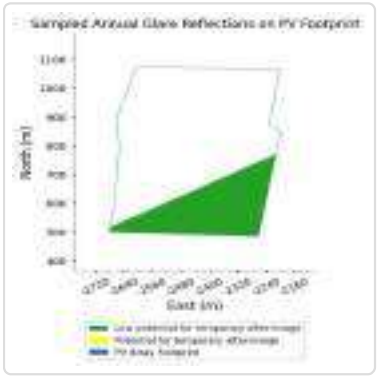

PV array is expected to produce the following glare for this receptor:

- 883 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

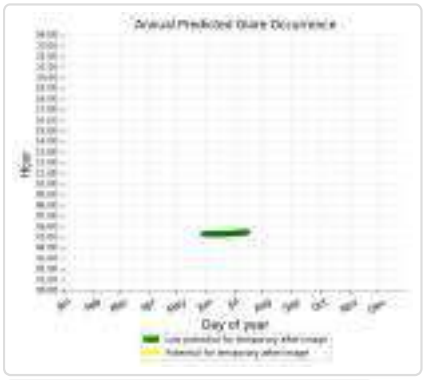

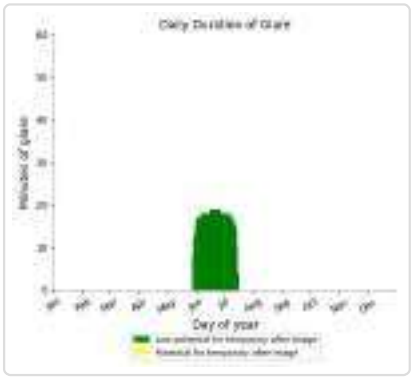

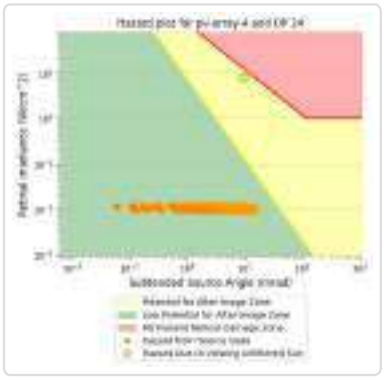

PV array 4: OP 24

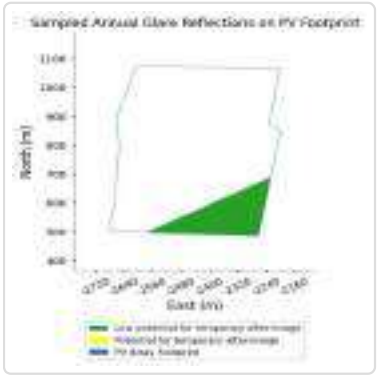

PV array is expected to produce the following glare for this receptor:

- 847 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

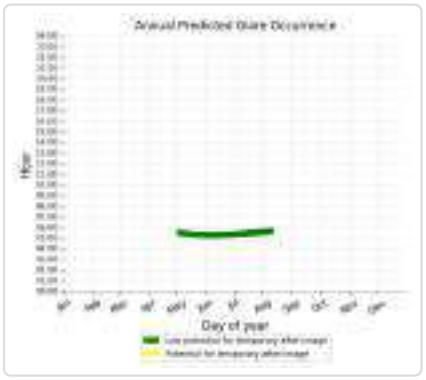

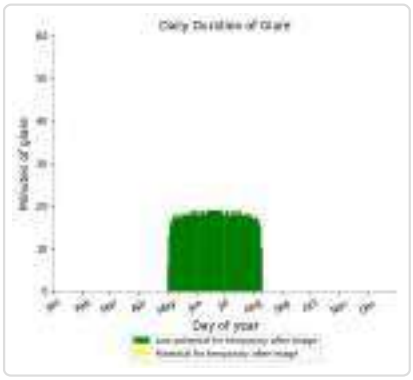

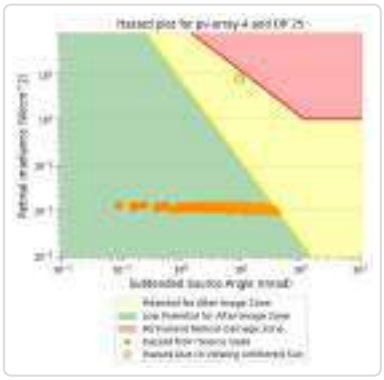

PV array 4: OP 25

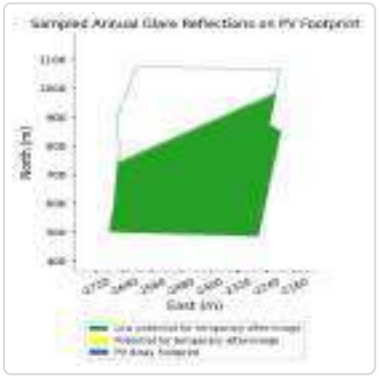

PV array is expected to produce the following glare for this receptor:

- 1,800 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

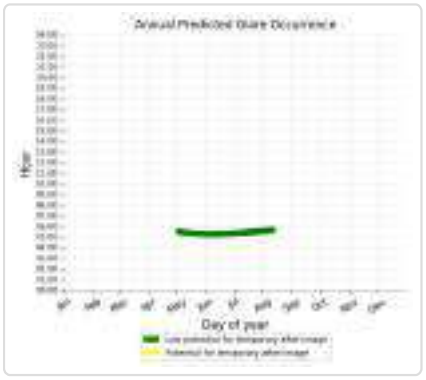

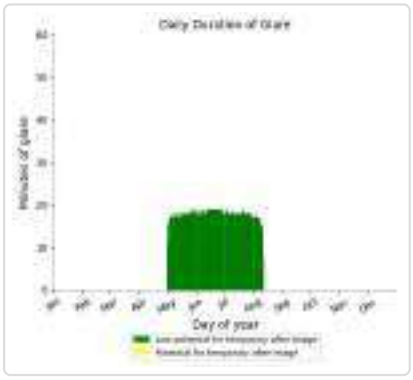

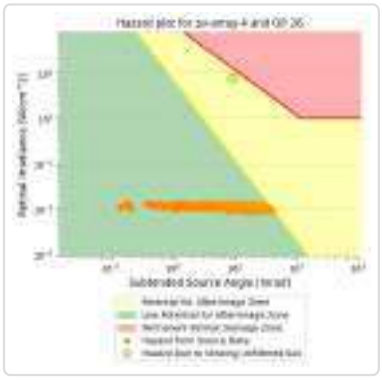

PV array 4: OP 26

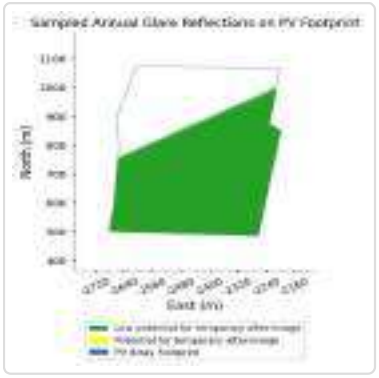

PV array is expected to produce the following glare for this receptor:

- 1,850 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

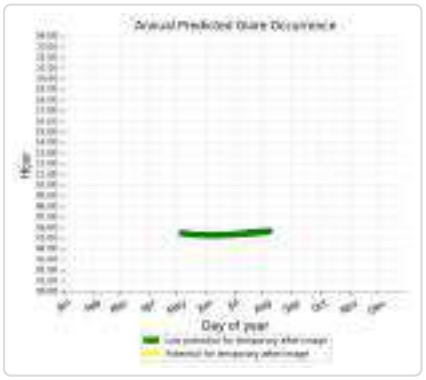

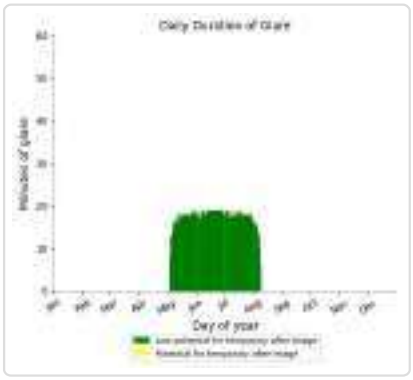

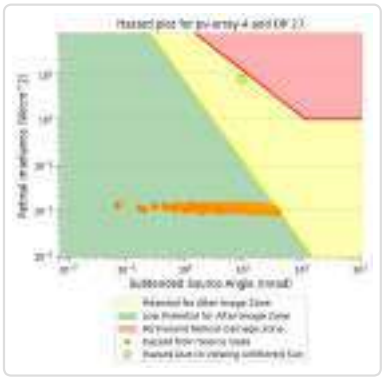

PV array 4: OP 27

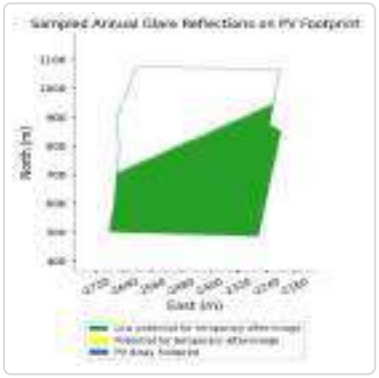

PV array is expected to produce the following glare for this receptor:

- 1,715 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

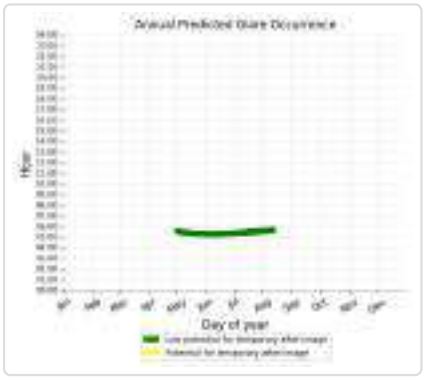

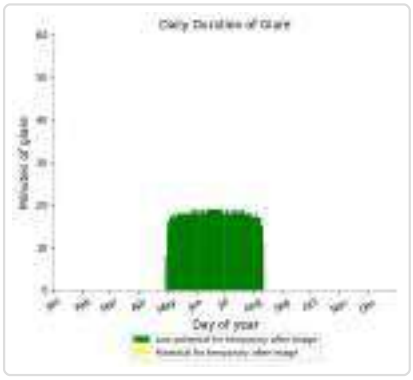

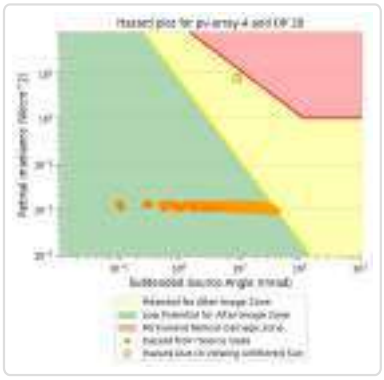

PV array 4: OP 28

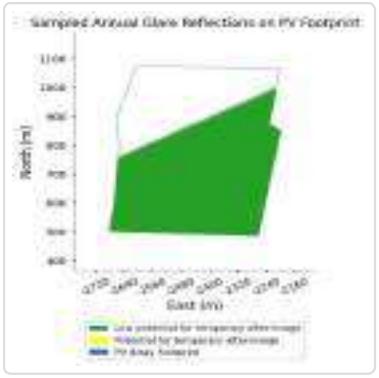

PV array is expected to produce the following glare for this receptor:

- 1,879 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

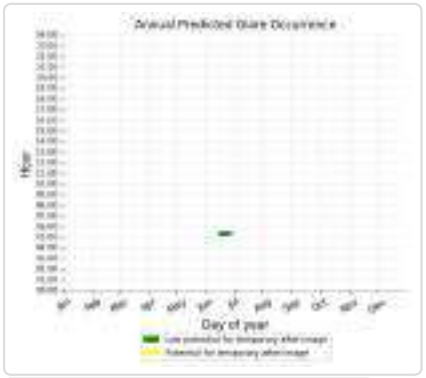

PV array 4: OP 29

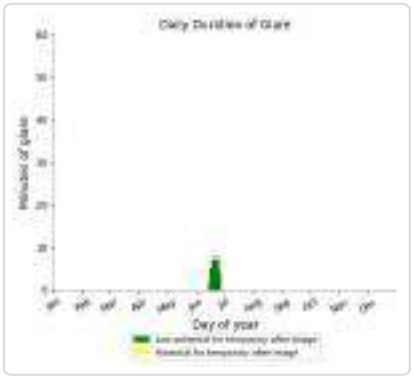

No glare found

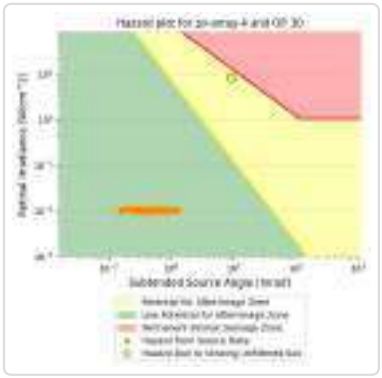

PV array 4: OP 30

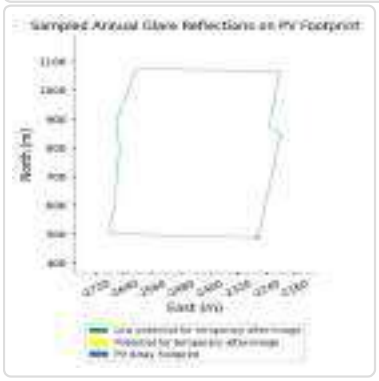

PV array is expected to produce the following glare for this receptor:

- 79 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

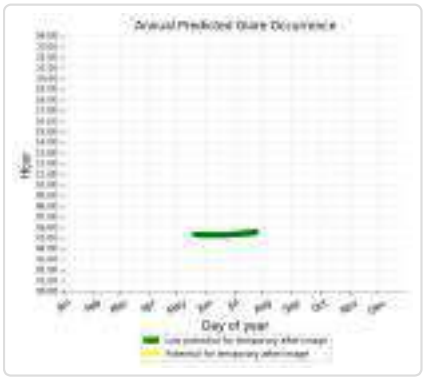

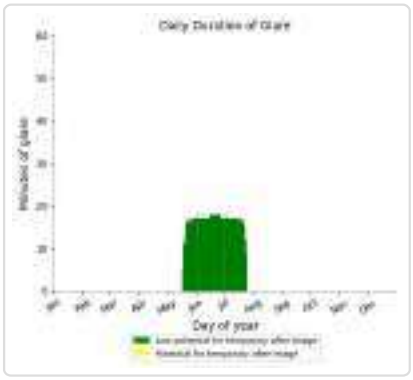

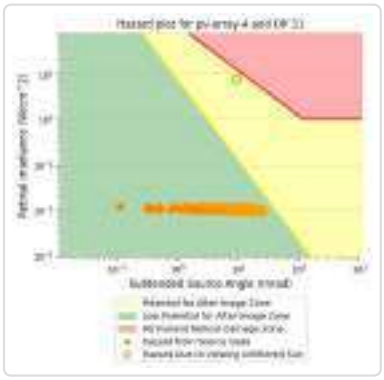

PV array 4: OP 31

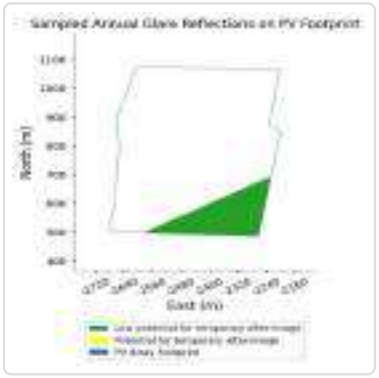

PV array is expected to produce the following glare for this receptor:

- 1,144 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

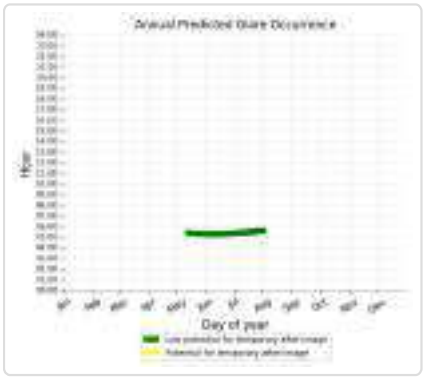

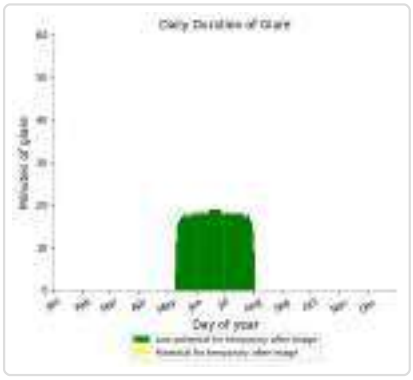

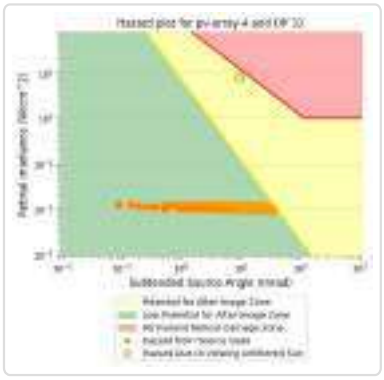

PV array 4: OP 32

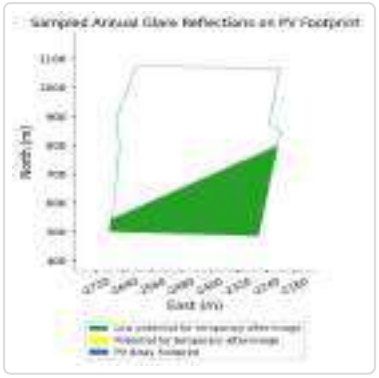

PV array is expected to produce the following glare for this receptor:

- 1,483 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

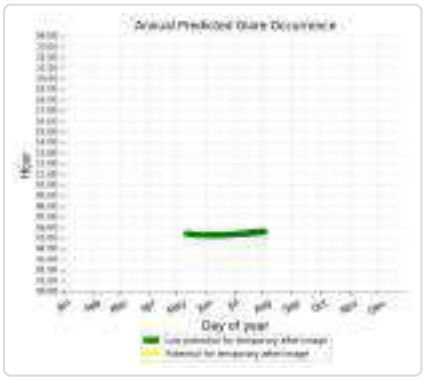

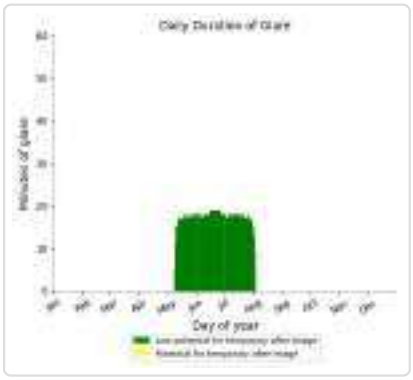

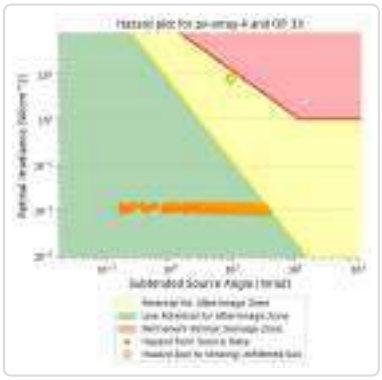

PV array 4: OP 33

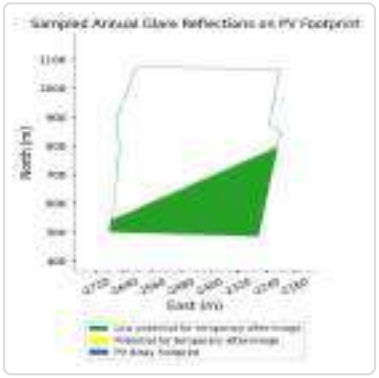

PV array is expected to produce the following glare for this receptor:

- 1,507 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

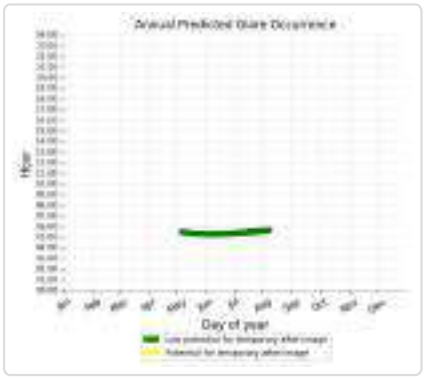

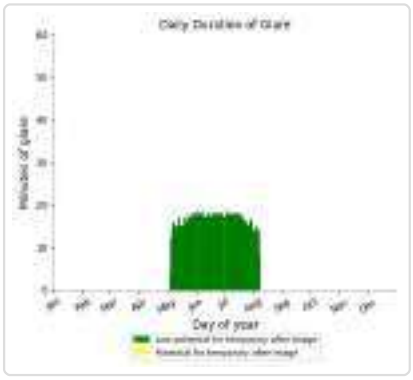

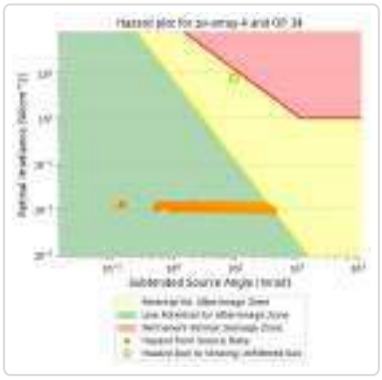

PV array 4: OP 34

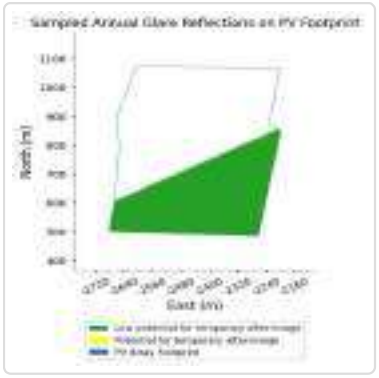

PV array is expected to produce the following glare for this receptor:

- 1,616 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

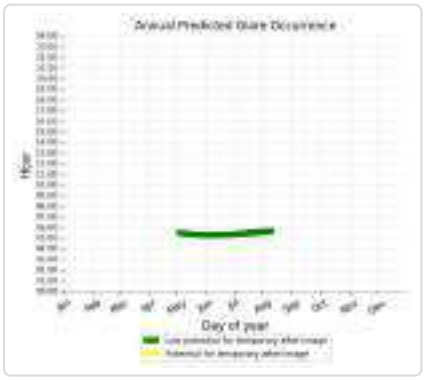

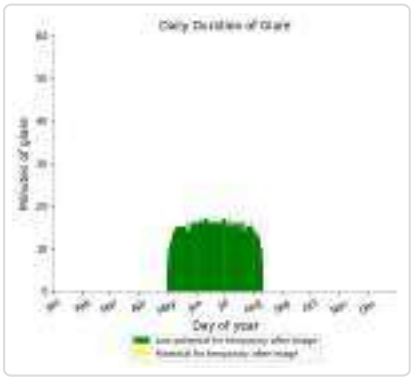

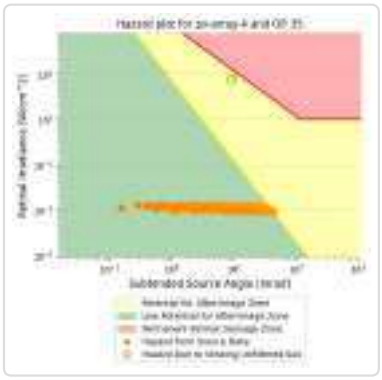

PV array 4: OP 35

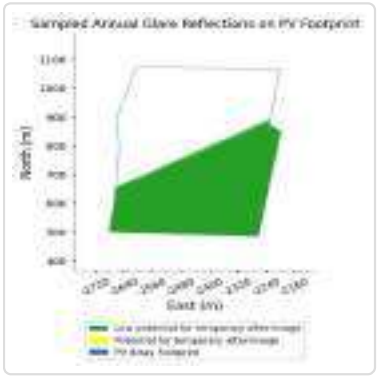

PV array is expected to produce the following glare for this receptor:

- 1,537 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

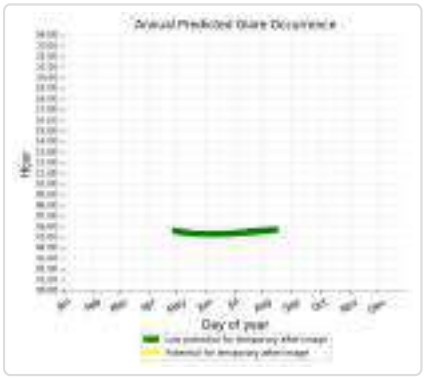

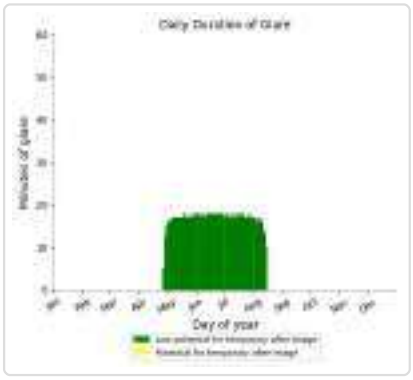

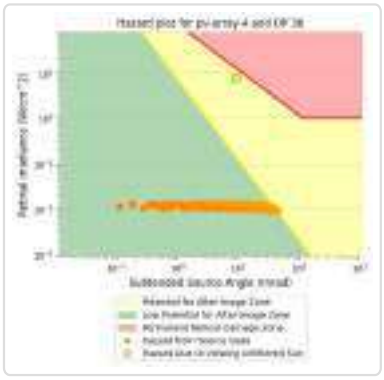

PV array 4: OP 36

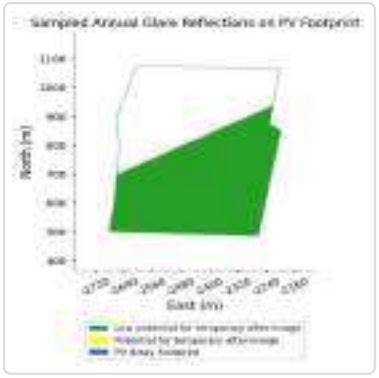

PV array is expected to produce the following glare for this receptor:

- 1,885 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

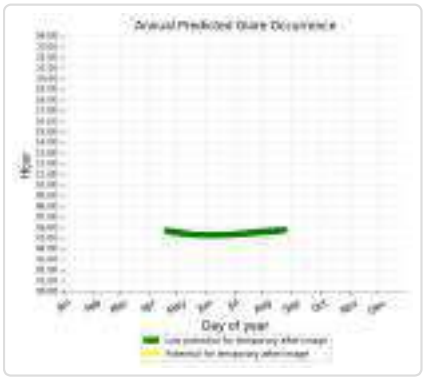

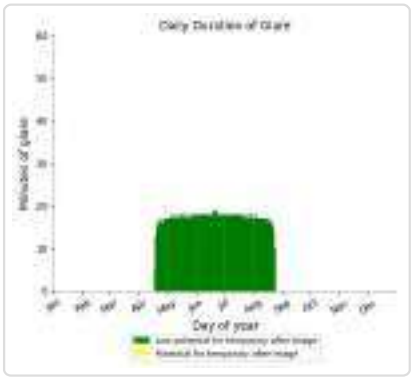

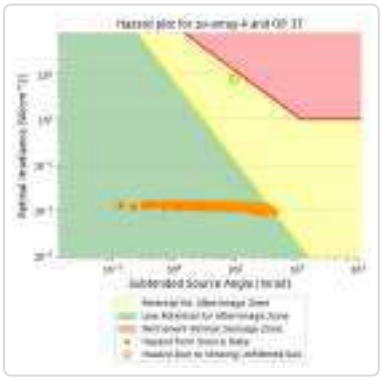

PV array 4: OP 37

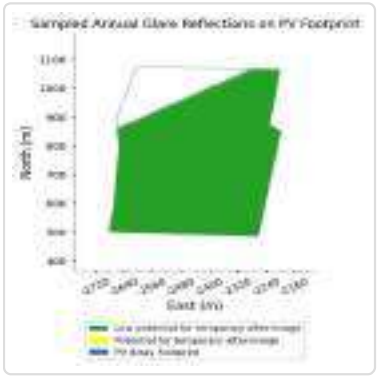

PV array is expected to produce the following glare for this receptor:

- 2,234 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

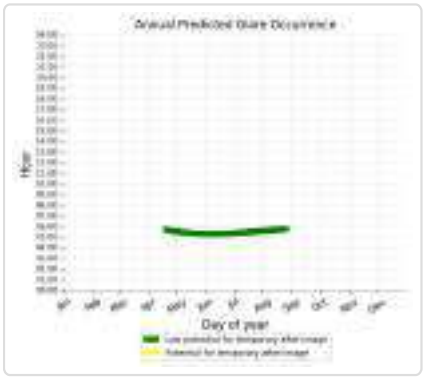

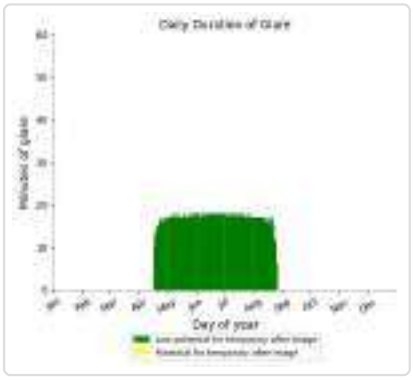

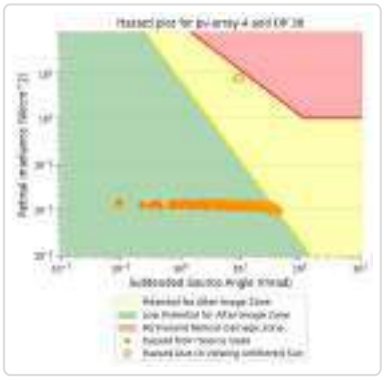

PV array 4: OP 38

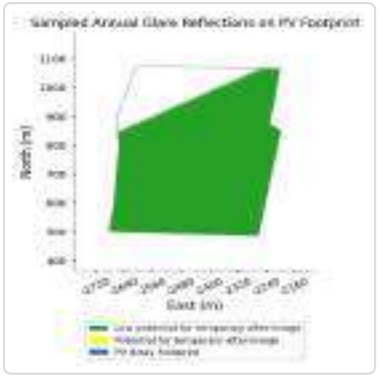

PV array is expected to produce the following glare for this receptor:

- 2,248 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

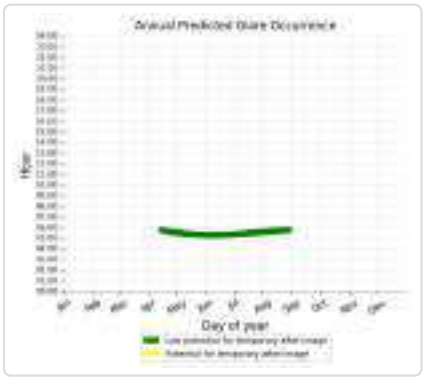

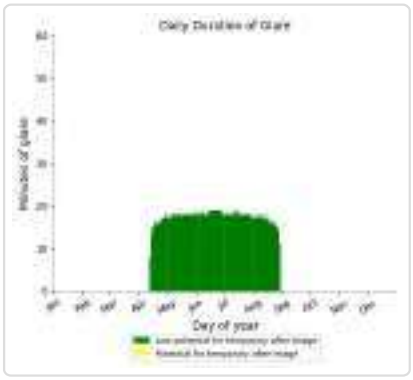

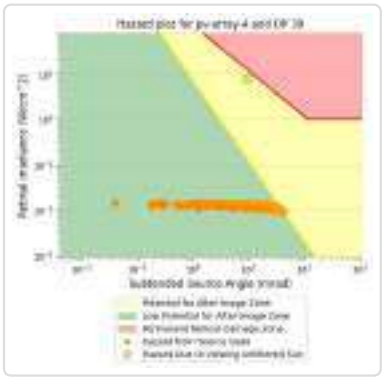

PV array 4: OP 39

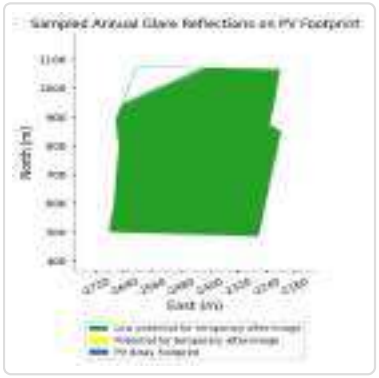

PV array is expected to produce the following glare for this receptor:

- 2,430 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

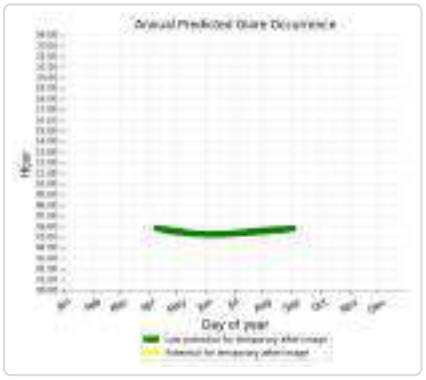

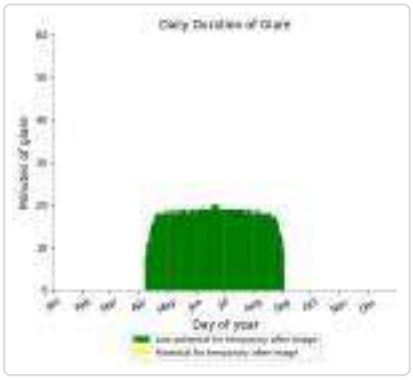

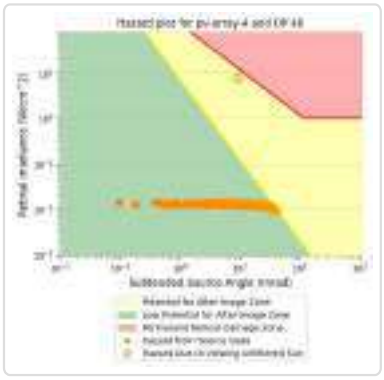

PV array 4: OP 40

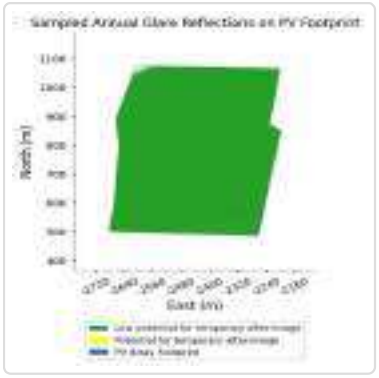

PV array is expected to produce the following glare for this receptor:

- 2,674 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

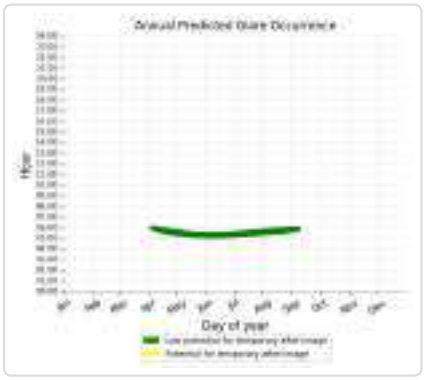

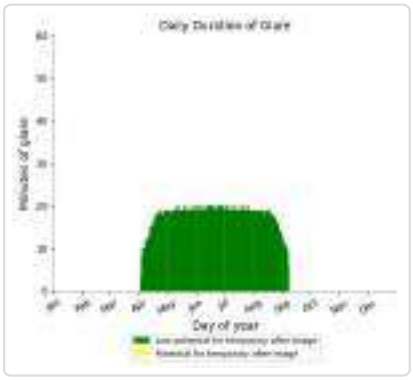

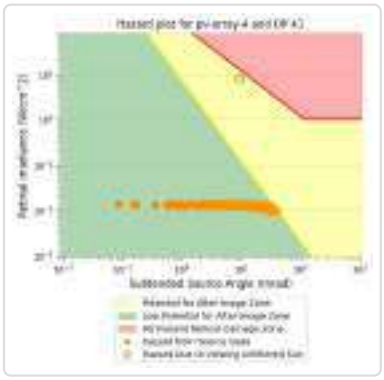

PV array 4: OP 41

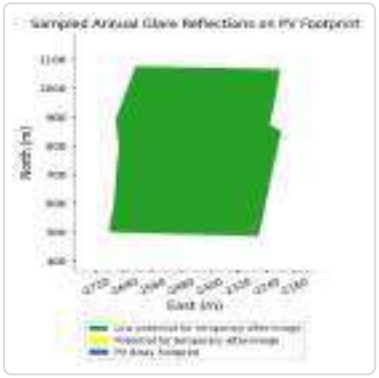

PV array is expected to produce the following glare for this receptor:

- 2,847 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

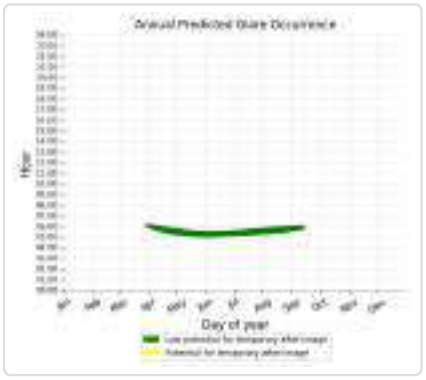

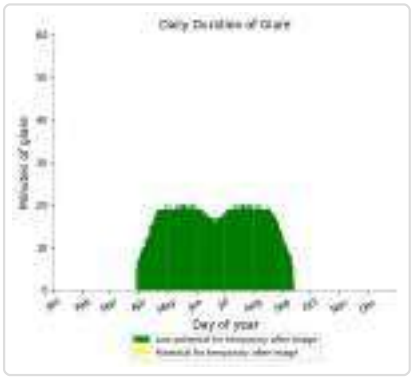

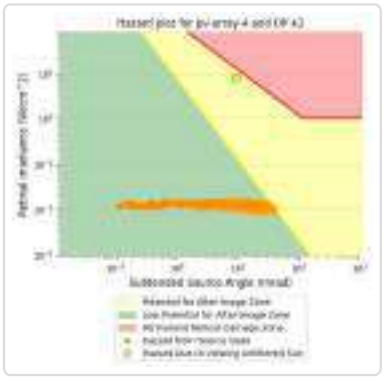

PV array 4: OP 42

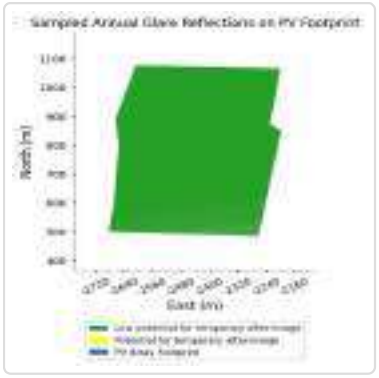

PV array is expected to produce the following glare for this receptor:

- 2,875 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

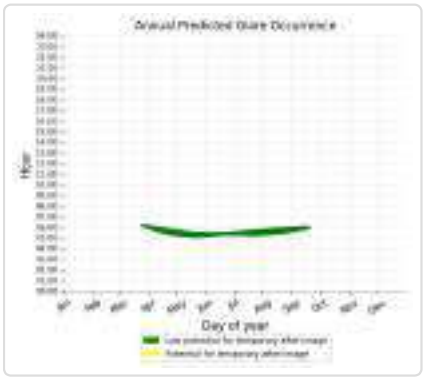

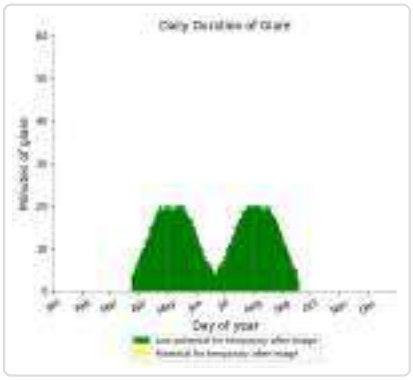

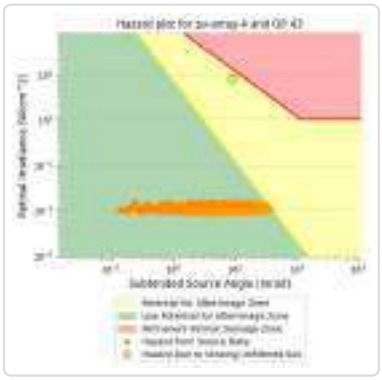

PV array 4: OP 43

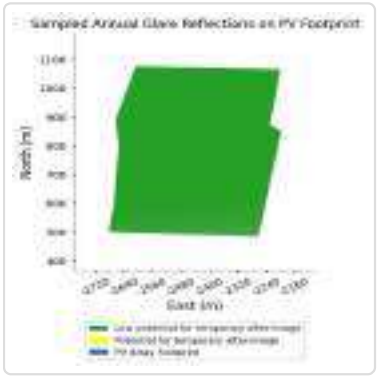

PV array is expected to produce the following glare for this receptor:

- 2,480 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

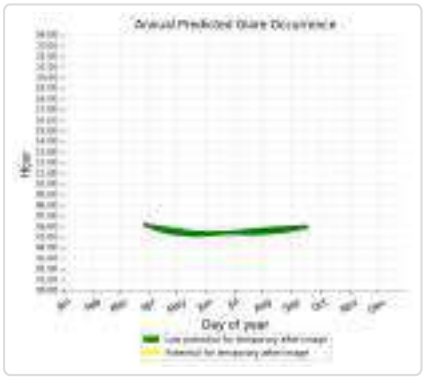

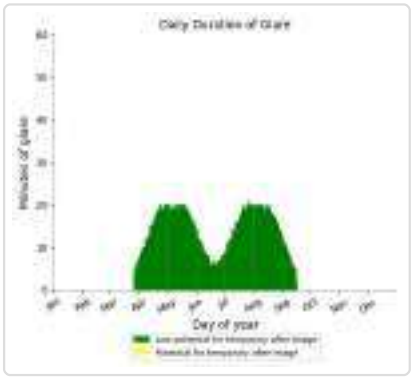

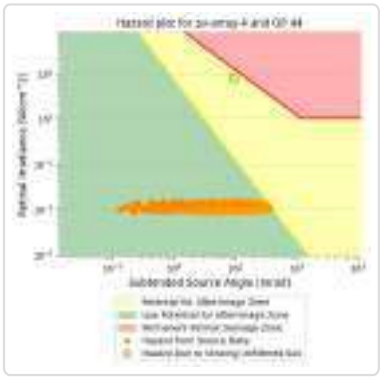

PV array 4: OP 44

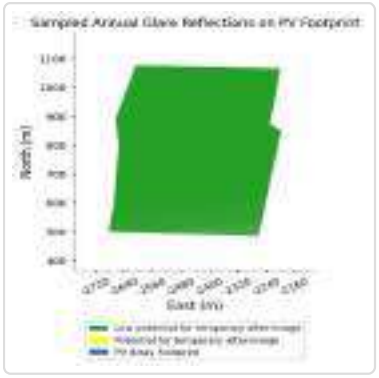

PV array is expected to produce the following glare for this receptor:

- 2,530 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

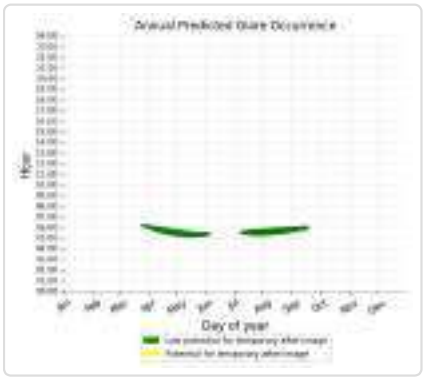

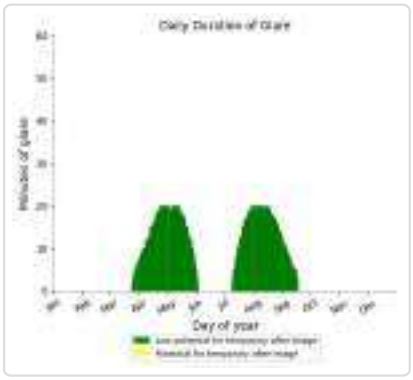

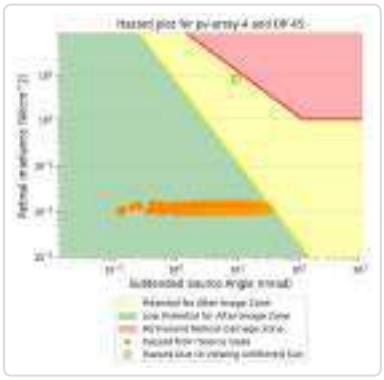

PV array 4: OP 45

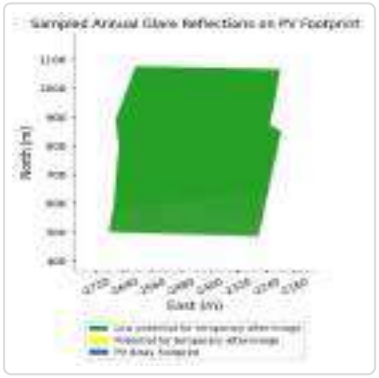

PV array is expected to produce the following glare for this receptor:

- 2,040 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

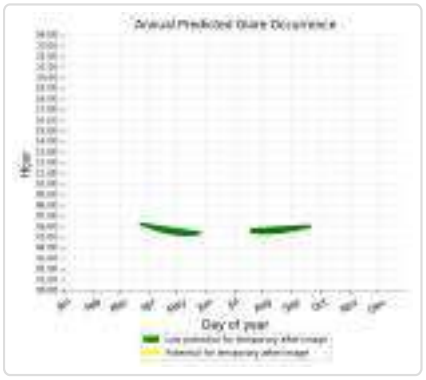

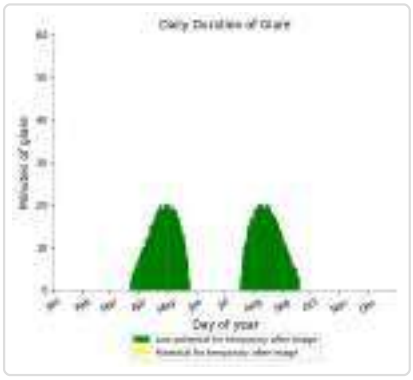

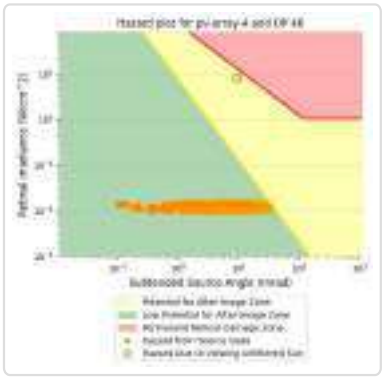

PV array 4: OP 46

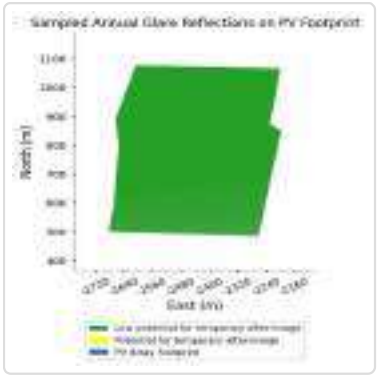

PV array is expected to produce the following glare for this receptor:

- 1,741 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

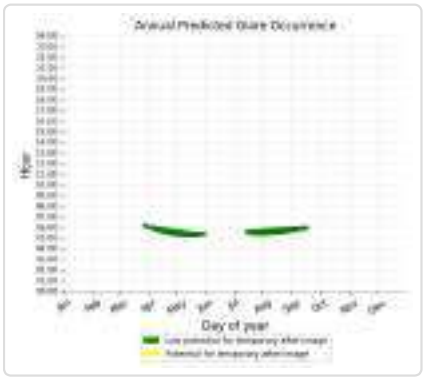

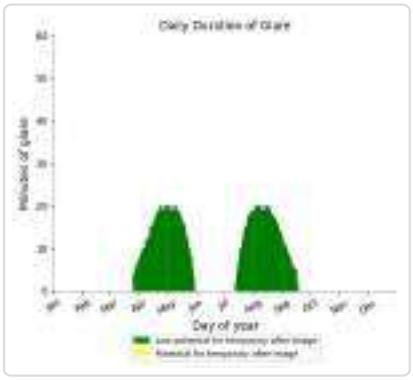

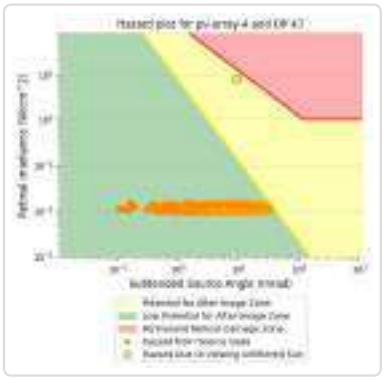

PV array 4: OP 47

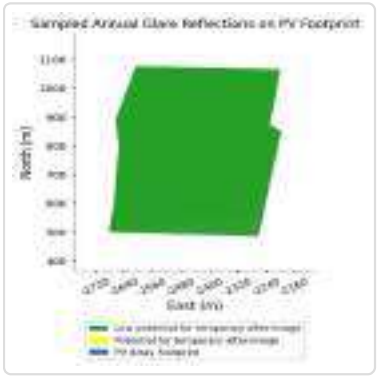

PV array is expected to produce the following glare for this receptor:

- 1,898 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

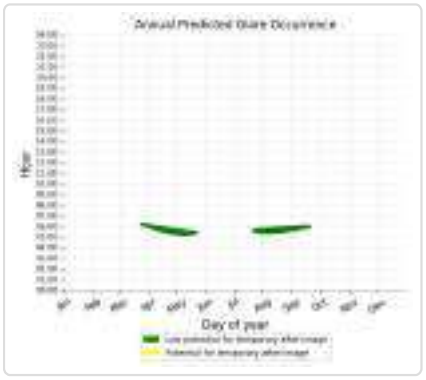

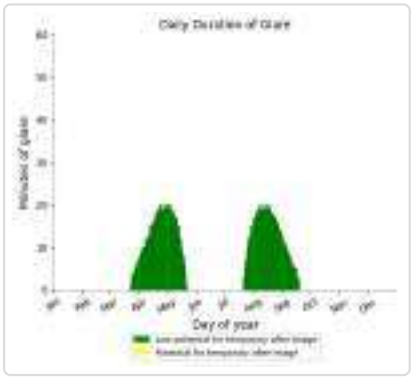

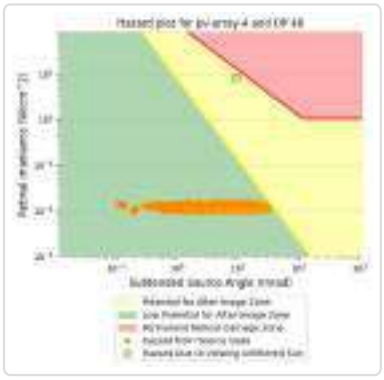

PV array 4: OP 48

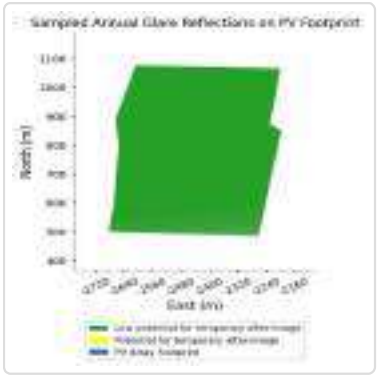

PV array is expected to produce the following glare for this receptor:

- 1,610 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

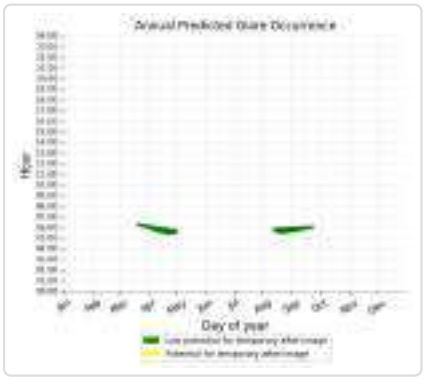

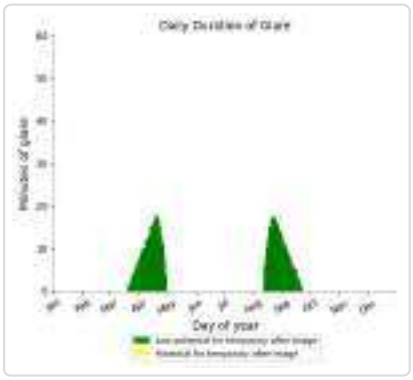

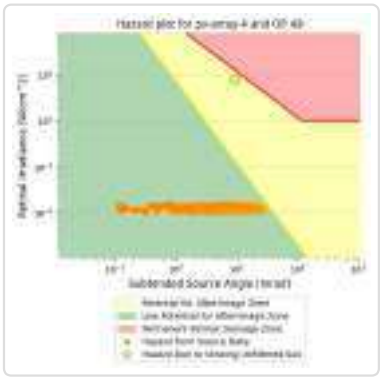

PV array 4: OP 49

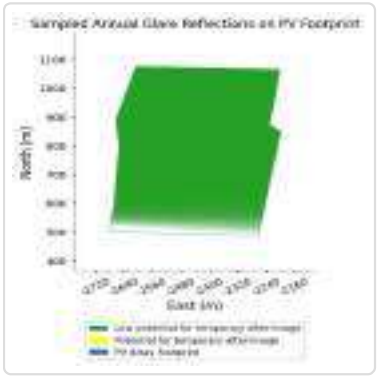

PV array is expected to produce the following glare for this receptor:

- 845 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

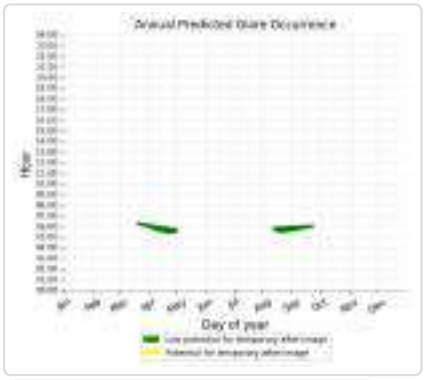

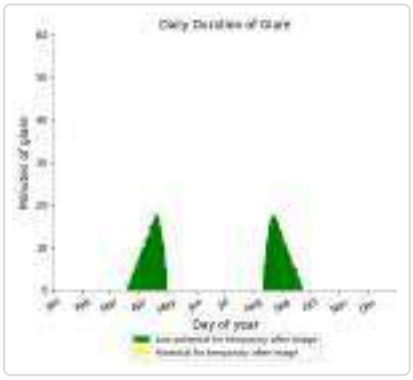

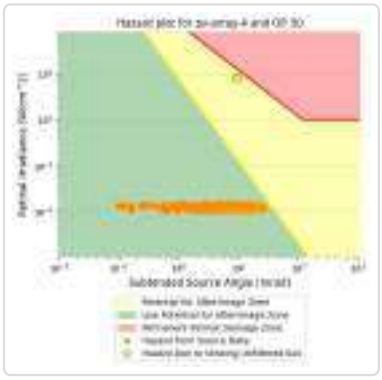

PV array 4: OP 50

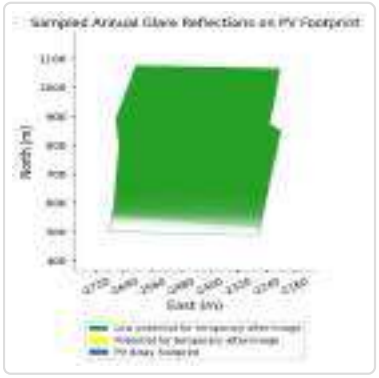

PV array is expected to produce the following glare for this receptor:

- 852 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

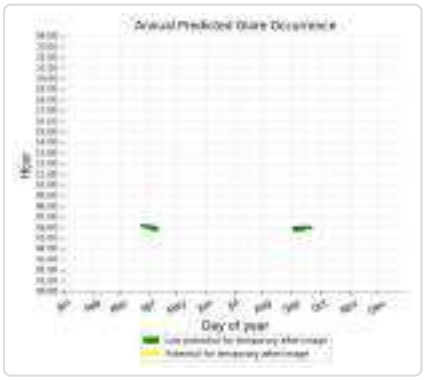

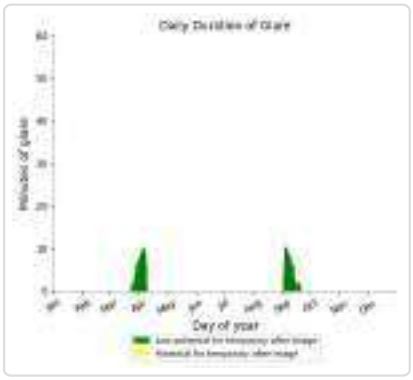

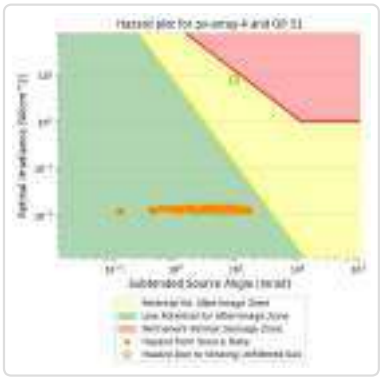

PV array 4: OP 51

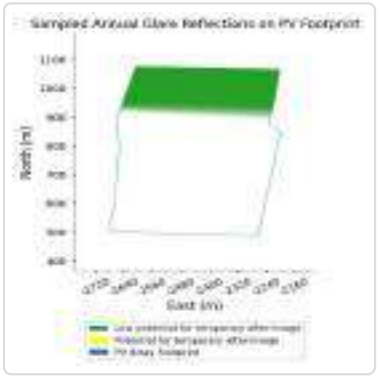

PV array is expected to produce the following glare for this receptor:

- 216 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

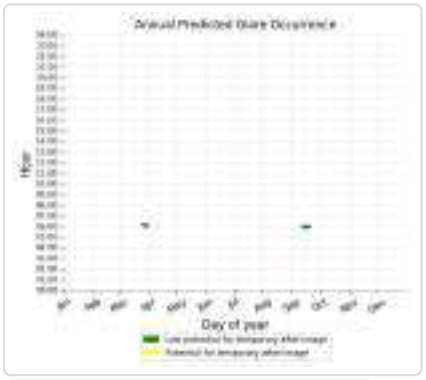

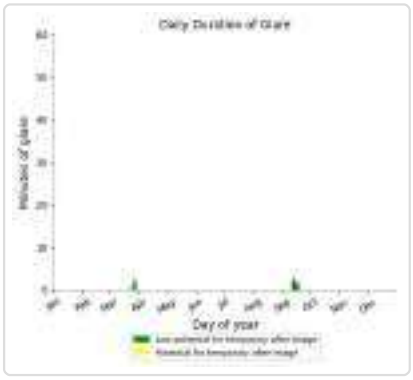

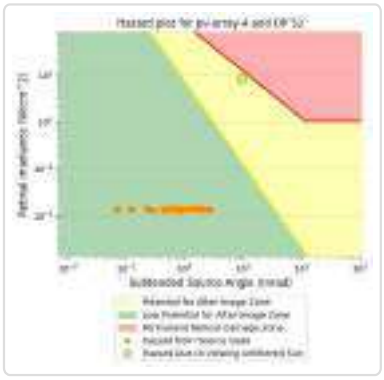

PV array 4: OP 52

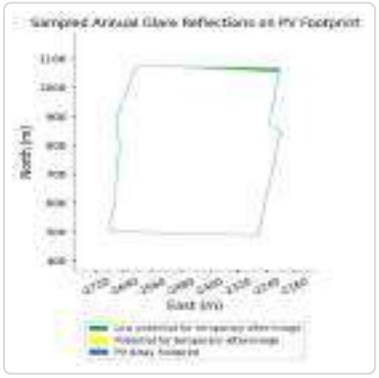

PV array is expected to produce the following glare for this receptor:

- 23 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 5: OP 1

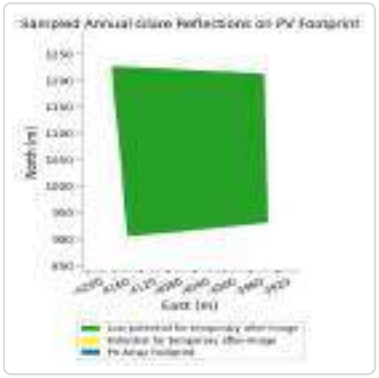

PV array is expected to produce the following glare for this receptor:

- 1,145 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

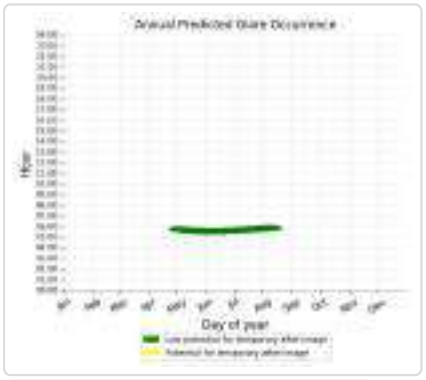

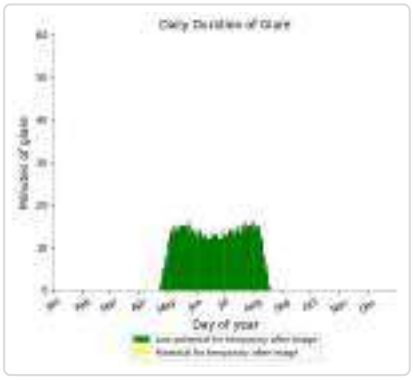

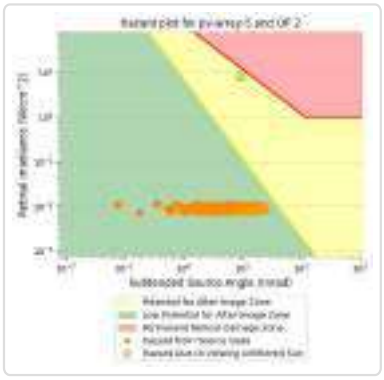

PV array 5: OP 2

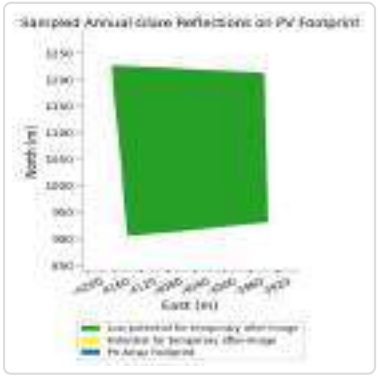

PV array is expected to produce the following glare for this receptor:

- 1,482 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

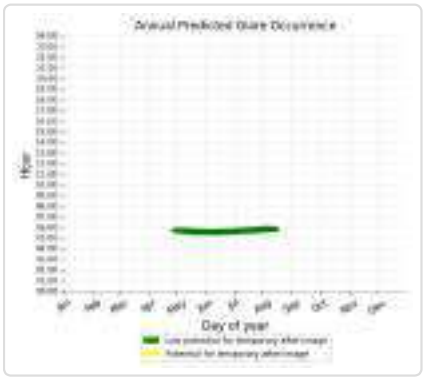

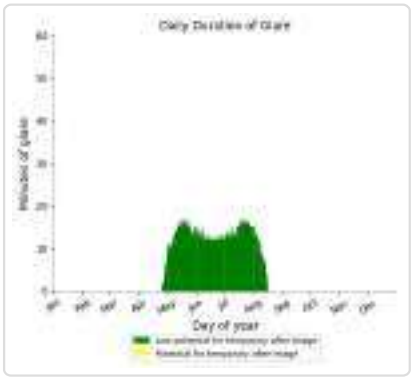

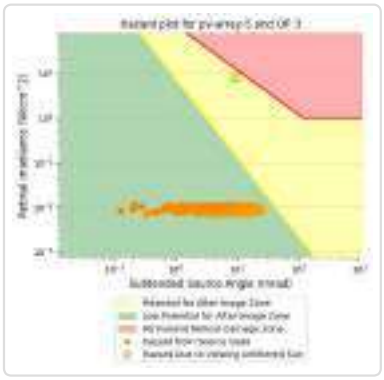

PV array 5: OP 3

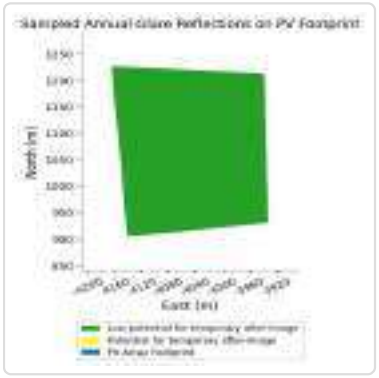

PV array is expected to produce the following glare for this receptor:

- 1,448 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

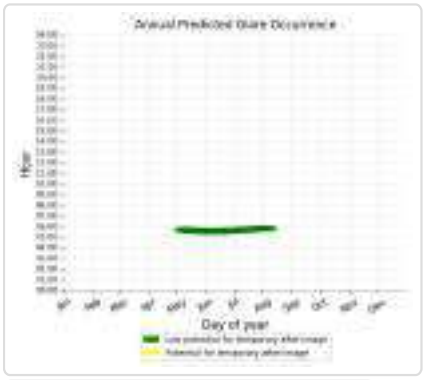

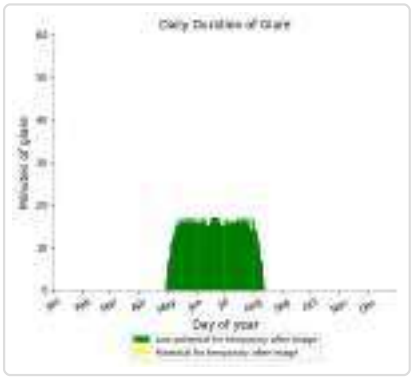

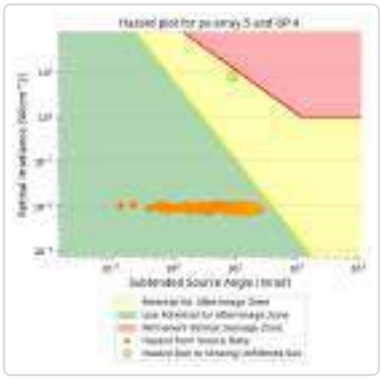

PV array 5: OP 4

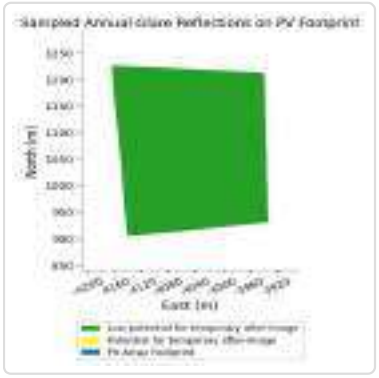

PV array is expected to produce the following glare for this receptor:

- 1,558 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

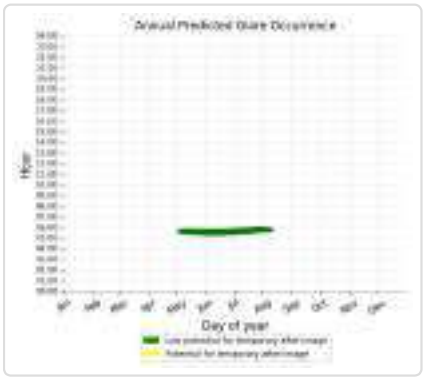

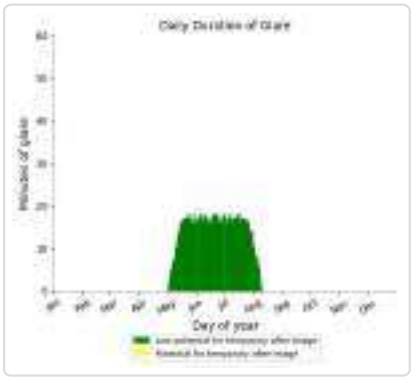

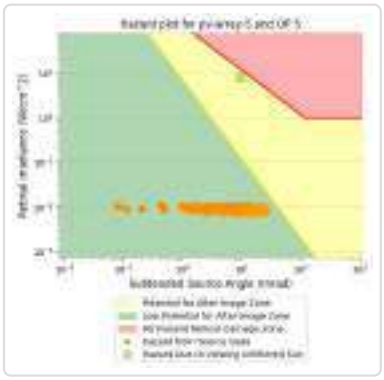

PV array 5: OP 5

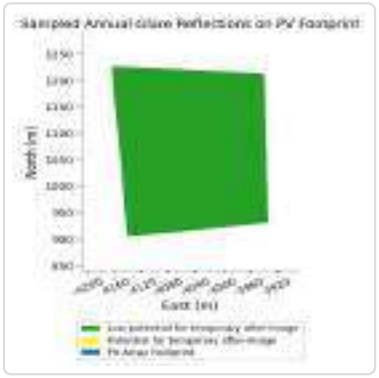

PV array is expected to produce the following glare for this receptor:

- 1,498 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

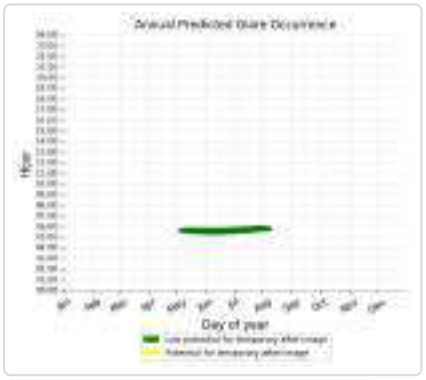

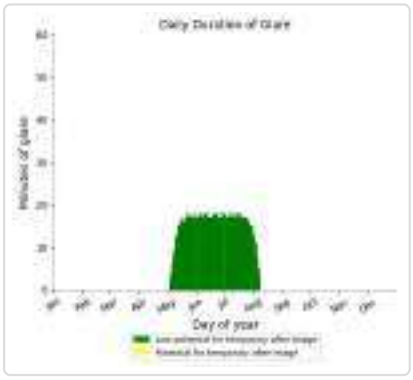

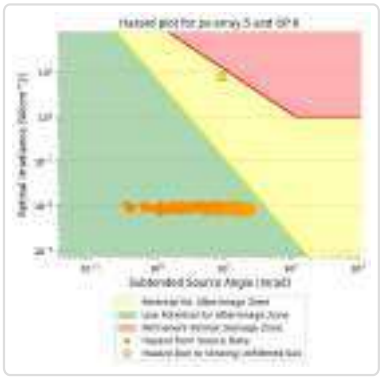

PV array 5: OP 6

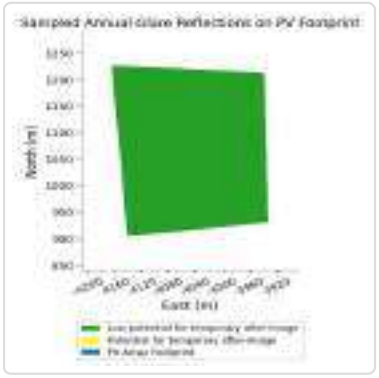

PV array is expected to produce the following glare for this receptor:

- 1,524 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

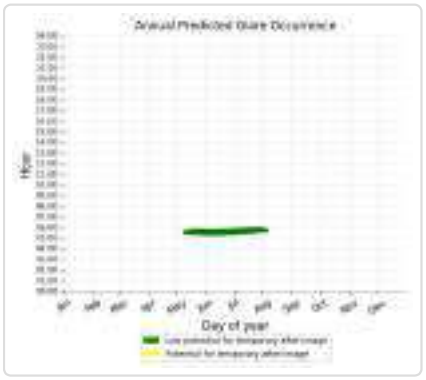

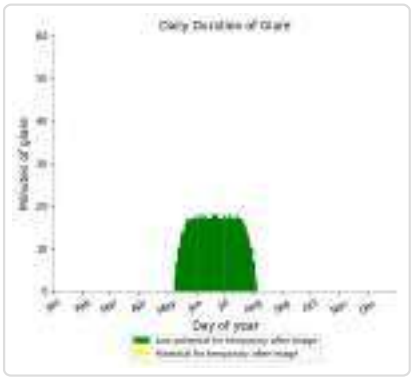

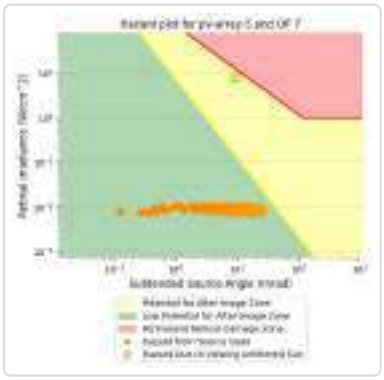

PV array 5: OP 7

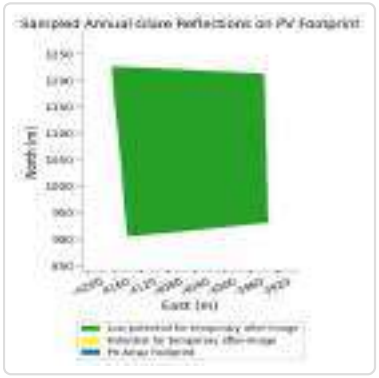

PV array is expected to produce the following glare for this receptor:

- 1,344 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

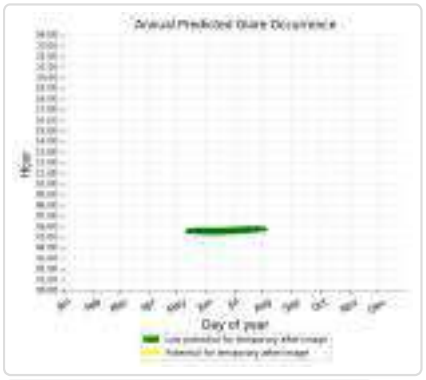

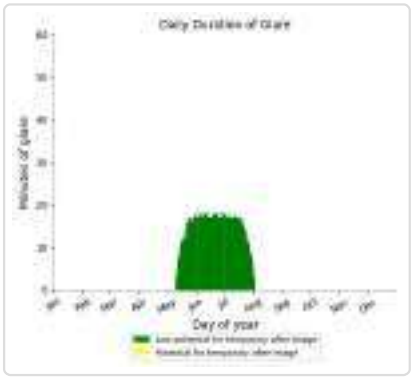

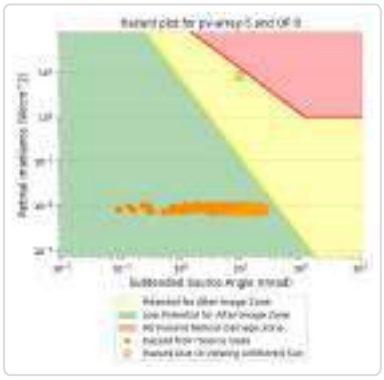

PV array 5: OP 8

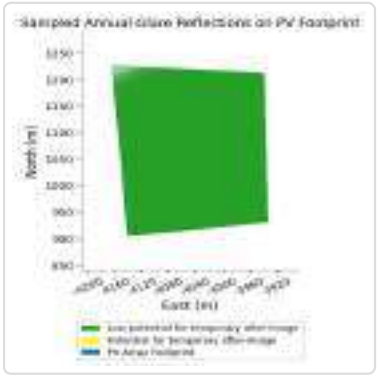

PV array is expected to produce the following glare for this receptor:

- 1,282 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

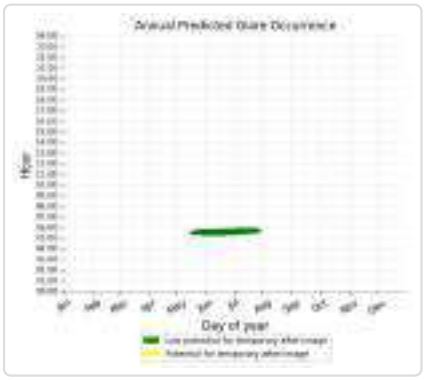

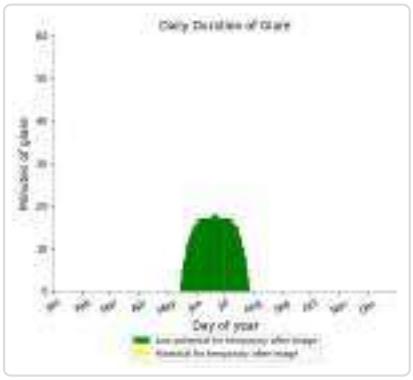

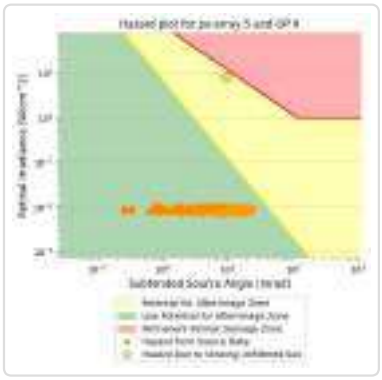

PV array 5: OP 9

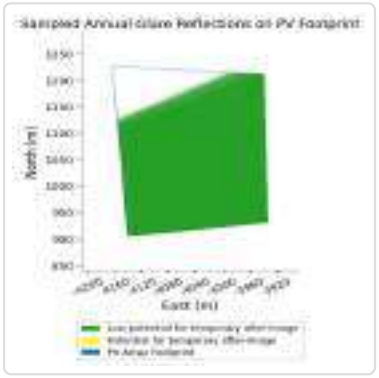

PV array is expected to produce the following glare for this receptor:

- 1,043 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

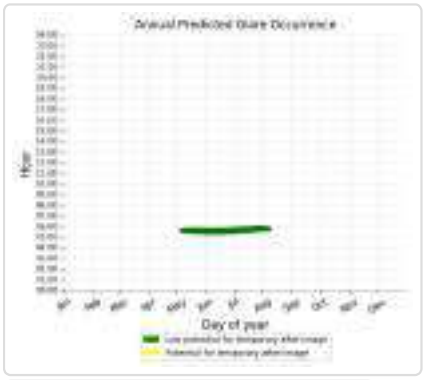

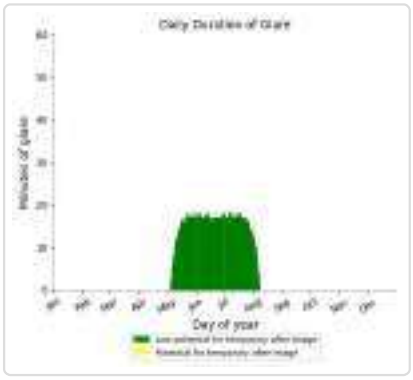

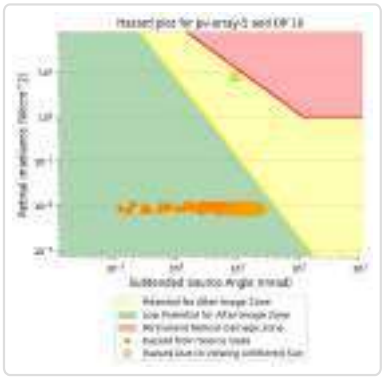

PV array 5: OP 10

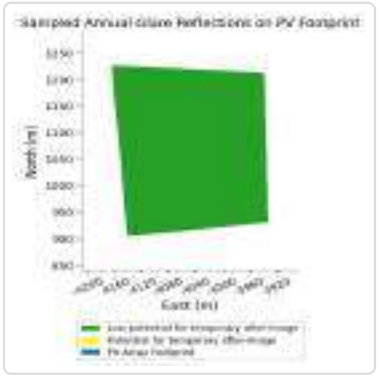

PV array is expected to produce the following glare for this receptor:

- 1,494 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

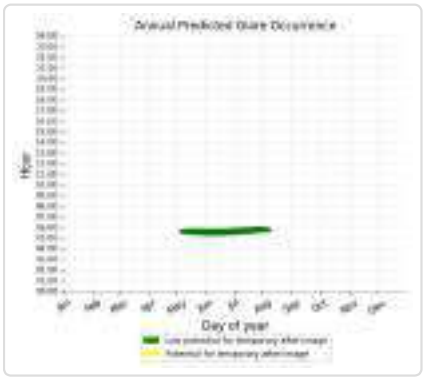

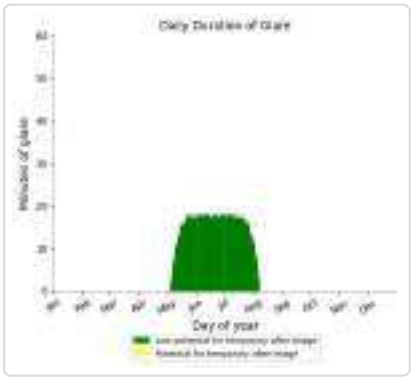

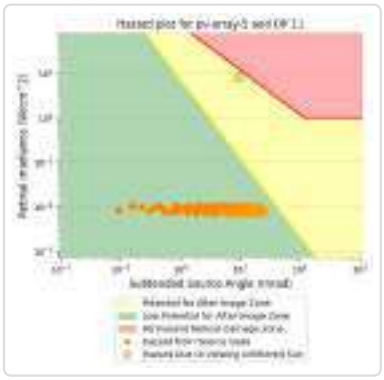

PV array 5: OP 11

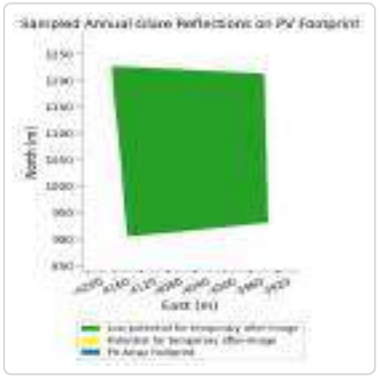

PV array is expected to produce the following glare for this receptor:

- 1,486 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

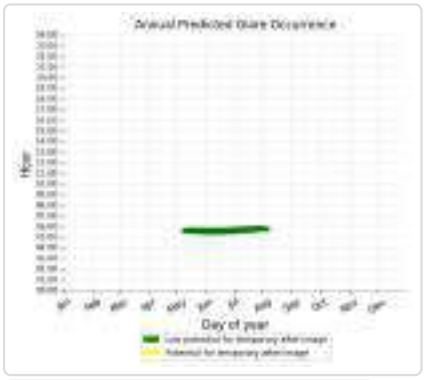

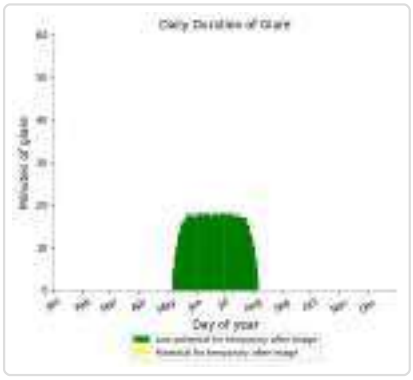

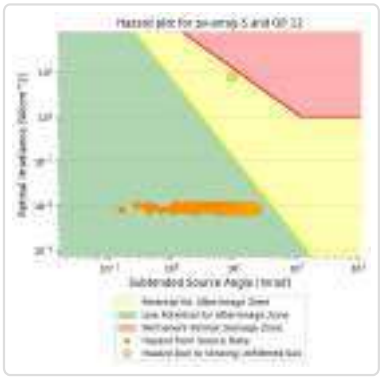

PV array 5: OP 12

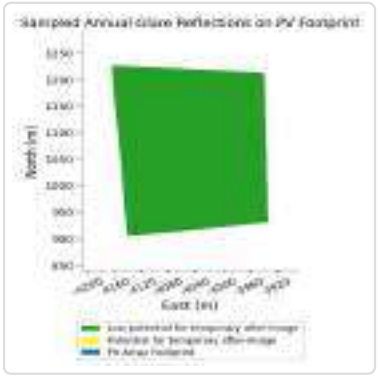

PV array is expected to produce the following glare for this receptor:

- 1,459 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

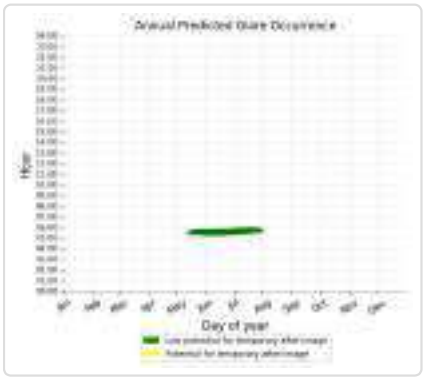

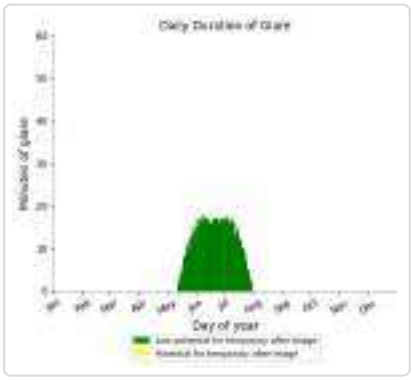

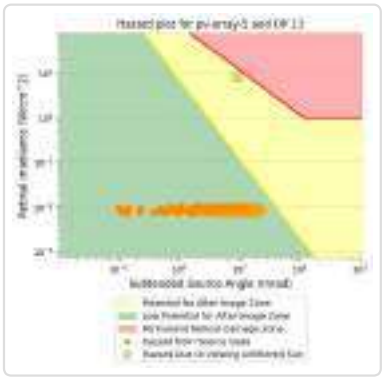

PV array 5: OP 13

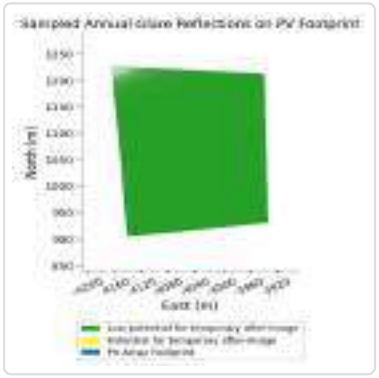

PV array is expected to produce the following glare for this receptor:

- 1,040 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

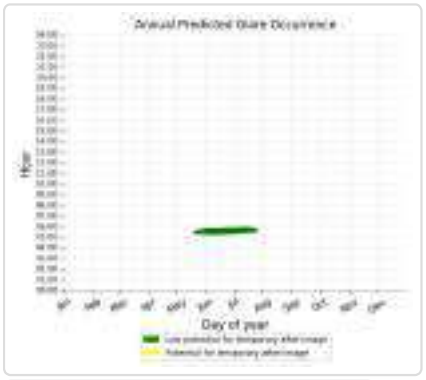

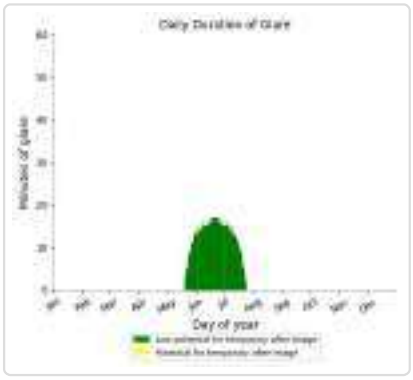

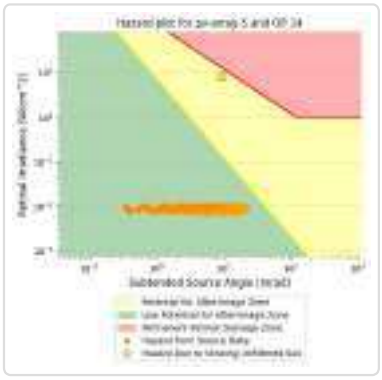

PV array 5: OP 14

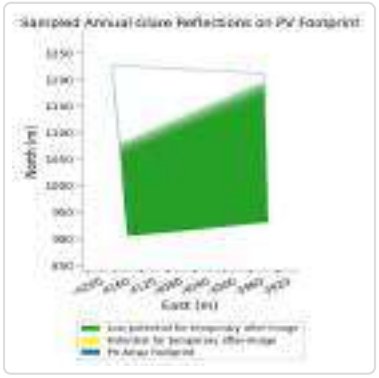

PV array is expected to produce the following glare for this receptor:

- 841 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

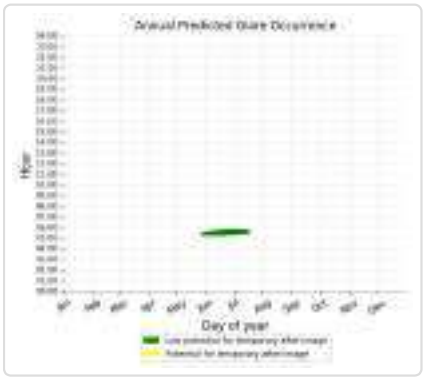

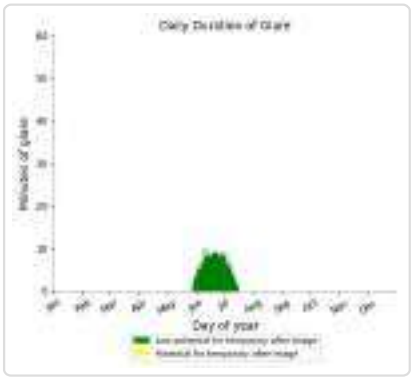

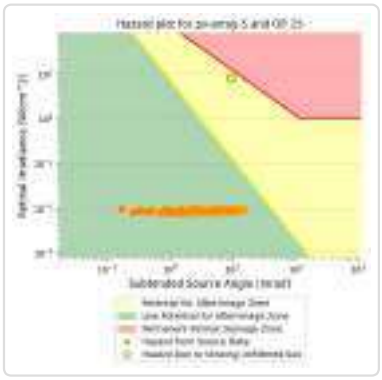

PV array 5: OP 15

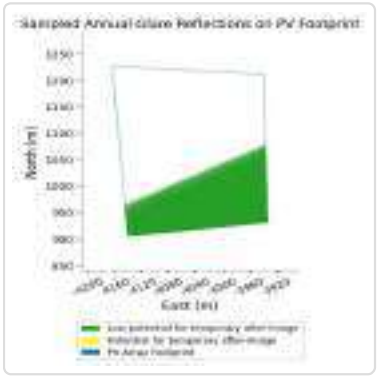

PV array is expected to produce the following glare for this receptor:

- 319 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

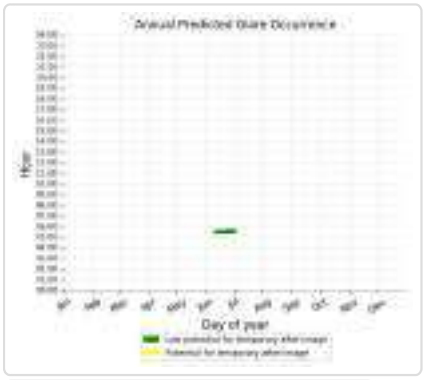

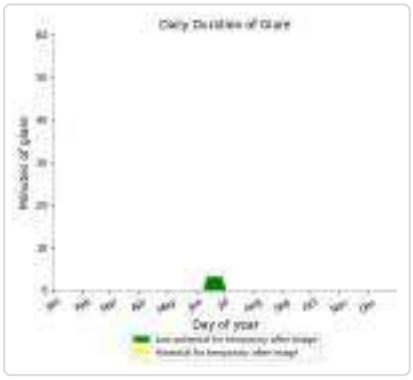

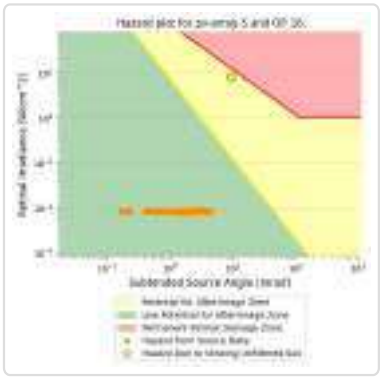

PV array 5: OP 16

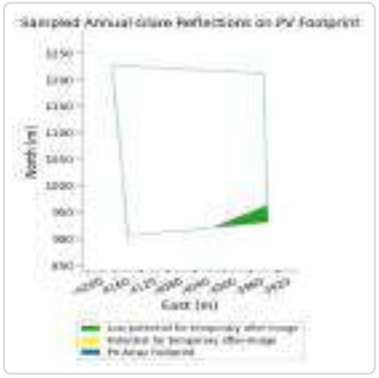

PV array is expected to produce the following glare for this receptor:

- 59 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

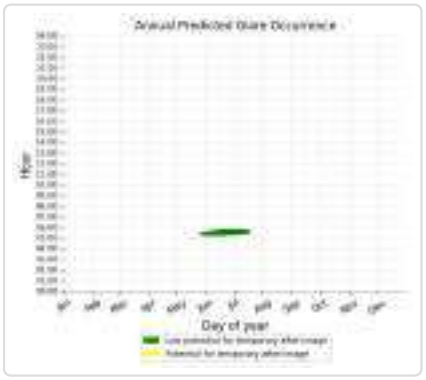

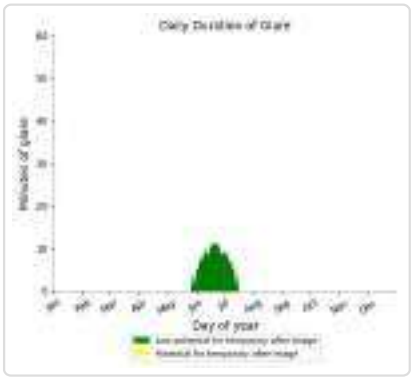

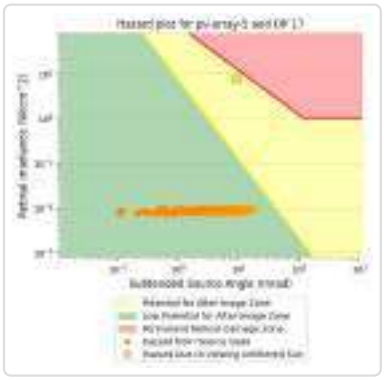

PV array 5: OP 17

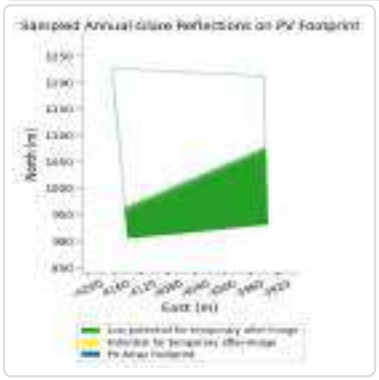

PV array is expected to produce the following glare for this receptor:

- 374 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 6: OP 1

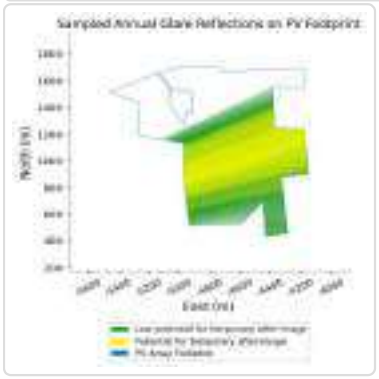

PV array is expected to produce the following glare for this receptor:

- 1,666 minutes of "green" glare with low potential to cause temporary after-image.
- 25 minutes of "yellow" glare with potential to cause temporary after-image.

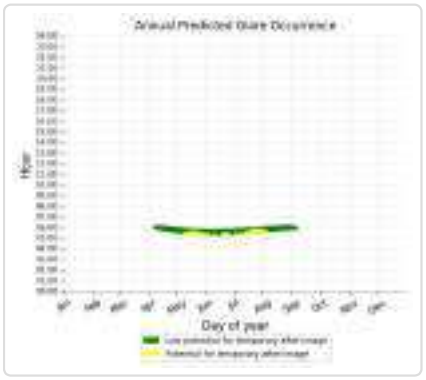

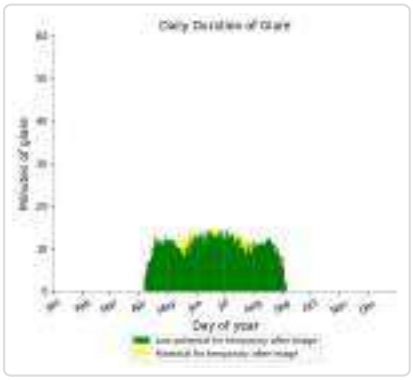

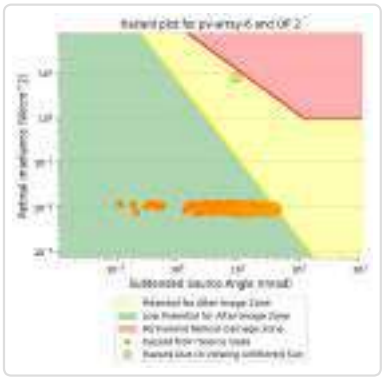

PV array 6: OP 2

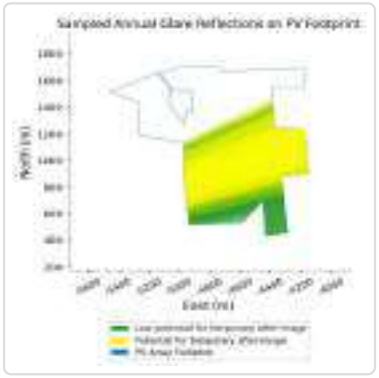

PV array is expected to produce the following glare for this receptor:

- 1,673 minutes of "green" glare with low potential to cause temporary after-image.
- 83 minutes of "yellow" glare with potential to cause temporary after-image.

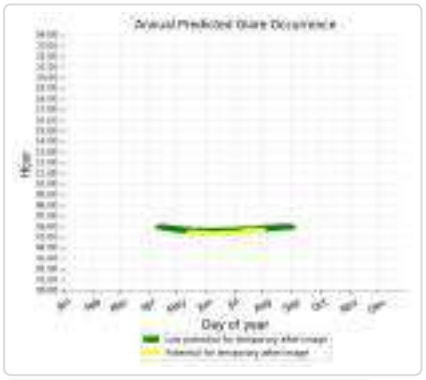

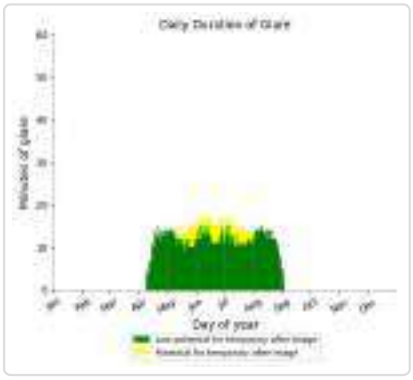

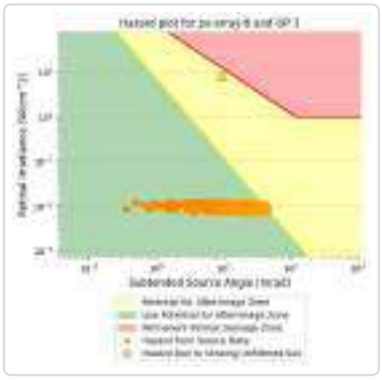

PV array 6: OP 3

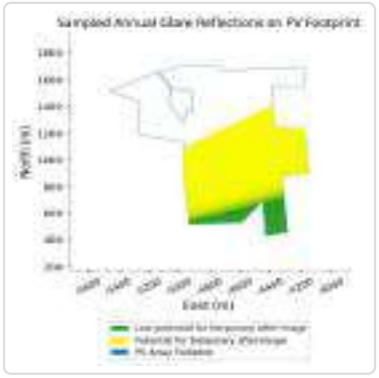

PV array is expected to produce the following glare for this receptor:

- 1,742 minutes of "green" glare with low potential to cause temporary after-image.
- 262 minutes of "yellow" glare with potential to cause temporary after-image.

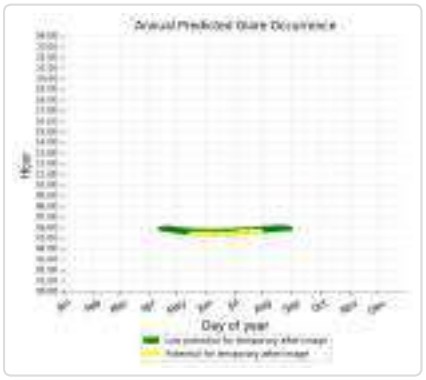

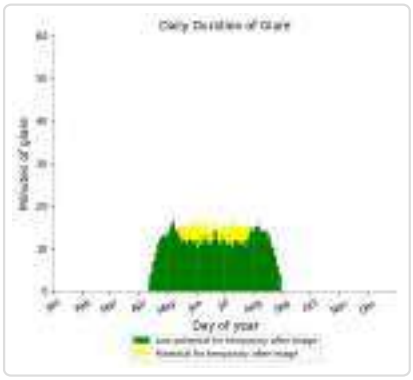

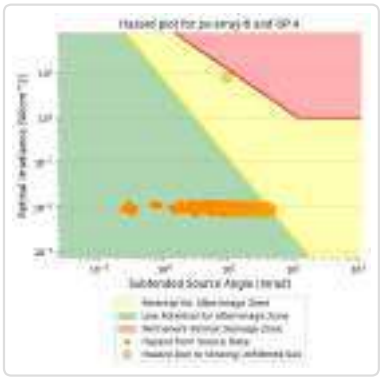

PV array 6: OP 4

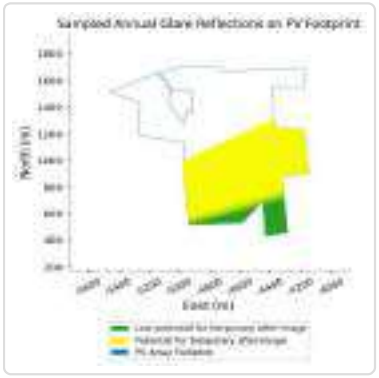

PV array is expected to produce the following glare for this receptor:

- 1,653 minutes of "green" glare with low potential to cause temporary after-image.
- 255 minutes of "yellow" glare with potential to cause temporary after-image.

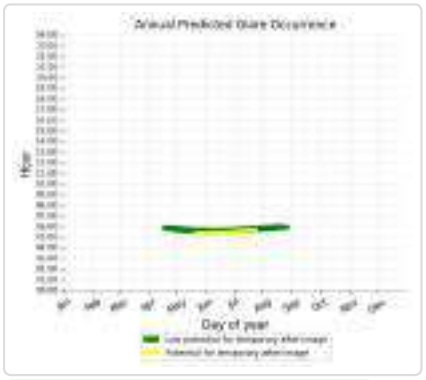

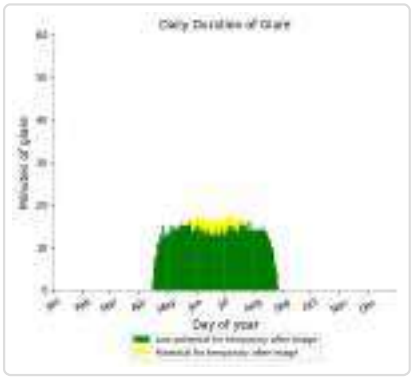

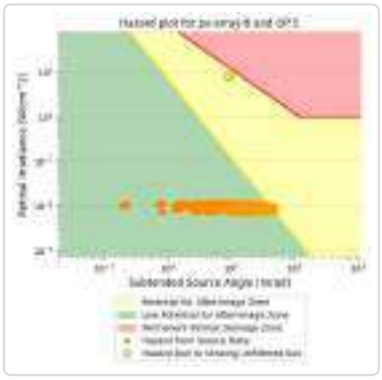

PV array 6: OP 5

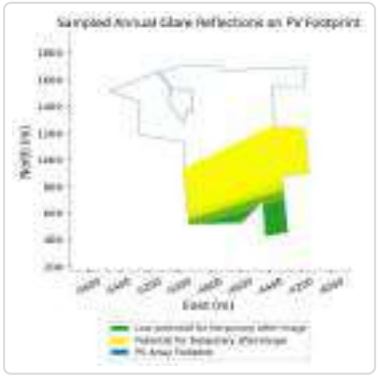

PV array is expected to produce the following glare for this receptor:

- 1,779 minutes of "green" glare with low potential to cause temporary after-image.
- 152 minutes of "yellow" glare with potential to cause temporary after-image.

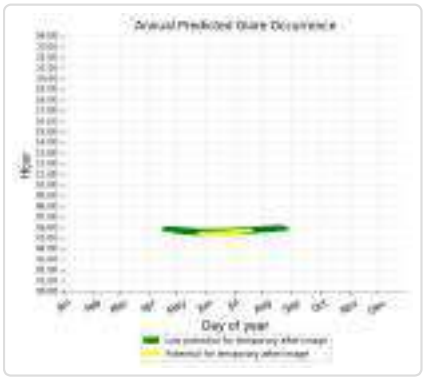

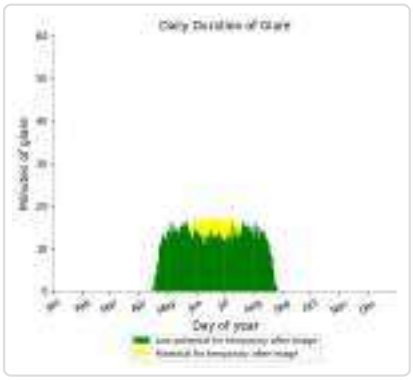

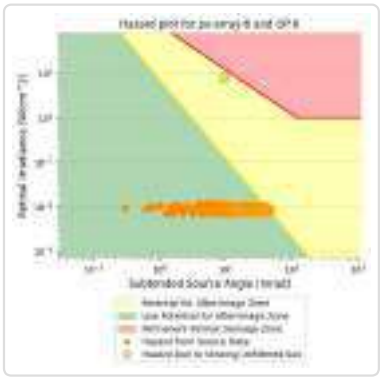

PV array 6: OP 6

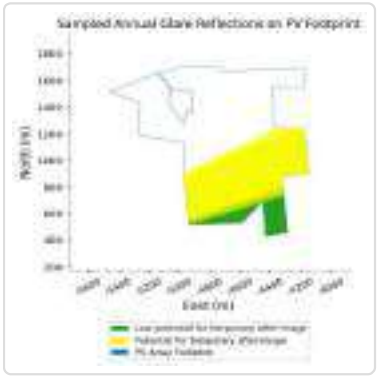

PV array is expected to produce the following glare for this receptor:

- 1,676 minutes of "green" glare with low potential to cause temporary after-image.
- 177 minutes of "yellow" glare with potential to cause temporary after-image.

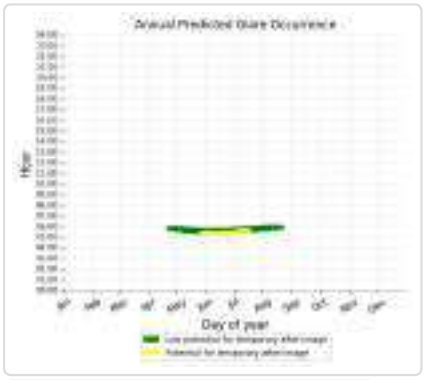

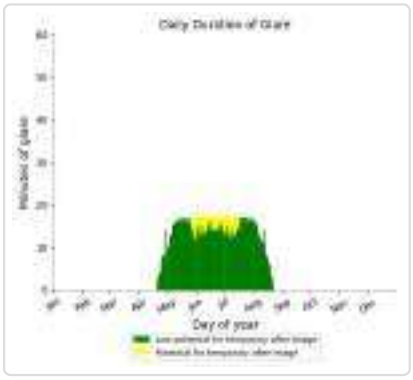

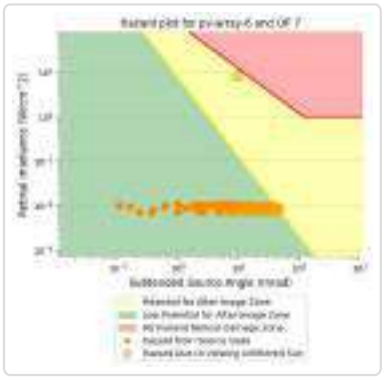

PV array 6: OP 7

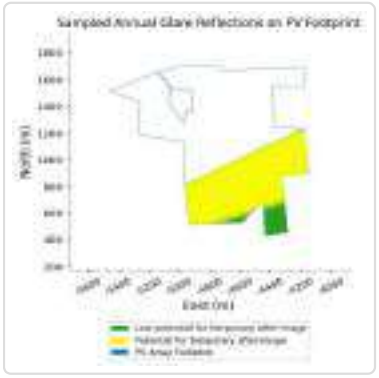

PV array is expected to produce the following glare for this receptor:

- 1,639 minutes of "green" glare with low potential to cause temporary after-image.
- 170 minutes of "yellow" glare with potential to cause temporary after-image.

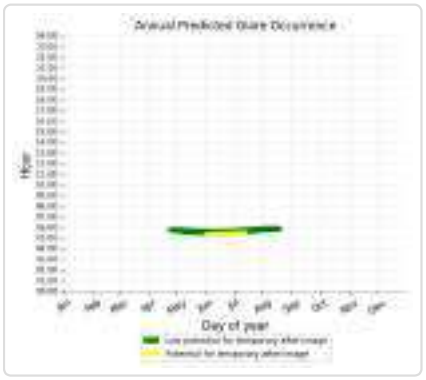

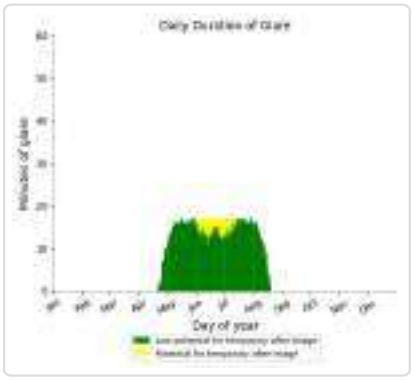

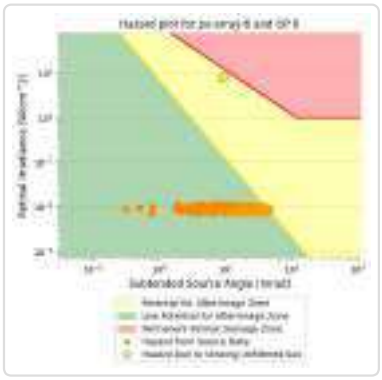

PV array 6: OP 8

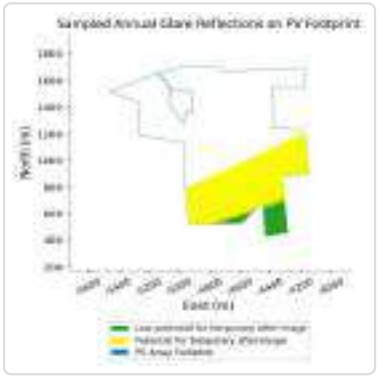

PV array is expected to produce the following glare for this receptor:

- 1,641 minutes of "green" glare with low potential to cause temporary after-image.
- 131 minutes of "yellow" glare with potential to cause temporary after-image.

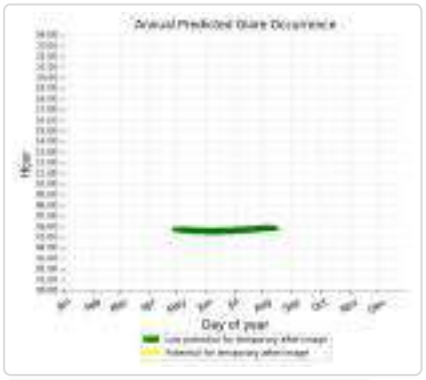

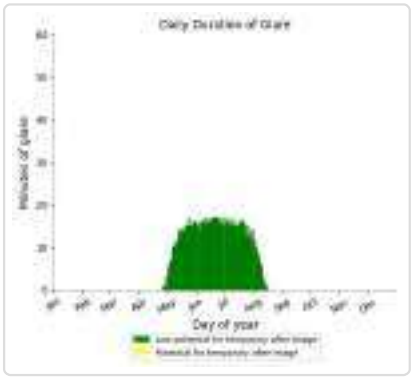

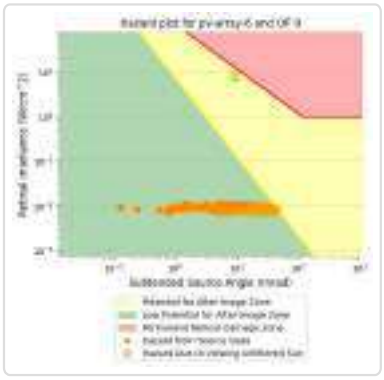

PV array 6: OP 9

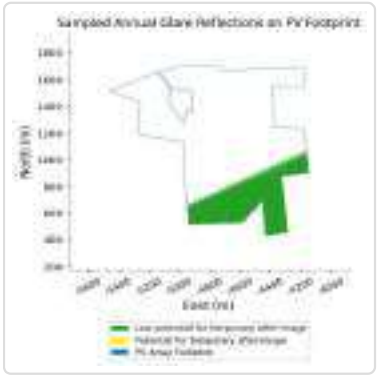

PV array is expected to produce the following glare for this receptor:

- 1,461 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

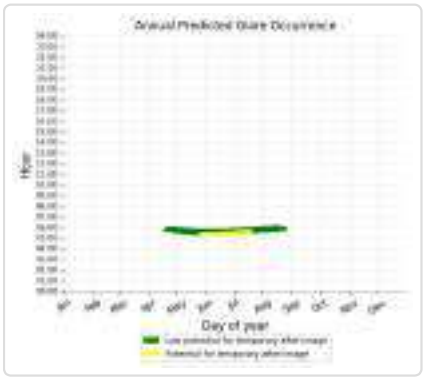

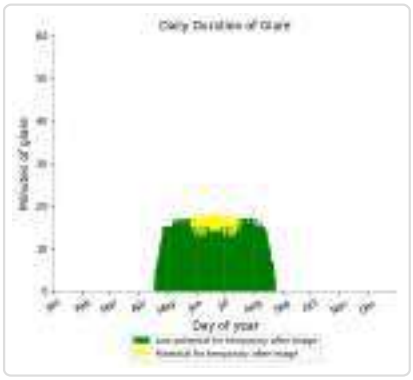

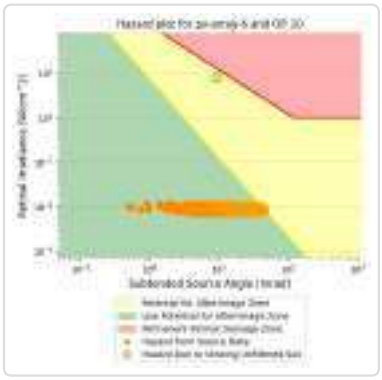

PV array 6: OP 10

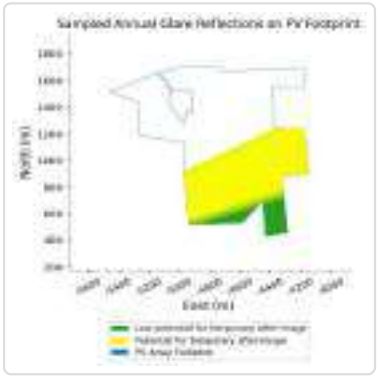

PV array is expected to produce the following glare for this receptor:

- 1,822 minutes of "green" glare with low potential to cause temporary after-image.
- 186 minutes of "yellow" glare with potential to cause temporary after-image.

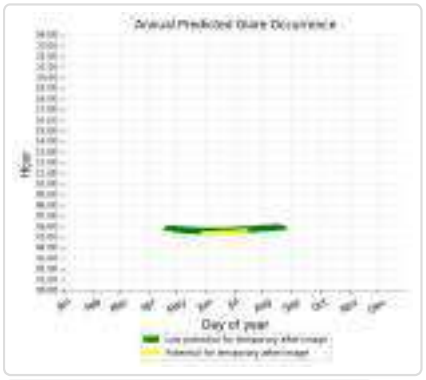

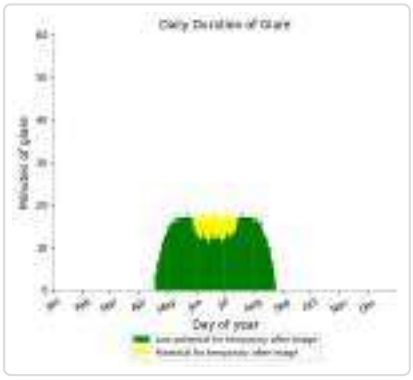

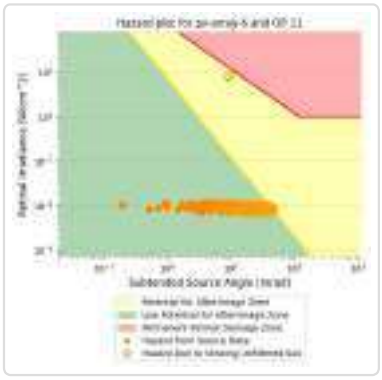

PV array 6: OP 11

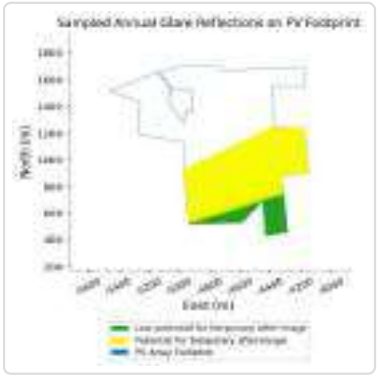

PV array is expected to produce the following glare for this receptor:

- 1,750 minutes of "green" glare with low potential to cause temporary after-image.
- 213 minutes of "yellow" glare with potential to cause temporary after-image.

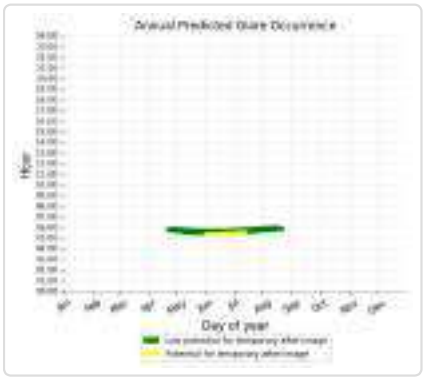

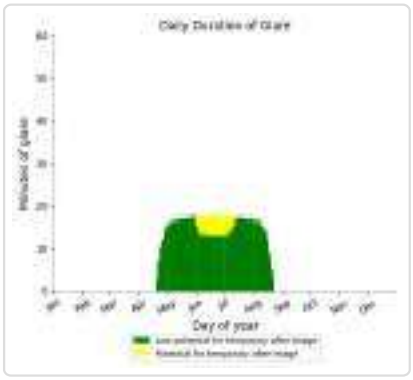

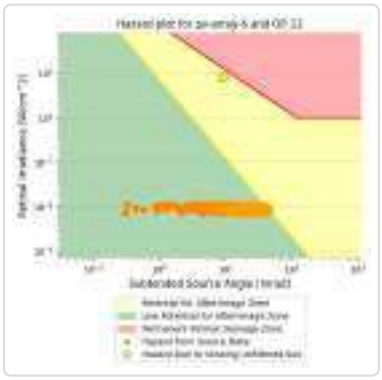

PV array 6: OP 12

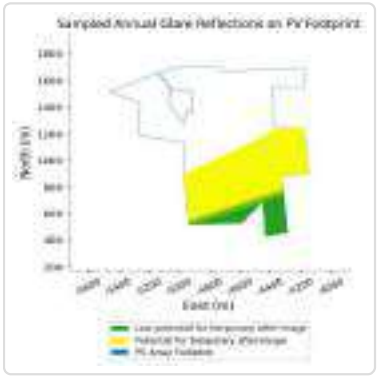

PV array is expected to produce the following glare for this receptor:

- 1,806 minutes of "green" glare with low potential to cause temporary after-image.
- 180 minutes of "yellow" glare with potential to cause temporary after-image.

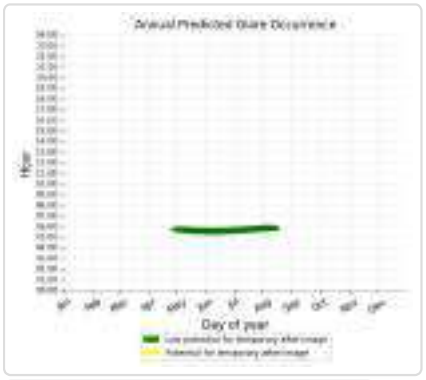

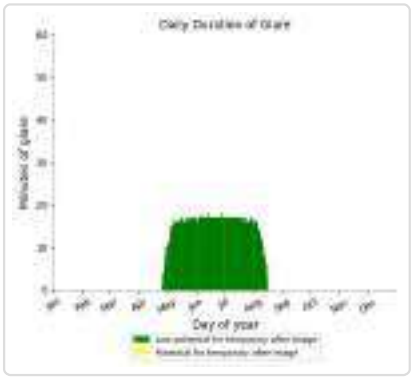

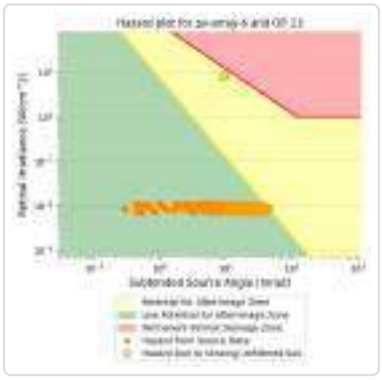

PV array 6: OP 13

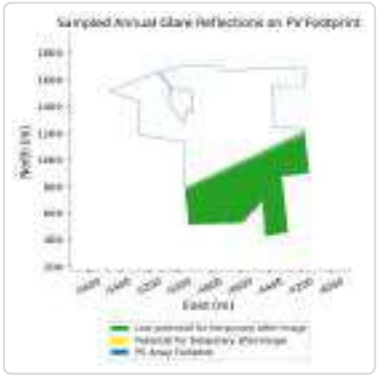

PV array is expected to produce the following glare for this receptor:

- 1,739 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

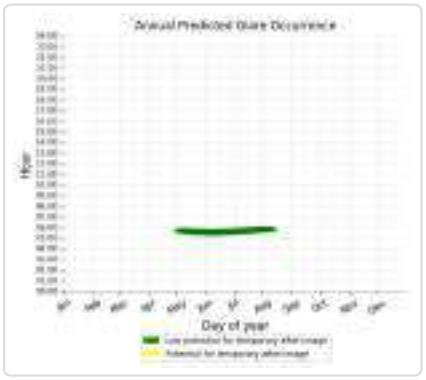

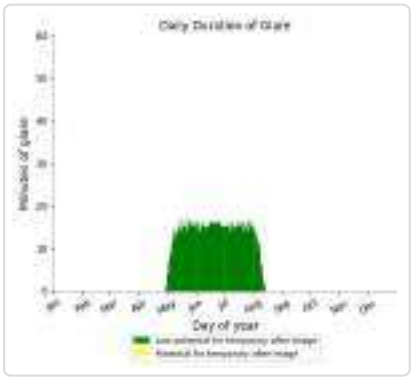

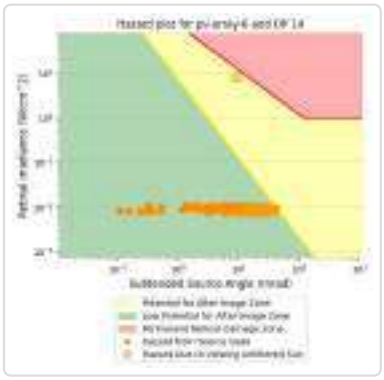

PV array 6: OP 14

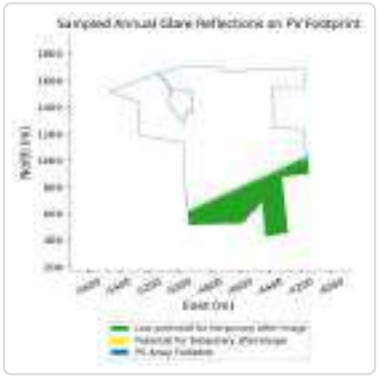

PV array is expected to produce the following glare for this receptor:

- 1,472 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

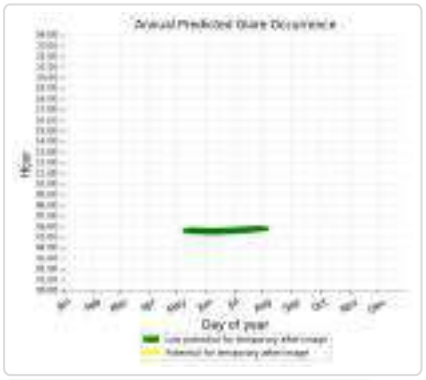

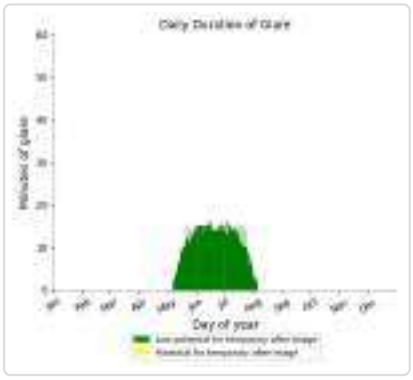

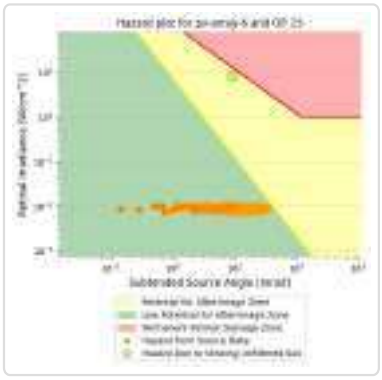

PV array 6: OP 15

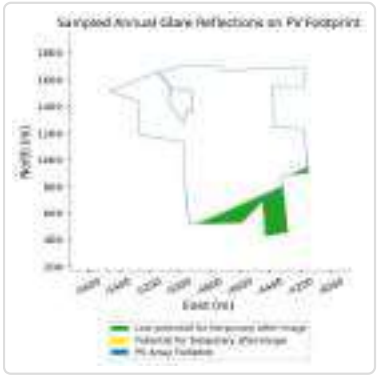

PV array is expected to produce the following glare for this receptor:

- 1,058 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

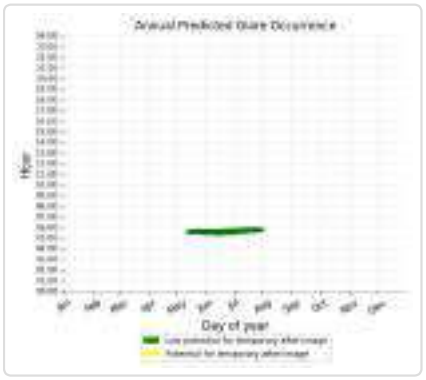

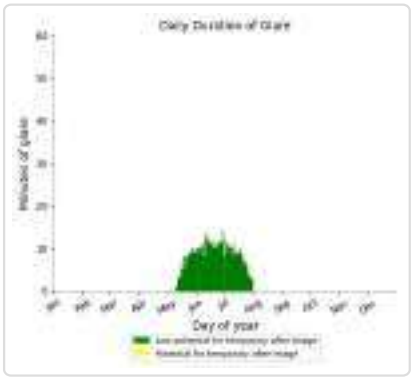

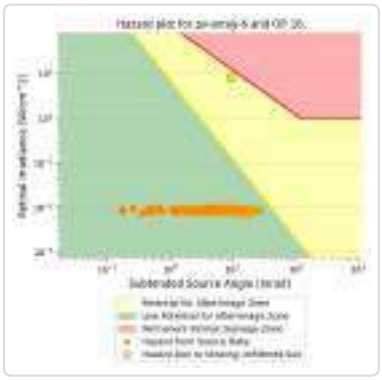

PV array 6: OP 16

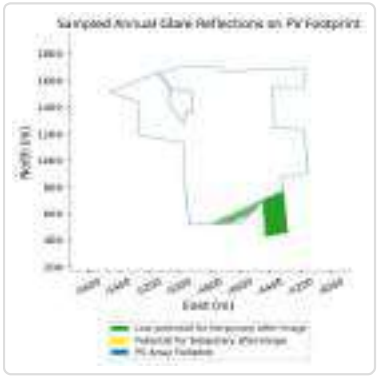

PV array is expected to produce the following glare for this receptor:

- 711 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

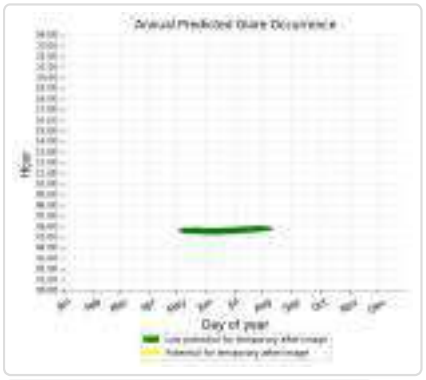

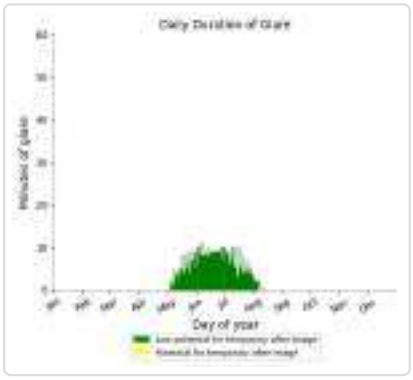

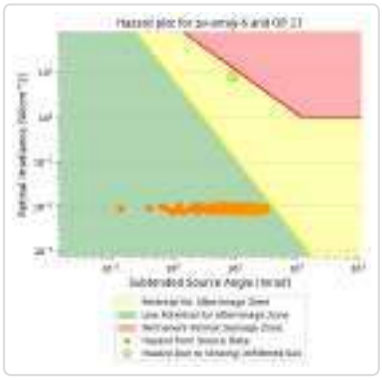

PV array 6: OP 17

PV array is expected to produce the following glare for this receptor:

PV array 7: OP 1

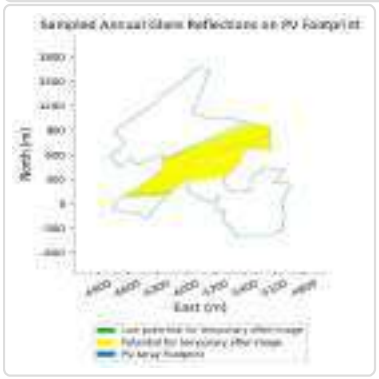

PV array is expected to produce the following glare for this receptor:

- 1,585 minutes of "green" glare with low potential to cause temporary after-image.
- 396 minutes of "yellow" glare with potential to cause temporary after-image.

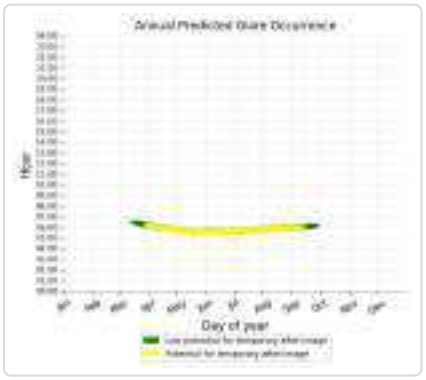

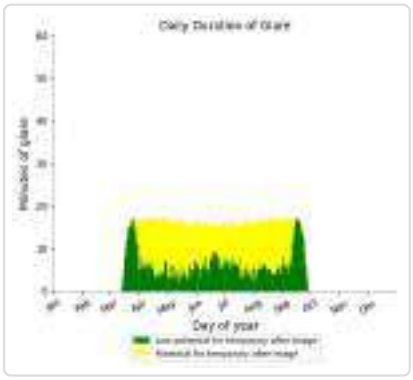

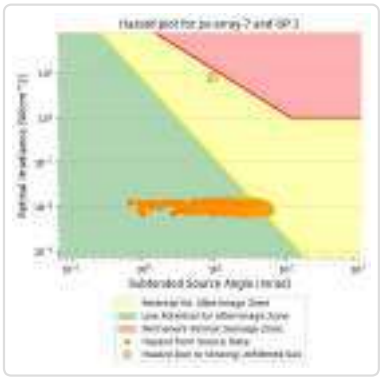

PV array 7: OP 2

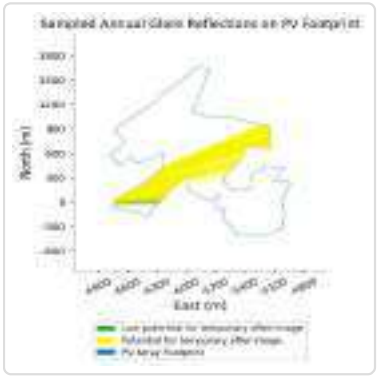

PV array is expected to produce the following glare for this receptor:

- 1,319 minutes of "green" glare with low potential to cause temporary after-image.
- 1,782 minutes of "yellow" glare with potential to cause temporary after-image.

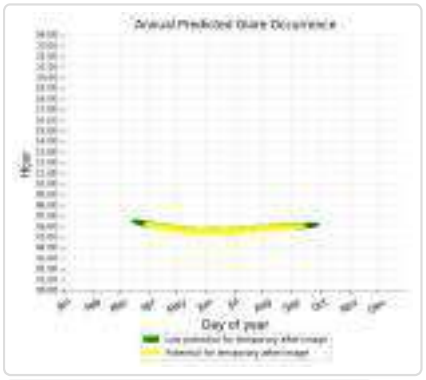

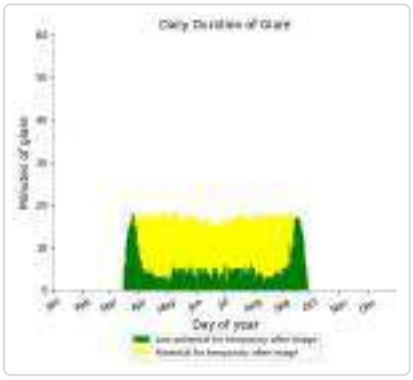

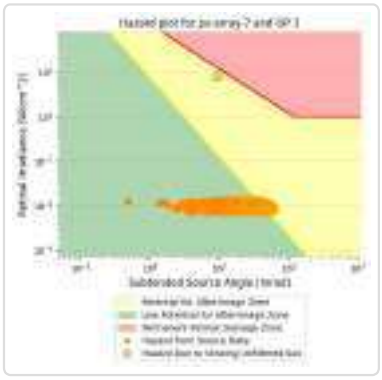

PV array 7: OP 3

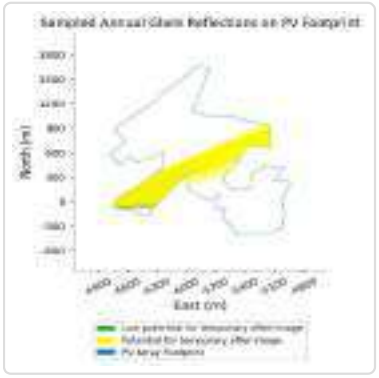

PV array is expected to produce the following glare for this receptor:

- 1,141 minutes of "green" glare with low potential to cause temporary after-image.
- 2,097 minutes of "yellow" glare with potential to cause temporary after-image.

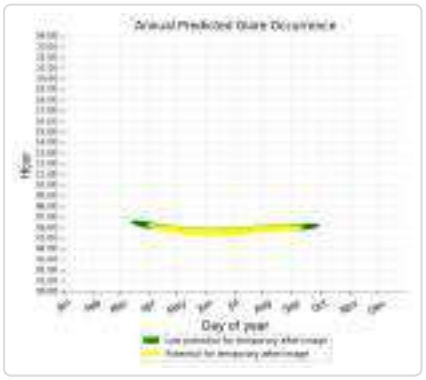

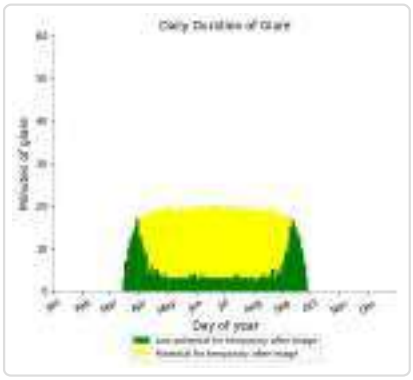

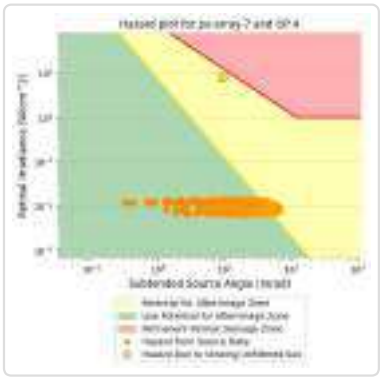

PV array 7: OP 4

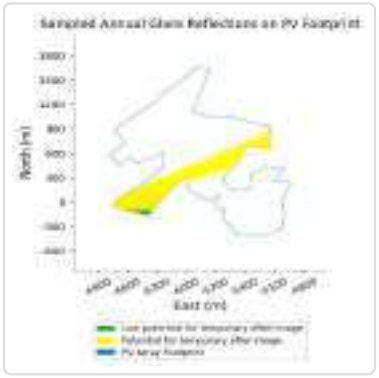

PV array is expected to produce the following glare for this receptor:

- 1,093 minutes of "green" glare with low potential to cause temporary after-image.
- 2,411 minutes of "yellow" glare with potential to cause temporary after-image.

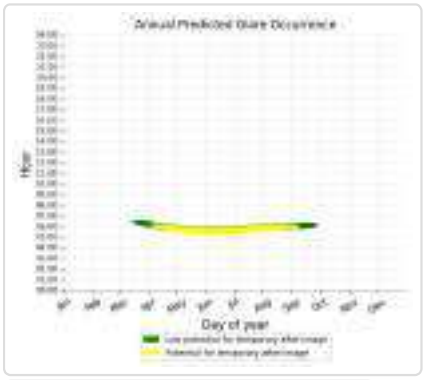

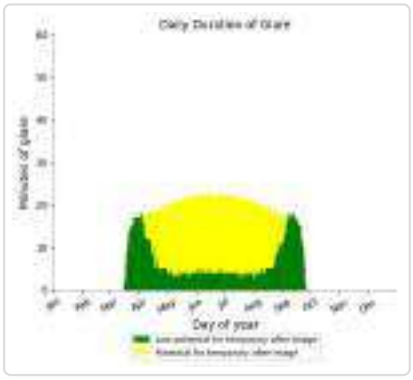

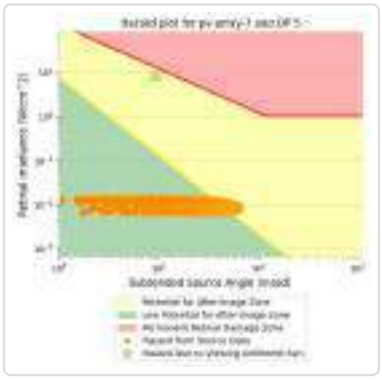

PV array 7: OP 5

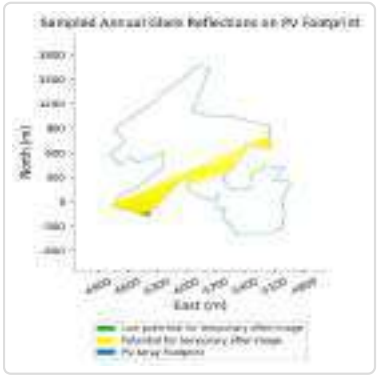

PV array is expected to produce the following glare for this receptor:

- 1,393 minutes of "green" glare with low potential to cause temporary after-image.
- 2,339 minutes of "yellow" glare with potential to cause temporary after-image.

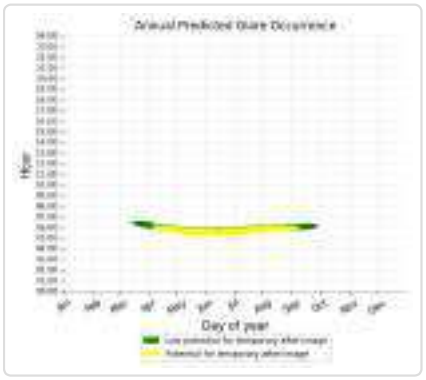

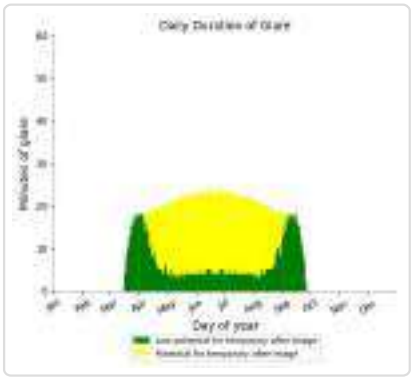

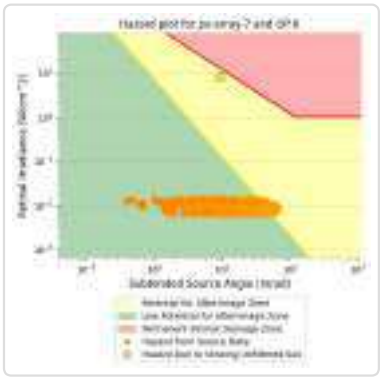

PV array 7: OP 6

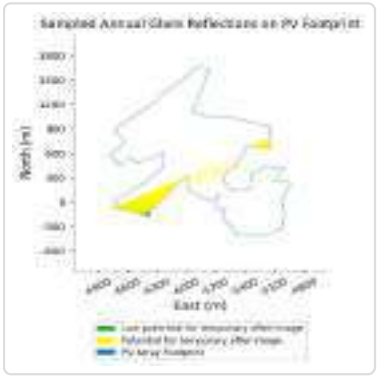

PV array is expected to produce the following glare for this receptor:

- 1,430 minutes of "green" glare with low potential to cause temporary after-image.
- 2,406 minutes of "yellow" glare with potential to cause temporary after-image.

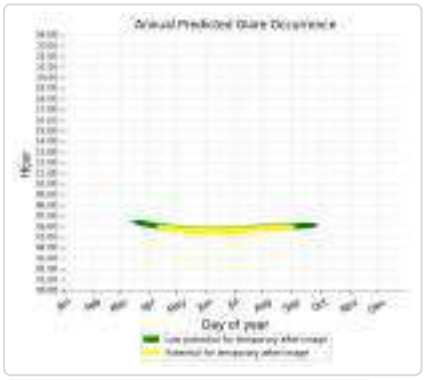

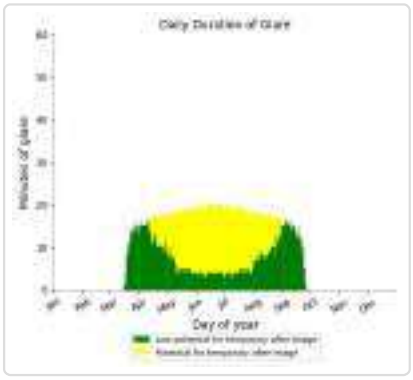

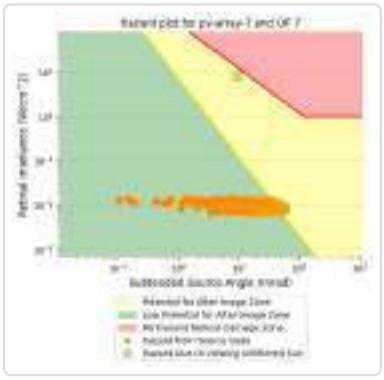

PV array 7: OP 7

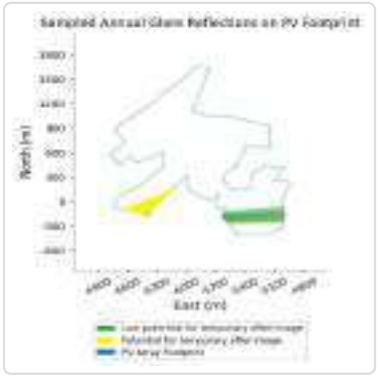

PV array is expected to produce the following glare for this receptor:

- 1,580 minutes of "green" glare with low potential to cause temporary after-image.
- 1,729 minutes of "yellow" glare with potential to cause temporary after-image.

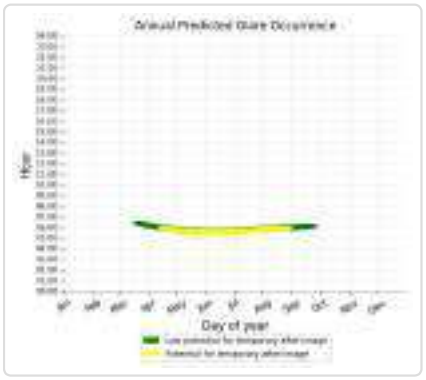

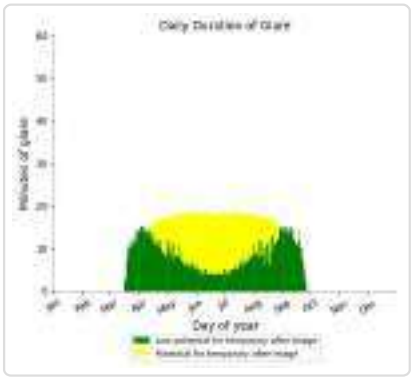

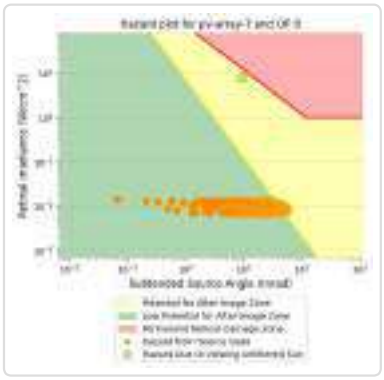

PV array 7: OP 8

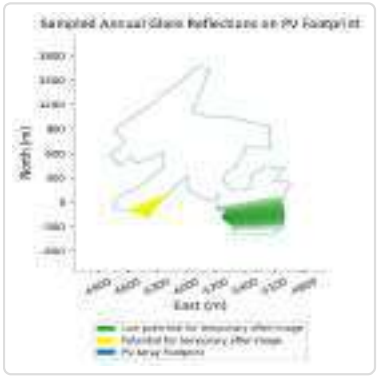

PV array is expected to produce the following glare for this receptor:

- 1,692 minutes of "green" glare with low potential to cause temporary after-image.
- 1,415 minutes of "yellow" glare with potential to cause temporary after-image.

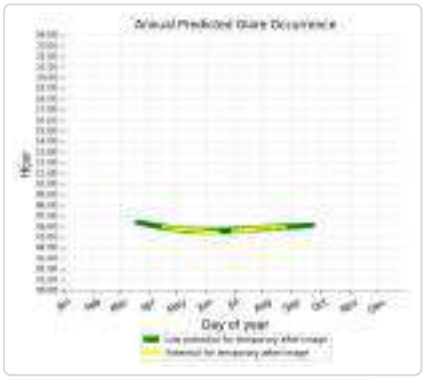

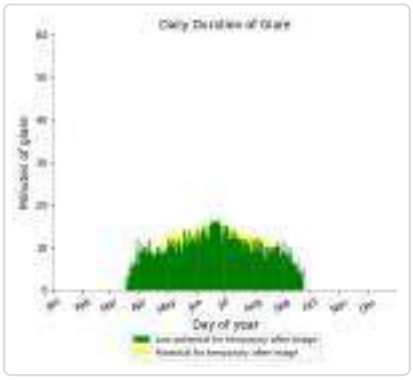

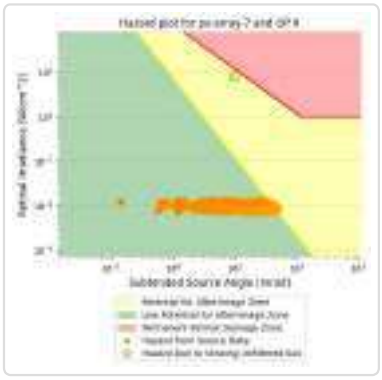

PV array 7: OP 9

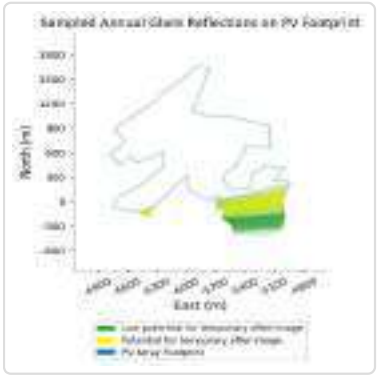

PV array is expected to produce the following glare for this receptor:

- 1,973 minutes of "green" glare with low potential to cause temporary after-image.
- 156 minutes of "yellow" glare with potential to cause temporary after-image.

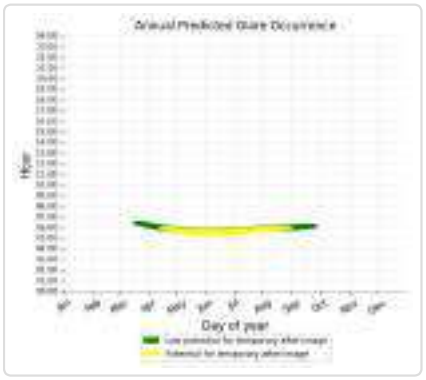

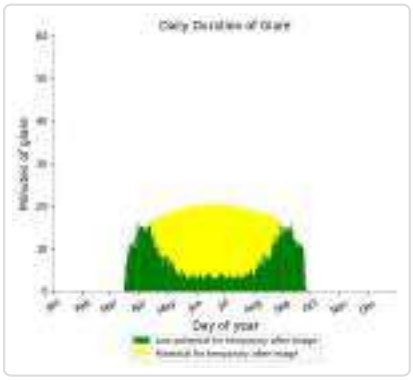

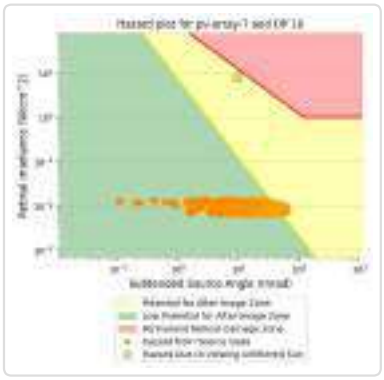

PV array 7: OP 10

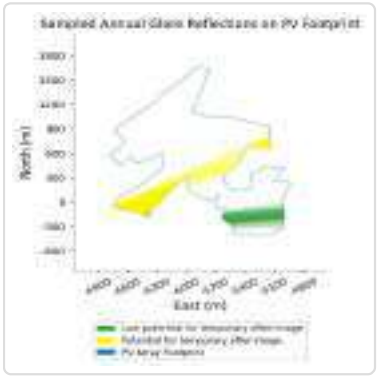

PV array is expected to produce the following glare for this receptor:

- 1,441 minutes of "green" glare with low potential to cause temporary after-image.
- 1,859 minutes of "yellow" glare with potential to cause temporary after-image.

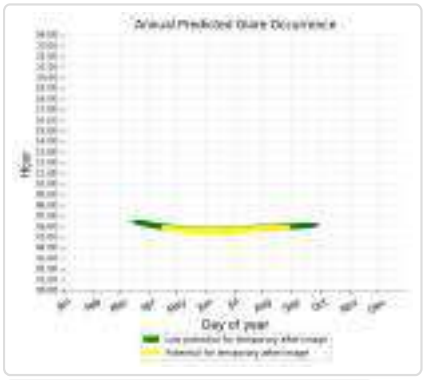

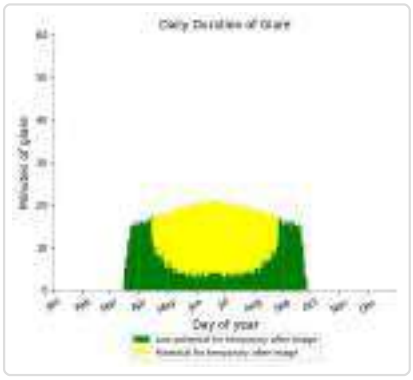

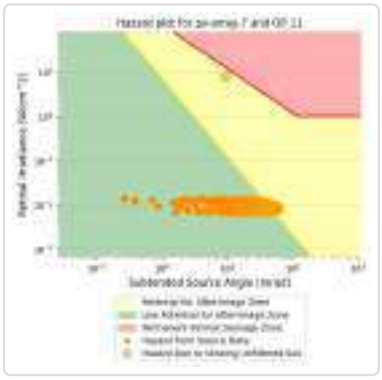

PV array 7: OP 11

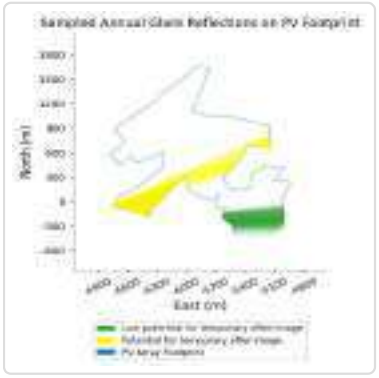

PV array is expected to produce the following glare for this receptor:

- 1,518 minutes of "green" glare with low potential to cause temporary after-image.
- 1,936 minutes of "yellow" glare with potential to cause temporary after-image.

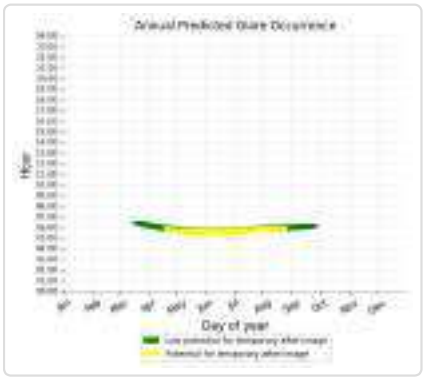

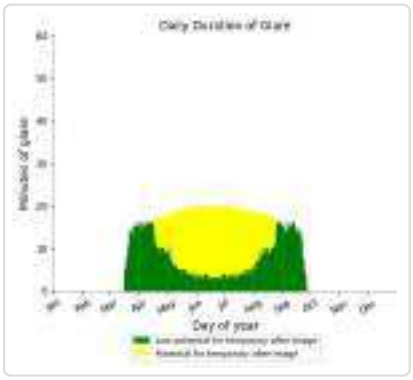

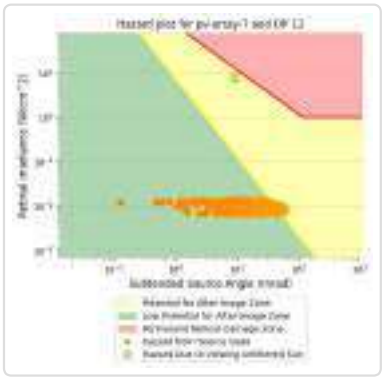

PV array 7: OP 12

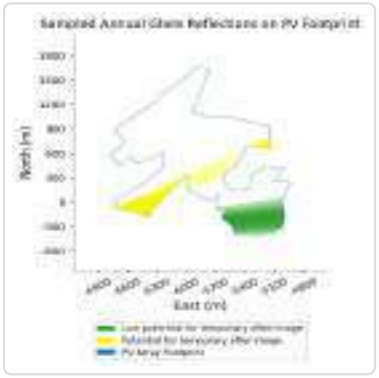

PV array is expected to produce the following glare for this receptor:

- 1,648 minutes of "green" glare with low potential to cause temporary after-image.
- 1,712 minutes of "yellow" glare with potential to cause temporary after-image.

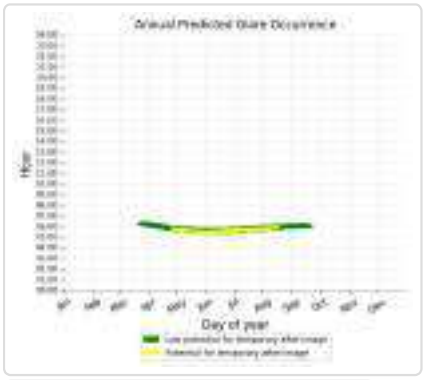

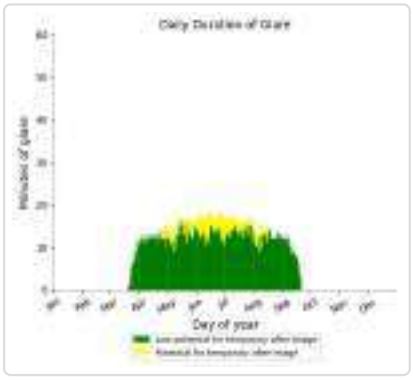

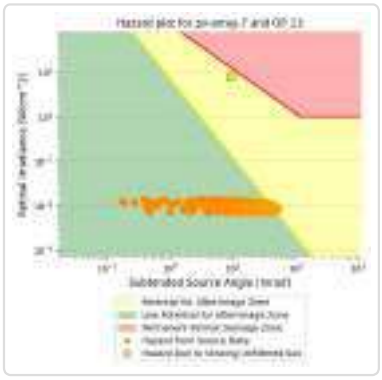

PV array 7: OP 13

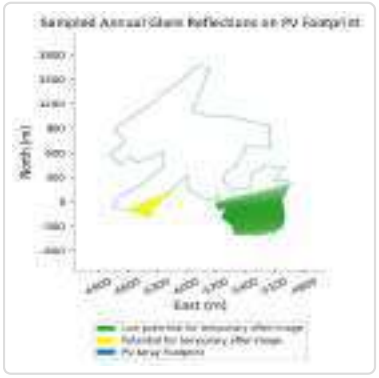

PV array is expected to produce the following glare for this receptor:

- 2,199 minutes of "green" glare with low potential to cause temporary after-image.
- 348 minutes of "yellow" glare with potential to cause temporary after-image.

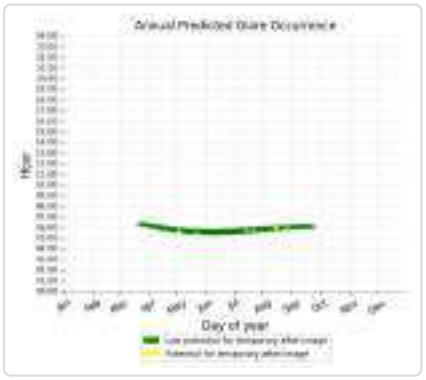

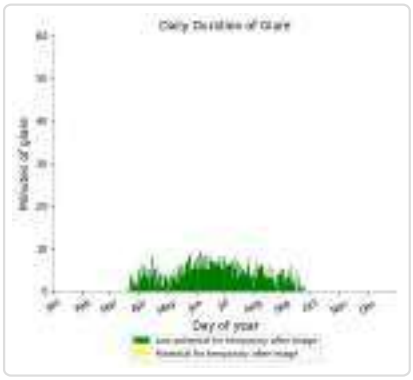

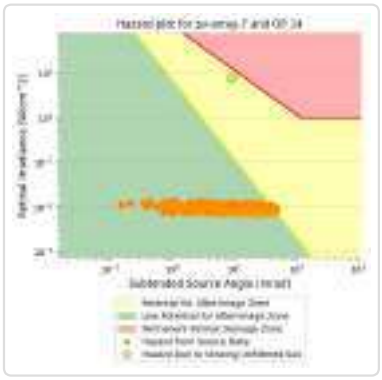

PV array 7: OP 14

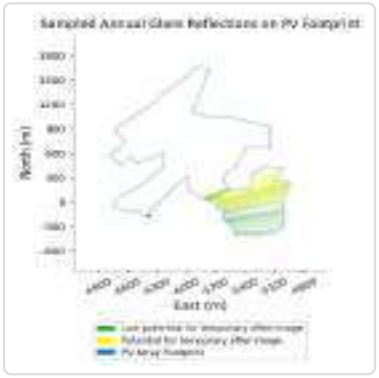

PV array is expected to produce the following glare for this receptor:

- 822 minutes of "green" glare with low potential to cause temporary after-image.
- 9 minutes of "yellow" glare with potential to cause temporary after-image.

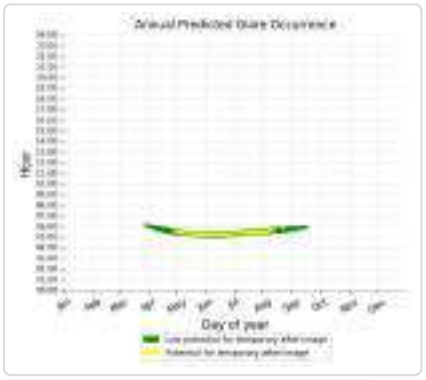

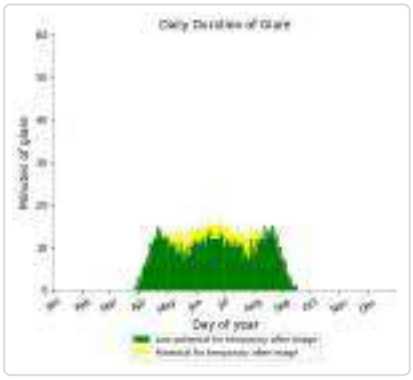

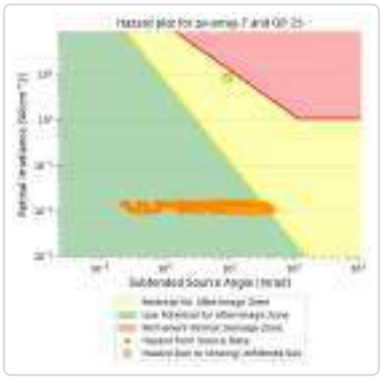

PV array 7: OP 15

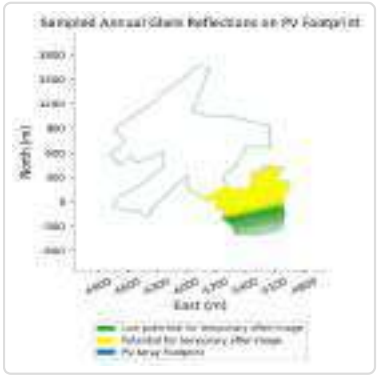

PV array is expected to produce the following glare for this receptor:

- 1,708 minutes of "green" glare with low potential to cause temporary after-image.
- 293 minutes of "yellow" glare with potential to cause temporary after-image.

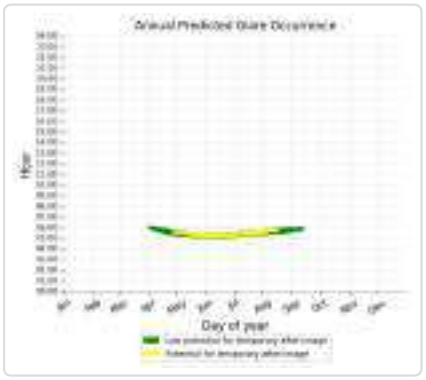

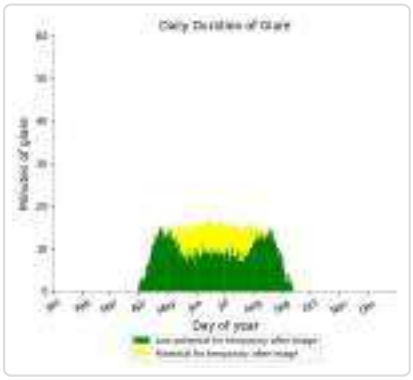

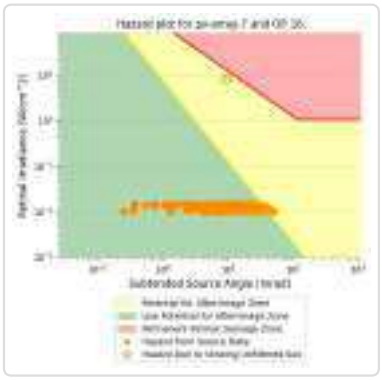

PV array 7: OP 16

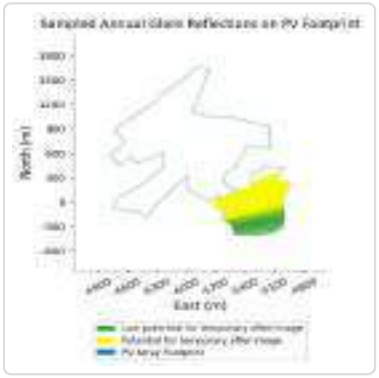

PV array is expected to produce the following glare for this receptor:

- 1,531 minutes of "green" glare with low potential to cause temporary after-image.
- 562 minutes of "yellow" glare with potential to cause temporary after-image.

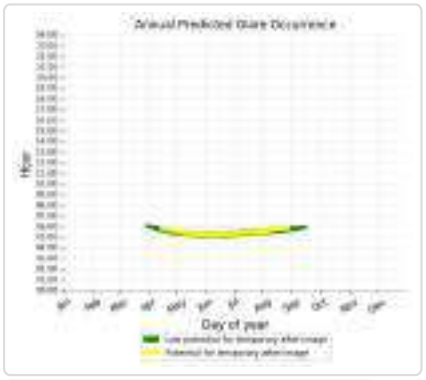

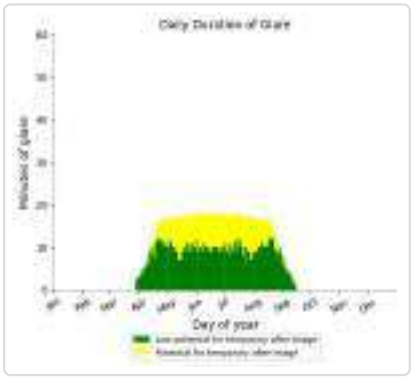

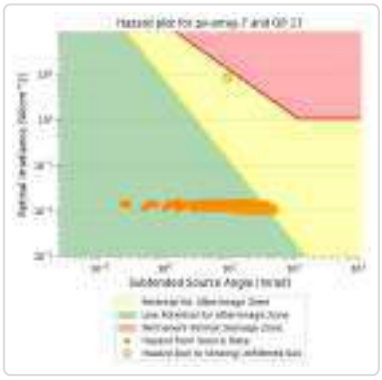

PV array 7: OP 17

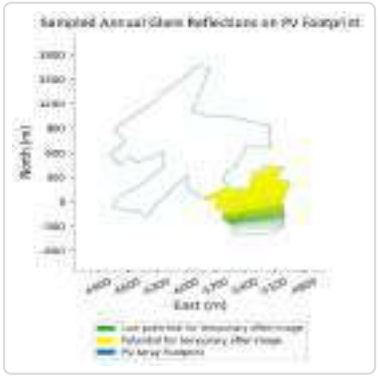

PV array is expected to produce the following glare for this receptor:

- 1,524 minutes of "green" glare with low potential to cause temporary after-image.
- 929 minutes of "yellow" glare with potential to cause temporary after-image.

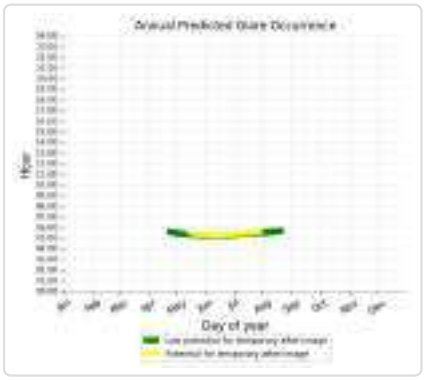

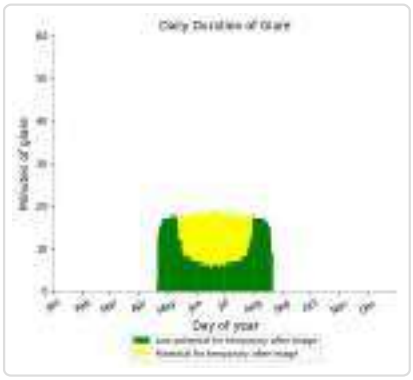

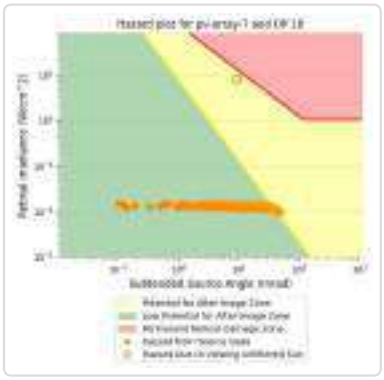

PV array 7: OP 18

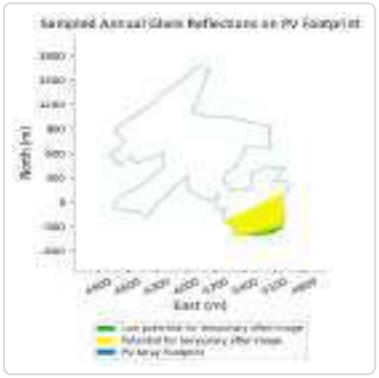

PV array is expected to produce the following glare for this receptor:

- 1,296 minutes of "green" glare with low potential to cause temporary after-image.
- 841 minutes of "yellow" glare with potential to cause temporary after-image.

PV array 7: OP 25

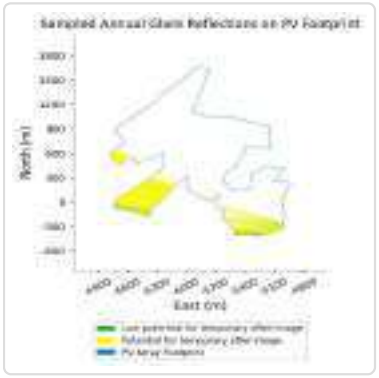

PV array is expected to produce the following glare for this receptor:

- 1,188 minutes of "green" glare with low potential to cause temporary after-image.
- 2,146 minutes of "yellow" glare with potential to cause temporary after-image.

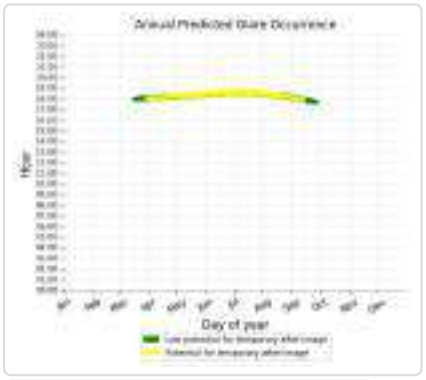

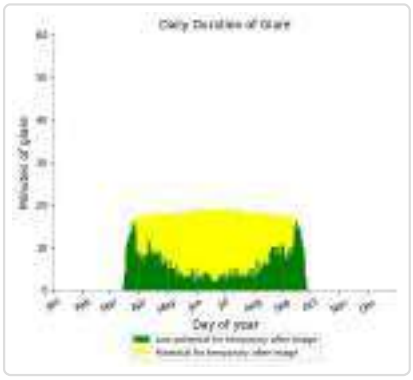

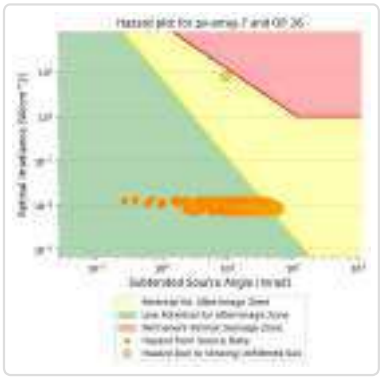

PV array 7: OP 26

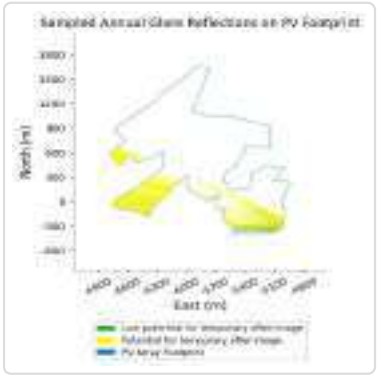

PV array is expected to produce the following glare for this receptor:

- 1,276 minutes of "green" glare with low potential to cause temporary after-image.
- 2,101 minutes of "yellow" glare with potential to cause temporary after-image.

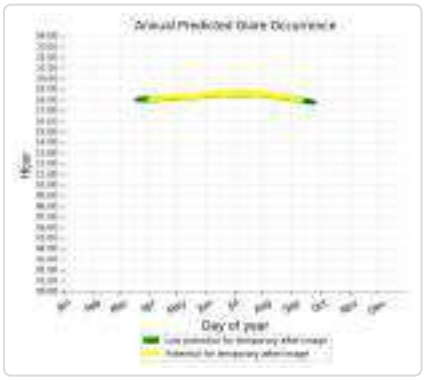

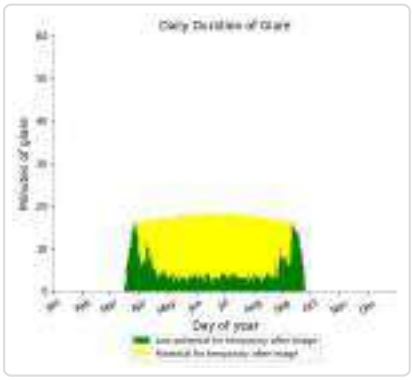

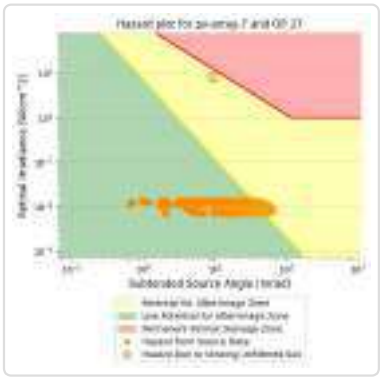

PV array 7: OP 27

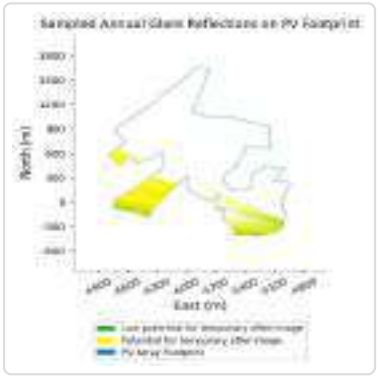

PV array is expected to produce the following glare for this receptor:

- 992 minutes of "green" glare with low potential to cause temporary after-image.
- 2,153 minutes of "yellow" glare with potential to cause temporary after-image.

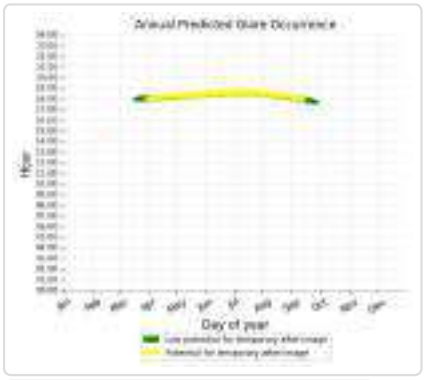

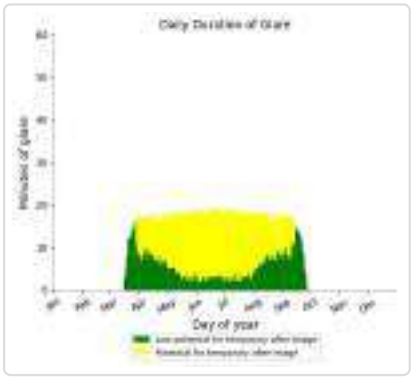

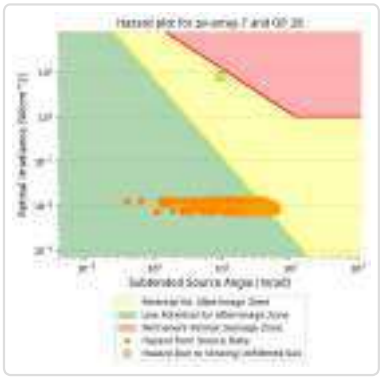

PV array 7: OP 28

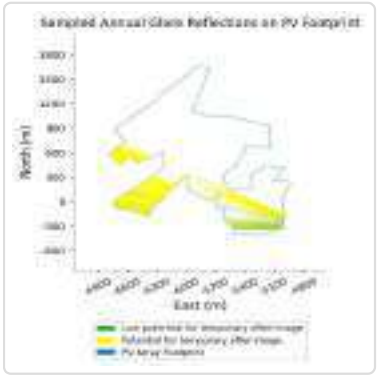

PV array is expected to produce the following glare for this receptor:

- 1,149 minutes of "green" glare with low potential to cause temporary after-image.
- 2,153 minutes of "yellow" glare with potential to cause temporary after-image.

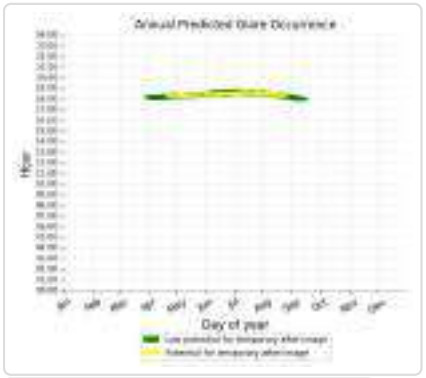

PV array 7: OP 29

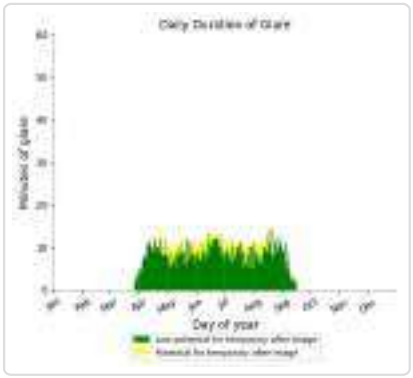

No glare found

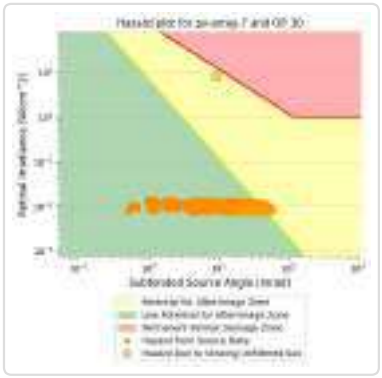

PV array 7: OP 30

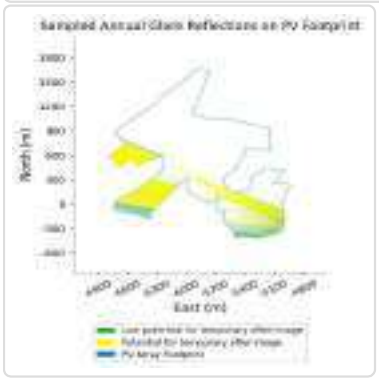

PV array is expected to produce the following glare for this receptor:

- 1,457 minutes of "green" glare with low potential to cause temporary after-image.
- 241 minutes of "yellow" glare with potential to cause temporary after-image.

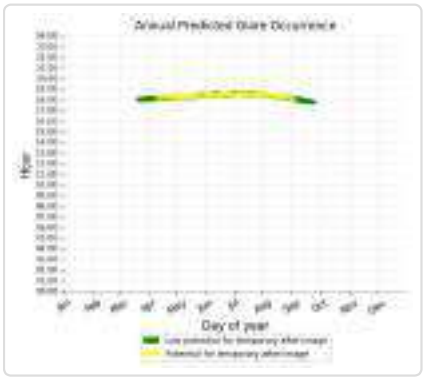

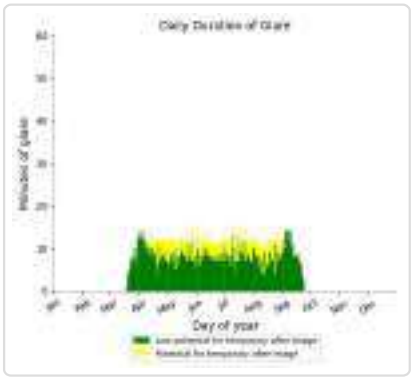

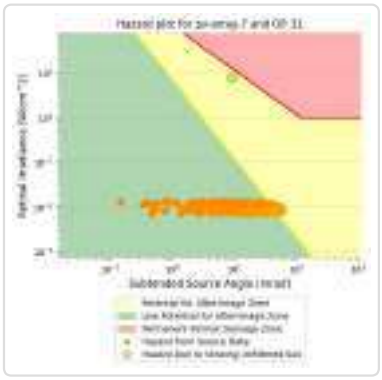

PV array 7: OP 31

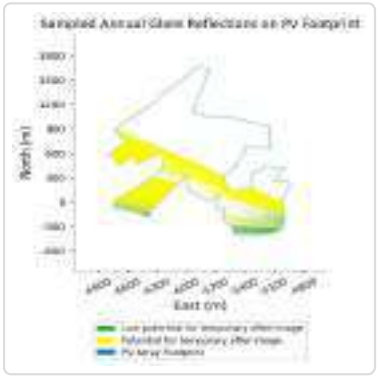

PV array is expected to produce the following glare for this receptor:

- 1,584 minutes of "green" glare with low potential to cause temporary after-image.
- 518 minutes of "yellow" glare with potential to cause temporary after-image.

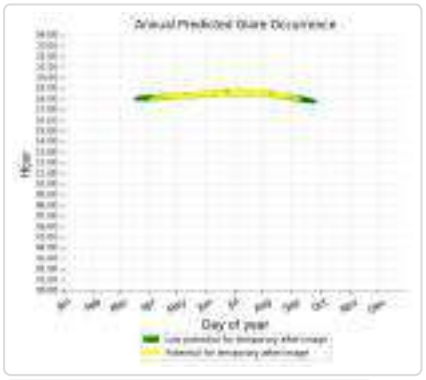

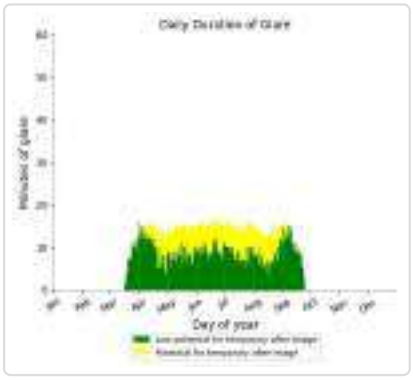

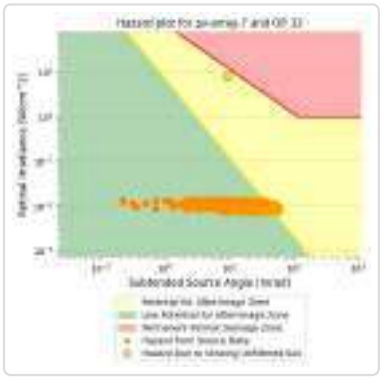

PV array 7: OP 32

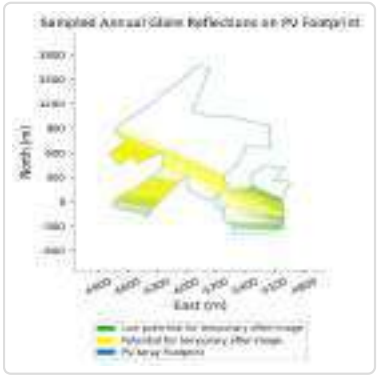

PV array is expected to produce the following glare for this receptor:

- 1,731 minutes of "green" glare with low potential to cause temporary after-image.
- 887 minutes of "yellow" glare with potential to cause temporary after-image.

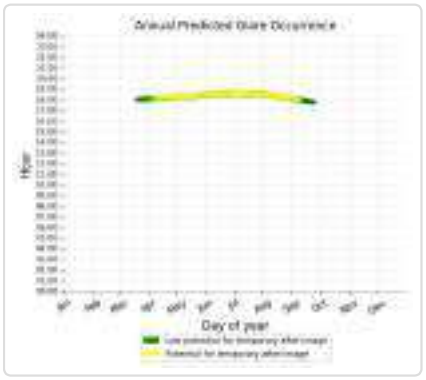

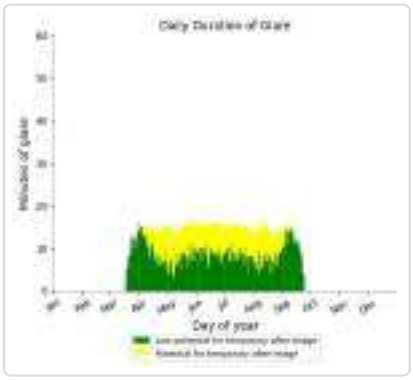

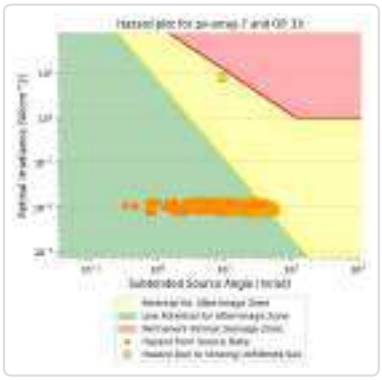

PV array 7: OP 33

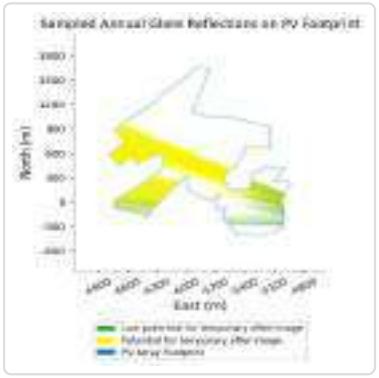

PV array is expected to produce the following glare for this receptor:

- 1,644 minutes of "green" glare with low potential to cause temporary after-image.
- 1,052 minutes of "yellow" glare with potential to cause temporary after-image.

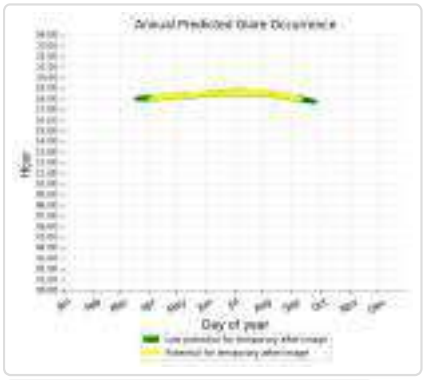

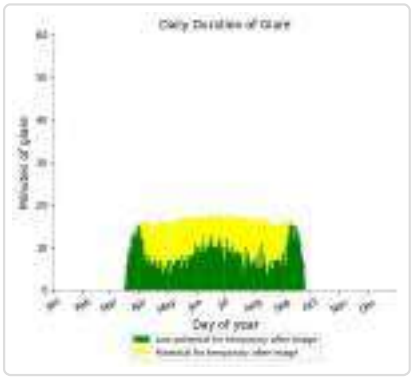

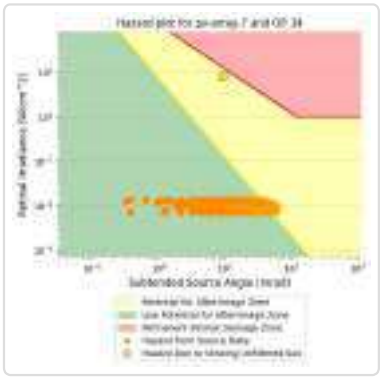

PV array 7: OP 34

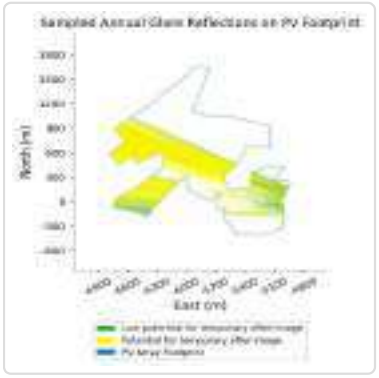

PV array is expected to produce the following glare for this receptor:

- 1,658 minutes of "green" glare with low potential to cause temporary after-image.
- 1,325 minutes of "yellow" glare with potential to cause temporary after-image.

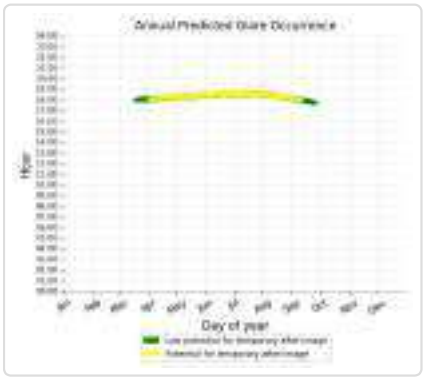

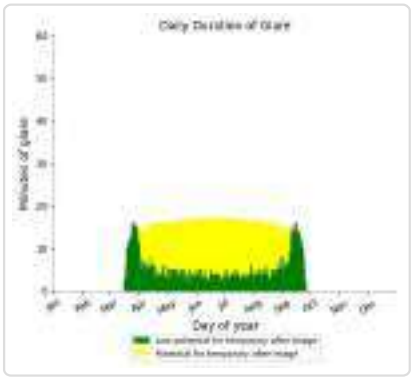

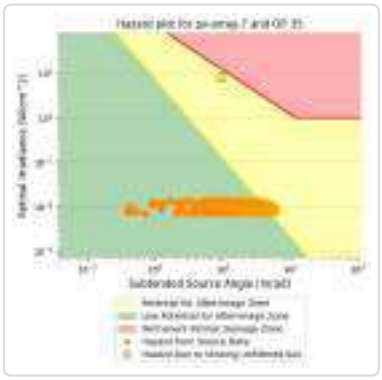

PV array 7: OP 35

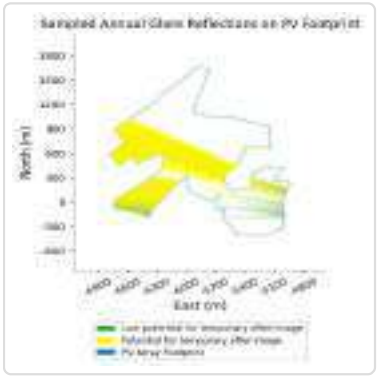

PV array is expected to produce the following glare for this receptor:

- 1,145 minutes of "green" glare with low potential to cause temporary after-image.
- 1,873 minutes of "yellow" glare with potential to cause temporary after-image.

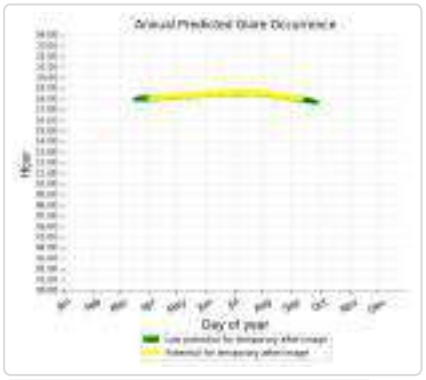

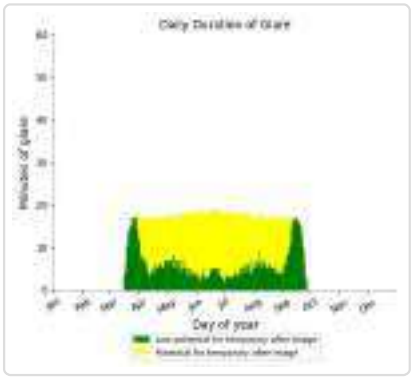

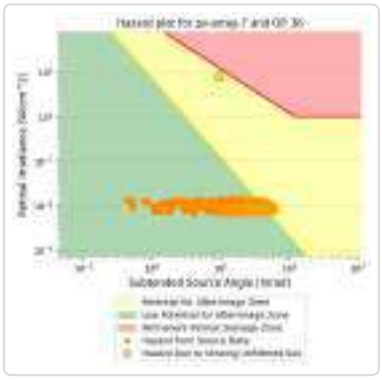

PV array 7: OP 36

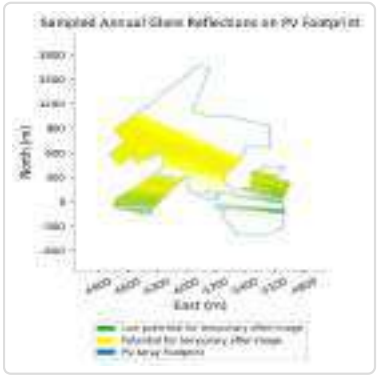

PV array is expected to produce the following glare for this receptor:

- 1,256 minutes of "green" glare with low potential to cause temporary after-image.
- 2,034 minutes of "yellow" glare with potential to cause temporary after-image.

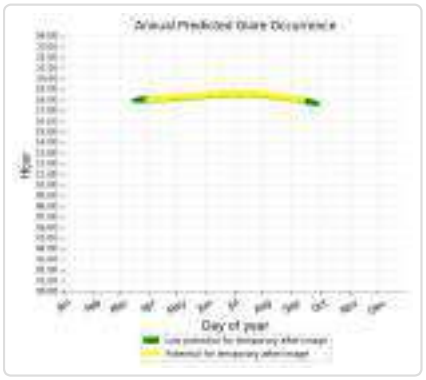

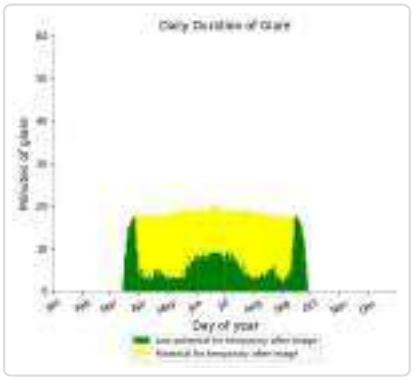

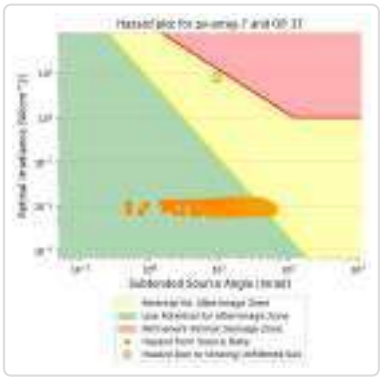

PV array 7: OP 37

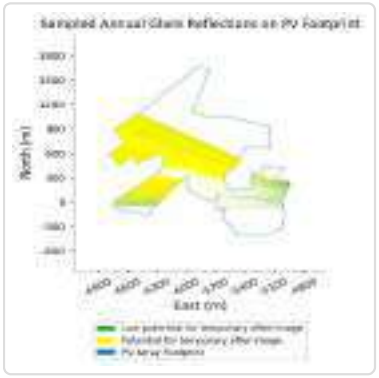

PV array is expected to produce the following glare for this receptor:

- 1,290 minutes of "green" glare with low potential to cause temporary after-image.
- 2,192 minutes of "yellow" glare with potential to cause temporary after-image.

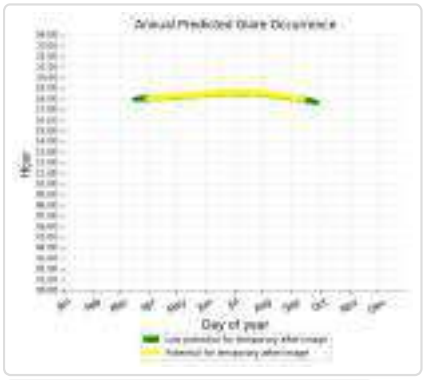

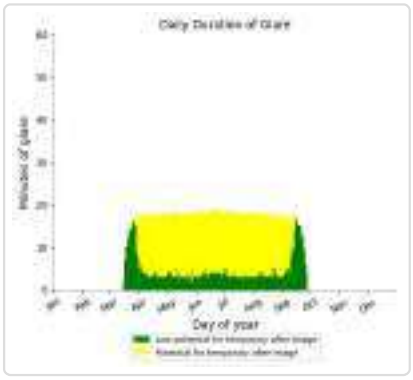

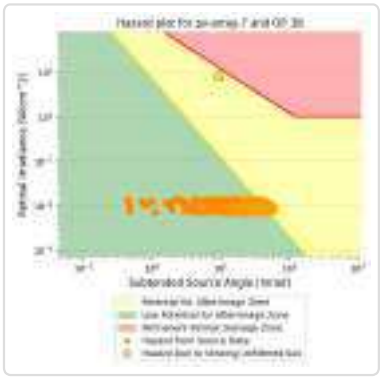

PV array 7: OP 38

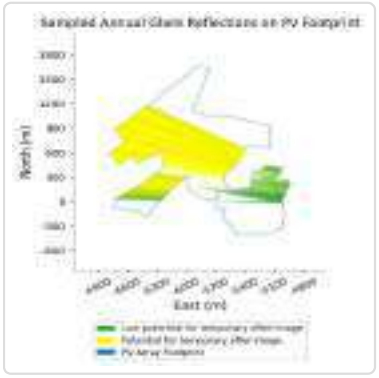

PV array is expected to produce the following glare for this receptor:

- 964 minutes of "green" glare with low potential to cause temporary after-image.
- 2,399 minutes of "yellow" glare with potential to cause temporary after-image.

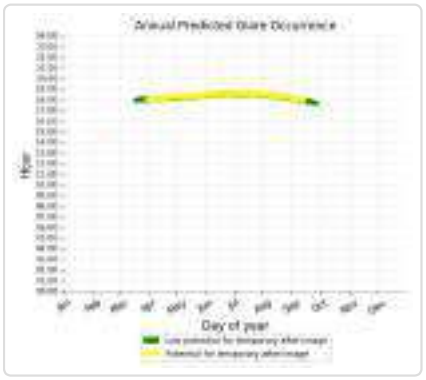

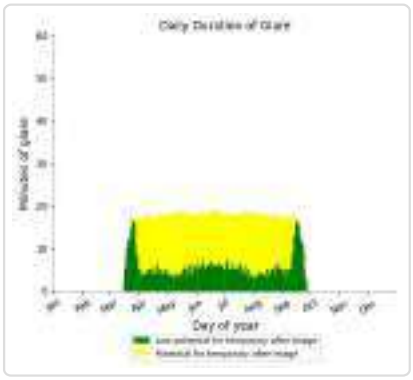

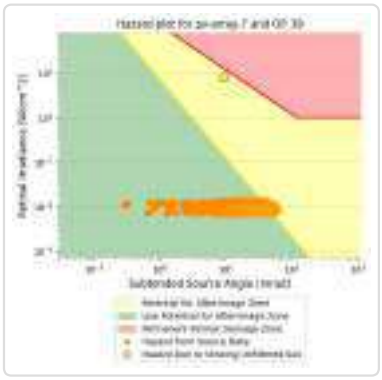

PV array 7: OP 39

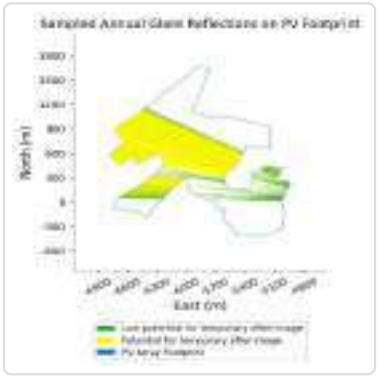

PV array is expected to produce the following glare for this receptor:

- 1,181 minutes of "green" glare with low potential to cause temporary after-image.
- 2,171 minutes of "yellow" glare with potential to cause temporary after-image.

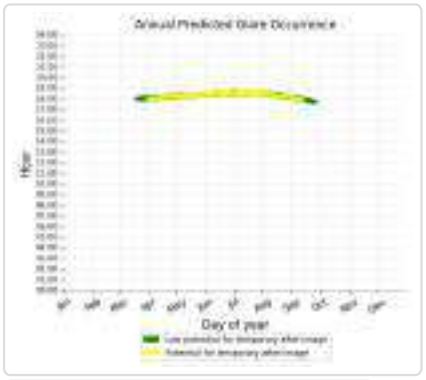

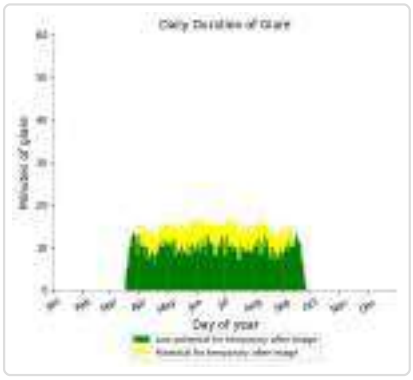

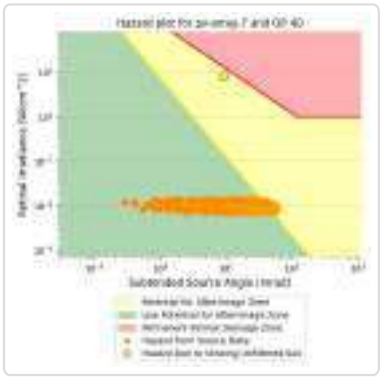

PV array 7: OP 40

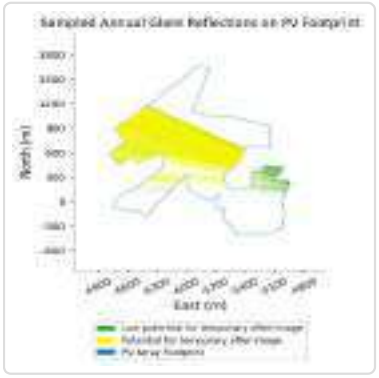

PV array is expected to produce the following glare for this receptor:

- 1,873 minutes of "green" glare with low potential to cause temporary after-image.
- 816 minutes of "yellow" glare with potential to cause temporary after-image.

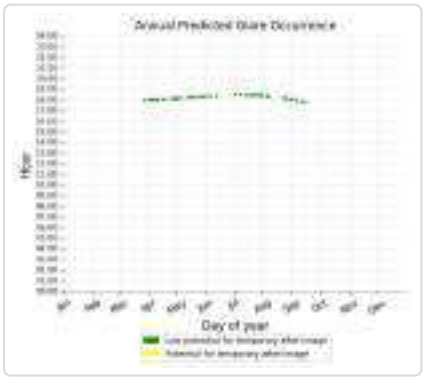

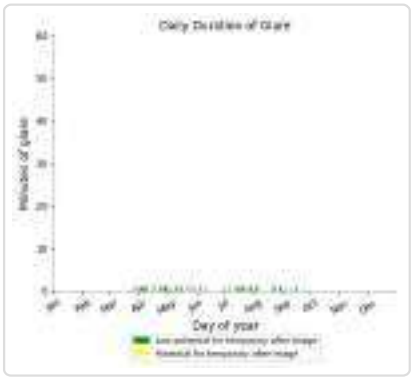

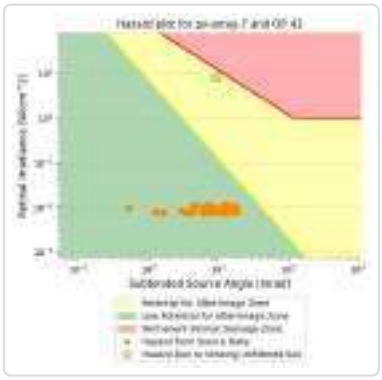

PV array 7: OP 41

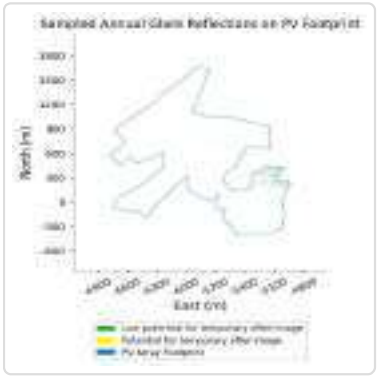

PV array is expected to produce the following glare for this receptor:

- 41 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

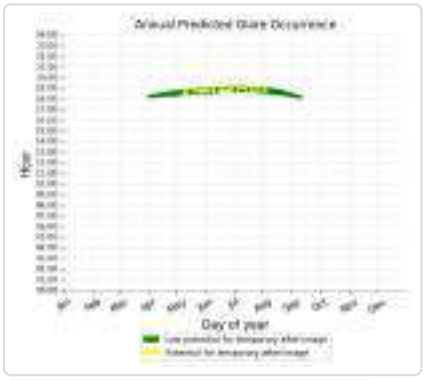

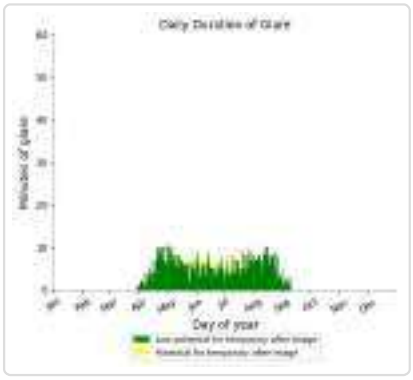

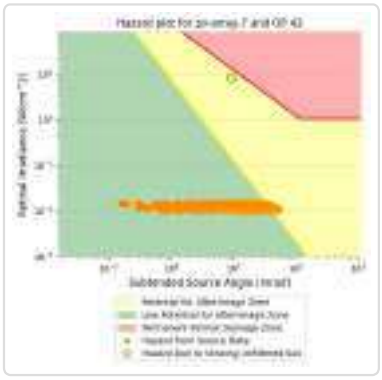

PV array 7: OP 42

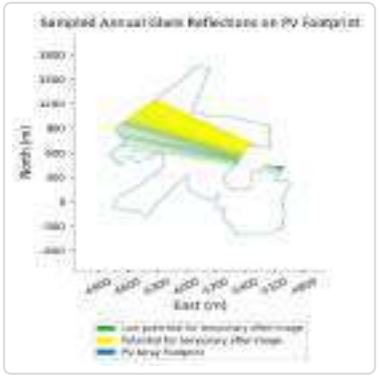

PV array is expected to produce the following glare for this receptor:

- 936 minutes of "green" glare with low potential to cause temporary after-image.
- 65 minutes of "yellow" glare with potential to cause temporary after-image.

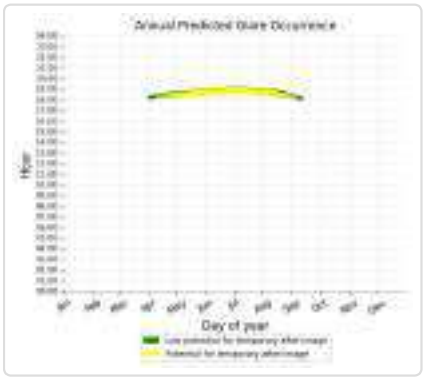

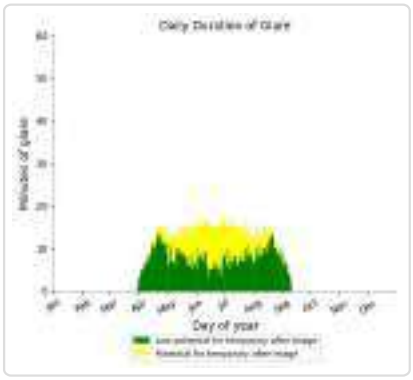

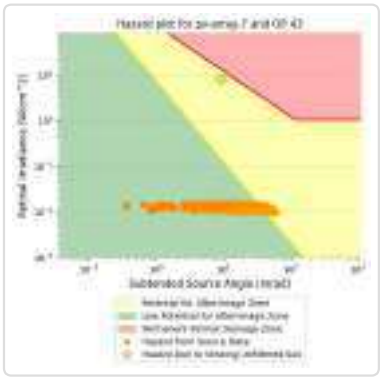

PV array 7: OP 43

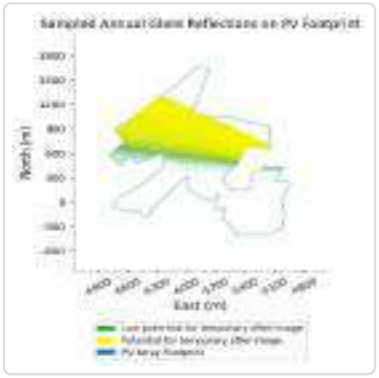

PV array is expected to produce the following glare for this receptor:

- 1,292 minutes of "green" glare with low potential to cause temporary after-image.
- 816 minutes of "yellow" glare with potential to cause temporary after-image.

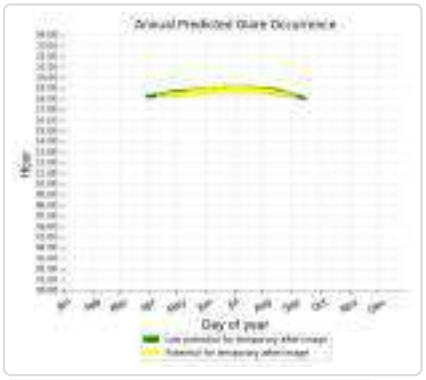

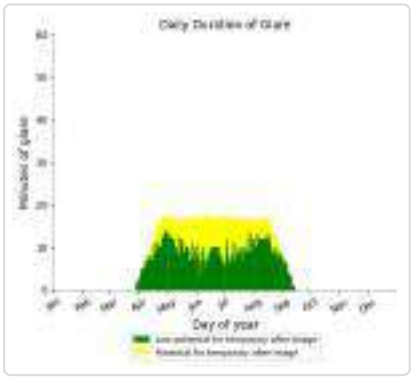

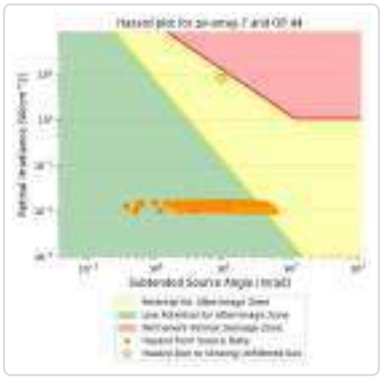

PV array 7: OP 44

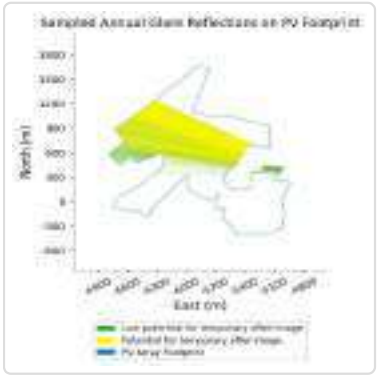

PV array is expected to produce the following glare for this receptor:

- 1,534 minutes of "green" glare with low potential to cause temporary after-image.
- 868 minutes of "yellow" glare with potential to cause temporary after-image.

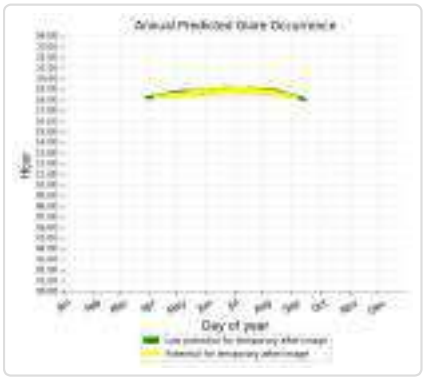

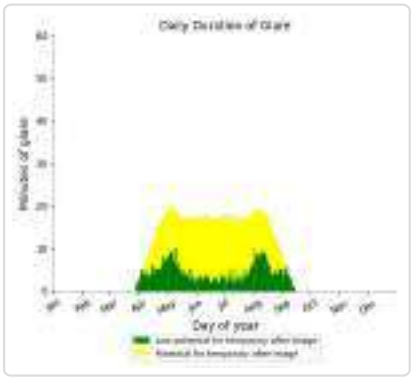

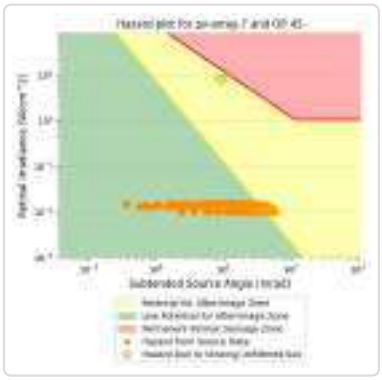

PV array 7: OP 45

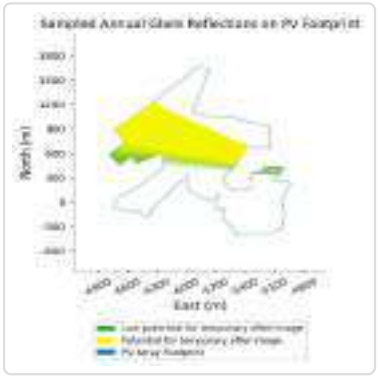

PV array is expected to produce the following glare for this receptor:

- 782 minutes of "green" glare with low potential to cause temporary after-image.
- 1,727 minutes of "yellow" glare with potential to cause temporary after-image.

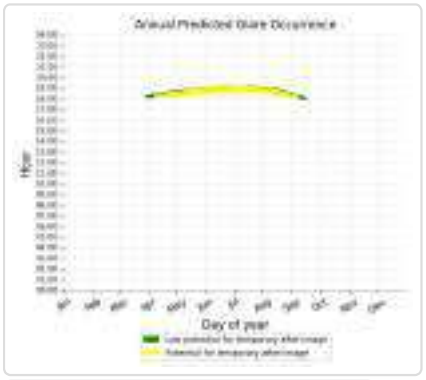

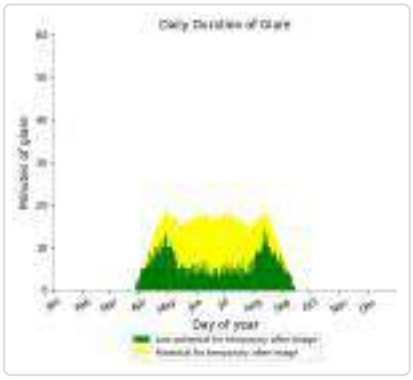

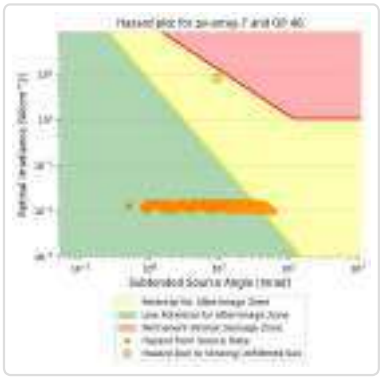

PV array 7: OP 46

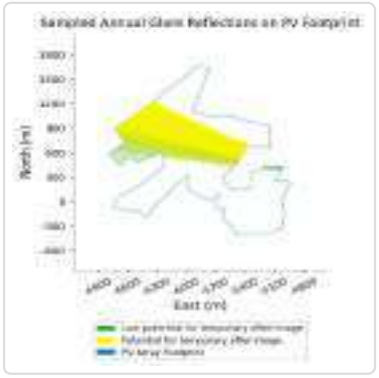

PV array is expected to produce the following glare for this receptor:

- 1,065 minutes of "green" glare with low potential to cause temporary after-image.
- 1,322 minutes of "yellow" glare with potential to cause temporary after-image.

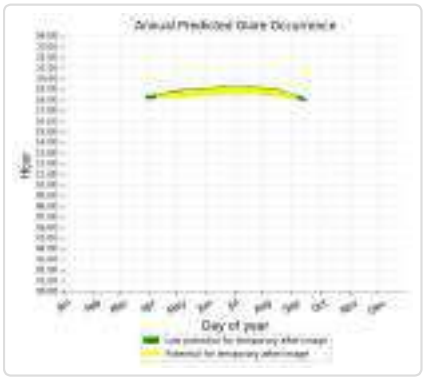

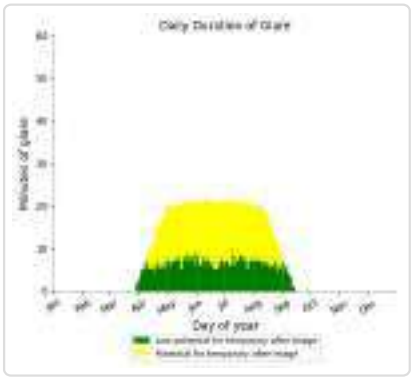

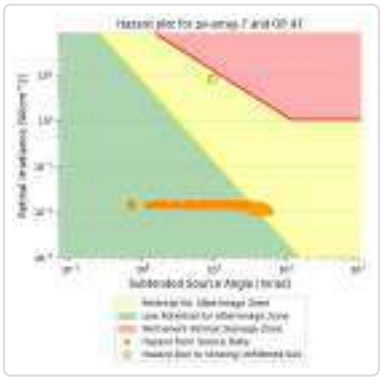

PV array 7: OP 47

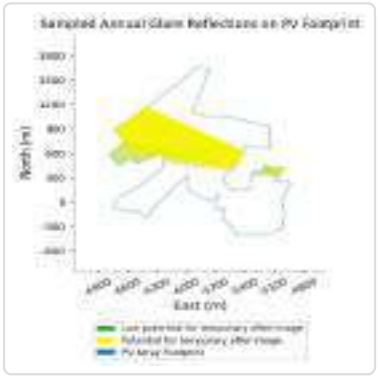

PV array is expected to produce the following glare for this receptor:

- 1,060 minutes of "green" glare with low potential to cause temporary after-image.
- 1,750 minutes of "yellow" glare with potential to cause temporary after-image.

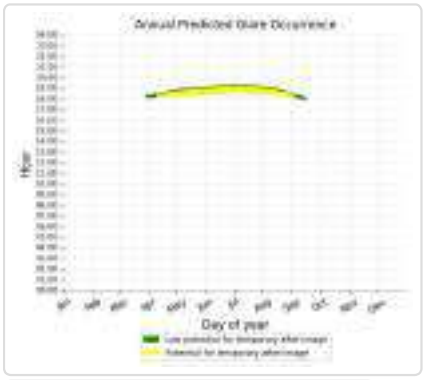

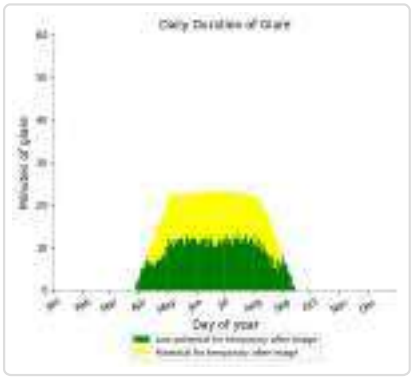

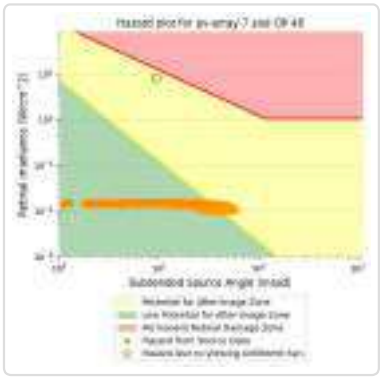

PV array 7: OP 48

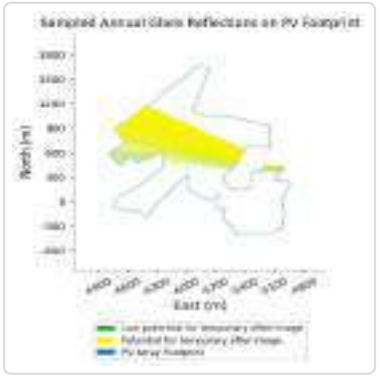

PV array is expected to produce the following glare for this receptor:

- 1,587 minutes of "green" glare with low potential to cause temporary after-image.
- 1,408 minutes of "yellow" glare with potential to cause temporary after-image.

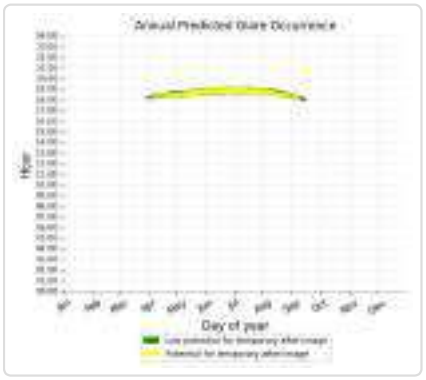

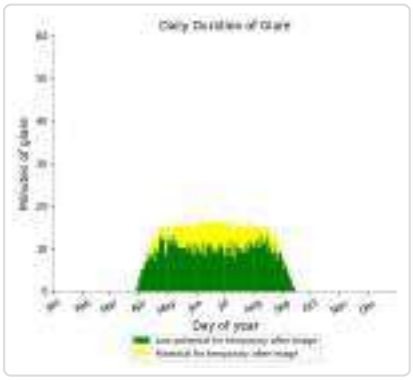

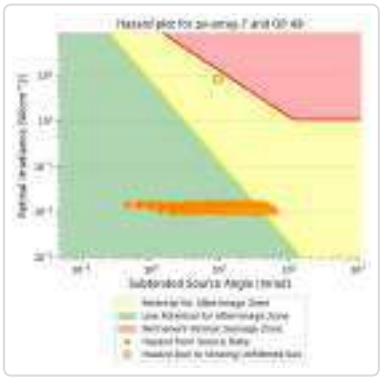

PV array 7: OP 49

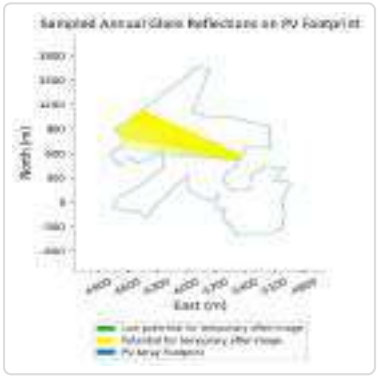

PV array is expected to produce the following glare for this receptor:

- 1,552 minutes of "green" glare with low potential to cause temporary after-image.
- 647 minutes of "yellow" glare with potential to cause temporary after-image.

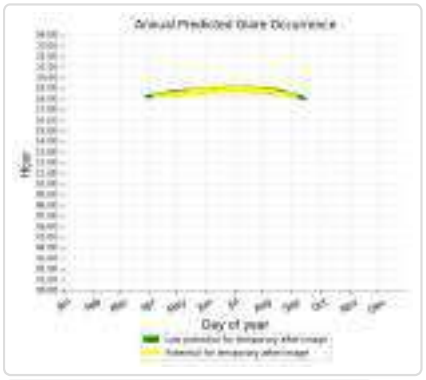

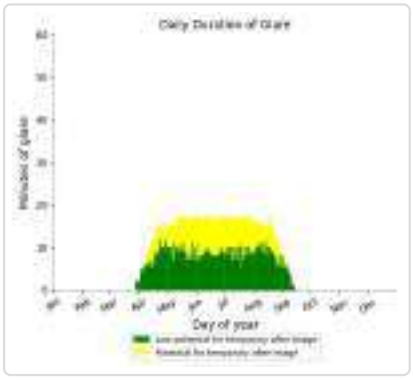

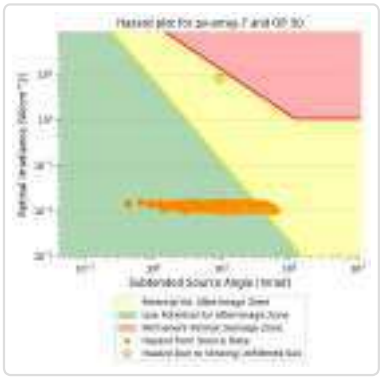

PV array 7: OP 50

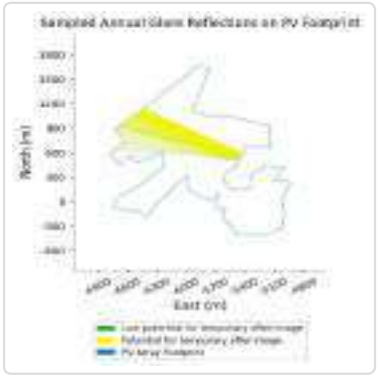

PV array is expected to produce the following glare for this receptor:

- 1,369 minutes of "green" glare with low potential to cause temporary after-image.
- 994 minutes of "yellow" glare with potential to cause temporary after-image.

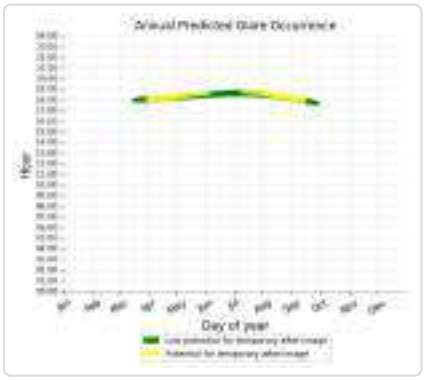

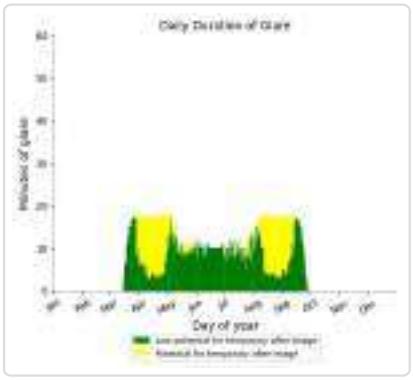

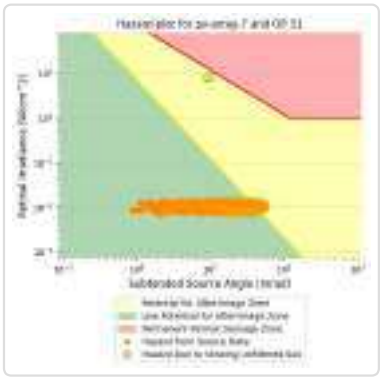

PV array 7: OP 51

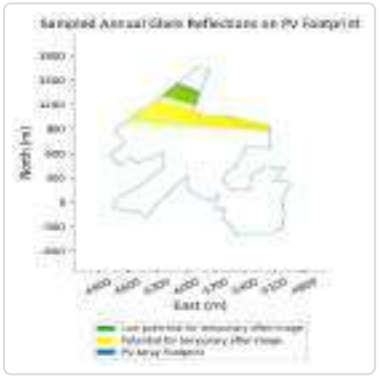

PV array is expected to produce the following glare for this receptor:

- 1,731 minutes of "green" glare with low potential to cause temporary after-image.
- 954 minutes of "yellow" glare with potential to cause temporary after-image.

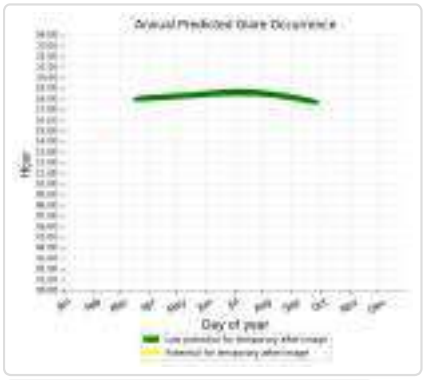

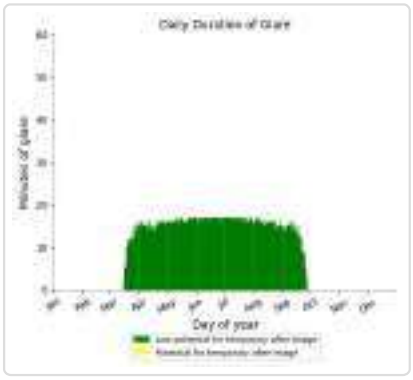

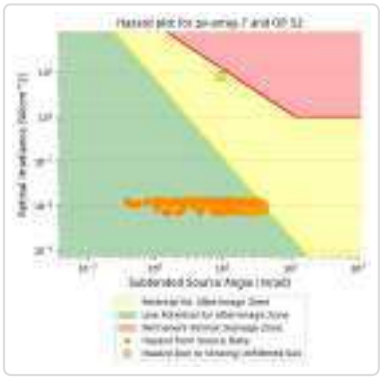

PV array 7: OP 52

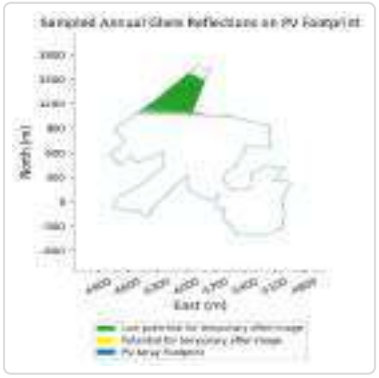

PV array is expected to produce the following glare for this receptor:

- 3,003 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

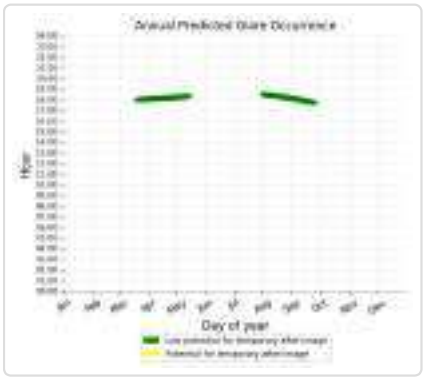

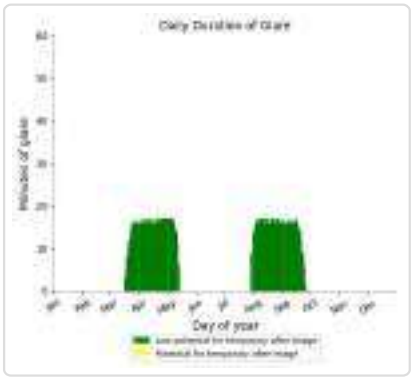

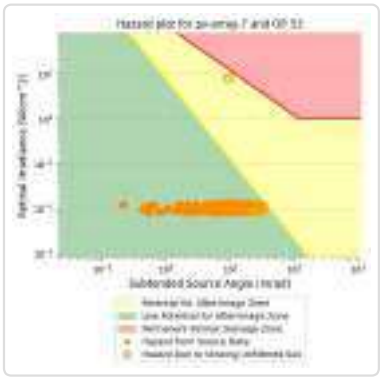

PV array 7: OP 53

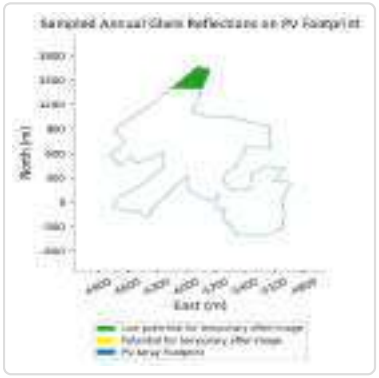

PV array is expected to produce the following glare for this receptor:

- 1,793 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

PV array is expected to produce the following glare for this receptor:

- 47 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

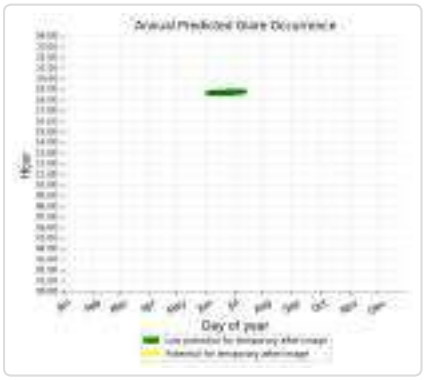

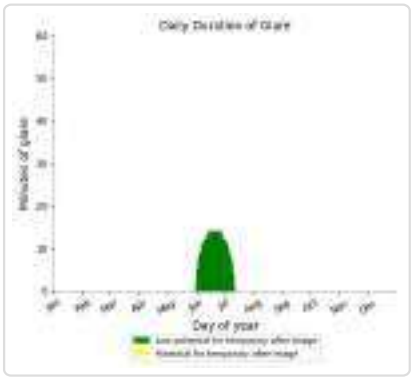

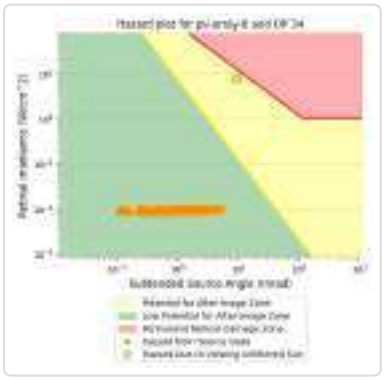

PV array 8: OP 34

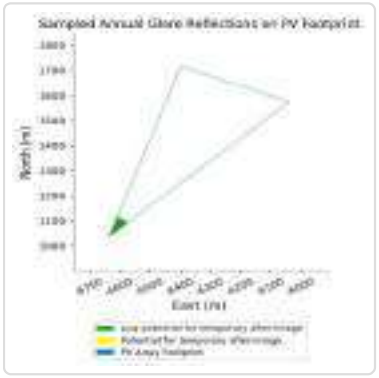

PV array is expected to produce the following glare for this receptor:

- 463 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

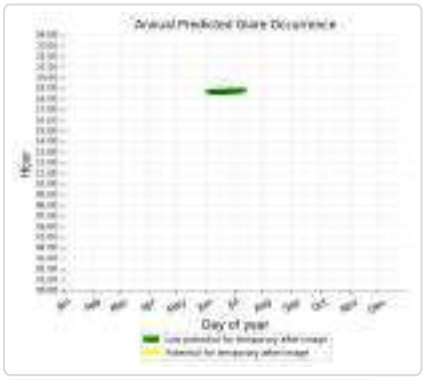

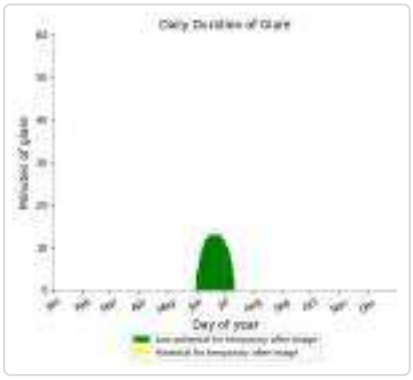

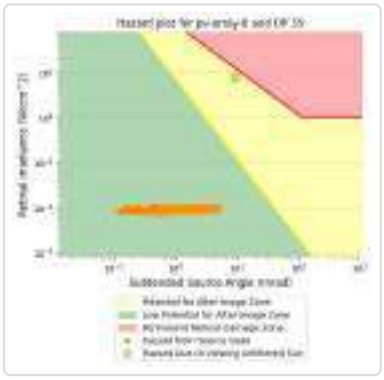

PV array 8: OP 35

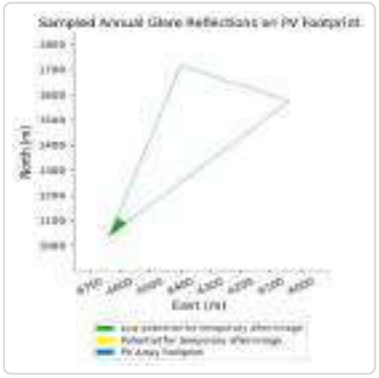

PV array is expected to produce the following glare for this receptor:

- 420 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

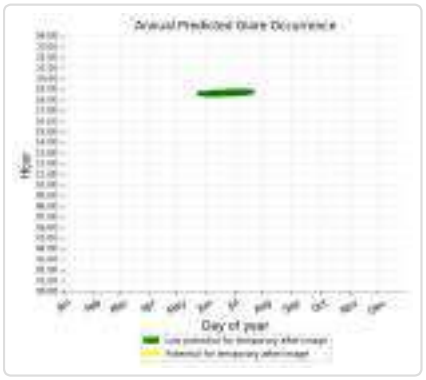

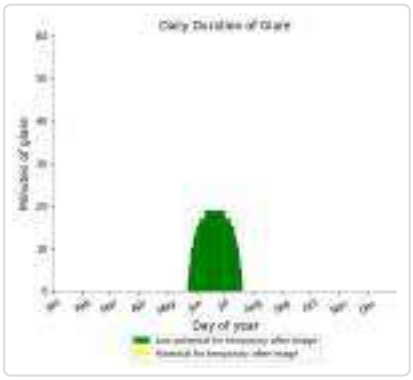

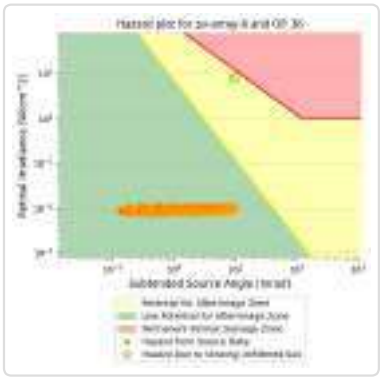

PV array 8: OP 36

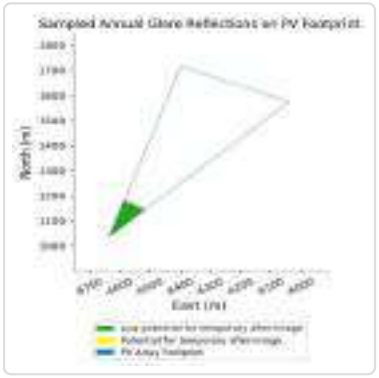

PV array is expected to produce the following glare for this receptor:

- 886 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

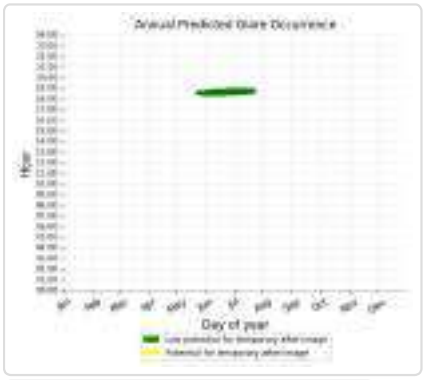

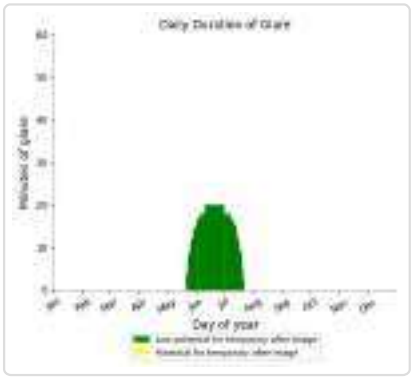

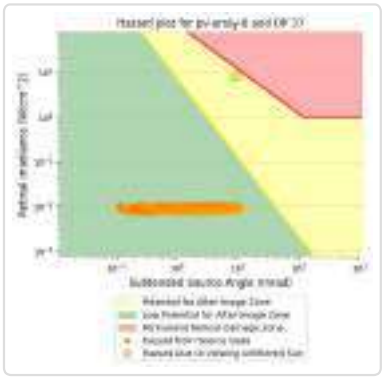

PV array 8: OP 37

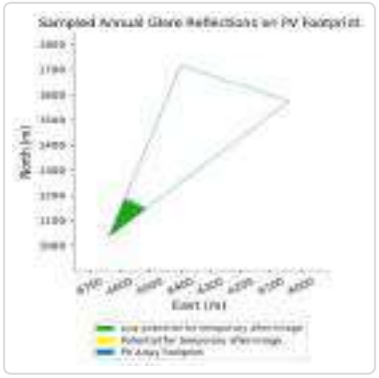

PV array is expected to produce the following glare for this receptor:

- 984 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

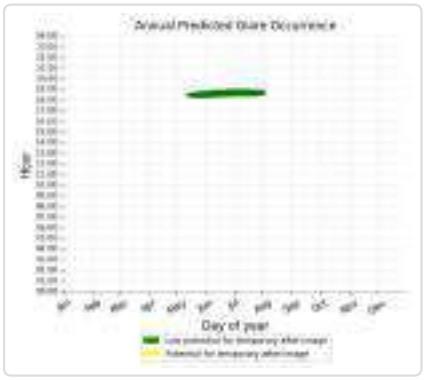

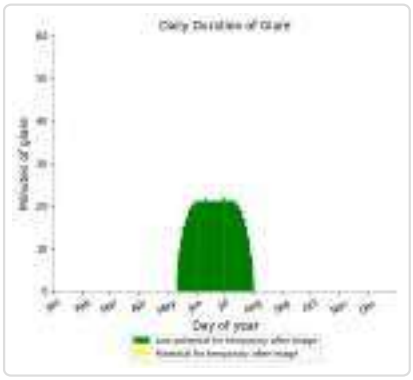

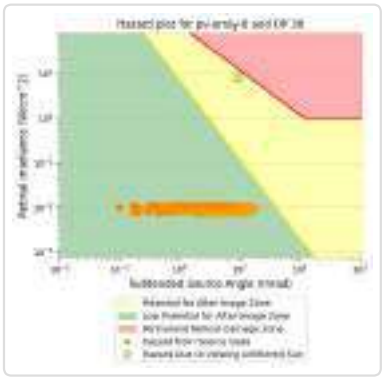

PV array 8: OP 38

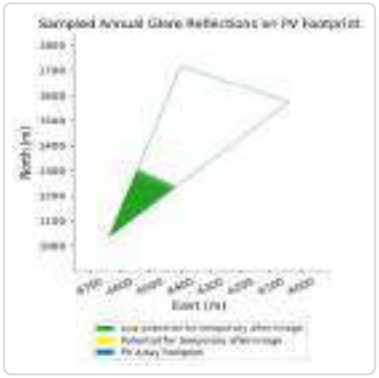

PV array is expected to produce the following glare for this receptor:

- 1,504 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

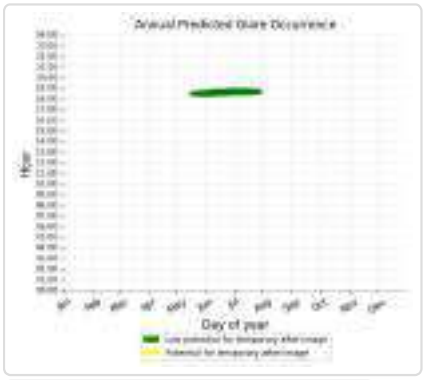

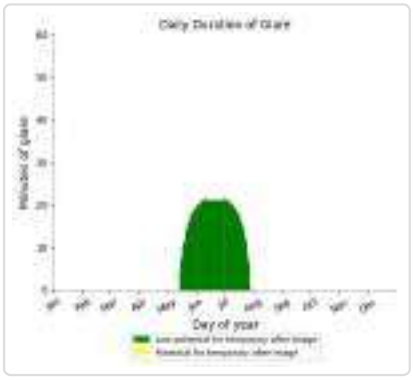

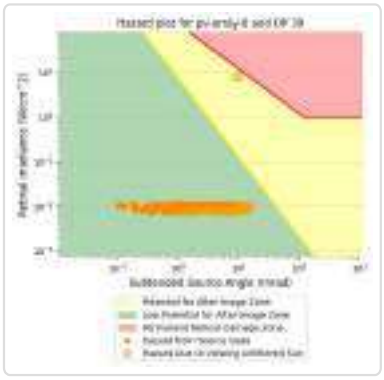

PV array 8: OP 39

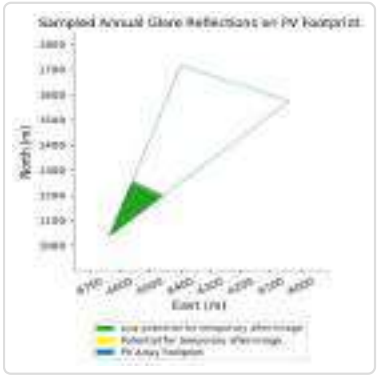

PV array is expected to produce the following glare for this receptor:

- 1,340 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

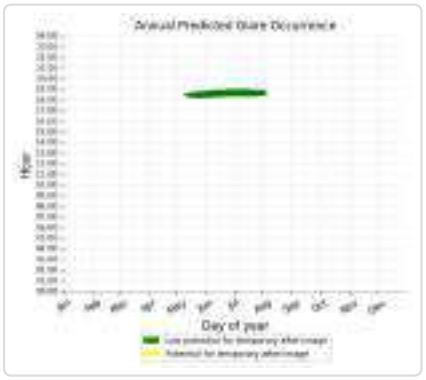

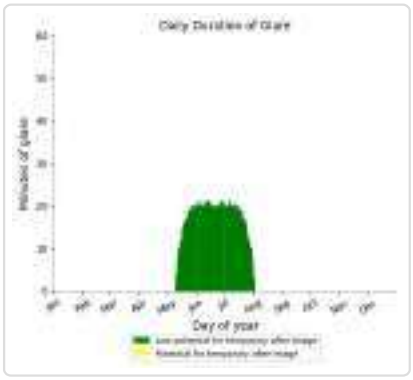

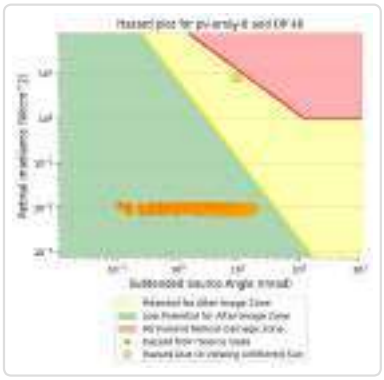

PV array 8: OP 40

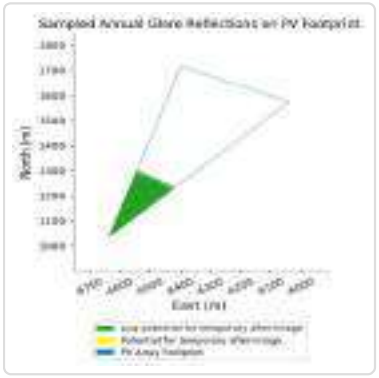

PV array is expected to produce the following glare for this receptor:

- 1,499 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

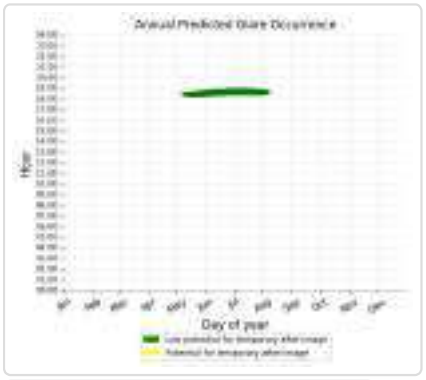

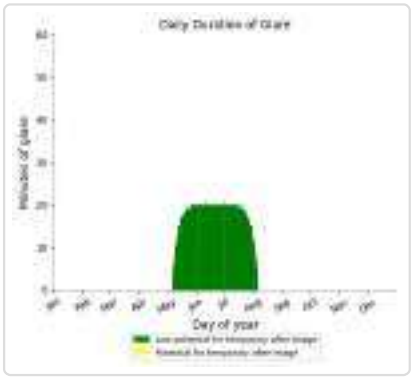

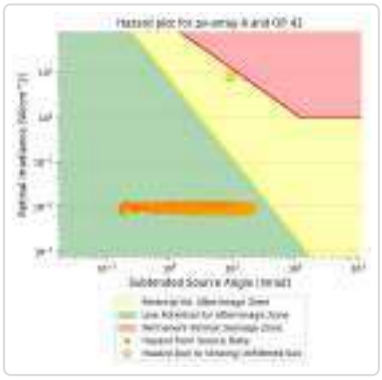

PV array 8: OP 41

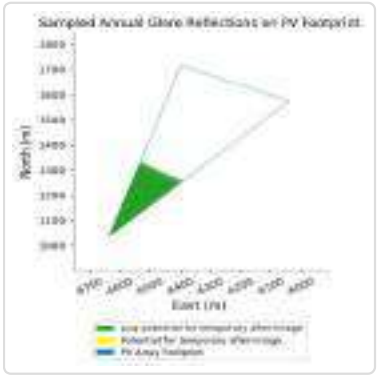

PV array is expected to produce the following glare for this receptor:

- 1,629 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

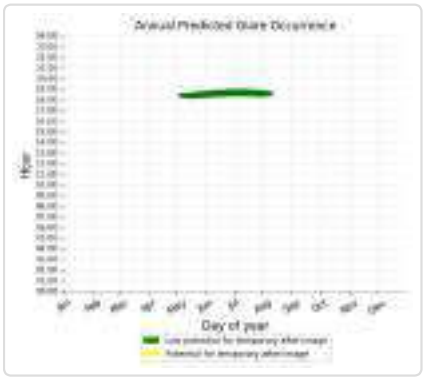

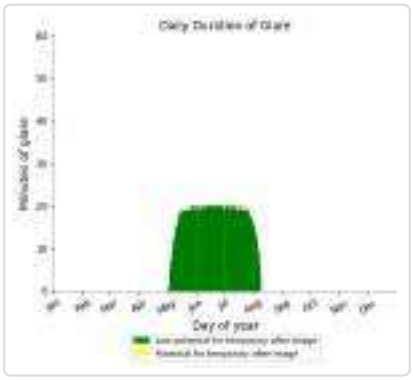

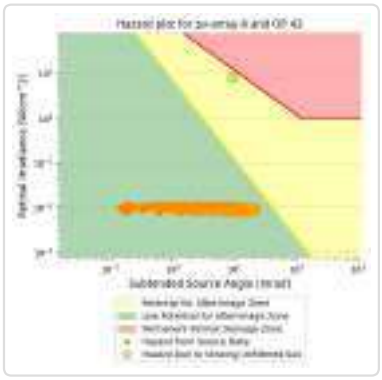

PV array 8: OP 42

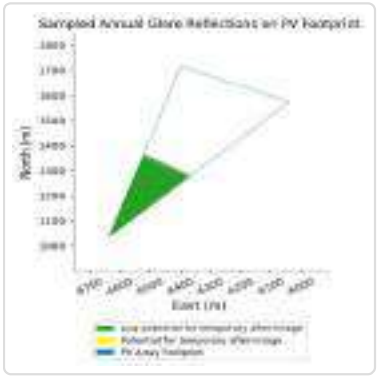

PV array is expected to produce the following glare for this receptor:

- 1,755 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

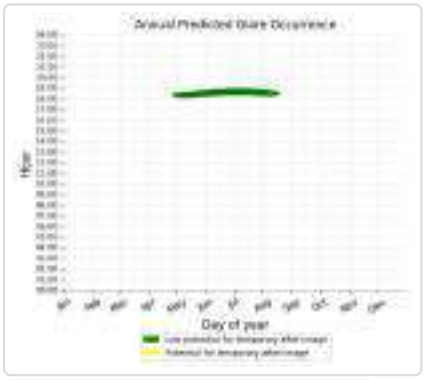

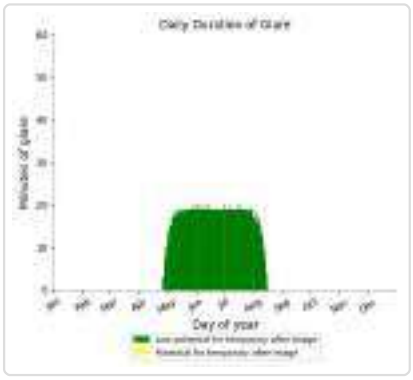

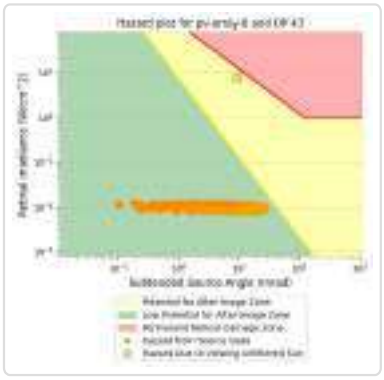

PV array 8: OP 43

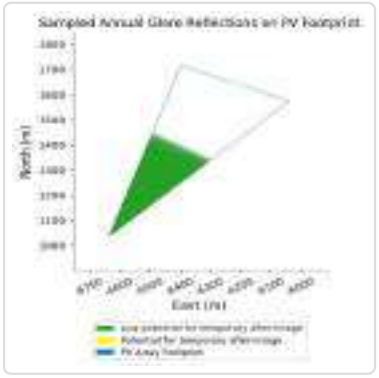

PV array is expected to produce the following glare for this receptor:

- 1,952 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

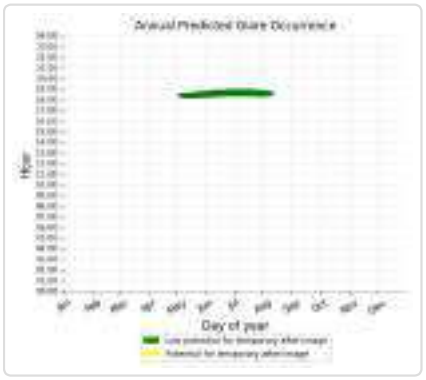

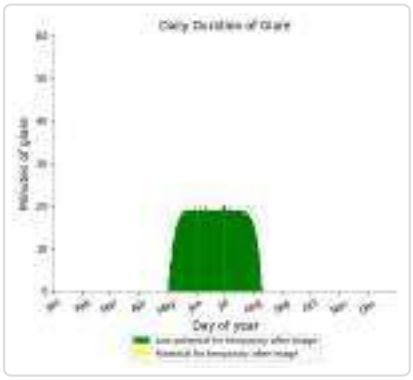

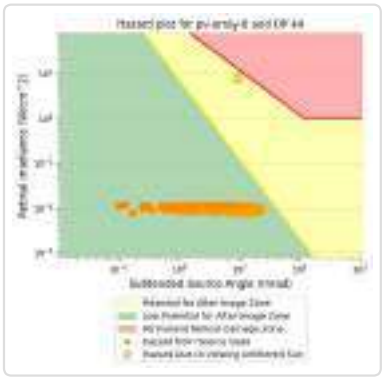

PV array 8: OP 44

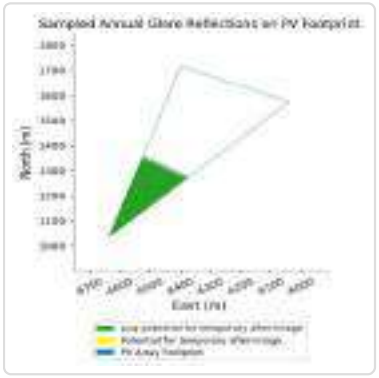

PV array is expected to produce the following glare for this receptor:

- 1,714 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

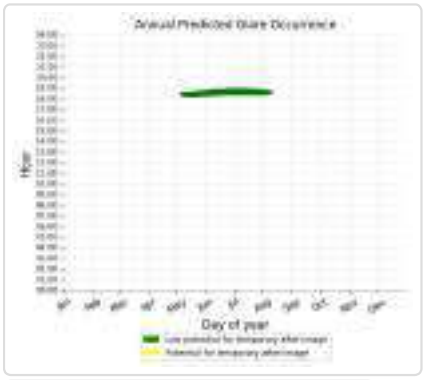

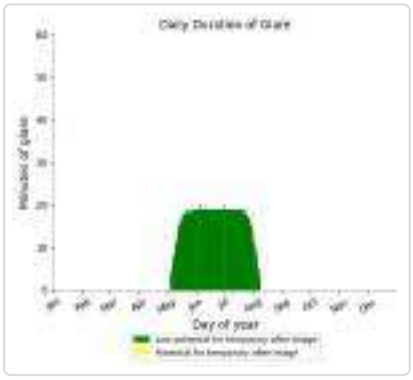

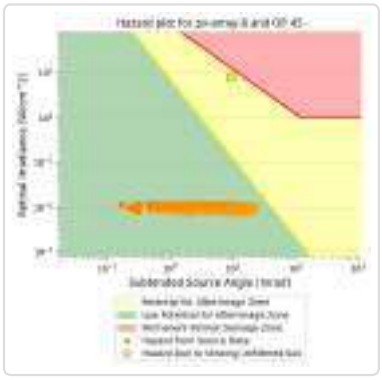

PV array 8: OP 45

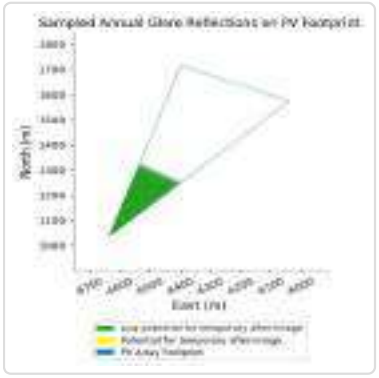

PV array is expected to produce the following glare for this receptor:

- 1,607 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

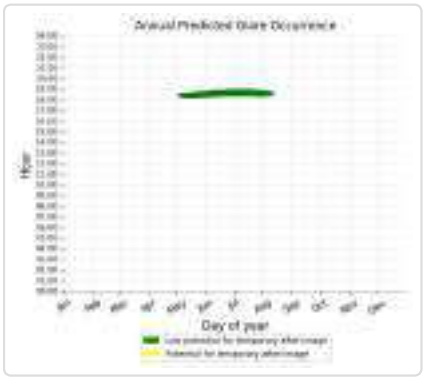

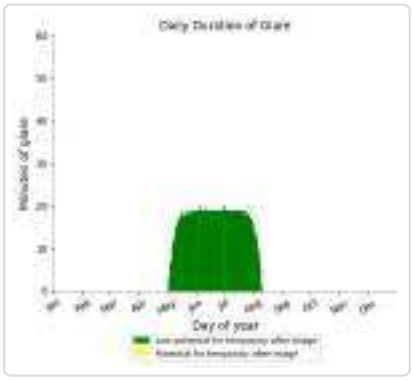

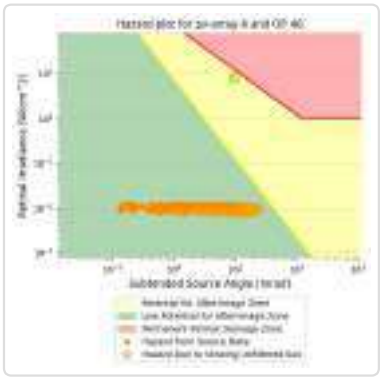

PV array 8: OP 46

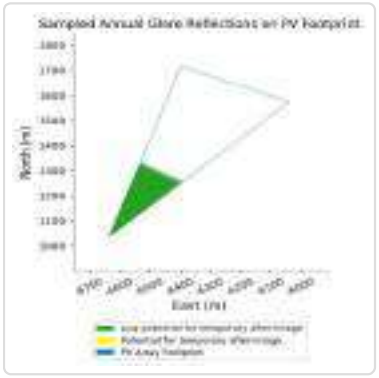

PV array is expected to produce the following glare for this receptor:

- 1,706 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

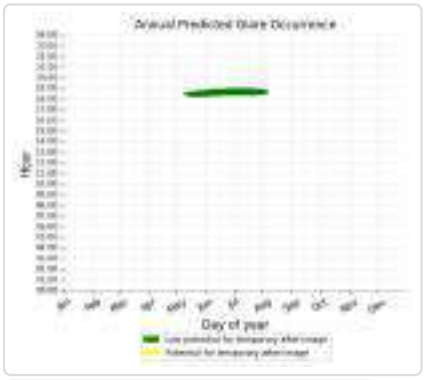

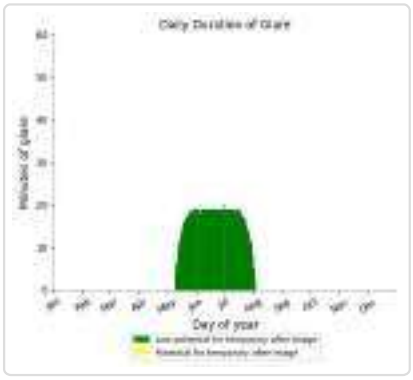

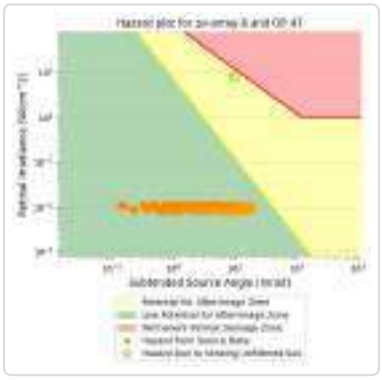

PV array 8: OP 47

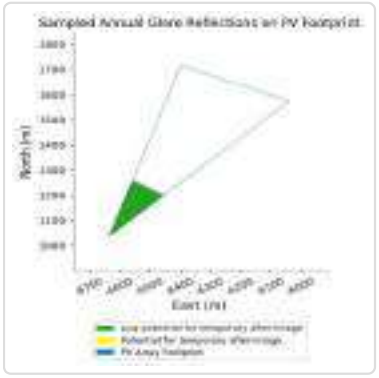

PV array is expected to produce the following glare for this receptor:

- 1,441 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

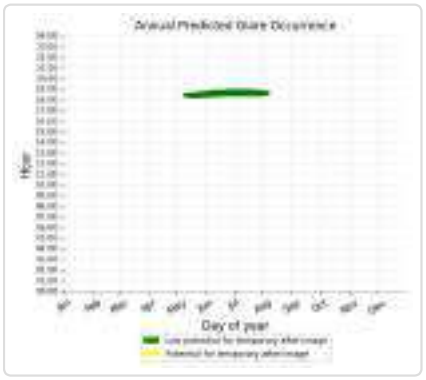

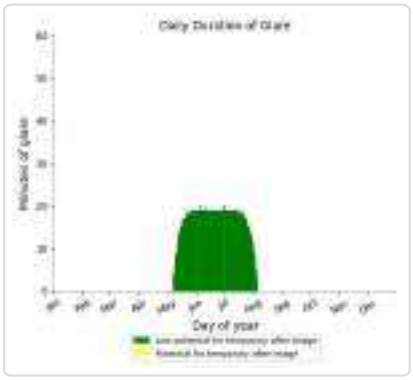

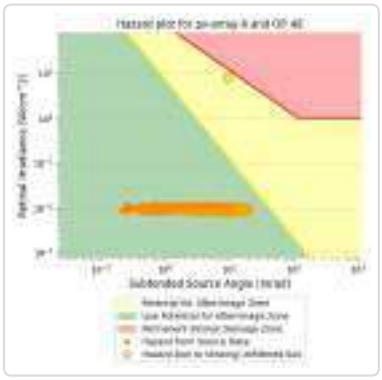

PV array 8: OP 48

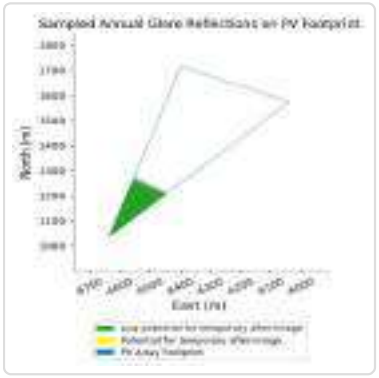

PV array is expected to produce the following glare for this receptor:

- 1,528 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

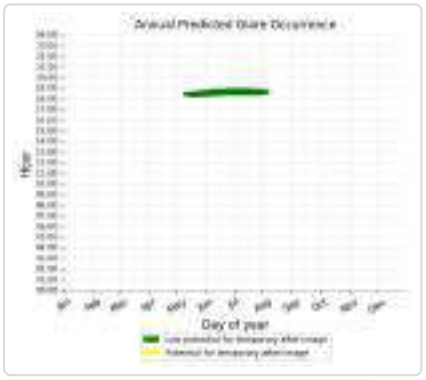

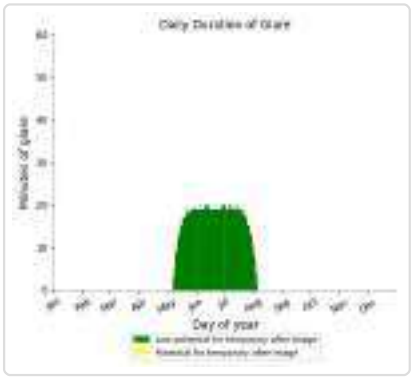

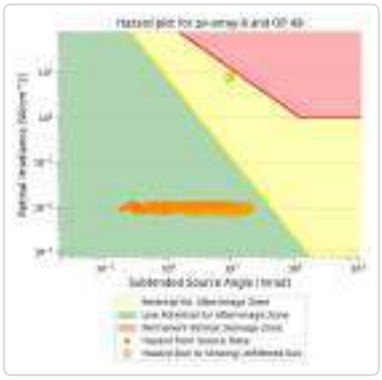

PV array 8: OP 49

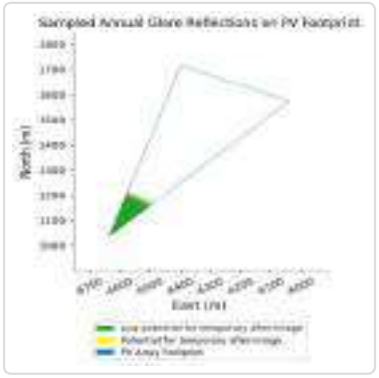

PV array is expected to produce the following glare for this receptor:

- 1,526 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

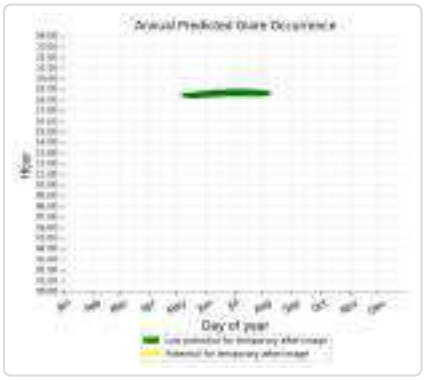

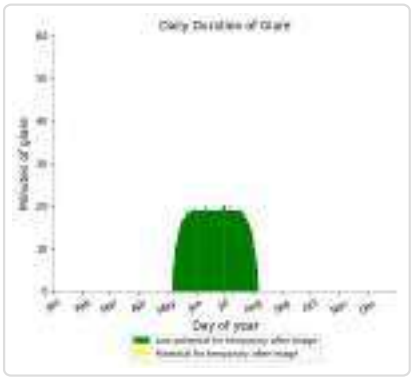

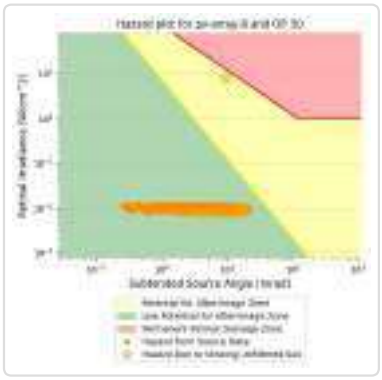

PV array 8: OP 50

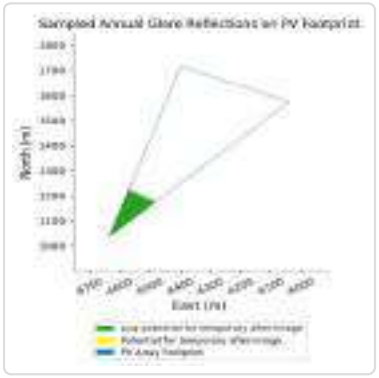

PV array is expected to produce the following glare for this receptor:

- 1,561 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

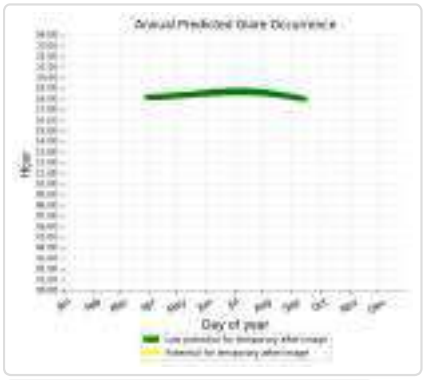

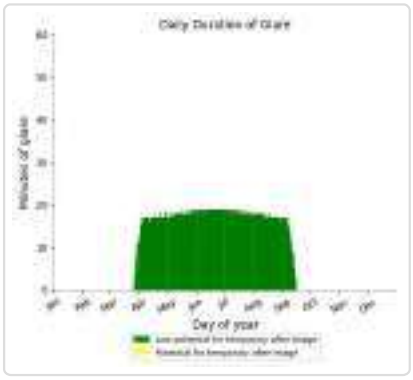

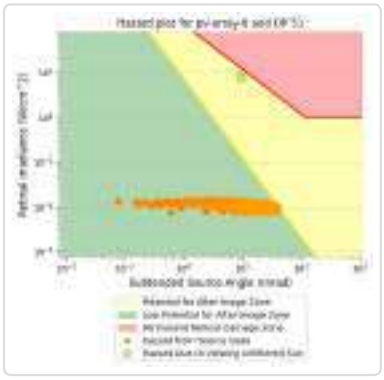

PV array 8: OP 51

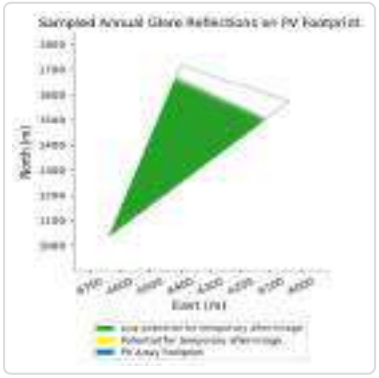

PV array is expected to produce the following glare for this receptor:

- 2,973 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

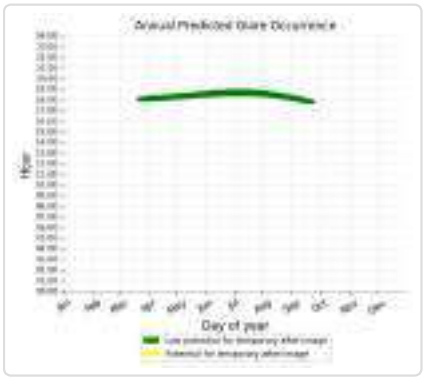

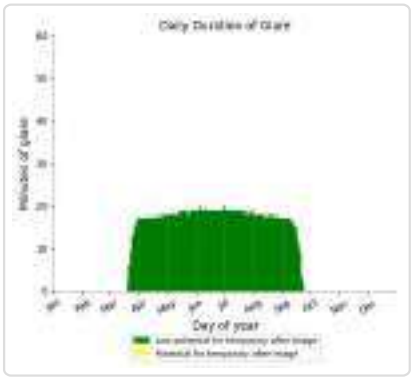

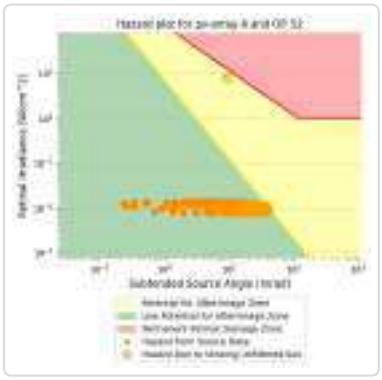

PV array 8: OP 52

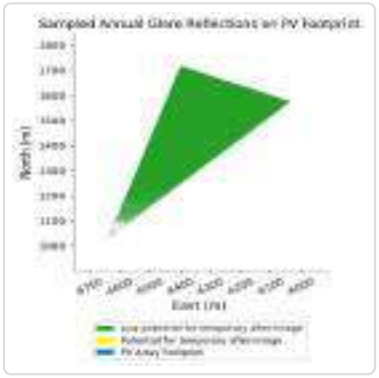

PV array is expected to produce the following glare for this receptor:

- 3,248 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

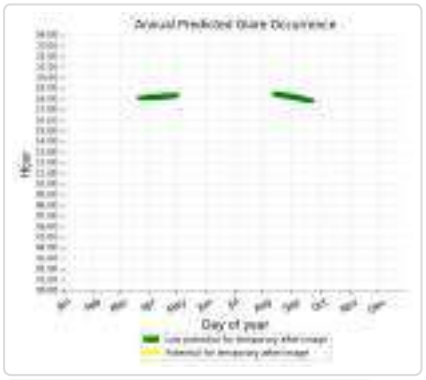

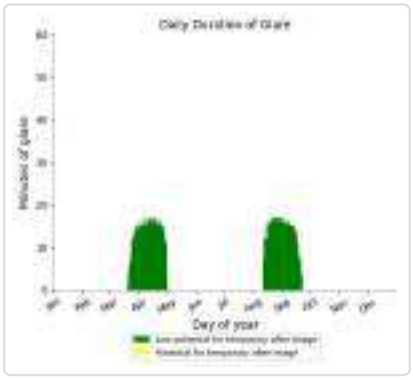

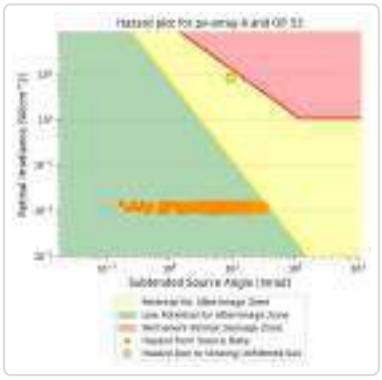

PV array 8: OP 53

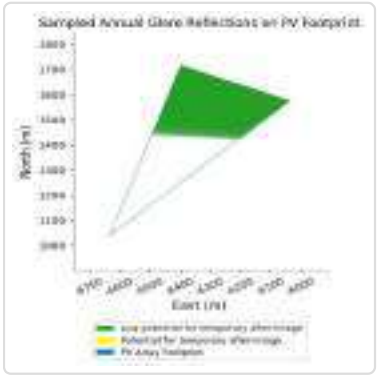

PV array is expected to produce the following glare for this receptor:

PV array 9: OP 34

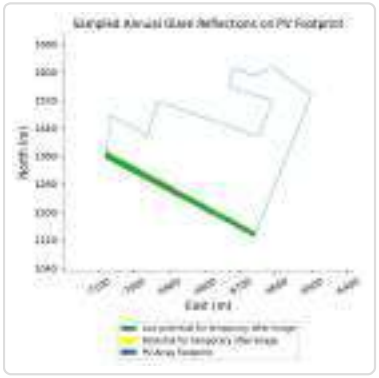

PV array is expected to produce the following glare for this receptor:

- 46 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

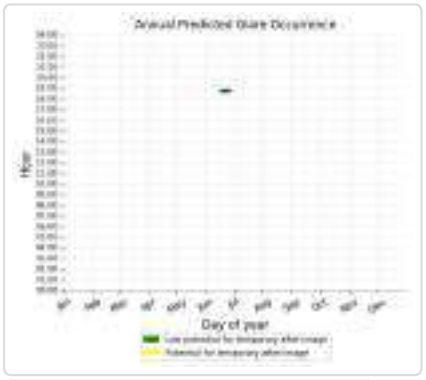

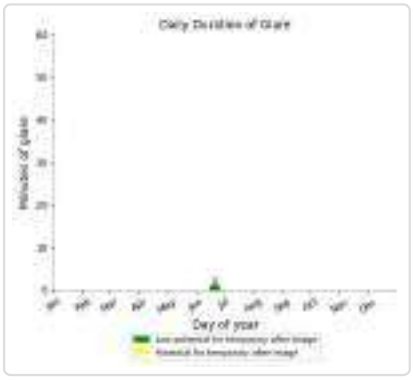

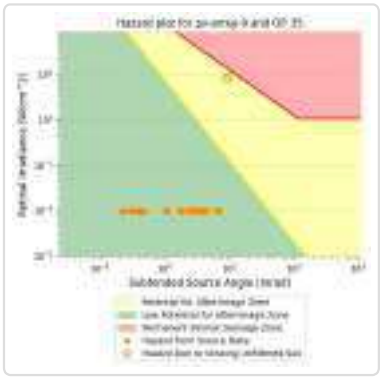

PV array 9: OP 35

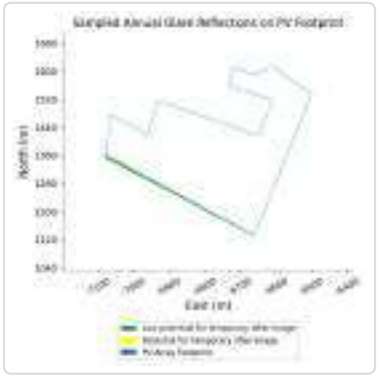

PV array is expected to produce the following glare for this receptor:

- 16 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

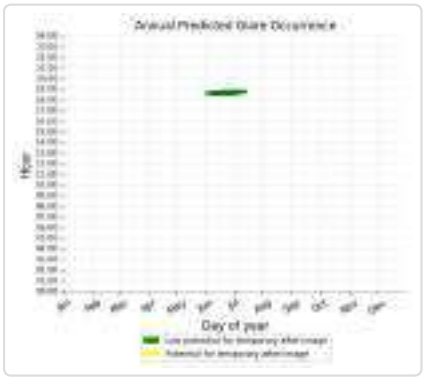

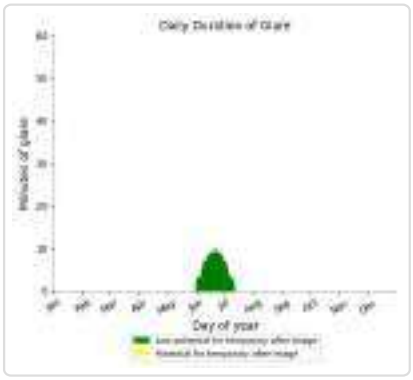

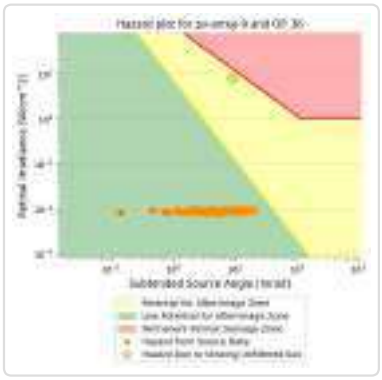

PV array 9: OP 36

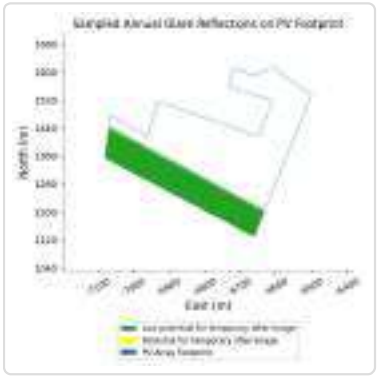

PV array is expected to produce the following glare for this receptor:

- 269 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

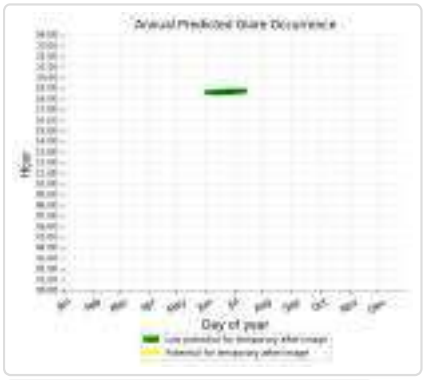

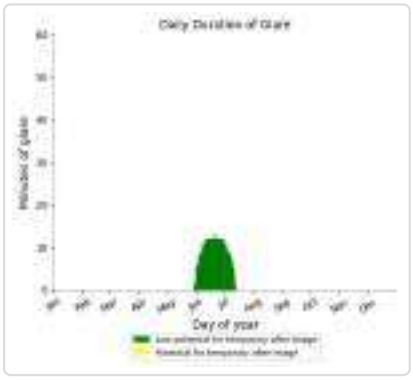

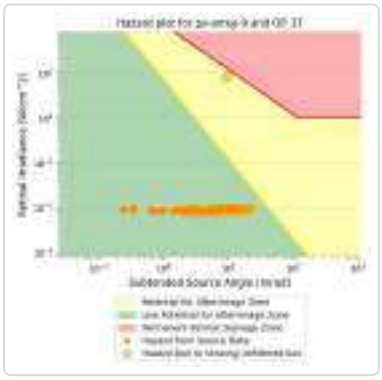

PV array 9: OP 37

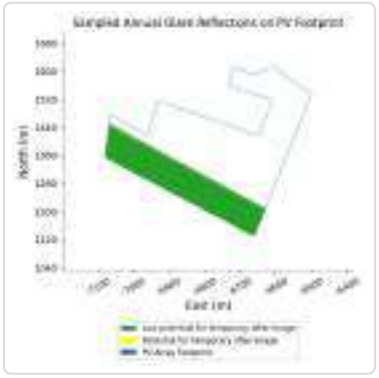

PV array is expected to produce the following glare for this receptor:

- 427 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

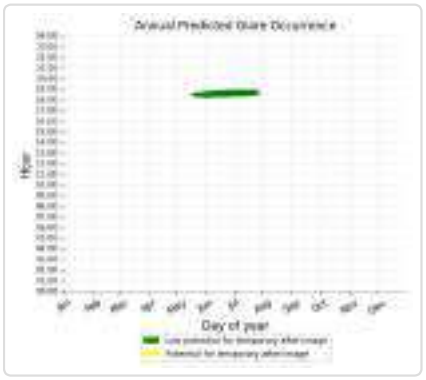

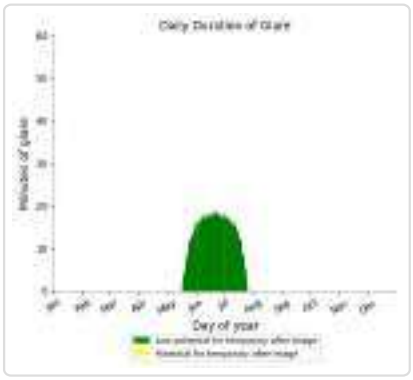

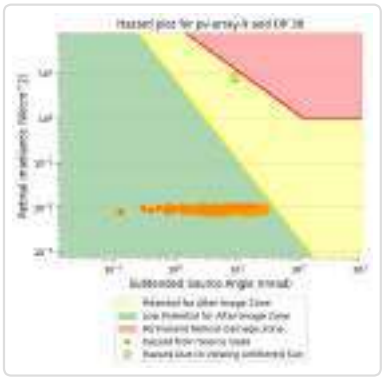

PV array 9: OP 38

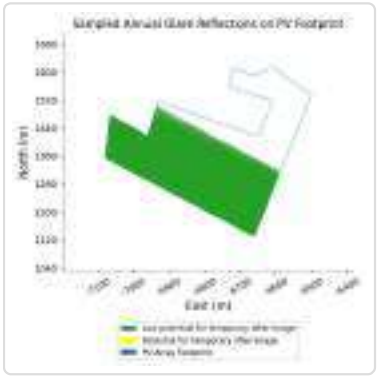

PV array is expected to produce the following glare for this receptor:

- 999 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

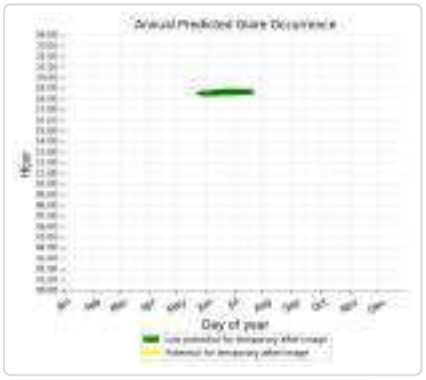

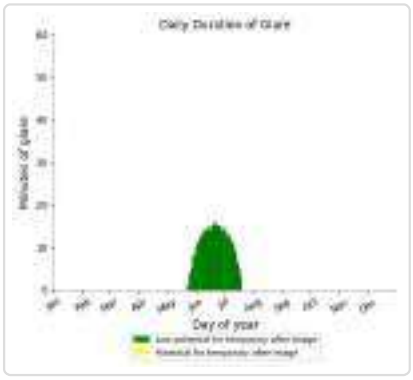

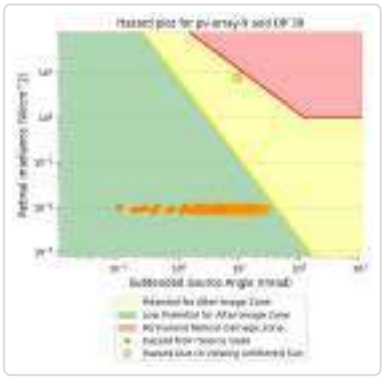

PV array 9: OP 39

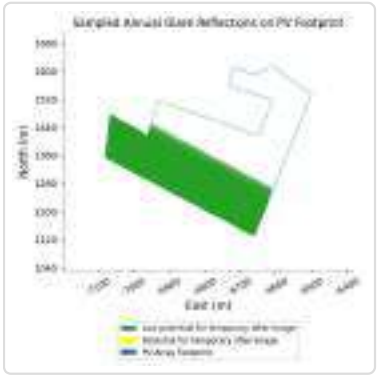

PV array is expected to produce the following glare for this receptor:

- 657 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

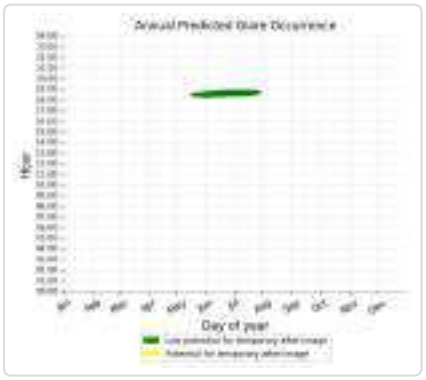

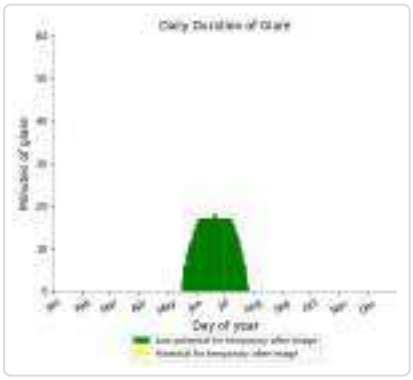

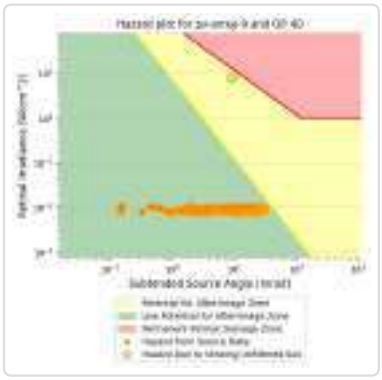

PV array 9: OP 40

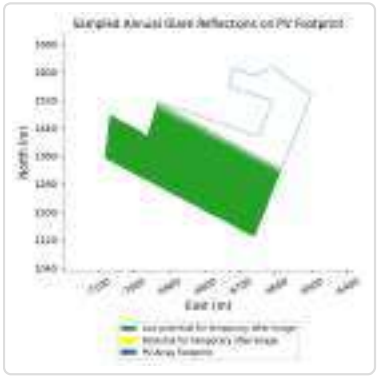

PV array is expected to produce the following glare for this receptor:

- 985 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

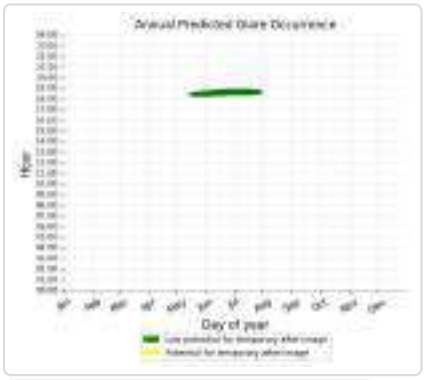

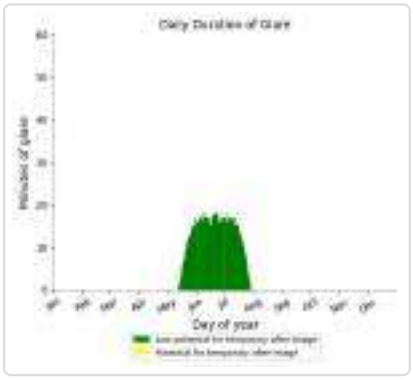

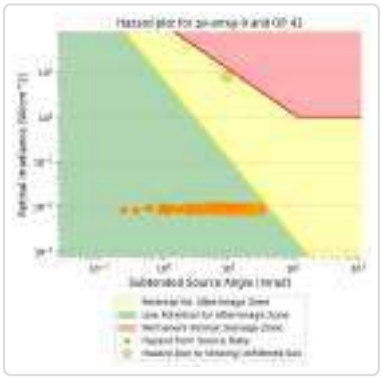

PV array 9: OP 41

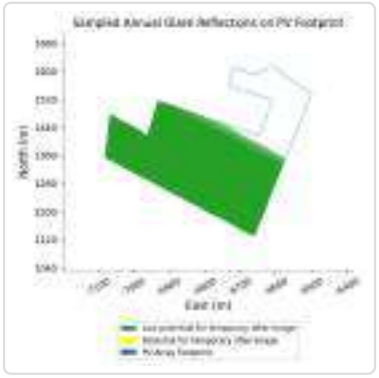

PV array is expected to produce the following glare for this receptor:

- 1,056 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

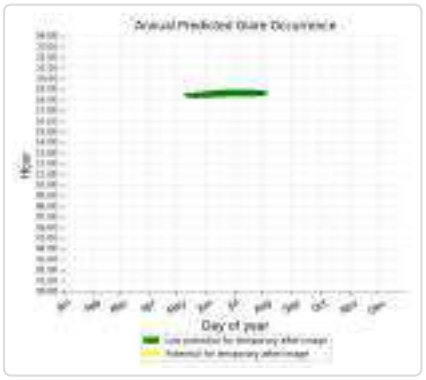

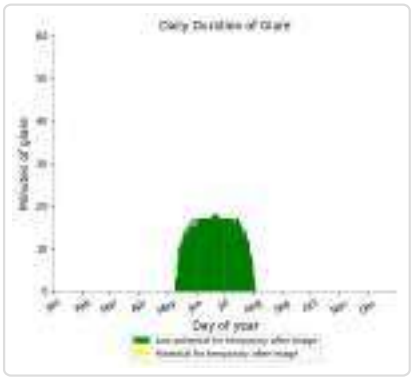

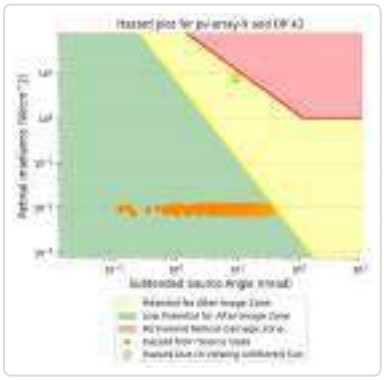

PV array 9: OP 42

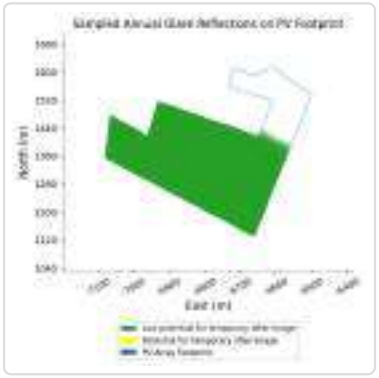

PV array is expected to produce the following glare for this receptor:

- 1,256 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

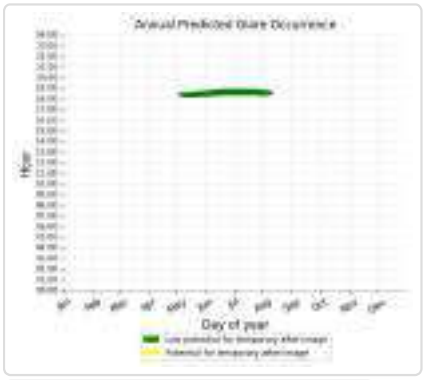

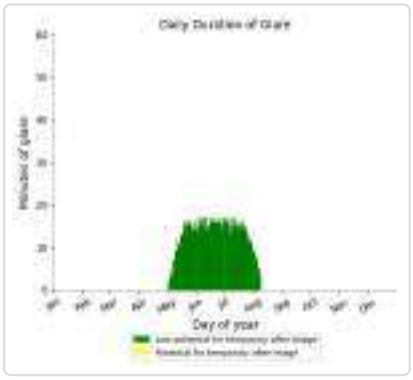

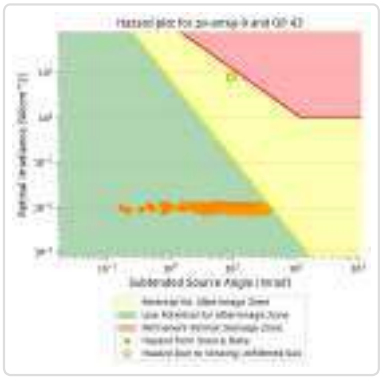

PV array 9: OP 43

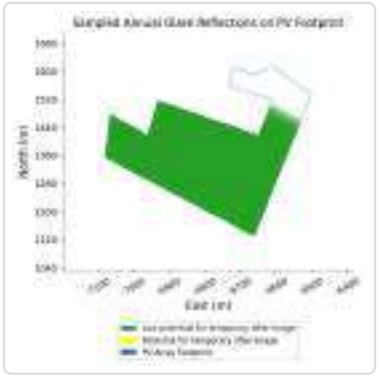

PV array is expected to produce the following glare for this receptor:

- 1,322 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

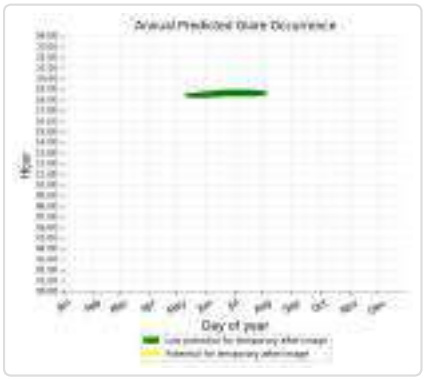

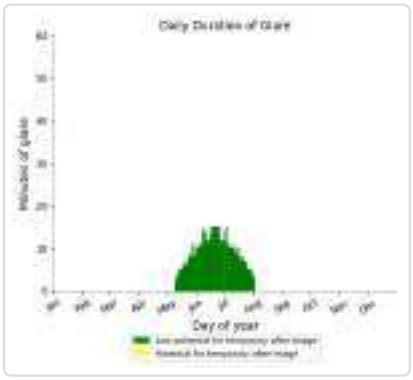

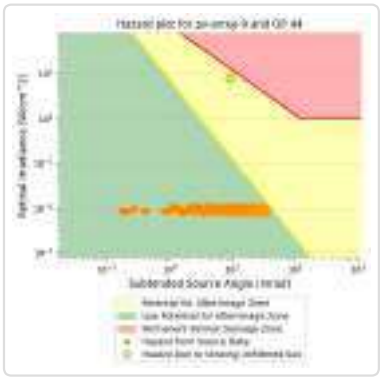

PV array 9: OP 44

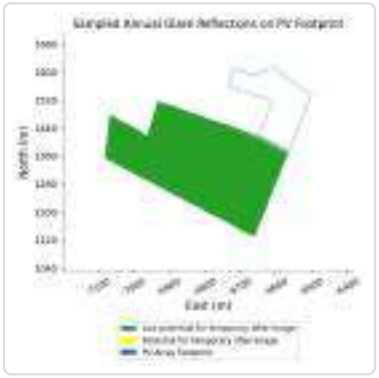

PV array is expected to produce the following glare for this receptor:

- 810 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

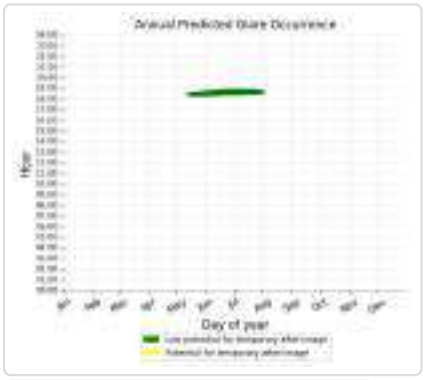

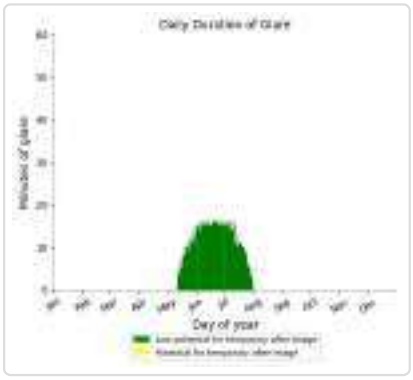

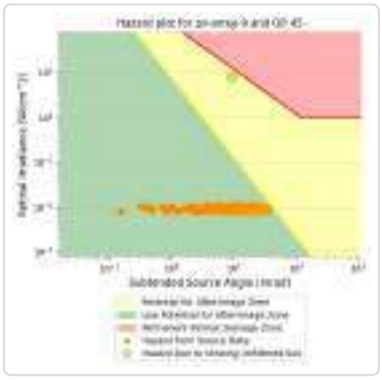

PV array 9: OP 45

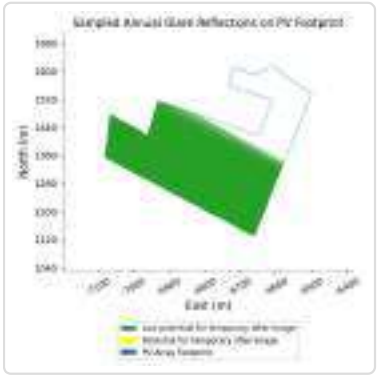

PV array is expected to produce the following glare for this receptor:

- 981 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

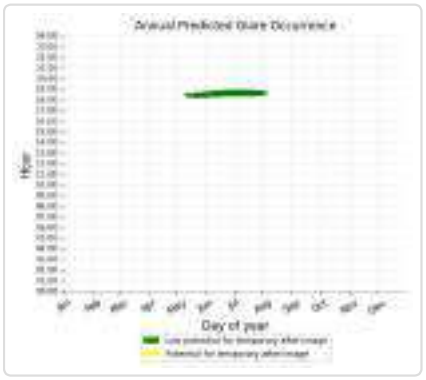

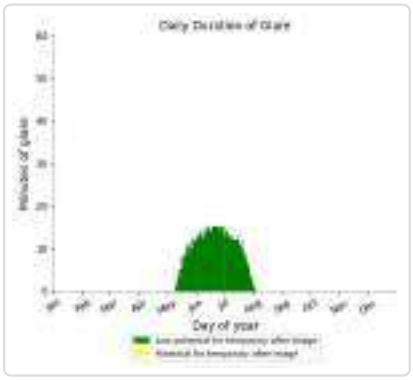

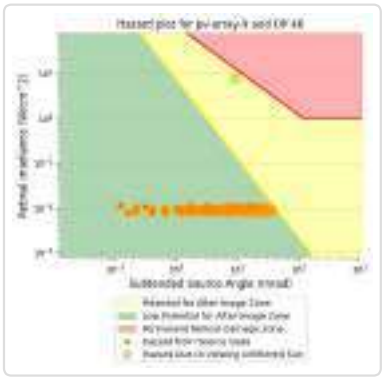

PV array 9: OP 46

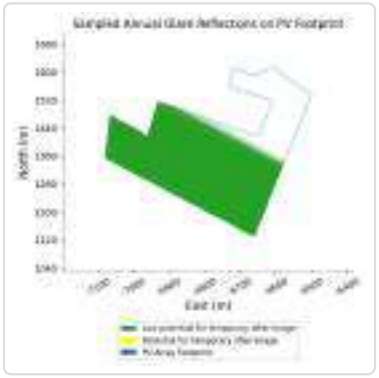

PV array is expected to produce the following glare for this receptor:

- 917 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

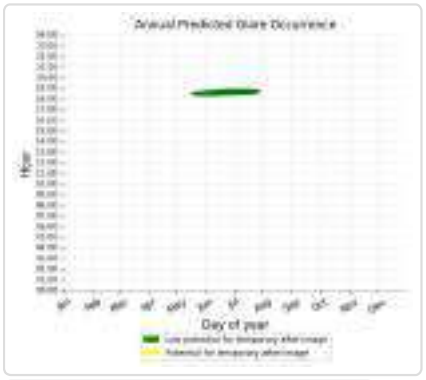

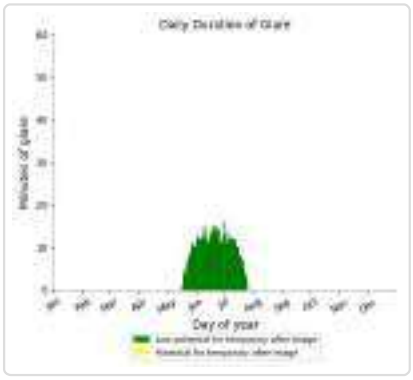

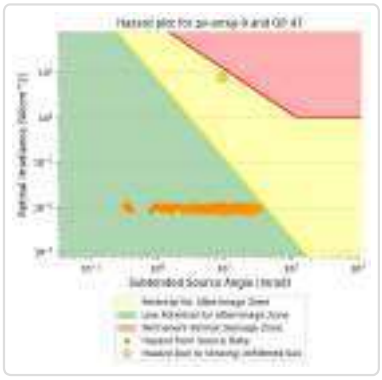

PV array 9: OP 47

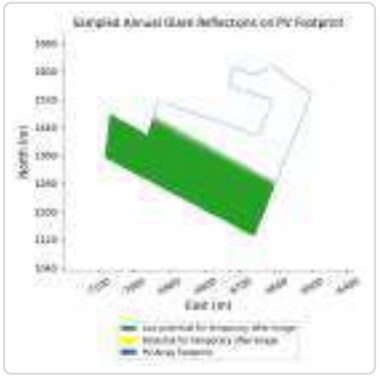

PV array is expected to produce the following glare for this receptor:

- 742 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

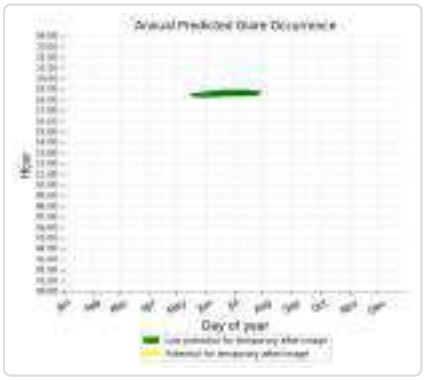

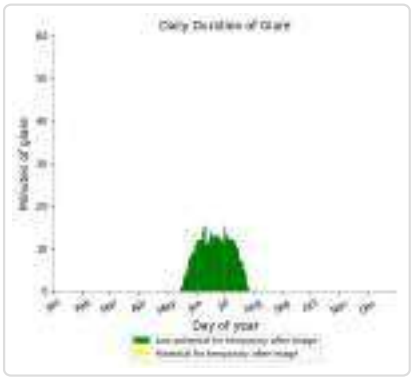

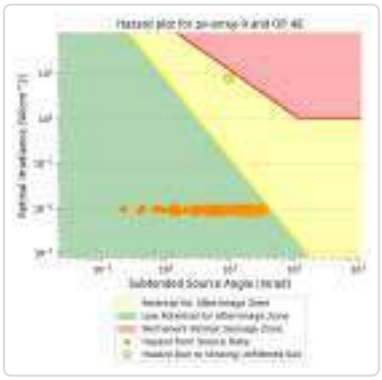

PV array 9: OP 48

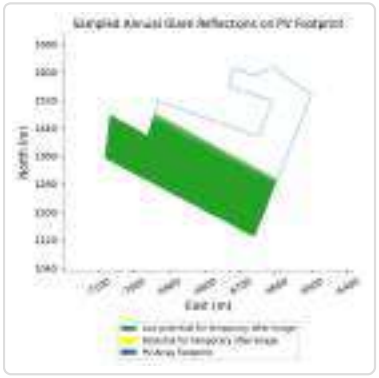

PV array is expected to produce the following glare for this receptor:

- 713 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

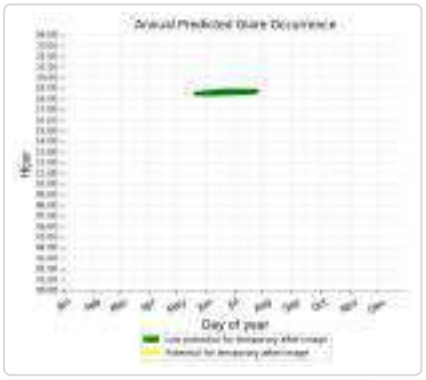

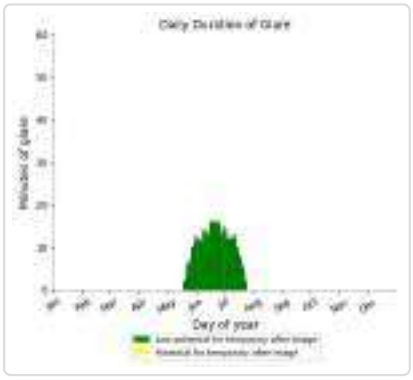

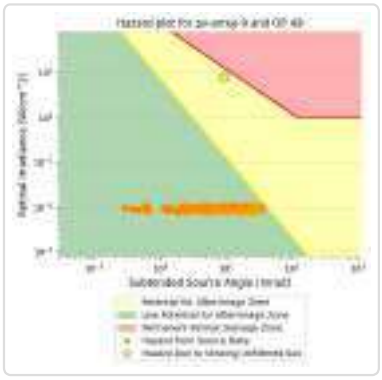

PV array 9: OP 49

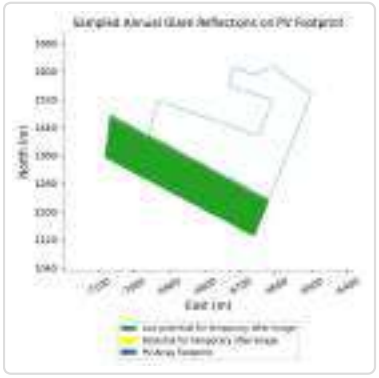

PV array is expected to produce the following glare for this receptor:

- 765 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

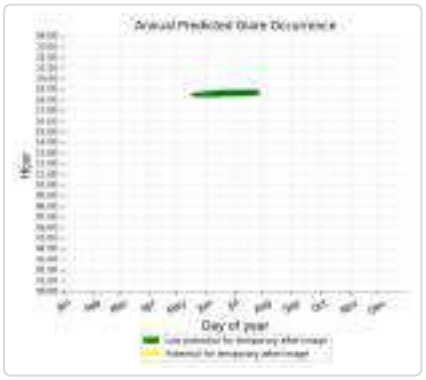

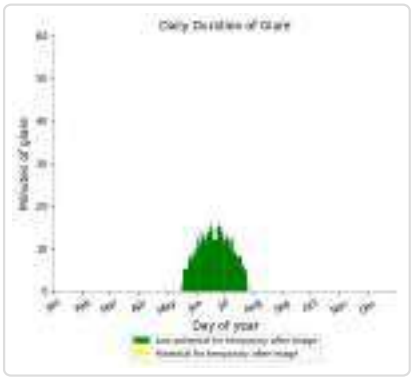

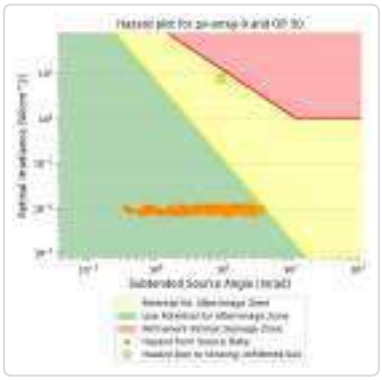

PV array 9: OP 50

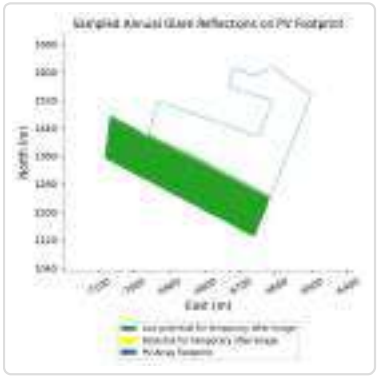

PV array is expected to produce the following glare for this receptor:

- 712 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

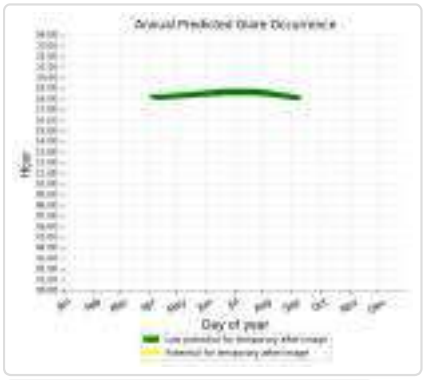

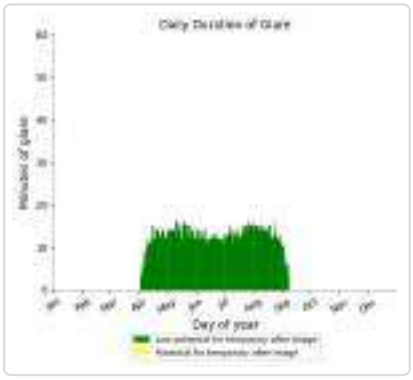

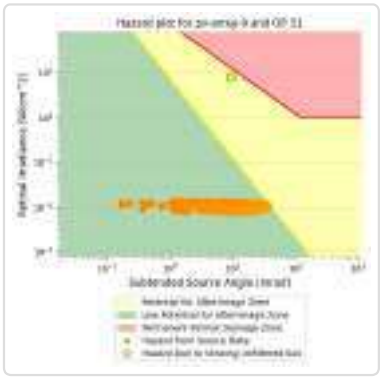

PV array 9: OP 51

PV array is expected to produce the following glare for this receptor:

- 2,042 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

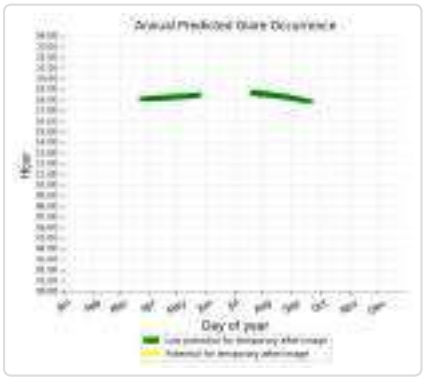

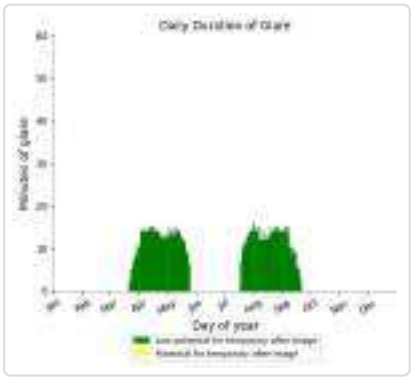

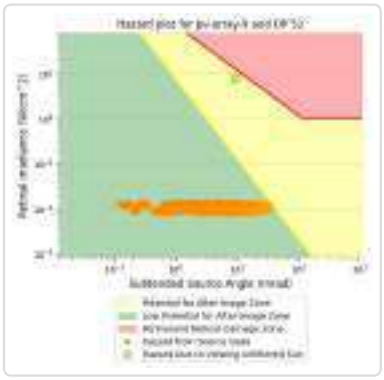

PV array 9: OP 52

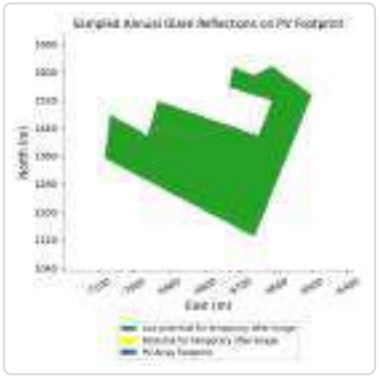

PV array is expected to produce the following glare for this receptor:

- 1,572 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

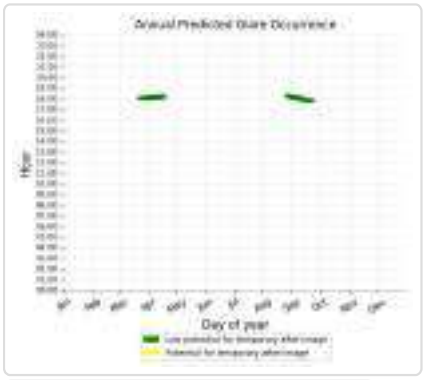

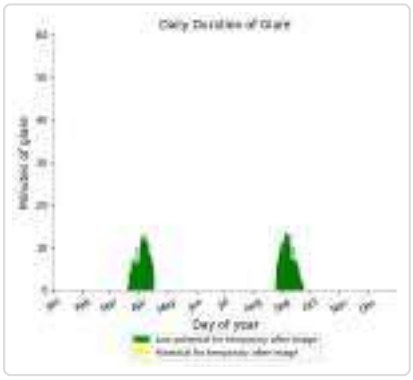

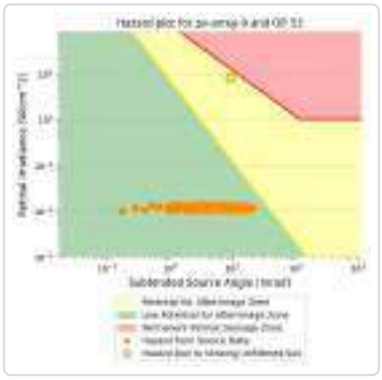

PV array 9: OP 53

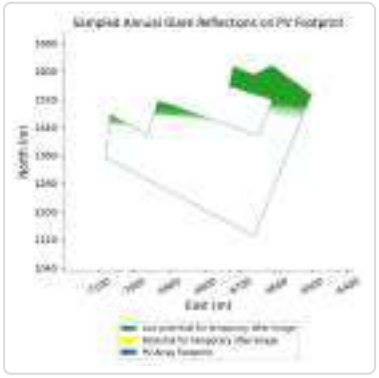

PV array is expected to produce the following glare for this receptor:

- 472 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

Summary of Vertical Surface Glare Analysis

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographi obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for larg PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, nc discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.
