

Common sense would suggest that the siting of BSS close to a nationally significant gas infrastructure can't be a good idea. BSS have a history of instability and toxic fires. Heavy machinery would be used on the site giving the possibility of weakening the gas pipe joints. Added to this, we are in one of the driest regions of the country and this could exacerbate the problems. No amount of precautions can account for every eventuality. Therefore, I would suggest that it makes the whole scheme unfeasible.
