

With such a vast area of planning for solar panels, in light of what we ALREADY have around, which includes 4 SEPARATE wind farms already viewable, 3 solar farms already sited, in an area of high agricultural value, is very worrying, when we have so many houses and factories/warehouses with nothing on them. The money would be better spent on installing on already bare residential and industry, and putting farm land to the production of produce and food. This is where local and national governments just look at the money raised, and ease of install, versus what is the right path, of which THIS is not it!
