

I am against the solar farm being built using up so many acres of valuable agricultural land. We already have hundreds of acres already used for solar with a 3 mile radius of us. The noise, local disruption for traffic, and work force transport to the area will have a huge impact on local communities for years to come.

We already have enough generation as shown by wind power being turned off during periods because the system cannot cope with the amount it produces. Solar will not meet the ballance needed during the winter months when we only have six hours of very limited sunlight. This says, solar is not the answer to the problem and we should not waste our valuable land with such.
