

This application is totally without merit.

Its annual average output efficiency is approximately just over 10% - which is totally unacceptable in view of the agricultural land take.

The land in question is 74% best and

Most versatile- very good agricultural food producing land. Food security should be at the forefront of all our decisions- we cannot eat solar panels

Solar panels should be on commercial and public building rooftops, residential properties, transport corridors and car park canopies amongst other better placed avenues.

Our area has already covered more than any other area in solar developments with wide ranging cluster developments - surely there are better places to site yet another one and leave our green and pleasant valley to the heritage, beautiful landscape, biodiversity, wildlife and residents who call this 'home'.

We do NOT want this scheme.
