Section 1: Introduction, Legislation and Conservation Status

Introduction

- 1.1. Tyler Grange was commissioned to undertake ecological surveys in relation to ‘The Scheme’ of a renewable energy generating project; comprising ground-mounted solar photovoltaic (‘PV’) arrays, together with on-site energy storage and associated infrastructure. The Scheme is located on land to the east of the town of Thorne and to the west of the town of Crowle (the ‘Order Limits’).
- 1.2. This report details results from habitat and field surveys and a Biodiversity Net Gain (BNG) assessment. undertaken by Tyler Grange in August 2024 and June/July 2025 . The objectives of this report are to provide the results of the BNG assessment.
- 1.3. This report presents the detailed field survey methodology and should be read with reference to the **ES Chapter 7 Ecology and Nature Conservation [REP2-035]**~~[Document Reference: 6.2.6]~~. This report should also be read alongside **Appendix 7.1 Baseline Habitats Report [APP-072]**~~[Document Reference 6.3.7.1]~~ included within the **ES Chapter 7 Ecology and Nature Conservation [REP2-035]**~~[Document Reference: 6.2.6]~~.
- ~~1.3. This report has been updated to reflect the latest post-development habitat proposals and associated updates to the Biodiversity Metric. The updates include revised treatment of grassland within the solar compartments, a precautionary allowance for panel bases and associated footings, updated treatment of public access within Mitigation Parcel M1(A), inclusion of additional mixed native scrub creation, and updates to the strategic significance assessment. These updates have been made to ensure the BNG assessment reflects the latest design, habitat management assumptions and stakeholder comments received during the Examination.~~
- 1.4. Landscape plans are provided in Appendix 1, illustrating the proposed post-development habitats and their locations within the site.
- 1.5. ~~This report has been updated following the Applicant’s notice of intention to submit a request for changes to the application [PD-006] and subsequent Change Request Document [Document Reference 8.14 Revision 1].~~ This report has been updated to reflect the latest post-development habitat proposals and associated updates to the Biodiversity Metric. The updates comprise the removal of parcels 1/A, 1/B, 1/C, 1/D, 2/B, 3/C, 3/D and 3/E from the extent of land subject to compulsory acquisition, temporary possession and works powers; the modification of Mitigation Parcel M1(A) to avoid registered common land/Countryside and Rights of Way Act 2000 access land parcels 1/E, 2/A, 3/A and 3/B; ~~and~~ an amendment to a proposed permissive path route through Mitigation Parcel M1(A) so that it would avoid

encroaching upon parcel 2/A; and revised ~~treatment~~ condition assessment of grassland within the solar compartments, culverts, a precautionary allowance for panel bases and associated footings. The BNG assessment has been updated to reflect these changes and effect of these on the BNG conclusions reached in this report is negligible. These updates have been made to ensure the BNG assessment reflects the latest design, habitat management assumptions and stakeholder comments received during the Examination.

Legislation and Conservation Status

- 1.6. It is not yet a mandatory requirement for NSIP applications to demonstrate a quantifiable biodiversity net gain (BNG) of at least 10% under the Environment Act 2021. However, the Applicant intends to provide evidence of the deliverability of measurable biodiversity gains in accordance with NERC obligations and the Overarching National Policy Statement for Energy (EN-1) and National Policy Statement for Renewable Energy Infrastructure (EN-3).
- 1.7. The DEFRA Statutory Biodiversity Metric Calculator has been utilised to provide evidence of achievable on-Site biodiversity gains, which is an established method to quantify biodiversity gains.

Section 2: Methodology

Survey Methodology 2022

- 2.1. Habitat surveys were undertaken by Avian Ecology Ltd. in 2022, and the full methodology and results are presented within **Appendix 7.1 Baseline Habitats and Desk Study Report** ~~Baseline Habitats Report~~ [\[APP-072\]](#) ~~[Document Reference 6.3.7.1]~~ included within the **ES Chapter 7 Ecology and Nature Conservation** [\[REP2-035\]](#) ~~[Document Reference: 6.2.6]~~, to be read alongside this report.

Survey Methodology 2024 and 2025

- 2.2. Following updates to the Order Limits a habitat survey was undertaken on areas not previously covered by Avian Ecology in August 2024 and June/July 2025 by Tyler Grange, with further detail in **Appendix 7.1 Baseline Habitats Report** [\[APP-072\]](#) ~~[Document Reference 6.3.7.1]~~ included within the **ES Chapter 7 Ecology and Nature Conservation** [\[REP2-035\]](#) ~~[Document Reference: 6.2.6]~~.

'Extended' Phase I Habitat Survey and UKHabs

- 2.3. The methods used during the habitat surveys broadly followed methods used in an 'extended' Phase I habitat survey¹ and entailed recording the main plant species and classifying and mapping habitat types with reference to the Habitat Definitions provided by the UK Habitat Classification Working Group².
- 2.4. Additionally, the habitats identified were evaluated for their potential to support legally protected and notable fauna species. Where access allowed, adjacent habitats were also considered in order to assess the Order Limits within the wider landscape and to provide information with which to assess possible impacts within the context of the Order Limits boundary.
- 2.5. All habitats were assessed utilising the relevant condition criteria for the relevant habitat type which included confirming 'pass' / 'fail' criteria in accordance with the Biodiversity Metric User Guide³.

¹ Joint Nature Conservation Committee (2010). Handbook for Phase 1 habitat survey - a technique for environmental audit. JNCC, Peterborough.

² UKHab Ltd. (2023). UK Habitat Classification Version 2.0 (at <https://www.ukhab.org>)

³ DEFRA (2025) Statutory biodiversity metric: user guide

Biodiversity Net Gain

2.6. The Statutory Biodiversity Metric operates by calculating the number of biodiversity units associated with a particular habitat type (both pre-and post-development) – the ‘unit’ value associated with each habitat type is calculated based on the following parameters:

- Size (in hectares)/Length (in km);
- Distinctiveness (i.e. how rare/valuable a given habitat is);
- Condition (i.e. how well the recorded habitat fits [or will fit] the standardised description of that habitat); and
- Strategic significance (i.e. if the existing or proposed habitat is within an area formally adopted in the local plan for green infrastructure or biodiversity improvements).

2.7. When considering the creation of new habitats in the post-development, other factors are also considered when calculating the ‘unit’ value of a given habitat and these are:

- Time to reach the target condition of each habitat; and
- Difficulty category for the creation of a given habitat.

2.8. The UK Habitat Classification was used to identify habitat types. Note that the calculation is completed separately for non-linear and linear habitats. Habitat areas entered into The Statutory Biodiversity Metric in hectares were rounded to two decimal places.

~~2.8.~~2.9. The BNG assessment has been completed in consideration with latest guidance for NSIPS, Biodiversity net gain: nationally significant infrastructure projects published 2 June 2026⁴, which comes into force from 2 November 2026

Limitations and Assumptions

~~2.9.~~2.10. Although all habitats within the Order Limits have been surveyed, due to the timing of the original surveys prior to the implementation of BNG, not all habitats within the Order Limits were surveyed with detailed condition assessments for BNG, although notes on the habitat conditions was still made. To provide a robust and precautionary approach in line with best practice, where sufficient data was not available, higher condition scores for baseline habitats have been assumed. This ensures that the assessment does not underestimate baseline biodiversity value and avoids overestimating potential net gain.

⁴ [Department for Environment, Food and Rural Affairs, Biodiversity net gain: nationally significant infrastructure projects, published 2 June 2026, accessed 29 June 2026.](#)

~~2.10-2.11.~~ 2.11. The majority of hedgerows within the Order Limits contain some gaps and are subject to impacts from ongoing farming activities, which would result in them achieving poor or moderate condition within BNG. However as full condition assessments were not available for all hedgerows, as a precautionary approach, all hedgerows have been included as being of good condition. This precautionary approach ensures that the baseline reflects the likely ecological function of the hedgerows while avoiding underestimation of their contribution to the Order Limits biodiversity value.

~~2.11-2.12.~~ 2.12. The Order Limits contains a large ditch network, comprising both large drainage ditches and smaller field ditches. The condition criteria⁵ for ditches states:

- The ditch is of good water quality, with clear water (low turbidity) indicating no obvious signs of pollution.
- A range of emergent, submerged and floating-leaved plants are present. As a guide >10 species of emergent, floating or submerged plants present in a 20 m ditch length.
- There is less than 10% cover of filamentous algae and or duckweed *Lemna* spp. (these are signs of eutrophication).
- A fringe of aquatic marginal vegetation is present along more than 75% of the ditch.
- Physical damage is evident along less than 5% of the ditch, with examples of damage including: excessive poaching, damage from machinery use or storage, or any other damaging management activities.
- Sufficient water levels are maintained - as a guide a minimum summer depth of approximately 50 cm in minor ditches and 1 m in main drains.
- Less than 10% of the ditch is heavily shaded.
- There is an absence of non-native plant and animal species

~~2.12-2.13.~~ 2.13. Based on available survey data, the majority of ditches would fail one or more of the condition criteria, which would result in them being of moderate condition, with many also failing at least 3 of the condition criteria, resulting in them achieving poor condition. The main reasons being due to poor water quality from agricultural run-off, low water levels, lack of emergent vegetation, lack of marginal vegetation and / or the presence of invasive species. However, to ensure the Order Limits is not undervalued within the BNG baseline, and adopting a precautionary approach, 25% of ditches have been recorded as being in good condition, 50% in moderate condition, and 25% in poor condition. This approach ensures that

⁵ DEFRA (2025) Statutory biodiversity metric condition assessments

the potential ecological value of the ditches in Order Limits is captured within the baseline. Further to this, all ditches are being retained and enhanced as part of the Scheme.

~~2.13.~~2.14. All ditches have been accounted for in the BNG calculations, but no River Morphology survey of the Stainforth and Keadby Canal or River Torne has been completed. This is due to only a small section of the canal located within the Order Limits boundary, the fact the canal and River are being fully retained and buffered, with habitat creation and enhancement to take place in proximity. Therefore, there will be no change or impact to the canal or River⁶. Furthermore, as BNG is not required for NSIPs, this detail is not needed as part of the assessment, which has focused within the boundaries of the Order Limits where potential impacts and changes to habitats are to take place.

⁶ [Department for Environment, Food and Rural Affairs, Biodiversity net gain: nationally significant infrastructure projects, published 2 June 2026, accessed 29 June 2026.](#)

Section 3: Results

- 3.1. The full extent of baseline habitats recorded across the site during all surveys is shown on Figure 1.

Survey Results 2022

- 3.2. Full habitat survey results from Avian Ecology Ltd are included in **ES Chapter 7 Ecology and Nature Conservation [REP2-035] and [Document Reference: 6.2.6], Appendix 7.1 Baseline Habitats and Desk Study Report [APP-072]. Appendix 7.1.** Surveys undertaken in 2022 recorded and mapped all habitat types within the Order Limits at that time.

Survey Results 2024 and 2025

- 3.3. The 2024 and 2025 surveys covered areas of the not previously included in the Order Limits boundary. These surveys also included high-level walkovers of the Order Limits to confirm that habitats had not significantly changed since the 2022 assessment. The 2022 surveys did not include a BNG assessment at the time, but the habitat survey results, including habitat descriptions and photographs, have been used alongside the 2024 and 2025 surveys to inform the current baseline habitat assessment.
- 3.4. The 2024 and 2025 surveys confirmed that there had been no significant change in the habitats recorded in 2022, and the results from the 2022 surveys are therefore still considered valid for the current assessment.

Habitats and Flora

- 3.5. The habitats present in the Order Limits are summarised below in **Table 23.2**, the location of habitats are shown on the Figure 1 - Habitats Features Condition assessment sheets are included on Appendix 2.

Table 2.2: Habitats and Flora

Habitat	Description and BNG Condition	Photograph
Arable Crops	Arable land is the dominant habitat within the Order Limits, with the majority of fields under cereal crops and smaller areas supporting non-cereal crops. Condition assessments are not required within BNG for cropland habitats.	

Modified Grassland

A small proportion of the Order Limits comprises modified grassland, primarily as pasture used for livestock and silage production, dominated by perennial ryegrass with other grass and herb species present. Field margins of modified grassland are present along arable edges, varying in width and species composition. This habitat has been assessed as Poor condition.

<p>Tall Ruderal</p>	<p>Present along field boundaries and comprising species such as nettle and common thistle, with occasional grass and herb species including false-oat grass, bramble, hogweed and reed canary grass. This habitat has been assessed as Moderate condition.</p>	
<p>Scrub</p>	<p>Scrub habitats include mixed scrub with willow, bramble, blackthorn, hawthorn, elder, and dogrose, and bramble-dominated scrub with tall herbs. This habitat has been assessed as Moderate condition.</p>	

<p>Hedgerows</p>	<p>Hedgerows throughout the Order Limits vary between unmanaged and intensively managed, intact and defunct, and are typically species-poor and hawthorn-dominated, with occasional blackthorn, elder, ash, and other native species. Most hedgerows contain immature to mature trees. Assessed as good condition.</p>	
<p>Lines of Trees</p>	<p>Lines of trees are present throughout the Order Limits, comprising mature, semi-mature, and immature trees of various native and occasional non-native species, including oak, lime, hazel, ash, willow, and birch. Assessed as moderate condition.</p>	

<p>Lakes and Ponds</p>	<p>Ponds within the Order Limits vary from shallow pools to deep waterbodies, with some supporting common reed and marginal willow scrub while others lack marginal vegetation. Some ponds support waterfowl and fish. This habitat has been assessed as Moderate condition.</p>	
<p>Ditches and Watercourses</p>	<p>The Order Limits contains a network of wet and dry ditches with seasonal water level fluctuations, supporting aquatic and marginal vegetation including bramble scrub, reed canary grass, and common reed. Banks vary from shallow to steep, often with modified grassland margins. Larger watercourses include the River Torne and the Stainforth and Keadby Canal within or adjacent to the Order Limits. Assessed as good, moderate and poor condition as described above.</p>	

Woodland

Woodland habitats within the Order Limits include wet woodland and deciduous woodland copses dominated by birch, oak, ash, poplar, and additional native tree species. Ground flora typically includes bramble and bracken. This habitat has been assessed as Moderate condition.

Strategic Significance

~~3.6. The Order Limits spans Council areas of Doncaster and North Lincolnshire. While neither has yet adopted its own Local Nature Recovery Strategy (LNRS), Doncaster falls within the developing South Yorkshire LNRS — currently led by the South Yorkshire Mayoral Combined Authority, with Doncaster Council as a supporting authority. North Lincolnshire lies within the Greater Lincolnshire LNRS area, which is also in preparation.~~

3.6. Importantly, the Order Limits is situated within or functionally linked to designated sites (SACs and SPAs). To ensure that the ecological significance of on-site habitats is properly recognised, the baseline assessment has recorded the Order Limits as “Location ecologically desirable but not yet referenced in a local strategy.”⁵. This classification recognises the potential for species movement and habitat support linking to adjacent designated sites, and ensures that the baseline reflects the contribution to broader ecological networks. The Order Limits spans the administrative areas of City of Doncaster Council and North Lincolnshire Council. The relevant strategic significance for each of the areas has been applied to both areas.

3.7. The part of the Order Limits within City of Doncaster Council falls within the South Yorkshire Local Nature Recovery Strategy (LNRS) area. The South Yorkshire LNRS is being prepared by the South Yorkshire Mayoral Combined Authority, with City of Doncaster Council identified as a supporting authority. At the time of writing, the South Yorkshire LNRS has not been formally published⁶. Therefore, the Doncaster section of the BNG assessment has had regard to City of Doncaster Council’s interim planning guidance for assigning strategic significance.

3.8. City of Doncaster Council’s interim guidance⁷ identifies Biodiversity Opportunity Areas as the relevant interim basis for assigning strategic significance prior to publication of the South Yorkshire LNRS. Where habitat creation or enhancement comprises a habitat type identified as important within the relevant Biodiversity Opportunity Area, this has been recorded within the Biodiversity Metric as “Formally identified in a Local Strategy”. This includes relevant habitat types such as other neutral grassland, ditches, ponds, woodland and native species hedgerows, where these are located within the relevant opportunity area or otherwise meet the criteria set out in the guidance.

3.9. The part of the Order Limits within North Lincolnshire Council falls within the Greater Lincolnshire LNRS area⁸. The Greater Lincolnshire LNRS has been progressed through

⁵ DEFRA (2025) Statutory biodiversity metric: user guide

⁶ Defra (2026). Local nature recovery strategies: responsible authorities. Webpage accessed June 2026.

⁷ City of Doncaster Council (2024). Planning Policy Guidance: Assigning Strategic Significance for Applications Subject to Mandatory Biodiversity Net Gain. March 2024.

⁸ Greater Lincolnshire Local Nature Recovery Strategy (2026). Progress. Webpage accessed June 2026.

consultation and was adopted in June 2026⁹. The Greater Lincolnshire LNRS includes a Statement of Biodiversity Priorities and a Local Habitat Map, including areas of particular importance for biodiversity and areas that could be of particular importance for biodiversity.

3.10. The North Lincolnshire section of the Order Limits within the BNG assessment has therefore had regard to the Greater Lincolnshire LNRS. Where proposed habitat creation or enhancement corresponds with relevant mapped LNRS actions or priorities, this has been recorded within the Biodiversity Metric as “Formally identified in a Local Strategy”. This includes relevant habitats such as neutral grassland, woodland, wet woodland, hedgerows, ditches, watercourses, ponds and other wetland habitats.

3.11. As the same broad habitat types are identified as local priorities across both areas, they have been recorded consistently within the Biodiversity Metric. The same strategic significance category has therefore been applied to the same habitat types across the Order Limits, where supported by the relevant local strategies.

Proposed Habitats

3.12. The proposals, as shown within Appendix 21 and Figure 2, have been used to calculate the proposed habitat areas. The rationale for target condition assessments is detailed within the metric 16413_M01a.

3.13. The post-development habitat areas have been updated to reflect the latest design and management approach, including the classification of grassland within the solar compartments, the allowance for panel bases and associated footings, areas of mixed native scrub, proposed culverts and the treatment of Mitigation Parcel M1(A).

3.14. Grassland within the solar compartments, defined as the areas beneath or between the rows of solar panels as shown on Figure 2, have been recorded as modified grassland in poor condition¹⁰. This takes account of shading from the solar panels.

3.15. The panels will be a maximum of 3.6 m high, with a clearance above ground level ranging from approximately 0.8 m to 2.3 m. This will allow grassland to establish beneath and between the panels.

3.16. Some areas within the solar compartments, including wider gaps between panels and security fence are likely to support grassland of a higher distinctiveness than areas directly beneath panels; however, the whole solar compartment grassland area beneath and between the

⁹ Greater Lincolnshire Local Nature Recovery Strategy (2026). Local Habitat Map. Webpage accessed June 2026.

¹⁰ South Yorkshire Councils, Advice Note – Post-development habitat creation and enhancement measures on solar farm sites for the purposes of Biodiversity Net Gain (BNG): South Yorkshire Councils (Barnsley, Doncaster, Rotherham and Sheffield) position, Revision B

panels have been recorded as modified grassland of poor condition to provide a precautionary assessment.

3.17. The total area within the solar compartments is approximately 1073.491 ha. As a precautionary approach in response to **8.10 Comments on Local Impact Reports (City of Doncaster Council) [REP2-089]**, 10% of this area has been recorded as developed land to allow for the bases of the solar panels. This equates to an additional 107.349 ha of developed land. This is a precautionary assumption within the BNG assessment to account for the pilings of the panels and any concrete pads in line with guidance¹¹.

3.18. The remaining area of grassland within the solar compartments has therefore been recorded as 966.142 ha of modified grassland in poor condition.

3.19. Areas within the security fences, but not located beneath or directly adjacent to the solar panels, have been recorded as other neutral grassland in poor condition, as shown on Figure 2. These areas are expected to support a higher species diversity than the grassland beneath and between the solar panels, due to reduced shading and fewer direct impacts from the panel infrastructure. However, a poor condition target has been applied as a precautionary approach.

3.20. Areas of grassland outside the solar compartments and security fencing, as shown on Figure 2, include buffers to retained habitats, ditch margins, hedgerow margins, grassland buffers and larger open mitigation parcels across the Order Limits. These areas have been recorded as other neutral grassland in moderate condition. These areas will be subject to appropriate management to maintain a varied sward height and species composition, supporting structural diversity and providing habitat for a range of flora and fauna. These areas will also provide buffers to retained ecological features such as ditches, hedgerows and woodland and contribute to habitat connectivity across the Order Limits.

~~3.7.3.21.~~ ~~A~~ The BNG metric has been updated in respect of Mitigation Parcel M1(A). The updates are precautionary and ensure that areas subject to existing rights of public access, described below, are still included within the BNG assessment.

¹¹ South Yorkshire Councils, Advice Note – Post-development habitat creation and enhancement measures on solar farm sites for the purposes of Biodiversity Net Gain (BNG): South Yorkshire Councils (Barnsley, Doncaster, Rotherham and Sheffield) position, Revision B

~~3.8.~~3.22. Within Mitigation Parcel M1(A), the area of registered common land / Countryside and Rights of Way (CRoW) Act 2000 access land¹² within parcels 1/E, 2A¹³, 3/A and 3/B, and the proposed permissive footpath through M1(A), all of which measures approximately 3.63ha, has been recorded in the BNG metric as lost and then recreated as other neutral grassland in Poor condition. This land was previously recorded as other neutral grassland in Moderate condition and will be retained in practice and managed to achieve Moderate condition. However, this precautionary approach has been used whereby the grassland is classified as Poor condition within the BNG metric, to take into account the potential effects of recreational pressure from the existence of public rights of access over the land.

~~3.9.~~3.23. The area of M1(A) outside of the CRoW access land and proposed permissive footpath route, comprising 6.81 ha, has been recorded as retained other neutral grassland in Moderate condition. Management will aim to maximise the importance of this grassland and achieve a higher condition where possible, although moderate condition has been used in the BNG metric as part of a precautionary approach.

3.24. The permissive footpath through M1(A) will be fenced to prevent recreational impacts to the grassland in M1(A), such as from trampling and dog fouling, and will comprise a mown grass path.

~~3.10.~~3.25. The bird mitigation areas have been included within the Biodiversity Net Gain assessment. Defra guidance¹⁴¹⁵ confirms that mitigation or compensation for functionally linked land may count only in part towards BNG, and that where such measures are counted in part, at least 10% of the total biodiversity units must come from additional activities other than mitigation and compensation. The assessment confirms that the Scheme achieves the required biodiversity units without relying on the bird mitigation areas and therefore accords with the additionality approach set out in the guidance.

~~3.11.~~3.26. Parcels 1/A, 1/B, 1/C, 1/D, 3/C, 3/D and 3/E, which total 0.0524 ha, are removed from the extent of land subject to compulsory acquisition, temporary possession or works powers. These parcels comprise small areas of drain and agricultural land. The existing areas of arable land within these parcels have been recorded in the BNG metric as retained. Approximately

¹² By virtue of section 2 (1) of the Countryside and Rights of Way Act 2000, any person is entitled to enter and remain on any access land for the purposes of open-air recreation

¹³ A small area of land previously forming part of parcel 2A is now identified as parcel 2B in the Land Plans [Document Reference 2.2 Revision 4]. That land is not subject to compulsory acquisition, temporary possession or works powers. In addition, no benefit is assigned to that land for the purposes of the assessment contained in this report as it has never formed part of Mitigation Parcel M1(A) and no other habitat enhancement is proposed in respect of the land.

¹⁴ Department for Environment, Food and Rural Affairs, What you can count towards a development's biodiversity net gain, published 2 May 2023, updated 2 June 2026, accessed 29 June 2026.

¹⁵ Department for Environment, Food and Rural Affairs, Biodiversity net gain: nationally significant infrastructure projects, published 2 June 2026, accessed 29 June 2026.

100 m of ditch within the drains in these parcels has also been recorded as retained, rather than enhanced.

~~3.12. A species rich grassland sward will be established beneath the solar panels and managed through grazing or appropriate mowing regimes. This grassland will be created prior to construction in these areas.~~

~~3.13. Although UKHab guidance indicates that recording vegetation beneath solar panels as U1B6 (Solar Panels with Vegetation), this was not applied as it would convert the habitat type to Developed Land Sealed Surface (u1b) — Developed Land (u1B6)⁴⁶ within the Biodiversity Metric. This does not accurately reflect the proposed vegetated habitat under the panels, which is to comprise neutral grassland. On a precautionary basis this has been classified as achieving poor condition within the metric, although in reality some areas are likely to achieve a higher condition.~~

~~3.14. Buffers adjacent to the solar panels will consist of diverse neutral grassland, managed to maintain a varied sward height and species composition. This management regime will encourage structural heterogeneity within the sward, supporting a wide range of flora and fauna. The varied sward structure will provide important habitat niches and promote biodiversity within these buffer areas. Again this will be created prior to construction commencing in these areas.~~

~~3.15. Large areas of neutral grassland managed to at least moderate condition are to be created within the Order Limits and will form part of the bird mitigation strategy. These areas will be created prior to the majority of the Order Limit being constructed.~~

3.27. The proposals include the planting of new woodland areas comprising a range of native tree species. This woodland habitat is expected to establish well and achieve at least poor condition initially, with potential for improvement through ongoing management. The native species mix will provide valuable habitat for a variety of wildlife and contribute positively to the Order Limits ecological network.

3.28. The proposals include the creation of new areas of mixed native scrub, as shown on Figure 2. The scrub planting will include a minimum of five native woody species and will be managed to establish dense and continuous vegetation. This will provide structural diversity, nesting and foraging opportunities for birds, invertebrates and other wildlife, and will contribute to habitat connectivity across the Order Limits. The scrub will be located to complement

⁴⁶ UKHab Ltd. (2023). UK Habitat Classification Version 2.0 (at <https://www.ukhab.org>)

retained and proposed habitats, including hedgerows with trees, woodland, ditches and grassland buffers.

3.29. New hedgerow planting, including hedgerows with trees, is also proposed across the Order Limits, as shown on Figure 2. These features will strengthen existing field boundaries, increase habitat connectivity and provide additional nesting, foraging and commuting habitat for a range of species.

3.30. Areas impacted by the proposed new culverts have been recorded within the watercourse section of the metric, this includes a total of 125 new culverts. As precautionary approach these are assumed to impact 5m each so a total of 0.625km of ditches have been recorded as lost and created as culverts. These comprise small areas across the wider ditch network and have been included to ensure that the effects of all the proposed culverts are appropriately reflected within the BNG assessment.

~~3.16.~~

~~3.17.~~ 3.31. Areas of hardstanding are also incorporated within the proposals which includes roads and other infrastructure. These are non-vegetated surfaces that do not require condition assessment under current BNG guidelines but contribute to the overall land use and Order Limits infrastructure.

~~3.18.~~ 3.32. Details of habitat establishment and long-term management is provided through the **Outline Landscape Ecological Management Plan (LEMP) [REP2-070]**~~[Document Reference 7.6]~~ which has been prepared in line with this BNG assessment. The LEMP sets out the prescriptions for the establishment and maintenance of the habitats for 40 years. These management measures take into account biodiversity enhancement alongside specific species enhancements.

Trading rules

~~3.33. The trading rules for BNG have not been met in relation to loss of scrub as a broad habitat type, as scrub habitats are being lost without like-for-like replacement. However, woodland of the same distinctiveness as the required scrub habitat is being provided, which, while not the same broad habitat type, contributes positively to overall habitat quality. In addition, the scheme is delivering over a 10% net gain in biodiversity units. The BNG metric has been updated to include the new areas of mixed native scrub. This has been included to address the scrub trading requirement and to provide like-for-like replacement for scrub habitats affected by the Scheme. Therefore the trading rules of the metric have been met,~~

BNG Conclusion

3.19.3.34. As described within The Statutory Biodiversity Metric **16413_M01a** and summarised below in **Figure 4.1**, based on the habitats present that will be lost and those to be created, the development would result in a gain of ~~3727.44~~1339.96 habitat units, a gain of ~~345.56~~349.75 hedgerow units, and a gain of ~~100.43~~99.39 watercourse units. This is a percentage gain of ~~79.82~~29.50% in habitat units, ~~178.57~~172.57% in hedgerow units and ~~10.84~~10.26% in watercourse units.

Figure 4.1: Biodiversity Net Gain Assessment Results Summary, taken from The Statutory Biodiversity Metric.

3.20.3.35. The BNG assessment for the Order Limits demonstrates that the proposed Scheme will deliver a measurable net gain in biodiversity across habitats, hedgerows, and watercourses.

3.21.3.36. The DEFRA Statutory Biodiversity Metric has demonstrated that the Scheme will achieve a net gain in biodiversity units exceeding 10% across the Order Limits, even when applying a precautionary baseline approach. This demonstrates the deliverability of measurable biodiversity improvements in line with the Applicant’s commitments under the NERC Act and relevant national policy, despite the Scheme not being subject to mandatory BNG requirements.

~~3.22.3.37.~~ These outcomes will be secured and maintained over the long term through implementation of the **Outline Landscape Ecological Management Plan (LEMP)** [REP2-070]~~[Document Reference 7.6]~~ prepared for the Scheme and will be implemented for 40 years, which is for the lifetime of the Scheme, although only 30 years is required for BNG.

					Grid reference						
Condition Assessment Criteria				Criterion passed (Yes or No)						Notes (such as justification)	
A	There are 6-8 vascular plant species per m ² present, including at least 2 forbs (these may include those listed in Footnote 1). Note - this criterion is essential for achieving Moderate or Good condition.				No						
	Where the vascular plant species present are characteristic of medium, high or very high distinctiveness grassland, or there are 9 or more of these characteristic species per m ² (excluding those listed in Footnote 1), please review the full UKHab description to assess whether the grassland should instead be classified as a higher distinctiveness grassland. Where a grassland is classed as medium, high, or very high distinctiveness, please use the relevant condition sheet.										
B	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20% is more than 7 cm) creating microclimates which provide opportunities for vertebrates and invertebrates to live and breed.				No						
C	Any scrub present accounts for less than 20% of the total grassland area. (Some scattered scrub such as bramble <i>Rubus fruticosus</i> agg. may be present). Note - patches of scrub with continuous (more than 90%) cover should be classified as the relevant scrub habitat type.				Yes						
D	Physical damage is evident in less than 5% of total grassland area. Examples of physical damage include excessive poaching, damage from machinery use or storage, erosion caused by high levels of access, or any other damaging management activities.				No						
E	Cover of bare ground is between 1% and 10%, including localised areas (for example, a concentration of rabbit warrens) ² .				No						
F	Cover of bracken <i>Pteridium aquilinum</i> is less than 20%.				Yes						
G	There is an absence of invasive non-native plant species ³ (as listed on Schedule 9 of WCA ⁴).				Yes						
Essential criterion achieved (Yes or No)				No							
Number of criteria passed				3							
Condition Assessment Result (out of 7 criteria)	Condition Assessment Score			Score Achieved x/√							

Condition Sheet: GRASSLAND Habitat Type (medium, high and very high distinctiveness)												
UK Habitat Classification (UKHab) Habitat Types												
Grassland - Lowland calcareous grassland Grassland - Lowland dry acid grassland Grassland - Lowland meadows Grassland - Other lowland acid grassland Grassland - Other neutral grassland Grassland - Tall herb communities (H6430) [Not to be confused with the Tall forbs secondary code – see UKHab guidance for details.] Grassland - Upland acid grassland Grassland - Upland calcareous grassland Grassland - Upland hay meadows Sparsely vegetated land - Calaminarian grassland

Limitations (if applicable)	See 16413_R11_BNG Report			Habitat parcel reference								
Condition Assessment Criteria				Grid reference								Notes (such as justification)
				9								
Criterion passed (Yes or No)												
A	The parcel represents a good example of its habitat type, with a consistently high proportion of characteristic indicator species present relevant to the specific habitat type (and relative to Footnote 3 suboptimal species which may be listed in the UKHab description). ¹ Note - this criterion is essential for achieving Moderate or Good condition for non-acid grassland types only.			No								
B	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20% is more than 7 cm) creating microclimates which provide opportunities for insects, birds and small mammals to live and breed.			Yes								
C	Cover of bare ground is between 1% and 5%, including localised areas, for example, rabbit warrens ² .			Yes								
D	Cover of bracken <i>Pteridium aquilinum</i> is less than 20% and cover of scrub (including bramble <i>Rubus fruticosus</i> agg.) is less than 5%.			Yes								
E	Combined cover of species indicative of suboptimal condition ³ and physical damage (such as excessive poaching, damage from machinery use or storage, damaging levels of access, or any other damaging management activities) accounts for less than 5% of total area. If any invasive non-native plant species ⁴ (as listed on Schedule 9 of WCA ⁵) are present, this criterion is automatically failed.			Yes								
Additional Criterion - must be assessed for all non-acid grassland types												

F	There are 10 or more vascular plant species per m ² present, including forbs that are characteristic of the habitat type (species referenced in Footnote 3 and 5 cannot contribute towards this count). Note - this criterion is essential for achieving Good condition for non-acid grassland types only.	No																		
Essential criterion for Good condition achieved (for non-acid grassland) (Yes or No)		No																		
Number of criteria passed		4																		
Condition Assessment Result	Condition Assessment Score	Score Achieved */√																		
Acid grassland types (Result out of 5 criteria)																				
Passes 5 criteria	Good (3)																			
Passes 3 or 4 criteria	Moderate (2)																			
Passes 2 or fewer criteria	Poor (1)																			
Non-acid grassland types (Result out of 6 criteria)																				
Passes 5 or 6 criteria, including essential criterion A and additional criterion F.	Good (3)																			
Passes 3 - 5 criteria, including essential criterion A.	Moderate (2)	Moderate																		
Passes 2 or fewer criteria; OR Passes 3 or 4 criteria excluding criterion A and F.	Poor (1)																			
Suggested enhancement interventions to improve condition score																				
Notes																				
<p>Footnote 1 - Professional judgement should be used alongside the UKHab description.</p> <p>Footnote 2 – For example, this could include small, scattered areas of bare ground allowing for plant colonisation, or localised patches not exceeding 5% cover.</p> <p>Footnote 3 - Species indicative of suboptimal condition for this habitat type include: creeping thistle <i>Cirsium arvense</i> , spear thistle <i>Cirsium vulgare</i> , curled dock <i>Rumex crispus</i> , broad-leaved dock <i>Rumex obtusifolius</i> , common nettle <i>Urtica dioica</i> , creeping buttercup <i>Ranunculus repens</i> , greater plantain <i>Plantago major</i> , white clover <i>Trifolium repens</i> and cow parsley <i>Anthriscus sylvestris</i> . There may be additional relevant species local to the region and or site.</p> <p>Footnote 4 – Assess this for each distinct habitat parcel. If the distribution of invasive non-native species varies across the habitat, split into parcels accordingly, applying a buffer zone around the invasive non-native species with a size relative to its risk of spread into adjacent habitat, by applying professional judgement.</p> <p>Footnote 5 – Wildlife and Countryside Act 1981 (as amended).</p>																				

E2.	Tree health	At least 95% of hedgerow trees are in a healthy condition (excluding veteran features valuable for wildlife). There is little or no evidence of an adverse impact on tree health by damage from livestock or wild animals, pests or diseases, or human activity.	This criterion identifies if the trees are subject to damage which compromises the survival and health of the individual specimens.	Yes														
-----	-------------	--	---	-----	--	--	--	--	--	--	--	--	--	--	--	--	--	--

The hedgerow condition assessment generates a weighting (score) ranging from 1 - 3, which is used within the Statutory Biodiversity Metric. The scores for each are set out in the tables below.

Condition categories for hedgerows without trees			Score achieved					
Category	Category Requirements	Metric Score						
Good	No more than 2 failures in total; AND No more than 1 failure in any functional group.	3						
Moderate	No more than 4 failures in total; AND <u>Does not fail both attributes</u> in more than one functional group (for example, fails attributes A1, A2, B1 and C2 = Moderate condition).	2						
Poor	Fails a total of more than 4 attributes; OR <u>Fails both attributes</u> in more than one functional group (for example, fails attributes A1, A2, B1 and B2 = Poor condition).	1						
Score achieved:								
Condition categories for hedgerows with trees			Score achieved					
Category	Category Requirements	Metric score						
Good	No more than 2 failures in total; AND No more than 1 failure in any functional group.	3						
Moderate	No more than 5 failures in total; AND <u>Does not fail both attributes</u> in more than one functional group (for example, fails attributes A1, A2, B1, C2 and E1 = Moderate condition).	2

Condition Sheet: WETLAND Habitat Type												
Habitat Types												
Grassland - Floodplain wetland mosaic and CFGM - See the Statutory Biodiversity Metric User Guide. Wetland - Blanket bog Wetland - Depression on peat substrates (H7150) Wetland - Fens (upland and lowland) Wetland - Lowland raised bog Wetland - Oceanic valley mire [1] (D2.1) Wetland - Purple moor grass and rush pastures Wetland - Reedbeds Wetland - Transition mires and quaking bogs (H7140)												
Habitat Description												
For Oceanic valley mires - see EUNIS See the Statutory Biodiversity Metric User Guide for Floodplain wetland mosaic (FWM) and coastal and floodplain grazing marsh (CFGM). For CFGM also see the below: Coastal and floodplain grazing marsh UK BAP Priority Habitat description Priority Habitat Inventory (England) - data.gov.uk												
All other wetland habitats - see UK Habitat Classification (UKHab):												
UKHab												
On-site or off-site, site name and location	Survey date and Surveyor name											
	Survey reference (if relating to a wider survey)											
Limitations (if applicable)	Habitat parcel reference											
	7											
Condition Assessment Criteria	Grid reference											
Criterion passed (Yes or No)											Notes (such as justification)	
Core Criteria - must be assessed for all wetland habitat types :												
A	The water table is at, or near the surface throughout the year - this could be open water or saturation of soil at the surface. There is no artificial drainage, unless specifically to maintain water levels as specified above. Note - this criterion is essential for achieving Good condition.	No										
B	The parcel represents a good example of its specific habitat type - the appearance and composition of the vegetation closely matches its UKHab description, with vascular and non-vascular characteristic indicator species consistently present. ¹	Yes										
C	The water supplies (groundwater, surface water and or rainwater) to the wetland are of good water quality, with clear water (low turbidity) indicating no obvious signs of pollution.	No										
D	Cover of scrub and scattered trees are less than 10%.	Yes										
E	Cover of bare ground is less than 5%.	Yes										
F	There is an absence of invasive non-native plant species ² (as listed on Schedule 9 of WCA ³) and species indicative of suboptimal condition ⁴ make up less than 5% of ground cover.	Yes										
Additional Criterion - must be assessed for Fen and Purple moor grass and rush pasture habitats only:												

G	Woodland regeneration	All three classes present in woodland ⁸ ; trees 4 - 7 cm Diameter at Breast Height (DBH), saplings and seedlings or advanced coppice regrowth.	One or two classes only present in woodland ⁸ .	No classes or coppice regrowth present in woodland ⁸ .	2														
H	Tree health	Tree mortality 10% or less, no pests or diseases and no crown dieback ⁹ .	11% to 25% tree mortality and or crown dieback or low-risk pest or disease present ⁹ .	Greater than 25% tree mortality and or any high-risk pest or disease present ⁹ .	3														
I	Vegetation and ground flora	Recognisable NVC plant community ¹⁰ at ground layer present, strongly characterised by ancient woodland flora specialists.	Recognisable woodland NVC plant community ¹⁰ at ground layer present.	No recognisable woodland NVC plant community ¹⁰ at ground layer present.	2														
J	Woodland vertical structure	Three or more storeys across all survey plots, or a complex woodland ¹¹ .	Two storeys across all survey plots ¹¹ .	One or less storey across all survey plots ¹¹ .	2														
K	Veteran trees	Two or more veteran trees ¹² per hectare.	One veteran tree ¹² per hectare.	No veteran trees ¹² present in woodland.	2														
L	Amount of deadwood	50% of all survey plots within the woodland parcel have deadwood, such as standing and fallen deadwood, large dead branches and or stems, branch stubs and stumps, or an abundance of small cavities ¹³ .	Between 25% and 50% of all survey plots within the woodland parcel have deadwood, such as standing and fallen deadwood, large dead branches and or stems, stubs and stumps, or an abundance of small cavities ¹³ .	Less than 25% of all survey plots within the woodland parcel have deadwood, such as standing and fallen deadwood, large dead branches and or stems, stubs and stumps, or an abundance of small cavities ¹³ .	2														
M	Woodland disturbance	No nutrient enrichment or damaged ground evident ¹⁴ .	Less than 1 hectare in total of nutrient enrichment across woodland area, and or less than 20% of woodland area has damaged ground ¹⁴ .	1 hectare or more of nutrient enrichment, and or 20% or more of woodland area has damaged ground ¹⁴ .	2														
Total Score (out of a possible 39)					27														
Condition Assessment Result		Condition Assessment Score			Result Achieved														
Total score >32 (33 to 39)		Good (3)																	
Total score 26 to 32		Moderate (2)			Moderate														
Total score <26 (13 to 25)		Poor (1)																	
Suggested enhancement interventions to improve condition score
