ANNEX B: RESIDENTIAL RECEPTOR GLARE RESULTS GROUP A (RECEPTORS 1 – 64) (15 DEGREES)

Fenwick Solar Farm

Fenwick Residential Group A 15 degrees

Created Nov 28, 2023
Updated Aug 06, 2024
Time-step 1 minute
Timezone offset UTC0
Minimum sun altitude 0.0 deg
Site ID 106533.18426

Project type Advanced
Project status: active
Category 10 MW to 100 MW

Misc. Analysis Settings

DNI: varies (1,000.0 W/m² peak)
 Ocular transmission coefficient: **0.5**
 Pupil diameter: **0.002 m**
 Eye focal length: **0.017 m**
 Sun subtended angle: **9.3 mrad**

PV Analysis Methodology: **Version 2**
 Enhanced subtended angle calculation: **On**

Summary of Results Glare with potential for temporary after-image predicted

PV Name	Tilt	Orientation	"Green" Glare	"Yellow" Glare	Energy Produced
	deg	deg	min	min	kWh
Central Array	15.0	180.0	26,999	2,130	-
East Array	15.0	180.0	74,497	0	-

Component Data

PV Array(s)

Total PV footprint area: 3,073,405 m²

Name: Central Array
Footprint area: 359,990 m²
Axis tracking: Fixed (no rotation)
Tilt: 15.0 deg
Orientation: 180.0 deg
Rated power: -
Panel material: Light textured glass with AR coating
Vary reflectivity with sun position? Yes
Correlate slope error with surface type? Yes
Slope error: 9.16 mrad

Assumptions

-
- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
 - Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
 - Detailed system geometry is not rigorously simulated.
 - The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
 - The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
 - Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
 - The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
 - Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
 - Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.

- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Central Array: OP 1

PV array is expected to produce the following glare for this receptor:

- 1,900 minutes of "green" glare with low potential to cause temporary after-image.
- 303 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 2

PV array is expected to produce the following glare for this receptor:

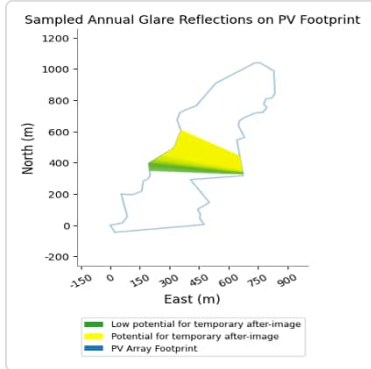

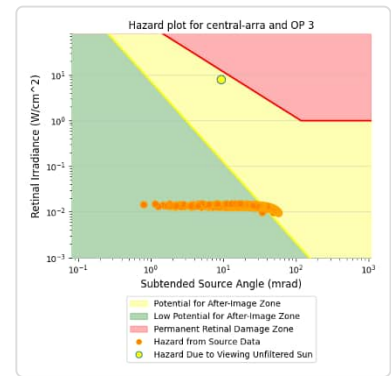

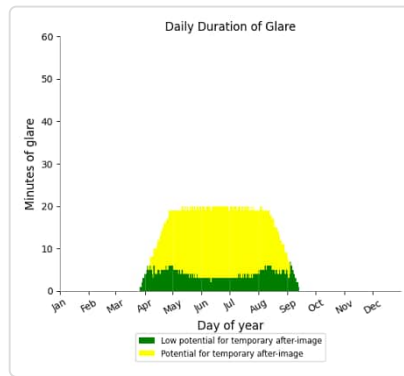

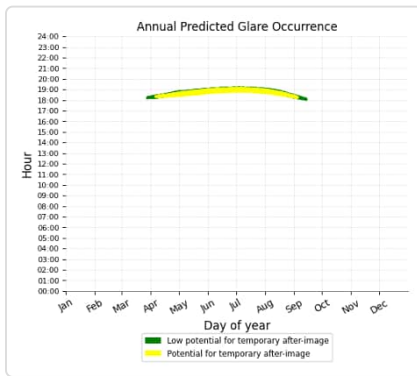

- 1,995 minutes of "green" glare with low potential to cause temporary after-image.
- 215 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 3

PV array is expected to produce the following glare for this receptor:

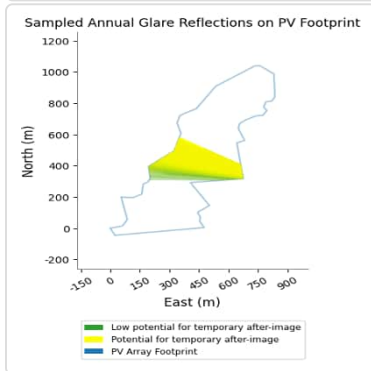

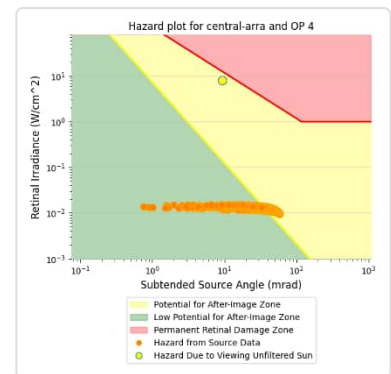

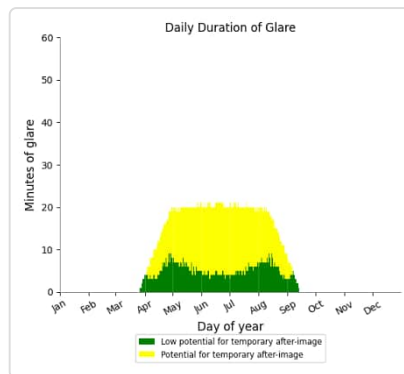

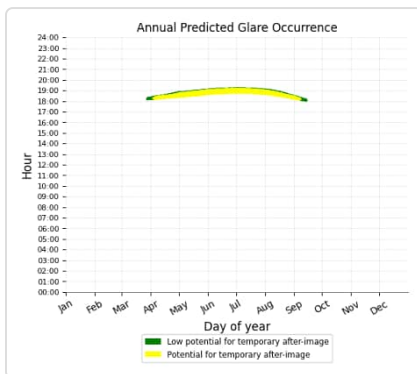

- 679 minutes of "green" glare with low potential to cause temporary after-image.
- 2,038 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 4

PV array is expected to produce the following glare for this receptor:

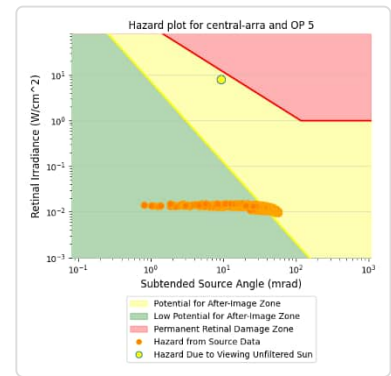

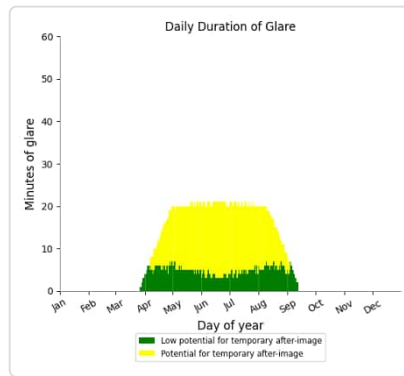

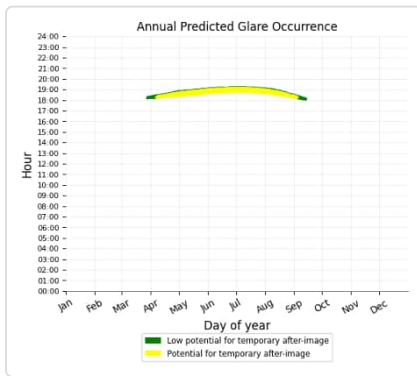

- 860 minutes of "green" glare with low potential to cause temporary after-image.
- 1,913 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 5

PV array is expected to produce the following glare for this receptor:

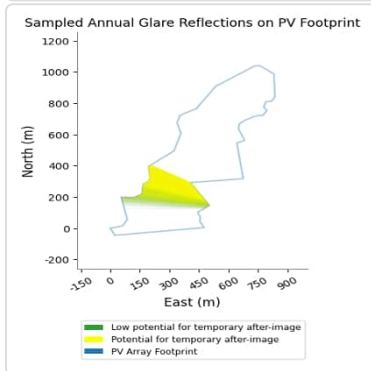

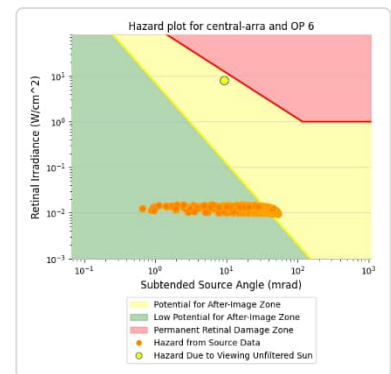

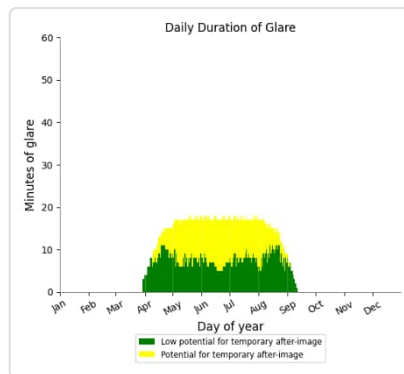

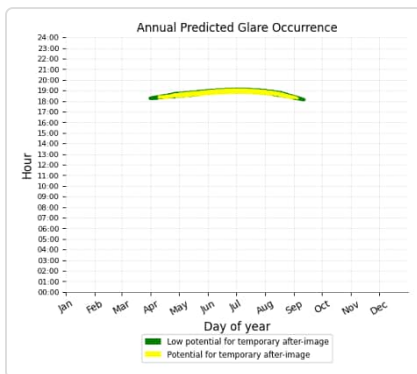

- 804 minutes of "green" glare with low potential to cause temporary after-image.
- 1,997 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 6

PV array is expected to produce the following glare for this receptor:

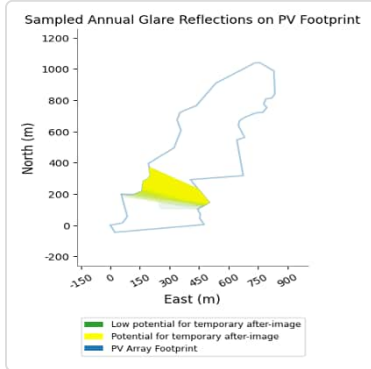

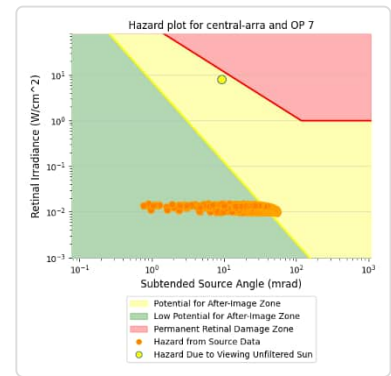

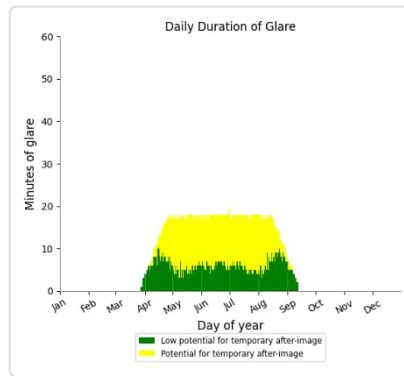

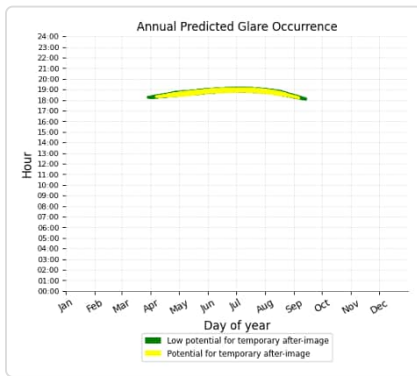

- 1,221 minutes of "green" glare with low potential to cause temporary after-image.
- 1,196 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 7

PV array is expected to produce the following glare for this receptor:

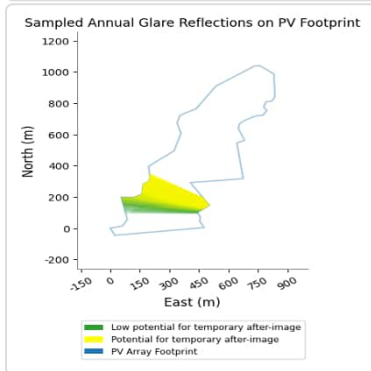

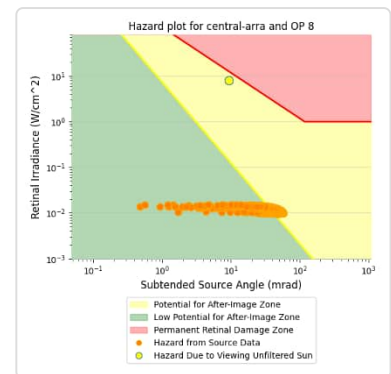

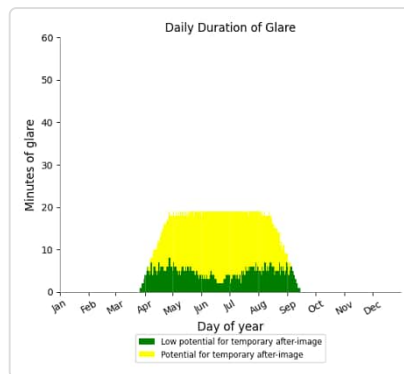

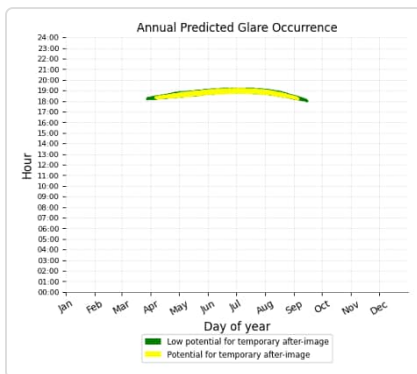

- 983 minutes of "green" glare with low potential to cause temporary after-image.
- 1,537 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 8

PV array is expected to produce the following glare for this receptor:

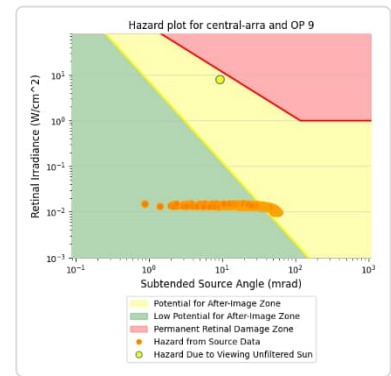

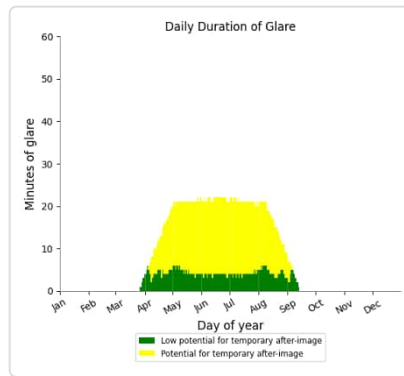

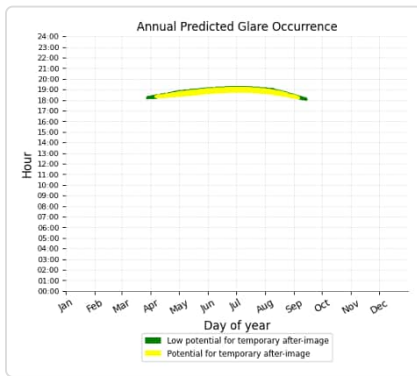

- 792 minutes of "green" glare with low potential to cause temporary after-image.
- 1,843 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 9

PV array is expected to produce the following glare for this receptor:

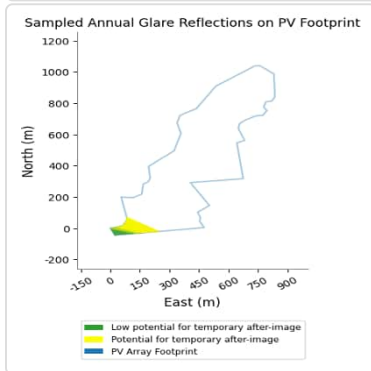

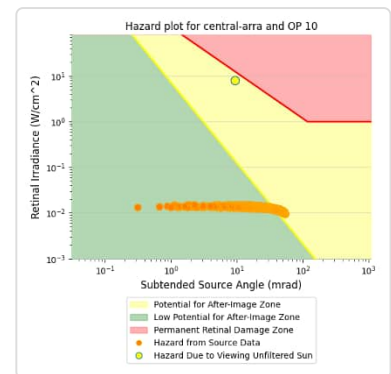

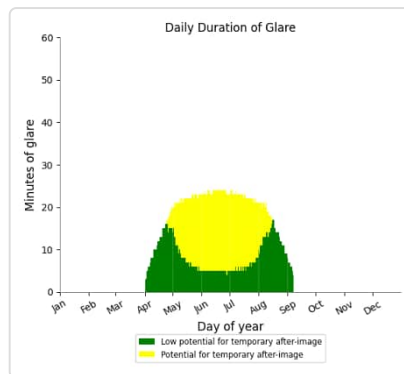

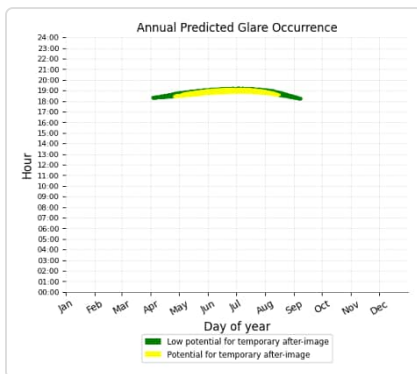

- 697 minutes of "green" glare with low potential to cause temporary after-image.
- 2,183 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 10

PV array is expected to produce the following glare for this receptor:

- 1,344 minutes of "green" glare with low potential to cause temporary after-image.
- 1,627 minutes of "yellow" glare with potential to cause temporary after-image.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Name: South Array
Footprint area: 1,204,919 m²
Axis tracking: Fixed (no rotation)
Tilt: 35.0 deg
Orientation: 180.0 deg

Rated power: -
Panel material: Light textured glass with AR coating
Vary reflectivity with sun position? Yes
Correlate slope error with surface type? Yes
Slope error: 9.16 mrad

PV array is expected to produce the following glare for this receptor:

- 1,250 minutes of "green" glare with low potential to cause temporary after-image.
- 379 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 6

PV array is expected to produce the following glare for this receptor:

- 27 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 7

PV array is expected to produce the following glare for this receptor:

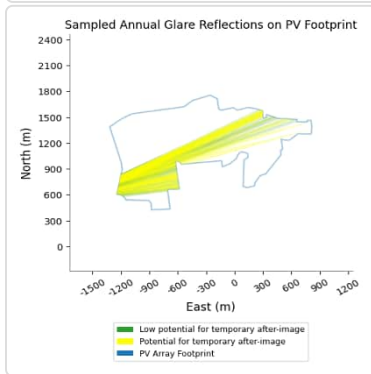

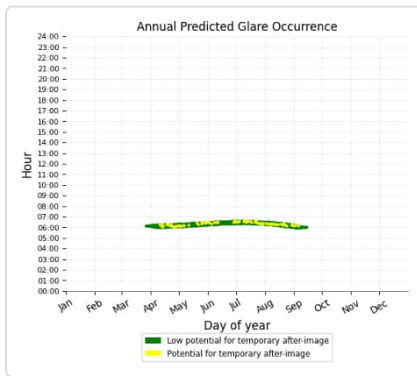

- 31 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 8

PV array is expected to produce the following glare for this receptor:

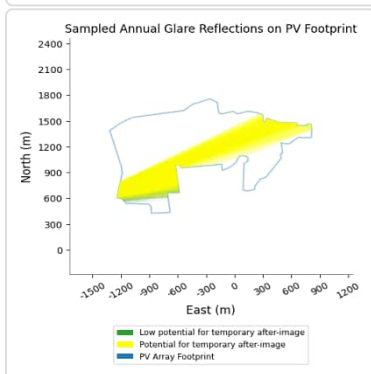

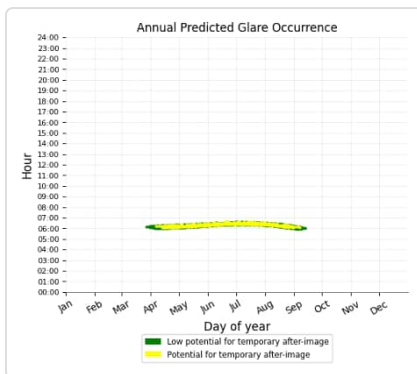

- 1,061 minutes of "green" glare with low potential to cause temporary after-image.
- 85 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 9

PV array is expected to produce the following glare for this receptor:

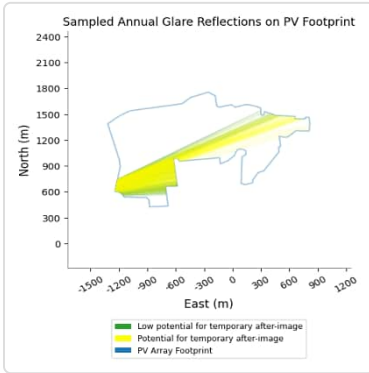

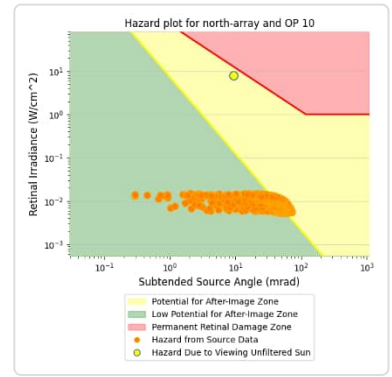

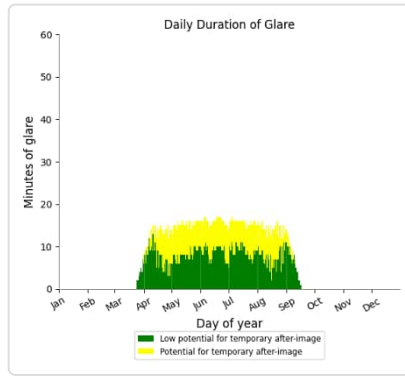

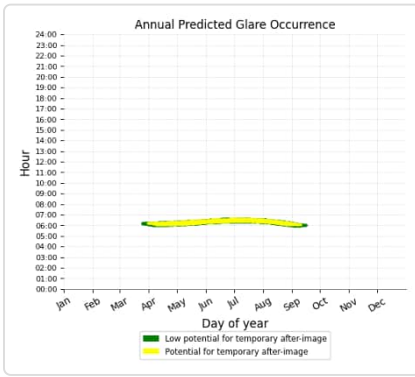

- 1,190 minutes of "green" glare with low potential to cause temporary after-image.
- 353 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 10

PV array is expected to produce the following glare for this receptor:

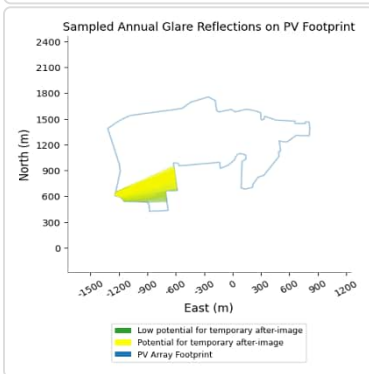

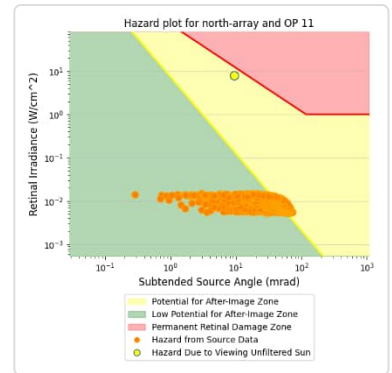

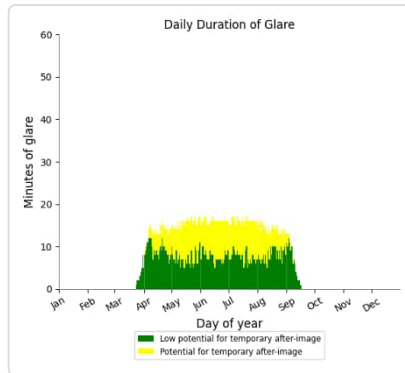

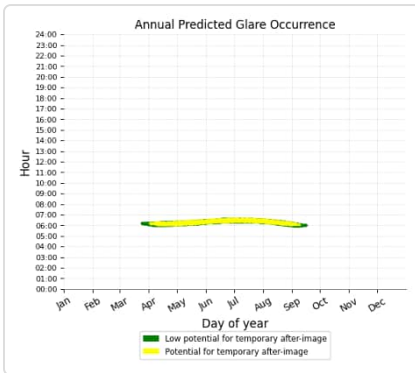

- 1,351 minutes of "green" glare with low potential to cause temporary after-image.
- 1,053 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 11

PV array is expected to produce the following glare for this receptor:

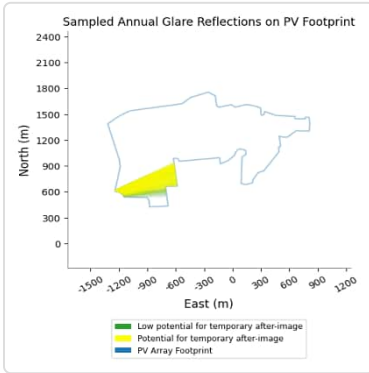

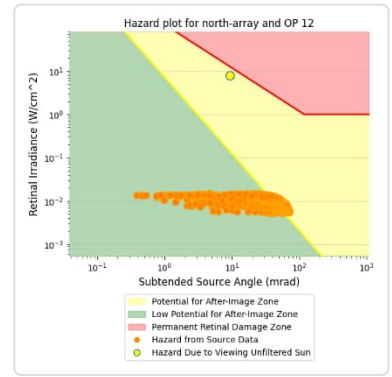

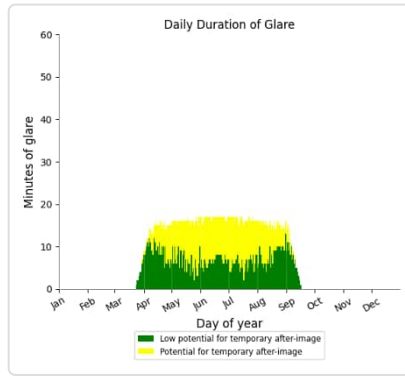

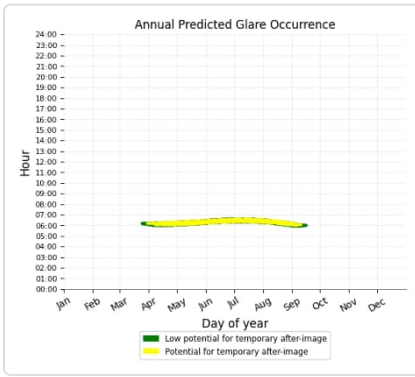

- 1,331 minutes of "green" glare with low potential to cause temporary after-image.
- 1,103 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 12

PV array is expected to produce the following glare for this receptor:

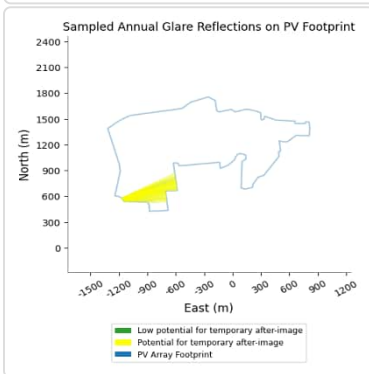

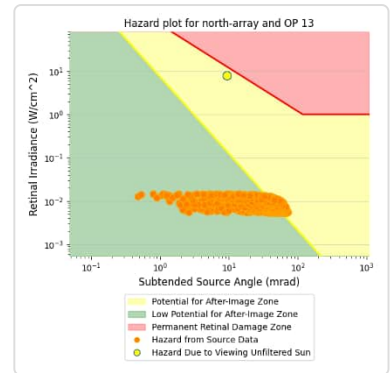

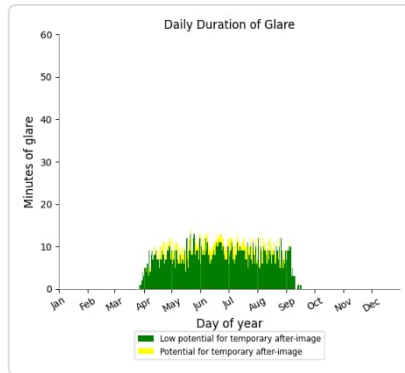

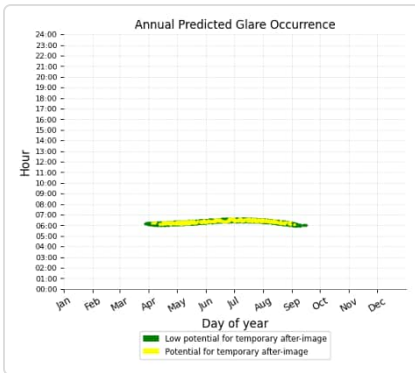

- 1,228 minutes of "green" glare with low potential to cause temporary after-image.
- 1,325 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 13

PV array is expected to produce the following glare for this receptor:

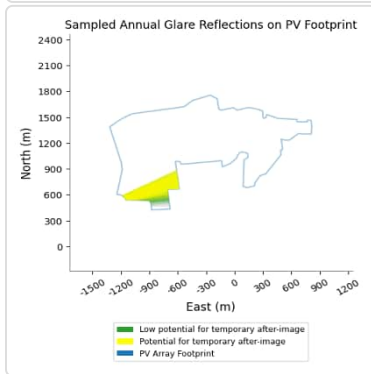

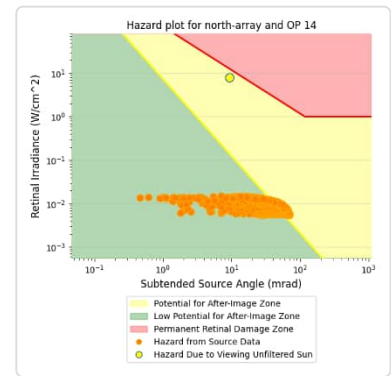

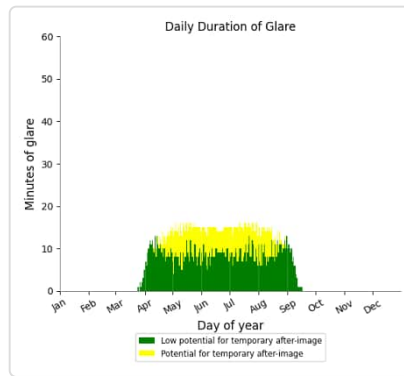

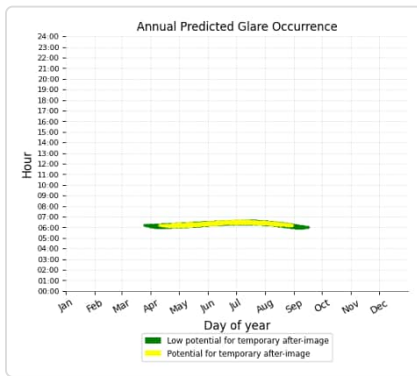

- 1,310 minutes of "green" glare with low potential to cause temporary after-image.
- 266 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 14

PV array is expected to produce the following glare for this receptor:

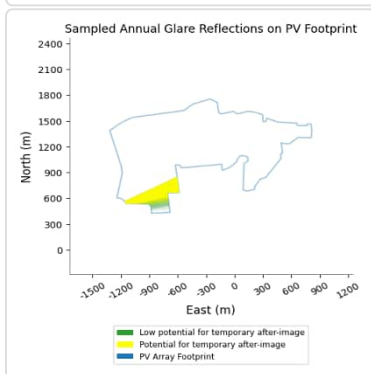

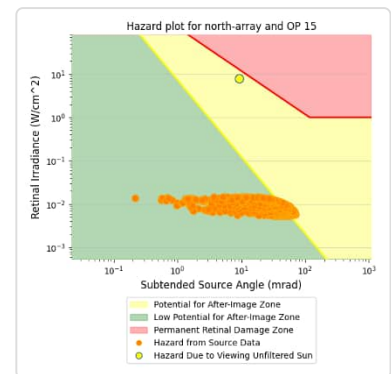

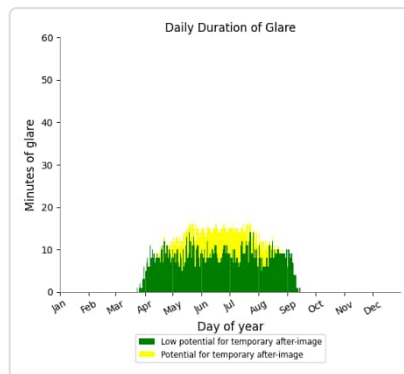

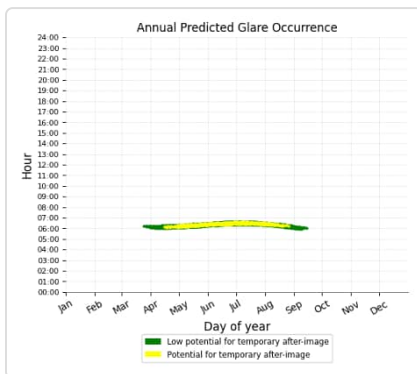

- 1,445 minutes of "green" glare with low potential to cause temporary after-image.
- 772 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 15

PV array is expected to produce the following glare for this receptor:

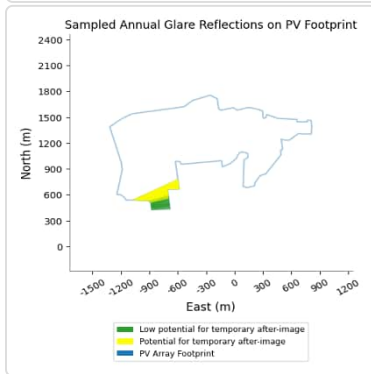

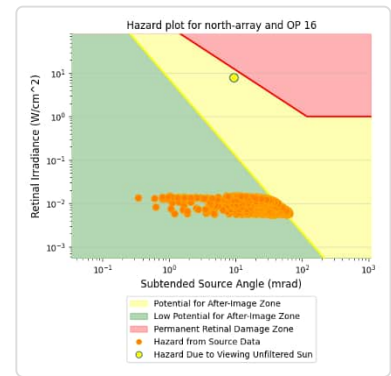

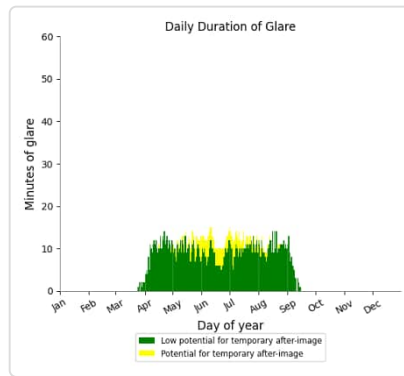

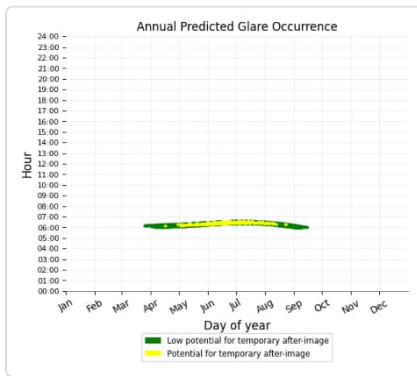

- 1,443 minutes of "green" glare with low potential to cause temporary after-image.
- 552 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 16

PV array is expected to produce the following glare for this receptor:

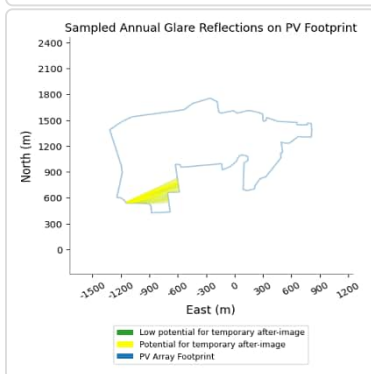

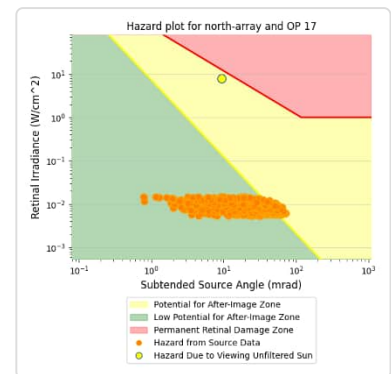

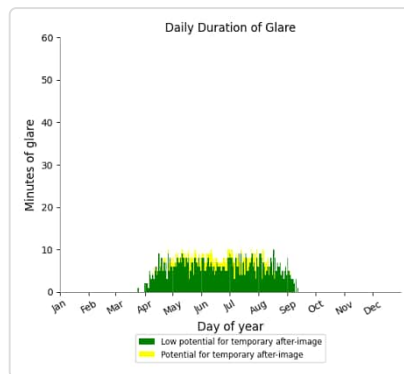

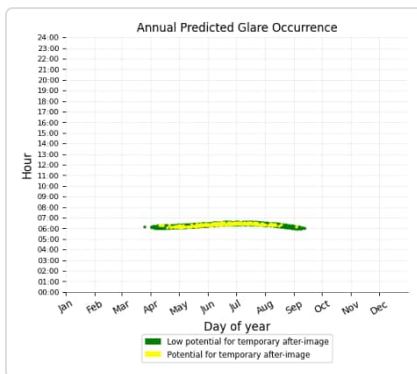

- 1,570 minutes of "green" glare with low potential to cause temporary after-image.
- 252 minutes of "yellow" glare with potential to cause temporary after-image.

North Array: OP 17

PV array is expected to produce the following glare for this receptor:

- 964 minutes of "green" glare with low potential to cause temporary after-image.
- 195 minutes of "yellow" glare with potential to cause temporary after-image.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Name: North Array

Footprint area: 1,458,806 m²

Axis tracking: Fixed (no rotation)

Tilt: 35.0 deg

Orientation: 180.0 deg

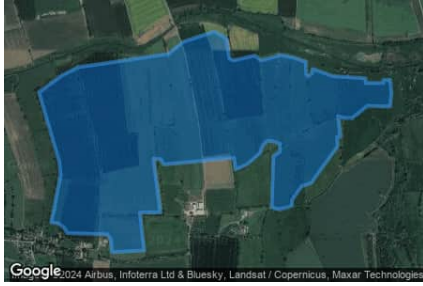

Rated power: -

Panel material: Light textured glass with AR coating

Vary reflectivity with sun position? Yes

Correlate slope error with surface type? Yes

Slope error: 9.16 mrad

Central Array: OP 1

PV array is expected to produce the following glare for this receptor:

- 2,023 minutes of "green" glare with low potential to cause temporary after-image.
- 318 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 2

PV array is expected to produce the following glare for this receptor:

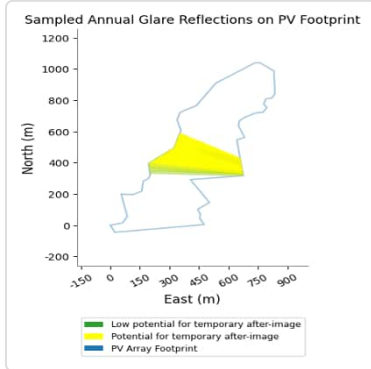

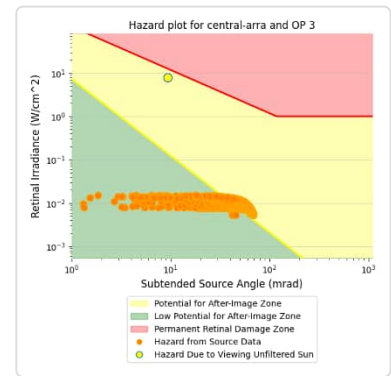

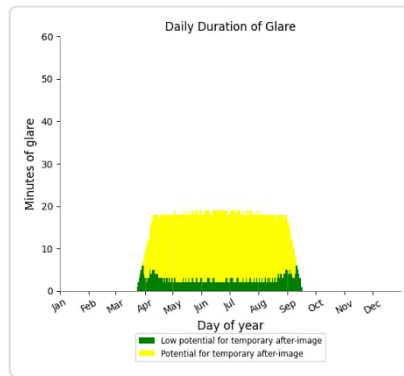

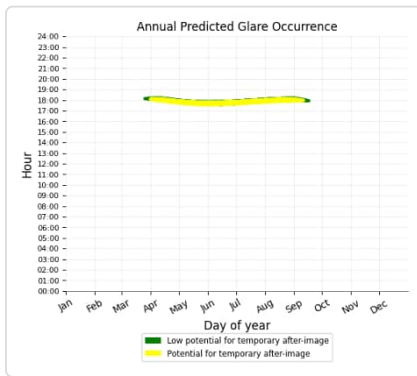

- 2,117 minutes of "green" glare with low potential to cause temporary after-image.
- 182 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 3

PV array is expected to produce the following glare for this receptor:

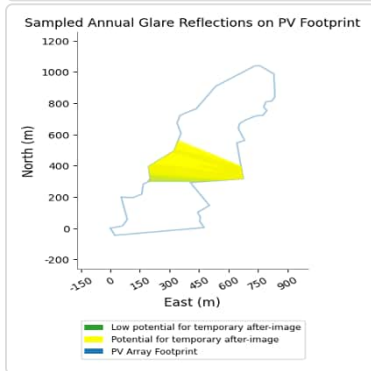

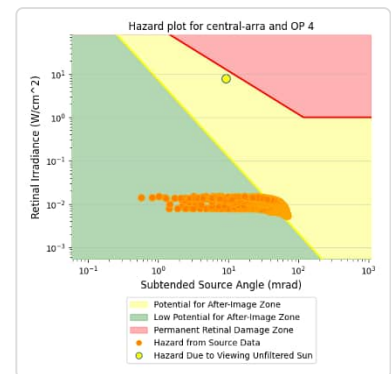

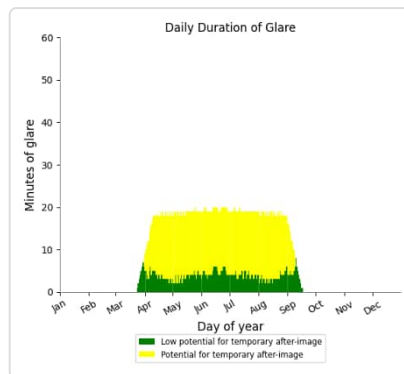

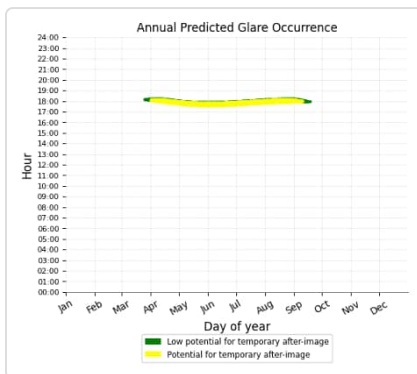

- 493 minutes of "green" glare with low potential to cause temporary after-image.
- 2,443 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 4

PV array is expected to produce the following glare for this receptor:

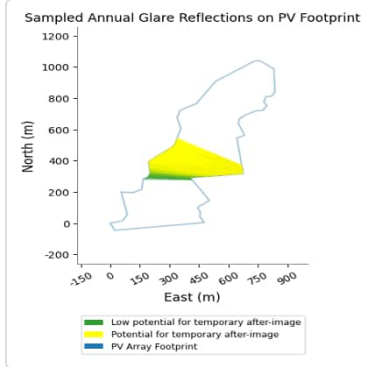

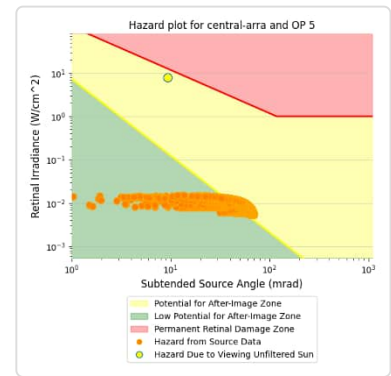

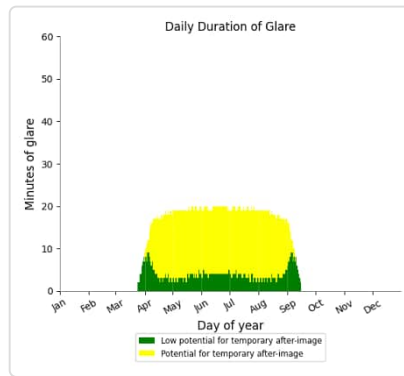

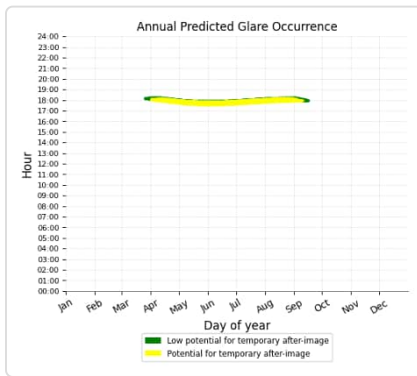

- 683 minutes of "green" glare with low potential to cause temporary after-image.
- 2,332 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 5

PV array is expected to produce the following glare for this receptor:

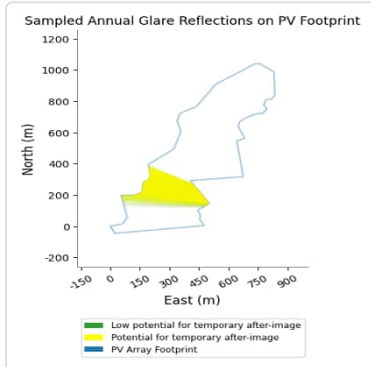

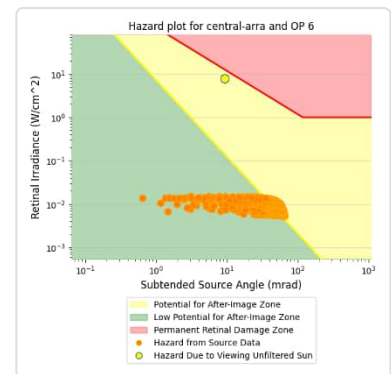

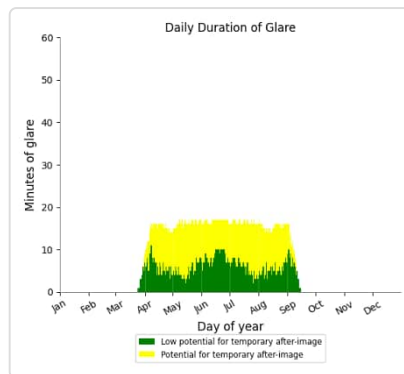

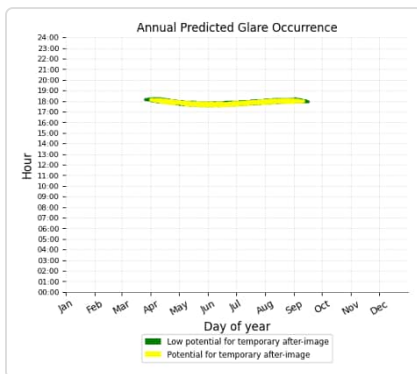

- 683 minutes of "green" glare with low potential to cause temporary after-image.
- 2,324 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 6

PV array is expected to produce the following glare for this receptor:

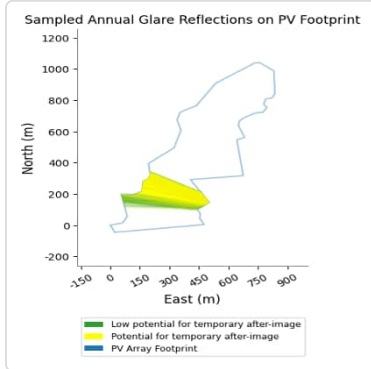

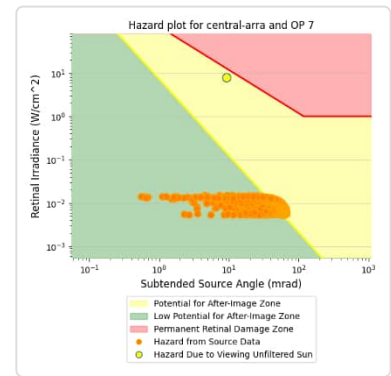

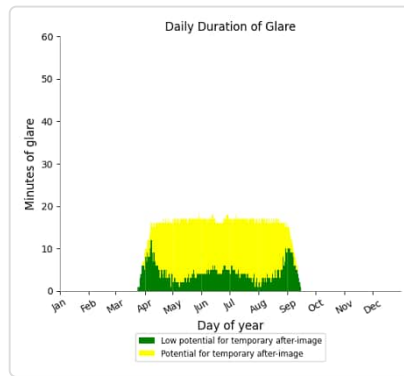

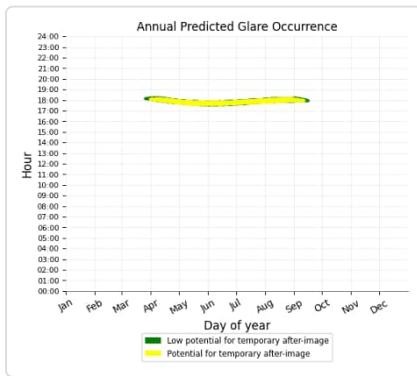

- 1,034 minutes of "green" glare with low potential to cause temporary after-image.
- 1,545 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 7

PV array is expected to produce the following glare for this receptor:

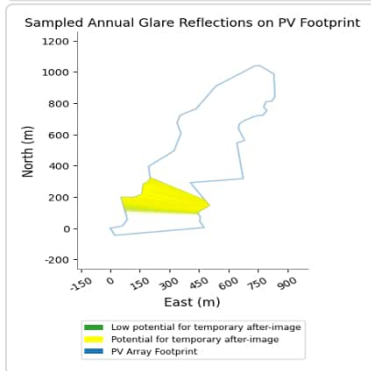

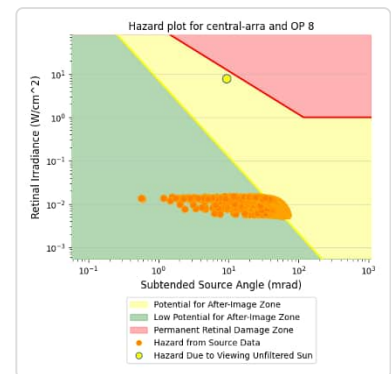

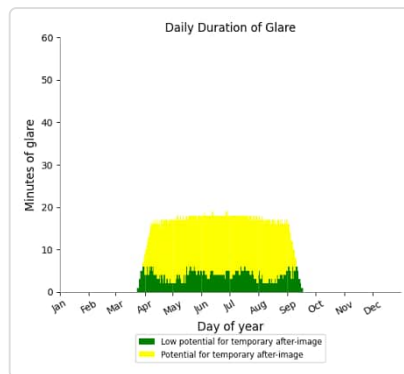

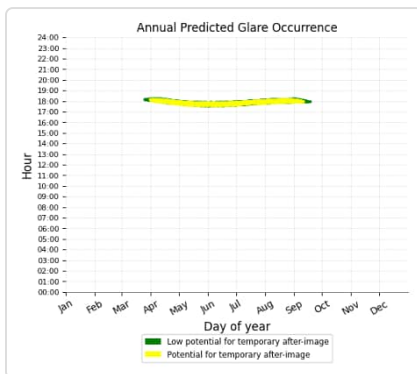

- 759 minutes of "green" glare with low potential to cause temporary after-image.
- 1,909 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 8

PV array is expected to produce the following glare for this receptor:

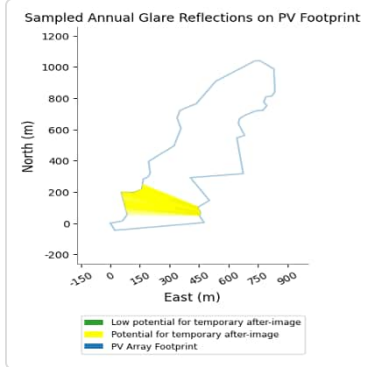

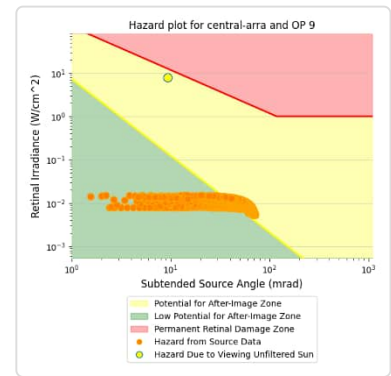

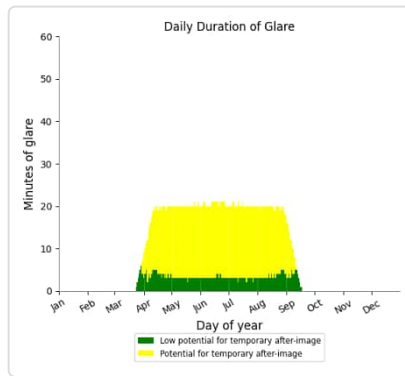

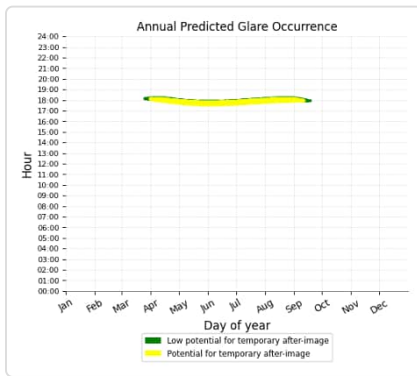

- 679 minutes of "green" glare with low potential to cause temporary after-image.
- 2,125 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 9

PV array is expected to produce the following glare for this receptor:

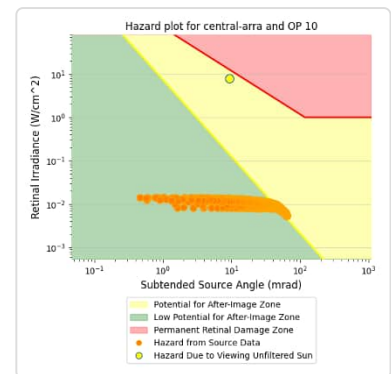

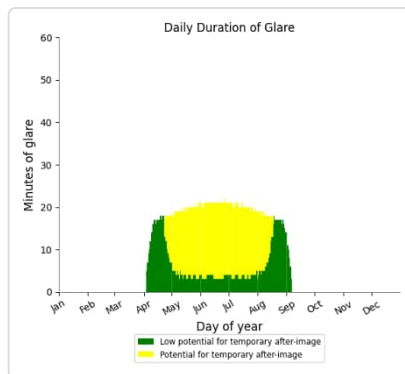

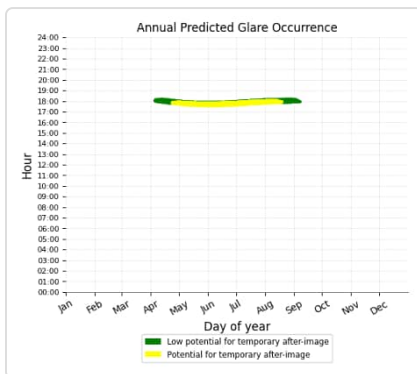

- 589 minutes of "green" glare with low potential to cause temporary after-image.
- 2,588 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 10

PV array is expected to produce the following glare for this receptor:

- 1,095 minutes of "green" glare with low potential to cause temporary after-image.
- 1,782 minutes of "yellow" glare with potential to cause temporary after-image.

- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 59

PV array is expected to produce the following glare for this receptor:

- 583 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 60

PV array is expected to produce the following glare for this receptor:

- 534 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

PV array is expected to produce the following glare for this receptor:

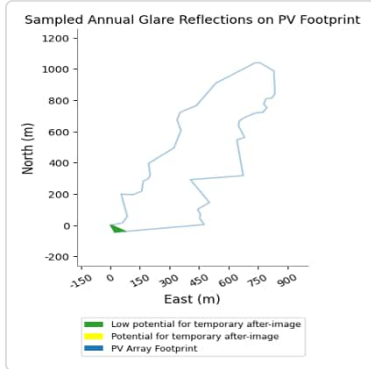

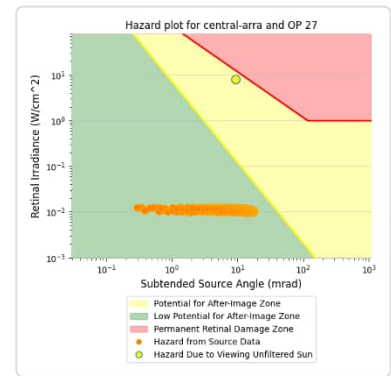

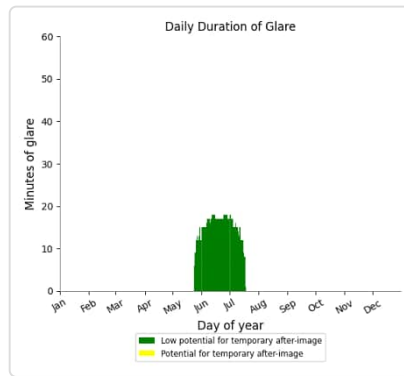

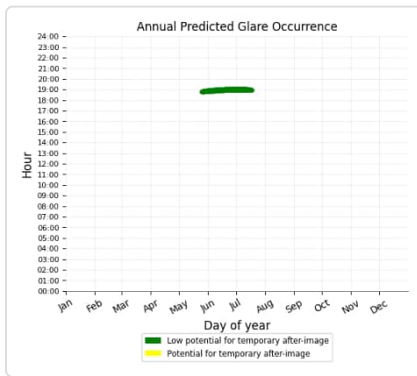

- 500 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 27

PV array is expected to produce the following glare for this receptor:

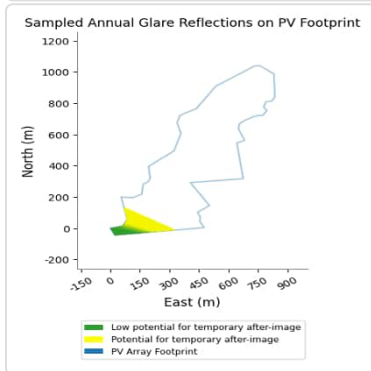

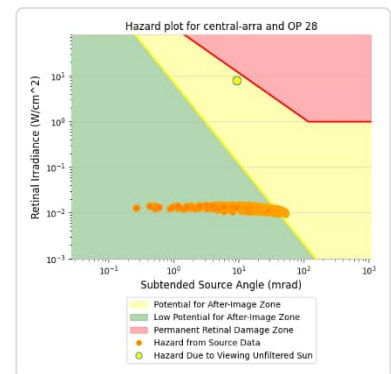

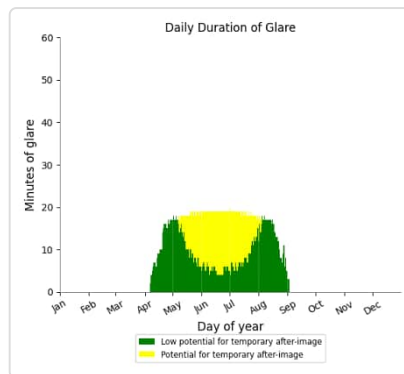

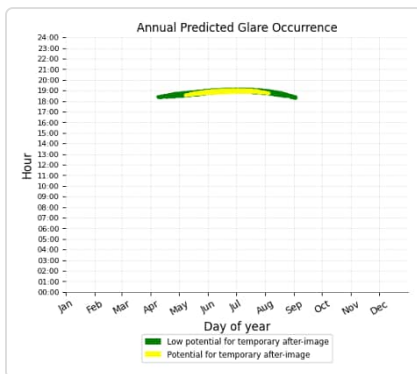

- 840 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 28

PV array is expected to produce the following glare for this receptor:

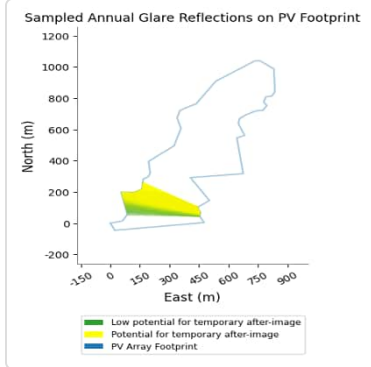

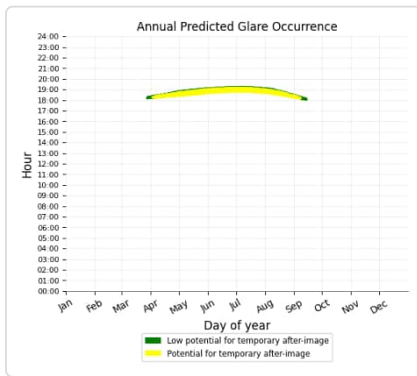

- 1,458 minutes of "green" glare with low potential to cause temporary after-image.
- 952 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 29

PV array is expected to produce the following glare for this receptor:

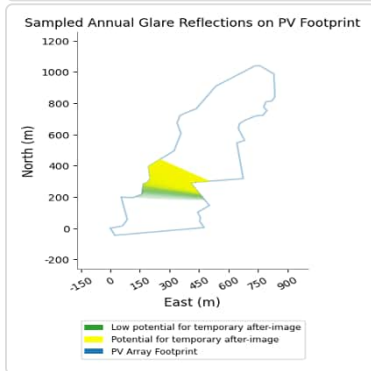

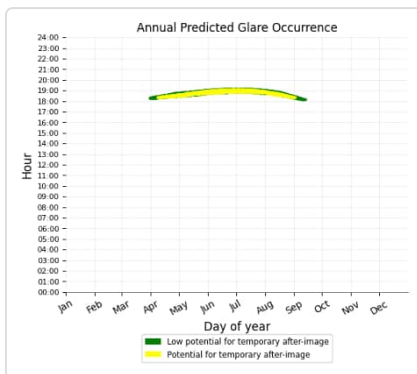

- 688 minutes of "green" glare with low potential to cause temporary after-image.
- 2,242 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 30

PV array is expected to produce the following glare for this receptor:

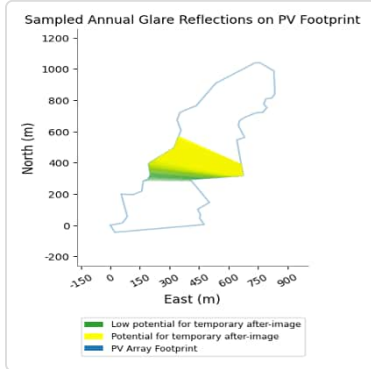

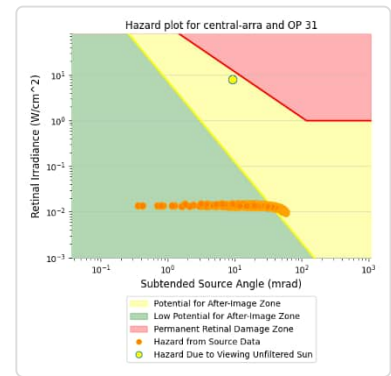

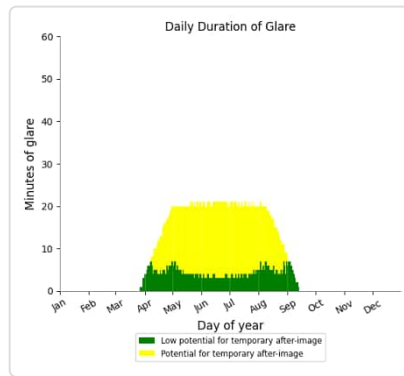

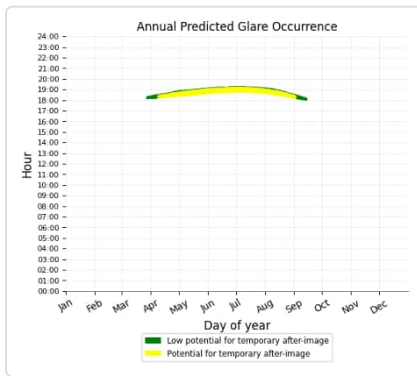

- 1,323 minutes of "green" glare with low potential to cause temporary after-image.
- 1,245 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 31

PV array is expected to produce the following glare for this receptor:

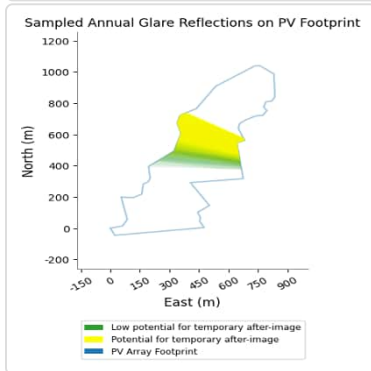

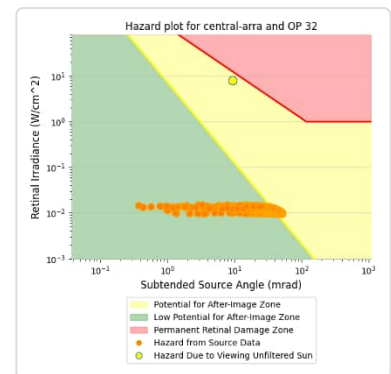

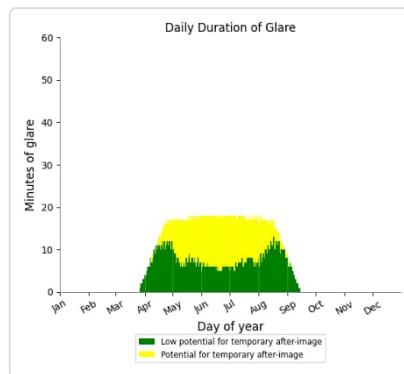

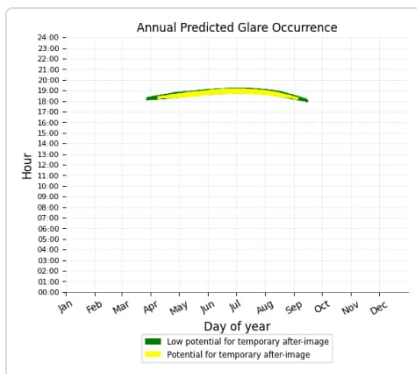

- 745 minutes of "green" glare with low potential to cause temporary after-image.
- 2,056 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 32

PV array is expected to produce the following glare for this receptor:

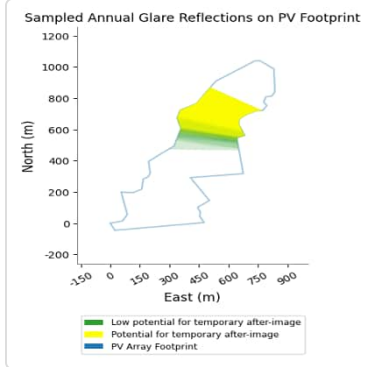

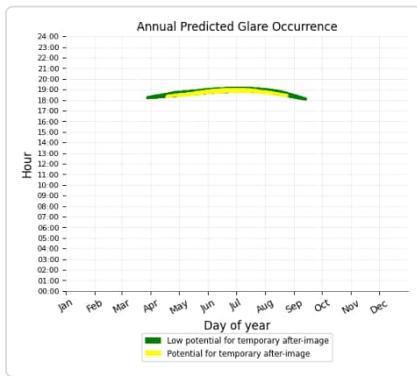

- 1,272 minutes of "green" glare with low potential to cause temporary after-image.
- 1,233 minutes of "yellow" glare with potential to cause temporary after-image.

- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 18

PV array is expected to produce the following glare for this receptor:

- 781 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 19

PV array is expected to produce the following glare for this receptor:

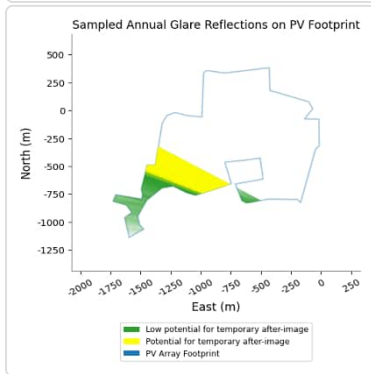

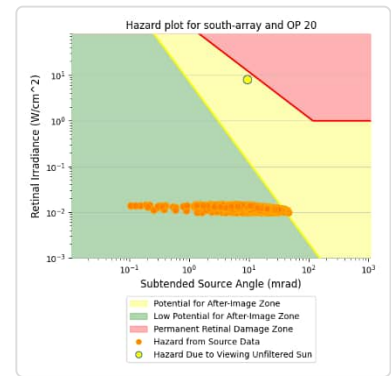

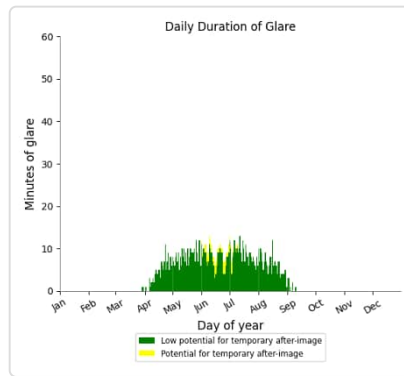

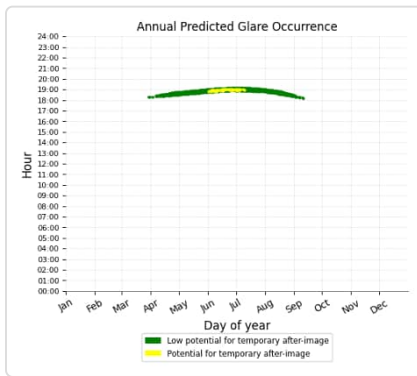

- 834 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 20

PV array is expected to produce the following glare for this receptor:

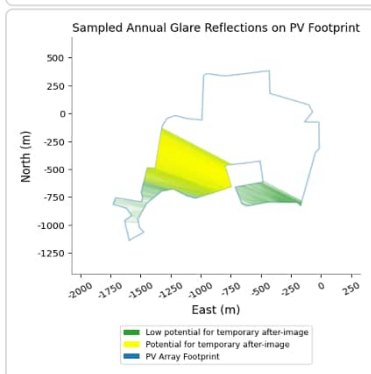

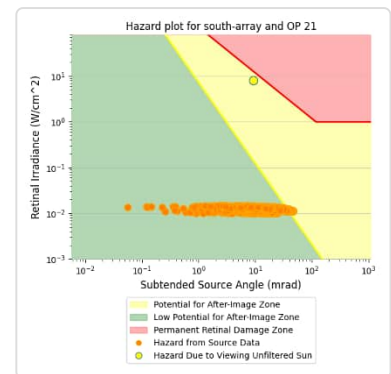

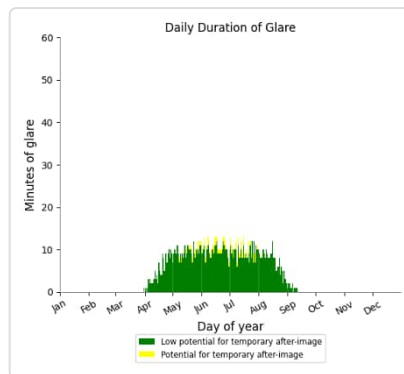

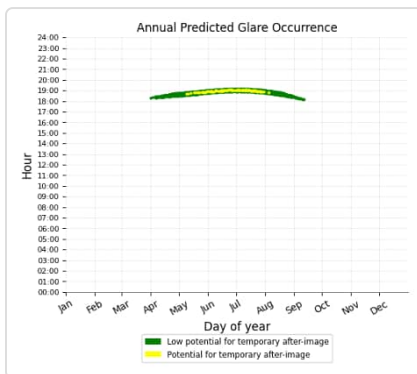

- 1,092 minutes of "green" glare with low potential to cause temporary after-image.
- 59 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 21

PV array is expected to produce the following glare for this receptor:

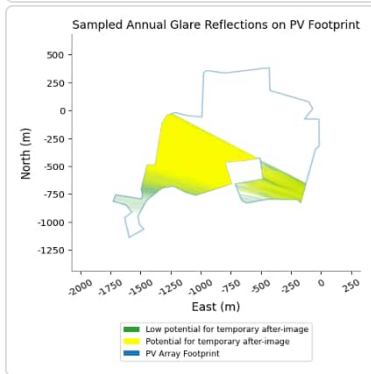

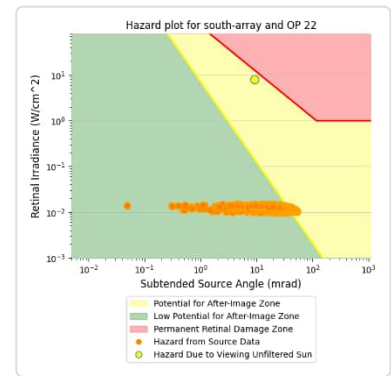

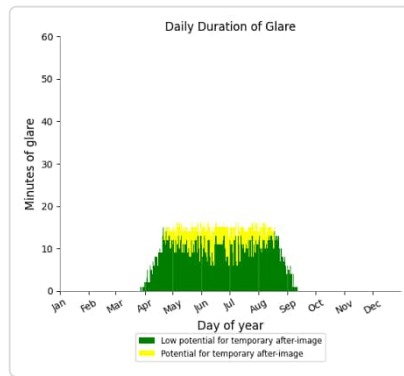

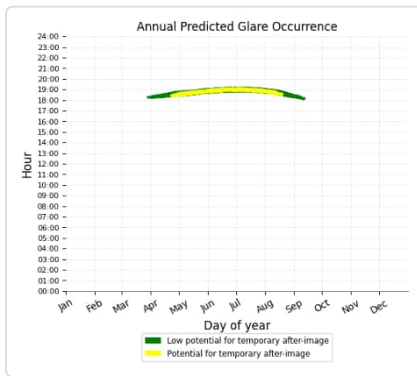

- 1,241 minutes of "green" glare with low potential to cause temporary after-image.
- 81 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 22

PV array is expected to produce the following glare for this receptor:

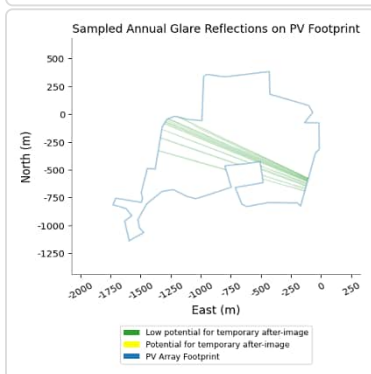

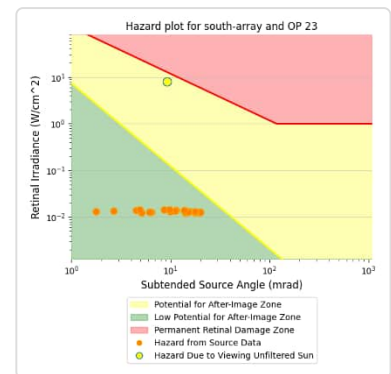

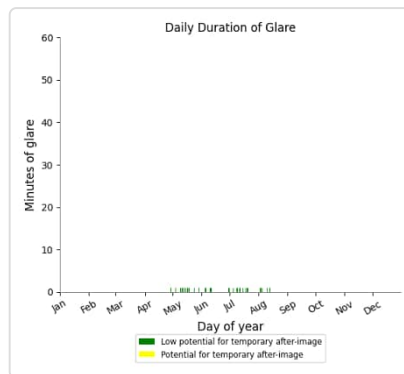

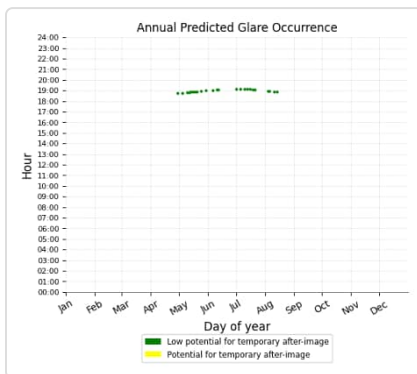

- 1,544 minutes of "green" glare with low potential to cause temporary after-image.
- 498 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 23

PV array is expected to produce the following glare for this receptor:

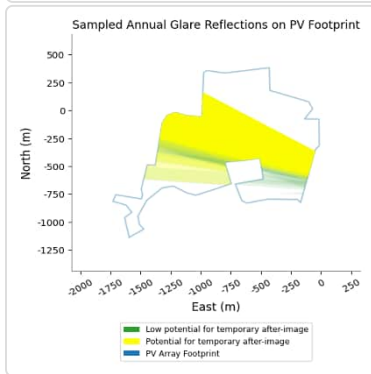

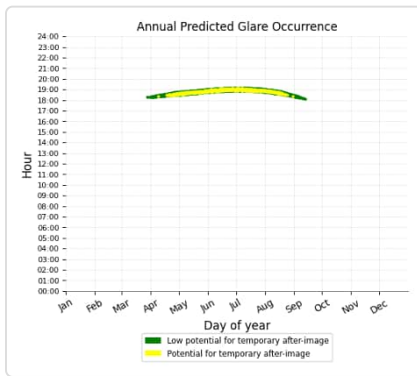

- 24 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 24

PV array is expected to produce the following glare for this receptor:

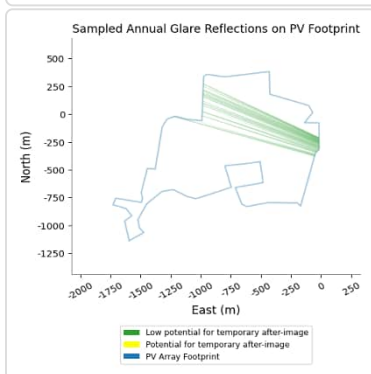

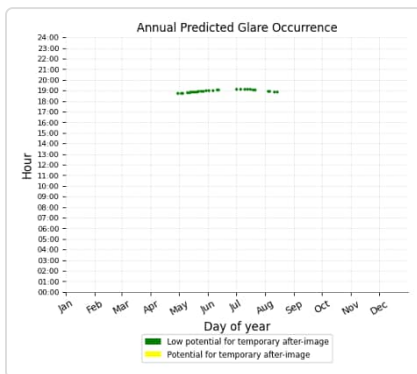

- 1,468 minutes of "green" glare with low potential to cause temporary after-image.
- 586 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 25

PV array is expected to produce the following glare for this receptor:

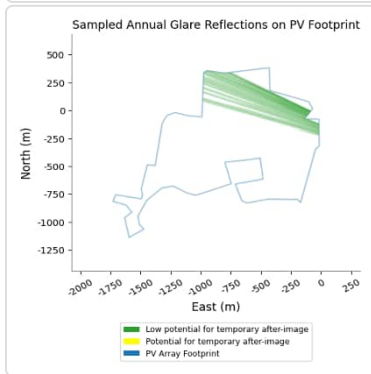

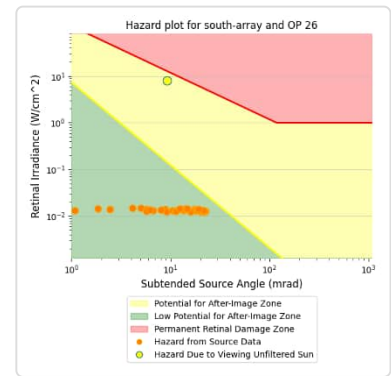

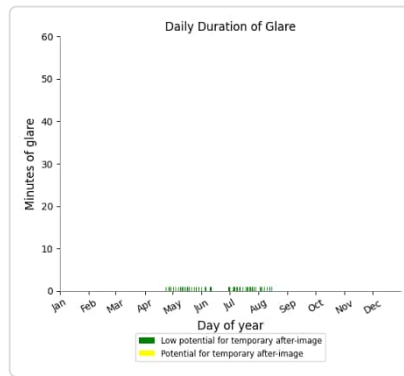

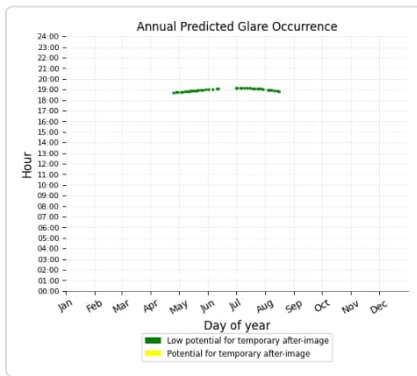

- 28 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 26

PV array is expected to produce the following glare for this receptor:

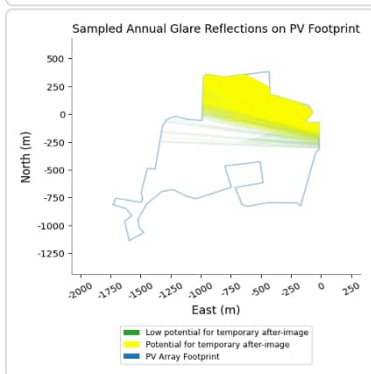

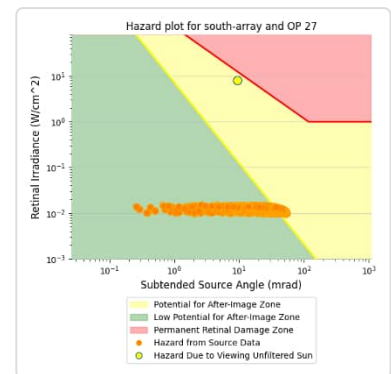

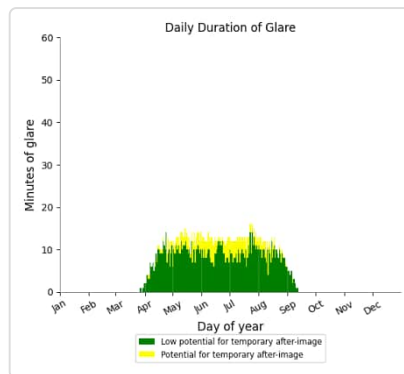

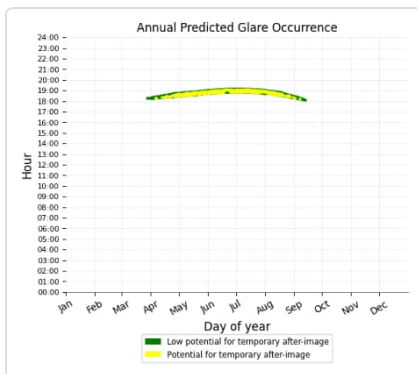

- 39 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 27

PV array is expected to produce the following glare for this receptor:

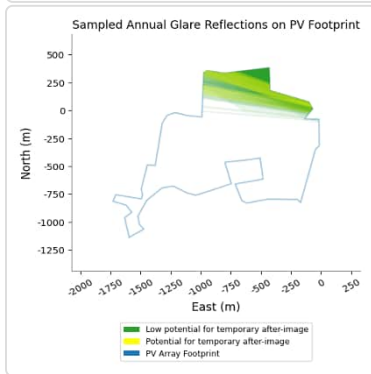

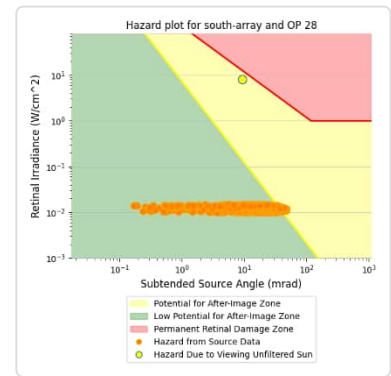

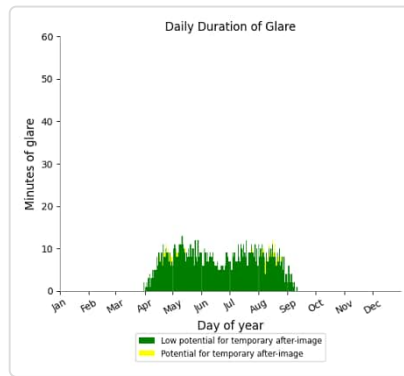

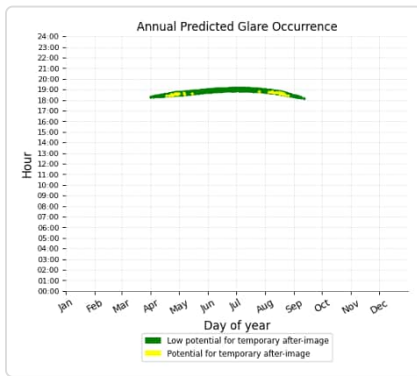

- 1,400 minutes of "green" glare with low potential to cause temporary after-image.
- 383 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 28

PV array is expected to produce the following glare for this receptor:

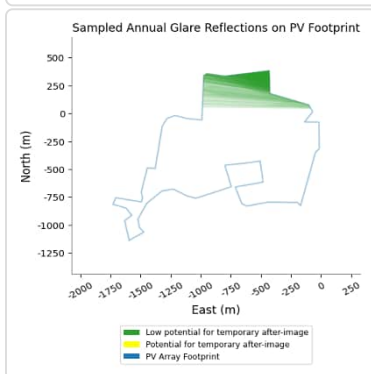

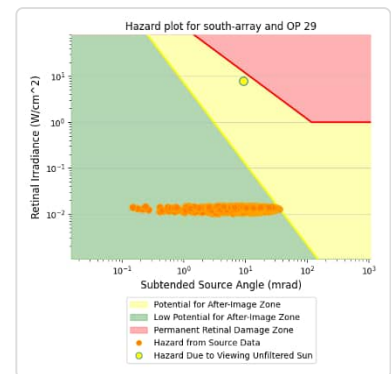

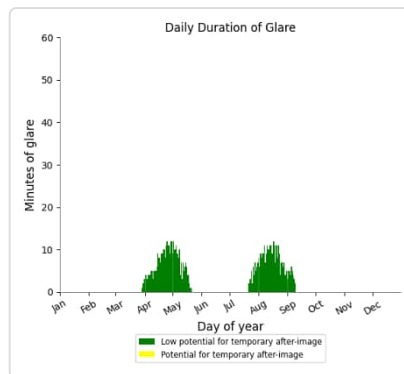

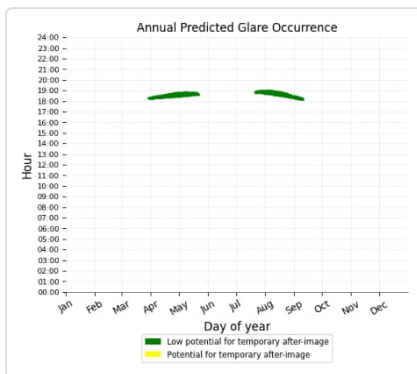

- 1,209 minutes of "green" glare with low potential to cause temporary after-image.
- 32 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 29

PV array is expected to produce the following glare for this receptor:

- 703 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.

- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Axis tracking: Fixed (no rotation)
Tilt: 35.0 deg
Orientation: 180.0 deg

Rated power: -
Panel material: Light textured glass with AR coating
Vary reflectivity with sun position? Yes
Correlate slope error with surface type? Yes
Slope error: 9.16 mrad

PV array is expected to produce the following glare for this receptor:

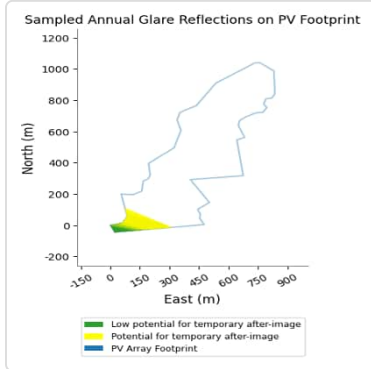

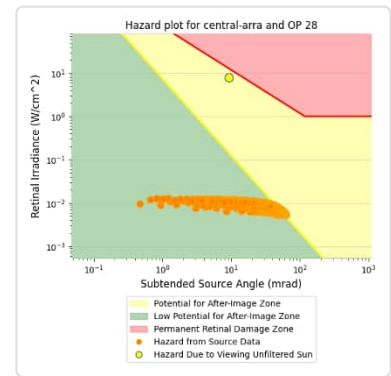

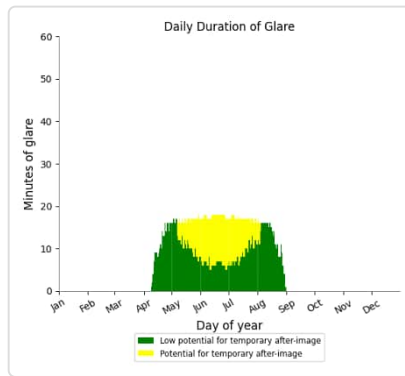

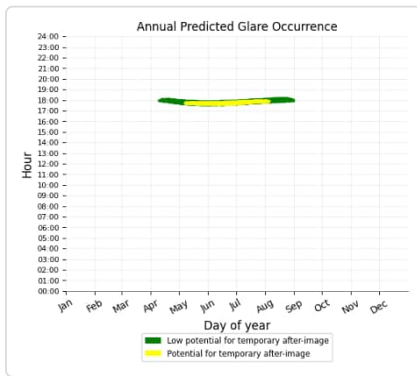

- 182 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 28

PV array is expected to produce the following glare for this receptor:

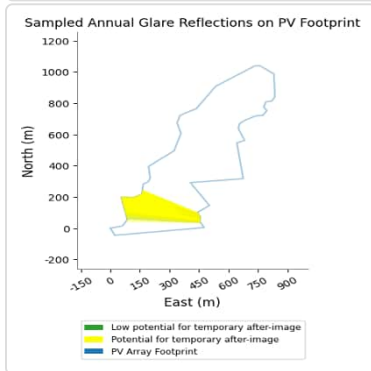

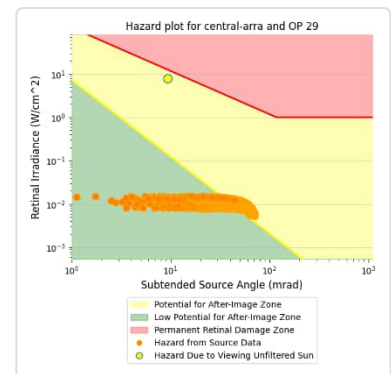

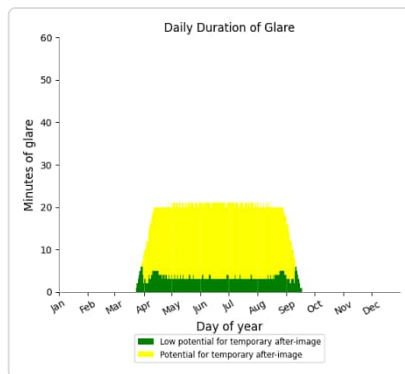

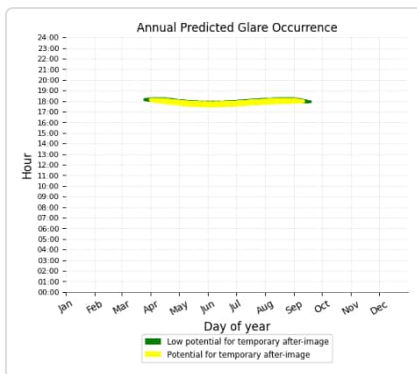

- 1,414 minutes of "green" glare with low potential to cause temporary after-image.
- 781 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 29

PV array is expected to produce the following glare for this receptor:

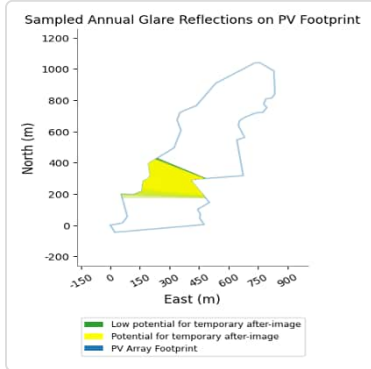

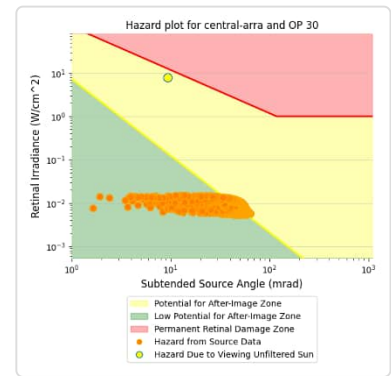

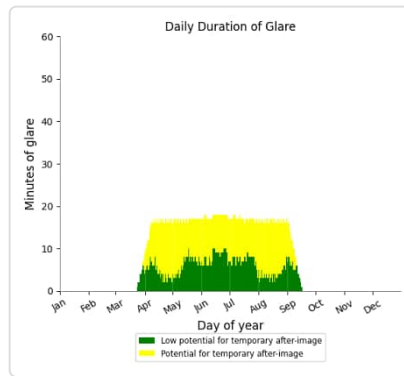

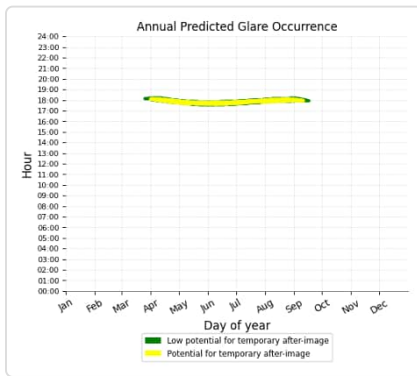

- 596 minutes of "green" glare with low potential to cause temporary after-image.
- 2,650 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 30

PV array is expected to produce the following glare for this receptor:

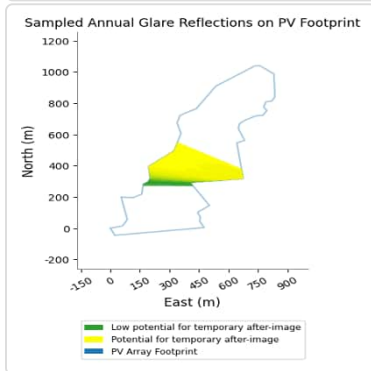

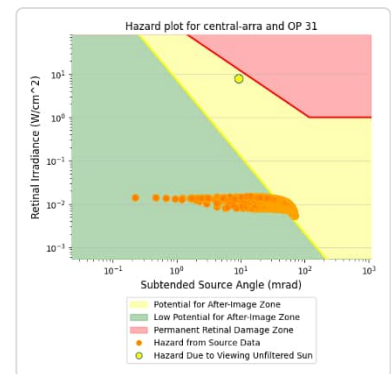

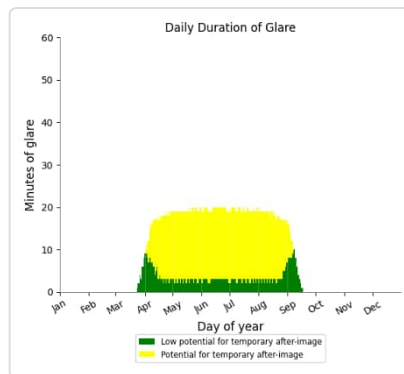

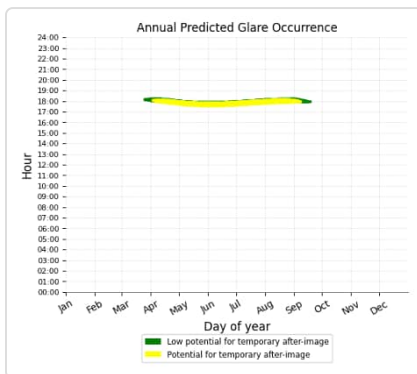

- 1,022 minutes of "green" glare with low potential to cause temporary after-image.
- 1,701 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 31

PV array is expected to produce the following glare for this receptor:

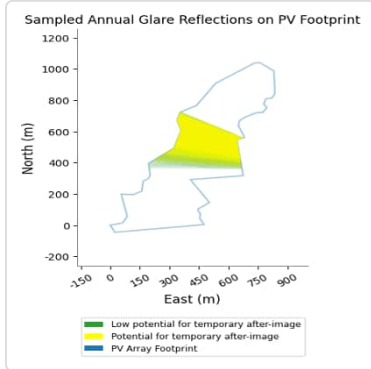

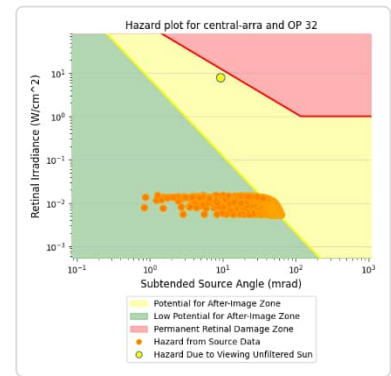

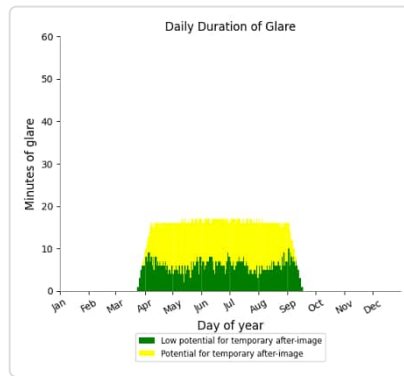

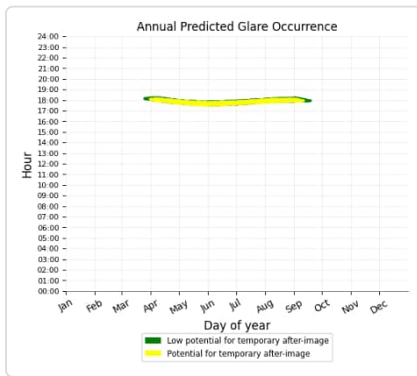

- 629 minutes of "green" glare with low potential to cause temporary after-image.
- 2,384 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 32

PV array is expected to produce the following glare for this receptor:

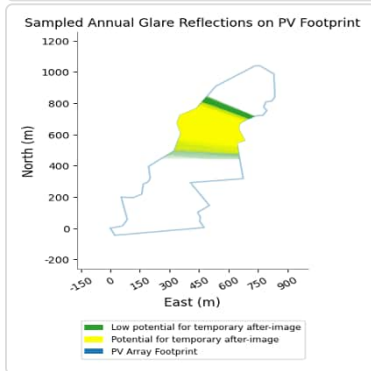

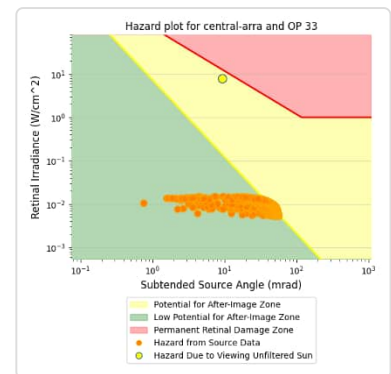

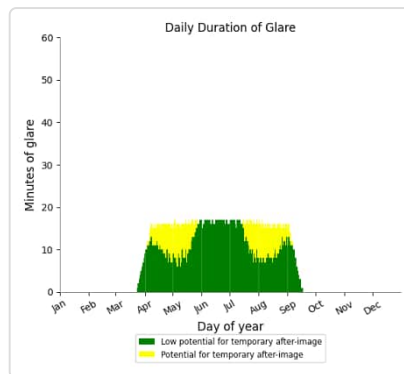

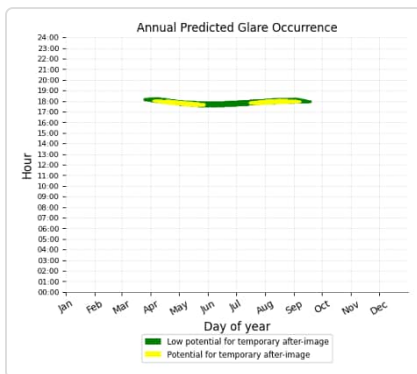

- 1,055 minutes of "green" glare with low potential to cause temporary after-image.
- 1,593 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 33

PV array is expected to produce the following glare for this receptor:

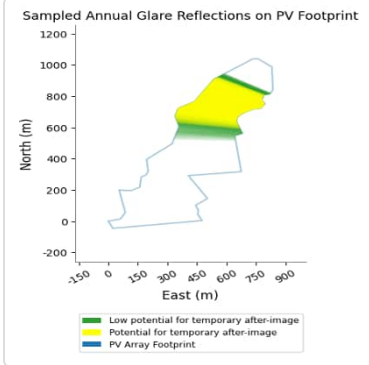

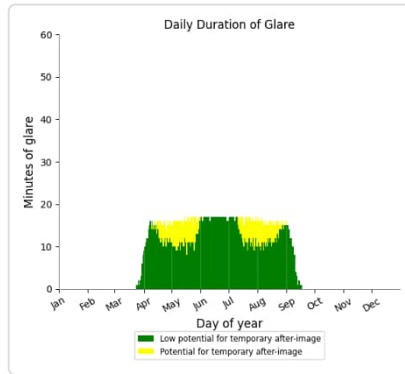

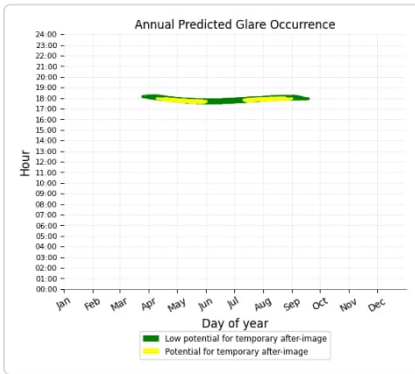

- 1,982 minutes of "green" glare with low potential to cause temporary after-image.
- 647 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 34

PV array is expected to produce the following glare for this receptor:

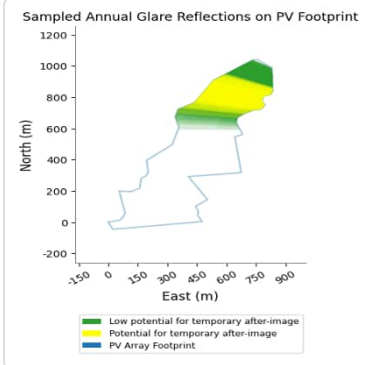

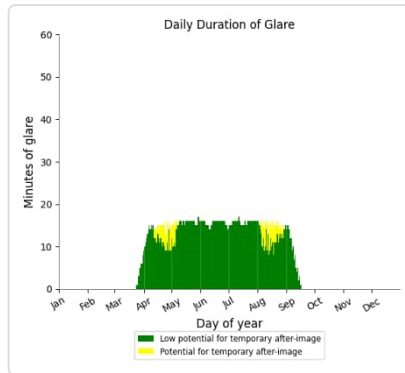

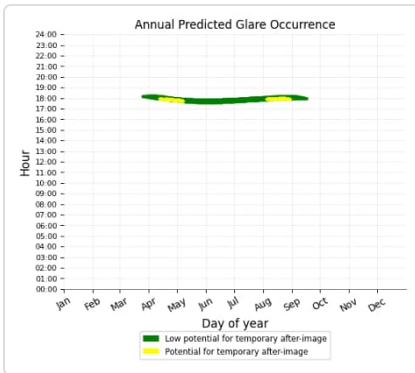

- 2,141 minutes of "green" glare with low potential to cause temporary after-image.
- 465 minutes of "yellow" glare with potential to cause temporary after-image.

Central Array: OP 35

PV array is expected to produce the following glare for this receptor:

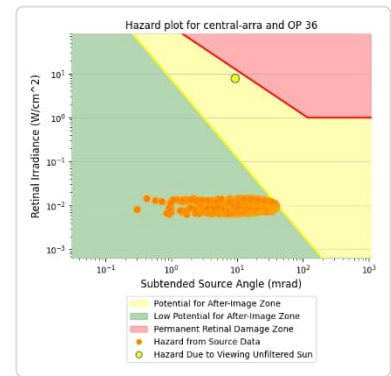

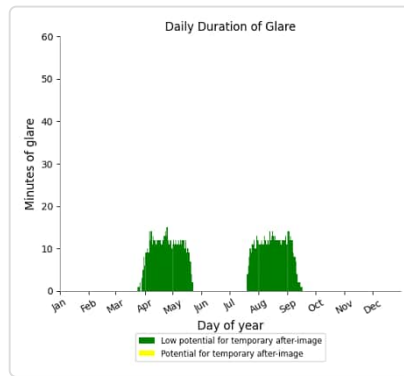

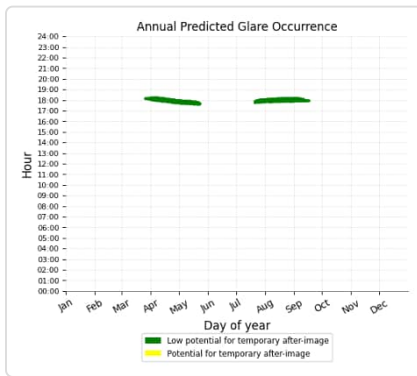

- 2,303 minutes of "green" glare with low potential to cause temporary after-image.
- 195 minutes of "yellow" glare with potential to cause temporary after-image.

- 1,154 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 12

PV array is expected to produce the following glare for this receptor:

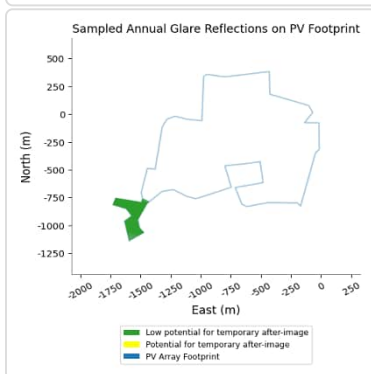

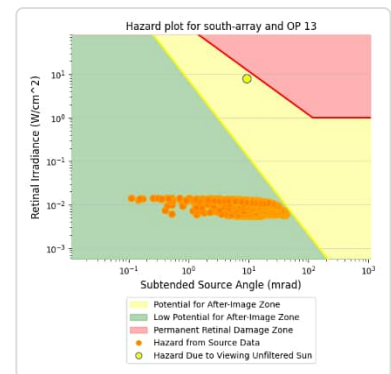

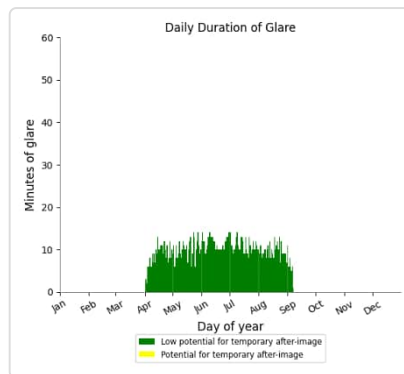

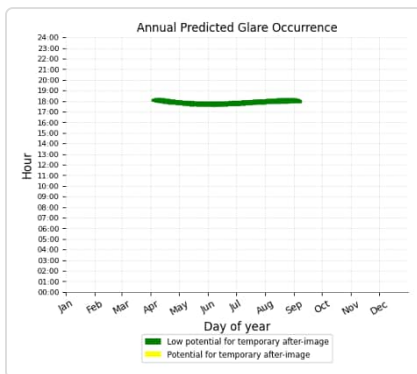

- 1,159 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 13

PV array is expected to produce the following glare for this receptor:

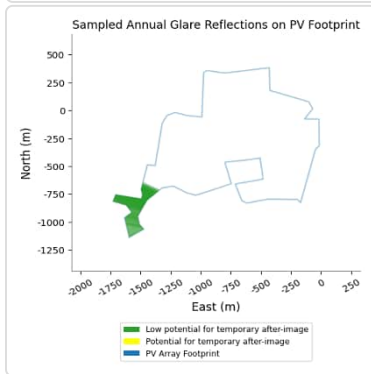

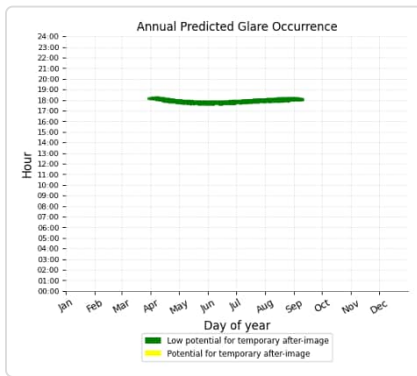

- 1,597 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 14

PV array is expected to produce the following glare for this receptor:

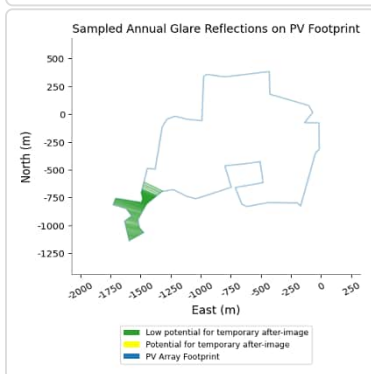

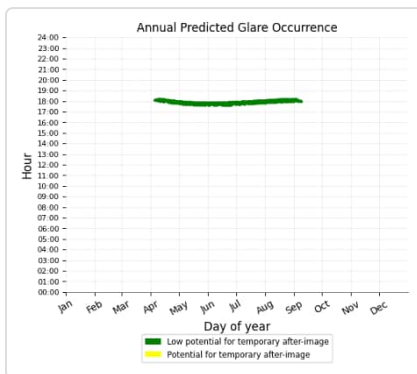

- 1,195 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 15

PV array is expected to produce the following glare for this receptor:

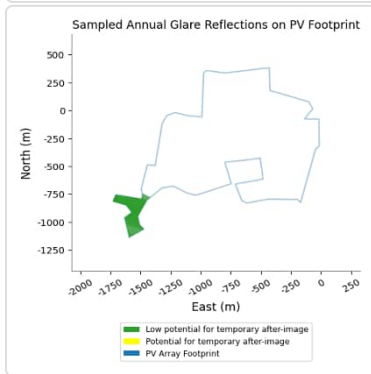

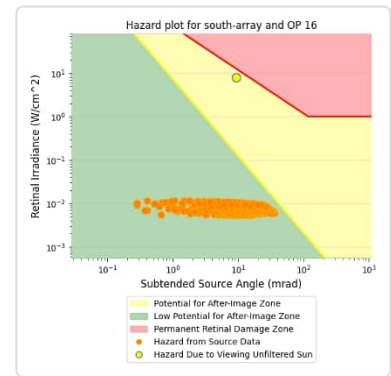

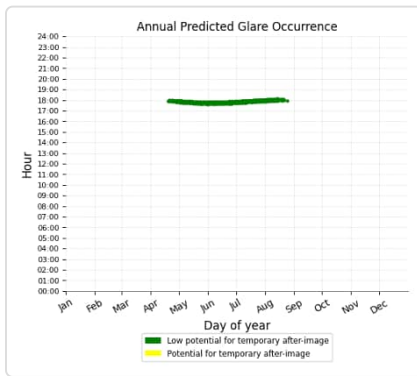

- 849 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 16

PV array is expected to produce the following glare for this receptor:

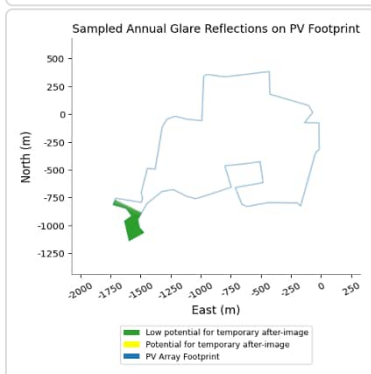

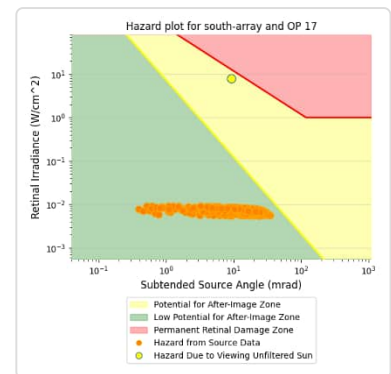

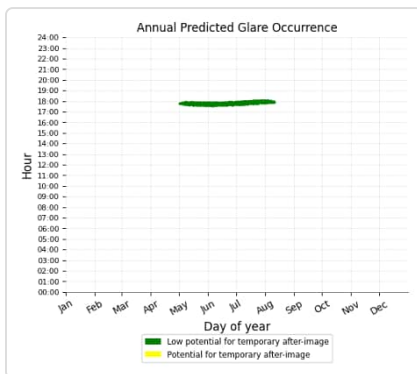

- 767 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 17

PV array is expected to produce the following glare for this receptor:

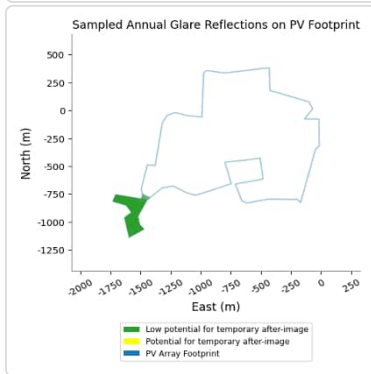

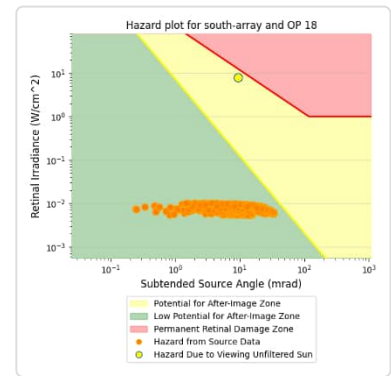

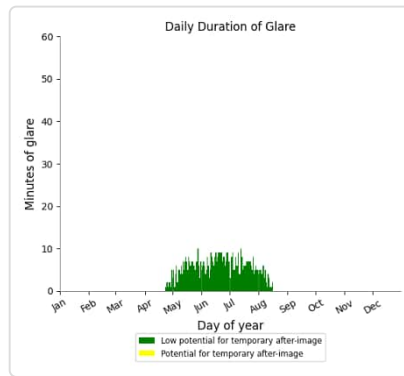

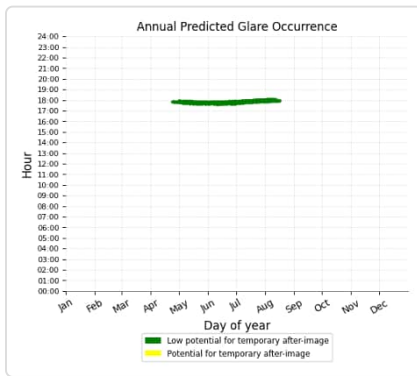

- 626 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 18

PV array is expected to produce the following glare for this receptor:

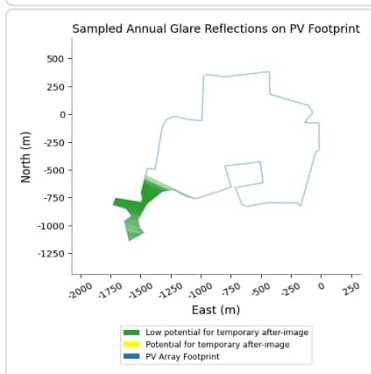

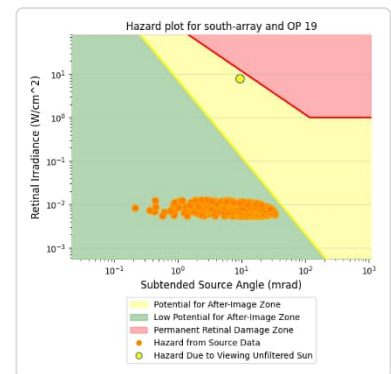

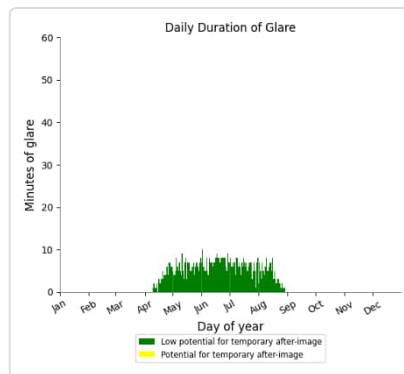

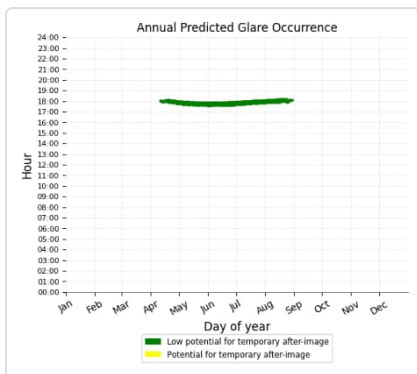

- 646 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 19

PV array is expected to produce the following glare for this receptor:

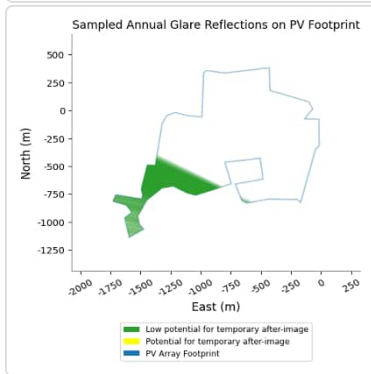

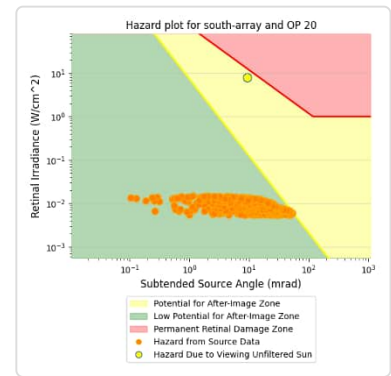

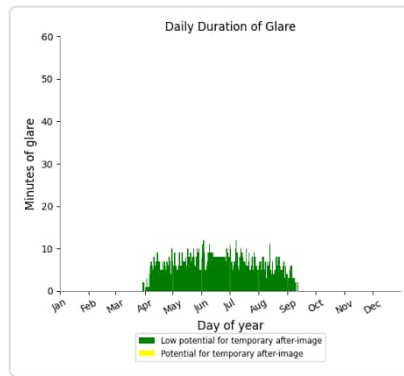

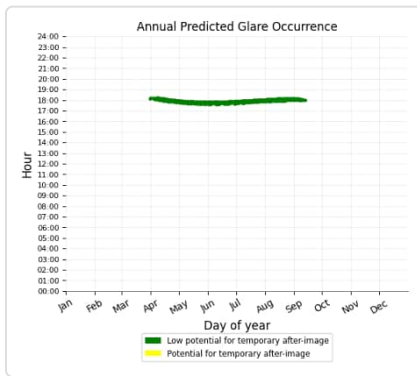

- 780 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 20

PV array is expected to produce the following glare for this receptor:

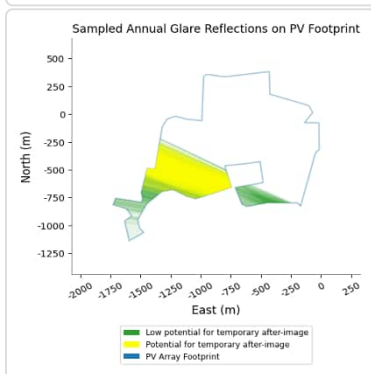

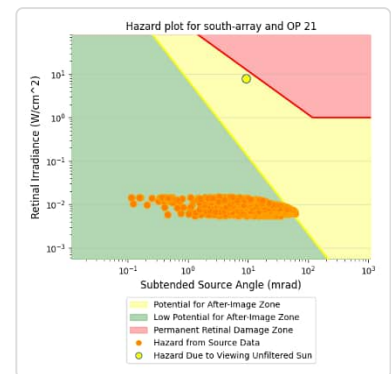

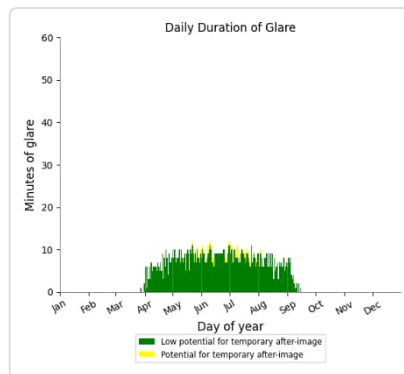

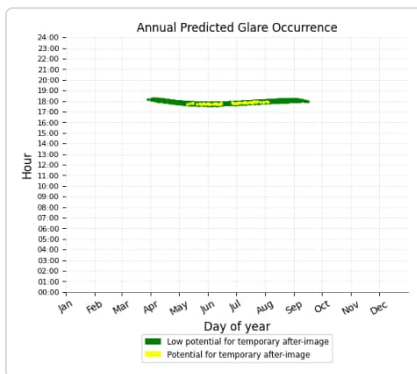

- 1,117 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 21

PV array is expected to produce the following glare for this receptor:

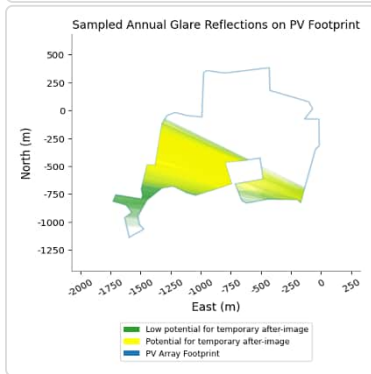

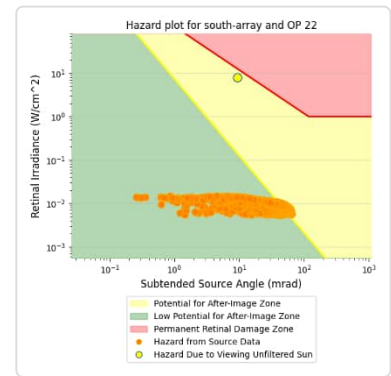

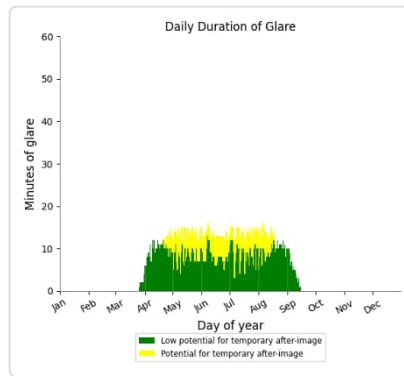

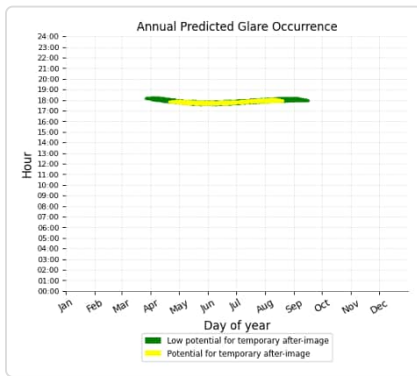

- 1,218 minutes of "green" glare with low potential to cause temporary after-image.
- 65 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 22

PV array is expected to produce the following glare for this receptor:

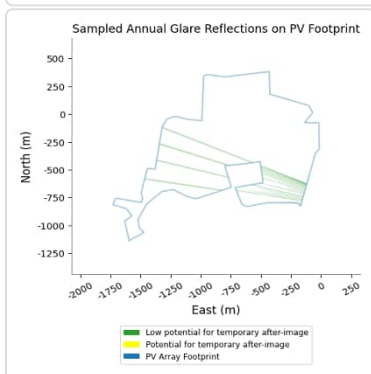

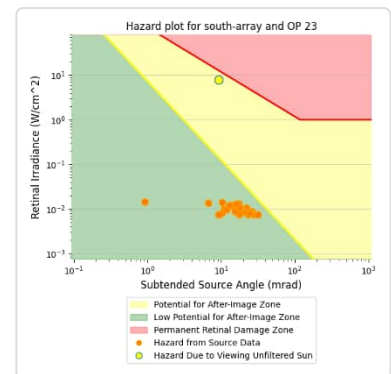

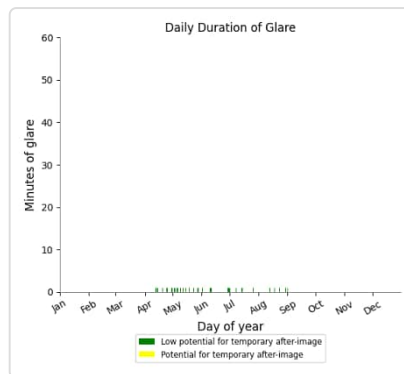

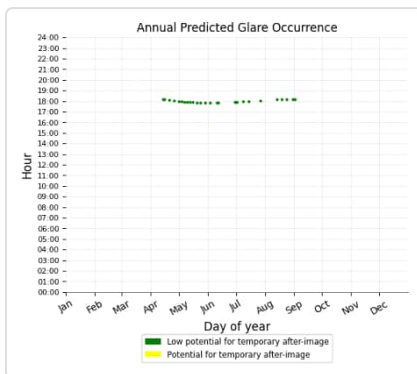

- 1,429 minutes of "green" glare with low potential to cause temporary after-image.
- 630 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 23

PV array is expected to produce the following glare for this receptor:

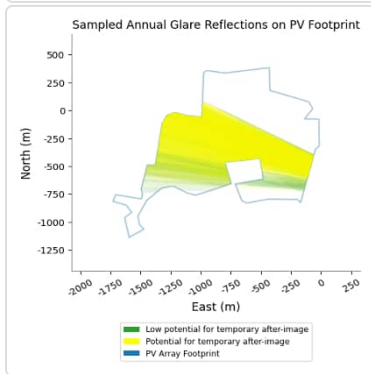

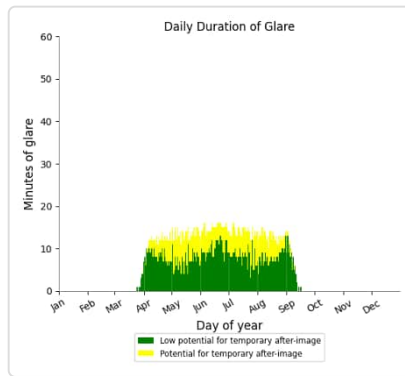

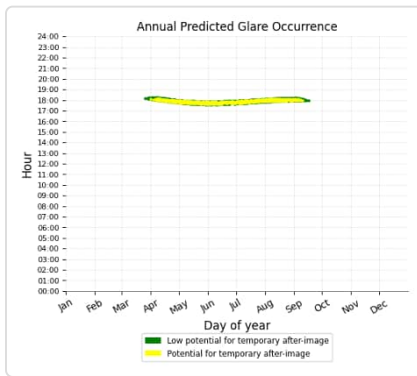

- 27 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 24

PV array is expected to produce the following glare for this receptor:

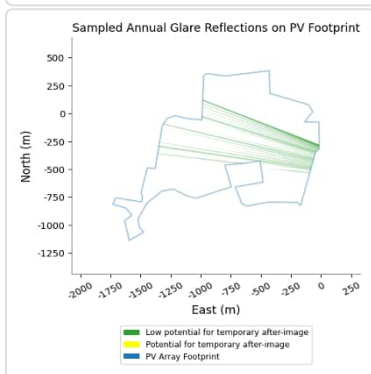

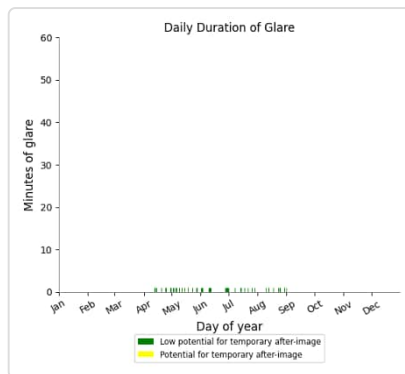

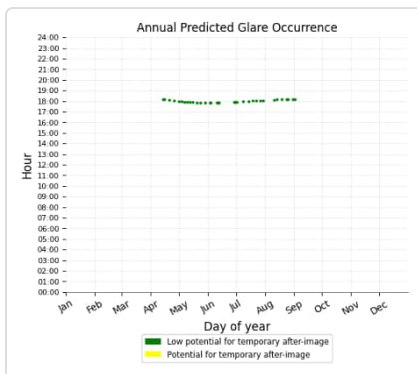

- 1,360 minutes of "green" glare with low potential to cause temporary after-image.
- 802 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 25

PV array is expected to produce the following glare for this receptor:

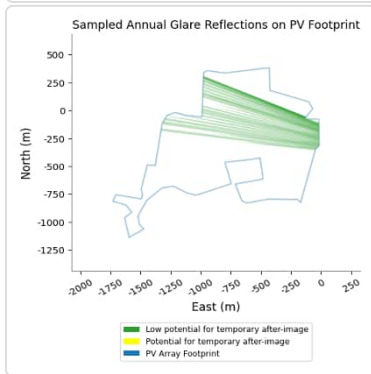

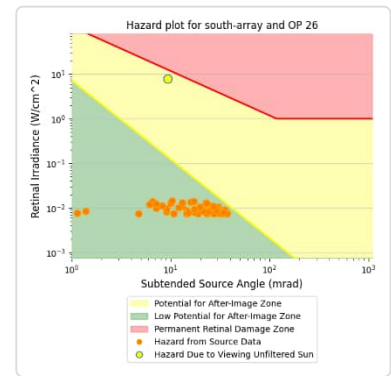

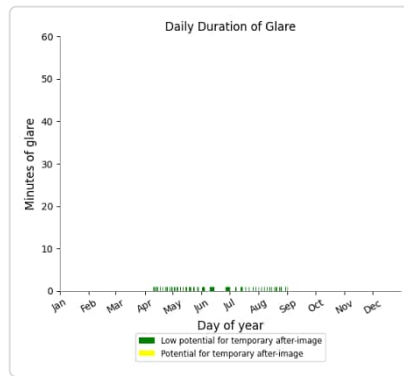

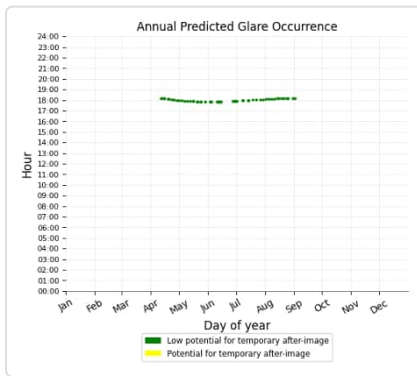

- 35 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 26

PV array is expected to produce the following glare for this receptor:

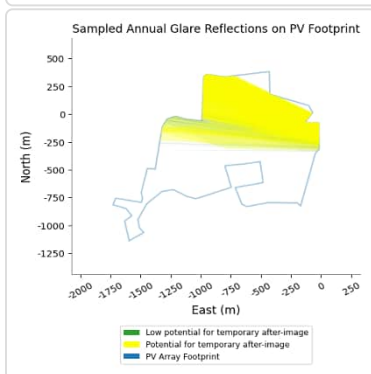

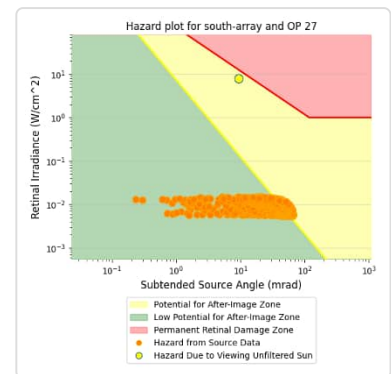

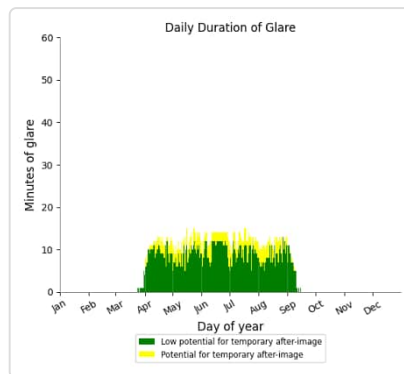

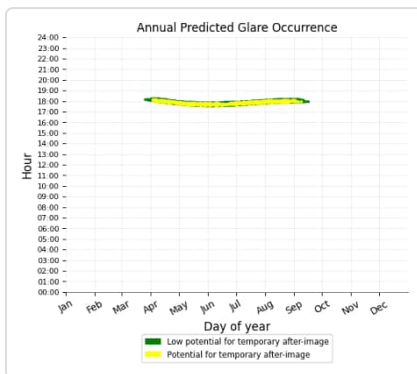

- 53 minutes of "green" glare with low potential to cause temporary after-image.
- 0 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 27

PV array is expected to produce the following glare for this receptor:

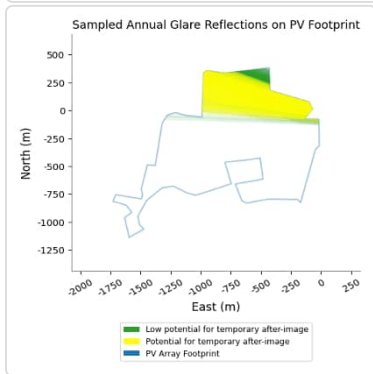

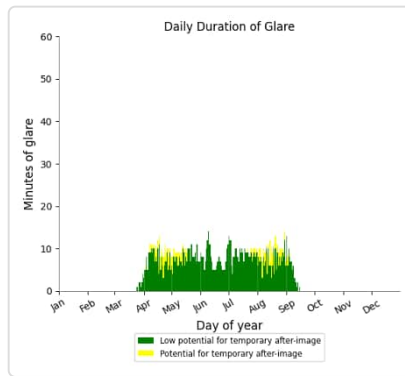

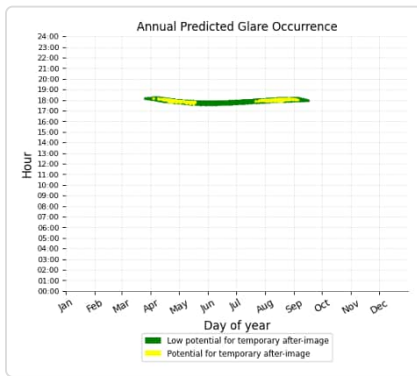

- 1,472 minutes of "green" glare with low potential to cause temporary after-image.
- 442 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 28

PV array is expected to produce the following glare for this receptor:

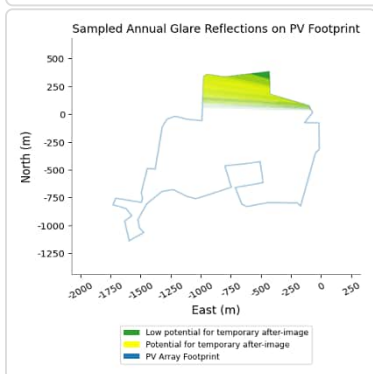

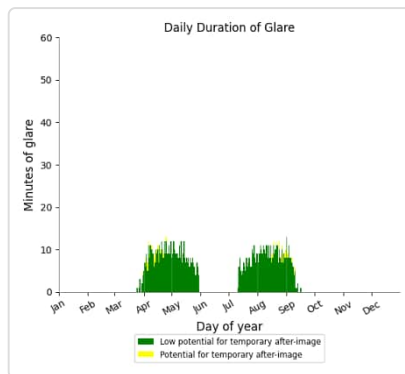

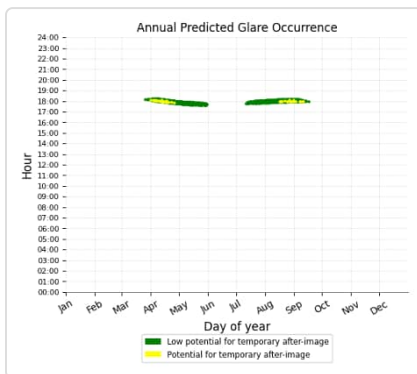

- 1,259 minutes of "green" glare with low potential to cause temporary after-image.
- 176 minutes of "yellow" glare with potential to cause temporary after-image.

South Array: OP 29

PV array is expected to produce the following glare for this receptor:

- 1,032 minutes of "green" glare with low potential to cause temporary after-image.
- 38 minutes of "yellow" glare with potential to cause temporary after-image.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.

- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

ANNEX I: RAIL RECEPTOR GLARE RESULTS (35 DEGREES)

Fenwick Solar Farm

Fenwick Rail 35 degrees

Created Nov 28, 2023
Updated Aug 08, 2024
Time-step 1 minute
Timezone offset UTC0
Minimum sun altitude 0.0 deg
Site ID 106536.18426

Project type Advanced
Project status: active
Category 10 MW to 100 MW

Misc. Analysis Settings

DNI: varies (1,000.0 W/m² peak)
Ocular transmission coefficient: 0.5
Pupil diameter: 0.002 m
Eye focal length: 0.017 m
Sun subtended angle: 9.3 mrad

PV Analysis Methodology: Version 2
Enhanced subtended angle calculation: On

Summary of Results Glare with potential for temporary after-image predicted

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Assumptions

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
- Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Refer to the **Help page** for detailed assumptions and limitations not listed here.

Assumptions

-
- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
 - Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
 - Detailed system geometry is not rigorously simulated.
 - The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
 - The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
 - Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
 - The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
 - Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
 - Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
 - Refer to the **Help page** for detailed assumptions and limitations not listed here.

Assumptions

-
- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
 - Glare analyses do not automatically account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
 - Detailed system geometry is not rigorously simulated.
 - The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
 - The system output calculation is a DNI-based approximation that assumes clear, sunny skies year-round. It should not be used in place of more rigorous modeling methods.
 - Several V1 calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
 - The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
 - Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
 - Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
 - Refer to the **Help page** for detailed assumptions and limitations not listed here.

ANNEX O SOLAR MODULE GLARE AND REFLECTANCE TECHNICAL MEMO

Solar Module Glare and Reflectance Technical Memo

Technical Notification

TITLE: SunPower Solar Module Glare and Reflectance**AUTHORS:** Technical Support**APPLICATION:** Residential/ Commercial**SCOPE:** SunPower Modules**SUMMARY:**

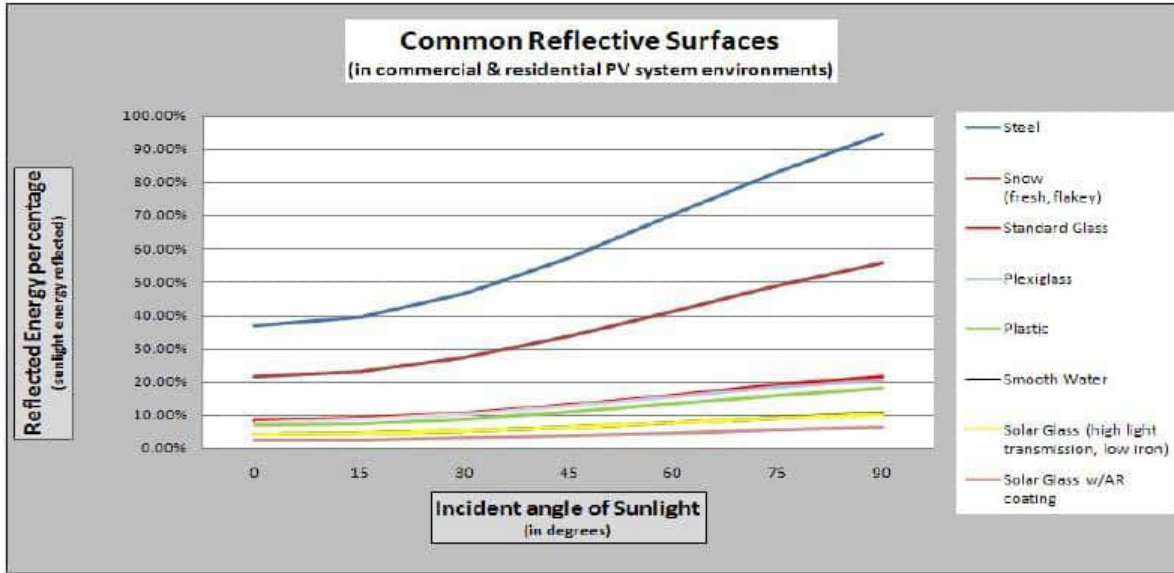

The objective of this document is to increase awareness concerning the possible glare and reflectance impact of PV Systems on their surrounding environment.

The glare and reflectance levels from a given PV system are decisively lower than the glare and reflectance generated by the standard glass and other common reflective surfaces in the environments surrounding the given PV system. Concerning random glare and reflectance observed from the air: SunPower has several large projects installed near airports or on air force bases. Each of these large projects has passed FAA or Air Force standards and all projects have been determined as "No Hazard to Air Navigation". Although the possible glare and reflectance from PV systems are at safe levels and are usually decisively lower than other standard residential and commercial reflective surfaces, SunPower suggests that customers and installers discuss any possible concerns with the neighbors/cohabitants near the planned PV system installation.

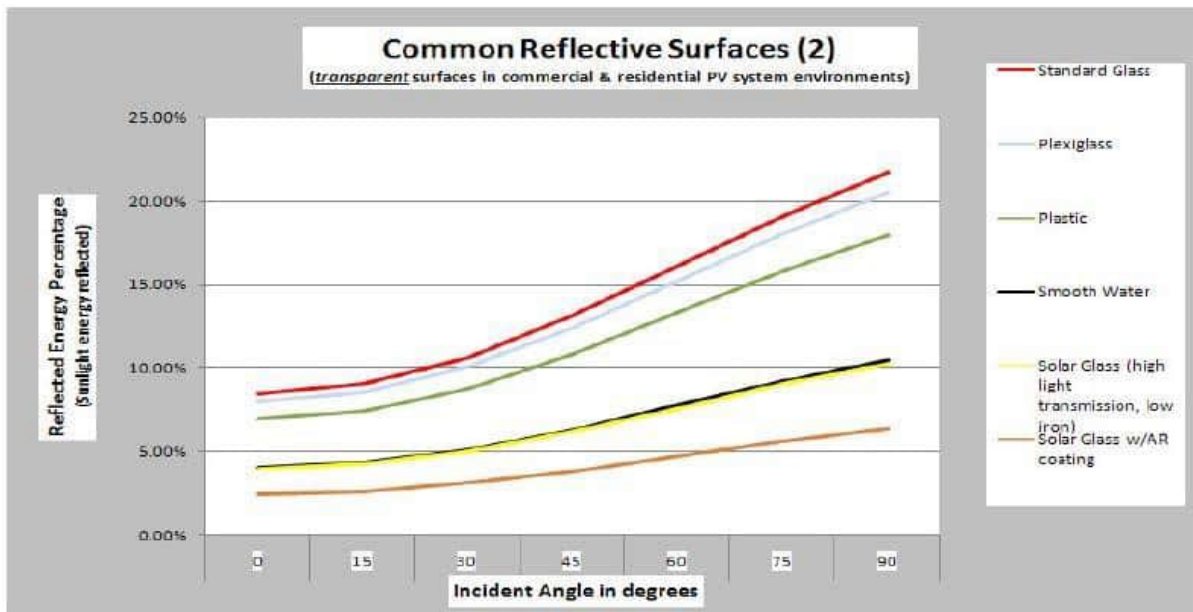

DETAILED EXPLANATION:

In general, since the whole concept of efficient solar power is to absorb as much light as possible while reflecting as little light as possible, standard solar module produces less glare and reflectance than standard window glass. This is pointed out very well in US Patent #6359212 which explains the differences in the refraction and reflection of solar module glass versus standard window glass. Solar modules use "high-transmission, low iron glass" which absorbs more light, producing small amounts of glare and reflectance than normal glass.

In the graph below, we show the reflected energy percentages of sunlight, of some common residential and commercial surfaces. The legend and the graph lists the items from top to bottom in order of the highest percentage of reflected energy.

It should be noted that the reflected energy percentage of Solar Glass is far below that of a standard glass and more on the level of smooth water. Also, below are the ratios of the common reflective surfaces:

Light beam physics resolves that the least amount of light is reflected when the beam is the normal, in other words, least light energy is reflected when the beam is at 0 degrees to the normal. The chart below is a result of light beam physics calculations:

Common Reflective Surfaces (in surrounding environments for PV systems)		Incident angle in degrees						
		0	15	30	45	60	75	90
Material Reflectivity (percent of incident light reflected)	Steel	36.73%	39.22%	46.34%	57.11%	70.02%	83.15%	94.40%
	Snow (fresh, flakey)	21.63%	23.09%	27.29%	33.63%	41.23%	48.96%	55.59%
	Standard Glass	8.44%	9.01%	10.65%	13.12%	16.09%	19.10%	21.69%
	Plexiglass	8.00%	8.54%	10.09%	12.44%	15.25%	18.11%	20.56%
	Plastic	6.99%	7.46%	8.82%	10.87%	13.33%	15.83%	17.97%
	Smooth Water	4.07%	4.35%	5.14%	6.33%	7.76%	9.22%	10.47%
	Solar Glass (high light transmission, low iron)	3.99%	4.26%	5.03%	6.20%	7.61%	9.03%	10.26%
	Solar Glass w/AR coating	2.47%	2.64%	3.12%	3.84%	4.71%	5.59%	6.35%

(Note: Index of refraction values may vary slightly depending on suppliers and reference documentation. The values for the above calculations are averages or single values obtained from the list of references for this document).

Important reference – “Stipples glass”: In addition to the superior refractive/reflective properties of solar glass versus standard glass, SunPower uses stippled solar glass for our modules. Stippled glass is used with high powered telescopes and powerful beacons and lights. The basic concept behind stippling is for the surfaces of the glass to be textured with small types of indentations. As a result, stippling allows more light energy to be channeled/ transmitted through the glass while diffusing the reflected light energy. This concept is why the reflection of off a SunPower solar module will look hazy and less-defined than the reflection from standard glass, this occurs because the stippled SunPower glass is transmitting a larger percentage of light to the solar cell while breaking up the intensity of the reflected light energy.

SUMMARY/ACTION REQUIRED:

The studies, data and light beam physics behind the charts and graphs prove beyond a reasonable doubt that solar glass has less glare and reflectance than standard glass. The figures also make it clear that the difference is very decisive between solar glass and other common residential/commercial glasses. In addition, not to be lost in the standard light/glass equations and calculations, the SunPower solar glass is stippled and has a very photon-absorbent solar cell attached to the back side, contributing two additional factors which results in even less light energy being reflected.
