

Dear Sir / Madam, while the importance of UK sustainable energy, grid decarbonisation and the achievement of net zero is essential for us all, we must try not to risk damaging our public health and ecology. So, in fulfilling these aims (that are of primary importance) we must have proper planning that does not risk enhancing the ecological emergency that we are in, as well as threatening public health. We have grave concerns regarding the suitability of this specific site, mainly focusing on knowledge (or lack of) of the risks and responsibilities of the (data- documented) historic landfill sites. Little but limited testing has been done, but the risks are still (largely) unknown.
