

I would like to express my concerns about this application.

Whilst I understand the need for renewable energy it seems to me that the applications submitted and planned for submission are excessive. My understanding is that the need for solar energy is all but fulfilled, and that battery sites are over subscribed according to the "Connection reform results" January 2026 on the Government's National Energy Operator(NESO) website.

I feel the countryside and villages will be badly affected during construction, maintenance and decommissioning. With regard to any decommissioning what is being put in place to guarantee that money/funds will be available when it comes to decommissioning?

I feel in general that industrial sites, motorways, rooftops would be better for this type of project - we should be protecting the countryside not industrialising it, particularly in areas of Tourism and Farming communities.

In the end whatever we do a nation will have little effect on climate change, at least not if other countries do not adopt similar strategies. And I doubt consumers will see any benefit from any of this - cheaper electricity - I don't believe it!

Please stop this application and all others in this beautiful part of Lincolnshire - it is wrong.
