

The production of solar energy on such a large scale has such a devastating impact on our environment, community and our way of Life. The irreversible damage to the land through contamination, the impact on wildlife and the unsustainable effect on local infrastructure far outweighs the benefits of production. Surely there are more sustainable and productive ways to meet the energy requirements - panels should be on industrial roof space, planning changes driving sustainability when building as well as wind. In these uncertain times we must protect our ability for farmers to farm, ensuring our ability to be self sufficient! Once this land is gone, it's gone.
