1. Introduction

1.1. Purpose of document

1.1.1. This document has been prepared by RSK Biocensus, on behalf of Rosefield Energyfarm Limited ('the Applicant') to present the results of a Biodiversity Net Gain (BNG) assessment to support the application for a Development Consent Order (DCO) for the construction, operation (including maintenance) and decommissioning of the proposed Rosefield Solar Farm (hereinafter referred to as 'the Proposed Development').

1.1.2. The document provides:

- a detailed methodology, including assumptions, for undertaking the BNG assessment;
- the baseline biodiversity value of habitats within the Order Limits prior to construction;
- the likely biodiversity value of habitats within the Order Limits postdevelopment based on the current design information; and
- the relative biodiversity change of habitats within the Order Limits after construction compared with before construction, determining whether the Proposed Development has achieved a 10% net gain in biodiversity.

1.2. Landscape context

- 1.2.1. The Order Limits are located within the administrative boundary of Buckinghamshire Council. The Order Limits are situated at site central grid reference SP 73100 23777. The Proposed Development encompasses approximately 675 hectares (ha) of land and comprises ponds, *Bramble scrub*, *Cereal crops*, *Lowland mixed deciduous woodland*, *Mixed scrub*, *Modified grassland*, *Non-cereal crops*, *Other neutral grassland*, *Other woodland; broadleaved*, *Other woodland; mixed*, *Reedbeds*, *Temporary grass and clover lays*, *Rural trees*, Hedgerows, Line of trees, *Other rivers and streams*, ditches, and urban habitats. (**Figure 1**).
- 1.2.2. The Order Limits are bordered to the north by Calvert Road and East Claydon Road, to the south by arable habitat and Finemere Wood, to the east by arable habitat and a tributary of Claydon Brook and to the west by arable habitat and woodland.
- 1.2.3. The Order Limits are situated in a largely rural context, surrounded by a network of arable fields and pasture interconnected by hedgerows, woodland, ditches and small streams. The village of East Claydon sits 415m to the west of the Order Limits and the village of Granborough sits 1.58km to the east of the Order Limits.
- 1.2.4. There are arable field margins, hedgerows, *Lowland mixed deciduous woodland*, *Reedbeds*, rivers and ponds that qualify as the priority habitat

types under Section 41 of The Natural Environment and Rural Communities (NERC) Act 2006 within the Order Limits.

1.3. Project overview

- 1.3.1. Rosefield Solar Farm is a proposed solar farm with energy storage which will generate and store renewable electricity for export to the National Grid. The main features of the Proposed Development consists of the following elements:
 - Solar PV development consisting of:
 - Ground mounted Solar PV generating station. The generating station would include Solar PV modules and mounting structures; and
 - Balance of Solar System (BoSS) which comprises: Inverters;
 Transformers; Switchgear; Combiner Boxes; acoustic barriers and cabling.
 - A project substation (the 'Rosefield Substation') compound comprising: Transformers; Switchgear; reactive power compensation bays; disconnectors; circuit breakers; busbars; control equipment; lightning surge arrestors; building(s) including office, control, functions, material storage, material laydown areas and welfare facilities; firewalls; fencing and acoustic barriers; a security cabin; parking as well as wider monitoring, maintenance and emergency equipment;
 - A Main Collector Compound and two Satellite Collector Compounds comprising: Switchgear; Transformers; ancillary equipment; operation and maintenance and welfare facilities; material storage; material laydown areas; fencing and acoustic barriers; and security cabins;
 - Battery Energy Storage System (BESS) compound comprising: batteries and associated Inverters; Transformers; Switchgear, ancillary equipment and their containers; office, control and welfare buildings; fencing and acoustic barriers; monitoring, maintenance and emergency systems; air conditioning; electrical cables; fire safety infrastructure; operation (including maintenance) security facilities; material storage; and material laydown areas;
 - Interconnecting Cabling Corridor(s) to connect the Solar PV modules and the BESS to the Satellite and Main Collector Compounds to the Rosefield Substation;
 - A Grid Connection Cable Corridor to connect the Rosefield Substation to the National Grid East Claydon Substation via 400kV cabling;
 - Ancillary infrastructure works comprising: boundary treatment; security equipment; lighting; fencing; landscaping; internal access tracks; works to facilitate vehicular access; earthing devices; earthworks; surface water management; utility connections and diversions; and any other works identified as necessary to enable the Proposed Development;

- Green and blue infrastructure, recreation and amenity works comprising: landscaping; habitat management; biodiversity enhancement; the creation of three permissive footpaths; and works to permanently divert four public right of way footpaths in five instances;
- Site-wide operational monitoring and security equipment; and
- Highways infrastructure improvements and safety works comprising: minor junction improvement works; road widening; passing places; and works to facilitate vehicular access to the Site.

1.4. Policy context

1.4.1. The primary aims of the BNG process are for developments to secure a measurable improvement in habitat for biodiversity, to minimise biodiversity losses and to help to restore ecological networks whilst streamlining development processes. BNG does not replace other existing legislation and policy for nature conservation. The below legislation and policy provide the context behind the need to achieve BNG.

The Environment Act

1.4.2. The Environment Act 2021 mandates a statutory requirement for developments to deliver a minimum of 10% BNG which has been mandatory for most developments from February 2024. Nationally Significant Infrastructure Projects (NSIP) (including the Proposed Development) are currently exempt from BNG requirements, BNG for NSIPs is expected to become mandatory in May 2026.

Town and Country Planning Act

1.4.3. Schedule 7A of the Town and Country Planning Act 1990 (as amended) mandates a statutory requirement for developments to deliver a minimum 10% BNG which has been mandatory from February 2024.

National Planning Policy Framework

- 1.4.4. The National Planning Policy Framework (NPPF) sets out the Government's planning policies for England and how these are expected to be applied by Local Authorities within their Local Development Frameworks. The revised NPPF was published on 12 December 2024 and updated in February 2025 [Ref. 1].
- 1.4.5. Chapter 15 paragraph 187(d) of the NPPF 'Conserving and enhancing the natural environment' sets out the requirements to consider BNG in planning decisions. Paragraph 170 states: "Planning policies and decisions should contribute to and enhance the natural and local environment by: ... d) minimising impacts and providing net gains for biodiversity, including by establishing coherent ecological networks that are more resilient to current and future pressures;"

Local plans

1.4.6. Buckinghamshire Council requires applicants to achieve 10% net gain on all non-exempt developments **[Ref. 2]**.

2. Methods

2.1. Introduction

- 2.1.1. This BNG assessment has been carried out as a desk-based exercise and has been undertaken by a competent person in accordance with best practice (Senior ecologist, BSc, 5 years' experience MCIEEM).
- 2.1.2. The results of UK Habitat Classification (UKHab) surveys carried out within the Order Limits by RSK Biocensus in June and July 2023, October 2023, January 2024, May 2024, April 2025 and September 2025 have been used to determine the biodiversity value of habitats within the Order Limits before construction (**Figure 2**).
- 2.1.3. The river condition assessment was undertaken by an accredited competent person (Principal Ecologist, Modular River Physical (MoRPh) trained, BSc (Hons.), MSc, MCIEEM and Principal Aquatic Ecologist CEnv MIFM, MoRPh trained). The MoRPh survey was undertaken in line with best -practice guidance [Ref. 3 and Ref. 4].
- 2.1.4. The landscape plans provided by the Applicant for the Proposed Development have been used to determine the biodiversity value of habitats within the Order Limits after construction (**Figure 3**).
- 2.1.5. The primary documents consulted as part of this assessment include:
 - Outline Landscape and Ecological Management Plan (Outline LEMP) [EN010158/APP/7.6] including Appendix 1: Green Infrastructure Parameters of the Outline LEMP, Appendix 2: Landscape and Ecological Mitigation and Enhancements and Appendix 3: Vegetation Removal Parameters.
 - Outline Drainage Strategy [EN010158/APP/7.11] which provides detail on the attenuation ponds proposed as part of the Proposed Development.
 - ES Volume 4, Appendix 7.7: Preliminary Ecological Appraisal (2025) [EN010158/APP/6.4] which provides the baseline survey information for the Order Limits.
 - ES Volume 4, Appendix 7.13: Arboricultural Impact Assessment [EN010158/APP/6.4] which provided information about trees within hedgerows.

2.2. Biodiversity assessment methods

2.2.1. This assessment was undertaken in line with guidance from the Chartered Institute of Ecology and Environmental Management, the British Standard

- for Biodiversity Net Gain (BS 8683) [Ref. 5] and industry best practice¹ [Ref. 6].
- 2.2.2. To calculate the baseline values for the Order Limits, and assess any changes arising from the Proposed Development, this study uses methods set out the in Statutory Biodiversity Metric (hereafter 'the Metric') user guide [Ref. 7]. The Metric measures biodiversity value for habitats in 'biodiversity units' (BUs).
- 2.2.3. The Metric is designed to quantify losses and gains of biodiversity as a result of proposed development or land management to inform and improve planning, design, land management and decision-making. The Metric uses habitats as a proxy to describe biodiversity.
- 2.2.4. The Metric can calculate biodiversity value of:
 - · existing habitats;
 - · habitat enhancement; and
 - habitat creation.
- 2.2.5. The Metric can calculate different types of BUs. There are three types of biodiversity units, which are calculated in three separate 'modules' of the Metric. These are:
 - area habitat units (e.g. woodland, grasslands, wetlands);
 - hedgerow units (e.g. hedgerows and lines of trees); and
 - watercourse units (e.g. culverts, canals, wet ditches, rivers and streams).
- 2.2.6. Consequently, a site can have three biodiversity unit values, which are assessed using the Metric, but which cannot be summed together or traded between.
- 2.2.7. The area or length of a habitat is multiplied by several factors in the Metric (called multipliers) that indicate its quality and value (distinctiveness, condition and strategic location), and this provides its BU value.
- 2.2.8. In addition, for those habitats that are to be created or enhanced, the risk of failure is accounted for by applying multipliers for risk factors (difficulty, time to target condition, and off-site risk).

Application Document Ref: EN010158/APP/6.4 Planning Inspectorate Scheme Ref: EN010158

6

¹ A competent person has the knowledge and skills to perform specified tasks to complete and review biodiversity metric calculations. This is obtained through training, qualifications, experience, or a combination of them. Competency is aligned with the British Standard 'Process for designing and implementing biodiversity net gain (BS 8683:202)

2.2.9. A brief description of the different multipliers contained within the Metric are detailed below in **Table 1**.

Table 1: Statutory biodiversity metric multipliers and their explanations

Biodiversity metric multiplier	Explanation
Habitat distinctiveness	 A measure based on the type of habitat and its distinguishing features. This includes: consideration of species richness and rarity; the extent to which the habitat is protected by designations; and the degree to which a habitat supports species rarely found in other habitats.
Habitat condition	A measure of the habitat against its ecological optimum state. Condition is a way of measuring variation in the quality of patches of the same habitat type.
Strategic significance	Describes the local significance of the habitat based on its location and the habitat type.
Difficulty	A measure which represents the uncertainty in the effectiveness of management techniques used to enhance or create habitat.
Time to target condition	The average time taken between starting creation or enhancement of habitats and that habitat reaching its target condition or distinctiveness.
Spatial risk	Spatial risk represents the relationship between the location of biodiversity loss (on-site) and where the off-site habitat is being delivered. This is applied to off-site interventions only.
Riparian zone encroachment	A measure of any feature or intervention within the riparian zone that reduces the quantity, quality or ecological function of the riparian habitat.
Watercourse encroachment	A measure of any feature that adversely affects the natural function of the watercourse, or results in localised changes in habitat, species and migratory pathways.

2.3. BNG good practice principles for development

2.3.1. The Metric has been designed as a tool to help inform plans and decisions; however, when undertaking BNG assessments this must be undertaken in accordance with set principles outlined in the user guide [Ref. 8]. These are outlined in Table 2 along with a full justification regarding how each principle has been considered.

Biodiversity metric multiplier	Explanation
Principle 1: The metric assessment should be completed by a competent person.	The metric was completed by a senior ecologist with full membership of CIEEM who has 5 years' experience in completing BNG calculations. Technical review carried out by Principal Ecologist and a Technical Director, both of whom are full members of CIEEM.
Principle 2: The use of this biodiversity metric does not override existing biodiversity protections, statutory obligations, policy requirements, ecological mitigation hierarchy or any other requirements. This includes consenting or licensing processes, for example woodlands.	Existing levels of protection afforded to protected species and habitats are not changed by use of this or any other metric. Statutory obligations will still need to be satisfied. The Environmental Statement details the presence of protected and/or notable species, sites and habitats, and assesses potential impacts and outlines suitable mitigation measures to address these. The required mitigation measures have been factored into the Proposed Development with a clear distinction made between mitigation and enhancement for biodiversity.
Principle 3: The biodiversity metric should be used in accordance with established good practice guidance and professional codes.	The mitigation hierarchy has been applied to the design of the Proposed Development. The area of permanent habitat loss has been kept to a minimum without compromising the Proposed Development. The habitats that will be created and enhanced within the Order Limits will be appropriate, and of the correct distinctiveness, to compensate for the habitats that will be impacted. This assessment was undertaken in line with guidance from the Chartered Institute of Ecology and Environmental Management, the British Standard for Biodiversity Net Gain (BS 8683) [Ref. 5] and industry best practice [Ref. 6].
Principle 4: The biodiversity metric is not a complex or comprehensive ecological model and is not a substitute for expert ecological advice.	The Applicant acknowledges that the Defra Metric has been kept deliberately simple to be of practical use. The calculations have been undertaken by specialists and input is underpinned by robust baseline evidence and ecological knowledge and experience.
Principle 5: Biodiversity units	The Applicant acknowledges that the Defra

are a proxy for biodiversity and should be treated as relative values.

The Applicant acknowledges that the Defra Metric is a tool to be used as a means of assessing changes in biodiversity value (losses or gains) brought about by the Proposed

Biodiversity metric multiplier	Explanation
	Development and is a habitat based approach to determining a proxy biodiversity value within the Order Limits, and the output does not represent absolute values.
Principle 6: This biodiversity metric is designed to inform decisions in conjunction with locally relevant evidence, expert input, or guidance.	Impacts to protected and notable species and habitats have been fully assessed as part of the Ecological Impact Assessment undertaken for the Proposed Development and is reflected in this BNG Assessment with a clear distinction made between mitigation and enhancement for biodiversity.
Principle 7: Habitat interventions need to be realistic and deliverable within a relevant project timeframe.	The habitats chosen for creation and enhancement have been selected based on the existing on-site conditions and local context, not purely to achieve the greatest possible BNG result using the Metric. The post-development habitats will be created, enhanced, managed and maintained in accordance with the Outline LEMP [EN010158/APP/7.6] which will ensure that the habitats achieve their target condition.
Principle 8: Created and enhanced habitats should be, where practical and reasonable, local to any impact and deliver strategically important outcomes for nature conservation.	The created and enhanced habitats to achieve the BNG requirements are all being delivered within the Order Limits and are therefore local to the impacts. The landscape plans have been designed to be in keeping with the local character of the area whilst also being in accordance with the Lawton principles of 'bigger, better, more and joined up' [Ref. 9].
Principle 9: The biodiversity metric does not enforce a minimum habitat size ratio for compensation of losses. Proposals should aim to: • maintain habitat extent - supporting more, bigger, better and more joined up ecological networks • ensure that proposed or retained habitat parcels are of sufficient size for ecological function	Figure 3 details significant areas of habitat creation/enhancement that will be of higher quality than is currently present and provides a buffer of habitats adjacent to existing designated sites. These proposals will ensure that the Proposed Development Site continues to provide an ecological corridor to the wider landscape, facilitating faunal and flora movement.

2.4. Irreplaceable habitats and very high distinctiveness habitats

- 2.4.1. Irreplaceable habitats are habitats which are very difficult (or take a very significant time) to restore, recreate or replace once destroyed, which can be due to their age, uniqueness, species diversity or rarity.
- 2.4.2. Very high distinctiveness habitats are highly threatened, internationally scarce habitats which require conservation action. Impacts to these habitats should be avoided in line with planning policy.
- 2.4.3. Irreplaceable habitats (as provided for in secondary legislation for BNG) do not have a BNG requirement as they are too valuable to be compensated for. As such, any losses to irreplaceable habitats cannot be calculated by the biodiversity metric tool and they are removed from the baseline.
- 2.4.4. Impacts to very high distinctiveness habitat cannot always be adequately compensated for through BNG. Therefore, bespoke compensation can be agreed for impacts to these habitat types.
- 2.4.5. There are irreplaceable veteran and ancient trees present within the Order Limits. In order to access areas proposed for landscaping and environmental habitat creation in Parcel 1a, an existing track, located within Romer Wood and Greatsea Wood (ancient woodland within the Order Limits), currently used by maintenance traffic associated with HS2 landscape planting would be used to allow light vehicles, such as tractors, to access this area for habitat creation works. No loss of ancient woodland would be required as existing access tracks would be utilised and no built development is proposed along the access track. Areas of ancient woodland are also located immediately adjacent to the Order Limits. These will all be retained and protected within the Proposed Development and therefore no offsetting is required.
- 2.4.6. There are no very high distinctiveness habitat types within the Order Limits.

2.5. Assumptions and limitations

- 2.5.1. The assessment is based on the description of the Proposed Development in ES Volume 1, Chapter 3: Proposed Development Description [EN010158/APP/6.1] and the Outline LEMP [EN010158/APP/7.6] including Appendix 1: Green Infrastructure Parameters of the Outline LEMP, Appendix 2: Landscape and Ecological Mitigation and Enhancements and Appendix 3: Vegetation Removal Parameters. If the Proposed Development design or Order Limits change, a further BNG assessment may be required.
- 2.5.2. Access constraints meant that the baseline UKHab survey could not be completed in a single survey season.
- 2.5.3. Less conspicuous plant species (including invasive non-native species) may have been missed as a result of the survey being undertaken outside

- of the ideal survey season. However, the majority of plants present were confidently identified, and the survey was sufficient to make a broad assessment of the habitats present within the Order Limits.
- 2.5.4. Within the baseline habitat survey, various areas of tussocky arable field margin were identified. The majority of these areas will be transformed into species rich grassland and scrub buffers to hedgerows and woodlands. Arable field margin is a medium distinctiveness habitat which needs to be replaced with the same broad habitat type to balance the trading rules within the metric.
- 2.5.5. As the land is being taken out of arable production, there will not be new arable field margin created as part of the Proposed Development (excepting some small areas of *Arable field margins game bird mix*, see **Table 9**), and therefore the Proposed Development would not satisfy the trading rules associated with this habitat type. In order to address this, in terms of the Metric the arable field margins have been entered as *Other neutral grassland* in poor condition in the baseline tab. This is considered appropriate as this generates the same number of units as the equivalent amount of arable field margin (as the habitats are the same distinctiveness) and it represents a very similar habitat to that recorded as part of the baseline surveys.
- 2.5.6. The ecological function of these two habitat types is extremely similar and would generally be made up of the same plant species which provide the same resources to wildlife (food sources and ground cover). The habitats are considered to be functionally similar and exchanging them in this way is considered appropriate for the assessment.
- 2.5.7. A small area of *Arable field margin game bird mix* is proposed. Although this will not be within an area of arable habitat this is considered the most appropriate habitat type to assign to the wild bird mix intended for these areas (as detailed in the **Outline LEMP [EN010158/APP/7.6]**).
- 2.5.8. Up to 37 trees could be lost as part of the Proposed Development, comprising 23 medium, large or very large trees and 14 small trees. These trees are all part of hedgerows, recorded in the baseline survey as various 'hedge with trees' or 'line of trees' habitat types. Therefore, a full condition assessment of each individual tree was not undertaken. However, in line with metric guidance, where a medium, large or very large tree within a hedgerow or line of trees is being removed, this also has to be recorded as an individual tree in the baseline. Therefore, the 23 medium, large or very large trees proposed to be removed have been added to the baseline with a precautionary condition score of 'good'. All trees to be removed will be subject to appropriate assessment regards roosting bats and nesting birds prior to removal. Tree sizes were determined using information from ES Volume 4, Appendix 7.13: Arboricultural Impact Assessment [EN010158/APP/6.4].
- 2.5.9. Where new trees are proposed to be planted within existing hedgerows, these have been included as 'individual trees' within the habitat creation

- tab of the Metric. This is appropriate as all the trees being lost are also within hedgerows and the new habitats will therefore be analogous to those lost. The addition of trees to the existing hedgerows does not form part of the recorded enhancements to the hedges and therefore no double counting of tree planting is being recorded.
- 2.5.10. An **Outline Drainage Strategy [EN010158/APP/7.11]** for the Proposed Development is submitted in support of the DCO Application; however, the final details which will include attenuation basins and grassed swales will be defined at the detailed design stage. The location and sizes of these features are not yet known. Therefore, these have not been considered in this BNG assessment. It is considered that proposed swales will represent an *Other neutral grassland* habitat type analogous with grassland in the hedgerow buffers and therefore including them in the BNG assessment will not alter the overall score. A final BNG assessment will be completed prior to construction starting to take account of any design changes and the drainage arrangements.
- 2.5.11. There are minor differences in the values stated for hedgerow loss and creation and tree loss within the Outline LEMP [EN010158/APP/7.6], ES Volume 4, Appendix 7.13: Arboricultural Impact Assessment, ES Volume 4, Appendix 7.17: Biodiversity Net Gain Assessment, [EN010158/APP/6.4] and ES Volume 2, Chapter 7: Biodiversity [EN010158/APP/6.2]. These differences arise due to the data used within the Outline LEMP [EN010158/APP/7.6] being based on topographical survey data and aerial photography and data used with ES Volume 4. Appendix 7.13: Arboricultural Impact Assessment based on BS5837:2012 survey data, supported by topographical baseline mapping. The data used within ES Volume 4, Appendix 7.17: Biodiversity Net Gain Assessment [EN010158/APP/6.4] and ES Volume 2, Chapter 7: Biodiversity [EN010158/APP/6.2] is based on data collected as part of UKHab surveys detailed within ES Volume 4, Appendix 7.7: Preliminary Ecological Appraisal (2025) [EN010158/APP/6.4]. While the locations of proposed vegetation removal and creation are accurately represented, variations may occur in the description of what is impacted. This is due to differences in classification methodologies applied to vegetation and trees across the respective disciplines.
- 2.5.12. Within the baseline each habitat parcel, hedgerow and tree has been given a unique habitat reference. Individual areas have been separated out within the baseline metric tabs where possible. The habitat reference number column contains the habitat reference number for each parcel which also appears in the condition assessment tables in **Annex B** and on **Figure 2**. Lines have been combined for areas without condition assessments (i.e. developed land; sealed surface and cereal crops). This has been done as the number of individual habitat areas are over the limit of rows available within the metric document.
- 2.5.13. Within the post-development tab of the Metric each habitat parcel, and hedgerow was assigned a unique post-development habitat reference.

- These can be found in the habitat reference number column of the post-construction tabs within the Metric and on **Figure 3**. In the post-development tabs of the Meric, polygons of the same habitat type have been combined into a single row.
- 2.5.14. Buckinghamshire does not yet have a published Local Nature Recovery Strategy. Therefore, the Strategic Significance applied within the Metric is based on the Buckinghamshire Interim Strategic Significance & Spatial Risk Guidance for Biodiversity Net Gain [Ref. 10].
- 2.5.15. The Order Limits are partially within the Bernwood Biodiversity Opportunity Area (BOA).
- 2.5.16. In line with the guidance from Buckinghamshire Council [Ref. 10]: All habitats in the baseline have been assigned a low strategic significance, in line with guidance contained in the Buckinghamshire Interim Strategic Significance & Spatial Risk Guidance for Biodiversity Net Gain. Habitats in the post-construction scenario within the BOA which meet the aims of the BOA have been assigned a high strategic significance. This includes the following habitats:
 - Proposed ponds within the BOA; and
 - Proposed and enhanced hedgerows within the BOA
- 2.5.17. The mitigation areas which fall within the BOA and new proposed tree planting have been assigned a medium strategic significance. All other habitats outside of the BOA have been assigned a low strategic significance. This is in accordance with the Buckinghamshire Interim Strategic Significance & Spatial Risk Guidance for Biodiversity Net Gain, which states that medium strategic significance can be used for habitats which are 'enhanced or created for BNG either on-site or off-site are considered 'ecologically desirable' if the location and type of habitat produced is justified by a professional ecologist'.
- 2.5.18. This is considered to be appropriate level of strategic significance to assign to these habitats, as the mitigation areas will provide significant areas of species-rich grassland and scrub habitats which will be beneficial for a range of species and occur within the ecologically desirable location of the BOA.
- 2.5.19. No delay in starting habitat creation has been applied to any habitats within the Metric. This is because there is not anticipated to be a significant delay between habitat removal, and the habitat creation works.
- 2.5.20. A 1-year advance in habitat creation has been applied to a number of the woodland blocks and newly created hedgerows (which aren't reinstatement of existing hedge sections which will be lost). Based on the assumption of construction being undertaken in 2029, the implementation of these habitats would be planned for 2028.

3. Results

3.1. Overview

- 3.1.1. To calculate the overall biodiversity accounting position for the Proposed Development, the BU values for the existing habitats (pre-development) and the proposed newly created/enhanced habitats (post-development) need calculating.
- 3.1.2. The full results of this assessment are summarised in **Annex A**, with the habitat condition sheets presented in **Annex B** (pre-development) and **Annex C** (post-development).

3.2. Pre-development

- 3.2.1. The Order Limits predominantly consist of agricultural fields (mostly arable with some grassland) interspersed with hedgerows, small woodland blocks, ponds and farm access tracks. Several minor watercourses run adjacent to or within the Order Limits, including the Claydon Brook and tributaries, alongside small field drains and ditches that run parallel to numerous field boundaries.
- 3.2.2. The UKHab Plan (**Figure 2**) has been used to determine all of the habitats present within the Order Limits before construction. UKHab names appear in italics.
- 3.2.3. It should be noted that the habitats' description below does not include areas of Ancient Woodland such as Sheephouse and Finemere Wood that lie outside the Order Limits but in close proximity to it, as they do not sit within the Order Limits and therefore do not fall under the scope of this assessment. They have not been subject to survey. These Ancient Woodlands will be retained and protected by appropriate buffers.

Other neutral grassland (g3c)

3.2.4. A larger number of the grassland areas with the Order Limits were recorded as *Other neutral grassland*. No areas scored good condition. Common species included Crested Dog's-tail (*Cynosurus cristatus*), Cock's-foot (*Dactylis glomerata*), Creeping Buttercup (*Ranunculus repens*), Sweet Vernal-grass (*Anthoxanthum odoratum*) and Meadow Foxtail (*Alopecurus pratensis*).

Modified grassland (g4)

3.2.5. Many grassland areas throughout the Order Limits fell into this classification and were largely used for pasture, grazing cattle or sheep. Species included Perennial Rye-grass (*Lolium perenne*), meadow-grass (*Poa* sp.), Yorkshire-fog (*Holcus lanatus*) and White Clover (*Trifolium repens*). The majority of these areas were in poor condition having failed essential Criterion A by having a low species diversity. A smaller number

of the areas passed this criterion and were therefore in moderate or good condition

Lowland mixed deciduous woodland (w1f)

3.2.6. Six areas of this priority habitat type were recorded throughout the Order Limits. The majority of these were located on boundaries between fields or adjacent to watercourses. All of the areas were in moderate condition. Species recorded within the woodlands included Pedunculate Oak (Quercus robur), Horse-chestnut (Aesculus hippocastanum), Hornbeam (Carpinus betulus), Ash (Fraxinus excelsior), Lime (Tilia platyphyllos x cordata = T. x europaea), poplar (Poplus sp.) and cherry (Prunus sp.). The majority contained an understory consisting of Hawthorn (Crataegus monogyna), Bramble (Rubus fruticosus agg.) and Blackthorn (Prunus spinosa) with one also including elm (Ulmus sp.). Ground layer species included Common Nettle (Urtica dioica), Hogweed (Heracleum sphondylium) and Cow Parsley (Anthriscus sylvestris).

Other woodland; broadleaved (w1g)

3.2.7. Areas of *Other woodland; broadleaved* were found throughout the Order Limits, generally in small pockets between fields. The majority of these areas were in moderate condition with smaller numbers being in poor or good condition. Common species included Pedunculate Oak, White Poplar (*Populus alba*), Ash, Apple (*Malus pumila*), Field Maple (*Acer campestre*), Lime and Hornbeam. Some areas contained non-native species including Turkey Oak (*Quercus cerris*). Typical understory species included Hawthorn, Blackthorn and Bramble. Typical ground layer species included Hogweed, dock species (*Rumex* sp.), Common Nettle, Cow Parsley and grass species.

Other woodland; mixed (w1h)

3.2.8. Three areas of mixed coniferous and broadleaved woodland were recorded. These were primarily in the east of the Order Limits with species comprising oak (*Quercus* sp.), White Poplar, Cherry, Hawthorn and a mixture of coniferous trees. Two of these areas were in moderate condition with one achieving a poor condition.

Bramble scrub (h3d)

3.2.9. There were four patches of *Bramble scrub* recorded throughout the Order Limits. This habitat type has a pre-determined condition of 'condition assessment N/A' within the Metric.

Mixed scrub (h3h)

3.2.10. There were seven areas of *Mixed scrub* recorded with conditions ranging from poor to good. These were all small pockets of scrub with species

- including Blackthorn, Hawthorn, Bramble, willow (*Salix* sp.) and Ash. The majority of these were in moderate condition. Reedbeds (f2e)
- 3.2.11. There was one parcel of *Reedbed* within the Order Limits. The reedbed appeared to be man-made with cut water channels running throughout it. This habitat was in poor condition.

Cereal crops (c1c)

3.2.12. Many of the agricultural fields within the Order Limits contained *Cereal crops* including Barley (*Hordeum vulgare*), Oat (*Avena sativa*) and wheat (*Triticum* sp.). This habitat type has a pre-determined condition of 'condition assessment N/A' within the Metric.

Non-cereal crops (c1d)

3.2.13. Some of the arable fields within the Order Limits contained *non-cereal crops* including legumes (*Fabaceae* sp.). This habitat type has a predetermined condition of 'condition assessment N/A' within the Metric.

Temporary grass and clover leys (c1b)

3.2.14. Two fields within the Order Limits contained a temporary ley of White Clover and Perennial Rye-grass. This habitat type has a pre-determined condition of 'condition assessment N/A' within the Metric.

Ponds (non-priority habitat) (r1)

3.2.15. There were ten ponds classified as non-priority habitat within the Order Limits. Species included Pendulous Sedge (*Carex pendula*), Branched Bur-reed (*Sparganium erectum*), Fool's-water-cress (*Helosciadium nodiflorum*), Soft-rush (*Juncus effusus*) and Bulrush (*Typha latifolia*). These ponds ranged from good to poor condition.

Ponds (priority habitat) (r1)

3.2.16. There were nine ponds classified as priority habitat within the Order Limits. Species included Branched Bur-reed. These ponds were classified as priority habitat due to the presence of great crested newt (*Triturus cristatus*). All but one of these ponds was in moderate condition with one scoring poor condition.

Artificial unvegetated, unsealed surface (u1c)

3.2.17. Farm tracks comprising *Artificial unvegetated, unsealed surface* were present throughout the Order Limits. This habitat type has a predetermined condition of 'N/A – Other' within the Metric.

Developed land; sealed surface (u1b)

3.2.18. Buildings, roads and other areas of hardstanding within the Order Limits fall within this category. This habitat type has a pre-determined condition of 'N/A – Other' within the Metric.

Vegetated garden (u1)

3.2.19. One parcel of *Vegetated garden* was recorded adjacent to a farm building within the Order Limits. This habitat type has a pre-determined condition of 'condition assessment N/A' within the Metric.

Individual trees

3.2.20. The Order Limits contain a total of 182 scattered trees ranging from small to very large in size. These also ranged in condition from poor to good with the majority being in good condition. There were also three veteran and one ancient tree within the Order Limits, which are irreplaceable habitats with any loss being unacceptable within the Metric. Species included Pedunculate Oak, Ash and Large-leaved Lime (*Tilia platyphyllos*).

Lines of trees

3.2.21. There were ten lines of trees recorded throughout the Order Limits with two being classified as an *ecologically valuable line of trees* due to the presence of mature trees within the line. Species included willow, apple, Lime, White Poplar, Sycamore (*Acer pseudoplatanus*), Wild Cherry (*Prunus avium*), Ash and Pedunculate Oak. The majority of these were in moderate condition with two being in poor condition.

Hedgerows

3.2.22. There is a total of 248 hedgerows within the Order Limits separating fields and along the boundary of the Order Limits. These included species-rich hedgerows, hedgerows with trees and hedgerows associated with a bank or ditch. The majority of the hedgerows were in good or moderate condition. Common species included Hawthorn, Blackthorn, Ash and Bramble.

Ditches

3.2.23. There were five ditches identified within the Order Limits. Species included Soft-rush, False Fox-sedge (*Carex otrubae*), horsetail (*Equisetum* sp). and Hard Rush (*Juncus inflexus*). Three of the ditches were in good condition and two in poor condition. All ditches present were subject to a degree of riparian encroachment.

Other rivers and streams

- 3.2.24. East Claydon Brook was split into two sections for the purposes of the MoRPh survey. The longer section which makes up the eastern boundary of much of the Order Limits was assessed as being in fairly poor condition. A very small section which runs east to west in the north of the Order Limits was assessed as being in moderate condition. The Order Limits also contained two smaller watercourses, the Muxwell Brook and a tributary of the Padbury Borok. These were largely in moderate condition with a small section of the Muxwell Brook being in fairly poor condition. All rivers and streams were subject to a degree of riparian encroachment on at least one bank.
- 3.2.25. Full details of the MoRPh survey can be found in **Annex B**.

Area habitats

3.2.26. The total area of each area habitat recorded within the Order Limits before construction, the condition of each habitat (i.e. its current status), its strategic significance and a summary of the BUs this represents, are all presented in **Table 3**. Total area and unit values have been taken from the Metric, but these may not exactly match the totals of the individual numbers within the tables. This is because of minor rounding differences.

Table 3: Baseline biodiversity unit values for each habitat recorded within the Order Limits before construction

Habitat type (UKHab classification)	Baseline habitat condition	Area (ha)	Strategic significance	Baseline BU value
Developed land; sealed surface	N/A - Other	15.64	Low	0.00
Artificial unvegetated, unsealed surface	N/A - Other	0.59	Low	0.00

Total		0	1.04	3.30	0	10.05	22.56

3.3. Post-development

3.3.1. The landscape plans (**Figure 3**) have been used to identify all the habitats that will be created, enhanced or retained within the Order Limits after construction. There are no proposed biodiversity offsets off-site for the Proposed Development. Total area and unit values have been taken from the Metric, but these may not match the exact totals of the individual numbers within the tables. This is because of rounding differences.

Area habitats

3.3.2. A breakdown of areas for each proposed area habitat retained, created or enhanced post-development within Order Limits and a summary of the BUs this represents are presented in **Table 9**.

Table 9: Post-development habitat biodiversity unit values within the Order Limits based on the current design

Habitat type	Forecast habitat condition	Strategic significance	Forecast area (ha)	Forecast BU value

Total (without individual to	ees)		675.09	3117.61
Total (with individual trees		681.85		

- 3.3.3. The post-development biodiversity accounting calculations for area habitats have been undertaken using the following assumptions based on the landscape plans presented in **Figure 3** and the **Outline LEMP** [EN010158/APP/7.6]:
 - The proposed siting zones for BESS, Main Collector Compound and Satellite Collector Compounds have all been included as *Developed land*; sealed surface within the Metric.
 - Proposed ecological ponds (and former ponds with potential to be restored) have been included as *Ponds (non-priority habitat)* in moderate condition.
 - Indicative area for Solar PV development has been included as 95%
 Other neutral grassland in poor condition to account for the shading produced by the panels. The remaining 5% of this area has been recorded as Developed land; sealed surface to account for the legs of the panels.
 - Indicative mitigation areas for ground nesting birds and bats have been included as Other neutral grassland in good condition. This will create a habitat suitable for foraging bats and ground nesting birds.
 - Indicative general mitigation area has been included as 95% Other neutral grassland in good condition with the remaining 5% being Mixed scrub in moderate condition which will create a habitat mosaic suitable for a wide range of species.
 - Indicative mitigation buffer around woodlands for bats has been included as 90% Other neutral grassland in moderate condition and the remaining 10% as Mixed scrub in moderate condition. With the shading from the woodland and scrub moderate is considered to be an appropriate condition for the grassland in this area.
 - Indicative mitigation corridor for bats has been included as 90% Other neutral grassland in moderate condition and the remaining 10% as Mixed scrub in moderate condition. With the shading from the hedgerows and scrub, moderate is considered to be an appropriate condition for the grassland in this area.
 - Indicative mitigation buffer along hedgerows for bats has been included as 90% Other neutral grassland in moderate condition (due to the shading from adjacent hedgerow), 5% Mixed scrub in moderate condition and 5% Arable field margin game bird mix. The arable field margins will be in distinct areas adjacent to areas likely to attract wild birds including woodlands and nesting bird mitigation. This will provide suitable habitat for farmland bird species. Although no arable land is being created, it has been decided to call this habitat type arable field margin game bird mix as this is what is considered to be the closest habitat type for the wild bird seed mixed proposed for these areas.

- Indicative mitigation buffer along key Public Rights of Way and indicative mitigation buffer along Public Rights of Way has been included as Other neutral grassland in poor condition. This habitat is likely to experience a high level of disturbance.
- Indicative ecological enhancement/mitigation screening has been included as Other woodland, broadleaved in poor condition. The indicative mitigation screening which is labelled as early planting has also been included as Other woodland, broadleaved in poor condition with one year advanced planting applied.
- Indicative enhancement area along watercourses has been included as Other neutral grassland in moderate condition as the OLEMP suggests that this area will resemble a wet grassland habitat.
- The **Outline LEMP [EN010158/APP/7.6]** states that 435 new individual trees will be planted within existing hedgerows. These have been included as rural trees in moderate condition.
- Existing woodland, existing ponds and all other non-shaded areas have been recorded as retained habitat.
- 3.3.4. The planting schedules and seed mixes for each newly created area habitat are detailed within the **Outline LEMP [EN010158/APP/7.6]**.
- 3.3.5. Condition assessment criteria for newly created and enhanced area habitats are provided in **Annex C**.

Hedgerows

3.3.6. A breakdown of lengths for each proposed hedgerow, retained, created or enhanced post-development within the Order Limits and a summary of the BUs this represents are presented in **Table 10**.

Table 10: Post-development hedgerow biodiversity unit values within the Order Limits based on the current design

Habitat type	Forecast habitat condition	Strategic significance (Post- construction)	Forecast length (km)	Forecast BU value
Retained habitats				
Native hedgerow	Good	Low	5.10	30.66
Native hedgerow	Moderate	Low	0.05	0.20
Native hedgerow - associated with bank or ditch	Good	Low	2.94	35.16
Native hedgerow with trees	Good	Low	4.42	53.16

Habitat type	Forecast habitat condition	Strategic significance (Post- construction)	Forecast length (km)	Forecast BU value
Native hedgerow with trees - associated with bank or ditch	Good	Low	4.90	87.66
Native hedgerow with trees - associated with bank or ditch	Moderate	Low	0.02	0.24
Non-native and ornamental hedgerow	Poor	Low	0.11	0.11
Species-rich native hedgerow	Good	Low	0.94	11.40
Species-rich native hedgerow	Poor	Low	0.02	0.08
Species-rich native hedgerow - associated with bank or ditch	Good	Low	3.79	68.22
Species-rich native hedgerow with trees	Good	Low	2.60	50.22
Species-rich native hedgerow with trees	Moderate	Low	0.46	5.52
Species-rich native hedgerow with trees - associated with bank or ditch	Good	Low	3.39	81.36
Enhanced habitat				
Ecologically valuable line of trees	Good	Medium	0.27	3.21
Ecologically valuable line of trees	Good	High	0.03	0.37
Line of trees	Moderate	Medium	0.03	0.10
Line of trees	Moderate	High	0.04	0.14
Line of trees	Good	High	0.85	5.28
Native hedgerow	Moderate	High	1.75	7.64
Native hedgerow	Moderate	Medium	0.97	4.05

Habitat type	Forecast habitat condition	Strategic significance (Post- construction)	Forecast length (km)	Forecast BU value
Native hedgerow	Good	High	1.72	11.6
Native hedgerow	Good	Medium	4.37	28.18
Native hedgerow - associated with bank or ditch	Good	Medium	0.41	5.29
Native hedgerow with trees	Good	High	1.75	23.08
Native hedgerow with trees	Good	Medium	3.27	41.25
Native hedgerow with trees	Moderate	Medium	0.81	6.44
Native hedgerow with trees - associated with bank or ditch	Good	High	2.18	43.13
Native hedgerow with trees - associated with bank or ditch	Good	Medium	1.81	34.25
Native hedgerow with trees - associated with bank or ditch	Moderate	High	0.09	1.12
Native hedgerow with trees - associated with bank or ditch	Moderate	Medium	0.37	4.41
Species-rich native hedgerow	Good	High	0.63	8.49
Species-rich native hedgerow with trees	Good	High	0.26	5.14
Species-rich native hedgerow with trees	Good	Medium	0.23	4.35
Species-rich native hedgerow with trees	Moderate	High	0.29	3.62
Species-rich native hedgerow with trees	Good	High	0.84	22.16

Habitat type	Forecast habitat condition	Strategic significance (Post- construction)	Forecast length (km)	Forecast BU value
- associated with bank or ditch				
Species-rich native hedgerow with trees - associated with bank or ditch	Good	Medium	0.14	3.53
Species-rich native hedgerow with trees - associated with bank or ditch	Moderate	Medium	0.32	5.09
Created habitats				
Species-rich native hedgerow with trees	Good	High	2.77	28.26
Species-rich native hedgerow with trees	Good	Medium	1.35	13.39
Species-rich native hedgerow with trees - associated with bank or ditch	Good	Medium	0.05	0.65
Total			56.52	738.22

- 3.3.7. The post-development biodiversity accounting calculations for hedgerows have been undertaken using the following assumptions based on the landscape plans presented in **Figure 3** and the **Outline LEMP** [EN010158/APP/7.6]:
 - Newly created hedges (including those labelled as replanted hedgerows) have been included as Species rich native hedgerows with trees. The OLEMP indicates that these hedges will be planted with five or more species per 30m and contain trees.
 - Replanted hedges associated with bank or ditch have been included as Species rich native hedgerows with trees – associated with bank or ditch.
 - Retained hedgerows throughout the main Order Limits will be managed for biodiversity with any gaps filled in and 10m hedgerow buffers maintained. For this reason, all retained hedgerows have been included as enhanced one condition score (hedges which are poor in the baseline are enhanced to moderate, hedgerows which are moderate in the baseline are enhanced to good).

- Retained hedgerows within the area of Snake Lane/Fiddlers Field road improvements will not be enhanced.
- Hedgerow loss has been calculated using the vegetation removal plan Appendix 3: Vegetation Removal Parameters of the Outline LEMP [EN010158/APP/7.6].
- 3.3.8. Condition assessment criteria for newly created and enhanced hedgerows are provided in **Annex C**.

Watercourses

3.3.9. A breakdown of lengths for each proposed watercourse created or enhanced post-development within Order Limits and a summary of the BUs this represents are presented in **Table 11**.

Table 11: Post-development watercourse biodiversity unit values within the Order Limits based on the current design

Habitat type	Forecast habitat condition	Habitat intervention	Strategic significance	Watercourse encroachment	Riparian encroachment (left bank)	Riparian encroachment (right bank)	Forecast length (km)	Forecast BU value
Ditches	Poor	Retained	Low	No encroachment	Major	No Encroachment	0.12	0.42
Ditches	Good	Retained	Low	No encroachment	Major	Major	0.27	2.43
Other rivers and streams	Fairly poor	Retained	Low	No encroachment	No Encroachment	No Encroachment	0.18	1.62
Other rivers and streams	Moderate	Retained	Low	No encroachment	No Encroachment	No Encroachment	0.25	3.00
Other rivers and streams	Moderate	Retained	Low	No encroachment	Minor	No Encroachment	0.22	2.59
Ditches	Poor	Enhanced	Low	No encroachment	No Encroachment	No Encroachment	0.14	0.56
Ditches	Good	Enhanced	Low	No encroachment	No Encroachment	No Encroachment	0.22	2.64
Ditches	Good	Enhanced	Low	No encroachment	Major	No Encroachment	0.06	0.63
Other rivers and streams	Fairly poor	Enhanced	Low	No encroachment	Major	No encroachment	0.28	21.92
Other rivers and streams	Moderate	Enhanced	Low	No encroachment	No Encroachment	No Encroachment	0.08	0.96
Total							4.34	36.77

- 3.3.10. The post-development biodiversity accounting calculations for watercourses have been undertaken using the following assumption based on the landscape plans presented in **Figure 3** and the **Outline LEMP [EN010158/APP/7.6]**.
 - Enhancement to retained watercourses have been achieved through reducing the amount of encroachment. The majority of watercourses within the Site are subject to a high level of encroachment. All watercourses will be retained and managed with a 10m buffer so that there is no encroachment into the riparian zone. Watercourses with both banks within the Order Limits have been enhanced to show no encroachment on either bank. Watercourses with only one bank within the Order Limits have been enhanced to show no encroachment on one bank.
- 3.3.11. The planting schedules and seed mixes for each enhanced watercourse are detailed within the **Outline LEMP [EN010158/APP/7.6]**.
- 3.3.12. Condition assessment criteria for newly created and enhanced watercourses are provided in **Annex C**.
- 3.4. Change in biodiversity value
- 3.4.1. The habitat creation and enhancement proposals as per the landscape plans (**Figure 3**) is anticipated to result in a net increase/decrease of area habitat, hedgerow and watercourse BUs. This is summarised in **Table 12**.

Table 12: Summary of BU change

	,			
Post- development area habitat BU	Baseline area habitat area BU)		Change in area habitat BU	Percentage change (%)
3117.61	- 2078.61	=	1039	49.99%
Post- development hedgerow BU	Baseline hedgerow BU		Change in hedgerow BU	Percentage change (%)
738.22	- 609.29	=	128.93	21.16%
Post- development watercourse BU	Baseline watercourse BU		Change in watercourse BU	Percentage change (%)
36.77	- 32.61	=	4.15	12.73%

- 3.4.2. The change in biodiversity value for the Proposed Development, as set out in **Table 12**, indicates that post-development:
 - there would be an increase of 1039 area habitat BUs which equates to a 49.99% net gain in area habitats. The trading rules associated with

the Metric have been met for area habitats as a result of the Proposed Development.

- there would also be an increase of 128.93 hedgerow BUs which equates to an 21.16% net gain in hedgerows. The trading rules associated with the Metric have been met for hedgerows as a result of the Proposed Development.
- there would also be an increase of 4.15 watercourse BUs which equates to an 12.73% net gain in watercourses. The trading rules associated with the Metric have been met for watercourses as a result of the Proposed Development.

- 4. Project implementation and construction plan and outline biodiversity net gain management and monitoring plan
- 4.1.1. The implementation and creation of habitats post development is detailed and secured by the **Outline LEMP [EN010158/APP/7.6]**.
- 4.1.2. These include detailed drawings, management proposals and timetables, as well as a plan to define who is responsible for activities.
- 4.1.3. The **Outline LEMP [EN010158/APP/7.6]** details the adaptive management and monitoring plan which will guide all habitat management and monitoring at the Order Limits. The **Outline LEMP [EN010158/APP/7.6]** also includes necessary interventions should habitats fall short of their desired future condition.

5. Evaluation and conclusions

5.1. Biodiversity net gain

- 5.1.1. The Proposed Development will lead to the loss of Cereal and non-cereal crops, *Modified grassland*, *Other neutral grassland* and smaller areas of scrub, trees and hedgerows. However, to compensate and offset for these impacts the Proposed Development will result in the creation of over 200 ha of compensatory habitats including large areas of *Other neutral grassland*, *Mixed scrub* and *Other woodland broadleaved* as well as new hedgerows and individual trees. The Proposed Development will also result in retaining and enhancing hedgerows and areas of *Other neutral grassland*, *Cereal crops*, *Lowland mixed deciduous woodland* and ponds.
- 5.1.2. Overall, the Proposed Development will result in a 49.99% net gain in area habitat BUs, a 21.16% net gain in hedgerow BUs and a 12.73% net gain in watercourse BUs.
- 5.1.3. 864.96 units are generated from the solar areas alone (which are not mitigation). This represents 27.75% of the 3117.61 BU present post-construction. Therefore, satisfying the requirement for over 10% of the post-construction units to come from non-mitigation enhancement.
- 5.1.4. The trading rules associated with the Metric have been met for area habitats, hedgerows and watercourses.

Annex B – Predevelopment habitat condition survey results

Annex B – Pre-development habitat condition survey results

Table 13: Low distinctiveness grassland areas condition assessment

Source of condition assessment criteria: Statutory Biodiversity metric -Technical Annex 1

Habitat Type – Modified grassland

Date of survey

June 2023, July 2023, October 2023, January 2024, May 2024, April 2024

Condition Assessment Criteria

- A- There are 6-8 vascular plant species per m² present, including at least 2 forbs Note this criterion is essential for achieving Moderate or Good condition.
- B- Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20% is more than 7 cm) creating microclimates which provide opportunities for vertebrates and invertebrates to live and breed.
- C- Any scrub present accounts for less than 20% of the total grassland area. (Some scattered scrub such as bramble Rubus fruticosus agg. may be present).
- D- Physical damage is evident in less than 5% of total grassland area. Examples of physical damage include excessive poaching, damage from machinery use or storage, erosion caused by high levels of access, or any other damaging management activities.
- E- Cover of bare ground is between 1% and 10%, including localised areas (for example, a concentration of rabbit warrens).
- F- Cover of bracken Pteridium aquilinum is less than 20%.
- G- There is an absence of invasive non-native plant species (as listed on Schedule 9 of WCA).

Condition

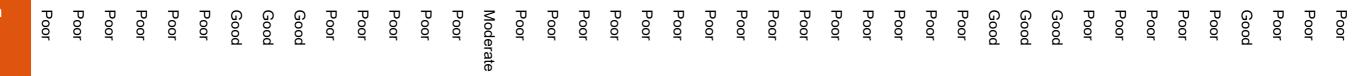

Table 14: Medium, high and very high distinctiveness grasslands Part 1

Source of condition assessment criteria: Statutory Biodiversity metric -Technical Annex 1

Habitat type - Other neutral grassland

Date of survey

June 2023, July 2023, October 2023, January 2024, May 2024, April 2024

Condition Assessment Criteria

- A- The parcel represents a good example of its habitat type, with a consistently high proportion of characteristic indicator species present relevant to the specific habitat type Note this criterion is essential for achieving Moderate or Good condition for non-acid grassland types only.
- B- Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20% is more than 7 cm) creating microclimates which provide opportunities for insects, birds and small mammals to live and breed.
- C- Cover of bare ground is between 1% and 5%, including localised areas, for example, rabbit warrens.
- D- Cover of bracken Pteridium aquilinum is less than 20% and cover of scrub (including bramble Rubus fruticosus agg.) is less than 5%.
- E- Combined cover of species indicative of suboptimal condition and physical damage (such as excessive poaching, damage from machinery use or storage, damaging levels of access, or any other damaging management activities) accounts for less than 5% of total area.
- F- There are 10 or more vascular plant species per m² present, including forbs that are characteristic of the habitat type Note this criterion is essential for achieving Good condition for non-acid grassland types only.

Habitat type – Mixed scrub

Date of survey

Condition Assessment Criteria	Habitat refe	rence number					
	78	89	438	439	448	506	537
A The parcel represents a good example of its habitat type - the appearance and composition of the vegetation closely matches its UKHab description (where in its natural range).	Х			X		X	X
- At least 80% of scrub is native,							
- There are at least three native woody species,							
- No single species comprises more than 75% of the cover (except hazel <i>Corylus avellana</i> , common juniper <i>Juniperus communis</i> , sea buckthorn <i>Hippophae rhamnoides</i> (only in its restricted native range), or box Buxus sempervirens, which can be up to 100% cover).							
B Seedlings, saplings, young shrubs and mature (or ancient or veteran) shrubs are all present		Χ	Χ	Χ		Χ	
C There is an absence of invasive non-native plant species (as listed on Schedule 9 of WCA) and species indicative of suboptimal condition make up less than 5% of ground cover.	X	X	Χ	X	X	Χ	Χ
D The scrub has a well-developed edge with scattered scrub and tall grassland and or forbs present between the scrub and adjacent habitat.	X	X	X	X		X	
E There are clearings, glades or rides present within the scrub, providing sheltered edges.		Χ				Χ	Χ
Condition	Moderate	Moderate	Moderate	Moderate	Poor	Good	Moderate

Table 19: Wetland habitats

Source of condition assessment criteria: Statutory Biodiversity metric -Technical Annex 1

Habitat type - Reedbeds

Date of survey

June 2023, July 2023, October 2023, January 2024, May 2024, April 2024	Habitat or from a complete
Condition Assessment Criteria	Habitat reference number
	81
A The water table is at, or near the surface throughout the year - this could be open water or saturation of soil at the surface. There is no artificial drainage, unless specifically to maintain water levels as specified above.	X
Note - this criterion is essential for achieving Good condition."	
B The parcel represents a good example of its specific habitat type - the appearance and composition of the vegetation closely matches its UKHab description, with vascular and non-vascular characteristic indicator species consistently present.	
C The water supplies (groundwater, surface water and or rainwater) to the wetland are of good water quality, with clear water (low turbidity) indicating no obvious signs of pollution.	
D Cover of scrub and scattered trees are less than 10%.	Χ
E Cover of bare ground is less than 5%.	
F There is an absence of invasive non-native plant species (as listed on Schedule 9 of WCA) and species indicative of suboptimal condition make up less than 5% of ground cover.	X
G No more than 25% of the habitat area has a continuous cover of litter (such as dead vegetation) preventing regeneration.	
H Sphagnum moss Sphagnum spp. and cottongrasses Eriophorum spp. are at least Frequent. Cover of ericaceous dwarf shrubs6 is less than 75%.	
I The reedbed has a diverse structure with between 60% and 80% reeds <i>Phragmites australis</i> . Other areas may include open water (at least 10%), species-rich fen and or wet woodland.	
Condition	Poor

Table 22: Individual tree habitats

Source of condition assessment criteria: Statutory Biodiversity metric -Technical Annex 1

Habitat type – Rural tree

Date of survey

June 2023, July 2023, October 2023, January 2024, May 2024, April 2024

- A- The tree is a native species (or at least 70% within the block are native species).
- B- The tree canopy is predominantly continuous, with gaps in canopy cover making up <10% of total area and no individual gap being >5m wide (individual trees automatically pass this criterion).
- C- The tree is mature (or more than 50% within the block are mature).
- D- There is little or no evidence of an adverse impact on tree health by human activities (such as vandalism, herbicide or detrimental agricultural activity). And there is no current regular pruning regime, so the trees retain >75% of expected canopy for their age range and height.
- E- Natural ecological niches for vertebrates and invertebrates are present, such as presence of deadwood, cavities, ivy or loose bark.
- F- More than 20% of the tree canopy area is oversailing vegetation beneath.

June 2023, July 2023, October 2023, January 2024, May 2024, April 2024

- A- The tree is a native species (or at least 70% within the block are native species).
- B- The tree canopy is predominantly continuous, with gaps in canopy cover making up <10% of total area and no individual gap being >5m wide (individual trees automatically pass this criterion).
- C- The tree is mature (or more than 50% within the block are mature).
- D- There is little or no evidence of an adverse impact on tree health by human activities (such as vandalism, herbicide or detrimental agricultural activity). And there is no current regular pruning regime, so the trees retain >75% of expected canopy for their age range and height.
- E- Natural ecological niches for vertebrates and invertebrates are present, such as presence of deadwood, cavities, ivy or loose bark.
- F- More than 20% of the tree canopy area is oversailing vegetation beneath.

Habitat types -Native hedgerow with trees, Native hedgerow with trees - associated with bank or ditch, Species-rich native hedgerow with trees - associated with bank or ditch

Date of survey

June 2023, July 2023, October 2023, January 2024, May 2024, April 2024

- A1 1.5m average along length
- A2 >1.5m average along length
- B1 Gap between ground and base of canopy <0.5m for >90% of length
- B2 Gaps make up <10% of total length; and
- C1 >1m width of undisturbed ground with perennial herbaceous vegetation for >90% of length:
- C2 Plant species indicative of nutrient enrichment of soils dominate <20% cover of the area of undisturbed ground.
- D1 >90% of the hedgerow and undisturbed ground is free of invasive non-native plant species (including those listed on Schedule 9 of WCA3) and recently introduced species.
- D2 >90% of the hedgerow or undisturbed ground is free of damage caused by human activities.
- E1 There is more than one age-class (or morphology) of tree present (for example: young, mature, veteran and or ancient8), and there is on average at least one mature, ancient or veteran tree present per 20 50m of hedgerow.
- E2 At least 95% of hedgerow trees are in a healthy condition (excluding veteran features valuable for wildlife). There is little or no evidence of an adverse impact on tree health by damage from livestock or wild animals, pests or diseases, or human activity.

Table 44: Proposed Mixed scrub in moderate condition

Table 44. Proposed Mixed Scrub III moderate condition			
UŁ	KHab	Mixed scrub	
На	abitat description	Mixed scrub within species rich grassland mitigation, hedgerow buffers, bat mitigation corridors, ground nesting bird mitigation area and woodland buffers	
Co	ondition assessment criteria	Targeted	
Α	The parcel represents a good example of its habitat type - the appearance and composition of the vegetation closely matches its UKHab description (where in its natural range). - At least 80% of scrub is native,	Yes	
	- There are at least three native woody species,		
	- No single species comprises more than 75% of the cover (except hazel (<i>Corylus avellana</i>), common juniper (<i>Juniperus communis</i>), sea buckthorn (<i>Hippophae rhamnoides</i>) (only in its restricted native range), or box (Buxus sempervirens), which can be up to 100% cover).		
В	Seedlings, saplings, young shrubs and mature (or ancient or veteran) shrubs are all present.	Yes	
С	There is an absence of invasive non-native plant species (as listed on Schedule 9 of WCA) and species indicative of suboptimal condition make up less than 5% of ground cover.	Yes	
D	The scrub has a well-developed edge with scattered scrub and tall grassland and or forbs present between the scrub and adjacent habitat.	Yes	
Ε	There are clearings, glades or rides present within the scrub, providing sheltered edges.	No	
Co	ondition	Moderate	

Table 45: Proposed ponds (non-priority habitat) in moderate condition

Uł	KHab	Ponds (non-priority habitat)
На	abitat description	Proposed ponds
Co	ondition assessment criteria	Targeted
Α	The pond is of good water quality, with clear water (low turbidity) indicating no obvious signs of pollution. Turbidity is acceptable if the pond is grazed by livestock.	Yes
В	There is semi-natural habitat (moderate distinctiveness or above) completely surrounding the pond, for at least 10m from the pond edge for its entire perimeter.	Yes
С	Less than 10% of the water surface is covered with duckweed Lemna spp. or filamentous algae.	Yes
D	The pond is not artificially connected to other waterbodies, such as agricultural ditches or artificial pipework	Yes
Ε	Pond water levels can fluctuate naturally throughout the year. No obvious artificial dams, pumps or pipework.	Yes
F	There is an absence of listed non-native plant and animal species.	Yes
G	The pond is not artificially stocked with fish. If the pond naturally contains fish, it is a native fish assemblage at low densities.	Yes
Н	Emergent, submerged or floating plants (excluding duckweed) cover at least 50% of the pond area which is less than 3m deep.	No
ı	The pond surface is no more than 50% shaded by adjacent trees and scrub.	No
Co	ondition	Moderate

Table 46: Proposed Other woodland, broadleaved in poor condition

Habitat description		Proposed woodland		
Condition assessment crit		teria		Target score
	M No nutrient enrichment or damaged ground evident	Less than 1 hectare in total of nutrient enrichment across woodland area, and or less than 20% of woodland area has damaged ground	1 hectare or more of nutrient enrichment, and or 20% or more of woodland area has damaged ground	1
	Condition			Poor

Table 47: Proposed individual trees in moderate condition

UKHab	Rural tree
Habitat description	Proposed trees within existing hedgerows
Condition assessment criteria	Targeted
A The tree is a native species (or at least 70% within the block are native species).	Yes
B The tree canopy is predominantly continuous, with gaps in canopy cover making up <10% of total area and no individual gap being >5m wide (individual trees automatically pass this criterion).	Yes
C The tree is mature (or more than 50% within the block are mature).	No
D There is little or no evidence of an adverse impact on tree health by human activities (such as vandalism, herbicide or detrimental agricultural activity). And there is no current regular pruning regime, so the trees retain >75% of expected canopy for their age range and height.	Yes
E Natural ecological niches for vertebrates and invertebrates are present, such as presence of deadwood, cavities, ivy or loose bark.	No
F More than 20% of the tree canopy area is oversailing vegetation beneath.	Yes
Condition	Moderate

Table 48: Proposed species rich hedgerow with trees in good condition

Table 48: Proposed species rich hedgerow with trees in good condition				
UKHab		Species rich native hedgerow with trees and species rich native hedgerow with trees – associated with bank or ditch		
Habit	at description	Proposed new and replanted hedgerows		
Cond	lition assessment criteria	Targeted		
A1	>1.5m average along length	Yes		
A2	>1.5m average along length	Yes		
B1	Gap between ground and base of canopy <0.5m for >90% of length	Yes		
B2	Gaps make up <10% of total length; and	Yes		
C1	>1m width of undisturbed ground with perennial herbaceous vegetation for >90% of length:	Yes		
C2	Plant species indicative of nutrient enrichment of soils dominate <20% cover of the area of undisturbed ground.	Yes		
D1	>90% of the hedgerow and undisturbed ground is free of invasive non-native plant species (including those listed on Schedule 9 of WCA3) and recently introduced species.	Yes		
D2	>90% of the hedgerow or undisturbed ground is free of damage caused by human activities.	Yes		
E1	There is more than one age-class (or morphology) of tree present (for example: young, mature, veteran and or ancient8), and there is on average at least one mature, ancient or veteran tree present per 20 - 50m of hedgerow.	Yes		
E2	At least 95% of hedgerow trees are in a healthy condition (excluding veteran features valuable for wildlife). There is little or no evidence of an adverse impact on tree health by damage from livestock or wild animals, pests or diseases, or human activity.	Yes		
Cond	lition	Good
