

I'm against this development.

The solar panels are taking up a huge amount of productive agricultural land, it's all very well to say it's grade 3 or whatever BUT I know that land, it has produced crops and grass for many generations. It is not unproductive, it's land that has been used to support people and animals. Putting panels on it will remove land that should be used for our country's self sufficiency, this is extremely important especially considering the turbulent world we now live in, food we don't grow here has to be imported which adds to the global CO2 issue.

BESS is a huge fire risk, the fires are uncontrollable and will lead to land pollution and affect everyone nearby.

Land fenced off for the panels will be unavailable to anyone walking in the countryside and mammals that cannot fly.
