

I live close to the proposed site of Rosefield solar farm, construction traffic and future maintenance traffic is due to go through Quainton where I live. The roads here are not designed for HGV traffic, they are small country roads and have already been decimated by HS2 construction traffic. HS2 is not going away anytime soon and we also have a mega prison being built within the same area as the proposed site for the solar farm. We absolutely cannot sustain any additional works in this area.

Why are you planning to build a solar farm on productive farm land when you could cover every rooftop, every carpark, every existing Industrial area instead? The UK is one of the least food self sufficient countries in the world? What future will we have if you reduce that even more? How is this the green option? Use wind farms? Use tidal power. Don't replace a carbon sink with solar panels which have a lifespan of 25 years.
