

referring to my previous submitted response on 27th March ref S1FEB89D8

I have further questions regarding the Applicants due diligence when assessing EIA and Visual impacts arising from your questions in the recent ExQ1 document No.s Q1.15.15 and Q1.15.16 regarding RVAA Visual impact assessments . They refer back to original applicant document APP-114 Table A10.5.1 In that there are zero houses in [REDACTED], Botolph Claydon listed as being approached to view, not even the ones on the south side that are directly impacted by the PV installation . I can only assume the Applicant felt it was obvious they would be impacted and held back for their second submission that they would revise the boundary for the PV panels back 50m thus mitigating any concerns? Its also interesting that all the houses on Wier lane were discounted for LVIA as they are more than 200m from any development boundary.

There must be something other than these EIA laws that cover a wider visual impact not just construction up to or near a boundary ?

I would still like to submit a request for the Examining Authority to visit my house and see at first hand the impact that the PV arrays will have on our view of the natural countryside .

regards Miles Roberts
