

This application must at all costs be refused. Its total footprint is horrendous, and is taking valuable agricultural land which should be used to produce food -- which is especially relevant during this climate crisis. We must not, in the future rely on food imports to feed our ever growing population, but produce as much as possible ourselves.

The loss of biodiversity will be immense, made even worse by the use of high fencing all over the site, restricting the movement of deer and other mammals.

The landscape will be decimated, and the lives of people living in the area badly effected -- we will no longer be able to enjoy the countryside.

A Nationally important business will be lost, as well as the farmers who have farmed this land for generations.

The battery storage facilities are a serious fire hazard which could dangerously effect human health.

The construction phase will badly damage the small local roads, as well as once more ruin peoples lives.

Do not consider me a nimby, I do support green energy, but not this idea of an industrial landscape.

We already have several solar farms proposed in the local area, one of which is Furzen Farm. I will be supporting this company's approach, as the land will still be grazed, wildflower meadows are proposed, as well as picnic areas for local people and wide footpaths of 10 metres. This is NOT the attitude of Rosefield developers. This proposal is just awful.
