Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				land will return to farming, but the Applicant cannot dictate what will happen to the land post-decommissioning when the Applicant no longer has an interest in the land.

4.14 Helen Hood Business

Table 4-14 RR-1826

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
HHB-001	Socio-Economics, Tourism and Recreation	Tourism	I strongly believe that tourism will dramatically decrease if the proposed plan goes ahead - people visit the area and use our B&B because it is so incredibly unspoilt and quiet. Guests have indicated already that they would not visit if the area was ruined by solar panels - they would choose another destination. I feel this way too. The proposal removes our ability to continue our business. This would be financially damaging,	The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers how changes to landscape character or visual amenity (as assessed in **ES Volume 1, Chapter 8: Landscape and Visual Impact [APP-060]**) as a result of the Scheme are anticipated to influence visitor behaviour. The assessment acknowledges the Scheme is likely to have an adverse effect on the tourism economy, and while some localised effects on tourism receptors are anticipated to occur, overall, there is not anticipated to be a significant effect on the wider tourism economy. Additional mitigation measures through the **Outline Skills, Supply Chain and Employment Plan [APP-285]** seek to reduce tourism employment losses through focussing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries. A detailed skills, supply chain and employment plan for each part of the authorised development (substantially in accordance with the **Outline Skills, Supply Chain and Employment Plan [APP-285]**) must be submitted to and approved by the local planning authority before that part of the authorised development may commence. This approach is secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
HHB-002	Description and DCO Process	Summary	as well as all the other reasons which make this scheme unsuitable - traffic, noise, biodiversity, heritage, mental health, health, fire risk, food security etc etc. to allow this to go ahead really is an unacceptable conversion of rural communities to full on industrialisation - it's immoral.	Traffic The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This concludes that there would be negligible to minor adverse effects to the highway network which are non-significant. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (OCTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. Noise The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As shown in Table 8 and Table 9 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, levels would typically be below or slightly above the existing background sound in the area during the day and night. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				lifetime of the Scheme. <u>Biodiversity</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. <u>Heritage</u> The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-8 [APP-219 to APP-232]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that following mitigation, residual effects would be either neutral/negligible or minor/moderate and therefore not significant. <u>Mental Health</u>

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "*lens*" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. <u>Fire risk</u> The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant is discussing the approach to BESS safety with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and this discussion will be set out in the relevant Statement of Common Ground to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP)**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				[APP-286] has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the OBSMP confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out in the **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and **in ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]** — including advice to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of **the Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. Food security The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) and, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered high-quality agricultural land in planning terms. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

4.15 Stop Beacon Solar

Table 4-15 RR-4494

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
SBS-001	Landscape and Visual	Introduction	To Whom It May Concern, I am writing on behalf of Stop Beacon Solar to formally object to the Lime Down Solar proposal. While we recognise the importance of renewable energy generation, this proposal represents an inappropriate and disproportionate development that would cause significant and irreversible harm to the local landscape, agricultural land, rural character, and surrounding communities.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267].** Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies. The Applicant confirms that these matters have been addressed in detail in the responses below.
SBS-002	Landscape and Visual	Visual Impact	Scale and Landscape Harm. The sheer scale of the Lime Down Solar proposal would industrialise a predominantly rural landscape, fundamentally altering its character. The development would introduce extensive fencing, panel arrays, substations, access tracks, and associated infrastructure across open countryside, resulting in long-term visual harm that cannot be adequately mitigated. This level of development is wholly at odds with the established rural setting.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. The effects of the Scheme have been assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA recognises that there would be temporary Moderate Adverse effects on Landscape Character within the 1 km as a result of the change in land use from arable farmland to solar infrastructure. However, the Scheme proposes significant mitigation measures to reduce the effects of the Scheme on landscape character which will provide significant beneficial effects to the fabric of the Sites and the legacy Landscape As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
SBS-003	Soils and Agriculture	Loss of Agricultural Land and Food Security	Loss of Agricultural Land and Food Security The proposal would result in the loss of large areas of productive agricultural land. At a time when national policy increasingly recognises the importance of food security and sustainable land use, the permanent or long-term removal of farmland for industrial-scale solar development is unjustifiable.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP069]**, supported by **ES Volume 3, Appendix 171: Agricultural Land Classification and Soil Resource Survey Report [APP243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered highquality agricultural land in planning terms. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
SBS-004	Cumulative effects	Other Solar Projects in the Vicinity	Cumulative Impact This proposal cannot be viewed in isolation. When considered alongside existing and proposed solar developments in the wider area, the cumulative impact is severe. Incremental approval of large-scale solar schemes risks transforming the landscape into an energy industrial zone, contrary to planning principles	A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21 Cumulative and In-combination Effects [APP-073]** and associated **Appendices [APP-264**]. Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES, Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			that seek to protect rural environments from overdevelopment.	**073].** Existing schemes are captured within the baseline environment for each technical chapter. The four-stage cumulative assessment methodology is described **within ES Volume1, Chapter 6: EIA Methodology [APP-058]**. 358 developments were included in the **Long List [APP-264**]. 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level.
SBS-005	Ecology and Biodiversity	Biodiversity Net Gain	Ecology and Biodiversity Concerns Claims of biodiversity net gain remain largely theoretical and unproven at this scale. The disturbance caused during construction, the long-term presence of infrastructure, and the fragmentation of habitats raise serious concerns regarding impacts on wildlife, soil health, and local ecosystems.	Potential impacts on ecology and biodiversity are fully assessed **in ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant is discussing the approach to the assessment in relation to ecology and biodiversity in general with Wiltshire Council and Natural England and this discussion will be set out in the relevant Statements of Common Ground to be submitted

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out **in ES Volume 1, Chapter 10: Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9 Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1, Chapter 17: Soils and Agriculture [APP-069],** Sections 17.10 and 17.12). Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, is secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016].** The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, is secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016].** These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. The Scheme's baseline biodiversity units have been calculated with the use of the DEFRA published standardised Statutory Biodiversity Metric ('the Metric') and based on comprehensive habitat surveys undertaken by the Applicant's professional ecologists. The Metric has been used to compare the baseline biodiversity units with the projected post-development units. The projected post-development units have been calculated based on the habitat creation and enhancement measures shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **OLEMP [APP-283]**. Details of the Scheme's approach to BNG are provided in the **Biodiversity Net Gain Report [APP-273]** and the full BNG calculations are provided in a copy of the Metric **[APP-274]**. Whilst BNG for NSIPs such as the Scheme is not yet mandatory, the preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified habitat creation and enhancement measures will be delivered and maintained throughout the lifetime of the Scheme. Furthermore Requirement 9 of the **Draft Development Consent Order [APP-016]** specifically secures the provision of a minimum 10% Biodiversity Net Gain

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
SBS-006	Community Benefits	Local Community and Democracy	Community Impact and Democratic Deficit Local opposition to the Lime Down Solar proposal is substantial and well-documented. Communities feel excluded from decision-making processes and burdened by developments that provide little tangible benefit to local residents while imposing significant environmental and social costs.	The Applicant considers that the statutory consultation has been robust, thorough and undertaken in accordance with the requirements of the Planning Act 2008, the Environmental Impact Assessment (EIA) regulations, and the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009. The **Consultation Report [APP-022]** sets out the Applicant's approach to pre-application consultation. The Applicant also notes that the examination process provides a further opportunity for interested parties to comment on the Scheme. This examination is managed by an independently appointed Examining Authority. Further to this, the Applicant provided an extended relevant representation period beyond the minimum statutory timeframe to allow sufficient time for members of the public to review the submitted application documents and register as an interested party. The Applicant furthermore refers to the commitment for the provision of a community liaison group to be set up prior to construction commencing, who will act as the go-to body for queries, complaints or communication between members of the public and the construction contractors. This is secured through Requirement 4 of Schedule 2 to the **Draft DCO [APP-016]**. The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally when compared to the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population in addition to the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				employment and income especially during construction and peak replacement activities (as assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**), and providing skills and training opportunities (as secured through the **OSSCEP [APP-285]** through Requirement 18 of Schedule 2 to the **Draft DCO [APP-016]**). Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. This is secured through the **OLEMP [APP-283]** and **OPROWPPMP [APP-282]** through Requirements 7 and 16 of Schedule 2 to the **Draft DCO [APP-016]**. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme.
SBS-007	Site Selection and Alternatives	Location	Unsustainable Development in the Wrong Location Renewable energy should be delivered in a way that is proportionate, sensitively located, and aligned with local and national planning policy. This proposal fails that test. Large-scale solar developments should prioritise brownfield land, rooftops, and previously developed sites, rather than undeveloped countryside.	The Scheme has been designed and assessed in line with local and national planning policy. Further details regarding how the Scheme complies with policy, and the weight given to likely significant effects in Secretary of State decision making, can be found in the **Planning Statement [APP-267].** In particular, Annex A and B of the Planning Statement provide a comprehensive assessment of the Scheme's compliance with local and national planning policy. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed **in ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056], ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185] and in the**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Statement of Need [APP-266]. **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** provides further details on the brownfield land that has been considered, through a review of the brownfield land registers for the relevant local authorities. However, no brownfield sites were identified that would meet the minimum threshold of 40ha required for land parcels to be considered for inclusion in the Scheme. Further, many of the brownfield sites contained within the registers were either already in use or proposed to be used for other developments. The Applicant also considered commercial rooftops, but their use was not considered viable for a scheme of this size. Further in relation to the use of rooftops, national policy and government guidance, as set out in the **Statement of Need [APP-266],** recognises that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
SBS-008	Description and DCO Process	Conclusion	Conclusion For the reasons outlined above, Stop Beacon Solar strongly objects to the Lime Down Solar proposal and urges the planning authority to refuse consent. We support renewable energy in principle, but not at the expense of rural landscapes, agricultural land, and local communities. We respectfully request that the cumulative impacts, landscape harm, and loss of agricultural land are given significant weight in the determination of this application. Yours faithfully, Stop Beacon Solar	The Applicant confirms that these matters have been addressed in detail in the responses above. As to the weight that should be given to cumulative impacts, landscape and loss of agricultural land, the Applicant's position regarding the appropriate weight is set out in the **Planning Statement [APP-267]**. It is considered that cumulative impacts should be given neutral weight, landscape and visual impacts should be afforded moderate negative weight and agricultural land should be afforded moderate negative weight. However, it is considered that the clear and substantial benefits of the Scheme (i.e. the Scheme's contribution to electricity generation and security of supply, the positive impacts on climate change and greenhouse gas emissions, biological enhancements, creation of permissive paths, job creation and skills training) far

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				outweigh the negative impacts and that the balance lies in favour of making the development consent order.

4.16 Big Bull Storage Limited

Table 4-16 RR-0505

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
BSL-001	Transport and Access	Traffic Impact	I object to this project on a few grounds. I object to the amount of traffic with HGV vehicles on narrow lanes. The number of vehicles needed for this is substantial and the highways network here is completely unsuitable.	The number of HGV's is not considered unsuitable based on the assessment of potential effects of construction vehicles on the highway network. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]** , which consider construction vehicle movements, traffic volumes, vehicle types, route suitability, road safety, effects on road users, and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, including Annex H, which demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council, and identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. All construction routes also include passing points to allow two HGVs to pass. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the CTMP in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application, with the aim of ensuring that the effect of the construction phase on the local highway network is minimised. The

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Outline CTMP [APP-287] sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00, and includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
BSL-002	Cultural Heritage	Fosse Way	I object to the proposed use of the Roman road of the fosseway. This is a destruction of an ancient heritage road.	The potential effects of the Scheme on the Roman Roads (i.e. the Fosse Way), as well as other Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. Where an adverse effect has been identified to Roman archaeological assets appropriate mitigation in the form of preservation in situ or Strip, Map and Record is proposed. See Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation and Section 12.11 for additional mitigation. The chapter concluded that following mitigation, residual effects would be either neutral/negligible or minor/moderate and therefore not significant. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12.6 Archaeological Mitigation**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Strategy [APP-230] secured through Requirement 12 of the DCO.
BSL-003	Noise and Vibration	Noise Pollution	I object to the noise that will be caused by some of the installations once they are up and running. This area is known for its peacefullness and birdsong. Having this industrial noise come from.such a rural location.	An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation (see conclusions below) and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. The impacts of noise generated from elements of the Scheme during the operational phase on wildlife, including birds, is assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** The assessment concludes that

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				noise levels will not have a significant adverse effect on wildlife, including birds.
BSL-004	Socio-Economics, Tourism and Recreation	Use and Desirability of PRoWs	I object to The significant impact all the fencing, lighting, panels will have on the rural walks and footpaths. Only today in the Newspaper the Princess of Wales has been talking about the importance of rural walks for mental health. These footpaths will be like walking through an industrial landscape as the fences will be close to the paths on both sides.	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The assessment finds no significant residual effects to individual PROWs or the PROW network overall. However, residual significant effects are anticipated to some long-distance recreation routes during all phases of the Scheme due to their regional or national importance. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
SBL-005	Socio-Economics, Tourism and Recreation	Impact on Bridleways	I am (Redacted) and I value the rural walks and also rural horse riding. I regarly ride through Seagry wood towards Stanton and then take the bridlepath all the way to Rodbourne.	Impact on the bridleways and unsurfaced road affected by Lime Down E have been assessed in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241].** Therein it is

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			This is one of the most beautiful rides anywhere in England.	recognised that there will be residual significant adverse effects to both unsurfaced highways due to use by HGVs during construction. Whilst mitigation measures as set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**, are deemed to be sufficient to ensure user safety, the change of use and impact upon user experience are unable to be mitigated further, and as such will have to be considered as part of the planning balance in determining whether or not consent should be granted. Impacts from the Scheme on bridleways GSOM9/SEAG23 through Seagry Wood, SSTQ7 at Avil's Lane and MALW61/SSTQ4 connecting Avil's Lane to Rodbourne have been set out in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** where the assessment finds, subject to implementation of mitigation measures to PROW users secured through the Requirements in Schedule 2 to the **Draft DCO [APP-016]**, that they are not likely to be significantly adversely affected by the Scheme.
BSL-006	Ecology and Biodiversity	Impact on Wildlife	I object to the significant impact of wildlife in the area. The bridlepath from Stanton to Rodbourne is full of wildlife. Two springs ago i saw 10 leverets playing alonside the path. There are a lot of roe deer in the area. Also hedgehogs, badgers and many other mammals. How will these animals get through the fencing? Hedgehogs only use the paths they choose and will not roam. The disturbance of these routes will be catastrophic for these animals	Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The assessment concludes that, with embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			whose numbers have dwindled in the last 40 years.	to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and secured in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme, with measures for ongoing ecological management and maintenance set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Potential impacts of the Scheme on mammals, including deer, hedgehogs, and badgers, are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects on wildlife movement and habitat connectivity during construction, operation and decommissioning. The assessment identifies the presence of badger setts and foraging habitats within and around the Scheme and evaluates potential effects from habitat disturbance, displacement and construction activities. It concludes that, with embedded mitigation in place, no significant adverse effects on badgers are anticipated. The Applicant notes that the approach to the assessment in relation to badgers has been with Wiltshire Council and is under discussion with Natural England and Wiltshire Council and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. Mitigation measures to protect badgers include the application of minimum buffer distances around setts, timing controls on works near sensitive locations, pre-construction surveys, and habitat retention to maintain foraging and movement corridors. These measures are

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				detailed in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]** and long-term habitat management provisions are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Regarding hedgehogs, the assessment concludes that, with embedded mitigation and good practice measures in place, including habitat retention, ecological buffers, and permeable fencing to maintain habitat connectivity and allow continued movement of mammals, there would be no significant adverse effects on hedgehogs. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme. Lastly, the Applicant notes that deer populations in the UK are currently at historically high levels, and deer species are not endangered and nor are they targeted for conservation action. The Deer Act 1991 regulates the management and welfare of deer, restricting certain methods of taking or killing deer and setting closed seasons, and is primarily in place to regulate animal welfare and treatment concerns rather than for conservation purposes.
BSL-007	Description and DCO Process	Distance from the Grid	I object to the siting of this project. It is a long way from Melksham. These projects should be sited close to the grid. Wrong place.	The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered such as taking as direct a route as possible, whilst following existing features, such as roads; and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts.

4.17 The Church of the Holy Cross

Table 4-17 RR-4650

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
CHC-001	Description and DCO Process	Introduction	Holy Cross Sherston Our church has concerns about the impacts of this project. The area of this project lies within the Gauzebrook Group of Churches, a benefice of eight churches which are spread between Sherston in the north and Hullavington and Stanton St Quintin in the South. All residents of the Parish of Sherston are entitled to be baptised, married and have their funeral in our Church. We provide regular services, not only to our own Parish, but also in a shared mode with the other 7 churches in the benefice.	The Applicant notes this comment.
CHC-002	Cultural Heritage	Introduction	The Church building is Grade 1 listed, and therefore of the highest level of heritage.	The Applicant notes this comment.
CHC-003	Transport and Access	Impact on Transport LInks and Connectivity	All changes to the local environment will impact us, the rural nature of the local area changing to an industrial area will be a step change affecting our ministers, volunteers, and present and future congregations within the Parish, not only on Sundays for regular worship but also pastoral ministry throughout the week. The project works will impact on the transport links between these	The proposed construction routes have been carefully assessed and are considered to be the most appropriate routes to the Scheme. These do not directly pass any of the named churches. Construction traffic would also be temporary and controlled through measures in a CTMP to minimise adverse impacts on the highway network. The construction routes proposed for the Scheme are presented in **ES Figure 13-1 and Figure 13-2 [APP-146, APP-147]**. These provide access to the Solar PV Sites and the Cable Route Corridor via Junction 17 (Lime Down D and E) and Junction 18 (Lime Down A, B and C) of the M4.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			churches, changing physical communication between the churches and the changing the quality of the area, which is attractive to many visitors, including those visiting our churches.	An **OCTMP [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. A final CTMP would be prepared post consent and must be substantially in accordance with the **OCTMP [APP-287]** and approved by the relevant local planning authority (in consultation with the relevant highway authority and South Gloucestershire Council), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.
CHC-004	Cultural Heritage	Heritage Assets	The Athelstan Pilgrim Way, a pilgrimage trail based on the historical context of King Athelstan, links these churches and draws many visitors. Our church is grateful to many visitors who support our churches through donations made by them during their visit.	The Grade I Listed Church of The Holy Cross (NHLE: 1023223) is situated approximately 720m north of Lime Down A at its nearest points. Since the design presented at PEIR stage, Solar PV Panels have been removed entirely from within Fields A11 and A12, and from within the northern parts of Fields A1 and A4. No significant effects have been identified as a result of the Scheme to the Church of The Holy Cross (**see ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12.1: Heritage Statement [APP-219]**) Of the other 35 churches on the Athelstan Pilgrim Way, only five were assessed within the **ES Volume 3, Appendix 12.1: Heritage Statement [APP-219]** as potentially being impacted by the Scheme due to their proximity and intervisibility. These comprise Foxley Parish Church (NHLE: 1023219), Church of All Saints (NHLE: 1023214), Church of St Mary (NHLE: 1356040), Church of St Giles (NHLE: 1022362) and Church of St Mary and Saint Ethelbert (NHLE: 1199767). Foxley Parish Church is situated approximately 375m north-east of Lime Down B at their nearest points. Since the design presented at PEIR stage, Solar PV Panels have been removed entirely from within Field B12, the field which lies closest to Foxley. The nearest panels within Lime Down B will be within Field B11, approximately 760m south-west of the churchyard. Throughout Lime Down B, screening has

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				been proposed, enclosing the enhancement of existing hedgerows throughout, including along the north and north-eastern boundaries of Fields B11 and B12. No significant effects have been identified as a result of the Scheme. The Church of All Saints is situated approximately 440m south and approximately 880m east of Lime Down B at its nearest points, and approximately 250m north of Lime Down D at its nearest points. Since the design presented at PEIR stage, Solar PV Panels have been removed entirely from within Fields B1-B5, with the nearest panels situated within Fields B9 and B10 to the north and Fields D19-D21 to the south. Throughout Lime Down B and D, screening has been proposed, including the enhancement of existing hedgerows throughout, and in particular along the southern boundary of Lime Down B and the northern boundary of Lime Down D. No significant effects have been identified as a result of the Scheme. The Church of St Mary is situated approximately 980m south of Lime Down D at their nearest points. Throughout Lime Down D, screening has been proposed, including the enhancement of existing hedgerows throughout. No significant effects have been identified as a result of the Scheme. The Church of St Giles is situated approximately 160m west of Lime Down C at their nearest points. Since the design presented at PEIR stage, Solar PV Panels have been removed entirely from within Fields C1, C6 and C8 along the western boundary of Lime Down C. No significant effects have been identified as a result of the Scheme. The Church of St Mary and Saint Ethelbert is situated approximately 790m north-west of Lime Down C at their nearest points. Since the design presented at PEIR stage, Solar PV Panels have been removed entirely from within Fields C1, C6 and C8 along the western boundary of Lime

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Down C. No significant effects have been identified as a result of the Scheme.
CHC-005	Socio-Economics, Tourism and Recreation	Impact on PRoWs and Cycle Paths	The area is highly regarded for walking and cycling, and a major annual fund raising is based on a large event, "*The Wiltshire Historic Churches Ride and Stride*" which is held annually across the area and into adjacent counties. Downgrading the attractiveness of this area will reduce the footfall and hence our fundraising capability.	PRoW such as bridleways and byways and the use of the highway network for recreational users have been considered as specific recreational receptors in the assessment in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on individual PRoW are specifically assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment covers each phase of the Scheme: construction, operation, peak replacement works, and decommissioning, and is based on likely visual and amenity impacts, traffic movements, and changes to the usability and desirability of PRoW. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of PRoW is protected as much as possible through the implementation of embedded and additional mitigation measures set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant therefore considers that the Scheme would not cause significant detriment to the ability for The Wiltshire Historic Churches Ride and Stride to take place or continue fundraising in future.
CHC-006	Soils and Agriculture	Stewardship of Farmland	We are concerned with plans for the stewardship of the farmland. If this project proceeds it sets a poor precedent for encouragement proper	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP069]**, supported by **ES Volume 3, Appendix 171: Agricultural Land**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			use of our natural resources for food.	**Classification and Soil Resource Survey Report [APP243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered highquality agricultural land in planning terms. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

4.18 KMT Farming and Consultancy Limited

Table 4-18 RR-2711

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
KMT-001	Landscape and Visual	Visual Impact and Landscape Character	Landscape and visual impact: The project would cause substantial, long-term harm to landscape character over 749 hectares in a sensitive location near the Cotswolds National Landscape. We consider compliance with Core Policy 51 ("*protect and enhance landscape character*") is impossible at this scale.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Applicant considers that although there are some short-term significant effects to the character of the landscape due to the change in land use caused by the infrastructure, there would also be permanent beneficial effects to the fabric of the land within the Order Limits as a result of the embedded mitigation measures which would contribute positively to the legacy landscape and be in line with Core Policy 51 and Wiltshire's Nature Recovery Strategy.
KMT-002	Ecology and Biodiversity	Ecological Surveys and Biodiversity Net Gain	Ecology and biodiversity: Surveys for key species and habitats are incomplete, particularly along the cable route corridor. We ask for a precautionary approach and enforceable commitments for biodiversity net gain and habitat protection.	The Applicant acknowledges that some areas within the Cable Route Corridor had not been subject to ecological survey at the point of finalising **the ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Since the preparation of the Chapter, habitat surveys have now been completed across all previously un-surveyed areas. The survey methodology applied was consistent with that reported in the **ES Volume 3, Appendix 9-1: Ecological Baseline Report [APP-198]** for the rest of the Cable Route Corridor. The results of these surveys have been reviewed and, in the Applicant's view, do not alter the conclusions of **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** regarding likely significant effects. The precautionary assumptions previously applied in the ES were conservative and appropriately accounted for any uncertainty associated with un-surveyed areas. The Applicant has **updated ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and provided a revised version at Deadline 1 with the findings of these surveys, and it is considered these do not materially change the assessment of likely significant effects presented in the chapter. The scope of ecological and species-specific survey within the Cable Route Corridor was defined using a proportionate, risk-based approach. Survey scope and effort across the Order Limits were targeted to areas and features where there was a reasonable likelihood of significant effects, rather than applied uniformly across the Order Limits irrespective of risk.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The assessment has had regard to the short-term, temporary and construction-phase nature of works within the Cable Route Corridor, the absence of permanent operational effects, and a robust appraisal of habitat suitability for species based on baseline habitats data collected through surveys. Based on this, a reduced survey effort within the Cable Route Corridor has been undertaken compared to the Solar PV Sites. Potential impacts within the Cable Route Corridor, including temporary habitat loss, disturbance and fragmentation, have been assessed on a precautionary reasonable worst-case basis. This assumes that construction works within the Cable Route Corridor will be progressive over the approximate 18-month construction period. Embedded mitigation and further controls secured through the **Outline EPMS [APP-284],** including pre-construction surveys and inspections, micro-siting of cabling works, appointment of an Ecological Clerk of Works and species-specific protection measures, where appropriate, provide a recognised mechanism for managing residual risk. Furthermore, reinstatement of any disturbed habitats will take place as a priority following construction within the Cable Route Corridor. The Scheme's baseline biodiversity units have been calculated with the use of the DEFRA published standardised Statutory Biodiversity Metric ('the Metric') and based on comprehensive habitat surveys undertaken by the Applicant's professional ecologists across the Order Limits, including the Cable Route Corridor. Details of the Scheme's approach to Biodiversity Net Gain (BNG) are provided in the **Biodiversity Net Gain Report [APP-273**] and the full BNG calculations are provided in a copy of the **Metric [APP-274],** and the calculations include habitats within the Cable Route Corridor. Whilst BNG for NSIPs such as the Scheme is not yet mandatory, the preparation, approval and implementation of the detailed Landscape and Ecological Management Plan,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				substantially in accordance with the **Outline Landscape and Ecological Management Plan [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified habitat creation and enhancement measures will be delivered and maintained throughout the lifetime of the Scheme. Furthermore Requirement 9 of the **Draft Development Consent Order [APP-016]** specifically secures the provision of a minimum 10% Biodiversity Net Gain.
KMT-003	Climate Change and Energy Need	Carbon Emissions	Carbon and climate considerations: While the scheme could deliver net carbon savings over its lifetime, construction emissions mean carbon break-even would not occur until 2076.	It is not clear how the 2076 year of offset conclusion has been reached. **ES Volume 1, Chapter 7: Climate Change [APP-059]**, demonstrates that there is an overall net saving as a result of the Scheme on GHG emissions compared to a without-Scheme scenario.
KMT-004	Climate Change and Energy Need	Heritage Assets	Heritage and archaeology: Potential harm to heritage assets such as Bradfield Manor and Rodbourne Conservation Area has been under-assessed and archaeological mitigation strategies remain incomplete.	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12.1: Heritage Statement [APP-219]**, has assessed the potential impact of the Scheme on built heritage assets, and where required appropriate mitigation has been proposed (see Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation). Site visits were undertaken with Historic England on the 28th March 2025 and the Wiltshire County Council Conservation Officer on the 11th April 2025, which included visiting land adjacent to Grade I Listed Bradfield Manor Farmhouse and Rodbourne Conservation Area. A second site visit with Historic England was undertaken in the grounds of Bradfield Manor Farmhouse on the 22nd of May 2025 (see table 12-2 in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**). Feedback provided during the site visits was used to inform the Scheme design and assessment provided in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064].**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				As stated in **ES Volume 3, Appendix 12.1: Heritage Statement [APP-219]** when considering the contribution of setting to the significance of the Grade I Listed Bradfield Manor Farmhouse (NHLE: 1198808), the asset is largely defined and experienced from within the Bradfield Manor Farmhouse grounds, in particular the walled courtyard to the south-west of the asset, where the full architectural interest of its south-facing primary elevation can be appreciated. Lime Down D is located within agricultural land to the north of asset. Following advise provided by Historic England panels in Field D5 were set back away from Grade I Listed Bradfield Manor Farmhouse and enhanced screening is proposed along existing hedgerows. Views of the proposed BESS and 400 kV Substation from Bradfield Manor Farmhouse will be largely mitigated by the proposed new woodland belt along the south-eastern boundary of Field D3 which, in combination with the existing woodland block west of D1 and south of D22, provides extensive screening in views to and from Bradfield Manor Farmhouse. It was identified that there would be a moderate / minor (not significant) adverse effect to the asset (less than substantial harm at the lower end in NPPF terms) as a result of indirect (i.e. setting) impacts. With consideration to Rodbourne Conservation Area, embedded mitigation including the removal of Fields E5 and E8 from the Scheme Order Limits, removal of panels from Fields E7, E9 and E10, offsets to the PROW and enhanced screening of existing hedgerows are considered sufficient mitigation to remove any adverse impacts to the Conservation Area. As stated in Section 3.7 of the **Outline Construction Environmental Management Plan [APP-277]**, construction traffic routes have been identified to avoid large increases in HGV movements near to heritage assets. Highway improvement works would cause at most temporary construction effects and would not result in harm to the Conservation Area's significance. Therefore, a neutral effect

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				was identified as a result of the Scheme to the Conservation Area. Photomontages produced as part of the **LVIA [APP-103 to APP-104]** were used to inform **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12.1: Heritage Statement [APP-219],** include both summer and winter photography and as such show seasonal screening differences. Additional Heritage viewpoints were used to inform the assessment, a list of these is provided in Annex E of **Appendix 12.1: Heritage Statement [APP-219].** The Applicant considers that this assessment approach is robust and appropriate. The **Outline Landscape and Ecological Management Plan [APP-227]**, sets out a framework for the planting, management and monitoring of landscaping mitigation, which is proposed as part of embedded mitigation for built heritage assets. Archaeological mitigation has been addressed through **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12.6 Outline Archaeological Mitigation Strategy [APP-230]**. The Outline AMS sets out a proportionate, staged approach to archaeological mitigation, including preservation in situ and Strip, Map and Record, where required, informed by the sensitivity of different areas of the Scheme. The use of an OAMS is appropriate at this stage, prior to detailed design, as it provides a secured framework for mitigation while allowing flexibility to respond to final construction parameters. The OAMS is secured through Requirement 12 of the draft DCO. SSWSIs will be prepared and appended to the OAMS to refine mitigation measures, in

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				agreement with WCAS, following confirmation of detailed design.
KMT-005	Transport and Access	Traffic Mitigation	Highways and transport: Concerns include inadequate mitigation for HGV movements on narrow rural roads and insufficient commitments for passing places. We also believe there insufficient control over the works on the public highway.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle along construction routes. This confirms that no passing bay or widening improvements are needed to accommodate these movements along construction routes outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 m. To provide further comfort, additional information will be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and that document will be resubmitted at Deadline 1 of Examination to demonstrate that there is adequate carriageway width and/or passing place opportunity for two HGVs when accessing Lime Down Site D. The Applicant considers that these are appropriate and adequate commitments for passing places and requirements. An **OCTMP [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. This includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. A final CTMP would be prepared post consent and must be substantially in accordance with the **OCTMP [APP-287]** and

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				approved by the relevant local planning authority (in consultation with the relevant highway authority and South Gloucestershire Council), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**. The Applicant considers that this provides appropriate and proportionate mitigation for HGV movements. The powers to undertake works on the public highway are contained within the DCO providing control over works in the highway. The details of these works, including traffic management and programme, will be agreed at the Technical Approval/detailed design stage and is a requirement of the DCO. Clarity on whether an access is temporary, permanent of semi-permanent is provided in Table 13-19 and Table 13-32 in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. Details as to the location of the construction compounds are provided in the **Land Plans [APP-006]** and **Works Plans [APP-007]** under Works Number 5A(v). They are located outside of the Highways extent and will be cited in those locations temporarily for the purpose of construction. All works in private land will be reinstated following completion of the works. Details relating to how the construction areas will be accessed are provided in **ES Volume 1, Chapter 13.10.63 [APP-065]**. The design of the access and egress from the highways will be completed in conjunction with the local highway as set out within the **Outline Construction Traffic Management Plan [APP-287]**.
KMT-006	Socio-Economics, Tourism and Recreation	Agricultural and Tourism Jobs	Economic and community impact: The scheme risks the loss of agricultural and tourism jobs, removal of 878 hectares of land from food production, as well as adverse	The Applicant confirms that land agreements are being made with landowners who have their own contractual arrangements with tenant farmers. The Applicant understands that these arrangements may involve the termination of agricultural tenancies at the discretion of the landowner.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			effects on local businesses and communities.	The Applicant is cognisant of the potential impact this may have and seeks to retain agricultural workers where possible, provide reskilling opportunities, or supporting re-employment, as secured through the **Outline Skills, Supply Chain and Employment Plan [APP-285]** and Requirement 18 in Schedule 2 of the **Draft DCO [APP-016]**. The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers baseline tourism activity, visitor attractions, recreational assets, tourism-dependent businesses, and whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs during operation. This is a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant is discussing the approach to assessing tourism impacts with Wiltshire Council's Economic and Regeneration Team and this discussion is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The likely effects of the Scheme on the local economy and employment are also assessed in **ES Volume 1, Chapter 16: Socio-economics, Tourism and Recreation [APP-068]**, with supporting evidence in **ES Volume 3, Appendix**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]. This assessment considers construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions across construction, operation and decommissioning. The assessment concludes that effects on the local economy are negligible to minor beneficial, with construction expenditure and employment generating positive, temporary effects. It concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply chain opportunities, are expected during construction, with more modest economic, skills and supply chain opportunities during operation. The approach to assessing socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the Team as recorded in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period. The assessment identifies that land would be removed from arable rotation for the operational life of the Scheme, anticipated to be approximately 60 years, but that, although the primary agricultural use would cease during this period, the soil and land resource would be retained and would continue to fulfil ecological functions. Reduced

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				disturbance during operation allows soils to recover from previous intensive agricultural use, with benefits to soil structure and soil biology over time. All land is to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated.
KMT-007	Landscape and Visual	Landscape Character	Landscape and visual impact: The project would cause substantial, long-term harm to landscape character over 749 hectares in a sensitive location near the Cotswolds National Landscape. We consider compliance with Core Policy 51 ("*protect and enhance landscape character*") is impossible at this scale.	It is recognised that the Scheme is within the setting of the Cotswolds National Landscape (CNL) . Although there are no direct impacts on the CNL, the effects of the Scheme are fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term harm to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				(as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process, to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, as shown in the **Work Plans [APP-007]**, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant considers that although there are some short-term significant effects to the character of the landscape due to the change in land use caused by the infrastructure, there would also be permanent beneficial effects to the fabric of the Site as a result of the embedded mitigation measures which would contribute positively to the legacy landscape and be in line with Core Policy 51 and Wiltshire's Nature Recovery Strategy.
KMT-008	Climate Change and Energy Need	Carbon Emissions	Carbon and climate considerations: While the scheme could deliver net carbon savings over its lifetime, construction emissions mean carbon break-even would not occur until 2076.	**ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. The carbon payback period occurs within the operational lifetime of the Scheme and substantially earlier than 2076. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				UK's legally binding carbon budgets and transition to net zero.
KMT-009	Cultural Heritage	Heritage Assets	Heritage and archaeology: Potential harm to heritage assets such as Bradfield Manor and Rodbourne Conservation Area has been under-assessed and archaeological mitigation strategies remain incomplete.	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **Volume 3, Appendix 12.1: Heritage Statement [APP-219]**, assessed the potential impacts of the Scheme on Rodbourne Conservation Area and the Grade I Listed Bradfield Manor Farmhouse (NHLE: 1198808). With consideration to Rodbourne Conservation Area, embedded mitigation secured through Requirement 12 of the DCO including the removal of Fields E5 and E8 from the Scheme Order Limits, removal of panels from Fields E7, E9 and E10, offsets to the PROW and enhanced screening of existing hedgerows are considered sufficient mitigation to remove any adverse impacts to the Conservation Area. Therefore, no impact was identified as a result of the Scheme to the Conservation Area. As stated in **Appendix 12.1: Heritage Statement [APP-219]** when considering the contribution of setting to the significance of Bradfield Manor Farmhouse, the asset is largely defined and experienced from within the Bradfield Manor Farmhouse grounds, in particular the walled courtyard to the south-west of the asset, where the full architectural interest of its south-facing primary elevation can be appreciated. Lime Down D is located within agricultural land to the north of asset. Following advice provided by Historic England, panels in Field D5 were set back away from Grade I Listed Bradfield Manor Farmhouse and enhanced screening is proposed along existing hedgerows. Views of the proposed BESS and 400 kV Substation from Bradfield Manor Farmhouse will be largely mitigated by the proposed new woodland belt along the south-eastern boundary of Field D3 which, in combination with the existing woodland block west of D1 and south of D22, provides extensive screening in views to and from Bradfield Manor Farmhouse. It was identified that there would be a moderate / minor (not significant) adverse effect to the asset (less than

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				substantial harm at the lower end in NPPF terms) as a result of indirect (i.e. setting) impacts.
KMT-010	Transport and Access	Traffic Mitigation	Highways and transport: Concerns include inadequate mitigation for HGV movements on narrow rural roads and insufficient commitments for passing places. We also believe there insufficient control over the works on the public highway.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]** . The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
KMT-011	Socio-Economics, Tourism and Recreation	Agricultural and Tourism Jobs	Economic and community impact: The scheme risks the loss of agricultural and tourism jobs, removal of 878 hectares of land from food production, as well as adverse effects on local businesses and communities.	The Applicant confirms that land agreements are being made with landowners who have their own contractual arrangements with tenant farmers. This may, therefore, involve the termination of agricultural tenancies at the discretion of the landowner. The Applicant is, however, cognisant of the impact this may have and so seeks to source ways of retaining agricultural workers, providing reskilling opportunities, or providing re-employment opportunities as secured in the **Outline Skills, Supply Chain and Employment Plan [APP-285].** The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant is discussing the approach to assessment of tourism impacts with Wiltshire Council's Economic and Regeneration Team and those discussions will be set out in the Statement of Common Ground to be submitted at Deadline 1.**]** An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is still discussing with the team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025).It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2024) states that solar development is not considered to compromise food security, and that climate change itself poses the greatest

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				long-term risk to food production - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. Post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed; the landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Whilst there is an environmental and economic cost to importing food, and it is recognised the UK imports a far greater amount of food than it exports, the impact of the Scheme on food import requirements or the food and drinks economy is not material at a national scale and has therefore not been assessed.

4.19 W H P Renovations Ltd

Table 4-19 RR-4880

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WHPR-001	Transport and Access	Road Infrastructure	W H P Renovations Ltd undertake many property renovations in and around the proposed site area. The solar farm would have the following effects on our business: 1, the roads in the area are predominantly narrow, winding, often single lane and often severely potholed. Many years of construction traffic would put an intolerable pressure on this fragile infrastructure, having a knock on effect on our journey times and ease of access to many sites.	The Applicant has assessed the likely impacts of construction traffic movements on the local highway network in **ES Volume 1 Chapter 13: Transport and Access [APP-065]** and finds there are no significant adverse effects to driver delay or highway safety, subject to implementation of the **OCTMP [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. As no significant effects to travelling on the local highway network is anticipated, no subsequent significant effect on business users of the highway network is expected.
WHPR-002	Socio-Economics, Tourism and Recreation	Property Values	2, If this area of the Southern Cotswolds were to become blighted by solar panels I believe property values in the area would be depressed and transactions stagnate. Our business is reliant on a buoyant property market and confident property owners wishing to invest in their properties, not worrying about falling values.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].** As a result, other impacts on the local property market have not been assessed either. Notwithstanding, the Applicant has sought to minimise impacts upon residential properties and residential amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant has also assessed likely impacts on community and social wellbeing, and on the impacts of the Scheme on sense of community and sense of place (under then assessment category 'community identity, culture, resilience and influence') in **ES Volume 1 Chapter 18: Human Health [APP-070]**. The assessment concludes that there are no significant adverse effects anticipated to population and community or social health and wellbeing.
WHPR-003	Site Selection and Alternatives	Rooftop Solar	3, Working within the property industry I find it bizarre that it isn't a stipulation of residential	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
	Soils and Agriculture		development planning that every property should have roof top panels. Why on farmland not rooves, both residential and commercial.	considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects (see conclusions below) arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in ES Chapter 17, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in ES Chapter 17, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (ES Chapter 17, Sections 17.10 and 17.12). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution and in the Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.

4.20 Wildnature Rites of Passage CIC

Table 4-20 RR-4897

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WRPCIC-001	Description and DCO Process	Introduction	I am registering to participate in the examination because the proposed development would have a direct and significant impact on my day-to-day life, my work, and a community interest company (CIC) that I run, which operates in woodland close to the proposed site near Foxley. I am a director of Wildnature Rites of Passage, a Community Interest Company that delivers rites of passage camps for under-privileged teenage boys. These camps take place in woodland close to the proposed development area and rely fundamentally on quiet, intact natural environments, dark skies, wildlife presence, and a sense of remoteness and immersion in nature.	The Applicant has sought to minimise environmental effects to the Scheme in relation to noise, visual impacts, and ecology, and has set out specific mitigation measures to minimise effects from the Scheme's construction in the **OCEMP [APP-277]**. These measures are secured by the Requirements in Schedule 2 to the **Draft DCO [APP-016]**. The location of the Wildnature Rites of Passage campsite has not been made publicly available, and as such, the Applicant cannot make location specific comments. That notwithstanding, the Applicant confirms Lime Down B is the closest of the Solar PV Sites to the village of Foxley, and following comments have been made on that basis of impacts on Foxley village in a generalised sense.
WRPCIC-002	Human Health	Impact on Mental Health and Wellbeing	Impact on wellbeing, mental health and vulnerable young people The camps are designed specifically to support boys who are often struggling with: - anxiety and poor mental health, - lack of stable male role models, - disconnection from education and society, - limited access to safe green spaces. A core element of the programme is	The Applicant is confident that the mitigation measures set out for construction and during the operational lifetime of the Scheme, as secured through the relevant requirements in Schedule 2 to the **Draft DCO [APP-016]** are sufficient to ensure no significant adverse effects occur to the business or community service operated by Wildnature Rites of Passage CIC. Population-scale assessments of impacts to socio-economic conditions and human health and wellbeing are set out in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 1 Chapter 18: Human Health [APP-070]** respectively. Neither assessment finds significant adverse effects to people's lives and livelihoods as a result of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			deep nature connection, including silence, night-time experiences, wildlife awareness, and mentoring activities that depend on an undisturbed natural setting. The proposed development would materially affect this by: - introducing visual intrusion into a currently rural and natural setting, - increasing background noise (including construction activity and long-term operational noise), - reducing perceived safety and seclusion, - altering wildlife behaviour and presence, - increasing light pollution at night. These impacts would undermine the therapeutic and developmental value of the camps and reduce their effectiveness for vulnerable young people who already have limited opportunities.	The Scheme's impacts on wildlife are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061**], which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on wildlife are anticipated. This is further discussed below.
WRPCIC-003	Landscape and Visual	Impact on Landscape Characer	Loss of quiet, dark, and natural character essential to the camps The woodland location near Foxley is chosen deliberately because it provides: - quiet away from roads and development, - dark skies and low artificial	Sound propagation from the Scheme has been modelled under the reasonable worst-case of moderate downwind conditions and, as evidenced by **Figure 14-2 Daytime Operational Noise Contours [APP-160],** Figure 14-3 **Night-time Operational Noise Contours [APP-161]** and Tables 8 and 9 in **Appendix 14-4 Noise Modelling [APP-237],** levels in the area near Foxley would be below the existing background

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			lighting, - intact habitats where wildlife is present and observable, - a sense of continuity with nature that is increasingly rare. These qualities are not incidental; they are central to the programme's outcomes. The proposed development would fundamentally change the character of the area, even if located some distance away, because: - sound carries widely across open countryside, - night-time lighting affects large areas beyond the site boundary, - perceptions of enclosure and remoteness are easily lost, - cumulative change erodes the sense of being in nature This would directly affect my ability to run the camps as they are currently designed.	sound. As such the quiet character of the area would not be impacted by the Scheme. With reference to operational lighting: Lighting is not required within the Solar Arrays for the operational phase. Motion sensing security lighting will be provided within substations and within the BESS to be used only for maintenance and security purposes. Standard good practice measures would be employed to minimise light spill, including glare during construction, operation and decommissioning. Refer to section 3.5.12 in Chapter 3 of the **ES: The Scheme [APP-055]** for more information on operational lighting. The **LVIA [APP-060]** robustly assesses both the landscape and visual effects of the Scheme independently to ensure both the impacts and effects on the fabric and character of the landscape are taken into account as well as the views and visibility. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. Mitigation measures set out in the assessment are proposed to safeguard habitats and species, and avoid disturbance and displacement of wildlife. These include protective buffers around important habitats (such as woodlands, hedgerows and ponds), species-specific mitigation, and pollution prevention controls which will be secured via the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]** The Scheme will create and enhance a range of habitats, such as woodlands, hedgerows and ponds, that will benefit a wide range of wildlife present in the area, as well as strengthen connective links to habitats within the Scheme and in the wider

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				landscape. A comprehensive package of habitat creation and enhancement measures are shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283**].
WRPCIC-004	Socio-Economic, Tourism and Recreation	Impact on Livelihoods	Impact on my day-to-day work and livelihood My day-to-day life involves: - preparing and running camps on site, - working outdoors with groups of young people, - facilitating activities that depend on calm, natural surroundings, - managing safeguarding and emotional wellbeing in a controlled, peaceful environment. The proposed development would introduce unpredictable disturbances (construction phases, traffic, visual change) that would: - disrupt programme delivery, - require changes to safeguarding and risk management, - potentially make the location unsuitable for certain activities, - reduce demand for the camps from referring organisations. This represents a direct impact on my work and the viability of a community service, not an abstract concern.	The Applicant is confident that the mitigation measures set out for construction and during the operational lifetime of the Scheme, as secured through the relevant requirements in Schedule 2 to the **Draft DCO [APP-016]** are sufficient to ensure no significant adverse effects occur to the business or community service operated by Wildnature Rites of Passage CIC. Impacts on an individuals livelihood have not been assessed as this is disproportionate to assessment of the Scheme. That notwithstanding, population-scale assessments of impacts to socio-economic conditions and human health and wellbeing are set out in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 1 Chapter 18: Human Health [APP-070]** respectively. Neither assessment finds significant adverse effects to people's lives and livelihoods as a result of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WRPCIC-005	Cumulative and In-Combination Effects	Other Proposed Developments in the Vicinity	Cumulative impact with other proposed development The proposed development must also be considered in combination with: - nearby housing growth, - increased traffic and infrastructure pressure, - other land-use changes in the are. Individually, developments may be presented as limited in impact, but cumulatively they risk the gradual loss of the very landscapes that support wellbeing, biodiversity and community-based initiatives like ours. There is currently no clear assessment of how cumulative landscape, noise, lighting and ecological impacts affect non-statutory but socially valuable uses of the countryside, such as outdoor education, mentoring and nature-based wellbeing services.	Cumulative assessment is a key and important part of the DCO submission. A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21 [APP-074]** and associated Appendices **[APP-264]**. Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **Environmental Statement Chapter 21 In-Combination and Cumulative Effects [APP-073]**. Existing schemes are captured within the baseline environment. The four stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6 EIA Methodology [APP-058]**. 358 developments were included in the Long List **[APP-264]**. 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level.
WRPCIC-006	Landscape and Visual	Impact on Landscape	Planning balance and public interest While I recognise the importance of	The Applicant is confident that the assessment of socio-economic effects in **ES Volume 1 Chapter 16: Socio-**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
	Socio-Economics, Tourism and Recreation	and Local Community	renewable energy and infrastructure, I believe the planning balance must also consider: - the social value of quiet rural landscapes, - the role of nature-based programmes in supporting vulnerable young people, - the increasing scarcity of places where deep nature connection is possible, - the loss of community-led, preventative wellbeing initiatives if such environments are degraded. Once the character of this landscape is changed, it cannot realistically be restored for these purposes.	**Economics, Tourism and Recreation [APP-068]** and to human health and wellbeing in **ES Volume 1 Chapter 18: Human Health [APP-070]** robustly and proportionately set out the likely significance of effects on people as a result of the Scheme. The Applicant is therefore confident that this means there are no significant adverse effects anticipated to the users or operators of Wildnature Rites of Passage CIC. The Scheme provides extensive mitigation and management measures to protect the character of the quiet rural landscape which are embedded within the Scheme. This includes general offsets / buffers to infrastucture, new tree, hedgerow and woodland planting, new wildflower meadows and margins, and riparian corridors within the Scheme as set out in Section 8.9 of the LVIA in **ES Volume 1, Chapter 8: Landscape and Visual Impact [APP-060].**
WRPCIC-07	Socio-Economic, Tourism and Recreation	Conclusion	Conclusion The proposed development would have a real, tangible and negative impact on: - my day-to-day life, - my work running a CIC for vulnerable young people, - the wellbeing of the boys who attend our camps, - and the quiet natural environment on which the programme depends. For these reasons, I wish to participate in the examination and ask that the Planning Inspector gives full weight to the social, wellbeing and	The Applicant is confident that the assessment of socio-economic effects in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and to human health and wellbeing in **ES Volume 1 Chapter 18: Human Health [APP-070]** robustly and proportionately set out the likely significance of effects on people as a result of the Scheme. The Applicant is therefore confident that this means there are no significant adverse effects anticipated to the users or operators of Wildnature Rites of Passage CIC.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			community impacts of the proposal, alongside environmental and technical considerations.	

4.21 Atlantis AV Solutions

Table 4-21 RR-0434

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
AVAS-001	Description and DCO Process	Introduction	Introduction and Business Interest Atlantis AV Solutions Ltd is a locally based rural business operating in and around North Wiltshire. We design, supply and maintain high-quality audio-visual, connectivity and control systems for private homes, farms, equestrian businesses and small commercial premises across the surrounding villages, including Foxley, Norton and neighbouring communities. Our business is rooted in this landscape. We rely on the rural character of the area, the quality of life it offers to staff, and the continued attractiveness of the countryside to residents, landowners and businesses who choose to live and invest here.	The Applicant notes this comment.
AVAS-002	Socio-Economics, Tourism and Recreation	Rural Environment and Business Sustainability	Rural Environment and Business Sustainability Our ability to recruit and retain skilled staff depends heavily on the quality of the local environment. Many of our employees choose to work for a rural business precisely because it offers peace, safety, and a working life that is not dominated by industrial noise, traffic or visual intrusion. The countryside around Lime Down is not a backdrop; it is a working environment that supports small	The Applicant has assessed effects on the landscape character and visual surroundings of the Scheme in **ES Volume 1, Chapter 8: Landscape and Visual Impact [APP-060]**. While the assessment has concluded significant adverse effect to specific views, no significant effect to the landscape character is anticipated as a result of any phase of the Scheme. The assessment of economic impacts from the Scheme in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** has largely been undertaken at an industry-level rather than individual businesses, which is considered a proportionate approach given the scale of the Scheme. The Applicant has aimed to provide a robust assessment of

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			businesses, farming, tourism, equestrian activity and professional services. The introduction of industrial-scale energy infrastructure would permanently change that environment, making it less attractive for both employees and clients. Once an area becomes defined by large-scale infrastructure, fencing, substations, lighting and service roads, it loses the very qualities that underpin rural enterprise. This has long-term implications for local economic resilience that are rarely reversed.	impacts to tourism and recreation, and to local employment in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. These impacts are not considered significant, accounting for approximately 0.17% of tourism-dependent employment across Wiltshire (29,000 estimate from Visit Wiltshire, 2021) and less than 0.29% of agricultural employment in Wiltshire (BRES, 2023). Additional mitigation measures have been secured through the **OCTMP [APP-287]**, **OPROWPPMP [APP-282]** and the **OSSCEP [APP-285]**. Together these seek to reduce these losses to tourism through mitigating traffic impacts, impact to PRoW, and focussing on local recruitment, promoting local suppliers where practicable, and through providing retention and retraining opportunities for workers in agriculture and tourism-dependent industries. These measures are secured by the relevant requirements in Schedule 2 to the **Draft DCO [APP-016]**.
AVAS-003	Site Selection and Alternatives Landscape and Visual	Scheme Location	Principle, Scale and Location Atlantis AV Solutions Ltd supports renewable energy in principle. We regularly install and integrate solar, battery and energy-management systems for private clients and understand the importance of the transition to low-carbon power. However, support for renewable energy does not imply support for inappropriate siting. The Lime Down proposal represents industrial-scale infrastructure spread across approximately 1,300 acres of open countryside. This is not small-scale rural diversification, but a fundamental change in land use.	National Policy Statement for renewable energy infrastructure (EN-3) Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Section 7 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			The scale, intensity and permanence of the proposal are incompatible with the existing rural economy, which is based on agriculture, small businesses, tourism, heritage and high-quality residential use.	As set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report **at ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation (being the grid connection point for the Scheme) has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
AVAS-004	Socio-Economics, Tourism and Recreation	Cumulative Impacts of Projects on Local Business	Cumulative Impact on Rural Business This proposal must be considered in the context of the cumulative impact of solar development across Wiltshire. The county has already absorbed a significant amount of ground-mounted solar infrastructure, much of it concentrated in rural locations. From a business perspective, the cumulative effect is not theoretical. It manifests in increased traffic, fragmented landscapes, loss of visual quality, and gradual industrialisation of areas that previously supported diverse rural enterprise. Lime Down is exceptionally large. Its impacts, including construction traffic, visual intrusion, noise, flood risk and disruption associated with a long cable route, would not merely add to existing pressures but significantly intensify them. The burden placed on rural infrastructure, roads and communities risks becoming unsustainable. For local businesses, this creates uncertainty and discourages investment.	A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out **within ES Volume 1, Chapter 21 Cumulative and In-combination Effects [APP-073] and associated Appendices [APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073]**. Existing schemes are captured within the baseline environment in each of the technical assessments. The four-stage cumulative assessment methodology is described **within ES Volume 1, Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the **Long List [APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. With specific regard to the cumulative effects of the Scheme on economic conditions for local businesses, the assessment in Section 16.13 of **ES Volume 1, Chapter 16: Socio-**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Economics, Tourism and Recreation [APP-068] identifies that where cumulative impacts to tourism and recreation receptors may have an increased effect on local businesses, this is not anticipated to be of any greater significance than the Scheme assessed in isolation. As such, no cumulative significant adverse effect to local businesses has been assessed as likely to occur at any phase of the cumulatively assessed developments.
AVAS-005	Other Environmental Matters	BESS	Battery Energy Storage System (BESS) and Business and Operational Risks The inclusion of a large-scale Battery Energy Storage System introduces additional concerns from a business and operational standpoint. BESS facilities carry well-documented risks associated with thermal runaway and fire. Evidence from incidents elsewhere shows that such fires can be prolonged, difficult to extinguish, and require significant emergency response resources. In rural areas with limited fire-fighting capacity, this represents a non-trivial risk. There is also the potential for hazardous runoff resulting from fire suppression or battery damage, with implications for land, watercourses and downstream users. Any contamination event would have consequences not just for agriculture but for rural businesses operating nearby.	The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown **on ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081],** the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant is currently discussing the approach to BESS safety with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and this discussion will be set out in the relevant Statement of Common Ground to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the **OBSMP [APP-286]** confirms that at the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			In addition, BESS installations rely on continuous cooling systems involving fans and electrical equipment operating day and night. This introduces constant mechanical and tonal noise into environments that are currently extremely quiet. For businesses like ours, which operate in close relationship with residential and rural settings, the introduction of persistent background noise undermines amenity, staff wellbeing and the overall quality of the working environment.	detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out in the **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the **OBSMP [APP-286]** specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072],** Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided **in ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]** — including advice

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery Safety Management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the **OBSMP [APP-286]**. The **Draft DCO [APP-016]** also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. Potential effects of the Scheme on water quality and contamination risk are assessed in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**, which considers pollution pathways to surface water and groundwater during both construction and operation. The Scheme incorporates sealed and isolatable drainage principles for the BESS and substations to ensure that operational spillages or firewater can be contained and managed without discharge to the surrounding environment. In the event of an incident, drainage isolation measures allow potentially contaminated water to be retained on site and tested prior to any controlled release or removal by a licensed waste contractor. These principles are consistent with the approach described in the **OBSMP [APP-286]** and will be further developed through the detailed drainage design secured through the DCO discharge process. The Applicant notes that it is discussing the approach to pollution resulting from battery fire is with both the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Environment Agency and the Lead Local Flood Authority (LLFA) and this discussion will be set out in the relevant Statements of Common Ground to be submitted at Deadline 1. Mitigation measures to control contamination risk during construction are set out in the **Outline Construction Environmental Management Plan [APP-277].** Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a Construction Environmental Management Plan substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277]** is secured through Requirement 13 in Schedule 2 of **the Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are appropriately managed throughout construction of the Scheme. The noise impacts from the operation of the Scheme and its components, including the BESS, are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066],** with supporting modelling provided **in ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers operational noise from all Scheme infrastructure, including the BESS, using realistic worst-case design parameters.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				A penalty has been applied to predicted noise levels from the Scheme infrastructure to account for the distinctive nature of the sound. Tonal noise would be associated with the substation transformers but noise from the transformers is expected to be well below that of other sources at all residential dwellings. The Applicant notes that the approach to noise from BESS has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066].** Potential mitigation measures are detailed in Section 14.9 **of ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with these measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides reassurance that significant effects from operational noise will be avoided while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline operational environmental management plan, is secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise from the BESS and other Scheme components is appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Impacts on mental health and wellbeing, in respect of noise as a result of impacts on amenity, have been assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]** and find that no significant effects to mental health and wellbeing are anticipated as a result of any phase of the Scheme.
AVAS-006	Transport and Access	Transport, Construction and Disruption	Transport, Construction and Disruption The proposed level of construction activity, involving approximately 20,000 vehicle movements, would place heavy pressure on rural roads that are not designed for sustained HGV traffic. Disruption of this scale affects business operations directly: delayed travel times, reduced reliability for site visits, increased safety risks, and damage to roads that serve farms, homes and local enterprises. These impacts extend well beyond the construction site itself and would persist for years.	The potential effects of construction traffic on the local highway network are assessed **in ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. The operational period is for up to 60 years. During the operation and maintenance phase, there are anticipated to be around five visits to each Solar PV Site per month for maintenance purposes. These would typically be made by light van or 4 x 4 type vehicles. There will be occasional trips to the proposed habitat areas within the Solar PV Sites for operational and maintenance purposes. These would typically be made by light van or 4 x 4 type vehicles and will use the existing field access locations detailed in Table 3-5 **of ES Volume 1, Chapter 3: The Scheme [APP-055] shown in ES Volume 2, Figure 13-13: Operational Only Access Locations: Solar PV Sites [APP-158].** Vehicle trip generation associated with these access locations will be the same or lower than the existing agricultural use. There will be no transport operation effects associated with the installed Grid Connection Cables (within the Cable Route Corridor) as they will be located underground. Access may

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				be required for maintenance, but this is only likely once or twice a year. In light of this, effects on severance, driver delay, NMU delay and amenity, road safety and hazardous loads during the operation and maintenance phase of the Scheme are considered to be negligible or not significant. The effects will be long-term, as the design life of the Scheme is anticipated to be 60 years The construction period set out in **ES Volume 1, Chapter 13: Transport and Access [APP-065]** is two years and the impact is summarised below. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				[APP-287], are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065],** which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided **in ES Volume 3, Appendix 13-1: Transport Assessment [APP-233],** which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065],** which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3,**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Appendix 13-1: Transport Assessment [APP-233], which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by WC. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan (OCTMP) [APP-287]** , which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring construction traffic is managed safely and impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
AVAS-007	Description and DCO Process	Conclusion	Conclusion I have already written in a personal capacity but as MD of my business I confirm that Atlantis AV Solutions Ltd is not opposed to renewable energy, nor to progress. We are, however, opposed to development that is in the wrong place, at the	The Applicant is confident that the assessment undertaken in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** has been undertaken in a robust manner and has sufficiently considered the Scheme's likely effects on local economic conditions. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			wrong scale, and with impacts that undermine the long-term viability of rural communities and businesses. The Lime Down proposal represents industrial-scale infrastructure imposed on a landscape whose value lies in its tranquillity, productivity and diversity of use. The cumulative effects on agriculture, transport, landscape character, noise, safety and business confidence weigh heavily against consent. From a local business perspective, this proposal threatens the very conditions that allow rural enterprise to function and grow. For these reasons, Atlantis AV Solutions Ltd believes that the Development Consent Order should be refused. Thank you for considering this representation.	decommissioning. The assessment does not anticipate that the Scheme will generate any significant adverse effects to any industry or economic sector at any phase of the Scheme.

4.22 Wiltshire Ramblers

Table 4-22 RR-4935

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WR-001	Description and DCO Process	Introduction	I refer to my submission in a personal capacity to the non-statutory consultation by the Lime Down Solar Farm (LDSF), which I provided on 25 April 2024, and to my submission on behalf of the Wiltshire Ramblers to the statutory consultation by the LDSF, which I provided on 19 March 2025.	The Applicant acknowledges the submissions made in a personal capacity during the non-statutory consultation on 25 April 2024 and on behalf of the Wiltshire Ramblers during the statutory consultation on 19 March 2025. The representation submitted during the non-statutory consultation is recorded and summarised within the **Stage 1 Consultation Summary Report [APP-022]**, and the representation submitted during the statutory consultation is recorded and addressed within the **Consultation Report [APP-031],** which sets out how feedback received has been taken into account in the development of the Scheme.
WR-002	Description and DCO Process	Introduction	In the latter submission I merely advised that we agreed with the detailed response made by the Wiltshire branch of the British Horse Society (BHS).	The Applicant has provided a detailed response to BHS's Relevant Representation, see Applicant's Response to RR-4647.
WR-003	Description and DCO Process	Introduction	I now refer to the response made on 2 January 2026 by the BHS in connection with LDSF's application to the Planning Inspectorate (PINS) for a Development Consent Order to be made. Wiltshire Ramblers again confirm that we agree with the comments made by BHS, which are essentially a summary of its previous responses.	The Applicant has provided a detailed response to BHS's Relevant Representation, see Applicant's Response to RR-4647.
WR-004	Landscape and Visual	Impact on Landscape Character	As a summary of our own position on the application, in our view: • We are strongly opposed to the whole project, which will convert a peaceful rural community into an	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			industrial zone, and will have a markedly negative effect, primarily on the inhabitants of the huge area to be covered by the LDSF, but also on those in the surrounding area	As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.
WR-005	Description and DCO Process	Alternative Methods of Clean Energy	• We are of course aware of the need to maximise the provision of clean electricity because of climate change but believe that there are other, better methods of achieving this aim than the creation of gigantic solar farms.	The **Statement of Need [APP-266]** describes that there is an urgent and unprecedented need for new low carbon generation in the UK to meet our climate change, energy security and affordability targets. Further, the Government considers that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Further, Section 2.9 of the **Statement of Need [APP-266]** describes that the government is seeking a large capacity of new low carbon schemes to come forwards to prioritise projects needed for 2030, while maintaining a robust pipeline of projects beyond 2030 towards meeting net zero by 2050.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The government's Clean Power 2030 Action Plan (December 2024) includes technologies prioritised for 2030 and which are considered to be important to developing a robust pipeline of projects for delivery after 2030, including wind, solar, nuclear, hydro and abated thermal generation. The Applicant considers that nuclear and abated thermal generation are not suitable to be deployed at this location in similar timeframes to the Scheme, if at all. Offshore wind is also clearly not applicable due to the landlocked location of the Scheme. No large nearby river courses could offer a hydro scheme of a similar scale to the Scheme. Section 6.7 of the **Statement of Need [APP-266]** demonstrates that at a large-scale scheme level, the amount of electricity generated from an onshore wind scheme per year per acre of that scheme is similar to the amount of electricity generated from a large-scale solar scheme, and the indicative design of this Scheme specifically leads to a land-take ratio which lies within the guideline range of 2 – 4 acres per MW of output for the solar and related infrastructure, as set out at NPS EN-3 (2023) Paragraph 2.10.17. The Scheme is also therefore within the guideline range of 4 – 5.6 acres per MW of output as updated in NPS EN-3 (2025) Paragraph 2.10.9. The Scheme has received notification that, as part of NESO's connection queue reprioritisation process, the solar component of the scheme has been re-prioritised as a Gate 2 Phase 1 connection (i.e. connecting in 2030 or earlier) and that the BESS component of the Scheme has been re-prioritised as a Gate 1 connection. The indicative connection date of the BESS has not yet been confirmed. National Policy Statement EN-1 also states that the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Secretary of State should assess all applications for development consent for the types of infrastructure included by the NPS (including solar) on the basis that there is demonstrated urgent need for them, that substantial weight should be given to this need, and that the Secretary of State is not required to consider the specific contribution of any individual project to be satisfied that need is established [EN-1 Paras 3.2.6 - 3.2.8]. This representation goes to the merits of the NPS, and to have regard to it would be directly in contradiction of NPS EN-1 (in particular the paragraphs cited above that make clear that the need is established and that there is no requirement to consider the contribution of individual projects). The determination of the Applicant's DCO Application is not the means by which to challenge the provisions of the NPS, and it is for this reason that the ExA and SoS are able to disregard this representation and any similar others, pursuant to sections 87, 94 and 106 of the Planning Act 2008 during the examination of the Application and when determining the Application.
WR-006	Cumulative and In-Combination effects	Other Solar Projects in the Vicinity	Wiltshire apparently already contains 8 out of the 10 largest solar farms in the country and we question the need for another very large one.	Cumulative effects with other projects has been carefully considered as part of the Scheme with other projects, both existing and proposed, taken into account. In terms of the Lime Down project, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated Appendices **[APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073].** Existing schemes are captured within the baseline environment. The four-stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the Long List **[APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Table 21-8 within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073] identifies that,** taking a conservative worse case approach, significant cumulative effects with the short list of developments are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.
WR-007	Soils and Agriculture	Agricultural Land	The LDSF project will be built on productive farmland which we can ill afford to lose	The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (ES Chapter 17, Sections 17.10 and 17.12).
WR-008	Socio-Economics, Tourism and Recreation	PRoWs	We do not agree with your astonishing claim that the project will have no significant impact on users of the Public Rights of Way (PRoW) within and around it. During the two-year construction period they will suffer significant damage, and any users of the PRoW will be at	The Applicant has assessed the likely effects to PROWs within a 2 km Study Area surrounding the Scheme's Order Limits. While **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** has summarised the effects on the PROW network as not being significant at any phase of the Scheme, this is an overall assessment and accounts for the proportion of significant vs non-significant effects across the assessed area. This also considers the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			constant risk of coming into contact with noisy machinery.	embedded and additional mitigation measures set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. A more detailed route-by-route assessment is undertaken in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**, which identified residual significant effects to a small number of PROWs at Lime Down E, where construction and decommissioning effects cannot be mitigated to below a significant level, and as such will have to be considered as part of the planning balance in determining whether or not consent should be granted.. This also sets out the anticipated type of effect to each assessed PROW route at each phase of the Scheme, and what mitigation measures have been secured for it.
WR-009	Socio-Economics, Tourism and Recreation	PRoWs	After this they are likely to find that their chosen PRoW go through field after field full of solar panels and are flanked by high fences which will destroy the present views. Use of PRoW is likely to diminish dramatically, with the resulting risk that they will become overgrown and lost long before the solar park is decommissioned	The Applicant understands the importance of PROWs for recreation and their benefit to physical and mental wellbeing. Whilst the user experience will be different to current conditions, the planting of landscape and ecological mitigation, and the provision of permissive paths to improve connectivity is anticipated to go a substantial way to improve user experience and maintain the number of users of the affected PROWs. These measures are shown on **ES Volume 2, Figures 3-4-1 to 3-4-5.2 [APP-084]** and secured through the **OLEMP [APP-283]** by Requirement 7 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant is committed to ensuring PROWs are kept to a good standard throughout the Scheme's operational lifetime, as maintenance of public rights of way within land under freehold acquisition by the Applicant is their responsibility to maintain, and is secured through the **OPROWPPMP [APP-282]** by Requirement 16 in Schedule 2 to the **Draft DCO [APP-016]**. Furthermore, fencing is not proposed within 15 m of the centreline of existing PROWs. The majority of site

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				fencing is to consist of 2 m deer stock fencing. This is secured in the **OPROWPPMP [APP-282]** This is to control large mammalian movements and provide a visual deterrent to entering the Solar PV Array areas, whilst maintaining a more open aspect for PROW users.
WR-010	Socio-Economics, Tourism and Recreation	PRoWs	• We note from the Permissive Paths Management Plan that it is intended to provide permissive paths for PRoW users during and after the period of construction. Like the BHS, we are not in favour of permissive routes. As they can be withdrawn, temporarily or permanently, at any time, and are not usually shown on either the definitive map or the Ordnance Survey maps. Dedication of such permissive routes by the landowners wold clearly define responsibilities for their enforcement and maintenance	The Applicant has committed to the provision of permissive paths to improve connectivity across the existing PROW network. The operation of permissive paths is set out in the **OPROWPPMP [APP-282]** and secured by Requirement 16 in Schedule 2 to the **Draft DCO [APP-016]**. This commits to ensuring these routes are kept open and well maintained throughout the operational lifetime of the Scheme. The Applicant accepts that the provision of permissive paths is less preferential than new rights of way; however, this comes as a result of practical limitations of the Scheme. As the Scheme's operational lifetime is no more than 60 years, this is temporary (albeit long-term), and the **Draft DCO [APP-016]** commits to the requirement for the decommissioning of the Scheme and restoration of the land back to agricultural use. As part of that agreement, any permissive access to the land would go back to being the responsibility of the landowner. For some of the permissive routes (such as on Lime Down B), retaining these routes as proposed may cause barriers to returning the land in full to agriculture.
WR-011	Description and DCO Process	Developer	The LDSF has emphasised its green credentials, but in our view this is no more than a cynical attempt to disguise the fact that the project is essentially a potentially very profitable investment opportunity for	The Scheme aims to help meet national targets for clean energy and net zero targets set out in legislation and policy. The aim is to deliver long term environmental benefit alongside a secure energy supply.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			what appear to be mainly foreign investors	The **ES [APP-052 to APP-265]**, **Statement of Need [APP-266]**, and **Planning Statement [APP-267]** provide an assessment of the adverse and beneficial effects associated with the Scheme, an explanation of why the Scheme is needed and the benefits of solar energy generation, and the other benefits proposed by the Scheme. The Applicant recognises that both landowners and the local community are key stakeholders. While landowners will receive a lease income, as in normal in any commercial lease agreements, the Scheme also aims to deliver wider benefits, including biodiversity enhancements, opportunities for local supply chain involvement, and onsite and offsite community benefit initiatives, which will be developed in consultation with local representatives. The Applicant is committed to meeting all planning, environmental, and construction policies and standards. The Scheme is being developed in line with legal and regulatory requirements, with engagement with all statutory and non-statutory bodies, ensuring quality and accountability throughout. The Applicant, Lime Down Solar Park Limited is a 100% subsidiary of IGP UK Projects Limited. Both are registered in England and Wales and subject to UK tax law and regulations. Investment may come from a range of sources, including international ones. This is common practice with UK infrastructure Schemes and helps fund the transition to clean energy at the scale required.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WR-012	Consultation and Engagement	Consideration of Feedback	The whole premise of the consultations that have taken place is that the project will go ahead, and you are only seeking comments on the effectiveness or potential problems of various aspects of the project.	The Applicant considers that the statutory consultation has been robust, thorough and undertaken in accordance with the requirements of the Planning Act 2008, the Environmental Impact Assessment (EIA) regulations, and the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009. The **Consultation Report [APP-022]** sets out the Applicant's approach to pre-application consultation. Throughout the consultation period, anyone was welcome and encouraged to get in touch through any of the free-to-use communication channels provided, including email, freephone, and post. Respondents were also invited to attend the in-person and virtual community information events, where they could view the maps and ask questions or seek clarification directly to the Project team. The Applicant also notes that the examination process provides a further opportunity for interested parties to comment on the Scheme. This examination is managed by an independently appointed Examining Authority. Further to this, the Applicant provided an extended relevant representation period beyond the minimum statutory timeframe to allow sufficient time for members of the public to review the submitted application documents and register as an interested party. While the formal consultation process has now ended, the Applicant continues to welcome engagement from the community through this next phase of the Examination process.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WR-013	Socio-Economics, Tourism and Recreation Community Benefits	PRoWs and Community Benefits	On the assumption that this is what will happen, we commend Wiltshire Council's recommended improvements to the PRoW in and around the LDSF site, as described in Wiltshire Council's Relevant Representation, which was provided to you earlier this month	The Applicant confirms that they are in ongoing discussions with Wiltshire Council's PROW and Countryside Access Team to agree which of the PROW improvement recommendations can be secured directly through the Scheme, versus those that can be funded through the Community Benefit Fund. This discussion is ongoing and is reported in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.

4.23 Alicia Hawker Eventing Ltd

Table 4-23 RR-0145

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
AHEL-001	Description and DCO Process	Introduction	Relevant Representation in Opposition to Lime Down Solar Park (EN010168) To the Planning Inspectorate, I am writing to formally register as an Interested Party and to submit my strong objection to the Development Consent Order application for Lime Down Solar Park.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.
AHEL-002	Description and DCO Process	Introduction	I operate a horse livery and competition horse training business near Hullavington, within close proximity to the proposed development. My objection is based on the severe, adverse impacts the project would have on my business, the safety of my clients, the local economy, and the character of the area.	The Applicant confirms that Alicia Hawker Eventing Ltd. was not identified as an equestrian facility in the DCO submission documentation and, as such, was not assessed in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The Applicant has identified the location of this business based on the business' website, and has identified that they are located approximately 2.3 km from the Cable Route Corridor, and 2.5 km from the nearest Solar PV Sites (Lime Down C and D). As such, the Applicant considers that they would have been minded to scope this location out from full assessment on the basis of the distance between the Scheme and this equestrian facility, and the minimal likelihood of direct impacts on their operations. The Applicant has responded to each of the matters raised below.
AHEL-003	Transport and Access	Traffic Impact	Direct Threat to a Viable Rural Business and Employment The proposed industrialisation of the countryside directly threatens the viability of my business.	The Applicant has assessed the likely impacts of construction traffic movements on the local highway network in **ES Volume 1 Chapter 13: Transport and Access [APP-065]** and finds there are no significant adverse effects to driver delay, non-motorised user delay, safety, or fear and

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			· Loss of Core Business Function: The safety and tranquillity of the local lanes are the primary reasons my seven clients keep their horses at my livery. All have indicated they will remove their horses if the project proceeds, due to the anticipated surge in traffic and the destruction of the rural environment they pay to access. This would result in the immediate loss of my primary income.	intimidation to users from HGV movements, subject to implementation of mitigation measures in the **OCTMP [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. Proposed construction routes for HGVs have been presented at **ES Volume 2, Figures 13-11 and 13-12 [APP-156 and APP-157]**. While there is potential for interaction with equestrians from Alicia Hawker Eventing on hacking routes west of the Cable Route Corridor or where crossing the A429, no construction routes are proposed within approximately 2 km of the facility (the A429, and the road from the A429 at Hullavington towards Norton). As such, no substantial change to the safety or tranquillity of the environment around the equestrian facility is anticipated.
AHEL-004	Transport and Access	Traffic Impact	Endangerment of Essential Training: I train competition horses, for which hacking on quiet roads is an irreplaceable part of their training and mental wellbeing. The introduction of heavy goods vehicles (HGVs) and construction traffic onto narrow rural lanes would make this activity prohibitively dangerous, destroying a key component of my business.	Proposed construction routes for HGVs have been presented at **ES Volume 2, Figures 13-11 and 13-12 [APP-156 and APP-157]**. While there is potential for interaction with equestrians from Alicia Hawker Eventing on hacking routes west of the Cable Route Corridor or where crossing the A429, no construction routes are proposed within approximately 2 km of the facility (the A429, and the road from the A429 at Hullavington towards Norton). Given the amount of optionality for hacking routes available to the facility's users, it is not anticipated that traffic associated with the Scheme will have a substantial impact on the safety of hacking in the area surrounding the facility. The Applicant furthermore points to the commitments that HGV movements associated with Scheme construction would be limited to 09:30-16:30 on weekdays and 09:30-13:30 on Saturdays, with no works being undertaken on Sundays. This is committed through the **OCTMP [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. As such, the Applicant is confident that there are sufficient

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				measures to ensure equestrian users of highways are not significantly affected.
AHEL-005	Socio-Economics, Tourism and Recreation	Employment	Redundancies and Loss of Local Employment: The likely closure of my business would force me to make two full-time staff redundant and cease using the services of four local freelance grooms. This aligns with Wiltshire Council's assessment that the project could cause the loss of up to 50 tourism-related jobs.	The Applicant does not consider that this facility is likely to experience any significant adverse effects to its operations, as a result of its distance from the Scheme and intervening topography largely mitigating visual impacts, and the avoidance of its location for use by HGV traffic. The Applicant therefore does not consider it likely that job losses as a result of the Scheme at this location are likely.
AHEL-006	Transport and Access	Highway Safety	2. Incompatibility with Highway Safety and Existing Land Use The developer's proposals fail to adequately address the severe highway safety implications for vulnerable road users.	The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network including for Non Motorised Users. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. Mitigation measures to manage construction traffic safely are

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline Construction Traffic Management Plan [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme.
AHEL-007	Transport and Access	Suitability of Local Road Infrastructure	The narrow local lanes are wholly unsuitable for the volume and type of construction traffic generated by an 878-hectare project.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by WC. All construction routes also include passing points to allow two HGVs to pass.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]** . The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
AHEL-008	Transport and Access	Highway Safety	Mixing HGVs with horses, cyclists, and pedestrians on these roads creates an unacceptable risk of serious accidents. The British Horse Society emphasises the importance of safety for equestrians on roads, a condition the project would utterly undermine.	The Applicant notes that road safety has been addressed in detail in the Applicant's responses above. With regard to horse-riders, public rights of way such as bridleways and byways and the use of the highway network for recreational users have been considered as specific recreational receptors in the assessment in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on individual PROWs are specifically assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of PROWs is protected as much as possible through the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				implementation of embedded and additional mitigation measures set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. To confirm, an assessment on safety and accidents is provided in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. Links with traffic increases above identified thresholds, were taken forward for further assessment. As part of the assessment, it is concluded that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on the links in the Study Area. The Scheme has sought to comply with British Horse Society guidance for drivers by including relevant measures for HGVs (speed limits of 10mph and giving way to non-vehicular users) at points where HGVs and horse riders are most likely to meet (site accesses and where accesses cross or utilise any part of unsurfaced roads or PROWs). The Applicant has also committed to HGVs being required to use specific routes to access the Scheme, allowing horse riders to better plan around meeting HGV traffic on their hacking routes. These measures are secured through the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**.
AHEL-009	Socio-Economics, Tourism and Recreation	Tourism	3. Significant Adverse Impact on Local Economy and Landscape My business is a small but representative part of the wider local economy and landscape that stands to be damaged. Wiltshire Council	The Applicant has assessed the likely impacts to the tourism-based economy in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. Therein, the Applicant has assessed that there is a likely worst-case temporary loss of 50 FTE tourism industry jobs and loss of £1.76 million GVA per annum as a result of the Scheme's

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			estimates the construction would cause a loss of approximately £1.76 million per year in tourism spending. My business contributes to this visitor economy, and its closure would be part of this wider economic harm. · The council also states the project would cause "*substantial, long-term harm to landscape character*", directly undermining the rural appeal that businesses like mine depend upon.	construction. The Applicant does not however agree with Wiltshire Council that this effect on tourism employment is significant, accounting for approximately 0.17% of tourism employment across Wiltshire and less than 0.15% of the value of the combined tourism industry value across Wiltshire (Visit Wiltshire, 2021). The Applicant also seeks to reiterate that this is a temporary effect, anticipated to occur during construction, based on a worst-case scenario determined by likely significant effects from the Scheme, with recovery to tourism businesses anticipated to begin as soon as construction works are complete. Additional mitigation measures (which were not quantified for inclusion in the assessment of potential losses to employment) through the **Outline Skills, Supply Chain and Employment Plan [APP-285]** seek to reduce tourism employment losses through focussing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries. The Applicant further reiterates that as a result of the location of Alicia Hawker Eventing in relation to the Scheme, that additional economic impacts are not anticipated to be material to this assessment outcome.
AHEL-010	Landscape and Visual	Mitigation	4. Contradiction of Stated Benefits and Community Interest The developer's claims of environmental harmony are contradicted by the scale of the proposal and its impacts. · Industrialising 878 hectares of countryside cannot be reconciled with "*responsible land use*" or preserving the area's character.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. The total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.
AHEL-011	Description and DCO Process	Adverse Impacts on Local Community	The project appears to prioritize national energy targets without proper regard for the "*significant adverse impacts*" on the local community and economy, as identified by the local planning authority.	The Applicant is confident that the assessment of socio-economic effects in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and to human health and wellbeing in **ES Volume 1, Chapter 18: Human Health [APP-070]** robustly and proportionately set out the likely significance of effects on the economic and social environment as a result of the Scheme. The Applicant is therefore confident that the Scheme has no significant adverse effects to employment, economic prosperity, or to community wellbeing at any phase of the Scheme.
AHEL-012	Description and DCO Process	Conclusion	Conclusion For the reasons stated above, I urge the Examining Authority to recommend that the Secretary of State refuse this application. The Lime Down Solar Park, in its proposed form and location, would cause irreparable harm to my livelihood, the safety of my clients and animals, and the rural economy and character of the area,	The Applicant is confident the Scheme has no significant effect to this equestrian facility and business, nor to the wider rural economy.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			outweighing any claimed benefits. Yours faithfully, Alicia Hawker Eventing Ltd (Redacted)	

4.24 St Mary and St Ethelbert Church PCC

Table 4-24 RR-4431

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
SMSECPC C-001	Description and DCO Process	Introduction	Our church has concerns about the impacts of this project. The area of this project lies within the Gauzebrook Group of Churches, a benefice of eight churches which are spread between Sherston in the north and Hullavington and Stanton St Quintin in the South. All residents of the Parish of Luckington are entitled to be baptised, married and have their funeral in our Church. We provide regular services, not only to our own Parish, but also in a shared mode with the other 7 churches in the benefice.	The Applicant notes this comment and responds to the various concerns in turn below.
SMSECPC C-002	Cultural Heritage	Introduction	The Church building is Grade 1 listed, and therefore of the highest level of heritage.	The Applicant notes this comment.
SMSECPC C-003	Transport and Access	Transport Links and Connectivity	The project works will impact on the transport links between these churches, hindering physical communication between the churches and the quality of the area, which is attractive to many visitors, including those visiting our churches.	No construction routes directly pass any of the churches. Construction vehicle routes are presented in ES **Volume 2, Figure 13-6 and 13-7 [APP-151 – APP-152]** and **ES Volume 2, Figures 13-1 and 13-2 [APP-146 – APP-147].** The construction phase is temporary and during operation vehicle trips will be nominal with no or very occasional HGVs.
SMSECPC C-004	Socio-Economics, Tourism and Recreation	Heritage Assets	The Athelstan Pilgrim Way based on the historical context of King Athelstan links these churches and draws many visitors. Our church is grateful to many visitors who support our churches through donations made by them during their visit.	The Grade I Listed Church of The Holy Cross (NHLE: 1023223) is situated approximately 720m north of Lime Down A at its nearest points. Since the design presented at PEIR stage, Solar PV Panels have been removed entirely from within Fields A11 and A12, and from within the northern parts of Fields A1 and A4. No significant effects have been identified as a result of the Scheme to the Church of The Holy Cross (see **ES Volume 1, Chapter 12: Cultural**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			All changes to the local environment will impact us, the rural nature of the local area changing to an industrial area will be adverse. The area is highly regarded for walking and cycling. The Church is on the Macmillan Walking Way and we take part in a major annual fund raising event called 'Wiltshire Historic Churches Ride and Stride' which is held annually across the area and into adjacent counties.All changes to the local environment will impact us, the rural nature of the local area changing to an industrial area will be adverse. The area is highly regarded for walking and cycling. The Church is on the Macmillan Walking Way and we take part in a major annual fund raising event called 'Wiltshire Historic Churches Ride and Stride' which is held annually across the area and into adjacent counties. Downgrading the attractiveness of this area will reduce the footfall and hence our fundraising capability.	**Heritage [APP-064]**, supported by **Volume 3, Appendix 12.1: Heritage Statement [APP-219]**). Public rights of way such as bridleways and byways and the use of the highway network for recreational users have been considered as specific recreational receptors in the assessment in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on individual PROWs are specifically assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment covers each phase of the Scheme: construction, operation, peak replacement works, and decommissioning, and is based on likely visual and amenity impacts, traffic movements, and changes to the usability and desirability of PROWs. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of PROWs is protected as much as possible through the implementation of embedded and additional mitigation measures set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282**], secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant is confident therefore that the Scheme would not cause significant detriment to the ability for The Wiltshire Historic Churches Ride and Stride to take place or continue fundraising in future.
SMSECPCC-005	Soils and Agriculture	Stewardship of Farmland	We are also concerned with the aspects of stewardship of the	The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17: Soils and**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			farmland. If this project proceeds it sets a poor precedent for encouragement proper use of our natural resources for food.	**Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025).It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2024) states that solar development is not considered to compromise food security, and that climate change itself poses the greatest long-term risk to food production - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. Post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed, the landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Whilst there is

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				an environmental and economic cost to importing food, and it is recognised the UK imports a far greater amount of food than it exports, the impact of the Scheme on food import requirements or the food and drinks economy is not material at a national scale and has therefore not been assessed.

4.25 South Cotswolds Liberal Democrats

Table 4-25 RR-4430

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
SCLB-001	Description and DCO Process	Introduction	This representation is submitted on behalf of the South Cotswolds Liberal Democrat Local Party. The South Cotswolds Liberal Democrats wish to express their opposition to the proposed Lime Down Solar Park development. The South Cotswolds Liberal Democrats supports the expansion of renewable energy generation and recognises the urgent need to address climate change. Solar power will play an important role in meeting national and local net zero targets. However, support for renewable energy does not remove the need for schemes to be appropriately located, proportionate in scale, policy-compliant, and supported by robust evidence and effective mitigation. For the reasons set out below, the Lime Down Solar Park proposal represents the wrong development in the wrong place, and its harms currently outweigh its benefits.	The Applicant confirms that these matters have been addressed in detail in the responses below.
SCLB-002	Site selection and Alternatives	Scale, Location and Landscape Harm	Scale, Location and Landscape Harm The proposed development is of an exceptional scale, comprising approximately 3056 acres including 1850 acres of solar PV arrays and a	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			22km cable route corridor, with an operational lifespan of up to 60 years. Its scale and dispersed nature would result in long-term industrialisation of a sensitive rural landscape. The site lies close to the Cotswolds National Landscape, and the proposal would cause substantial and enduring harm to landscape character, settlement settings, and long-distance views. As Wiltshire Council has identified, the scale of the scheme makes compliance with landscape protection policies extremely difficult, if not impossible. The magnitude of change would fundamentally alter the character of the countryside that defines the South Cotswolds.	**Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA recognises that there would be temporary Moderate Adverse effects on Landscape Character within the 1 km as a result of the change in land use from arable farmland to solar infrastructure. However, the Scheme proposes significant mitigation measures informed by Wiltshire's Nature Recovery Strategy to reduce the effects of the Scheme on landscape character which will provide significant beneficial effects to the fabric of the Sites and the legacy Landscape. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. An assessment of landscape and visual effects is provided in

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the Landscape and Visual Impact Assessment (LVIA) presented **in ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and designated landscapes such as the Cotswolds National Landscape (CNL), and identifies where significant effects may occur. The CNL is also fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Cotswolds National Landscape and its Special Qualities [APP-197].** This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The LVIA found no Significant Long Term Visual Effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects, including effects on the CNL and its setting. As part of this design evolution, panels along the edge of the Cotswolds CNL and along the Fosse Way have been removed. Panels along the edge of the CNL were also removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Mitigation measures to address landscape and visual effects, including effects on the CNL and its setting, are set out **in ES Volume 1, Chapter 8: Landscape and Visual [APP-060],** Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284].** These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts and protect the setting of the CNL. Details of the proposed landscape and ecological mitigation and enhancement measures are also provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084], the Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284].** The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				accordance with the **OLEMP [APP-283],** is secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284],** is secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016].** These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
SCLB-003	Cumulative and In-Combination Effects	Assessment of Cumulative Impacts	Cumulative impacts, including the interaction of multiple solar sites and the cable route corridor, have not been robustly or transparently assessed. Embedded mitigation measures, such as hedgerows and buffers, lack clear justification in relation to baseline landscape character and may themselves introduce further harm.	Details on how the design of the Cable Route Corridor has evolved and been designed can be found **in ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered in order to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts. A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21 Cumulative and In-combination Effects [APP-073] and associated**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Appendices [APP-264]. Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073].** Existing schemes are captured within the baseline environment for each technical assessment. The four stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the **Long List [APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Buffers are areas of open space to provide an off sett from existing landscape features such as trees, hedgerows and woodlands. These buffers are predominantly proposed as margins of wildflower meadow and in places as native scrub. All existing hedgerows would be enhanced by gapping up and where required to provide visual screening of infrastructure they would be allowed to grow to a height of 4m, or be maintained at their current height if already greater than 4 m.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Scheme has been designed to be sympathetic to local character and setting having been informed by the Landscape Character Assessment Guidelines set out in **ES Volume 3, Appendix 8-4 [APP-195]** and Wiltshire's Nature Recovery Strategy to protect and enhance the landscape through the landscape- led design. It is recognised that low hedges are a characteristic feature of the landscape. However, it is noted that not all of Wiltshire's hedgerows are maintained to a low height and this change would not be significant or permanent as hedgerows could be clipped low again following decommissioning.
SCLB-004	Description and DCO Process	Incomplete Assessment and Unresolved Impacts Idenitified by Wiltshire Council	Incomplete Assessment and Unresolved Impacts Wiltshire Council, as the host authority, has identified significant gaps in the application, including unresolved construction methodologies, access arrangements, and insufficiently defined mitigation. Of particular concern are substantial gaps in ecological survey data, especially along the cable route corridor, including limited or absent surveys for bats, birds, and protected species. Without this information, it is not possible to conclude that impacts on biodiversity and designated ecological sites can be adequately mitigated. The absence of secured, enforceable and detailed mitigation strategies undermines confidence that the scheme can	The Applicant has reviewed Wiltshire Council's Relevant Representations and provided detailed responses to all matters raised. The Applicant acknowledges that some areas within the Cable Route Corridor had not been subject to ecological survey at the point of finalising **the ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** Since the preparation of the Chapter, habitat surveys have now been completed across all previously un-surveyed areas. The survey methodology applied was consistent with that reported in **the ES Volume 3, Appendix 9-1: Ecological Baseline Report [APP-198]** for the rest of the CRC. The results of these surveys have been reviewed and, in the Applicant's view, do not alter the conclusions of **ES Volume 1, Chapter 9 [APP-061]** regarding likely significant effects. The precautionary assumptions previously applied in the ES were conservative and appropriately accounted for any uncertainty associated with un-surveyed areas. The Applicant has updated **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and provided a revised version at Deadline 1 with the findings of these surveys, and it is considered these do not materially change the assessment of

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			comply with local and national planning policy.	likely significant effects presented in the chapter. The scope of ecological and species-specific survey within the Cable Route Corridor was defined using a proportionate, risk-based approach. Survey scope and effort across the Order Limits were targeted to areas and features where there was a reasonable likelihood of significant effects, rather than applied uniformly across the Order Limits irrespective of risk. The assessment has had regard to the short-term, temporary and construction-phase nature of works within the Cable Route Corridor, the absence of permanent operational effects, and a robust appraisal of habitat suitability for species based on baseline habitats data collected through surveys. Based on this that a reduced survey effort within the Cable Route Corridor has been undertaken compared to the Solar PV Sites. Potential impacts within the Cable Route Corridor, including temporary habitat loss, disturbance and fragmentation, have been assessed on a precautionary reasonable worst-case basis. This assumes that construction works within the Cable Route Corridor will be progressive over the approximate 18-month period. Embedded mitigation and further controls secured through the **Outline EPMS [APP-284],** including pre-construction surveys and inspections, micro-siting of cabling works, appointment of an Ecological Clerk of Works and species-specific protection measures, where appropriate, provide a recognised mechanism for managing residual risk. Furthermore, reinstatement of any disturbed habitats will take place as a priority following construction within the Cable Route Corridor. The Applicant does not agree that the survey approach

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				means that impacts and adequate mitigation cannot be adequately concluded. The baseline information is considered sufficient to support a robust and proportionate assessment of likely significant effects within the Cable Route Corridor, and the conclusions of **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** remain appropriate and justified.
SCLB-005	Soils and Agriculture	Agricultural Land, Food Security and the Rural Economy	Agricultural Land, Food Security and Rural Economy The scheme would remove approximately 878 hectares of land from food production, including a significant proportion of best and most versatile agricultural land. This equates to the loss of thousands of tonnes of crops annually over several decades. At a time of increasing concern over food security and domestic agricultural resilience, the long-term loss of productive farmland for large-scale energy infrastructure is difficult to justify, particularly when alternatives such as brownfield land, rooftops, and lower-quality land remain underutilised.	The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069],** which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that approximately one-third of the agricultural land within the Solar PV Panel Areas is BMV quality, mostly in Subgrade 3a which is the lowest of the BMV grades, and approximately two-thirds is non-BMV in Subgrade 3b and Grade 4. An appraisal of alternative sites is presented in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. This assessment considered alternative sites within a 20 km radius of the existing National Grid Melksham Substation and concludes that there are no more suitable locations within the defined search area than the proposed Site. The Site Selection Assessment explains how brownfield land, industrial land, previously developed land and lower-grade agricultural land were considered in accordance with policy. Government led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				potential benefits to agricultural land and the wider farming estate.
SCLB-006	Socio-Economics, Tourism and Recreation	Local Economy and Employment	Wiltshire Council has also identified adverse impacts on the rural economy, including farming and tourism employment, and a reduction in tourism spending. These long-term economic harms weigh against the limited local economic benefits offered by the scheme.'	The Applicant has responded directly to comments made by Wiltshire Council **[RR-4934]** in respect of impacts on the rural economy within the Applicant's response to paragraphs 18.6 – 18.12. The Applicant is discussing the approach to assessment of tourism impacts with Wiltshire Council's Economic and Regeneration Team and those discussions will be set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The Applicant has provided a robust assessment of impacts to tourism and recreation, and to agricultural employment in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. While employment and economic losses to the agriculture and tourism industries have been identified, the Applicant furthermore reiterates that these impacts are worst-case estimates based the likely significance of effects from the Scheme, and do not include for additional mitigation measures being applied. These impacts are not considered significant, with the peak impacts during construction accounting for approximately 0.17% of tourism employment across Wiltshire (29,000 estimate from Visit Wiltshire, 2021) and the long-term impact to agriculture less than 0.29% of agricultural employment in Wiltshire (BRES, 2023). Additional mitigation measures have been secured through the **OCTMP [APP-287]**, **OPROWPPMP [APP-282]** and the **OSSCEP [APP-285]**. Together these seek to reduce these losses to agriculture and tourism through mitigating traffic impacts, impact to PROWs, and focussing on local recruitment, promoting local

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				suppliers where practicable, and through providing retention and retraining opportunities for workers in agriculture and tourism-dependent industries. These measures are secured by the relevant requirements in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant also seeks to highlight that these adverse effects do not outweigh the beneficial employment and economic effects anticipated during construction, replacement works, and decommissioning. During operation, economic benefits from the Scheme are recognised to be more modest and limited in scope. However, enhancement measures through the **OSSCEP [APP-285]** to improve local employment opportunities have not been included in these calculations, nor have potential community benefits financed through the Community Benefit Fund been included in the DCO (as it is agreed through a separate process).
SCLB-007	Climate change and Energy Need	Carbon Balance and Climate Considerations	Carbon Balance and Climate Considerations While the proposal would deliver long-term carbon savings, Wiltshire Council's assessment highlights substantial construction-phase emissions, with carbon break-even not achieved until several decades into the project's lifespan. This raises important questions about the timing of benefits relative to immediate environmental, social and economic harm. True sustainability requires that climate benefits are delivered without disproportionate damage to	It is agreed that the Scheme will deliver long term carbon savings and the Scheme must be considered in the planning balance with a view of other potential environmental factors. It is not clear how the conclusion that the 'carbon break-even' would not occur until several decades into the project has been reached. **ES Volume 1 Chapter 7: Climate Change [APP-068]** demonstrates that the development has a net beneficial effect **ES Volume 1 Chapter 7: Climate Change [APP-059]** concludes that the emissions from construction will be offset by savings from the Scheme in comparison to a 'without Scheme' scenario.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			landscapes, communities and local economies. In this case, the balance has not yet been demonstrated.	
SCLB-008	Other Environmental Matters	Safety, Infrastructure and Community Impact	Safety, Infrastructure and Community Impact The inclusion of large-scale Battery Energy Storage Systems (BESS) introduces additional safety and public protection considerations. While incidents may be infrequent, the consequences of failure could be severe, particularly given the proximity of infrastructure such as transport corridors and sensitive water environments. These risks must be fully addressed through clear, enforceable design and mitigation, which is currently lacking. Construction and operation of the scheme would place significant pressure on rural road networks, public rights of way, and local amenity. Communities would experience prolonged disruption from construction traffic, noise and altered access, yet the scheme provides no clear or guaranteed local benefits such as reduced energy costs or meaningful community investment.	<u>Battery Storage</u> The location of the Battery Energy Storage System (BESS) has been informed by a detailed site selection and design evolution process, as set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056].** This chapter explains that land at Lime Down D was identified as an appropriate location due to its proximity to the solar PV arrays and the on-site substation, providing operational benefits including minimising transmission losses, maximising storage efficiency, and enabling rapid and reliable grid response. In considering options for co-locating the BESS with the solar PV Sites, Lime Down D was selected as the preferred location due to its central position within the Scheme, effective natural and proposed screening, limited proximity to residential properties, and closeness to existing infrastructure corridors, including the railway line. Locating the BESS within an existing infrastructure corridor reduces the need for additional land take and avoids introducing new isolated infrastructure into undeveloped areas. The assessment concludes that siting the BESS at Lime Down D presents the lowest potential for significant adverse environmental effects. Accordingly, the proximity of the BESS to the railway line does not give rise to significant safety or environmental concerns. The Applicant has followed National Fire Chiefs Council

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				(NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166].** The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through Requirement 6 of the **draft DCO [APP-016]:** "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be*

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				below relevant public health exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.4) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider." The Applicant is discussing the approach to BESS safety with Dorset & Wiltshire Fire & Rescue Service (D&WFRS), and this discussion is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Potential effects of the Scheme on water quality and contamination risk are assessed in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**, which considers pollution pathways to surface water and groundwater during both construction and operation. The Scheme incorporates sealed and isolatable drainage principles for the BESS and substations to ensure that operational spillages or firewater can be contained and managed without discharge to the surrounding environment. In the event of an incident, drainage isolation measures allow potentially contaminated water to be retained on site and tested prior to any controlled release or removal by a licensed waste contractor. These principles are consistent with the approach described in the **OBSMP [APP-286]** and will be further developed through the detailed drainage design secured through the DCO discharge process. The Applicant is discussing the approach to pollution

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				resulting from battery fire is under discussion with both the Environment Agency and the Lead Local Flood Authority (LLFA) and this discussion is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. Mitigation measures to control contamination risk during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]**. Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a Construction Environmental Management Plan substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277]** is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are appropriately managed throughout construction of the Scheme. The Applicant considers that this approach to assessment and mitigation is appropriate and robust. <u>Construction Traffic</u>

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233],** which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by WC. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]** . The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the detailed CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme. Operational Traffic The operational period is for up to 60 years. During the operation and maintenance phase, there are anticipated to be around five visits to each Solar PV Site per month for maintenance purposes. These would typically be made by light van or 4 x 4 type vehicles. There will be occasional trips to the proposed habitat areas within the Solar PV Sites for operational and maintenance purposes. These would typically be made by light van or 4 x 4 type vehicles and will use the existing field access locations detailed in Table 3-5 of **ES Volume 1, Chapter 3: The Scheme [APP-055] shown in ES Volume 2, Figure 13-13: Operational Only Access Locations: Solar PV Sites [APP-158].** Vehicle trip generation associated with these access locations will be the same or lower than the existing agricultural use There will be no transport operation effects associated with the installed Grid Connection Cables (within the Cable Route Corridor) as they will be located underground. Access may be required for maintenance, but this is only likely once or twice a year In light of this, effects on severance, driver delay, NMU delay and amenity, road safety and hazardous loads during the operation and maintenance phase of the Scheme are considered to be negligible or not significant. The effects will be long-term, as the design life of the Scheme is anticipated to be 60 years.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Noise The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. The Applicant notes that the approach to construction noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, are secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled throughout the construction phase of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Public Rights of Way and Local Amenity A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant is discussing the assessment of PROW impacts and mitigation with Wiltshire Council's Countryside Access Team and this discussion is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**. These are confirmed as embedded mitigation measures in Section 16.9 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. New permissive access routes have been included in the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283]**. These are considered as additional mitigation and enhancement measures in Section 16.11 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The preparation, approval and implementation of the PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the relevant outline plans, is secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. <u>Local Benefits</u> The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally compared with the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population as well as the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				peak replacement activities (as assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**), and providing skills and training opportunities (as secured through the **OSSCEP [APP-285]** through Requirement 18 of Schedule 2 to the **Draft DCO [APP-016]**). Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. This is secured through the **OLEMP [APP-283]** and **OPROWPPMP [APP-282]** through Requirements 7 and 16 of Schedule 2 to the **Draft DCO [APP-016]**. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme.
SCLB-009	Description and DCO Process	Democratic Opposition and Community Confidence	Democratic Opposition and Community Confidence Wiltshire Council has formally concluded that it does not support the proposal as submitted. This position is supported by parish councils, local communities and the Member of Parliament for South	The Applicant confirms that these matters have been addressed in detail in the responses to **RR-4430**.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			Cotswolds,(Redacted). This level of consistent local opposition reflects genuine concern about the scale, impacts and long-term consequences of the scheme. While the Nationally Significant Infrastructure Projects regime allows decisions to be taken at a national level, the planning balance must still give appropriate weight to local impacts, democratic representation and community confidence. Conclusion The South Cotswolds Liberal Democrats support renewable energy and recognises the importance of meeting climate targets. However, this proposal, as currently submitted, fails to demonstrate that its benefits outweigh the substantial and long-lasting harm it would cause to landscape character, ecology, agricultural land, rural economies and community wellbeing. The concerns raised by Wiltshire Council and MP (Redacted) regarding missing information, inadequate mitigation and policy non-compliance are significant and unresolved. When combined with the scale of local opposition and the	

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			absence of meaningful local benefit, the planning balance weighs firmly against the scheme. For these reasons, the South Cotswolds Liberal Democrats urges the Planning Inspectorate to refuse development consent for the Lime Down Solar Park as currently proposed.	

4.26 West Street Farm Farming Partnership

Table 4-26 RR-4893

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WSFFP-001	Hydrology, Flood Risk and Drainage	Flooding	I object to this project due to the increased flooding risk to the north side of great somerford.	The hydrology, flood risk and drainage assessment concludes that the Scheme would not increase flood risk beyond the Order limits, including to communities such as Great Somerford. This conclusion is set out in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063],** supported by the Flood Risk Assessment and Drainage Strategy which demonstrates that runoff rates and volumes would be controlled to prevent off site effects. On this basis, the assessment does not identify an increased flooding risk to the north side of Great Somerford arising from the Scheme.
WSFFP-002	Hydrology, Flood Risk and Drainage	Flooding	I object to this project due to the flooding it will cause in Chippenham. In the winter of 2024 the river rose above the main bridge at the bottom of the high street. This caused significant disruption.	The hydrology, flood risk and drainage assessment concludes that the Scheme would not increase flood risk beyond the Order limits, including to downstream communities such as Chippenham. This conclusion is set out in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063],** supported by the Flood Risk Assessment and Drainage Strategy which demonstrates that runoff rates and volumes would be controlled to prevent off site effects. On this basis, the assessment does not identify the Scheme as a cause of increased flooding in Chippenham.
WSFFP-003	Landscape and Visual	Visual Impact	I object to the industrialisation of this beautiful part of the South Cotswolds.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

4.27 Sevington Victorian School

Table 4-27 RR-4315

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
SVS-001	Description and DCO Process	Introduction	My name is Lesley Palmer and I am a trustee of Sevington Victorian School, charity registration number (Redacted) I make this submission on behalf of the trustees of the Victorian School and we object to the proposed Lime Down Solar Power and battery storage project.	The Applicant acknowledges this comment and submits that it is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the **Planning Statement [APP-267]** which set out an appraisal of the Scheme against the policies.
SVS-002	Socio-Economics, Tourism and Recreation	Impact on Business	Sevington Victorian School, built in 1849 is a perfectly preserved village school room and school teacher's house, together with a garden, wash house and outdoor privy. It is a Grade II* listed building. The purposes of the charity are two fold: to provide an authentic, immersive experience of Victorian school life for children and adults and to conserve the heritage of the school buildings and gardens for future generations to experience. The first of these aims is delivered through a programme of visits for primary schools and adult groups, as well as open events for the general public. The second is managed by the trustees who plan and supervise a programme of repair and maintenance. Visits to the school are conducted on a non-profit making basis. However the income from	Applicant does not consider that the construction of the Scheme will mean that Sevington Victorian School can no longer operate. The access to the Cable Route Corridor on Sevington Lane is anticipated to only be in operation for approximately 90-days during the construction phase with approximately four HGV deliveries per day (1 movement per hour) during the proposed construction times in the **OCTMP [APP-287]**. This will result in a non-material impact on access to Sevington Victorian School. The assessment in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]** has specifically assessed impact on the Sevington Conservation Area as a visitor destination and as such, the assessment outcomes therein pertain to the Sevington Victorian School. The assessment finds a medium-term temporary moderate-minor adverse effect during construction, predominantly occurring as a result of amenity impacts from the proximity to cabling works. HGV impacts on approach routes do not make a material impact to this assessment. The Applicant seeks to clarify that this effect is anticipated to last only as

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			these visits is vital to ensure that there are sufficient funds to continue to maintain this unique historical asset. Schools come from a wide geographical area. Last year we were visited by schools from Bath & N E Somerset, Bristol, Gloucestershire, North Somerset, South Gloucestershire, Swindon and all areas of Wiltshire. The cable route corridor shown in the submitted plans will severely impact access to the school and will undoubtedly deter schools from booking visits while the construction work is underway. As has been explained the revenue from visits is essential to ensure that the charity continues to operate in the future. Revenue is also generated from adult groups and open days and these will also be affected by the lengthy construction works proposed in the Lime Down application. A quote from an adult group visit encapsulates what is so special about Sevington Victorian School "*An amazing time-capsule of social history and education which must be preserved for posterity*" It would be devastating if the school, which celebrated its 175th Anniversary in 2024, was no longer able to operate. This application must be refused.	long as cable construction activities are occurring within the Sevington area (between the M4 and Park Farm), after which the impacts are neutral for the duration of the Scheme's operational lifetime.

4.28 Roberts Berry Farm

Table 4-28 RR-4027

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
RBF-001	Socio-Economic, Tourism and Recreation	Cable Route Corridor	As far as our business is concerned this project will have a significant negative impact. The chosen route for the cable is incorrect in my view. It should go through the participants land before going through non - interested third parties' land. It will bisect and destroy sections of our ancient pasture land causing significant practical difficulties during construction (access to grazing land on the other side, water etc). It will involve the destruction of mature trees and will damage the drainage.	The Applicant confirms that no agricultural land will be destroyed as a result of the Scheme. The soil handling for the installation of the cables will be managed in accordance with a detailed Soil Resources Management Plan (SRMP). The **Outline SRMP [APP-280]** sets out the broad best practice principles as well as handling windows to minimise effects on soils. The disturbance will be short-term; there will be no resulting access difficulties arising from the short-term cable installation works. Potential effects on local drainage associated with cable installation are assessed and managed through the hydrology, flood risk and drainage assessment, which concludes that the Cable Route Corridor can be constructed without increasing flood risk or causing adverse off site effects when the defined controls are implemented. This is set out in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** and the corridor specific assessment in **ES Volume 3, Appendix 11-9 Flood Risk Assessment and Drainage Strategy - Lime Down Cable Route Corridor [APP-218]**. The construction approach includes measures to maintain existing drainage function during works, manage temporary flow routing, and reinstate drainage features and ground levels following installation, with construction controls secured through the construction environmental management framework in **Outline Construction Environmental Management Plan [APP-277]** and detailed method statements subject to approval prior to commencement. On this basis, the Scheme is not expected to result in lasting damage to drainage. The anticipated effects to the farming business affected by cable routing are likely to be temporary and restricted to the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				width of the Cable Route Corridor. Where fields have been bisected, working practices around cable laying works should allow for access to be maintained to both sides of the Cable Route Corridor to allow for agricultural work to be continued even during construction. The **OCEMP [APP-277]** furthermore commits to the reinstatement of land affected by cabling works as soon as practicable to allow for agricultural work on the land to recommence as usual as soon as construction of that section of cable route is complete. No veteran or ancient trees are proposed to be removed to facilitate the Scheme. The Scheme has been designed through an iterative process to retain existing arboricultural features as far as practicable and to avoid and reduce impacts on trees, groups of trees and woodland. Potential impacts on arboriculture are fully assessed in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**, which considers baseline arboricultural conditions and evaluates likely effects during construction, operation and decommissioning. This assessment identifies where tree removal or pruning may be required and concludes that, with embedded mitigation in place, no significant adverse residual effects on arboricultural features are anticipated. Embedded mitigation measures include sensitive siting of infrastructure, minimum offsets from retained trees, protection of root protection areas, supervision by an Arboricultural Clerk of Works, and the use of trenchless construction techniques where required to avoid impacts on high-value trees. Where any unavoidable tree losses are necessary, compensatory tree and woodland planting is proposed as part of the Scheme's landscape and ecological mitigation.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Details of tree protection, replacement planting and long-term management are set out in the **Outline Landscape and Ecological Management Plan [APP-283]** and the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of a detailed landscape and ecological management plan and a detailed construction environmental management plan, substantially in accordance with the relevant outline plans, are secured through Requirements 7 and 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that arboricultural mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
RBF-002	Soils and Agriculture	Biomass Crop	It will involve the destruction of an established biomass crop.	The Applicant acknowledges that some crop losses will occur where crops are perennial, as biomass crops generally are, and as the suitable soil handling window is likely to be during the growing season. Disturbance to the land will be of a restricted width for installation of the cable, minimising the area of potential crop loss. Land and soils subject to disturbance for the installation of the cables will be reinstated as soon as reasonably practicable and in agreement with the landowner Furthermore, loss of agricultural revenue as a result of temporary works to construct the Cable Route Corridor can be compensated either through voluntary agreement with the Applicant, or through the application of compulsory acquisition powers.
RBF-003	Socio-Economics, Tourism and Recreation	Loss of Income and Compensation	The compensation offered fails to take into account the cost of replanting and the loss of income for the following 3 years. Overall, the compensation being offered in no way reflects the actual cost and loss	The Applicant seeks to minimise disruption to affected farming businesses where practicable by ensuring works are undertaken to a high standard. As such, the measures in the **OCEMP [APP-277]** and **OSRMP [APP-280]** together commit to ensuring full soil surveys are undertaken and soil stripping, storage and reinstatement are controlled to minimise effects

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			of earnings that this upheaval will cause. From experience we know that disturbed land can take many years to return to its original potential. A sewer pipe was laid by compulsory order across our land in 2017. This year the yield from that section of the field was approximately 50%less than the rest of that same field.	from disturbance and compaction. These documents are secured by Requirements 13 and 17 in Schedule 2 to the **Draft DCO [APP-016]**. Where there are any residual impacts on farm businesses, the Applicant will engage with landowners to compensate them through voluntary agreements or the compensation mechanisms available for the use of compulsory acquisition powers. The Applicant is continuing to engage with landowners to understand potential impacts on their businesses over this period, including on impacts related to crop yield.
RBF-004	Description and DCO Process	Project Deliverability	Lime Down Solar Park Ltd, in their dealings to date have shown a high level of incompetence, sending out legal documents with their own name incorrect, with decimal points in the wrong place, and with gagging clauses erroneously included, to name a few examples. As a business, we have no confidence that this company is able to deliver this project efficiently and do not look forward to having to deal with them. Please reject this application. This is not NIMBYism - it does not benefit the local community in any way, it will increase electricity prices for all and when considered alongside the many other similar projects, will have a negative effect on the nation's food security. Really not a good idea!	The Applicant works with an experienced professional team across planning, environmental, legal and land disciplines. Where minor administrative errors are identified in correspondence or draft documentation, these are corrected in the normal course of project management and do not affect the substance of the Application or the robustness of the assessment. The Applicant remains committed to engaging professionally and constructively with all stakeholders throughout the Examination. The **Statement of Need [APP-266]** describes that there is an urgent and unprecedented need for new low carbon generation in the UK to meet our climate change, energy security and affordability targets. Further, the Government considers that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Further, Section 2.9 of the **Statement of Need [APP-266]** describes that the government is seeking a large capacity of new low carbon schemes to come forwards to prioritise projects needed for 2030, while maintaining a robust pipeline of projects beyond 2030 towards meeting net zero by 2050

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
RBF-005	Socio-Economics, Tourism and Recreation	Cable Route Corridor	As far as our business is concerned this project will have a significant negative impact. The chosen route for the cable is incorrect in my view. It should go through the participants land before going through non - interested third parties' land. It will bisect and destroy sections of our ancient pasture land causing significant practical difficulties during construction (access to grazing land on the other side, water etc). It will involve the destruction of mature trees and will damage the drainage.	The Applicant confirms that no agricultural land will be destroyed as a result of the Scheme. The soil handling for the installation of the cables will be managed in accordance with a detailed Soil Resources Management Plan (SRMP). The **Outline SRMP [APP-280]** sets out the broad best practice principles as well as handling windows to minimise effects on soils. The disturbance will be short-term; there will be no resulting access difficulties arising from the short-term cable installation works. Potential effects on local drainage associated with cable installation are assessed and managed through the hydrology, flood risk and drainage assessment, which concludes that the Cable Route Corridor can be constructed without increasing flood risk or causing adverse off site effects when the defined controls are implemented. This is set out in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** and the corridor specific assessment in **ES Volume 3, Appendix 11-9 Flood Risk Assessment and Drainage Strategy - Lime Down Cable Route Corridor [APP-218]**. The construction approach includes measures to maintain existing drainage function during works, manage temporary flow routing, and reinstate drainage features and ground levels following installation, with construction controls secured through the construction environmental management framework in **Outline Construction Environmental Management Plan [APP-277]** and detailed method statements subject to approval prior to commencement. On this basis, the Scheme is not expected to result in lasting damage to drainage. The anticipated effects to the farming business affected by cable routing are likely to be temporary and restricted to the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				width of the Cable Route Corridor. Where fields have been bisected, working practices around cable laying works should allow for access to be maintained to both sides of the Cable Route Corridor to allow for agricultural work to be continued even during construction. The **OCEMP [APP-277]** furthermore commits to the reinstatement of land affected by cabling works as soon as practicable to allow for agricultural work on the land to recommence as usual as soon as construction of that section of cable route is complete. No veteran or ancient trees are proposed to be removed to facilitate the Scheme. The Scheme has been designed through an iterative process to retain existing arboricultural features as far as practicable and to avoid and reduce impacts on trees, groups of trees and woodland. Potential impacts on arboriculture are fully assessed in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**, which considers baseline arboricultural conditions and evaluates likely effects during construction, operation and decommissioning. This assessment identifies where tree removal or pruning may be required and concludes that, with embedded mitigation in place, no significant adverse residual effects on arboricultural features are anticipated. Embedded mitigation measures include sensitive siting of infrastructure, minimum offsets from retained trees, protection of root protection areas, supervision by an Arboricultural Clerk of Works, and the use of trenchless construction techniques where required to avoid impacts on high-value trees. Where any unavoidable tree losses are necessary, compensatory tree and woodland planting is proposed as part of the Scheme's landscape and ecological mitigation.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Details of tree protection, replacement planting and long-term management are set out in the **Outline Landscape and Ecological Management Plan [APP-283]** and the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of a detailed landscape and ecological management plan and a detailed construction environmental management plan, substantially in accordance with the relevant outline plans, are secured through Requirements 7 and 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that arboricultural mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

4.29 The Vine Tree

Table 4-29 RR-4654

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
VT-001	Socio-Economics, Tourism and Recreation	Threat to Livelihood and Recent Investment	Threat to Livelihood and Recent Investment a. I have recently invested heavily to save and restore The Vine Tree, a historic pub that was once a popular hub frequented even by royalty. b. This project poses an existential threat to my business and the immense personal time and money invested in making it a success again. c. The loss of the pub would cause significant damage to community character, house prices, and the social fabric of the area.	Whilst individual businesses were not assessed in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, the Applicant recognises that the location of The Vine Tree in Norton gives it an increased sensitivity to changes in economic conditions and visitor spending as a tourism and visitor-dependent business. The Applicant has sought to minimise impacts upon neighbouring properties and amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**. Specifically at Norton, this has included ensuring the Scheme design at Lime Down B is buffered considerably from residential and community buildings (including The Vine Tree pub) to minimise visual impacts, while traffic impacts are mitigated through the use of a haul route parallel to the Fosse Way to access Lime Down B for construction, rather than using the local highway network through Norton, and the use of traffic mitigation measures to reduce impacts on the Norton-Hullavington road. These measures seek to minimise impacts to residents and to visitors, and as such, look to mitigate against significant effects to the business at The Vine Tree pub. The Applicant has committed to measures to enhance local employment and skills development through the **OSSCEP [APP-285]**, secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**. Should the Scheme impact upon patronage to the pub affecting its viability as a business, the operators of The Vine Tree would be eligible to benefit from those measures, subject to the final SSCEP being agreed by Wiltshire Council and any other stakeholders.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				As the Applicant has sought to minimise impacts on neighbouring properties and amenity, and thus on the business at The Vine Tree pub, the Applicant considers it unlikely that the Scheme would lead to the loss of the pub, or any subsequent impacts on community character, house prices, and the social fabric of the area.
VT-002	Socio-Economics, Tourism and Recreation	Tourism and Trade	Direct Impact on Tourism and Trade a. The pub's resurgence relies on visitors who come to walk, enjoy lunch, and sit in our garden to experience the countryside. b. Every access route to the pub will be lined with industrial-scale solar panels, which will actively deter these visitors. c. While Wiltshire Council estimates a £1.8 million loss in tourism income for the area, I believe the true figure will be higher, as my pub and others will be dramatically and directly affected.	The assessment of impacts to tourism and recreation receptors in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and its supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** has assessed the impacts to each PROW on the approach to Norton, and finds no significant adverse effects to these routes at any phase of the Scheme, subject to implementation of mitigation measures. A significant adverse effect to the Wiltshire Way cycle route during construction and decommissioning has been assessed, however this is predominantly likely to occur as a result of HGV traffic and direct views of the Scheme along the Fosse Way between Ladyswood and Grittleton. Access routes to The Vine Tree which interact with the Scheme will largely be screened by landscape planting, which will mature during the operational phase of the Scheme, reducing the visual amenity effect from travelling net to the Solar PV Arrays. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Applicant has assessed that there is a likely worst-case temporary loss of £1.76 million GVA per annum as a result of the Scheme's construction. The Applicant does not however agree with Wiltshire Council that this effect on tourism employment is significant, accounting for approximately 0.17% of tourism employment across Wiltshire and less than 0.15% of the value of the combined tourism industry value across Wiltshire (Visit Wiltshire, 2021). The Applicant also seeks to reiterate that this is a temporary effect, anticipated to occur during construction, based on a worst-case scenario determined by likely significant effects from the Scheme, with recovery to tourism businesses anticipated to begin as soon as construction works are complete. Additional mitigation measures (which were not quantified for inclusion in the assessment of potential losses to employment) secured in the **Outline Skills, Supply Chain and Employment Plan [APP-285]** seek to reduce tourism employment losses through focussing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries.
VT-003	Landscape and Visual	Destruction of Local Character and Heritage	Destruction of Local Character and Heritage a. Norton is a very beautiful village, and The Vine Tree has a long history documented in paintings for centuries. b. Covering the surrounding fields with solar panels will devastate the landscape that visitors and locals cherish, destroying the very atmosphere people come for.	The Applicant has sought to minimise impacts upon neighbouring properties and amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**. Specifically at Norton, this has included ensuring the Scheme design at Lime Down B is buffered considerably from residential and community buildings (including The Vine Tree pub) to minimise visual impacts, while traffic impacts are mitigated through the use of a haul route parallel to the Fosse Way to access Lime Down B for construction, rather than using the local highway network through Norton, and the use of traffic mitigation measures to reduce impacts on the Norton-Hullavington road. These measures seek to minimise impacts to residents

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				and to visitors, and as such, look to mitigate against significant effects to the business at The Vine Tree pub. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads and identifies where significant effects may occur. The LVIA recognises that there would be temporary Moderate Adverse effects on Landscape Character within the 1 km as a result of the change in land use from arable farmland to solar infrastructure. However, the Scheme proposes significant mitigation measures informed by Wiltshire's Nature Recovery Strategy to reduce the effects of the Scheme on landscape character which will provide significant beneficial effects to the fabric of the Sites and the legacy Landscape. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
VT-004	Socio-Economics, Tourism and Recreation	Risk to Local Employment and Community	Risk to Local Employment and Community a. I will likely be forced to reduce staff, most of whom are local residents and families for whom the pub provides vital first jobs and ongoing employment. b. The local community has been a huge support, but if the project proceeds, the days of having a viable pub here are numbered, leading to job losses, lost revenue, and another community pub closure.	Whilst individual businesses were not assessed in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, the Applicant recognises that the location of The Vine Tree in Norton gives it an increased sensitivity to changes in economic conditions and visitor spending as a tourism and visitor-dependent business. The Applicant has sought to minimise impacts upon neighbouring properties and amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**, and hopes this can mitigate the majority of adverse effects to the operation of The Vine Tree pub. The Applicant has also committed to measures to enhance local employment and skills development through the **OSSCEP [APP-285]**, secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**. The operators of

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Vine Tree would be eligible to benefit from those measures, subject to the final SSCEP being agreed by Wiltshire Council and any other stakeholders.
VT-005	Hydrology, Flood risk and Drainage	Flooding	Practical and Environmental Hazards a. Flooding Risk: The pub is in a known flash flood zone at the bottom of a hill. Covering upstream fields with solar infrastructure could worsen runoff and flood risk, potentially trapping cars and limiting access to the pub.	The assessment presented in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** recognises that there are existing areas within the surrounding locality that experience surface water and flash flooding under baseline conditions. The assessment concludes, however, that the Scheme would not increase surface water runoff or exacerbate flood risk to receptors beyond the Order limits, including properties and businesses located downslope. Solar PV panels drain to the existing ground surface and do not create roof like runoff behaviour, and runoff from the Scheme is controlled so that post development discharge rates and volumes do not exceed the greenfield condition. On this basis, while existing flooding issues may continue to occur, the Scheme is not expected to worsen surface water flood risk or affect access during heavy rainfall events.
VT-006	Transport and Access	Traffic Impact	b. Access & Transport Chaos: During the two-year construction, roads will be clogged with roughly one heavy goods vehicle every 10 minutes, making it next to impossible for staff and guests to reach the pub.	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. The construction period is temporary an example of flows included in the assessment are: • trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average;

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				• trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route) • delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287].** There will be no HGV trips outside of these hours; The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the CTMP in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
VT-007	Noise and Vibration	Noise and Amenity Destruction	c. Noise and Amenity Destruction: The constant noise and vibration from construction and the operational BESS will drive customers away, especially from our garden, causing immense economic damage.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**; this includes The Vine Tree (R43). Mitigation measures are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, noise exposure levels at the Vine Tree are expected to be around 53 dB, which is the level of regular conversation and should not therefore drive customers away. This noise would primarily originate from the construction of the solar PV sites to the north of Honey Lane, and levels would be lower still once this section of the Scheme was complete. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. This is secured in the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Outline Construction Environmental Management Plan [APP-277]. During operation of the Scheme, noise levels at The Vine Tree are expected to be around 34 dB, as shown in Table 8 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. This level is well below that of regular conversation and equivalent to the existing background sound level in the vicinity of this location. The **Outline Operational Environmental Management Plan [APP-278]** commits to these levels, providing assurance that significant effects from operational noise will be avoided.
VT-008	Description and DCO Process	Conclusion	Final Opposition a. I strongly oppose this proposal. It is the wrong scale, in the wrong place, and for the wrong reasons. b. I urge you to refuse this application to protect my business, my staff's jobs, the local community, and the historic character of this area.	The Applicant notes the matters raised and confirms that these have been addressed in the responses provided above.

4.30 Amy Kent Rugs Ltd

Table 4-30 RR-0224

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
AKR-001	Description and DCO Process	Introduction	As a business I avidly object to the Lime Down project. This is not only an area of huge beauty that attracts lots of visitors to be in the countryside, but it is also an area where there are lots of small artisan businesses (like mine).	The Applicant has assessed the likely impacts to the tourism-based economy in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, based on a worst-case scenario determined by likely significant effects from the Scheme at each phase of the Scheme. No significant adverse effect to any assessed economic sector has been identified in the assessment at any phase of the Scheme.
AKR-002	Socio-Economics, Tourism and Recreation	Impact on Business	I moved here because it was too expensive to have a showroom in London or any other town so my showroom is down here with my parents. My clients love coming to this area and when they do I recommend lots of local places to visit to eat at and also shop for other interior items for their house. Having this project here will undoubtedly prevent clients from visiting, especially because of the massive increase of traffic that is going to be caused during the construction phase. I know this phase is meant to be only a few years, but the damage would already have been done, and this area will have a bad reputation.	The Applicant has assessed the likely impacts to the tourism-based economy in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, based on a worst-case scenario determined by likely significant effects from the Scheme at each phase of the Scheme. The most substantial considerations within this are visual and amenity impacts to tourism destinations and PRoW that may dissuade visitors from accessing the areas affected by the Scheme. Impacts from construction traffic have also been considered in specific locations where interactions with construction HGVs are most likely to occur. However, impacts from HGVs on the highway network are not anticipated to be significant, as assessed in **ES Volume 1 Chapter 13: Transport and Access [APP-065]**, and therefore it is not considered likely that there would be any significant effect to the ability for visitors to access the affected areas by road. The Applicant is in agreement with the commentor that the effects from construction are a temporary effect, and the Applicant anticipates recovery to tourism businesses to begin as soon as construction works are complete. Additional mitigation measures through the **Outline Skills, Supply Chain and Employment Plan [APP-285]** seek to reduce tourism employment losses through focussing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				tourism-dependent industries. The **Outline Skills, Supply Chain and Employment Plan [APP-285]** is secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**.
AKR-003	Socio-Economics, Tourism and Recreation	Tourism	A lot of tourists from outside the UK also come to this area as part of their UK experience, and again will visit my showroom as well as others, on a tour of the countryside. The proposal is bang in the middle of the Cotswolds, one of the most renown areas that attracts tourism, creating business and economy for this whole area.	The Applicant has considered the likely impacts to the tourism-based economy in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** with respect to international tourism spending and day visits as an integral part of the assessment piece. As such, regionally and nationally important tourism destinations such as the Cotswolds National Landscape (to which the Scheme borders) have been specifically assessed in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The assessment finds no significant effects to these important tourism receptors at any phase of the Scheme. Furthermore, the Applicant has been engaging with the Cotswolds National Landscape Board to ensure that there is agreement on assessment methodology and appropriate mitigation. This has primarily revolved around landscape, with tourism impacts to the National Landscape not yet raised as a specific concern. This is however still under discussion through the process of agreeing a Statement of Common Ground with the Cotswolds National Landscape Board to be submitted at Deadline 1.
AKR-004	Site Selection and Alternatives	Scheme Location	I cannot believe that this is a good place to have a 'mega solar scheme'. It just seems madness.	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme.
AKR-005	Socio-Economics, Tourism and Recreation	Property Market	Many people buy houses in this area which results in jobs and employment for skilled artisan creators and workmen. This will drop hugely, no-one will want to buy here.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].** As a result, other impacts on the local property market have not been assessed either. That notwithstanding, the Applicant has sought to minimise impacts upon residential properties and residential amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant has also assessed likely impacts on community and social wellbeing, and on the physical and mental health impacts of the Scheme on the local population in **ES Volume 1 Chapter 18: Human Health [APP-070]**. The assessment concludes that there are no significant adverse effects anticipated to population and community or social health and wellbeing.
AKR-006	Socio-Economics,	Impact on Local Community	This would have a massive effect on everything around here - the	The Applicant does not consider the Scheme is likely to have any significant adverse effects on socio-demographic or

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
	Tourism and Recreation		occupation in the schools, the local shops and restaurants, the national trust places that rely on visitors and donations, like Westonbirt. So many repercussions. Thank you for considering my objection.	population, and does not anticipate any changes to the desirability of the area to live in would affect the number of people accessing local services like schools or businesses. This has been assessed with respect to the Scheme in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. Impacts on tourism destinations have been assessed specifically in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** based on the likelihood of impacts upon them and the likely affect the Scheme will have on them as tourism destinations. For example, Westonbirt Arboretum was scoped out of full assessment on the basis that visual amenity from the Scheme or accessibility impacts from HGVs would not have a material impact upon its tourism value or its operation. Where impacts to tourism-destinations have been assessed, it is anticipated that significant effects can be mitigated against, albeit as a worst-case scenario, the Scheme is assessed as having the potential to cause a temporary loss of 50 FTE jobs and £1.76 million GVA per annum during the construction phase. The Applicant anticipates recovery to tourism businesses to begin as soon as construction works are complete. Additional mitigation measures through the **Outline Skills, Supply Chain and Employment Plan [APP-285]** seek to reduce tourism employment losses through focussing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries. The **Outline Skills, Supply Chain and Employment Plan [APP-285]** is secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**.

4.31 BDP Imports Holdings Limited

Table 4-31 RR-0456

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
BDPIH-001	Socio-Economics, Tourism and Recreation	Local Economy	I object to this development due to the potential negative impact on the local economy.	An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is still discussing with the Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
BDPIH-002	Site Selection and Alternatives	Brownfield Land and Rooftop Solar	Surely large-scale solar developments of this type are better suited on brownfield land, industrial sites and large commercial rooftops where infrastructure already exists. This will reduce the need for disruptive construction and grid upgrades. These more suitable sites will also minimise visual impact and protect the character and existence of our dwindling countryside.	In relation to suggestions that brownfield land or alternative locations should be used, including rooftops, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution and in the Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The LVIA recognises that there would be temporary Moderate Adverse effects on Landscape Character within the 1 km as a result of the change in land use from arable farmland to solar infrastructure. However, the Scheme proposes significant mitigation measures informed by Wiltshire's Nature Recovery Strategy to reduce the effects of the Scheme on landscape character which will provide significant beneficial effects to the fabric of the Sites and the legacy Landscape.
BDPIH-003	Transport and Access	Traffic Impact	The developer's own transport assessment shows a terrifying volume of construction and HGV movements over an extended period creating chaos to the local and main road networks.	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
BDPIH-004	Human Health Landscape and Visual	Landscape Character and Local Wellbeing	The planned development in incompatible with the character, needs and long-term wellbeing of the area. I therefore strongly object and ask that the application is refused.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "*lens*" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.

4.32 The Baraka Catering Company

Table 4-32 RR-4646

Reference	Theme		Comments/Issues Raised	Applicant's Response
BCC-001	Soils and Agriculture	Use of Farmland	Running a food business I am up in arms about this, farmland is being destroyed, food costs will keep going up and this could in the end bring my business to an end.	As the Scheme is unlikely to make a material difference to food prices in the UK, there is therefore no likely indirect effect to this business resulting from the Scheme.
BCC-002	Transport and Access	Traffic Impact	Traffic will be a disaster in the area during all the years it takes to build. It must be stopped	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the CTMP in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback

Reference	Theme		Comments/Issues Raised	Applicant's Response
				should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.

4.33 Hawker Farms

Table 4-33 RR-1793

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response

HF-001	Description and DCO Process	Introduction	Lime Down Solar Park. As a long-established family farming business in Hullavington, we are directly and severely affected by the proposal. We register our STRONG OBJECTION. Our core objections are as follows	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

HF-002	Soils and Agriculture	Agricultural Businesses and Food Security	- Threat to Agricultural Business Viability & Food Security o The proposed compulsory acquisition of land we own plus an additional approximately 100 acres we rent, would critically undermine our business model. We will be unable to feed the livestock we have.	The Applicant has identified Hawker Farms as having interests in land along the Cable Route Corridor in two locations. The anticipated effects to the farming business affected by cable routing are likely to be temporary and restricted to the width required for cable trenching works and any associated haul route, or entry and exit pits for horizontal directional drilling operations. Where fields have been bisected, working practices around cable laying works should allow for access to be maintained to both sides of the Cable Route Corridor to allow for agricultural work to be continued even during construction. The **OCEMP [APP-277]** furthermore commits to the reinstatement of land affected by cabling works as soon as practicable to allow for agricultural work on the land to recommence as usual as soon as construction of that section of cable route is complete. The assessment of effects on agricultural land and farming operations, including temporary land take associated with the cable route, is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, with detailed construction methodology set out in **ES Volume 3, Appendix 3-2: Cable Route Construction Method Statement [APP-183]**. The cable trench required for installation of underground cables would have a maximum anticipated working width of approximately 7 m. This equates to a temporary disturbance of approximately 0.07 hectares per hectare of land crossed. Disturbance associated with cable installation would be short term and localised, and following reinstatement, agricultural operations within the affected fields would be able to recommence. Accordingly, land take associated with cable installation would not permanently remove the affected land from agricultural use, and the extent and duration of disturbance have been assessed as limited. The widest cable trench is anticipated to be 7m (**ES Volume 3, Appendix 3-2 Cable Route Construction Method Statement [APP-183]**), resulting in disturbance of 0.07ha of land/crop per hectare square of land. Disturbance of the land for installation of

				the cables will be short-term and of restricted extent, such that agricultural operations in the applicable fields will be able to recommence shortly after the trenches have been reinstated. The Applicant is actively engaging with the respondent to agree appropriate and reasonable accommodation works and to reach an amicable solution for all parties, updates of which will be captured in the **Land and Rights Negotiations Tracker [APP-021]**. The Applicant has sought wherever practicable to reduce the amount of land subject to compulsory acquisition powers and the impact on the local community as a result of the Scheme through an iterative design process, having regard to consultation feedback and engagement with affected landowners (**ES Volume 3, Appendix 4-1 Site Selection Assessment Report [APP-185]).** The **Statement of Reasons [APP-018**] sets out the justification for the use of compulsory acquisition powers as part of the Scheme. It also confirms that the Applicant will continue to seek voluntary agreement for the acquisition of land and rights needed to ensure the implementation of the Scheme and the status of ongoing negotiations with affected owners is recorded in the **Land Rights Tracker [APP-021].** Notwithstanding this, under the provisions of the Land Compensation Act 1961 and the Land Compensation Act 1973, reasonable losses incurred by the landowner or occupier as a result of the Applicant's works are recoverable following claims to the Applicant upon a loss being incurred. Where compulsory acquisition powers are exercised, appropriate compensation will be available to those entitled under the Compensation Code. The **Funding Statement [APP-019]** confirms that the Applicant has sufficient funds to provide this compensation.

HF-003	Soils and Agriculture	Agricultural Business	o This loss could directly jeopardise our ability to fulfil a high-end supermarket supply contract for milk and beef, putting generations of investment at risk.	Loss of agricultural revenue as a result of temporary works to construct the Cable Route Corridor can be compensated either through voluntary agreement with the Applicant, or through the application of compulsory acquisition powers. The **OCEMP [APP-277]** furthermore commits to the reinstatement of land affected by cabling works as soon as practicable to allow for agricultural work on the land to recommence as soon as construction of that section of cable route is complete. The Applicant engaged with representatives of Hawker Farms during Statutory Consultation in which this contract was verbally discussed, and priority land identified. For DCO submission, some of this priority land was removed from the Order Limits where options for Grid Connection Cable routing were able to be discounted or avoided. This demonstrates the Applicant's intention to reduce impacts on agriculture in the local area by taking into account engagement and commentary undertaken prior to DCO submission. The widest cable trench is anticipated to be 7m (**ES Volume 2, Appendix 3-2: Cable Route Construction Method Statement [APP-183]**, resulting in disturbance of 0.07ha of land/crop per hectare square of land. Installation of the cable would require a temporary, short-term disturbance to the agricultural land and soil, which would be reinstated and available for use as soon as practicable after cabling works are completed.

HF-004	Soils and Agriculture	BMV Land	o The project would remove Best and Most Versatile (BMV) agricultural land from production, contradicting Wiltshire Council's core strategy and national planning policy protecting food security.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP069]**, supported by **ES Volume 3, Appendix 171: Agricultural Land Classification and Soil Resource Survey Report [APP243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered highquality agricultural land in planning terms. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the

				landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

HF-005	Socio-Economics, Tourism and Recreation	Local Economy and Employment	- Severe Impact on Local Economy & Employment o Loss of the ability to use all the land we currently farm will incur downsizing and would force redundancies among our 11 permanent staff and eliminate many of our 10-20 seasonal roles, harming local employment.	Loss of agricultural revenue (and thus resultant impacts on employment) as a result of temporary works to construct the Cable Route Corridor can be compensated either through voluntary agreement with the Applicant, or through the application of compulsory acquisition powers. The anticipated effects to the farming business affected by cable routing works are likely to be temporary and restricted to the width required for cable construction works. The **OCEMP [APP-277]** furthermore commits to the reinstatement of land affected by cabling works as soon as practicable to allow for agricultural work on the land to recommence as soon as construction of that section of cable route is complete. Should redundancies be required as a result of the Scheme, affected workers would be eligible for accessing skills and employment support measures as secured through the **OSSCEP [APP-285]**, secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**, subject to the final SSCEP being agreed by Wiltshire Council and any other stakeholders. The assessment of impacts to agricultural employment in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** primarily focuses on potential impacts on land within the Solar PV Sites because of the type of area affected and longer duration of impact. It is considered that agricultural losses from the construction of the Cable Route Corridor are not likely to materially influence the assessment outcomes.

HF-006	Socio-Economics, Tourism and Recreation	Employment	o It would end our apprenticeship schemes and student placements, cutting vital skills training for young people in the rural economy.	The anticipated effects to farming businesses affected by cable routing are likely to be temporary and restricted to the width required for cable construction works. This is not anticipated to have a significant impact on agricultural farm holdings, and as such, knock-on effects to apprenticeship schemes are also not anticipated to be significant. The Applicant understands the importance of local skill sharing and uplifting and so has committed to improving local skills through the measures set out in the **OSSCEP [APP-285]**, secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant considers that the measures set out in the **OSSCEP [APP-285]** provide a good opportunity for the Applicant and Hawker Farms to engage in respect of a common benefit for the local area.
HF-007	Socio-Economics, Tourism and Recreation	Employment	o Our business supports a wide network of local contractors, merchants, and service providers; its degradation would have a significant negative knock-on effect across the immediate local economy. o We ask the Examiners to fully investigate the impact of harm to this local economy	The assessment of impacts to agricultural employment in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** has considered supply chain and downstream employment effects as part of its calculations of likely job losses and economic losses to the wider agricultural industry. The Applicant's assessment has identified a loss of up to 20 FTE jobs in the agricultural (and downstream) industry and an annual loss of £628,000, equivalent to 0.08% of the sector in the assessed 20 km Study Area. This has been considered as part of the assessment of changes in employment as a result of the Scheme in the Study Area, which finds no significant adverse effects to employment during any phase of the Scheme.

HF-008	Other Environmental Matters	BESS Location and Safety	- Unacceptable Animal Welfare & Safety Risks from BESS Proximity o Our pedigree dairy herd is housed within a few hundred metres of the proposed Battery Energy Storage System (BESS). o We fundamentally question the Applicant's noise assessment. Constant operational noise, especially at night, is proven to detrimentally affect cattle health and milk quality associated with high somatic cell counts. o We ask that Examiners commission and independent experts advise on the noise effects on high performance pedigree bovines in close proximity to an installation of the proposed magnitude.	The potential for operational noise from the Battery Energy Storage System (BESS) and other infrastructure to affect nearby receptors has been assessed in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, supported by technical modelling in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. Levels would typically be below or slightly above the existing background sound in the area during the day and night, and as such no significant effects on human receptors are expected. The Applicant has also considered potential disturbance to animals and wildlife in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. The assessment concludes no significant adverse effects on wildlife are anticipated. To ensure operational noise remains within these assessed limits, the **Outline Operational Environmental Management Plan (OEMP) [APP-278]** commits the Applicant to maintaining noise levels at or below those modelled in the ES. These commitments, alongside the safety protocols, are secured through Requirement 6 (Battery Safety Management) and Requirement 14 (OEMP) in Schedule 2 of the **Draft Development Consent Order [APP-016]**. Furthermore, safety risks associated with the BESS have been assessed in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** and are addressed through the **Outline Battery Safety Management Plan (OBSMP) [APP-286]**, which is being discussed with Dorset & Wiltshire Fire & Rescue Service. Regarding animal welfare, the Applicant notes that the cessation of intensive arable farming and the reversion to managed grassland during the operational phase of the Scheme is expected to reduce existing disturbance factors like heavy machinery use. While the Environmental Statement (ES) primarily assesses human and ecological receptors, the methodology for determining noise impacts on the local environment follows current policy and best practice guidance.

				In response to the request for independent experts, the Applicant maintains that the assessments have been conducted by competent experts with considerable experience in assessing large-scale infrastructure, as documented in **ES Volume 3, Appendix 1-1: Statement of Competence [APP-180]**.

HF-009	Noise and Vibration	Impact on Livestock	o What assurances will be made by the developers and ongoing owners, to ensure sufficient insurances would be put in place that will cover loss of stock through health implications or death linked with noise and likely toxic poisoning caused from the installations in the case of fire from the BESS	The Applicant confirms that where noise impacts are anticipated to effect livestock, further engagement will be undertaken with parties holding livestock on the scheduling of construction activities. This commitment to engagement is secured in the **Outline Construction Environmental Management Plan [APP-277].**
HF-010	Transport and Access	Traffic Impact	Unworkable Construction Impact & Permanent Highway Damage - The lanes are very narrow and difficult to negotiate. We know this from day to day use of agricultural vehicles and machinery. Two cars can barely pass. The addition of 100's of construction workers cars and HGVs accessing the construction sites and cable route, will cause unacceptable safety hazards, severe disruption to our daily farming operations, and permanent damage to the character and fabric of the lanes used by walkers, cyclists and horse riders.	To ensure operational noise remains within these assessed limits, the **Outline Operational Environmental Management Plan (OEMP) [APP-278]** commits the Applicant to maintaining noise levels at or below those modelled in the ES. These commitments, alongside the safety protocols, are legally secured through Requirement 6 (Battery Safety Management) and Requirement 14 (OEMP) in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment concludes that with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. This is supported by the conclusions of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** which finds no significant adverse effects to recreational users of the local highway network as a result of the Scheme. An **OCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and

				recreational users from hazards, including, traffic management measures such as signage and banksmen, fencing, and dust and noise control.
HF-011	Transport and Access	Traffic Impact	- There is a real worry locally that a great proportion of construction traffic accessing from the east will leave the M4 at Junction 17 to access the ENTIRE Lime Down panel area and cable route due to significantly reduced mileage, instead of Junction 18 as currently stated by the applicant. This would cause major disruption, damage to small lanes through Stanton St Quintin and Hullavington (both of which have schools), and danger to local residents. - We ask the examiners to insist on a full detailed analysis of the suitability of the proposed scheme due to the unsuitable nature of the access network of small rural lanes. How would the proposed traffic routes be guaranteed or indeed policed? How would the safety of other road users currently enjoying quiet countryside lanes be addressed?	The proposed construction routes have been carefully assessed and are considered to be the most appropriate routes to the Scheme. Construction traffic would also be temporary and controlled through measures in a CTMP to minimise adverse impacts on the highway network, including within the CNL. An **OCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes. It also includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. The **OCTMP [APP-287]** includes measures that separate the public and recreational users from hazards, including, traffic management measures such as signage and banksmen, fencing, and dust and noise control, With this mitigation in place, **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that impacts would be negligible to minor adverse. A final CTMP would be prepared post consent and must be substantially in accordance with the **OCTMP [APP-287]** and approved by the relevant local planning authority (in consultation with the relevant highway authority and South Gloucestershire Council), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**. This requirement states that all construction works associated with the authorised development must be carried out in accordance with the approved construction traffic management plan. The Applicant will be required to comply with the various controls and requirements of the made Order or risk committing a criminal offence.

				The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment concludes that with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme.
HF-012	Landscape and Visual	Scale and Visual Impact	- Inappropriate Scale, Cumulative Impact & Compulsory Acquisition o This industrial-scale development is totally alien to this rural location and would industrialise the countryside for 60 years.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The **LVIA [APP-060]** recognises that there would be temporary Moderate Adverse effects on Landscape Character within the 1 km as a result of the change in land use from arable farmland to solar infrastructure. However, the Scheme proposes significant mitigation measures informed by Wiltshire's Nature Recovery Strategyto reduce the effects of the Scheme on landscape character which will provide significant beneficial effects to the fabric of the Sites and the legacy Landscape. The **LVIA [APP-060]** includes an assessment of the cumulative effects of the five Solar Sites making up the Scheme (intra-project cumulative effects) to ensure the effects of the Scheme as a whole are understood. It also assesses the cumulative effects of the Scheme in combination with other similar developments in the area.

HF-013	Site Selection and Alternatives	Scheme Scale and Location	o We support renewable energy in the correct location; we have a 10-year-old solar installation on our farm building roofs and directly use the majority of electricity generated at source. There are currently numerous existing solar installations in the immediate area with more planned. We fully understand farmers need to boost their income by installing sensible sized, sympathetically sited arrays in conjunction with local authorities. BUT we are totally opposed to a scheme the sheer size of the proposed Lime Down NSIP. The unprecedented size and number of vast infrastructures, the amount of food producing land lost, the locality of the BESS, the danger, the distance from the grid connection, the untold damage to the very local fabric of this part of Wiltshire, its views, its ecology, it's archaeology. Projects of this magnitude must be directed to areas far better suited and closer to a grid connection. This scheme it far too large, in the wrong area and so potentially damaging it must be refused.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. <u>Agricultural Land and Food Production</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in ES Chapter 17, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES**

				Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in ES Chapter 17, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1, Chapter 17: Soils and Agriculture**

				[APP-069], Sections 17.10 and 17.12). The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2024) states that solar development is not considered to compromise food security, and that climate change itself poses the greatest long-term risk to food production - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. Location of the Battery Energy Storage System (BESS) The location of the BESS was determined through an options appraisal and iterative design process, having regard to technical requirements, environmental constraints and potential effects on nearby receptors. The BESS Area is located at Lime Down D, close to the Solar PV Sites and the on-site substation, which provides operational and efficiency benefits, including minimising transmission losses, maximising storage efficiency, supporting grid balancing, and enabling a rapid and reliable response to network fluctuations. Among the options considered for co-locating the BESS with the Solar PV Sites, Lime Down D was identified as the preferred location due to its central position within the Scheme, the presence of existing and proposed screening, its limited proximity to many residential properties, and its relationship with existing infrastructure, including the adjacent railway line. The various chapters of the **ES [APP-052 to APP-265]** assess the likely significant effects arising from the BESS at this location and identify mitigation measures where necessary. Overall, the

				assessment concludes that the siting of the BESS at Lime Down D presents the lowest potential for significant adverse effects when compared with reasonable alternatives. Further detail on the consideration of alternatives, the design evolution of the Scheme and the assessment of potential effects is provided in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**, which sets out the iterative process undertaken to identify the preferred location and layout for the Scheme, including the BESS Area in Section 4.7. BESS Safety The BESS containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant notes that the approach to BESS safety is under discussion with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Distance to Grid Connection The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown

				on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered such as taking as direct a route as possible, whilst following existing features, such as roads; and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts. <u>Landscape and Visual Effects</u> An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non – significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter**

				8: Landscape and Visual [APP-060] and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual**

				[APP-060], **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Ecology and Biodiversity</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**.

				The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9 [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range of protected and notable species, as identified in **ES Volume 1, Chapter 9 [APP-061]**. Mitigation and enhancement measures are detailed in the **OLEMP [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Archaeology and Cultural Heritage</u> The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter

				concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220]**, **Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224]**, and **Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225]**. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction. The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

HF-014	Description and DCO Process	Compulsory Acquisition	o The use of compulsory acquisition powers by an offshore investor to override a local family business's livelihood and legacy is unjust and demonstrates a clear disregard for the community.	The Applicant has sought wherever practicable to reduce the amount of land subject to compulsory acquisition powers and the impact on the local community through an iterative design process responding to consultation feedback, surveys and assessments (presented **in ES Volume 3, Appendix 4-1 Site Selection Assessment Report [APP-185]**). The **Statement of Reasons [APP-018]** sets out the justification for the use of compulsory acquisition powers to implement the Scheme. It also confirms that the Applicant will continue to seek voluntary agreement for the acquisition of land and rights needed to ensure the implementation of the Scheme and the status of ongoing negotiations with affected owners is recorded in the **Land Rights Tracker [APP-021**]. Where compulsory acquisition powers are exercised, appropriate compensation will be available to those entitled under the Compensation Code. The **Funding Statement [APP-019]** confirms that the Applicant has sufficient funds to provide this compensation. The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The benefits of the Scheme are set out in Section 5.3 of the **Planning Statement [APP-267]** and include the delivery of large amounts of cheap, secure, and low carbon electricity which will help the UK to achieve net zero by 2050, ecological and landscape enhancements, biodiversity net gain, permissive paths, employment generation, economic benefits and skills training. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved

				landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme.

4.34 Cllr Jon Atkey

Table 4-34 RR-0914

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
JA-001	Description and DCO Process	Introduction	I object to the so-called Lime Down Solar Park proposal in its entirety. Lime Down is not a real place, and the name itself is misleading: it implies a single, open, downland landscape suitable for industrialisation, when in reality the site comprises a network of villages, hamlets, farms, rights of way, and productive agricultural fields that maintain the distinct identity of multiple rural communities. No form of this proposal - in whole or in part - would be acceptable in this landscape.	As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185],** the Applicant undertook an initial review which did not identify a single site of the appropriate size (1,100 ha) within the area of search. Therefore, the Applicant considered both contiguous land parcels and land parcels near one another. The **Statement of Need [APP-266]** explains at Section 7.4 that NSIP proposals may comprise adjoining or separate parcels of land and that "*the connection of separate parcels of suitable land together into a single scheme may, subject to analysis, enable those parcels of land to connect economically to the electricity system*" which is the case for this scheme. Section 8.2 of the **Statement of Need [APP-266]** explains that by bringing the parcels together into a single scheme, the Scheme is able to carry a connection to the National Electricity Transmission System (NETS), thus providing a local source of low carbon electricity and also enabling the efficient bulk transfer of energy generated at the Scheme so that any surplus can be used to cover shortfalls elsewhere. By connecting to the NETS, the Scheme will not impact the feasibility or timing of distribution network connections for either new generation or consumption connections which among other things are required to support the delivery of Wiltshire County Council's growth plans. The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. <u>Landscape and Visual</u> An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Public Rights of Way</u> A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Applicant confirms that existing PRoW are to be controlled within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. <u>Use of Agricultural Land</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out **in ES Volume 1, Chapter 17: Soils and Agricultural Land [APP-069]** Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in Section 17 of **ES Volume 1, Chapter 17: Soils and Agricultural Land [APP-069]**, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agricultural Land [APP-069]**).
JA-002	Other Environmental Matters	BESS Location and Safety	The development is industrial in scale, covering 2,000 to 3,000 acres of agricultural land and placing major infrastructure - including a Battery Energy Storage System (BESS), substation, and solar arrays - just 300 metres from homes. The entire village of Hullavington would lie within one mile of the proposed BESS itself, meaning every resident would be directly exposed to the risks, impacts, and consequences of this installation. This proximity is not merely a matter of visual or acoustic intrusion. It represents a civil contingency level	As the precise location of the BESS will be determined in the detailed design stage, the Applicant has provided a BESS Area as part of the Scheme within which the site of the BESS would be located [REF to Works Plans]. In order to understand the impacts of the BESS within this wider area, six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166].** The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			risk too serious to contemplate. Large scale lithium battery systems carry internationally recognised hazards associated with thermal runaway, fire, explosion, and toxic plume generation. These events are rare but catastrophic, and emergency planners treat them with extreme caution. No credible mitigation has been proposed for a failure event of this nature - and in reality, none could be envisaged. The applicant has not demonstrated how a major incident could be contained, controlled, or prevented from affecting the village, the school, the surrounding communities, or the nearby mainline railway. The siting of the BESS so close to homes and critical infrastructure is wholly inappropriate and represents an unacceptable and unmanageable risk to public safety.	of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286]**. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage of the project as stipulated in Section 5.5.9 of the OBSMP and secured through Requirement 6 of the **Draft DCO [APP-016]**. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage (see: Section 5.5.9 of the **OBSMP [APP-286]**). The Applicant has prepared an **OBSMP [APP-286]** for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. This includes listing safety objectives for the design of the BESS site in Section 2.4, including that "*Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing*

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				(LSFT)" (Section 2.4.2). The **OBSMP [APP-286]** will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. As mandated under the National Fire Protection Association (NFPA) 855 (2026) the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the **OBSMP [APP-286]** pre-construction requirements (Section 6). As set out in the **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation, and decommissioning. The Applicant's ERP template includes all requirements specified in both NFCC and NFPA 855 guidance and recommendations. Section 5 of the **OBSMP [APP-286]** covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. Final comprehensive risk assessment reports, BESS design and site-specific consequence modelling, and detailed Emergency Response Plans (ERPs) can only be drafted when based upon the specific BESS design selected at the detailed design stage. Key safety content requires that all equipment within the BESS area is defined, battery system operating

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				limits and test data are fully defined, and the BESS failure protection system is defined. Incident response tactics require significant test data and rigorous consequence modelling from the specific BESS design to develop safe protocols for incident response. All risk assessments to be conducted at detailed design for BESS projects required by the Health and Safety Executive (HSE) to assess fire and explosion risk are stipulated in Section 6.1.5 of the **OBSMP [APP-286]**. Further explosion prevention, mitigation, and safety requirements for the Scheme are stipulated in the **OBSMP [APP-286]** Sections: 1.1.6 – 1.1.7, 4.1.3 – 4.1.10, 4.1.18, 4.1.27, 4.1.30 - 4.1.33, 4.1.36 – 4.1.39, 5.1.3, and 5.1.6. The Applicant is currently drafting a Statement of Common Ground (SOCG) with the Environment Agency (EA) on Scheme environmental protection issues including the BESS area drainage strategy. The agreed strategy document will be appended to the OBSMP at Deadline 1, to provide further assurance that all water pollution risks from a BESS fire are fully mitigated. The EA is a statutory consultee for the OBSMP and drainage strategies and must approve the final BSMP and drainage design at detailed design before construction of the BESS commences. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the **OBSMP [APP-286]**. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
JA-003	Other Environmental Matters	BESS Noise and Lighting	I object to the BESS for additional reasons: continuous noise emissions, visual intrusion, and operational lighting that would permanently destroy the tranquillity of the area. The predicted *"incessant hum*" from cooling fans, inverters, and transformers would severely impact residents' ability to sleep, enjoy their homes, or use their gardens.	The noise impacts from the operation of the Scheme and its components, including the BESS, are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers operational noise from all Scheme infrastructure, including the BESS, using realistic worst-case design parameters. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. The Applicant notes that the approach to noise from BESS has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with these measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides reassurance that significant effects from operational noise will be avoided while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise from the BESS and other Scheme components is appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The potential effects of lighting were considered within the Landscape and Visual Impact Assessment (LVIA) in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. No significant effects of lighting, above those recorded for landscape and visual receptors, were recorded. The LVIA has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** and further discussed in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. Measures to control construction lighting are set out in the **Outline Construction Environmental Management Plan (OCEMP) APP-277]**, and operational lighting controls form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed management plans, substantially in

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme. An assessment of landscape and visual effects is provided in the LVIA presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
JA-004	Transport and Access	Traffic Impacts	I object to the construction traffic proposals, which rely on narrow rural lanes that are physically incapable of safely accommodating the volume of HGVs required. Independent analysis shows the applicant has underestimated traffic by over 40%, meaning more than 100 HGV movements per day on single-track	The proposed construction routes have been carefully assessed and are considered to be the most appropriate routes to the Scheme. These do not directly pass any schools. Construction traffic would also be temporary and controlled through measures in the **OCTMP [APP-287]**. The Applicant notes that independent analysis of construction HGV trip generation has not been provided so is unable to comment on this at this stage.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			roads used by schoolchildren, walkers, cyclists, and local residents. This creates an unacceptable and unmanageable safety risk, particularly where there are no pavements, limited verges, blind bends, and multiple public rights of way.	The Applicant has predicted the worst-case construction traffic flows for the Scheme based on a realistic breakdown of construction materials, such as aggregate and number of modules. Calculations are provided in Annex E of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. Further detail of trip generation will also be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and resubmitted at Deadline 1 of Examination. The potential impact of the Scheme on non-motorised users (NMU) is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]** which concludes that there would be no significant impact on NMU as a result of the Scheme. Highway widths of construction routes have been assessed and provide sufficient width for HGV traffic to comfortably pass cyclists and equestrians and, as there is a lack of pedestrian infrastructure (such as pavements) along construction routes, these are considered to be unattractive as walking routes so an increase in HGV construction traffic would not result in a significant adverse impact. An **OCTMP [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]** support the DCO Application and includes outline measures to ensure impacts to NMU along highways and PRoW are minimised as far as practicable. A final CTMP and Public Rights of Way and Permissive Paths Management Plan would be prepared post consent and must be substantially in accordance with the **OCTMP [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]**, respectively, and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 and Requirement 16 in Schedule 2 of the **Draft DCO [APP-016]**.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
JA-005	Socio-Economics, Tourism and Recreation	PRoW and Cycle Path Impacts	I object to the severe impacts on active travel, local walks, and the Wiltshire Cycleway. The frequency of HGVs - one every six minutes - would intimidate vulnerable users, deter people from walking and cycling, and destroy the amenity value of routes that are central to community life and local tourism.	The potential impact of the Scheme on non-motorised users (NMU) is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]** which concludes that there would be no significant impact on NMU as a result of the Scheme. Highway widths of construction routes have been assessed and provide sufficient width for HGV traffic to comfortably pass cyclists and equestrians and, as there is a lack of pedestrian infrastructure (such as pavements) along construction routes, these are considered to be unattractive as walking routes so an increase in HGV construction traffic would not result in a significant adverse impact. An **OCTMP [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]** support the DCO Application and includes outline measures to ensure impacts to NMU along highways and PRoW are minimised as far as practicable. The **OCTMP [APP-287]** confirms that construction deliveries will be managed to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads and restricted to outside of peak hours. With these measures in place, **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that the impact would be negligible to minor adverse. A final CTMP and Public Rights of Way and Permissive Paths Management Plan would be prepared post consent and must be substantially in accordance with the **OCTMP [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]**, respectively, and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 and Requirement 16 in Schedule 2 of the **Draft DCO [APP-016]**. The Applicant confirms that consideration of impacts to PROWs, unsurfaced roads, and the recreational use of the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				highway network has been assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however, understands that some significant adverse effects to users of routes in Lime Down E or regionally important long-distance recreational routes cannot be mitigated further during construction. The assessment has considered the impacts to individual routes to build a picture of the likely impact on the overall PROW and highway network, determining that the overall effects within the 2 km Study Area is not a significant adverse effect at any stage of the Scheme. This is largely owing to the large number of PROWs and rural routes, given a great level of optionality to users, even in the presence of the Scheme. The Applicant has assessed the likely effects on The Wiltshire Way in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers transport matters (safety and delay) but also user experience, amenity and desirability. As a result of the Scheme, and the implementation of mitigation measures to protect cyclist on this route, the Scheme is anticipated to generate a significant adverse effect to users of the Wiltshire Way during construction and decommissioning. The Scheme is however not anticipated to generate any long-term significant adverse effect on users of The Wiltshire Way during the Scheme's operational phase.
JA-006	Socio-Economics, Tourism and Recreation	PRoWs	In particular, I object to the profound impact on the popular Walks Around Hullavington routes, which are enjoyed daily by residents and visitors and are publicly available via the Hullavington Community website - https://hullavington.org/hullavington-	The Applicant confirms that consideration of impacts to PRoW, unsurfaced roads, and the recreational use of the highway network has been assessed in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The routes used for the Hullavington Walks have been assessed therein. The

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			walks/. Walks 1, 2, 3, 4, 6, 7, 8 and 9 all rely on the tranquillity, open views, wildlife, and quiet lanes that define this landscape. Many of these routes use the very lanes and rights of way that would be dominated by HGV traffic, construction noise, dust, and industrial fencing. What are currently peaceful, restorative walks would become unpleasant, unsafe, and in some cases effectively unusable. These walks are not incidental; they are part of the parish's identity, wellbeing, and social fabric. They connect residents to nature, link villages, support local businesses, and attract visitors. The proposal would destroy the qualities that make these routes special, replacing them with noise, intimidation, and industrialisation.	Applicant confirms all routes except routes 1, 3, and 5 interact with Order Limits to some extent. No significant adverse effects (i.e. no greater than moderate-minor adverse effects) to these Hullavington Walks routes are anticipated as a result of the Scheme, subject to implementation of embedded and additional mitigation measures as secured through the **OCTMP [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant seeks to confirm that HGV access for construction is only proposed in this location along the Hullavington-Norton Road to access Lime Down D. The road at Surrendell Farm is only required to facilitate construction of an emergency access to the BESS Site. HGV traffic associated with Lime Down C is only anticipated to cross Pig Lane at a controlled crossing point south of the railway line. PRoW will only be protected by fencing where they go through Solar PV Areas. In this instance, deerstock fencing is proposed, and this will be set back no less than 15 m from the PROW centreline. Elsewhere, either landscape planting will be introduced to reduce visual impacts from nearby elements of the Scheme, or views from PROWs away from the Scheme will be left open. This is shown on **ES Volume 2, Figures 3-4-1 to 3-4-5.2 [APP-084]** based on the indicative Scheme design and is secured in principle through the **OLEMP [APP-283]** by Requirement 7 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant has assessed the impacts of the Scheme on community, social, and personal wellbeing in **ES Volume 1 Chapter 18: Human Health [APP-070]**, wherein the assessment has determined that there are no significant adverse effects to health and wellbeing as a result of the Scheme at any phase.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
JA-007	Landscape and Visual Ecology and Biodiversity	Fencing	I object to the environmental and landscape harm caused by industrial fencing, large-scale visual structures, and the fragmentation of wildlife habitats.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **OEPMS [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **OLEMP [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **OEPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
JA-008	Landscape and Visual	Landscape Recovery Objectives	The proposal contradicts local and national Landscape Recovery objectives by creating impermeable barriers that block natural wildlife movement and erode the rural character of the area.	Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **OEPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme. The landscape and visual effects of the Scheme, including the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				effectiveness of proposed mitigation, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses the Scheme using realistic worst-case design parameters and identifies where significant effects may occur, taking into account embedded mitigation. The Scheme design has been informed by an iterative design process and incorporates a comprehensive package of embedded mitigation measures to avoid, reduce and mitigate landscape and visual effects. These measures include sensitive siting, reductions to the Scheme boundary, minimum offsets from key receptors, retention of existing vegetation, and the provision of new landscape planting and enhancement. The LVIA assesses the effectiveness of these mitigation measures over time and concludes that, in many locations, landscape and visual effects would reduce as mitigation planting establishes and matures. NPS EN-1 recognises at para 5.10.5 that "*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation.*" Details of the mitigation measures and their long-term management are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 in the **OEPMS [APP-084]** and the **OLEMP [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
JA-009	Description and DCO Process	Conclusion	Crucially, I object because the impacts extend far beyond Hullavington. The land within and around the proposed site is a shared rural asset used daily by residents from Norton, Foxley, Corston, Rodbourne, Sherston, Grittleton, and many other communities. They rely on this landscape for its rights of way, tranquillity, open views, wildlife, and the sense of separation between settlements. The proposal would industrialise these shared spaces, replacing a permeable, wildlife-'rich environment with fencing, noise, traffic, and infrastructure that would degrade the experience for every community around the site. This is not a localised impact. It is a 'regional loss of amenity', affecting thousands of people who walk, cycle, ride, and enjoy this landscape as part of their daily lives. The proposal would erase the rural qualities that bind these communities together and define this part of the South Cotswolds. In summary, the so-called 'Lime Down Solar Park' is a misnamed, inappropriate, and fundamentally unacceptable industrial proposal. It places an intolerable burden on Hullavington and its neighbouring villages, industrialises a cherished landscape, endangers residents,	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The assessment finds no significant residual effects to individual PROWs or the PROW network overall. However, residual significant effects are anticipated to some long-distance recreation routes during all phases of the Scheme due to their regional or national importance. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. <u>Visual</u> An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			fragments wildlife habitats, and permanently damages the environment and community life across the wider area. For these reasons, I strongly object to the proposal in its entirety.	rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Noise</u>

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. <u>Construction phase</u> The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan (OCEMP) [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **OCEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan (OOEMP) [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. Traffic The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (OCTMP) [APP-287**] has been prepared and submitted with the DCO application. The aim of the **OCTMP [APP-287]** is to ensure that the effect of the construction phase on the local highway network is minimised. The **OCTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **OCTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. Wildlife and habitats

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9 [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9 [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.

4.35 Cotswolds Edge Riding Club

Table 4-35 RR-0943

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
CERC-001	Socio-Economics, Tourism and Recreation	PRoWs	I object - As a riding club and supporting many riders to fresh air and exercise if Lime kiln is built this will decimate our routes and cut the amount of grazing and crop growing needed to sustain our passion. please reconsider	The Applicant confirms that impacts to PROWs, unsurfaced roads, and the recreational use of the highway network have been assessed in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241].** Consideration of the likely impact on views, character and the desirability of these routes to users has been fundamental to the assessment of likely significant effects. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. Otherwise, no significant adverse effects to horse riders is anticipated at any phase of the Scheme.

4.36 Jackdaws Coffee House

Table 4-36 RR-1975

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
JDH-001	Description and DCO Process	Planning Constraints and Grid Connection	The proposal does not provide adequate detail on planning constraints, grid connection arrangements, or the potential impact on the local area. These omissions make it difficult to properly assess the project's feasibility and raise concerns about its deliverability at this stage.	The Applicant is confident that the management and mitigation measures proposed are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267].** Sections 3.3 and 3.4 of the Planning Statement **[APP-267]** set out the planning constraints within and surrounding the Order Limits of the Scheme. These constraints have been considered as appropriate in the assessments set out within the Environmental Statement. In addition, Section 8 of the Planning Statement **[APP-267]** provides an appraisal of the Scheme's compliance with planning policy. Annex A and Annex B of the Planning Statement **[APP-267]** provide further detail relating to policy accordance in relation to national and local planning policies. Grid connection arrangements have been assessed throughout the **ES [APP-052 to APP-265]**, which considers the likely significant construction effects associated with these works. The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068], and Chapter 18: Human Health [APP-070],** all of which consider potential impacts on residential properties and local communities. The **Grid Connection Statement [APP-270]** details the status of the grid connection offer and provides confirmation that the grid connection forms part of the Scheme and, as such, constitutes a single application to the Secretary of State.

4.37 The Chimney Sweeper Ltd

Table 4-37 RR-4649

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
TCW-001	Consultation and Engagement	Consideration of Feedback	I have made a separate personal submission. However I would like to add from the perspective of my local chimney sweeping company. Travelling from property to property and speaking to local residents it is very apparent that there is a high level of dismay amongst local residents. I would also report there is a big feeling of helplessness and I suspect many, especially older residents, will not engage with this process and many feel it is futile as the inspectorates recommendations can be ignored by government anyway.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The Applicant considers that the statutory consultation has been robust, thorough and undertaken in accordance with the requirements of the Planning Act 2008, the Environmental Impact Assessment Regulations, and the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009. The **Consultation Report [APP-022]** sets out the Applicant's approach to pre-application consultation and demonstrates how consultation was undertaken with a wide range of stakeholders, including local communities, community organisations, statutory consultees and those with an interest in land. Throughout the pre-application period, the Applicant adopted a multi-channel and accessible consultation approach designed to ensure that consultation opportunities were available to all members of the community, including those who may have limited access to digital engagement methods, such as older residents. The consultation strategy therefore included both online and in-person engagement opportunities, alongside a range of offline materials and communication channels. This included multiple in-person community information events. The Applicant also ensured that consultation materials were available in both digital and hard copy formats. The Applicant provided free-to-use communication channels including a Freephone telephone number, Freepost address and dedicated project email address. The Applicant has sought to engage with communities ahead of construction through the implementation of a Community Liaison Group, as secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]**. Whilst this group is set up for the construction phase of the Scheme, the Applicant has committed to providing a designated community contact within

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the Scheme's operation and maintenance team during the operational lifetime of the Scheme, with a dedicated Community Liaison Manager committed to during peak replacement events and decommissioning. This is secured through the **Outline OEMP [APP-279]** and **Outline DS [APP-279]** by Requirements 14 and 20 in Schedule 2 to the **Draft DCO [APP-016]**.
TCW-002	Hydrology, Flood risk and Drainage	Flooding	There are real fears of flooding and dismay at the destruction of the countryside.	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].** The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The approved CEMP must be substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277],** and construction works must be carried out in accordance with the approved document. This includes implementation of the construction phase drainage management measures and surface water controls identified in the **Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218],** ensuring that flood risk and runoff from construction activities are appropriately managed. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**. This secures delivery and maintenance of the drainage strategy for scheme infrastructure, together with soil and water management controls during construction, ensuring there is no material increase in off-site flood risk over the lifetime of the Scheme.
TCW-003	Transport and Access	Traffic Impact	The construction phase will undoubtedly impact negatively on our business as the road network is going to be restricted with roadworks, diversions and heavy	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			traffic.there are limited alternative routes in this area.	with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment concludes that with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (OCTMP) [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen, fencing, and dust and noise control,

4.38 Martin Fausing Smith

Table 4-38 RR-3033

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
MFS-001	Description and DCO Process	Introduction	I'm the Wiltshire Councillor for the Sherston Division. Much of this project is within the area I represent. I wish to register my objection to the proposed Lime Down Solar Farm development.	The Applicant notes the objection raised. The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.
MFS-002	Socio-Economics, Tourism and Recreation Transport and Access	PRoWs and Access to the Countryside	Many residents enjoy the open spaces and use the roads that will be impacted by this project.	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The assessment finds no significant residual effects to individual PROWs or the PROW network overall. However, residual significant effects are anticipated to some long-distance recreation routes during all phases of the Scheme due to their regional or national importance. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
MFS-003	Landscape and Visual Human Health	Impact on Landscape and Local Wellbeing	I wish to state that I do not believe this this development is appropriate, and in fact will be severely detrimental to the landscape and to the wellbeing of surrounding communities.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "*lens*" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
MFS-004	Description and DCO Process	Scheme Location and Ownership	Whilst I support community renewable energy projects that benefit our local community, this project does not. It is the wrong project, in the wrong place, and under the wrong ownership.	The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities (as assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**), and providing skills and training opportunities (as secured through the **OSSCEP [APP-285]** through Requirement 18 of Schedule 2 to the **Draft DCO [APP-016]**). Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. This is secured through the **OLEMP [APP-283]** and **OPROWPPMP [APP-282]** through

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Requirements 7 and 16 of Schedule 2 to the **Draft DCO [APP-016]**. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Regarding the Scheme ownership, the Applicant has demonstrated compliance with all statutory requirements under the Planning Act 2008 and applicable legislation such as The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. The Applicant is subject to legally binding DCO requirements. The Planning Act 2008 also contains enforcement provisions regarding compliance with the terms of a DCO The DCO process itself incorporates enforceable mechanisms to regulate Scheme delivery. Any breach of development consent order or failure to comply with Requirements can result in enforcement action. The Applicant, Lime Down Solar Park Limited is a 100% subsidiary of IGP UK Projects Limited. Both are registered in England and Wales and subject to UK tax law and regulations. Investment may come from a range of sources, including international ones. This is common practice with UK infrastructure Schemes and helps fund the transition to clean energy at the scale required. The **Funding Statement [APP-019]** submitted with the DCO application demonstrates that the Scheme is financially viable and adequately funded to deliver the Scheme in full.
MFS-005	Site Selection and Alternatives	Panel Height	Scale and Landscape Impact. The solar panels will be much bigger and higher than any project we have seen in the UK.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Landscape and Visual Effects The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. The landscape and visual effects of the Scheme, including the effects of the maximum panel height, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors during construction, operation and decommissioning, using the maximum design parameters to ensure a robust assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These include new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
MFS-006	Landscape and Visual Socio-Economics, Tourism and Recreation	PRoWs and Fencing	Our footpaths will be hemmed in by high wire fences.	Fencing is not proposed within 15 m of the centreline of existing PRoW. The buffer space between PROWs and fences, would be planted with either hedgerows or low-level ground cover planting to encourage either visual screening, or improve biodiversity. These are shown on **ES Volume 2, Figures 3-4-1 to 3-4-5.2 [APP-084]** and secured through the **OLEMP [APP-283]** by Requirement 7 in Schedule 2 to the **Draft DCO [APP-016]**. Where PROWs run alongside existing or proposed hedgerows, these will only be to one side of the PROW to maintain open aspect and passing space on the opposite side. Only PROWs or unsurfaced roads that are hedge lined on both sides will be maintained as such. The majority of site fencing is to consist of 2 m deer stock fencing. This is to control large mammalian movements and provide a visual deterrent to entering the Solar PV Sites. Metal palisade fencing is only proposed in locations where there is a danger to life, and so is limited to substation and BESS enclosures. Palisade fencing is not proposed adjacent to PROWs. Where PROWs run adjacent to substations, these are separated by existing hedgerows, which will be strengthened, and palisade security fencing will only be located on side of the hedgerow facing the substation infrastructure.
MFS-007	Landscape and Visual	Visual Impact and Mitigation	The open, rolling landscape will be covered by a sea of black panels. Mitigating the visual impact will be impossible.	The Applicant notes that visual impacts are addressed in detail in the response above and does not repeat that information here to avoid duplication. The LVIA assesses the effectiveness of these mitigation measures over time and concludes that, in many locations, landscape and visual effects would reduce as mitigation planting establishes and matures. NPS EN-1 recognises at para 5.10.5 that "*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape*

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				character impacts arising from mitigation." Details of the mitigation measures and their long-term management are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**.
MFS-008	Noise and Vibration	Noise Pollution	There is also the constant noise pollution that will be generated by a large number of moving panels. substations and battery storage in what is a tranquil environment.	An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
MFS-009	Landscape and Visual		The substations and battery storage system will be industrial in scale and totally out of keeping with a landscape that border the Cotswolds National Landscape. The proposed development would have a major and lasting impact on the open spaces and visual amenity afforded to local residents.	The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084] and** the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
MFS-010	Soils and Agriculture	Loss of Farmland	Loss of Productive Farmland. Approximately 30% of the farmland is 'best and most versatile' farmland. The removal of this high-quality farmland for decades at a time is not compatible with sustainable planning. With growing concerns over food supply and national resilience, we should not be trading productive soil for imported food while leaving roofs, brownfield sites, and degraded land underused for renewable generation – especially when national targets for solar energy can be met by prioritising	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in ES Chapter 17, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%)

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			those more suitable locations first, as stated by the Council for the Protection of Rural England.	of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in ES Chapter 17, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (ES Chapter 17, Sections 17.10 and 17.12). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution and in the Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
MFS-011	Construction and Decommissioning	Construction and Disruption	Disruption Without Local Benefit. The construction and maintenance of such a large installation would bring years of disruption to nearby communities, including heavy vehicle movements on rural roads and lanes ill-suited to industrial traffic.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by WC. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
MFS-012	Transport and Access	HGV Modelling	I believe the truck movements modelled in the proposals are seriously underestimated.	The Applicant has predicted construction traffic flows for the Scheme based on a realistic breakdown of construction materials, such as aggregate and number of modules. Calculations are provided in Annex E of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. Further detail of trip generation will also be added to **ES Volume 3,**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Appendix 13-1: Transport Assessment [APP-233] and resubmitted at Deadline 1 of Examination.
MFS-013	Transport and Access	Highway Improvement Areas	The proposals include major changes to rural lanes and urban roundabouts to allow vehicles through that are so large they need an escort.	All changes to accommodate AIL vehicles are minor and included within the Order Limits as Highway Improvement Areas (HIA). Details of HIA are provided in the **OCTMP [APP-287]** and would include temporary works including minor carriageway widening, removal of street furniture, and vegetation clearance. AIL movements are one-off and the Applicant will follow the standard procedures which can include the requirement for escort.
MFS-014	Community Benefits	Benefits for Local Residents	Yet the proposal offers no tangible benefits for local residents – no reduction in energy bills, and no meaningful community investment. Local people are being asked to bear the costs without sharing in the gains.	The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities (as assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**), and providing skills and training opportunities (as secured through the **OSSCEP [APP-285]** through Requirement 18 of Schedule 2 to the **Draft DCO [APP-016]**). Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. This is secured through the **OLEMP [APP-283]** and **OPROWPPMP [APP-282]** through

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Requirements 7 and 16 of Schedule 2 to the **Draft DCO [APP-016]**. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme.
MFS-015	Other Environmental Matters	Glint and Glare	Glint and Glare. Normally it would be possible to model the impact of glint and glare on residents and road/footpath users, but this modelling is impossible when dealing with panels that will be constantly moving whilst tracking the sun.	An assessment of glint and glare effects arising from the Scheme is provided in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072], Section 20.5: Glint and Glare**. The assessment considers potential effects on surrounding receptors, including road and rail users, residential properties, public rights of way, aerodromes and sensitive viewpoints within the Cotswolds National Landscape. Modelling glint and glare from tracking panels requires a model to account for the movement of panels throughout the day but this is well-understood within the industry and is implemented within the modelling software used in the preparation of the **ES Volume 3, Appendix 20-4: Solar Photovoltaic** **Glint and Glare Study [APP-261].** The assessment concludes that, with embedded mitigation measures, including the use of fixed-tilt panels at a maximum height of 2.5 metres where required, no significant glint or glare effects are predicted to occur as a result of the Scheme.
MFS-016	Other Environmental Matters	BESS Safety	Fire and Safety Risks – Battery Energy Storage Systems (BESS). The proposed large-scale Battery Energy	The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			Storage System (BESS) in the Lime Down proposal brings additional risk. This is very close to Sherston. Fires in lithium-ion battery installations are rare but can be catastrophic. Once thermal runaway begins, such fires are extremely difficult to control, burning at high temperatures and releasing toxic gases. If the wind is in the wrong direction, I can envisage the evacuation of Sherston village and/or Malmesbury due to the plume of toxic smoke.	fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: BESS Fire Emissions Study Area[APP-166]**. The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286]**. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: "*...at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is fully*

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.4) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider." An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the OBSMP. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 2.4.2 of the OBSMP stipulates that: *"Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing (LSFT) and rigorous consequence modelling to minimise the requirement for any D&WFRS intervention in a thermal runaway incident. LSFT must establish minimum equipment spacing distances that demonstrate there is no fire propagation to adjacent BESS enclosures or ESS equipment. D&WFRS intervention in worst case scenarios would typically be limited to boundary cooling of adjacent BESS and Energy Storage System (ESS) units to prevent the fire from spreading. This strategy will be finalised with D&WFRS and be clearly communicated in the Emergency Response Plan (ERP);* • *To ensure that fire, smoke, and any release of toxic gases does not significantly impact site operatives, first responders, and the local community; and* • *To ensure that firewater run-off is contained and tested before release or, if necessary, removed by tanker and treated offsite."*

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Final comprehensive risk assessment reports, BESS design and site-specific consequence modelling, and detailed Emergency Response Plans (ERPs) can only be drafted when based upon the specific BESS design selected at the detailed design stage. Key safety content requires that all equipment within the BESS area is defined, battery system operating limits and test data are fully defined, and the BESS failure protection system is defined. Incident response tactics require significant test data and rigorous consequence modelling from the specific BESS design to develop safe protocols for incident response. As now mandated under NFPA 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP pre-construction requirements (Section 6). The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
MFS-016	Other Environmental Matters	Contamination to Water Sources	Risk of Contamination of Drinking Water and Rivers from Fire Suppression. If a fire were to occur, the water and chemicals required to	Potential contamination of ground and surface waters arising from a BESS fire and fire suppression activities has been assessed, and the assessment concludes that the proposed design would prevent uncontrolled release to the water

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			extinguish it would likely enter the soil and local watercourses, contaminating the aquifer that supplies nearby communities. This is a classic "*low risk, high consequence*" scenario – one that planning authorities must treat with the utmost seriousness. Even if the statistical likelihood is low, the consequences of failure would be severe and long-lasting, with potential impacts on public health and the environment.	environment, including groundwater and connected watercourses. This is set out in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**, supported by the BESS specific drainage, containment and pollution control strategy in **ES Volume 3, Appendix 11-6 Flood Risk Assessment and Drainage Strategy – Lime Down D BESS [APP-215]**. The BESS drainage strategy incorporates engineered containment, isolation and controlled drainage to retain firewater and any potentially contaminated runoff within the site, breaking pathways to soils, aquifers and surface waters. These measures are complemented by the operational controls and incident response framework set out in **Outline Battery Safety Management Plan [APP-286]**, which addresses fire response, management of contaminated water and protection of the surrounding environment. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant is currently drafting a Statement of Common Ground (SOCG) with the Environment Agency (EA) on Scheme environmental protection issues including the BESS area drainage strategy. The agreed strategy document will be appended to the OBSMP at Deadline 1, to provide further assurance that all water pollution risks from a BESS fire are fully mitigated. The EA is a statutory consultee for the OBSMP and drainage strategies and must approve the final BSMP and drainage design at detailed design before construction of the BESS commences. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. Detailed implementation of firewater management and pollution control measures will be set out within the relevant management plans, including the OBSMP, which are secured through requirements in Schedule 2 of the Draft Development Consent Order and must be submitted to and approved by the relevant planning authority prior to construction and operation, ensuring that groundwater and drinking water supplies are appropriately protected.
MFS-017	Human Health	Mental Health	Mental Health. Many residents enjoy walking, cycling and riding through the byways and footpaths in our beautiful landscape. I believe that many residents mental health will be adversely impacted if they are walking along paths bordered by high security fences overlooking a sea of black solar panels in every direction; Residents choose to live in this rural area. If they wanted to live in an industrial landscape they would choose to live somewhere else.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health *"lens"* to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**. These are confirmed as embedded mitigation measures in Section 16.9 of ES Chapter 16. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283]**. These are considered as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths MP is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction.
MFS-018	Hydrology, Flood risk an d Drainage	Flooding	Flood risk. We live on top of a complicated geology with two important acquifers below us, which supply drinking water to this area, to Bath and even to London. We are also	The hydrology, flood risk and drainage assessment considers surface water, fluvial flood risk, groundwater and downstream receptors across the Bristol Avon catchment and concludes that the Scheme would not increase flood risk or adversely affect groundwater resources. This assessment is set out

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			at the head of the Bristol Avon catchment. We already have flooding issues in the area with sometimes major flooding at Brook End (near Luckington), Malmebury, Corston, Chippenham and beyond. Its vital that there is no increased risk of flooding caused by the unpredictable runoff from solar panels which could be at very different orientations depending on the time of day. I see little serious evaluation of this risk.	in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063**], which considers existing flooding constraints and effects beyond the Order limits, including locations downstream of the Site. The submitted assessment presented in **ES Volume 3, Appendix 11-1 Flood Risk Assessment and Drainage Strategy - Lime Down Covering Report [APP-210]** reflects established hydrological evidence that the addition of solar panels over a vegetated field does not materially increase runoff volumes, peak discharges or response times, and that changes in hydrologic response are primarily associated with alterations to ground cover beneath the panels rather than the panels themselves. Panelled areas are therefore designed so rainfall continues to drain to ground, with no creation of extensive impermeable surfaces and with controls in place to avoid any increase in discharge to watercourses. On this basis, the assessment presented in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** concludes that the Scheme would not increase flood risk to downstream locations such as Brook End, Malmesbury, Corston or Chippenham. Measures to manage surface water runoff and drainage are set out in the outline drainage and construction management plans (**ES Volume 3, Appendix 11: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218] and Outline Construction Environmental Management Plan [APP-277]** accompanying the Application. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Consistent with NPS EN-3 paragraph 2.10.84, these controls distinguish between solar PV panel areas, which drain to the existing ground and do not generally

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				give rise to significant drainage effects, and associated infrastructure where runoff controls are required. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**. This secures delivery and maintenance of the drainage strategy for Scheme infrastructure, together with soil and water management controls during construction, ensuring there is no material increase in off-site flood risk over the lifetime of the Scheme.
MFS-019	Cultural Heritage	Archaeology	Archaeology. The proposal from Island Green Power already admits that the project will cause archaeological harm in an area where there is evidence of Roman and pre-Roman settlements. This issue needs to be addressed.	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by appendices in **ES Volume 3 (12.2 to 12.5) [APP-220 to APP-230],** has assessed the potential impact of the scheme on identified archaeological assets. The chapter concluded that following mitigation, residual effects would either be neutral/negligible or minor/moderate and therefore not significant. Where required, appropriate mitigation is proposed such as preservation in situ or Strip, Map and Record. See Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation and Section 12.11 for additional mitigation. An outline archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12.6 Archaeological Mitigation Strategy [APP-230]** and secured through Requirement 12.

4.39 Grittleton Sevington and Leigh Delamere Village Hall and Recreation Ground

Table 4-39 RR-1743

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
GS-001	Description and DCO Process	Introduction	My name is Lawrence Copeland. I am a resident of Grittleton and a Trustee of the Grittleton Village Hall Charity (see Background below). I make this submission in my capacity as a Trustee of the Village Hall Charity for and on behalf of the Trustees of the Village Hall Charity, collectively. The Trustees of the Village Hall Charity object to the proposed Lime Down Solar Power and battery energy storage project. Main reasons are:	The Applicant notes this comment.
GS-002	Transport and Access	Traffic Impact	Due to its proximity to the Village Hall, the construction required for the underground cables, including compound, could significantly impact the number of users of the Hall. 1.1. The heavy construction traffic, with its disruption, noise & pollution, coupled with the safety aspect of getting to the Hall along a narrow road, would dissuade people from attending the activities offered.	Grittleton Village Hall has been assessed as a specific recreational receptor in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. This identifies that during construction, a residual medium-term temporary moderate-minor adverse effect is anticipated to users of these facilities. This is not a significant effect, subject to the implementation of additional mitigation measures to control HGV movements to and from the construction compound. Construction deliveries are restricted to outside of peak hours and not on Sundays secured as part of the CTMP. These measures are set out in the **Outline Construction Traffic Management Plan (OCTMP) [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**.
GS-003	Description and DCO Process	Background	Background of the Village Hall Charity Grittleton has a modern village hall and sports field/recreation ground, including a cricket square, a	The Applicant notes these comments, and it confident the level of assessment to identify the likely significance of effects to the village hall, as a locally important recreational facility, is proportionate and robust.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			Victorian Cricket Pavillion, a well-equipped children's playground and a Multi-Use Games Area with an all-weather surface. That ground, referred to elsewhere in this submission as 'the Village Ground' has an area of 5.74 acres and includes the site of the current village hall. The Village Ground was conveyed by former owners of Grittleton House and the Grittleton Estate to Trustees, members of the local community, by a Conveyance made on 11 July 1984 ('the 1984 Conveyance'). In effect, the 1984 Conveyance vested the Village Ground in the community for the benefit of those living in the community. The freehold title to the Village Ground is registered with title absolute at Land Registry under title WT287079. The Village Ground is vested in The Official Custodian for Charities on behalf of the Trustees of the charity known as Grittleton Sevington and Leigh Delamere Village Hall and Recreation Ground. Grittleton Sevington and Leigh Delamere Village Hall and Recreation Ground is a registered charity (Charity number 290380). The working name of that charity is 'Grittleton Village Hall'. It is referred to elsewhere in this submission as 'the Grittleton Village Hall Charity'.	

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			The 1984 Conveyance records the objects of the Grittleton Village Hall Charity namely (and to quote from the 1984 Conveyance) the provision and maintenance of a village hall and a recreation ground for the use of the inhabitants of the Parish of Grittleton Sevington and Leigh Delamere, without distinction of political religious or other opinions including use for meetings lectures and classes and for other forms of recreation and leisure-time occupation with the object of improving the conditions of life for the said inhabitants. The 1984 Conveyance also records a requirement for administration and management of the Grittleton Village Hall Charity, including a requirement for a Committee of Management whose members shall be the Charity Trustees of the Charity for the purposes of the Charities Act 1960. There are eleven Trustees of the Grittleton Village Hall Charity, all residents in the local community. They are referred to elsewhere in this submission as the GVH Trustees or simply 'the Trustees'. The Village Ground is within the boundary of the Cotswolds National Landscape and also the Grittleton Conservation Area (see Appendix A). Being located at the eastern edge of Grittleton village and looking out over open farmland or parkland,	

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			the Village Ground is in a tranquil spot, ideally suited to recreational and leisure activities. It is the home ground of Grittleton Cricket Club. Cricket has been played on this ground since before 1868. Apart from the Grittleton Cricket Club, the ground is also used by the village pub team, The Neeld Arms, service personnel from Buckly Barracks in Hullavington and a Chipping Sodbury Cricket Team from South Gloucestershire. The Village Hall was architect designed and built towards the southern end of the Village Ground in the late 1980's. It was completely refurbished in 2015 and can accommodate a wide variety of activities and functions ranging from wedding celebrations, village pantomimes, film nights and music evenings, band/orchestra rehearsals and wellbeing classes such as pilates, yoga and ballroom. Over 130 people each week take part in the various classes offered and during the pantomime period, over 150 villagers of all ages will play a part in its production. The playground, located in the southeast corner of the Village Ground was first laid out, fenced and equipped approximately 20 years ago with the benefit of funds totalling £40,000 raised entirely by fund raising activities within the	

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			community. The Multi-Use Games Area, situated adjacent to the Village Hall and the playground, was first constructed some years later at a cost of £50,000 of which £25,000 was raised by fund raising activities within the community. The raising of those funds was a phenomenal achievement for a community of 160+ households and a measure of its commitment to provide such facilities at the Village Ground for all to use. The playground has been much modernised since its original construction. The Village Hall, Multi-Use Games Area and playground are carefully managed and maintained by the GVH Trustees. As a popular venue for daytime and evening activities and functions, the Village Hall benefits from regular and frequent bookings for which hire charges are payable. The income in the form of hire charges received by the Grittleton Village Hall Charity for those bookings is an essential source of income (92% over the last 3 years) to help with payment of all outgoings on and costs of maintenance of the Village Hall, the Multi-Use Games Area and the playground.	
GS-003	Transport and Access	Cable Route Corridor	Impact on the running of the Hall The GVH Trustees see from Lime Down Solar's application that the proposed project includes:	Grittleton Village Hall has been assessed as a specific recreational receptor in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. This identifies that during construction, a residual medium-term

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			a. the laying of underground cables linking the proposed Lime Down Solar Power and battery energy storage facilities to the Melksham substation along a route passing close to the eastern boundary of the Village Ground b. a contractor's compound located close to the Village Ground. The Trustees are most concerned that, if the proposed Lime Down Solar Power and battery energy storage project were to go ahead, the additional vehicular traffic generated by the laying of underground cables and use of the contractor's compound close to the Village Ground (See Appendix B), including articulated lorries, HGVs, vans and cars transporting materials, workers and others to and from site for a period of two years or longer, would create noise and pollution and endanger pedestrians and cyclists.	temporary moderate-minor adverse effect is anticipated to users of these facilities. This is not a significant effect, subject to the implementation of additional mitigation measures to control HGV movements to and from the construction compound. These measures are set out in the **Outline Construction Traffic Management Plan (OCTMP) [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**.
GS-004	Transport and Access Noise and Vibration	Noise and Pollution from Construction Traffic	The noise and pollution would be to the detriment of the tranquillity and other special qualities of the facilities at the Village Ground. This would likely cause users of the facilities, including children and adults, to reconsider their participation in the various wellbeing and physical activities offered. It is hard to relax and unwind with constant traffic, gear changing and braking as they	The assessment of likely effects to Grittleton Village Hall as assessed **in ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** identifies that during construction, a residual medium-term temporary moderate-minor adverse effect is anticipated to users of these facilities. This has considered likely amenity impacts from noise and visual impacts as a result of the proximity of cable works and the construction compound to the village hall complex, and the likely impact on accessibility and amenity as a result of HGV movements. This is not a significant effect, subject to the implementation of additional

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			prepare to turn into the cable route entrances or accelerating away.	mitigation measures to control HGV movements to and from the construction compound and cable route access points. These measures are set out in the **Outline Construction Traffic Management Plan (OCTMP) [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**.
GS-005	Transport and Access	Traffic Impacts	The timing of construction traffic arriving/departing, 09:00 - 17:00, avoiding 'network peak hours' clashes with the peak income earning periods for the Village Hall, 09:30 - 12:00. This is assuming that the construction workers will need to arrive as soon after 09:00 as possible. There are also concerns over walking or cycling to the Village Ground. Many users of amenities at the Village Ground walk on footpaths along The Street or cycle along The Street to gain access to and from the Village Ground. In particular, there is likely to be a perception of a risk of harm to users of the playground and the Multi-Use Games Area, those outside facilities being just yards away from the roadway over which the heavy construction traffic would pass. The number of users of those facilities would reduce as a consequence. A reduction in bookings of the Village Hall would cause a reduction in the income receivable by the Grittleton Village Hall Charity to the detriment of the Charity's financial position and	Vehicle movements for workers and for HGV deliveries have been proposed to be controlled through the measures set out in the **Outline Construction Environmental Management Plan (OCEMP) [APP-277]** and **Outline Construction Traffic Management Plan (OCTMP) [APP-287]**. These set out that construction workers are anticipated onsite from 07:00-18:00 on weekdays and 08:00-13:30 on Saturdays, with traffic movements restricted during morning (08:00-09:00) and evening (17:00-18:00) peaks. HGV deliveries will be further restricted to the hours of 09:30-16:30 during weekdays and 09:30-13:30 on Saturdays. These measures have been implemented to avoid traffic movements at peak times, thus minimising impacts on other highway users, including non-motorised users (such as pedestrians and cyclists). Resultantly, the assessment in **ES Volume 1 Chapter 13: Transport and Access [APP-065]** does not identify any significant adverse effects to highway users. The Applicant is therefore confident that the Scheme would not result in any significant indirect impacts to the use of and access to the Village Hall and its supporting sports and play facilities. A final CEMP and CTMP would be prepared post consent and must be substantially in accordance with the **OCEMP [APP-277]** and **OCTMP [APP-287]** and approved by the relevant local planning authorities, as secured by

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			would also be detrimental to the community.	Requirement 13 and 15 in Schedule 2 of the **Draft DCO [APP-016]**, respectively.
GS-006	Transport and Access	Access	Access to the Village Hall Occasionally, it is necessary for users of the Village Hall or other amenities at the Village Ground to lawfully park their vehicles on The Street adjacent to the Village Ground. This happens on occasions when there is insufficient space in the metalled car park within the Village Ground. The Village Ground is accessed from The Street, Grittleton - a minor road, classified under the Government's road classification system as a 'classified unnumbered' road. The parking of vehicles on The Street has the effect of reducing the width of The Street capable of being used by other vehicles. In effect, this can make lengthy sections of The Street single track. The likelihood of damage to Village Ground user's vehicles parked on The Street would be increased if the proposed Lime Down Solar Power and battery energy storage project were to go ahead and additional vehicular traffic generated by the project, including articulated lorries, HGVs, vans and cars transporting materials, workers and others to and from site were to be routed through Grittleton.	The Street through Grittleton does not form part of the construction routes for the Solar PV Sites and instead would serve two accesses for construction within the Cable Route Corridor. The proposed construction routes have been carefully assessed and are considered to be the most appropriate routes to the Scheme. The Street is already suitable for existing traffic and would be able to accommodate the additional traffic required. Construction traffic would also be temporary and controlled through measures in a CTMP. As set out in Paragraph 13.10.66 of **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, the construction of the Cable Route Corridor is anticipated to generate a low level of trips and will only be in use for a temporary construction period of approximately 90 days.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
GS-007	Transport and Access	Traffic Impacts	Grittleton is located relatively close to the M4 motorway, part way between M4 Junction 17 and M4 Junction 18. The Street, Grittleton is on a vehicular route which has become an alternative route for users of the M4 who, assisted by satellite navigation systems, choose to divert from the M4 to avoid obstructions or delays on the M4 between Junctions 17 and 18. This happens surprisingly frequently and chaotic scenes on The Street have been witnessed when heavy volumes of traffic, diverted from the M4 and coming from opposite directions, attempt to negotiate a way through Grittleton by passing along The Street the useable width of which is reduced by cars lawfully parked on The Street. In these circumstances, vehicles have been seen mounting the kerbs at the side of The Street, driving along the pavements at the side of The Street and making a dash for a gap in the traffic in an effort to get through. Situations such as those described would be aggravated and made even worse if the proposed Lime Down Solar Power and battery energy storage project were to go ahead and additional vehicular traffic generated by the project, including articulated lorries, HGVs, vans and cars transporting materials, workers and others to and from site were to	The Street through Grittleton does not form part of the construction routes for the Solar PV Sites and instead would serve two accesses for construction within the Cable Route Corridor. The construction deliveries are along fixed routes and restricted to outside of network peak hours as set out in the **Outline Construction Traffic Management Plan (OCTMP) [APP-287]**. No rerouting will be made to avoid delays due to these fixed construction routes and trips outside of peak hours makes any delays less likely. If a diversion is in place, then the low number of vehicles generated by the cable route access will not add significantly to the existing diverted traffic. The proposed construction routes have been carefully assessed and are considered to be the most appropriate routes to the Scheme. The Street is already suitable for existing traffic and would be able to accommodate the additional traffic required. Construction traffic would also be temporary and controlled through measures in a **(OCTMP) [APP-287]**. As set out in Paragraph 13.10.66 of **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, the construction of the Cable Route Corridor is anticipated to generate a low level of trips and will only be in use for a temporary construction period of approximately 90 days. Rerouting of traffic between Junction 17 and 18 of the M4 would also only be occasional.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			be routed through Grittleton. Such impacts would be detrimental to users of amenities at the Village Ground.	
GS-008	Socio-Economics, Tourism and Recreation	Conclusion	Summary Island Green Power has stated that the "*project will minimise impacts*" and "*minimise effects*" but GVH Trustees are most concerned that adverse impacts and effects from this development would be unavoidable and would have negative effects on users of amenities at the Village Ground. Alongside the detriment to their physical health and mental wellbeing, if enough of these users were to seek alternative locations for their classes, the financial impact on the Village Hall Charity would be significant, impacting its ability to provide for the use of the inhabitants of the Parish of Grittleton Sevington and Leigh Delamere. Appendix A " Map of Grittleton Conservation Area Appendix B " Extract from Lime Down 'Outline Construction Traffic Management Plan' showing location of Village Hall Ground and Construction Entrances to the Cable Route	The assessment of effects to users of Grittleton Village Hall acknowledges there is likely to be a medium-term temporary moderate-minor adverse effect during construction. Whilst the Applicant has committed to mitigate effects as much as possible, it is appreciated that there will be some level of adverse effect to amenity and use. That notwithstanding, the Applicant seeks to reiterate that this is a temporary effect, and will last only as long as construction works on this section of the cable route are ongoing. The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions (as identified within **ES Volume 1 Chapter 3 The Scheme APP-055**-to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route will be undertaken within the parameters (including in relation to width and depth of the cable trench) assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Outline CTMP includes community liaison measures to keep local communities informed of construction activity and to provide a contact point for feedback should any issues arise. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that prior to construction, a CEMP must be submitted to and approved by the relevant planning authority, and that CEMP must be substantially in accordance with the **Outline CEMP [APP-277]**All construction works will be carried out in accordance with the approved CEMP. Furthermore, the Applicant has considered the likely effects on health and wellbeing as a result of impacts to 'open space, leisure and play' facilities in **ES Volume 1 Chapter 18: Human Health [APP-070]**. Again, this identifies that whilst there is some level of adverse effect predicted as a result of the Scheme (overall a minor adverse effect), this is anticipated to be temporary and is not considered a significant effect.

4.40 Whatley Manor Hotel

Table 4-40 RR-4894

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WMH-001	Soils and Agriculture	Use of Farmland	I totally object to this project which is destroying valuable agricultural land. Use roofs, verges of motorway, verges of train tracks... Chippenham if full of vast industrial buildings, put solar panels on their roofs! We need food in this country, stop destroying valuable land with solar farm and housing estates. Think smart like other countries!!	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in ES Chapter 17, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in ES Chapter 17, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

				Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (ES Chapter 17, Sections 17.10 and 17.12). Government led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF).

				Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution and in the Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.

4.41 Whatley Manor Hotel & Spa

Table 4-41 RR-4895

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
WMHS-001	Landscape and Visual Soils and Agriculture	Scheme Scale and Location	To Whom it may concern, I am writing to lodge my formal objection to the proposed development of a large-scale solar farm covering approximately 3000 acres of agricultural land located within an area of outstanding natural beauty (AONB). While I do support and like the idea of transitioning to renewable energy, this proposal is absolutely wrong in terms of scale and location. The AONB area exists to protect and conserve some of the nations most loved landscapes, the proposed planning of panels, fencing, cameras and other infrastructure's would permanently damage and change the visual character of this area.	<u>Scale</u> The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. The total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. <u>Agricultural Land Use</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in ES Chapter 17, Section

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in Section 17.10 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				(OSRMP) [APP-280], which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**). <u>Location</u> National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the Site Selection

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. <u>Proximity to the Cotswolds National Landscape</u> The Applicant confirms that the Scheme is not located within the Cotswolds National Landscape (formerly Area of Outstanding Natural Beauty). The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the **Biodiversity Net Gain Assessment Report (BNG assessment) [APP-273**]) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed, and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084] and** the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Outline Landscape and Ecological Management Plan (OLEMP) [APP-283], and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
WMHS-002	Soils and Agriculture	Food Security	The proposal would remove a vast area that could be used for agricultural reasons at a time where food security and local food are increasingly important. how can we back British farmers if we are openly taking their resources away from them?.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP069]**, supported by **ES Volume 3, Appendix 171: Agricultural Land Classification and Soil Resource Survey Report [APP243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered highquality agricultural land in planning terms. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
WMHS-003	Soils and Agriculture	Rooftop Solar	There are far more better options in terms of location for solar panels such as brownfield land, rooftops of industrial estates, car parks etc. So many countries around the world have	The Applicant has addressed the use of agricultural land in the responses provided above. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution and in the**

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			already implemented this yet we are here voicing our concerns and forcing the government to follow these measures when really its a no brainer!.	**Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
WMHS-004	Ecology and Biodiversity	Biodiversity and Ecosystems	The effect on bio diversity and local ecology would be detrimental due to the sheer scale of the development. it would disturb wildlife colonies, and a have a massive toll on ecosystems. AONB's are known to have legally protected habitats surely the disruption of these contradicts the national policy aim to enhance such areas?.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9 [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9 [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.
WMHS-005	Socio-Economics, Tourism and Recreation	Tourism	The development would risk harming tourism in the Cotswolds area which already so popular amongst people living this country and people visiting this country. Local residents, walkers visitors and businesses depend on the value of this area , industrialising it would have a massive impact on the local economy of the area. For these reasons I respectfully request that the Examining Authority refuse the Lime Down Solar Project.	The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the **ES Chapter 16 [APP-068]** and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant is discussing the approach to assessment of tourism impacts with Wiltshire Council's Economic and Regeneration Team and those discussions will be set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
WMHS-006	Soils and Agriculture	Use of Farmland	I totally object to this project which is destroying valuable agricultural land. Use roofs, verges of motorway, verges of train tracks... Chippenham if full of vast industrial buildings, put solar panels on their roofs! We need food in this country, stop destroying valuable land with solar farm and housing estates. Think smart like other countries!!	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in ES Chapter 17, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in ES Chapter 17, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (ES Chapter 17, Sections 17.10 and 17.12).

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution and in the Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.

4.42 Grittleton Tennis Club

Table 4-42 RR-1744

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
GTC-001	Socio-Economics, Tourism and Recreation	Recreational Facilities	I am the Chairman of Grittleton tennis club and on behalf of its members strongly object to this scheme. The club was formed in 1995 and celebrated its 30th anniversary this year. The club has 36 members who are from the surrounding area and has been able to exist on the kind provision of courts at Grittleton House, Church House and The Village Hall MUGA. The club provides a fantastic opportunity for beginners and improvers at its weekly social tennis evenings and more competitive competition to the best players as part of a mixed league team in the Wiltshire area. Parking for tennis is in the small residential street in Grittleton, access between the courts is provided by walking between the properties in The Street, Grittleton and the games are generallly played at a time that would coincide with construction hours for the scheme. The benefit and appeal to most members and visitors alike, is the friendly and peaceful setting around a village of listed buildings, all of which,including The Street itself, sit within Grittleton Conservation Area	The likely effects on recreational facilities have been assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241].** Grittleton Tennis Club has identified that it uses the tennis courts at Grittleton Village Hall, which has been included as part of the assessment of the facilities for the Grittleton Cricket Club. The Applicant has identified a temporary medium-term moderate-minor adverse effect to the sports facilities at Grittleton Cricket Club (which includes the tennis courts) due to the proximity of the proposed cable route construction compound, and the use of The Street for HGV movements during construction. These effects are subject to mitigation measures to minimise effects from construction movements in this area, as secured through the **OCTMP [APP-287]** by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. This includes limitations on HGV movement times to 09:30-16:30 on weekdays and 09:30-13:00 on Saturdays, to ensure HGV movements do not coincide with morning and evening peaks. The Street is not part of the construction route so the club won't be affected directly by construction traffic however, delays and the potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			and the Cotswolds National Landscape. The proposed scheme puts this club at risk of closure unnecessarily, all because the land identified for the solar panels is devoid of a grid connection. The requirement to devastate 22km of peaceful open countryside, used in this countries food production, all for a distant connection is a madness that will threaten peoples livelyhood, their safety, their education, their opportunites and their wellbeing. We are only one club, of which there must be hundreds, that are at risk from this scheme. As a nation, we should all be aware of the effect mental health has on the population and the crucial part played by clubs like ours. The issues created by this scheme that effect our club centre on the proposal to utilise small unclassified country and village roads and streets for the construction, in the case of Grittleton, those that form part of the Grittleton Conservation Area and the Cotswolds National Landscape.	The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment concludes that with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. An **OCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen, fencing, and dust and noise control. With regards to the Scheme's grid connection, the Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered such as taking as direct a route as possible, whilst following existing features, such as roads; and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts. With regard to mental health, impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health *"lens"* to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. With regard to the Grittleton Conservation Area, **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **Appendix 12.1: Heritage Statement [APP-219]**, has assessed the potential impact of the scheme on Grittleton Conservation Area. The cable route corridor is proposed to pass to the east of Grittleton Conservation Area (Fields F107-F114). While the Scheme will comprise temporary and localised construction activity as part of the installation of cabling, the assessment

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				identified that will be no impact to the character and appearance of Grittleton Conservation Area. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. With regard to the Cotswolds National Landscape, the CNL is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston.

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, as shown in the **Works Plans [APP-007]**, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP069]**, supported by **ES Volume 3, Appendix 171: Agricultural Land Classification and Soil Resource Survey Report [APP243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land,

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				which is not considered highquality agricultural land in planning terms. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
GTC-002	Socio-Economics, Tourism and Recreation	Impact on Business	The direct issues which could cause the closure of our long established club are as follows:- Threat to the business of SME's that could be lost and no longer provide our facilities. Necessity to close on safety grounds as access between the courts could no longer be deemed safe. Access to and between our facilities being closed or obstructed. Members leaving as the whole peaceful appeal of the club is lost. League teams being unwilling to travel to our club because of safety issues. League barring our team on the grounds of safety using our facilities. No scheme should be allowed to be the cause of so much needless destruction to peoples lives and mental health all because profit to overseas investors is put above national food security. PLEASE REJECT	The assessment of traffic movement on The Street, Grittleton associated with the Scheme is set out in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, identifying no greater than a minor adverse effect to road and non-motorised users of The Street, Grittleton during construction. The assessment identifies that on a peak day, the Scheme is likely to increase HGV movements on this road by 16 (8 in each direction) and cars and vans movements by 56 (28 in each direction) over the course of the day. This is not anticipated to create any significant effect on road safety for any type of user, and is therefore not anticipated to affect the safety of tennis club member accessing any of the tennis courts in Grittleton. The likely effect to the recreational use of sports facilities in Grittleton (based on the assessment of the Grittleton Cricket Club and the tennis court located there in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**) is anticipated to be impacted predominantly as a result of amenity and thus its desirability for use, far more so than physical barriers to accessing the facilities. Although considered over a wider geographic area than just Grittleton, it is anticipated the Scheme will have no more than a minor adverse effect (which is not significant) to health and wellbeing as a result of impacts to open space, leisure and play, including recreational sports (see **ES Volume 1, Chapter 18: Human Health [APP-070]**). These impacts are also anticipated to be temporary and medium-term as no ongoing impacts from the

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				Scheme are anticipated in Grittleton village once the Cable Route Corridor has been constructed. The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP069]**, supported by **ES Volume 3, Appendix 171: Agricultural Land Classification and Soil Resource Survey Report [APP243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered highquality agricultural land in planning terms. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

4.43 Practical Car and Van Rental

Table 4-43 RR-3841

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
PCVR-001	Socio-Economics, Tourism and Recreation	Impact on Business	this will have a negative impact on our business as any members of the public needing to rent a car or van in the Malmesbury to Hullavington area and further afield will not be able to without having to endure construction traffic so will put them off. we also doe lots of deliveries to the Cotswolds and Gloucester, the route we usually take is 24 miles. this will extend that to well over 50 miles increasing our CO2 output exponentially. we will lose out as we can only charge per mile on the shortest route. this will have a dramatic negative impact on our business.	The Applicant has assessed likely impacts to the highway network as a result of construction traffic generated by the Scheme in **ES Volume 1 Chapter 13: Transport and Access [APP-065]**. This identifies no significant adverse effects to driver delay or driver safety as a result of the Scheme. Road closures to facilitate cable crossing works will be minimised in duration, or avoided through the utilisation of trenchless techniques (such as Horizontal directional drilling) for major road crossings. As a result, the Applicant considered that indirect impacts on a car and van hire business are likely to be minimal, and do not materially change connectivity for deliveries between Chippenham (Practical Car & Van Hire location) and the Cotswolds or its other outlet location in Gloucester.
PCVR-002	Ecology and Biodiversity	Wildlife and Habitats	this will also have a negative impact on the local wildlife, there are lots of the successfully re-introduced Red Kite. this will cause loss of habitat and food / prey items for them to continue thriving.	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. Although red kites are primarily scavengers, within the Solar PV Sites, the cessation of intensive agricultural land use and reversion of the land to low-input grasslands would likely result in an increase in abundance of small mammals such as mice, voles and shrews which form a key part of the diet of red kites.

4.44 M4 Property Solutions Limited

Table 4-44 RR-2917

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
MPSL-001	Description and DCO Process		We strongly object and urge the inspectorate to reject the proposal before it goes any further.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.
MPSL-002	Description and DCO Process	Developer	We abhor the [REDACTED] behaviour of the developer in writing to 45 local objectors offering them financial incentive to withdraw their objections. On this ground alone the proposal should be rejected. This behaviour might be expected in other less developed countries but must surely be absolutely rejected in the UK in 2025.	The correspondence referred to related to proposed voluntary heads of terms agreements. Such agreements are entirely voluntary and landowners are under no obligation to enter into them. They are standard practice on nationally significant infrastructure projects and provide a transparent mechanism for agreeing matters such as access, mitigation or accommodation works where relevant. Entering into, or declining to enter into, a voluntary agreement does not affect any individual's right to make representations to the Planning Inspectorate or to maintain an objection to the Scheme. Any recipient of correspondence was free to object to the project and to participate fully in the Examination process irrespective of whether they wished to engage in discussions regarding heads of terms.
MPSL-003	Other Environmental Matters	Glint and Glare	The use of consultants to carry out flawed research based on out-dated and inaccurate software, and to publish findings about potential Glint and Glare is an aspect of the proposal which should be challenged. The glint and glare from this proposed 650,000 panel site over thousands of acres of Cotswolds AONB under Western flight paths (and Bristol airport approach flight	The **ES [APP-052 to APP-265]** and the environmental surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details of qualifications, experience and professional institute membership are provided within **ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]**. An assessment of glint and glare effects arising from the Scheme is provided in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072],** Section 20.5: Glint and Glare. The assessment considers potential effects on

			path) will seriously affect those local properties with West facing gardens, together with nesting and migrating birds	surrounding receptors, including road and rail users, residential properties, public rights of way, aerodromes and sensitive viewpoints within the Cotswolds National Landscape. The assessment concludes that, with embedded mitigation measures, including the use of fixed-tilt panels at a maximum height of 2.5 metres where required, no significant glint or glare effects are predicted to occur as a result of the Scheme. There is no evidence that nesting and migrating birds are significantly affected by glint and glare, and this is not a consideration within the Glint and Glare Assessment.
MPSL-004	Socio-Economics, Tourism and Recreation Transport and Access	Impact of Traffic on Business	The serious negative effect on local businesses and communities is currently completely ignored but will be significant, based on traffic and disturbance assessments alone. This should be examined by the assessment panel and challenged.	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment concludes that with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the

				construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity.

				The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is still discussing with the Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.

4.45 Pewsey Community Area Partnership

Table 4-45 RR-3773

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
PCAP-001	Cumulative and In-Combination Effects	Scheme Scale and Size in Combination with Other Solar Project in Vicinity	This project is far too large and invasive in a county already inundated with other solar projects.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. The total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. Cumulative effects with other projects has been carefully considered as part of the Scheme with other projects, both existing and proposed, taken into account. In terms of the Lime Down project, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated Appendices **[APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				summary of each of these assessments provided within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073].** Existing schemes are captured within the baseline environment. The four-stage cumulative assessment methodology is described within **ES Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the Long List **[APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Table 21-8 within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073] identifies that,** taking a conservative worse case approach, significant cumulative effects with the short list of developments are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.
PCAP-002	Soils and Agriculture	Use of Farmland	Land for animals and arable etc needs to be prioritised if climate changes impact on farming is to be managed to feed the uk population. Solar should be installed on all new buildings , over carparks, giving shade to vehicles and power for those electric chargers that will be needed.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP069]**, supported by **ES Volume 3, Appendix 171: Agricultural Land Classification and Soil Resource Survey Report [APP243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered highquality agricultural land in planning terms. Governmentled agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that longterm food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and longterm land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				security, but that the climate and nature crisis poses the greatest long-term risk to food security - a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution and in the Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
PCAP-003	Description and DCO Process	Motivation	This is profit over practicalities at its worst.	The Applicant notes the concerns about the reasons behind the Scheme. The Scheme aims to help meet national targets for clean energy and net zero targets set out in legislation and policy. The aim is to deliver long term environmental benefit alongside a secure energy supply. The **ES [APP-052 to APP-265]**, **Statement of Need [APP-266]**, and **Planning Statement [APP-267]** provide an assessment of the adverse and beneficial effects associated with the Scheme, an explanation of why the Scheme is needed and the benefits of solar energy generation, and the other benefits proposed by the Scheme. The Applicant is committed to meeting all planning, environmental, and construction policies and standards. The Scheme is being developed in line with legal and regulatory requirements, with engagement with all statutory and non-statutory bodies, ensuring quality and accountability throughout.

4.46 Clubs4Kids Ltd

Table 4-46 RR-0915

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
C4KL-001	Description and DCO Process	Objection	I wish to register my strong objection to the Lime Down Solar Park application.	The Applicant notes this comment but is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.
C4KL-002	Transport and Access	Highway Safety	As a teacher who runs French clubs in primary schools across Sherston, Luckington, Hawkesbury Upton, Tetbury, Acton Turville, and Lea, the construction phase poses a direct and severe threat to my livelihood, my safety on the road, and my health.	The Applicant has sought to minimise impacts upon neighbouring properties and amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant has responded to the individual points raised below, including regarding impacts on businesses, road safety and human health.
C4KL-003	Transport and Access	Traffic Impact	My key objections are: My Business Will Suffer: My entire livelihood depends on being able to drive reliably between schools throughout the day. The plan to put hundreds more HGVs on my essential routes, like the Fosse Way, will cause major delays. If I'm late, I have to refund the schools, which directly costs me money and damages the professional reputation I've worked hard to build.	The Applicant has assessed the likely impacts of construction traffic movements on the local highway network in **ES Volume 1 Chapter 13: Transport and Access [APP-065]** and finds there are no significant adverse effects to driver delay or highway safety, subject to implementation of mitigation measures in the **OCTMP [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. As no significant effects to travelling on the local highway network is anticipated, no subsequent significant effect on business users of the highway network is expected. Furthermore, proposed HGV construction routes have been presented at **ES Volume 2, Figures 13-11 and 13-12 [APP-156 and APP-157]**. These show the routes HGVs are proposed to be limited to during construction, as secured through the **OCTMP [APP-287]** by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. As these routes are to be fixed ahead of construction, the Applicant is confident that this allows local

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
				residents and business travellers to be able to confidently understand which routes are affected, and how they can adapt routing plans as required.
C4KL-004	Transport and Access	Highway Safety	The Roads Will Become Unsafe: I am deeply worried about having to share our narrow, single-track lanes with a constant stream of massive construction lorries. As someone who drives these roads regularly every day to get to my schools, this is an unacceptable safety risk, especially on routes like the B4040 which already has a history of serious accidents.	The proposed construction routes have been carefully assessed and are considered to be the most appropriate routes to the Scheme. Construction traffic would also be temporary and controlled through measures in a **CTMP [APP-166]**to minimise adverse impacts on the highway network. The B4040 is a B-road which has an intended purpose is to feed traffic between A roads and smaller roads on the network. It is therefore designed to accommodate all type of vehicles, including HGVs.
C4KL-005	Human Health	Impacts to Health	My Health Will Be Affected: I suffer from (Redacted). The constant, loud noise from this construction traffic over two years will severely worsen my condition, leading to permanent headaches and stress. This will impact my ability to concentrate on driving safely and to be the energetic, focused teacher the children deserve.	The Applicant has assessed the residential address associated with this business, and has engaged with the residential homeowners during pre-submission consultation stages to try to reduce construction impacts on the property's inhabitants. The assessment of construction noise impacts in **ES Volume 1 Chapter 14: Noise and Vibration [APP-066]** demonstrates that estimated construction noise levels at this property are between the LOAEL and SOAEL, indicating that while an adverse effect is likely to be experienced, it is not anticipated to be significant. This assessment outcome has been directly translated to assumptions on the likely effects to human health as a result of noise and vibration in **ES Volume 1 Chapter 18: Human Health [APP-070]**. While it is considered likely that the construction of the Scheme will have up to a moderate-minor adverse effect on this receptor, this is expected to be a medium-term temporary effect, and therefore is not a significant, nor long-term effect.
C4KL-006	Transport and Access	Traffic Flow and Mitigation	The Promises Aren't Good Enough: The developer's traffic report seems to ignore the reality of my daily life. Dismissing a 500% increase in lorries because the starting number is "*low"* is	It is notable that on roads where baseline traffic flows are very low, any increase in traffic flow may result in a predicted increase that would be high. Therefore, in accordance with IEMA guidance Environmental Assessment of Traffic and Movement paragraph 3.16, it is important to consider any

Reference	Theme	Issue	Comments/Issues Raised	Applicant's Response
			completely unrealistic. Their plans to manage this chaos are just promises on paper, with no real guarantee they will protect people like me.	overall increase in road traffic in relation to the capacity of the road and its temporary nature. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** includes link flows and the link on which there would be an increase of over 500% is Neeld Court, Grittleton. This is where there is an existing HGV flow of just three vehicles. This link will provide access to two cable route corridor construction access points, which will be in operation for a temporary period of approximately 90 days.
C4KL-007	Description and DCO Process	Highway Safety	I trust that the Examiner will look closely at Traffic Safety and how to monitor this in the hearings next year.	The Applicant notes this comment and confirms that the Examination is managed by an independently appointed Examining Authority.

5 The Applicant's responses to town councils, parish councils, and parish meetings

5.1 Melksham Without Parish Council

Table 5-1 RR-3141

Reference	Theme	Comments/Issues Raised	Applicant's Response
MWPC-001	Description and DCO Process	Dear Sir or Madam, On behalf of Melksham Without Parish Council, I write in connection with the Lime Down Solar Park Development Consent Order application (EN010168) to accompany our submission to the Examination. The Parish Council wishes to place on record its full support for the Relevant Representation submitted by Community Action: Whitley and Shaw (CAWS). We endorse both the substance and the reasoning of that submission and consider it to be a clear and well-evidenced articulation of the cumulative and system-level impacts arising from the proposed development. Melksham Without Parish Council supports renewable energy development in principle and recognises the importance of national net zero objectives. However, we share CAWS's concern that the current application does not provide a sufficiently robust, integrated or cumulative evidence base to enable the Examining Authority to properly assess impacts on the villages of Shaw, Whitley and Beanacre. These communities occupy a particularly sensitive down-slope, downstream and down-network position within an already highly concentrated cluster of	A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073]** and associated Appendices **ES Volume 3, Appendix 21-1 [APP-264].** Interaction of the Scheme with other developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments and their conclusions provided **within ES Volume 1, Chapter 21: In-Combination and Cumulative Effects [APP-073]**. The methodology for identifying future proposed or consented schemes and undertaking the cumulative assessment is in accordance with Planning Inspectorate Advice Note 17 on Cumulative Effects. The four-stage methodology is described within **ES Volume 1, Chapter 6: EIA Methodology [APP-058].** The list of developments included in the cumulative assessment were reviewed and developed in consultation with Wiltshire Council. 358 developments were included in the long list provided within **ES Volume 3, Appendix 21-1 [APP-264].** 41 developments are included in the short list (provided in **Table 21-4 of ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073**]) including a number of proposed solar and BESS developments. Cumulative and in-combination effects on hydrology, flood risk and drainage have been assessed for the Scheme, including consideration of downstream receptors and the assessment concludes that the Scheme would not increase flood risk or cause adverse cumulative effects on water environment receptors, subject to the embedded mitigation and secured management measures. **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**. The embedded mitigation

Reference	Theme	Comments/Issues Raised	Applicant's Response
		energy and grid infrastructure affecting the Parish.	and management measures relied upon in this assessment form part of the assessed design and are secured through the parameters and commitments set out in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and the **Flood Risk Assessment and Drainage Strategy [APP-097]**. This conclusion is supported by the Scheme's runoff management approach and construction phase controls, which are secured through the DCO discharge process and the requirement to implement detailed management plans substantially in accordance with the submitted **Outline Construction Environmental Management Plan [APP-277].**
MWPC-002	Hydrology, Flood Risk and Drainage	As set out in detail by CAWS, impacts associated with construction activity, surface-water hydrology, the 22 km Cable Route Corridor, Battery Energy Storage Systems, emergency response capacity and increasing reliance on Melksham Substation do not operate independently. Rather, they interact and compound through shared systems, including headwater drainage networks and emergency services with finite capacity.	The interaction between each of the elements identified is considered both within each of the **Environmental Statement** technical chapters **[APP-059 - APP-72]** and as part of the Cumulative and In-Combination Effects assessment reported **in ES Volume 1, Chapter 21: [APP-073]**. Potential interactions between construction activity, surface water hydrology, the Cable Route Corridor, BESS and other Scheme elements have been considered within the hydrology, flood risk and drainage assessment, including cumulative and in-combination effects on downstream receptors. The assessment concludes that, with the embedded mitigation and secured management measures in place, the Scheme would not give rise to adverse cumulative effects on surface water flood risk or drainage. **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063**]. Matters relating to emergency response capacity and electrical infrastructure operation do not introduce additional surface water or flood risk pathways beyond those assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, and therefore do not alter the conclusions of the cumulative hydrology assessment.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Controls on construction phase runoff, trenchless works and pollution prevention along the Cable Route Corridor are secured through the DCO Requirements and the implementation of detailed management plans approved at discharge, ensuring that interactions between these elements do not result in increased flood risk or cumulative surface water effects. **Outline Construction Environmental Management Plan [APP-277]**.
MWPC-003	Hydrology, Flood Risk and Drainage	The Parish Council is particularly concerned that the Environmental Statement relies predominantly on site-by-site and asset-specific assessments, with key matters deferred to outline plans or post-consent stages, thereby limiting the ability of the Examining Authority to understand how cumulative effects would arise in practice.	The ES provides a detailed and comprehensive assessment of all elements of the Project, as described in **ES Volume 1, Chapter 3: The Scheme [APP-055].** Interaction with other developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments and their conclusions is provided within **ES Volume 1, Chapter 21: In-Combination and Cumulative Effects [APP-073].** Accordingly, the cumulative and in-combination assessment identifies and assesses realistic interaction pathways between Scheme elements and other committed developments, and concludes that, with the embedded mitigation and secured management measures in place, the Scheme would not give rise to significant adverse cumulative effects in respect of hydrology, flood risk or drainage. These conclusions are reported in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and summarised in **ES Volume 1, Chapter 21: In-Combination and Cumulative Effects [APP-073]**.
MWPC-004	Hydrology, Flood Risk and Drainage	The absence of a construction-phase, catchment-scale hydrology and flood-risk assessment, together with the lack of a corridor-wide assessment of cable route construction impacts, represents a material evidential gap.	The Scheme has been assessed for hydrology, flood risk and drainage effects during construction, operation and maintenance and decommissioning, including effects beyond the Order Limits and where pathways could combine through connected headwater drainage networks. The assessment concludes that the Scheme would not increase off-site flood risk, subject to the embedded mitigation and drainage controls set out in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			063] and **ES Volume 3, Appendix 11-1: Flood Risk Assessment and Drainage Strategy – Covering Report [APP-210].** Construction phase mechanisms, including temporary disturbance, soil compaction, sediment-laden runoff, temporary works affecting flow routing, and interaction with drainage features, are assessed and controlled through the secured construction environmental management framework in **Outline Construction Environmental Management Plan [APP-277].** The Cable Route Corridor is assessed on a corridor-wide basis within **ES Volume 3, Appendix 11-9: Flood Risk Assessment and Drainage Strategy – Lime Down Cable Route Corridor [APP-218]**, including construction controls at watercourse crossings and measures to manage exceedance and pollution risks during linear works. On that basis, the submitted evidence does not identify a material evidential gap. No amendments to the application documents are required.
MWPC-005	Hydrology, Flood Risk and Drainage	This is of particular concern given the known sensitivity of Shaw, Whitley and Beanacre to surface-water exceedance and downstream impacts. The Parish Council also shares CAWS's concerns regarding the assessment of clustered Battery Energy Storage Systems, the adequacy of emergency response preparedness, and the reliance on draft or anticipated National Fire Chiefs Council guidance rather than formally issued standards.	Surface water effects, including any potential for downstream exceedance, have been fully assessed for the Scheme. The drainage strategy has been designed to ensure that there is no detrimental change to off-site surface water flood risk, including for downstream communities such as Shaw, Whitley and Beanacre, as set out in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063].** The Applicant has responded to CAWS in full within the Applicant's Response to **RR-0935 – Community Action: Whitley and Shaw (CAWS)**. The **Outline Battery Safety Management Plan (OBSMP) [APP-286]** is in full alignment with both the original and revised National Fire Chiefs Council guidance. NFCC has published the revised guidance in 2026.
MWPC-006	Human Health	In the Parish Council's view, matters of public safety, environmental protection, infrastructure resilience and cumulative	The Applicant has responded to CAWS in full.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		risk must be demonstrably addressed at the consent stage. They should not be deferred, nor should unresolved risk be transferred to local communities or public services.	The assessment of impacts on public safety with respect to human health has been undertaken in **ES Chapter 18: Human Health [APP-070]**, taking into account the assessment findings for other pertinent topic areas, such as hydrology and flood risk, air quality, and major accidents and disasters. The assessment does not find any significant adverse effects on human health subject to implementation of mitigation measures secured through the Requirements in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant also confirms that the assessment in **ES Chapter 18: Human Health [APP-070]** includes a distinct section on assessment of cumulative health effects from nearby developments. The Applicant also seeks to clarify that works within Melksham Without Parish are limited to the construction of the Grid Connection Cable, construction compounds to facilitate works in the Cable Route Corridor, and works to the existing National Grid Substation, as described in **ES Chapter 3: The Scheme [APP-055]**.
MWPC-007	Hydrology, Flood Risk and Drainage	Accordingly, Melksham Without Parish Council supports CAWS's request that the Examining Authority require further cumulative and system-level assessments, including those relating to hydrology, cable route construction impacts, Battery Energy Storage System major accident risk, emergency response capacity, landscape coalescence and substation resilience, before reaching any decision on the application.	**ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and **ES Volume 3, Appendices 11-1 to 11-9 Flood Risk Assessment and Drainage Strategies [APP-210 to APP-218]** distinguish between paneled areas and hardstanding areas associated with supporting electrical infrastructure such as BESS and substations, and considers interactions where relevant. In relation to emergency response and any reliance on NFCC guidance, the Scheme's approach for the water environment is to retain and manage potentially contaminated firewater without uncontrolled discharge to surface water or ground, secured through the **Outline Battery Safety Management Plan (BSMP) [APP-286]**. The Applicant is currently in discussion with the Environment Agency (EA) to develop a standalone drainage plan for the BESS area which will be appended to the **Outline BSMP [APP-286]**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			which will cover all key drainage principles and Emergency Response Plan (ERP) requirements. The EA is a statutory consultee which must approve the final Battery Safety Management Plan and requisite ERPs before construction of the BESS commences. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. Potential environmental and safety effects associated with the Building Failure, Fire and Associated Explosions (including any risk posed by the BESS) are assessed in **ES Volume 1, Chapter 20: Other Environmental Matters, Section 20.7: Major Accidents and Disasters [APP-072].** This assessment considers credible worst-case accident scenarios and concludes that, with embedded mitigation and appropriate management measures, no significant adverse effects are anticipated. Moreover, an **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and incorporating recommendations of the National Fire Chiefs Council. The **OBSMP [APP-286]** is fully compliant with the original NFCC Guidance and the revised guidance which was published in February 2026. The Applicant is in the process of agreeing a Statement of Common Ground (SOCG) with D&WFRS to provide assurance that all safety and emergency response requirements are fulfilled. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
MWPC-008	Hydrology, Flood Risk and Drainage	We respectfully ask that this letter be read alongside and given appropriate weight in conjunction with the CAWS Relevant Representation.	The Applicant notes this request and confirms that the CAWS Relevant Representation has been considered and responded to in full to RR-0935.

5.2 Grittleton Parish Council

Table 5-2 RR-1742

Reference	Theme	Comments/Issues Raised	Applicant's Response
GPC-001	Description and DCO Process	Grittleton Parish Council objects to the proposed development as it will have a significant impact on the daily lives and wellbeing of residents.	The Applicant has assessed matters relating to people's lives and livelihoods in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068],** and to their health and wellbeing in **ES Volume 1, Chapter 18: Human Health [APP-070].** These assessments find no significant adverse effects to population or individual receptors in Grittleton parish, subject to the implementation of mitigation measures secured through the Requirements in Schedule 2 to the **Draft DCO [APP-016].** With respect to human health, the assessment outcome that there is no significant adverse effect to health generated by the Scheme has been agreed by the UK Health Security Agency in their relevant representation **[RR-4798].**
GPC-002	Soils and Agriculture	Loss of agricultural land – the consequences for food production, loss of local employment on farms and support businesses.	The effects of the Scheme on agricultural land and food production are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, with supporting agricultural land classification data provided in **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. The assessment confirms that land would be taken out of arable rotation during the operational period of the Scheme but would remain productive and would be reinstated and returned to agricultural use as far as practicable following decommissioning. Approximately two thirds of the agricultural land affected is not Best and Most Versatile (BMV) quality under the Agricultural Land Classification system. The socio-economic effects of the Scheme, including impacts on agricultural employment and related supply chain businesses, are assessed in **ES Volume 1, Chapter 16: Socio Economics, Tourism and Recreation [APP 068]**. That assessment identifies a likely worst-case reduction of up to 20 full-time equivalent (FTE) agricultural jobs arising from changes in on site farming activity and associated downstream businesses. Measures to support workforce retention, reskilling and re-

Reference	Theme	Comments/Issues Raised	Applicant's Response
			employment are set out in the **Outline Skills, Supply Chain and Employment Plan [APP 285]**. This plan is secured through Requirement 18 in Schedule 2 to the **Draft DCO [APP 016].**
GPC-003	Landscape and Visual	Industrialisation of rural environment – impact on Cotswolds National Landscape and numerous local historic assets, ruination of enjoyment of picturesque countryside.	**ES Volume 1, Chapter 8: LVIA [APP-060]** identifies that there would be significant effects on the character of the landscape within the 1km Local Study Area and the visual amenity of users of some localised footpaths, as a result of the change in land use. However, due to the nature of the dispersed Sites and the character of the receiving landscape, with its rolling topography, the effect of the Scheme on the Wider and Outer Study Area reduces to Non-significant. The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting

Reference	Theme	Comments/Issues Raised	Applicant's Response
			of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed, and the land repurposed for ecological mitigation to protect the setting of Sherston within the CNL. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			(OLEMP) [APP-283], and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the Draft Development Consent Order [APP-016]. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. The Scheme is not permanent. The application is for a period of up to 60 years operational life. At which point, the Scheme would be required to be decommissioned. **ES Volume 1, Chapter 3: The Scheme [APP-055].** At decommissioning, agricultural fields would be returned back to the landowner, as set out in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. The LVIA in **[APP-060]** considers the effects of the Scheme at decommissioning and notes that as infrastructure is removed, there would be an overall benefit to the character of the area with landscape proposals retained providing long term benefit towards the legacy landscape. Following decommissioning, the land within the Order Limits would benefit from the significantly enhanced tree and hedgerow planting that has been carried out and has matured to create a much stronger and robust landscape, retaining, and enhancing the overall character and providing considerable biodiversity benefits over the years. Due

Reference	Theme	Comments/Issues Raised	Applicant's Response
			to the development, the landscape would be left in a better condition than current day. This betterment is established as a consequence of the landscape proposals resulting in greater species variety, greater age depth, enhanced structure, resilience to pest and disease and reinforcement of local landscape character across the Sites. The proposals have been developed in line with Wiltshire's Nature Recovery Strategy and the defining legacy of the landscape would be the robust framework of features that have improved through the mitigation and landscape enhancements embedded within the Scheme. This mitigation in turn would give rise to long-term wider benefits, including maintaining and enhancing biodiversity and in promoting the resilience of ecosystems. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning

Reference	Theme	Comments/Issues Raised	Applicant's Response
			to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-8 [APP-219 to APP-232]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220] and [APP-221]**, **Appendix 12-4: Archaeological Geophysical Survey Reports [APP-223] and [APP-224]**, and **Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225] to [APP-229]**. The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is being discussed with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching

Reference	Theme	Comments/Issues Raised	Applicant's Response
			archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation for each part of the Proposed Development, substantially in accordance with **Appendix 12-6 Outline Archaeological Mitigation Strategy [APP-230]**, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered during the relevant part of the Proposed Development.
GPC-004	Landscape and Visual	Cumulative impact - many local residents will find that their daily journeys are through the plethora of solar farms that have already been permitted in this part of Wiltshire, changing the countryside from open rolling with stone walls along with hedgerows to glass and metal structures surrounded by security fencing to shield the monocolour of panels.	A comprehensive Landscape and Visual Cumulative Assessment has been undertaken for the Scheme **(see ES Volume 1, Chapter 8: LVIA section 8.13) [APP-060]** together with **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073].** No cumulative landscape and visual effects are identified within the 10km Cumulative Study Areadue to the limited interaction and inter-visibility between the Lime Down scheme and other consented, proposed or reasonably foreseeable projects. Further, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated Appendices **[APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Chapter 21 [APP-073].** Existing schemes are captured within the baseline

Reference	Theme	Comments/Issues Raised	Applicant's Response
			environment. The four stage cumulative assessment methodology is described within **ES Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the Long List **[APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level.
GPC-005	Site Selection and Alternatives	Unsuitable site location – distance from grid connection – causing disruption to a large number of people along the proposed cable route.	The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185],** an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185].** Further, from an operational perspective, high voltage electricity transmission at 400kV, which in this case is proposed to connecct the site to Melksham substation, is specifically designed to minimise energy losses over long distances. As such, the length of the proposed cable route will result in negligible electrical losses. This is supported by NPS EN-1 paragraph 3.3.12, which recognises that high voltage transmission allows for a more

Reference	Theme	Comments/Issues Raised	Applicant's Response
			efficient bulk transfer of power than transmission at lower voltages. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts. Details of how those mitigation and enhancement measures is provided in the **Draft DCO [APP-016].**
GPC-006	Transport and Access	Unsuitable road access routes – affecting day to day life in the rural environment and the ability to maintain existing lifestyle.	The proposed construction routes have been carefully assessed (as set out within **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]**) and are considered to be the most appropriate routes to the Scheme. Construction traffic would also be temporary and controlled through measures in a CTMP. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. This includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. With this mitigation in place, **ES Volume**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			1, Chapter 13-1: Transport and Access [APP-065] concludes that impacts would be negligible to minor adverse. A final CTMP would be prepared post consent and must be substantially in accordance with the **Outline CTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.
GPC-007	Transport and Access	No alternative transport considered for delivery of equipment, thus forcing construction traffic onto unsuitable rural roads, again disrupting residential and working daily life.	The proposed construction routes have been carefully assessed in **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** and **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and are considered to be the most appropriate routes to the Scheme. Alternative modes of transport for delivery are limited and considered to be unfeasible. Construction traffic would also be temporary and controlled through measures in a CTMP. An **oCTMP [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. This includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. With this mitigation in place, **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** concludes that impacts would be negligible to minor adverse. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
GPC-008	Transport and Access	Transport management plan unenforceable thus disrupting existing lifestyle, commuting and school journeys.	An **oCTMP [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.
GPC-009	Socio-Economics, Tourism and Recreation	Impact on tourism during the construction period and going forward due to ruination of countryside, this will cause the loss of employment in the many tourist/hospitality businesses in the area.	The Applicant has assessed that there is a likely worst-case temporary loss of 50 FTE tourism industry jobs as a result of the Scheme, as set out in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068**]. This accounts for less than 0.7% of tourism-based employment within 5 km of the Scheme (BRES, 2023 data), and approximately 0.17% of tourism employment across Wiltshire (29,000 estimate from Visit Wiltshire, 2021). Where losses to tourism have been identified, these are worst-case estimates based on likely significant effects from the Scheme and do not include for additional mitigation measures being applied. This is also a temporary effect, anticipated to occur during construction, with recovery to tourism businesses anticipated to begin as soon as construction works are complete. During the Scheme's operational phase, the reduction in tourism compared to current conditions is anticipated to be equivalent to a loss of 11 FTE tourism-dependent jobs. Additional mitigation measures through the **OSSCEP [APP-285]** seek to reduce these losses through focusing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries. It is considered that these measures would help to reduce local losses in the local economy, and help to generate additional GVA in the local economy in alternative

Reference	Theme	Comments/Issues Raised	Applicant's Response
			industries. The OSSCEP is secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016].**
GPC-010	Transport and Access	Cable Route Access points are impractical and potentially damaging to conservation areas (Grittleton Village – Leigh Delamere – Sevington) thus impacting local residents in these small rural communities. Many of the properties in these parish areas have no off-street parking, so these roads are unsuitable for increased traffic volumes.	**ES Volume 3, Appendix 12-1 Heritage Statement** assessed the impact on the conservation areas and concluded that as the overall construction impacts will be temporary in nature, there will be no harm to the character and appearance of the Conservation Areas once construction works have finished. Construction impacts will also be controlled through measures in the final CTMP. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** assesses all highway links on the construction routes and takes account of sensitive receptors, such as residential areas (including Grittleton village), and concludes there are no significant impacts. **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates there would only be 4 HGVs per day, equivalent of one movement per hour during construction times for a temporary 90-day period. The proposed construction routes have been carefully assessed within **ES Volume 1, Chapter 13 [APP-065]** and are considered to be the most appropriate routes to the Scheme. These are already suitable for existing traffic and would be able to accommodate the additional traffic required. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
GPC-011	Consultation and Engagement	Furthermore, the outcome of a recent wide-ranging parish council survey clearly highlighted and evidenced residents' concerns and frustrations about the development.	The Applicant acknowledges the results of Grittleton Parish Council's recent survey and the concerns expressed by some residents. While recognising local sentiment, the Application must be determined on the basis of the technical assessment and objective evidence presented. The **ES [APP-052 to APP-265]** includes comprehensive assessment and mitigation across all relevant environmental topics, and the **Planning Statement [APP-267],** including Annexes A and B, demonstrates that the Scheme accords with applicable national and local planning policy. On this basis, the Applicant remains confident that the Scheme has been robustly assessed and that appropriate measures are in place to avoid, reduce or mitigate potential effects.

5.3 St Paul Malmesbury Without Parish Council

Table 5-3 RR-4432

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPMWPC-001	Hydrology, Flood Risk and Drainage	The St Paul Malmesbury Without Parish Council strongly opposes the Lime Down solar project for these principal reasons. At a later stage the Council will have further concerns to raise but for now the major ones are: 1 Flooding 1.i Many properties experience perennial flooding from the Gauzebrook. SPMWPC plans, in their infancy at present, seek to alleviate flooding by the use of upstream flood ponds. The Lime Down installation of panels, the BESS and other infrastructure would not only prevent this plan being delivered, but would significantly increase the existing levels of flooding from run-off. 1.	The Applicant notes the concern that land which the Parish Council has identified for potential upstream flood ponds may overlap with areas proposed for the Scheme. The potential for changes to runoff, floodplain behaviour and downstream flood risk has been assessed in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**, with supporting drainage principles set out in **Flood Risk Assessment and Drainage Strategy – Covering Report [APP-210]**. The assessment concludes that the Scheme would not give rise to significant effects on flood risk receptors and would not increase flood risk elsewhere. Panelled areas are designed so rainfall continues to drain to ground, and supporting infrastructure such as the BESS is subject to site specific engineered drainage and pollution control measures, as set out in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** and **ES Volume 3, Appendix 11-1: Flood Risk Assessment and Drainage Strategy – Covering Report [APP-210].** The Applicant recognises that the Parish Council's early stage flood alleviation proposals are separate to the Application and may be refined over time. The Scheme does not include or rely on land safeguarded for third party flood alleviation works, and any future proposals for upstream flood ponds would need to be progressed through the relevant land, technical and consenting processes.
SPMWPC-002	Hydrology, Flood Risk and Drainage	ii Run-off from the proposed infrastructure on to delicate compressed largely clay soils will only exacerbate the flooding problem.	The Applicant notes the concern regarding runoff from infrastructure on clay soils. The assessment of hydrology, flood risk and drainage within **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, supported by **ES Volume 3, Appendix 11-1: Flood Risk Assessment and Drainage Strategy – Covering Report [APP-210]**, considers the mechanisms by which runoff could increase as a result of the Scheme, including soil compaction, interception of overland flow

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and temporary construction effects. The assessment concludes that the Scheme would not increase runoff rates or volumes leaving land within the Order Limits and would not exacerbate flooding, subject to the embedded mitigation and drainage controls secured through the **Draft Development Consent Order [APP-016]**. In accordance with National Policy Statement EN-3 paragraph 3.10.75, **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** confirms that solar PV panels generally drain to ground and do not, in themselves, create significant drainage impacts. Panelled areas are designed so rainfall continues to drain to ground, with no increase in runoff leaving the Order Limits. Any potential risk of increased runoff is associated with ground disturbance rather than the presence of panels. Construction phase risks on clay soils, including soil compaction and sediment mobilisation, are addressed through secured controls for soil handling, trafficking management and temporary drainage set out in the **Outline Construction Environmental Management Plan [APP-277]**, which is secured through Requirements in the **Draft Development Consent Order [APP-016]**. These measures ensure that runoff pathways are controlled during construction and that flood risk is not increased. No amendments to the application documents are required.
SPMWPC-003	Transport and Access	2 Highways and traffic 2.i The narrow roads are simply not suitable for heavy construction traffic.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle. To provide further comfort, additional information will be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and resubmitted at Deadline 1 of Examination to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			demonstrate that there is adequate carriageway width and/or passing place opportunity for two HGVs when accessing Lime Down Site D. An **oCTMP [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. This includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. With these measures in place, **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** concludes that the impact would be negligible to minor adverse. A final CTMP will be prepared post consent and will be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.
SPMWPC-004	Transport and Access	2.ii The proposed 'new' road from the busy A429 to provide direct access to site E and left to site D will likely cause major hold ups.	The road identified is an internal haul road. An access is proposed along the A429, however, the use of the access will be subject to the measures within the **oCTMP [APP-287]** which include delivery booking and a requirement to undertake HGV deliveries outside of highway peak hours. Highway network peak hours are when the highway would be at its busiest, so avoiding this period would limit the potential for any delays. Peak hour capacity assessment cannot be undertaken as there will be no construction deliveries during the peak hour. However, daily impact has been assessed in **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** combined with the temporary and low number of predicted delivery trips, the impact on the A429 link will be negligible as shown in Table 13-24 of **ES Volume 1, Chapter 13-1: Transport and Access [APP-065].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPMWPC-005	Transport and Access	2.iii The proposed route for abnormal indivisible loads (AIL) via Cirencester around the Malmesbury by-pass and the necessary road alterations to accommodate this, will cause disruption to residents' journeys.	The AILs are one-off movements that typically have a police escort and will not require significant or permanent highway works. They will result in a one-off temporary disruption at the time of the AIL delivery. Residents will be notified prior to these movements, as per normal AIL procedure. Further detail regarding these procedures is set out in the **oCTMP [APP-287]**.
SPMWPC-006	Other Environmental Matters	3 The BESS 3.i Residents are severely alarmed about the intention to locate the BESS so near to homes and the railway line because of the possibility of fire, and as a consequence question how emergency services will access any conflagration and obtain sufficient water to extinguish it.	The location of the Battery Energy Storage System (BESS) has been informed by a detailed site selection and design evolution process, as set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. This chapter explains that land at Lime Down D was identified as an appropriate location due to its proximity to the solar PV arrays and the on-site substation, providing operational benefits including minimising transmission losses, maximising storage efficiency, and enabling rapid and reliable grid response. In considering options for co-locating the BESS with the solar PV Sites, Lime Down D was selected as the preferred location due to its central position within the Scheme, effective natural and proposed screening, limited proximity to residential properties, and closeness to existing infrastructure corridors, including the railway line. Locating the BESS within an existing infrastructure corridor reduces the need for additional land take and avoids introducing new isolated infrastructure into undeveloped areas. The assessment concludes that siting the BESS at Lime Down D presents the lowest potential for significant adverse environmental effects. Accordingly, the proximity of the BESS to the railway line does not give rise to significant safety or environmental concerns. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study (**ES Volume 3, Appendix 15-2 BESS Fire Emissions Modelling [APP-239]**) to model toxic gas emissions and visibility impacts

Reference	Theme	Comments/Issues Raised	Applicant's Response
			from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166].** The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (BSMP) [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the **Outline BSMP [APP-286]** and secured through the **Draft DCO [APP-016]** via Requirement 6.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			As now mandated under NFPA 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP pre-construction requirements. Section 5 of the **Outline BSMP [APP-286]** covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant notes that the approach to BESS safety is being discussed with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
SPMWPC-007	Landscape and Visual	4 Landscape, Noise and Amenity 4.i Disruption to PRoWs, visual impact and noise from the project all contribute to severe adverse impacts on the well-being of people living in neighbouring properties and walkers using the much-loved lanes and footpaths	With respect to visual impact, **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** identifies that there would be some significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be controlled within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The Scheme is not permanent. The application is for a period of up to 60 years operational life. At which point, the development would be required to be decommissioned.**ES Volume 1, Chapter 3: The Scheme [APP-055].** At decommissioning, agricultural fields would be returned back to the landowner. As infrastructure is removed, landscape proposals will be retained providing long term benefit towards legacy landscape. Following decommissioning, the land within the Order Limits would also benefit from the significantly enhanced tree and hedgerow planting that has been carried out and has matured to create a much stronger and robust

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape, retaining, and enhancing the overall character and providing considerable biodiversity benefits over the years. This betterment is established as a consequence of the landscape proposals resulting in greater species variety, greater age depth, enhanced structure, resilience to pest and disease and reinforcement of local landscape character across the Sites. Information on decommissioning activities is provided within the **ES [APP-052 to APP-265]** and within the **Outline Decommissioning Strategy [APP-279]**. The information is provided in accordance with the requirements of Part 1 of Schedule 4 of the EIA Regulations 2017 (as amended). Schedule 4 of the EIA Regulations 2017 (as amended) set out the information for inclusion in an ES. **ES Volume 1 Chapter 1 Introduction [APP-053]** Table 1-2 identifies where the requirements of Schedule 4 of the EIA Regulations 2017 (as amended) have been addressed. Measures to manage and minimise disruption during decommissioning are set out in the **Outline Decommissioning Strategy [APP-279]**. This explains how mitigation measures identified in the **ES [APP-052 to APP-265]** will be implemented during decommissioning and includes controls for working hours, noise, lighting, traffic management, pollution prevention, waste management and community liaison. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016].** The proposals have been developed in line with Wiltshire's Nature Recovery Strategy and the defining legacy of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape would be the robust framework of features that have improved through the mitigation and landscape enhancements embedded within the Scheme. This mitigation in turn would give rise to long-term wider benefits, including maintaining and enhancing biodiversity and in promoting the resilience of ecosystems. An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. <u>Construction phase</u> The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise

Reference	Theme	Comments/Issues Raised	Applicant's Response
			monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. <u>Operational phase</u> The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational

Reference	Theme	Comments/Issues Raised	Applicant's Response
			noise is appropriately controlled throughout the lifetime of the Scheme.

5.4 Corsham Town Council

Table 5-4 RR-0941

Reference	Theme	Comments/Issues Raised	Applicant's Response
CTC-001	Description and DCO Process	The Notice of Acceptance of an application for a Development Consent Order by the Planning Inspectorate (on behalf of the Secretary of State) under Section 56 of the Planning Act 2008 was considered by Corsham Town Council at its Planning Committee meeting on 3 December 2025. At that meeting it was resolved that Corsham Town Council would submit a representation to the Planning Inspector by 9 January 2026, that re-stated the objections to the application that the Town Council had made previously as below: Corsham Town Council (Planning) meeting on 25 June 2025:	The Applicant notes Corsham Town Council's objections and has responded in full in the responses below.
CTC-002	Transport and Access	The Town Council objects to the proposed amendment to the development of the boundary area at the A350/Corsham Road junction involving the temporary removal of traffic lights to allow an abnormal load vehicle to turn at the junction. The A350 is one of the most important traffic routes through Wiltshire and the removal of traffic lights from this junction, however temporary, would cause a significant increase in traffic congestion and risk of accidents.	Permanent signals will be removed to accommodate AIL movements. It is likely these will be replaced by temporary signals with similar signal timings as the existing signals to ensure normal operation of the junction. As set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]** full details of the form and proposed locations of any signs or signals to be placed on a public highway will be submitted to Wiltshire Council in advance of being placed (either as part of the Final CTMP or separately).
CTC-003	Transport and Access	The Town Council also objects to the Lime Down Solar Park project in general, as it has the following additional concerns:	The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety

Reference	Theme	Comments/Issues Raised	Applicant's Response
		• the detrimental impact that the Abnormal Load, HGV's and other construction vehicles will have on the local roads in terms of highway damage and traffic congestion	and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme
CTC-004	Description and DCO Process	• the huge scale of the development including the size and quantity of the solar panels	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas

Reference	Theme	Comments/Issues Raised	Applicant's Response
			dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Cable Route Corridor, which stretches approximately 22 km from 'Lime Down D' to Melksham Substation and links together the Solar PV Sites, covers approximately 463.2 ha. Approximately 17.8 ha (of which 5.9 ha overlap with the Cable Route Corridor) is proposed for Highway Improvement Areas within which improvements to sections of the existing highway network will be completed to facilitate access to the Scheme, such as improvements to road edge and traffic management. Work will be undertaken by the Applicant and National Grid within the Existing National Grid Melksham Substation, requiring a total area of 12.8 ha. The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. The landscape and visual effects of the Scheme, including the effects of the maximum panel height, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors during construction, operation and decommissioning, using the maximum design parameters to ensure a robust assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084] and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These include new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
CTC-005	Other Environmental Matters	• the volume of cabling and impact this will have on farmland and the environment.	The effects of the Scheme on soils and agricultural land, including those associated with the installation of underground cabling, are assessed **in ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, with supporting information provided in **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243].** The management of soil and land resources during cable installation will be undertaken in accordance with the principles set out in the **Outline Soil Resources Management Plan (SRMP) [APP 280].** Cable installation will result in short term and temporary disturbance to soils and agricultural land within the cable route corridor. The assessment concludes that, with appropriate soil handling and reinstatement measures secured through the SRMP framework, land would be restored and returned to agricultural use following completion of the works.
CTC-006	Site Selection and Alternatives	Corsham Town Council (Planning) meeting on 17 March 2025: The Town Council does NOT support the idea of having to install cable to service a solar park which is 20	**ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** details the alternatives considered, including Minety Substation as an alternative point of connection to Melksham substation. The Applicant has undertaken extensive engagement with National Grid throughout the scoping and

Reference	Theme	Comments/Issues Raised	Applicant's Response
		kilometres away when there is a substation much closer to the site of the panels. The substation at Minety should be upgraded to prevent the need for extensive cabling.	development of the Scheme to determine the appropriate point of connection. The Existing National Grid Melksham Substation was identified as having available capacity for a utility scale energy project such as the Scheme. Whilst Minety substation does house 400kV infrastructure, the Applicant's discussions with National Grid confirmed there was no connection available at Minety for the Scheme. On that basis, Minety Substation is not a viable alternative and the Existing National Grid Melksham Substation remains the only viable connection point for the Scheme.
CTC-007	Transport and Access	Access points for this solar park should be fit for purpose and appropriately placed. The current proposal raised concerns for the Town Council:	The Applicant notes Corsham Town Council's comments. Details of the proposed access points are presented in Annex C and Annex D of **ES Volume 3, Appendix 13-1: Transport Assessment.** The drawings include swept-path analysis to demonstrate the access points are suitable to accommodate the required movements of construction vehicles. Where possible geometries and visibility splays have been provided in accordance with guidance. Where this is not possible, suitable traffic management has been proposed to manage the movement of construction vehicles to/from the access.
CTC-008	Transport and Access	a. that the proposal would be contrary to Policy CNP E3 of the Corsham Neighbourhood Plan	Annex B: Local Policy Accordance Tables of the Planning Statement **[APP-267]** sets out the Scheme's compliance with local planning policy, including Policy CNP E3 of the Corsham Neighbourhood Plan. Policy CNP E3 requires development to protect, conserve and where possible enhance the special qualities of the Cotswolds National Landscape and the distinctive characteristics of the landscape setting of the Corsham Rolling Lowlands (see page 916 of the **Planning Statement [APP-267]** for the full reasons why the Scheme is considered compliant with this policy). The Cable Route Corridor, as described in **ES Volume 1, Chapter 3 The Scheme [APP-055]),** is located within the Corsham Neighbourhood Plan Area and will be located underground. Therefore, there would be no impact on the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Cotswolds National Landscape or the distinctive characteristics of the landscape setting of the Corsham Rolling Lowlands as a result of the Cable Route Corridor.
CTC-009	Socio-Economics, Tourism and Recreation	b. impacts on both residents and tourists	The Applicant has assessed matters relating to people's lives and livelihoods, including in relation to tourism and tourism-dependent businesses, in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, and to the population's health and wellbeing **in ES Volume 1, Chapter 18: Human Health [APP-070].** These assessments find no significant adverse effects to the population or individual receptors, including individual tourism and recreation attractions and facilities in Corsham, subject to the implementation of mitigation measures secured through the Requirements in Schedule 2 to the **Draft DCO [APP-016].**
CTC-010	Soils and Agriculture	c. impacts on agricultural land which may last for some time	The effects of the Scheme on agricultural land, including the duration of effects, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069],** with supporting information provided in **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243].** The assessment confirms that land would be removed from arable rotation for the operational life of the Scheme, anticipated to be approximately 60 years. While the primary agricultural use would cease during this period, the soil resource would be retained and would continue to perform its ecological functions. The assessment notes that reduced disturbance associated with the Scheme allows soils to recover from previous intensive agricultural use, with benefits to soil structure and soil biology over time. All land would be reinstated and returned to agricultural use as far as practicable following decommissioning.
CTC-011	Transport and Access	d. disruption to country roads which are heavily used, during the construction period	**ES Volume 1, Chapter 13: Transport and Access [APP-065]** presents an assessment of highwaylinks on all proposed construction routes, including country roads, this concludes there are the impacts are temporary and not significant.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The **oCTMP [APP-287]** includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local country roads, and restricted hours of deliveries outside of peak hours. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
CTC-012	Site Selection and Alternatives	e. the proposed width of the construction corridor	To allow flexibility in placement of the cables which will be determined in the detailed design stage, the Cable Route Corridor is 50 m wide along the majority of its length, with an increase in width up to 665 m at a number of locations including

Reference	Theme	Comments/Issues Raised	Applicant's Response
			road and rail crossings. The construction working width will typically be 25 m wide and will narrow at hedgerow crossings. For assessment purposes, the placing of the cable anywhere within the Cable Route Corridor has been considered, but the ultimate width and spacing of the cable trenches will vary depending on environmental constraints, engineering requirements, or if crossing third party apparatus (e.g. railway lines). For further details, please see **ES Volume 1, Chapter 3: The Scheme [APP-055].** **ES Volume 3, Appendix 3-2: Cable Route Construction Method Statement [APP-183]** provides more details on how the Cable Route Corridor is to be constructed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**.
CTC-012	Other Environmental Matters	f. fire and safety concerns	The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081],** the battery containers will be located more than 200 m from the nearest PROW and 500 m from the nearest dwelling from any residential receptors. At this distance, impact to health and wellbeing from air quality, fire or explosion impacts are minimal. As such, there are no significant adverse effects to human health anticipated as a result of the Scheme, as assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to BESS safety is being discussed with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and will be set out in the relevant Statement of Common Ground. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the **OBSMP [APP-286]**. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 6.1.1 of the **OBSMP [APP-286]** confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out **in Outline Battery Safety Management Plan (OBSMP) [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the **OBSMP [APP-286]** specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			ERPs will be drafted and approved for all stages of the Scheme, including construction, operation, and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and **in ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **OBSMP [APP-286]** - including advice to remain indoors and close windows - would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016],** which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
CTC-013	Cultural Heritage	possible disturbance of a Roman road	The potential effects of the Scheme on the Roman Roads (i.e. the Fosse Way (HER ST88SE300) and Roman road from Bath to Speen (HER ST86NE30)), as well as other Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices **in ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Where an adverse effect has been identified to Roman archaeological assets appropriate mitigation is proposed. See Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation and Section 12.11 for additional mitigation. An overarching archaeological mitigation strategy is provided **in ES Volume 3, Appendix 12.6 Archaeological Mitigation Strategy [APP-230].** Mitigation will be secured through requirement 12 of the DCO.
CTC-014	Transport and Access	h. the uncertainty of the route	The proposed construction routes are presented **in ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and **ES Volume 2, Figure 13-1: Study Area: Solar PV Sites [APP-146]** and **ES Volume 2, Figure 13-2: Study Area: Cable Route Corridor [APP-147].**
CTC-015	Other Environmental Matters	i. potential long-term effects of the electromagnetic field on land and livestock	**ES Volume 3, Appendix 20-5: High-Level Electromagnetic Field Assessment [APP-262]** focusses on potential impacts upon human health rather than land and livestock however it does show that EMFs from proposed cabling will be below ICNIRP reference thresholds at all locations above ground. NPS EN-5 states "*There is little evidence that exposure of crops, farm animals or natural ecosystems to transmission line EMFs has any agriculturally significant consequences*." EMFs would only occur whilst cables are in-situ and live and EMFs would cease to occur once the Scheme ceases operation.
CTC-016	Decommissioning and Construction	j. emergency access during the construction phase	With exception of the one-off AIL movements, no road closures are proposed. The impact on Driver delay is negligible as shown in Table 13-27 in **ES Volume 1, Chapter 13: Transport and Access [APP-065].** Emergency access will not be affected by the Scheme.
CTC-017	Soils and Agriculture	With further objections added at its meeting on 3 December 2025, on the grounds of: • Agricultural land and highways damage during and after the cabling installation	The effects of cabling works on agricultural land, including construction and post construction reinstatement, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, with supporting agricultural land classification and soil survey information provided in **ES Volume 3, Appendix 17 1:**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Agricultural Land Classification and Soil Resource Survey Report [APP 243]. Soils affected by cable installation will be managed in accordance with the principles set out in the **Outline Soil Resources Management Plan (SRMP) [APP 280]**. The Outline SRMP identifies appropriate soil handling windows with regard to rainfall and soil moisture conditions and sets out best practice methods for handling, storage and replacement of soils to minimise the risk of damage and compaction. Following installation of the cabling, soils will be replaced promptly within the cable trenches, ensuring agricultural land is reinstated after only a short term disturbance, as detailed in paragraphs 1.7.3 and 1.8.27 of the **Outline Soil Resources Management Plan (SRMP) [APP 280],** secured by Requirement 17 in Schedule 2 to the **Draft DCO [APP-016]**. The effects of construction traffic on the local highway network, including construction traffic associated with the construction of the cable route, are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme.
CTC-018	Socio-Economics, Tourism and Recreation	• An adverse impact on road traffic causing detrimental affects on businesses.	The assessment of traffic impacts associated with the Scheme is set out in **ES Volume 1 Chapter 13: Transport and Access [APP-065],** identifying no significant adverse effects to road user safety or delay during construction. As such, it is not anticipated there will be any significant adverse effects to businesses as a result of road traffic. However, a potential 'medium' impact has been considered as a worst-case scenario to tourism-dependent businesses in the Corsham area **in ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the **supporting ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** as a result of the combination of increased HGV traffic and views of construction works on approach routes. This however is not anticipated to have any significant adverse effects on businesses, subject to implementation of transport mitigation measures as secured through **the OCTMP [APP-287]** by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016**].

5.5 Biddestone & Slaughterford Parish Council

Table 5-5 RR-0504

Reference	Theme	Comments/Issues Raised	Applicant's Response
BSPC-001	Description and DCO Process	Objection to Lime Down Solar Park – From Biddestone and Slaughterford Parish Council. On behalf of Biddestone and Slaughterford Parish Council, I wish to submit a formal objection to the proposed Lime Down Solar Park. While the Council supports renewable energy in principle, this proposal raises serious concerns due to:	The Applicant notes Biddestone and Slaughterford Parish Council's objection and has responded to the comments in full below.

BSPC-002	Landscape and Visual	Its proximity to and visibility from the Cotswolds Area of Outstanding Natural Beauty (AONB), a nationally protected landscape to which Section 85 of the Countryside and Rights of Way Act 2000 applies. The development would have a significant adverse visual and environmental effect on the setting of the AONB.	Consultation with the Cotswolds National Landscape (CNL) Board has been carried out and it is agreed that Sites A, B and C are within the setting of the CNL. The Scheme has been designed sensitively to avoid harm to the CNL. Following the mitigation hierarchy, avoidance measures have been the primary way of avoiding harm. These measures are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include:
			
			• The removal of panels within the setting of the CNL in Sites A, B and C where there is a strong visual relationship between the CNL and the Scheme. This includes:
			  ○ Site A: The northern part of A1, A11 and A12;
			  ○ Site B: B12; and
			  ○ Site C: C1, C6, C8, part of C9 and the majority of C10.
			  ○ Panels in C2, C3 and C4 which are not on the boundary of the CNL, but where significant visual effects on receptors within the CNL were recorded at PEIR and subsequently removed from the Scheme following Statutory Consultation.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term harm to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time, as a result of the proposed mitigation. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the Draft Development Consent Order [APP-016]. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant has consulted with the CNL board regarding Section 85 of the Countryside and Rights of Way Act 2000 and how the Scheme proposes to further the purposes of the CNL. Refer to the standalone Assessment on the CNL and its Special Qualities in **Appendix 8-6 [APP-197].**
BSPC-003	Landscape and vVsual	We understand that the strengthened "*seek to further*" duty introduced by Section 245 of the Levelling-Up and Regeneration Act 2023 has been in force since 26 December 2023, and now legally requires all relevant authorities in England—including the Planning Inspectorate and Secretary of State for NSIPs—to actively seek to further the conservation and enhancement of the Cotswolds National Landscape when exercising any function affecting it .	The duty introduced by s245 of the Levelling-up and Regeneration Act 2023 has been considered by the Applicant and further details of its application to the Scheme are set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Further, in line with the duty imposed by s245, the Applicant has carried out an assessment of the effects of the Scheme on the Cotswolds National Landscape (CNL) which is set out in **ES Volume 3, Appendix 8-6: Assessment of Effects on the Cotswolds National Landscape and its Special Qualities [APP-197]** and concludes that there are no significant direct effects on the CNL or its special qualities**.** The landscape and visual effects of the Scheme on the CNL and its special qualities have been mitigated throughout the landscape-led, iterative design process in consultation with officers at the CNL Board and Wiltshire Council.
BSPC-004	Soils and Agriculture	The loss of Best and Most Versatile agricultural land, ALC grades 1,2 and 3a, which undermines national food security and contradicts planning guidance that seeks to protect productive farmland where alternatives exist.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Subgrade 3b and Grade 4 land, which is not considered high-quality agricultural land in planning terms. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Whilst there is an environmental and economic cost to importing food, and it is recognised the UK imports a far greater amount of food than it exports, the impact of the Scheme on food import requirements or the food and drinks economy is not material at a national scale and has therefore not been assessed. The **Planning Statement [APP-267]** provides further detail on how BMV agricultural land has been considered against planning policy and why its inclusion within the Scheme is justified. This is in line with planning policy which does not prohibit solar development on BMV land (NPS EN-3 paragraph 2.10.30) and states that while land type should not be a predominating factor in determining a site's suitability for solar development, poorer quality land should be preferred and BMV land avoided where possible (NPS EN-3 paragraph 2.10.29) . The consideration of alternatives, including the availability and suitability of land of lower agricultural quality, is set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP 056]** and **ES Volume 3, Appendix 4 1: Site Selection Assessment Report [APP 185]**. This assessment explains how alternative sites, including areas of brownfield land and lower grade agricultural land, were considered in accordance with planning policy, but were deemed unsuitable for development. In particular, the Applicant's site selection process initially excluded ALC grades 1, 2 and 3 in the first sift for potential development areas, in order to concentrate on non-BMV land. Brownfield land was also considered at stage 3 of the assessment. The initial potential development areas were not considered viable for

Reference	Theme	Comments/Issues Raised	Applicant's Response
			development, and therefore Grade 3 agricultural land was then considered. Grade 1 and 2 agricultural land remained broadly excluded from the Applicant's area of search and were only considered when sections of Grade 1 and 2 agricultural land were included within broader land parcels that were identified as potentially available.
BSPC-005	Cultural Heritage	Harm to designated heritage assets, including the setting of the Fosse Way (a scheduled monument) and Bradfield Manor (Grade I listed), contrary to the NPPF and statutory protections.	As detailed in Section 12.3 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, the cultural heritage assessment follows appropriate legislation, policy and guidance including the overarching NPS for Energy (EN-1) (January 2024), NPS for Renewable Energy Infrastructure (EN-3) (January 2024), the Wiltshire Core Strategy (2015), as well as guidance provided by Historic England and the Chartered Institute for Archaeology. The potential effects of the Scheme on the Roman Roads (i.e. the Fosse Way), as well as other Roman archaeological assets are fully assessed **in ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices **in ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. Where an adverse effect has been identified, mitigation is proposed. See Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation and Section 12.11 for additional mitigation. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12.6 Archaeological Mitigation Strategy [APP-230]**. Mitigation will be secured through requirement 12 of the DCO. **ES Volume 1, Chapter 12: Cultural Heritage [APP-064],** supported by **ES Volume 3, Appendix 12.1: Heritage Statement [APP-219]**, identified that there would be a moderate / minor (not significant) adverse effect to Bradfield Manor Farmhouse (less than substantial harm at the lower end in NPPF terms) as a result of indirect (i.e. setting) impacts.
BSPC-006	Cumulative Effects	The cumulative impact of these harms fail to meet the thresholds set out in	A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning

Reference	Theme	Comments/Issues Raised	Applicant's Response
		relevant policy and legislation. We respectfully urge the Secretary of State to refuse development consent.	Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within Environmental Statement **Chapter 21: Cumulative and In-Combination Effects [APP-073]** and **Appendix 21-1 Long List of In-Combination Effects and Cumulative Developments [APP-264]**. In combination effect interactions during the construction, operation and decommissioning phase do not increase the significance of effects of the Scheme. No significant inter project cumulative effects are identified other than Skylark at a District Level during the operational phase and on four PRoWs and Corsham Park (tourism and recreation) during the construction phase. Refer also to responses to the CAWS Relevant Representation for further detailed responses on cumulative effects.

5.6 Langley Burrell Without Parish Council

Table 5-6 RR-2721

Reference	Theme	Comments/Issues Raised	Applicant's Response
LBWPC-001	Description and DCO Process	The Parish Council will be submitting a comprehensive letter of objections to this proposal. These will include the overall size and scale of the project. The significant negative impact on the rural scene and landscapes, the surrounding village settings, ecology and biodiversity, hydrology, flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, highways and socio-economics, tourism and recreation all to be balanced against the potential gains of renewable energy generation and carbon reduction. In addition the concentration of solar farms, battery storage and associated infrastructure within the County of Wiltshire that represents a significant cumulative impact and industrialisation of the countryside destroying food production and the farming industry	The Applicant notes the Council's intention to submit a detailed letter of objections covering a range of topics including landscape and visual effects, setting, ecology and biodiversity, hydrology and flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, socio-economics, tourism and recreation, as well as concerns relating to cumulative development and the scale of the Scheme. The Applicant confirms that these matters have been assessed as part of the Environmental Impact Assessment (EIA) and are reported within the Environmental Statement (ES), including **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061], ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063], ES Volume 1, Chapter 14: Noise and Vibration [APP-066], ES Volume 1, Chapter 12: Cultural Heritage [APP-064], ES Volume 1, Chapter 13: Transport and Access [APP-065], ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073].** The Applicant's **Statement of Need [APP-266]** provides evidence that an unprecedented capacity of new low-carbon generation schemes is urgently needed for the UK to meet its legally binding climate change targets. The government has confirmed that solar energy is at the heart of the Clean Power 2030 Mission [NPS EN-3 (2025) Paras 2.10.1 & 2.10.2]. The Statement of Need confirms that the need for the Scheme is urgent and that substantial weight should be given to the need for the Scheme [NPS EN-1 (2023) Para 3.2.9-3.2.10]. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies. The Applicant recognises that the Council intends to provide further detailed submissions on these matters. The Applicant will continue to engage constructively with stakeholders throughout the Examination and will respond to issues raised through the formal Examination process.

5.7 Nettleton Parish Council

Table 5-7 RR-3443

Reference	Theme	Comments/Issues Raised	Applicant's Response
NPC-001	Transport and Access	Are the predicted traffic flows credible?	The Applicant has predicted construction traffic flows for the Scheme based on a realistic breakdown of construction materials, such as aggregate and number of modules. Calculations are provided in Annex E of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. Further detail of trip generation will also be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and an updated version submitted at Deadline 1 of Examination. The transport and access assessment has been completed by competent experts, as detailed in **ES Volume 3, Appendix 1-1: Statement of Competence [APP-180]**, and is considered to be a robust assessment of the Scheme.
NPC-002	Noise and Vibration Transport and Access Human Health	The impact on residents and vibration to houses foundations in Burton due to the increase of HGV's. Danger to children waiting for school bus.	The B4039 route through Burton is a B-Road and is suitable for carrying HGV traffic. There are no HGV restrictions along this route and it is currently used by HGVs. Evidence indicates that vibration from the passing of HGVs, even on a relatively poor road surface, is likely to be negligible. The following document presents a summary of such evidence: Appendix 12.9 of the Lower Thames Crossing Environmental Statement. The types of vibration effects from HGV's are the same as for this Scheme (being from HGV movements generally). As such, operational traffic vibration has been scoped out of the ES. This has been agreed as acceptable by the planning inspectorate as summarised in Table 14-1 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The assessment of traffic impacts associated with the Scheme is set out in **ES Volume 1, Chapter 13: Transport and Access [APP-065]** which identifies no significant adverse effects to non-vehicular road user safety, delay, or fear and intimidation during construction. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. As such, there is no respective significant adverse effect to human health and wellbeing as a result of transport and connections as assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. Furthermore, the Applicant has committed to limiting HGV movements during construction to the hours of 09:30 to 16:30 on weekdays, substantially reducing the likelihood of HGV movements coinciding with morning school movements. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme.

5.8 Castle Combe Parish Council

Table 5-8 RR-0645

Reference	Theme	Comments/Issues Raised	Applicant's Response
CCPC-001	Transport and Access	The site comprises a network of villages, hamlets, farms, rights of way, and productive agricultural fields that maintain the distinct identity of multiple rural communities.	The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **Environmental Statement [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft Development Consent Order [APP-016]**. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068],** and **Chapter 18: Human Health [APP-070],** all of which consider potential impacts on residential properties and local communities.
CCPC-002	Landscape and Visual	The development is industrial in scale, covering 2,000 to 3,000 acres of agricultural land and placing major infrastructure - including a Battery Energy Storage System (BESS), substation, and solar arrays - just 300 metres from homes.	A buffer of at least 50m from solar arrays to the curtilage of all residential properties has been incorporated into the layout of the Scheme to protect visual amenity. The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Cable Route Corridor, which stretches approximately 22 km from 'Lime Down D' to Melksham Substation and links together the Solar PV Sites, covers approximately 463.2 ha. Approximately 17.8 ha (of which 5.9 ha overlap with the Cable Route Corridor) is proposed for Highway Improvement Areas within which improvements to sections of the existing highway network will be completed to facilitate access to the Scheme, such as improvements to road edge and traffic management. Work will be undertaken by the Applicant and National Grid within the Existing National Grid Melksham Substation, requiring a total area of 12.8 ha. The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the Environmental Statement [**APP-052 – APP-065**] the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft Development Consent Order [APP-016]**. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Visual [APP-060], Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068], and Chapter 18: Human Health [APP-070], all of which consider potential impacts on residential properties and local communities. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.
CCPC-003	Other Environmental Matters	The applicant has not demonstrated how a major incident could be contained. The siting so close to homes and critical infrastructure is wholly inappropriate and represents an unacceptable and unmanageable risk to public safety	As a result of updated Scheme design for DCO submission, BESS infrastructure is proposed more than 500 m away from the nearest dwelling (refer to **ES Volume 3, Appendix 15-2 BESS Fire Emissions Modelling [APP-239]**). As such, there are no significant adverse effects to human health anticipated as a result of the Scheme, as assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** The location of the Battery Energy Storage System (BESS) has been informed by a detailed site selection and design evolution process, as set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056].** This chapter explains that land at Lime Down D was identified as an appropriate location due to its proximity to the solar PV arrays and the on-site substation, providing operational benefits including minimising transmission losses, maximising storage efficiency, and enabling rapid and reliable grid response. In considering options for co-locating the BESS with the solar PV Sites, Lime Down D was selected as the preferred location due to its central position within the Scheme, effective natural and proposed screening, limited proximity to residential properties, and closeness to existing infrastructure corridors,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			including the railway line. Locating the BESS within an existing infrastructure corridor reduces the need for additional land take and avoids introducing new isolated infrastructure into undeveloped areas. The assessment concludes that siting the BESS at Lime Down D presents the lowest potential for significant adverse environmental effects. Accordingly, the proximity of the BESS to the railway line does not give rise to significant safety or environmental concerns. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Plan (OBSMP) [APP-286]. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through Requirement 6 of the **Draft DCO [APP-016].** As now mandated under NFPA 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the **OBSMP [APP-286]** pre-construction requirements. Section 5 of the **OBSMP [APP-286]** covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant notes that the approach to BESS safety is being discussed with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and this will be set out in the relevant Statement of Common Ground.
CCPC-004	Noise and Vibration	Noise emissions, visual intrusion, and operational lighting would permanently destroy the tranquillity of the area.	The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 **of ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237].** A penalty has been applied to predicted

Reference	Theme	Comments/Issues Raised	Applicant's Response
			noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 **of ES Volume 1, Chapter 14: Noise and Vibration [APP-066],** and with such measures in place, significant effects from operational noise are not expected. As shown in Table 8 **of ES Volume 3, Appendix 14-4: Noise Modelling [APP-237],** levels would typically be below or slightly above the existing background sound in the area. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Potential effects relating to lighting are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. Measures to control construction lighting are set out in the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring

Reference	Theme	Comments/Issues Raised	Applicant's Response
			lighting impacts are appropriately controlled throughout the lifetime of the Scheme.
CCPC-005	Transport and Access	The construction traffic proposals rely on narrow rural lanes that are physically incapable of safely accommodating the volume of HGVs required. Independent analysis shows the applicant has underestimated traffic by over 40%. This creates an unacceptable and unmanageable safety risk, particularly where there are no pavements, limited verges, blind bends, and multiple public rights of way	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **OCTMP [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes (including this route) and will be confirmed as part of the final CTMP. Excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of is an estimate of the deliveries on a peak day, so does not represent a daily average;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • delivery times during the construction phase are limited to those times set out in the **OCTMP [APP-287]**. There will be no HGV construction trips outside of these hours; and • there would be a much greater impact on hedgerow, trees and character. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs. Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. The Applicant notes that independent analysis of construction HGV trip generation has not been provided so is unable to comment on this at this stage.
CCPC-006	Landscape and Visual	We object to the environmental and landscape harm caused by industrial fencing, large scale visual structures, and the fragmentation of wildlife habitats. The proposal contradicts local and national Landscape Recovery objectives by creating impermeable barriers that block natural wildlife movement and erode the rural character of the area.	Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061],** which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Sites that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely

Reference	Theme	Comments/Issues Raised	Applicant's Response
			access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described **in ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**.
CCPC-007	Socio-Economics, Tourism and Recreation	This is a regional loss of amenity, affecting thousands of people who walk, cycle, ride, and enjoy this landscape as part of their daily lives. The proposal would erase the rural qualities that bind these communities together and define this part of the South Cotswolds. We strongly object to the proposal.	The Applicant has aimed to provide a robust assessment of impacts to tourism and recreation in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068**], while impacts to the social environment, on amenity, and access to the countryside for leisure have been assessed in **ES Volume 1, Chapter 18: Human Health [APP-070],** with reliance on **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however, the assessment identifies residual significant adverse effects to a small number of PROWs and unsurfaced highways during construction, and to long-distance recreation routes during all phases of the Scheme (due to their regional or national importance). The assessment of human health impacts identifies no residual significant adverse effects. The assessment in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the **supporting ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** have assessed the likely impacts of the Scheme at construction, operation, peak replacement, and decommissioning on tourism and recreation receptors, including all PROWs within 2 km of the Scheme. Assessment of the likely impact on the Cotswolds National Landscape has been considered separately as both a landscape and visual impact in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, and as a tourism destination in in **ES Volume 1, Chapter 16: Socio-Economics,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Tourism and Recreation [APP-068]. The assessment in ES Chapter 16 concludes that there is no residual significant adverse effect to the Cotswolds National Landscape as a tourism destination.
CCPC-008	Soils and Agriculture	We are concerned about the loss of farm land.	The effects of the Scheme on agricultural land, including the duration of effects, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, with supporting information provided in **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. The assessment confirms that land would be removed from arable rotation for the operational life of the Scheme, anticipated to be approximately 60 years, but would not be permanently lost. While the primary agricultural use would cease during this period, the soil resource would be retained and would continue to perform its ecological functions. Reduced disturbance associated with the Scheme allows soils to recover from previous intensive agricultural use, resulting in long term benefits to soil structure and soil biology. All land would be reinstated and returned to agricultural use as far as practicable following decommissioning.
CCPC-009	Noise and Vibration	The disruption to residents on noise and travel while it is being built.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277],** is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between

Reference	Theme	Comments/Issues Raised	Applicant's Response
			09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
CCPC-010	Other Environmental Matters	The disruption while putting in 25 miles of cables to take the energy to the batteries site in Melksham. Is this sensible and safe to those residents there	The Applicant acknowledges concerns about disruption and safety during installation of the cable route to Melksham Substation. The works will be managed through the **Outline CEMP [APP-277]**, **Outline CTMP [APP-287],** and **OPROWPPMP [APP-282]** secured by Requirements 13, 15, and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**. Cable installation will be undertaken within managed, segregated work areas and, where appropriate, trenchless techniques will be used to avoid major roads and sensitive locations. Once installed, cables are buried to industry standards and present no safety risk to residents as per the assessment presented in **Chapter 20: Other Environmental Matters (Section 20.7 Major Accidents and Disasters)** and **Appendix 20-5 High-Level Electromagnetic Field Assessment [APP-262].** Regarding potential safety concerns relating to construction traffic, the potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 13: Transport and Access [APP-065], which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. Resultantly, the assessment of human health effects in **ES Chapter 18: Human Health [APP-070]** finds no significant adverse effects to health or people's safety as a result of construction works on the Cable Route Corridor. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme.
CCPC-011	ecommissioning andConstruction and Decommissioning	This proposal would have a devastating effect on the environment and considerable local disruption during the installation process.	The Applicant is confident that the management and mitigation measures proposed are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Wiltshire already has a disproportionate amount of solar farm acreage.	The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The likely significant effects of the Scheme during the construction phase are assessed throughout the **ES [APP-052 to APP-265]**, including effects on traffic and transport, noise and vibration, air quality, landscape and visual amenity, ecology, and local communities. Where likely significant effects are identified, appropriate mitigation measures are incorporated into the Scheme. Measures to limit disruption during construction are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068], and Chapter 18: Human Health [APP-070]**, all of which consider potential impacts on residential properties and local communities. As to the concern that Wiltshire already has a disproportionate amount of solar farm acreage, the Applicant notes this comment and recognises the commitment of Wiltshire residents to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			addressing climate change and supporting renewable electricity generation. The Scheme would build on this existing progress by making a further contribution to renewable energy generation and carbon emissions reduction at both a local and national level. The **Statement of Need [APP-266]** describes that there is an urgent and unprecedented need for new low carbon generation in the UK to meet our climate change, energy security and affordability targets. Further, the Government considers that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). In terms of the Lime Down project, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated Appendices **[APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073].** Existing schemes are captured within the baseline environment. The four-stage cumulative assessment methodology is described within **ES Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the Long List **[APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Table 21-8 within ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073] identifies that, taking a conservative worse case approach, significant cumulative effects with the short list of developments are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.

5.9 Kington St Michael Parish Council

Table 5-9 RR-2701

Reference	Theme	Comments/Issues Raised	Applicant's Response
KSMPC-011	Description and DCO Process	The Parish Council will be submitting a comprehensive letter of objections to this proposal. These will include the overall size and scale of the project. The significant negative impact on the rural scene and landscapes, the surrounding village settings, ecology and biodiversity, hydrology, flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, highways and socio-economics, tourism and recreation all to be balanced against the potential gains of renewable energy generation and carbon reduction. In addition the concentration of solar farms, battery storage and associated infrastructure within the County of Wiltshire that represents a significant cumulative impact and industrialisation of the countryside destroying food production and the farming industry	The Applicant notes the Council's intention to submit a detailed letter of objections covering a range of topics including landscape and visual effects, setting, ecology and biodiversity, hydrology and flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, socio-economics, tourism and recreation, as well as concerns relating to cumulative development and the scale of the Scheme. The Applicant confirms that these matters have been assessed as part of the Environmental Impact Assessment (EIA) and are reported within the Environmental Statement (ES), including **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061], ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063], ES Volume 1, Chapter 14: Noise and Vibration [APP-066], ES Volume 1, Chapter 12: Cultural Heritage [APP-064], ES Volume 1, Chapter 13: Transport and Access [APP-065], ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073].** The Applicant's **Statement of Need [APP-266]** provides evidence that an unprecedented capacity of new low-carbon generation schemes is urgently needed for the UK to meet its legally binding climate change targets. The government has confirmed that solar energy is at the heart of the Clean Power 2030 Mission [NPS EN-3 (2025) Paras 2.10.1 & 2.10.2]. The Statement of Need confirms that the need for the Scheme is urgent and that substantial weight should be given to the need for the Scheme [NPS EN-1 (2023) Para 3.2.9-3.2.10]. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies. The Applicant recognises that the Council intends to provide further detailed submissions on these matters. The Applicant will continue to engage constructively with stakeholders throughout the Examination and will respond to issues raised through the formal Examination process.

5.10 Stanton St Quintin Parish Council

Table 5-10 RR-0625

Reference	Theme	Comments/Issues Raised	Applicant's Response
SSQPC-001	Landscape and Visual	The Stanton St Quintin Parish Council has extremely strong objections to this proposal. The objections relate to the vast scale of the development in open countryside.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Cable Route Corridor, which stretches approximately 22 km from 'Lime Down D' to Melksham Substation and links together the Solar PV Sites, covers approximately 463.2 ha. Approximately 17.8 ha (of which 5.9 ha overlap with the Cable Route Corridor) is proposed for Highway Improvement Areas within which improvements to sections of the existing highway network will be completed to facilitate access to the Scheme, such as improvements to road edge and traffic management. Work will be undertaken by the Applicant and National Grid within the Existing National Grid Melksham Substation, requiring a total area of 12.8 ha. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
SSQPC-002	Transport and Access	There would be an issue with increased traffic on the local narrow roads; impact on the local hospitality and tourism and impact on walkers and riders in the area.	Traffic The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065],** which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by WC. To provide further comfort, additional information will be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and resubmitted at Deadline 1 of Examination to demonstrate that there is adequate carriageway width and/or

Reference	Theme	Comments/Issues Raised	Applicant's Response
			passing place opportunity for two HGVs when accessing Lime Down Site D. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287].** The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme. <u>Local businesses and tourism</u> The potential effects of the Scheme on tourism and recreation are assessed **in ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068],** supported **by ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is being discussed with Wiltshire Council's Economic and Regeneration Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economics and Regeneration Team, with the exception of matters relating to agricultural employment, which is still being discussed. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline1. <u>Walkers and riders</u> A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241].** This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			mitigation is being discussed with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in **the Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282].** These are confirmed as embedded mitigation measures in Section 16.9 of **ES Volume 1, Chapter 16: Socio Economics, Tourism and Recreation [APP-068]**. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007**] and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283].** These are considered as additional mitigation and enhancement measures in Section 16.11 of **ES Volume 1, Chapter 16: Socio Economics, Tourism and Recreation [APP-068]**. The PRoW and Permissive Paths MP is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016**]. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. Equestrian facilities, including private stables and paddocks, studs, riding schools, and on public rights of way such as bridleways and byways have been considered as specific recreational receptors in the assessment in the **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]. The likely effects on these locations and receptors are specifically and individually assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of equestrian facilities and PROWs is protected as much as possible through the implementation of embedded and additional mitigation measures set out in the **OCTMP [APP-287**] and **OPROWPPMP [APP-282],** secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016**]. The Applicant notes that the approach to equestrian and PROW impacts is being discussed with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
SSQPC-003	Socio-Economics, Tourism and Recreation	The development could also have a detrimental impact on the property prices	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].**
SSQPC-004	Hydrology, Flood Risk and Drainage	and the rain storm run-off from the panels would cause severe flooding.	An assessment of the effects of the Scheme on flood risk both within the Order Limits and the surrounding area is provided **in ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided **in ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment concludes that, with the embedded mitigation measures secured through the parameters assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, the detailed drainage design to be approved under the **Draft Development Consent Order [APP-016]**, and the implementation of construction controls through the **Outline Construction Environmental Management Plan [APP-277]**, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors. Any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
SSQPC-005	Socio-Economics, Tourism and Recreation	The huge number of workers on the site would impact on all the local residents which could impact on the already overstretched doctors and other local services.	Impacts on local services as a result of construction workers for the Scheme have been assessed **in ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **in ES Volume 1, Chapter 18: Human Health [APP-070]**. The assessment of socio-demographic changes as a result of inbound construction workers has determined that there are no significant adverse effects to the socio-demographic environment (age, health, disability, access to housing) as the inbound construction workforce are anticipated to be largely temporary, and accommodated in hotels across a 20 km Study Area. As such, impacts on access to services are likely to be spread across a large area, with the maximum population uplift over this area expected to be approximately 0.054%. With respect to access to service including health services, the assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** considers the likely health requirements for onsite workers to access general practice healthcare and emergency healthcare. Ignoring that temporary inbound workers are anticipated to be accommodated within 20 km of the Scheme, the additional workforce associated with inbound workers (+412) is equivalent to approximately 0.3% of the patient list of GP practices within 5 km of the Scheme. This is therefore not a substantial increase, and is not likely to have any significant effect on health and wellbeing of existing residents.

Reference	Theme	Comments/Issues Raised	Applicant's Response
SSQPC-006	Ecology and Biodiversity	The environmental impact on the local countryside is unacceptable with potential impact on local wildlife, heritage features and the scale of the infrastructure	Wildlife Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is being discussed with Wiltshire Council and Natural England and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10: Arboriculture [APP-062].** The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 9: Ecology and Biodiversity [APP-061], this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283],** are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016].** The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Heritage features</u> The potential effects of the Scheme on cultural heritage, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			3, Appendices 12-1 to 12-7 [APP-219 to APP-231]. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is being discussed with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064],** with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230],** which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Development Consent Order [APP-016], ensuring that appropriate protection, recording and mitigation are delivered before and during construction. Scale The Project has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.

			managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.
LAPC-003	Hydrology, Flood Risk and Drainage	For the reasons summarised below, Luckington and Alderton Parish Council is firmly opposed to the proposed Lime Down Solar Park (LDSP) development. This response was approved at the Luckington and Alderton Parish Council Meeting on Wednesday 10th December 2025. Climate Change: We believe that the area covered by the proposed Lime Down Solar Park development, in common with many other parts of the UK, has seen an increase in significant weather events, particularly storms and associated high risk flooding events during recent years. This has resulted in many severe flooding events 'downstream' of the proposed development site, and we are concerned that this increasing risk has not been adequately considered nor has it triggered appropriate mitigation proposals from the developer. This omission has potentially severe consequences for the wider community within the Bristol Avon catchment area and should be properly addressed.	The Applicant acknowledges concerns regarding recent storm events and flooding within the wider Bristol Avon catchment. Climate change is incorporated throughout **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** using the latest Environment Agency allowances for the relevant management catchments, including peak river flow uplifts and peak rainfall intensity allowances, applied within the assessment and, where proportionate, within site-specific hydraulic modelling. The assessment concludes that, with these allowances applied, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. The Outline CEMP will be secured via Requirement 13 of the **Draft DCO [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
LAPC-004	Hydrology, Flood Risk and Drainage	Flooding and Drainage: The area of the proposed Lime Down Solar Park is vast. It sits astride and encompasses a large part of the headwaters of the Bristol Avon river. The surface water which falls on the proposed development area either flows overground to the rivers, or through the subsoil or down to the aquifers to reach the Luckington Avon, Sherston Avon or Gauzebrook tributaries and onwards to the Bristol Avon. All of these tributaries and rivers suffer severe flooding, which significantly impacts the downstream conurbations of Malmesbury, Chippenham, Melksham, Trowbridge, Bradford n Avon, Bathford, Bath and Bristol.	The Applicant acknowledges that runoff from the Site contributes to the Luckington Avon, Sherston Avon and Gauze Brook tributaries and subsequently to the Bristol Avon catchment. An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063],** with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].** The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. The Outline CEMP will be secured via Requirement 13 of **the Draft DCO [APP-016].**
LAPC-005	Hydrology, Flood Risk and Drainage	The proposal includes enormous impermeable motorised solar panels erected above ground level, and with large impermeable battery and transformer installations. However these are constructed, they will	The Applicant does not agree that the solar PV arrays are "*enormous impermeable*" surfaces that inevitably speed up runoff or materially alter groundwater recharge. The assessment in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** explains that panels are elevated and configured such that rainfall drains to ground beneath and between panels,

Reference	Theme	Comments/Issues Raised	Applicant's Response
		inevitably speed up run off, alter the ways in which water enters the subsoil and aquifers, and erode/redirect surface water flows. The local waterways and fields frequently flood, blocking roads and damaging property. Changing this is highly likely to make matters much worse, yet these implications have been inadequately considered in the application. Irrespective of the limited mitigation measures proposed on-site by the developer, any water falling on, or passing through the development area will inevitably enter the River Avon at some point, yet the developers have dismissed the off-site flooding implications of this development as being unimportant. We feel this position is ill-judged and incorrect. The scale and extent of the proposed Lime Down Solar Park represent a very significant potential flooding threat to all of the land, housing and businesses downstream of the site along the whole catchment of the River Avon. The developers' proposals fail to adequately consider or mitigate for this substantial threat.	maintaining existing drainage pathways. The existing baseline comprises intensively managed arable land subject to trafficking, compaction and periods of bare ground, and the Scheme introduces permanent grass cover and reduced soil disturbance which improves infiltration capacity and soil structure relative to the baseline. National policy recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (NPS EN-3 paragraph 3.10.75). The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. The Outline CEMP will be secured via Requirement 13 of **the Draft DCO [APP-016]**.
LAPC-006	Human Health	Drinking Water: The proposed development site sits over the extensive and highly sensitive and vulnerable Oolitic limestone aquifers. These are an important source of safe	The Applicant does not agree that the Scheme presents a significant pollution threat to drinking water supplies or that mitigation is inadequate. Groundwater receptors, including the underlying aquifers, are assessed and controlled within **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		drinking water for an extensive geographic area. The proposals lack essential details, but we are concerned that the proposed location and construction of the solar panel installations, transformers and other installations, alongside the proposed BESS - battery facilities represent a significant threat of pollution, fire risk (with elevated pollution risk from contaminated water). This risk is likely to be particularly high during the construction and commissioning phase of the proposals, yet there is little detail in the proposals, and what is presented is wholly inadequate and offers no realistic mitigation options. We should not be risking such an important source of drinking water in this way.	**[APP-063]** and **ES Volume 1, Chapter 19: Ground Conditions [APP-071]**, which consider construction and operational pollution pathways and set out embedded and additional mitigation to avoid significant adverse effects on controlled waters. Potential pollution risks associated with hardstanding areas for supporting electrical infrastructure, including BESS and substations, are managed through the principle of controlled drainage and pollution prevention measures, with detailed design and operational controls secured through Requirements 5 and 14 of the **Draft Development Consent Order [APP-016]**, including emergency response provisions to prevent uncontrolled release of contaminated liquids. Construction phase risks, including during commissioning, are managed through secured pollution prevention and incident response measures within the **Outline CEMP [APP-277]**. No amendments to the application documents are required.
LAPC-007	Landscape and Visual	Landscape and Visual: The proposed Lime Down Solar Park development sits adjacent to the southern boundary of the Cotswolds Natural Landscape (CNL) (formerly ANOB), and much of the proposed development will be easily visible from within the CNL. The developer is proposing the use of enormous 4.5m motorised solar panels, which are ugly, impossible to effectively conceal within the iconic Cotswolds landscape, and noisy. Some of the other installations are intended to be over 7m high. The local landscape is such, that despite the	The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of

Reference	Theme	Comments/Issues Raised	Applicant's Response
		developers' best efforts to conceal them from view, they are likely to be visible from over 20 miles away. This gently rolling, picturesque landscape, with its characteristic far reaching views, simply cannot be made to 'hide' such enormous industrial facilities. They will be simply lost forever, and the suggestion that the area could be returned to it's present state after 60 years of industrial use is simply not credible.	visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. The landscape and visual effects of the Scheme, including the effects of the maximum panel height, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors during construction, operation and decommissioning, using the maximum design parameters to ensure a robust assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These include new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**.
LAPC-008	Transport and Access	Transport: The resident of the hamlets, villages and towns of North Wiltshire frequently use Chippenham for essential local services including medical facilities, hospitals, dentistry, pharmacy , retail and service provisions. There is little public transport in the area and all road routes from these settlements to Chippenham pass through the proposed Lime Down Solar Park development area. Many of these routes are unsuitable for large goods vehicles or safe two-way travel. Almost all of these routes are intended for use as 'access routes' by the large numbers of site vehicles associated with the development. The routes are	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **OCTMP [APP-287]**, a booking system will be

Reference	Theme	Comments/Issues Raised	Applicant's Response
		already busy, frequently disrupted by accidents, flooding and other road incidents, and the consequential delays are problematic for the communities involved. The duration of the prolonged (2 year) construction period, together with the size and number of vehicles movements involved in the construction, will cause the local community unacceptable disruption and hardship. It may even lead to members of the community being unable to access essential services in a timely manner. The local road network is inadequate and cannot adequately absorb the proposed construction traffic, even with the limited 'improvements' the developer has proposed. The so called 'improvements' seem to largely consist of removing 'inconvenient' road furniture (much of which is in place for sensible safety reasons) for the duration of the 2-year construction period. This is ill-considered and inappropriate. Oversized vehicles travelling in narrow rural lanes, wholly inadequate counter measures and the removal of important roadside safety furniture (for a very protracted period) will significantly increase the risks for those using these roads.	set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes (including this route) and will be confirmed as part of the final CTMP. Excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • delivery times during the construction phase are limited to those times set out in the **OCTMP [APP-287]**. There will be no HGV construction trips outside of these hours; and • there would be a much greater impact on hedgerow, trees and character; To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination.
LAPC-009	Other Environmental Matters	BESS - Battery Storage: The battery storage facilities planned as part of the Lime Down Solar Park proposals causes us much concern. They are intended to be located in close proximity to surface water sources and above the sensitive underground vulnerable aquifers, which are an important source of drinking water for a very large geographic area). The proposals lack essential details, but we are concerned that the proposed location and construction of these battery installations represent a significant threat of pollution, fire and noise. We are concerned that the developers proposed mitigation measures will prove completely inadequate in light of the challenging local conditions.	The assessment of likely impacts to human health from BESS fires and noise in **ES Volume 1, Chapter 18: Human Health [APP-070]** has been directed by the assessment of noise, hydrology, flood risk and drainage, and ground contamination, as set out across the relevant technical chapters of the ES. Furthermore, adverse impacts to people and the environment from the BESS are directly controlled through the mitigation measures set out in the **Outline BSMP [APP-286]**, which is secured by Requirement 6 in Schedule 2 to the **Draft DCO [APP-016].** No significant adverse effects to human health are assessed as anticipated to occur. An assessment of potential contamination risks is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063] and ES Volume 1, Chapter 19: Ground Conditions [APP-071]**, which consider risks to surface water, groundwater and sensitive receptors during construction, operation and decommissioning of the Scheme. These assessments conclude that, with appropriate mitigation and management measures in place, no significant contamination effects are anticipated. The Applicant notes that the approach to risk of contamination of groundwater and surface water has been agreed with Wiltshire Council and is under discussion with the Environment Agency and is set out in the relevant Statement of Common Ground with Wiltshire to be submitted at Deadline 1 and will be included in a future Statement of Common Ground with the Environment Agency. Mitigation and management measures to protect water and ground conditions are set out in the **Outline CEMP [APP-277]** and supporting management plans. These include pollution

Reference	Theme	Comments/Issues Raised	Applicant's Response
			prevention controls, containment measures, emergency response procedures, and site-specific drainage design. In particular, drainage within substation and Battery Energy Storage System (BESS) areas will incorporate lined drainage and automatically actuating shut-off valves to contain any accidental spills or firewater, preventing release to surrounding land or watercourses. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated
LAPC-010	Soils and Agriculture	Loss of Agricultural Land: The proposed Lime Down Solar Park encompasses an area of over 2000 acres of productive agricultural land, with much of it believed to be BMV (Best Most Valuable Land). We feel that the loss of such a large tract of land, currently under agriculture, is ill-advised and inappropriate. At a time when food security is so important, valuable agricultural land should not be used for this industrialised purpose. The Lime Down Solar Park proposal is for the site to be in use for 60 years. In reality, this agricultural land will be lost forever, and the suggestion that the area could be returned to its present productive agricultural use after 60 years of industrialisation is simply not credible.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered high-quality agricultural land in planning terms. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
LAPC-011	Ecology and Biodiversity	Impact on wildlife, fauna, flora and local environment: Previous solar industrial projects have been built on a scale which has allowed local mitigation measures to successfully address many of our concerns regarding the impact on wildlife, fauna, flora and local environment. The proposed Lime Down Solar Park is of a much larger order of	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		scale. We are concerned that the previously used mitigation measures are not scalable to be effective in protecting the significant diversity and density of wildlife, fauna and flora within the proposed development site, nor can they adequately protect the local environment from contamination and destruction when the development is of such a large industrial magnitude.	Mitigation measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat and species protection measures, buffer zones, monitoring and long-term ecological management. The prescribed measures are based on best-practice guidance and experience from numerous other schemes of a similar nature. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283],** are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284],** are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016].** These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.
LAPC-012	Consultation and Engagement	Adequacy of Consultation: Throughout the pre-application consultations, the developer of the Lime Down Solar Park proposals has appeared dismissive of local concerns, failed to provide additional information requested by the local community, and sought to make it difficult for many within the local community to engage with the developer and make their voices heard. This was particularly the case with the 'Targeted Consultation', where many of those directly affected by the traffic proposals were not adequately	The Applicant considers that the statutory consultation has been robust, thorough and undertaken in accordance with the requirements of the Planning Act 2008, the Environmental Impact Assessment (EIA) regulations, and the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009. The **Consultation Report [APP-022**] sets out the Applicant's approach to pre-application consultation. The Applicant considers that the general public was provided with a proportionate and reasonable opportunity to provide feedback on the changes that formed part of the Targeted Consultation, which was undertaken in accordance with the

Reference	Theme	Comments/Issues Raised	Applicant's Response
		informed of the developers' intentions and subsequently felt they had been excluded from the consultation process.	relevant principles as set out in the Statement of Community Compliance. A draft of the SoCC was shared with Wiltshire Council for feedback, and Wiltshire Council confirmed in its Adequacy of Consultation Representation that the approach set out in the SoCC was sufficient. As set out in the **Consultation Report [APP-022]**, a draft of the Applicant's proposed approach to Targeted Consultation was shared with Wiltshire Council and South Gloucestershire Council, and feedback was provided and incorporated before the Targeted Consultation period commenced. The Applicant also notes that the examination process provides a further opportunity for interested parties to comment on the Scheme. This examination is managed by an independently appointed Examining Authority. Further to this, the Applicant provided an extended relevant representation period beyond the minimum statutory timeframe to allow sufficient time for members of the public to review the submitted application documents and register as an interested party.
LAPC-013	Cumulative Effects	Cumulative Effect: Over recent years, the North and Central areas of Wiltshire have seen too many solar panel generating installations approved and built, and the area has been overly developed in this regard. The Lime Down Solar Park proposal is on a much larger scale and is a step too far. It will damage the iconic Cotswolds landscape and rural environment to an unacceptable degree.	A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In combination Effects [APP-073] and associated Appendices [APP-264]**. Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical **assessments [APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 In-Combination and Cumulative Effects [APP-073].** Existing schemes are captured within the baseline environment. The four stage cumulative assessment methodology is described **within ES Volume 1, Chapter 6: EIA Methodology [APP-058]**. 358 developments were included in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the **ES Volume 3, Appendix 21-1: Long List [APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant residual cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.
LAPC-014	Community Benefits	Community Benefits: The proposed Lime Down Solar Park development offers no benefits whatsoever to the local community (unlike many other similar local developments), yet it's scale, size, proposed cable route and use of overly large solar panels and other associated installations will destroy many of the local assets and amenities already used by both the	The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		local community and the large number of leisure visitors to the area. This represents a significant loss to the community, yet the developers offer nothing in mitigation or other consideration.	Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068], and Chapter 18: Human Health [APP-070]**, all of which consider potential impacts on residential properties and local communities. The Scheme is anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance. An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant

Reference	Theme	Comments/Issues Raised	Applicant's Response
			confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be controlled within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
LAPC-015	Cultural Heritage	Cultural Heritage, Socio-Economic, Tourism and Recreation: The proposed Lime Down Solar Park encompasses over 2000 acres of rolling Cotswolds landscape. It sits astride the historic Fosse Way Roman Road and there are numerous interesting archaeological and historical sites within the proposed development. It is a destination of recreational choice for visitors from far afield for cycling, driving, motorcycling, walking or horse-riding. Many local businesses are dependent on this for their customer base. We believe that it is likely that the excessive scale of the proposed development will severely curtail the attractiveness and viability of these activities in the future. This is likely to be particularly severe during the highly disruptive 2-year construction period, and their recovery after that must be considered very doubtful. We do not feel that the developer has given this sufficient weight, nor adequately addressed these important concerns.	The potential effects of the Scheme on the Roman Roads (i.e. the Fosse Way), as well as other Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. Where an adverse effect has been identified to Roman archaeological assets appropriate mitigation is proposed. See Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation and Section 12.11 for additional mitigation. An overarching archaeological mitigation strategy is provided **in ES Volume 3, Appendix 12.6 Archaeological Mitigation Strategy [APP-230].** Mitigation will be secured through requirement 12 of the DCO. The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

5.12 Sherston Parish Council

Table 5-12 RR-4350

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPC-001	Landscape and Visual	Sherston Parish Council is writing to register its objection to the proposed Lime Down Solar Farm development. Much of the proposed site is within or very close to the Parish and many of our residents enjoy the open spaces and use the roads that will be impacted by this project. The council wishes to state in the strongest possible terms that they do not believe this this development is appropriate, and in fact will be severely detrimental to the landscape and to the wellbeing of surrounding communities. Whilst we support community renewable energy projects that benefit our local community, this project does not. It is the wrong project, in the wrong place, and under the wrong ownership model.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits red line boundary has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and detailed within the **Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape and ecological management plans, substantially in accordance with the **LEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. In terms of the impact of the Scheme on wellbeing, this is assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "*lens*" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant. Mitigation measures in respect of human health are secured through the **OLEMP [APP-283]**, **OCEMP [APP-277]**, **OCTMP [APP-287]**, and **OPROWPPMP [APP-282]**, secured by

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Requirements 7, 13, 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**.
SPC-002	Landscape and Visual	Scale and Landscape Impact The proposed development would have a major and lasting impact on the open spaces and visual amenity afforded to our residents. The solar panels will be much bigger and higher than any project we have seen in the UK. Our footpaths will be hemmed in by high wire fences. The open, rolling landscape will be covered by a sea of black panels.	The Scheme is not permanent. The application is for a period of up to 60 years operational life. At which point, the development would be required to be decommissioned. **ES Volume 1, Chapter 3: The Scheme [APP-055].** The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, all land will be returned to its original use and condition as far as practicable and returned to the landowner. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the effects would be less than those likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. **ES Volume 1, Chapter 8: LVIA [APP-060]** robustly assesses both the landscape and visual effects of the Scheme independently to ensure both the impacts and effects on the fabric and character of the landscape are taken into account as well as the views and visibility. The Lime Down Solar Sites are dispersed in nature and have limited intervisibility with each other. In the assessment of effects for the 1km Local Study Area in Table 2.2 of Appendix 8-3-2-2 **[APP191**] it is noted that "*Construction activities would have an impact locally, and the change in land use from arable farmland to a solar scheme would cause a noticeable change to the character of the 1km Local Study Area. There would be short term Moderate Adverse effects during the construction phase*". With respect to visual impact, **ES Volume 1, Chapter 8: LVIA [APP-060]** identifies that there would be some significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting

Reference	Theme	Comments/Issues Raised	Applicant's Response
			would be inappropriate to landscape character and the legacy landscape. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant confirms that existing PRoW are to be controlled within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline

Reference	Theme	Comments/Issues Raised	Applicant's Response
			plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. The landscape and visual effects of the Scheme, including the effects of the maximum panel height, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors during construction, operation and decommissioning, using the maximum design parameters to ensure a robust assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These include new and enhanced planting, retention of existing hedgerows and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. Further detail on visual amenity is provided in the Applicant's response below.
SPC-003	Landscape and Visual	The open, rolling landscape will be covered by a sea of black panels. Mitigating the visual impact will be impossible. There is also the constant noise pollution that will be generated by a large number of moving panels. substations and battery storage in what is a tranquil environment. The substations and battery storage system will be industrial in scale and totally out of keeping with a landscape that border the Cotswolds National Landscape.	The landscape and visual effects of the Scheme, including the effectiveness of proposed mitigation, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses the Scheme using realistic worst-case design parameters and identifies where significant effects may occur, taking into account embedded mitigation. The Scheme design has been informed by an iterative design process and incorporates a comprehensive package of embedded mitigation measures to avoid, reduce and mitigate landscape and visual effects. These measures include sensitive siting, reductions to the Scheme boundary, minimum offsets from key receptors, retention of existing vegetation, and the provision of new landscape planting and enhancement. The LVIA assesses the effectiveness of these mitigation measures over time and concludes that, in many locations, landscape and visual effects would reduce as mitigation planting establishes and matures. NPS EN-1 recognises at para 5.10.5 that "*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			may also be beneficial landscape character impacts arising from mitigation." Details of the mitigation measures and their long-term management are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. <u>Construction phase</u>

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. <u>Operational phase</u> The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			(OLEMP) [APP-283], and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
SPC-004	Soils and Agriculture	Loss of Productive Farmland Approximately 30% of the farmland is 'best and most versatile' farmland. The removal of this high-quality farmland for decades at a time is not compatible with sustainable planning.	The effects of the Scheme on agricultural land, including Best and Most Versatile (BMV) agricultural land, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, supported by **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. . The Scheme would result in the long-term but temporary loss of agricultural use of the land, which would be reinstated as far as practicable following decommissioning. National planning policy recognises the economic and other benefits of BMV agricultural land and encourages the use of lower quality land where possible; however, agricultural land quality is one of a number of sustainability considerations to be weighed in the planning balance. The consideration of alternative sites, including the availability and suitability of land of lower agricultural quality, is set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP 056]** and ES Volume 3, Appendix 4 1: Site Selection Assessment Report **[APP 185].**
SPC-005	Soils and Agriculture	With growing concerns over food supply and national resilience, we	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		should not be trading productive soil for imported food while leaving roofs, brownfield sites, and degraded land underused for renewable generation – especially when national targets for solar energy can be met by prioritising those more suitable locations first, as stated by the Council for the Protection of Rural England.	**17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered high-quality agricultural land in planning terms. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly

Reference	Theme	Comments/Issues Raised	Applicant's Response
			helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Site selection is addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Paragraph 2.10.31 *at this scale, it is likely that applicant's developments will use some agricultural land. Applicants should explain their choice of site, noting the preference for development to be on suitable brownfield, industrial and low and medium grade agricultural land.* **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** explains how brownfield land, industrial land, previously developed land, and low-grade agricultural land were considered, policy. As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** the Applicant reviewed brownfield land registers for local authorities within the area of search including Wiltshire Council, South Gloucestershire Council, Bath and Northeast Somerset Council, and Somerset Council. The assessment concluded that there were no sites within the search area of sufficient size to accommodate a large-

Reference	Theme	Comments/Issues Raised	Applicant's Response
			scale solar development, either individually or cumulatively. The sites assessed were too small to support the proposed Scheme and were largely allocated for housing or mixed-use development, in line with local planning policies, thereby creating a conflict with the intended use for renewable energy infrastructure. Therefore, it was concluded that there was no available or suitable brownfield land for the purposes of the Scheme.

5.13 Hullavington Parish Council

Table 5-13 RR-1905

Reference	Theme	Comments/Issues Raised	Applicant's Response

HPC-001	Description and DCO Process	Analysis of Hullavington's Objections to the Lime Down Solar Park Introduction This report sets out the primary concerns raised by Hullavington Parish Council and residents regarding the proposed Lime Down Solar Park. The proposal attracts numerous broad objections, including the threat it poses to national food security and the disruption it would cause to the established pattern of rural settlements in this part of the South Cotswolds. This landscape is not an empty expanse, but a network of small villages and hamlets separated by productive agricultural fields that maintain each community's distinct identity.	The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **ES [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft Development Consent Order [APP-016]**. Hullavington Parish Council's specific concerns about community and food security and addressed by the Applicant in the responses below.
HPC-002	Description and DCO Process	The name *"Lime Down"* itself is misleading. It implies a single, wide-open area suitable for large scale industrial development, yet no such landscape exists here. Instead, the proposal would effectively industrialise the fields that currently provide separation between villages, overwhelming these rural communities and erasing the green spaces that define them.	The Applicant notes this Comment. As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant undertook an initial review which did not identify a single site of the appropriate size (1,100 ha) within the area of search. Therefore, the Applicant considered both contiguous land parcels and land parcels near one another. The **Statement of Need [APP-266]** explains at Section 7.4 that NSIP proposals may comprise adjoining or separate parcels of land and that "*the connection of separate parcels of suitable land together into a single scheme may, subject to analysis, enable those parcels of land to connect economically to the electricity system*" which is the case for this Scheme. Section 8.2 of the **Statement of Need [APP-266]** explains that by bringing the parcels together into a single scheme, the Scheme is able to carry a connection to the National Electricity Transmission System (NETS), thus providing a local source of low carbon electricity and also enabling the efficient bulk transfer

			of energy generated at the Scheme so that any surplus can be used to cover shortfalls elsewhere. By connecting to the NETS, the Scheme will not impact the feasibility or timing of distribution network connections for either new generation or consumption connections which among other things are required to support the delivery of Wiltshire County Council's growth plans. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties,

			ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
HPC-003	Site Selection and Alternatives	Within this wider context, the Parish of Hullavington faces a particularly disproportionate and unacceptable burden. The proposed location of the Battery Energy Storage System (BESS) and the construction traffic and access arrangements place significant and permanent risks on the parish's quality of life and safety. The overall assessment is that the industrialisation of the landscape immediately adjacent to Hullavington would have enduring and harmful consequences for the community.	The assessment in **ES Chapter 18: Human Health [APP-070]** has considered the location specific impacts of onsite infrastructure, and has identified Hullavington as one of the communities most likely to be affected by the Scheme. Indeed, the assessment considers Hullavington as a community of greater sensitivity to changes in its visual surroundings due to its current rural setting, and the anticipated extent to which the Scheme will change that character and potentially the quality of life for residents and visitors. The assessment considers that whilst this effect would be long-term throughout the Scheme's construction, operational and decommissioning phases, it is not anticipated to be a significant adverse effect to mental health and wellbeing. With regard to safety from BESS, **ES Chapter 18: Human Health [APP-070]** has considered the impact to health and wellbeing from air quality, fire or explosion impacts (informed by **Chapter 15: Air Quality [APP-067]** and **Chapter 20: Other Environmental Matters (Major Accidents and Disasters) [APP-072]).** As a result of updated Scheme design for DCO submission, BESS infrastructure more than 500 m from the nearest dwelling. At this distance, the effects to health and wellbeing from BESS are largely mitigated by virtue of distance, and as such, there are no significant adverse effects to human health anticipated as a result of the Scheme.

			Moreover, measures to control BESS fire emissions are outlined in the **Outline Battery Safety Management Plan [APP-286].** This includes measures to limit human exposure to air pollution in the event of a fire. The preparation, approval and implementation of the detailed Battery Safety Management Plan, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft DCO [APP-016].** With regard to road safety, **ES Chapter 18: Human Health [APP-070]** has relied upon the assessment outcomes in **ES Chapter 13: Transport and Access [APP-065].** While this has identified an increase in HGV and car and van movements through Hullavington (albeit no HGV movements along The Street), the likely effect on road safety for vehicular and non-motorised users, and increases in fear and intimidation as a result of HGV traffic, is considered to be a minor adverse effect, and is therefore not significant.
HPC-004	Soils and Agriculture	Project Scale and Proximity The sheer scale of the proposed development is the foundational objection. The project would cover over 2,000 acres of predominantly agricultural land, fundamentally changing the rural character of the area. This figure rises to 3,000 acres when the cable run is considered.	The Scheme would require the long-term but temporary use of agricultural land. The Lime Down Solar Sites are dispersed in nature and have limited intervisibility with each other due to the rolling topography. In the assessment of effects for the 1km Local Study Area in Table 2.2 of **Appendix 8-3-2-2 [APP-191]** it is noted that "*Construction activities would have an impact locally, and the change in land use from arable farmland to a solar scheme would cause a noticeable change to the character of the 1km Local Study Area. There would be short term Moderate Adverse effects during the construction phase*". These effects of the Scheme on the character of the landscape are reduced by Year 15 as a result of the extensive mitigation and enhancement measures as set out in the **Landscape and Ecology Mitigation Plans [APP-084]**. These mitigation measures would provide Beneficial effects to the fabric of the Site which upon decommissioning would provide the long-term legacy landscape. The landscape and visual effects of the Cable Route Corridor will be temporary in nature and are set out in **Appendix 8-3-4 of the**

			ES: Landscape and Visual Assessment Sheets - Cable Route Corridor [APP-193]. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

HPC-005	Landscape and Visual	Industrial Proximity A major concern for Hullavington is the proximity of the development, particularly the BESS and solar arrays, which are proposed to be situated just 300 meters from residential homes. This immediate adjacency to an industrial-scale energy facility is considered unacceptable and destructive to the peaceful, rural environment.	Alternative sites for the BESS are discussed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056].** The location of the BESS was determined through an options appraisal and iterative design process, having regard to technical requirements, environmental constraints and potential effects on nearby receptors. The BESS Area is located at Lime Down D, close to the Solar PV Sites and the on-site substation, which provides operational and efficiency benefits, including minimising transmission losses, maximising storage efficiency, supporting grid balancing, and enabling a rapid and reliable response to network fluctuations. Among the options considered for co-locating the BESS with the Solar PV Sites, Lime Down D was identified as the preferred location due to its central position within the Scheme, the presence of existing and proposed screening, its limited proximity to many residential properties, and its relationship with existing infrastructure, including the adjacent railway line. The various chapters of the **ES [APP-052 to APP-265]** assess the likely significant effects arising from the BESS at this location and identify mitigation measures where necessary. Overall, the assessment concludes that the siting of the BESS at Lime Down D presents the lowest potential for significant adverse effects when compared with reasonable alternatives.

HPC-006	Landscape and Visual	Element Scale / Measurement Implication Land Coverage 2,000+ acres Permanent (60 year) destruction of rural landscape and habitat. BESS Height ~3.5 meters Massive visual intrusion compared to existing rural architecture. Panel height 3.5 – 4.5 meters large areas covered and will be visible from many miles away, completely changing the landscape. Substation Height 4.8m Visible from many miles away, completely changing the landscape.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed.

			Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
HPC-007	Other Environmental Matters	Residential Proximity 300 meters Direct impact on noise, light, Pand safety for nearest residents. Local school - disruption during preparation, construction and operational life.	**ES Chapter 18: Human Health [APP-070]** has relied upon the assessment outcomes in other technical chapters and sections of the ES to determine the likely effects on safety, health and wellbeing. Subject to the implementation of all mitigation measures as secured through the requirements in Schedule 2 to the **Draft DCO [APP-016]**, there are no residual significant adverse effects on human health. As this has been applied to

			assessment of the general population and vulnerable sub-populations, this is also anticipated to apply to schoolchildren. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being below levels considered significant. This provides assurance that operational noise from the Scheme will be in line with or below existing sound levels in the area, while allowing flexibility in how this is achieved. **ES Volume 1, Chapter 18: Human Health [APP-070]** has relied upon the assessment outcomes in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** to determine that noise effects during the operational lifetime of the Scheme are anticipated to be no greater than a long-term minor/negligible adverse effect to receptors of the highest sensitivity. This is not a significant effect and is not anticipated to generate any increased human health effect over the duration of the operational phase of the Scheme. Potential effects relating to lighting are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor,

			particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. Measures to control construction lighting are set out in the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme.
HPC-008	Other Environmental Matters	Critical Impacts of the Battery Energy Storage System (BESS) The relocation of the BESS facility to an area north of Hullavington has intensified local opposition. The facility, designed to store electrical energy, presents three core concerns: visual intrusion, noise pollution, and safety.	The assessment in **ES Chapter 18: Human Health [APP-070]** has considered the location specific impacts of onsite infrastructure, and has identified Hullavington as one of the communities most likely to be affected by the Scheme. Indeed, the assessment considers Hullavington as a community of greater sensitivity to changes in its visual surroundings due to its current rural setting, and the anticipated extent to which the Scheme will change that character and potentially the quality of life for residents and visitors. The assessment considers that whilst this effect would be long-term throughout the Scheme's construction, operational and decommissioning phases, it is not anticipated to be a significant adverse effect to mental health and wellbeing. With regard to safety from BESS, **ES Chapter 18: Human Health [APP-070]** has considered the impact to health and wellbeing from air quality, fire or explosion impacts (informed by **Chapter 15: Air Quality [APP-067]** and **Chapter 20: Other Environmental Matters (Major Accidents and Disasters) [APP-072]).** As a result of updated Scheme design for DCO submission, BESS infrastructure is more than 500 m away from the nearest dwelling. At this distance, the effects to health and wellbeing from BESS are largely mitigated by virtue of distance,

			and as such, there are no significant adverse effects to human health anticipated as a result of the Scheme. Moreover, measures to control BESS fire emissions are outlined in the **Outline Battery Safety Management Plan [APP-286].** This includes measures to limit human exposure to air pollution in the event of a fire. The preparation, approval and implementation of the detailed Battery Safety Management Plan, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft DCO [APP-016].** With reference to the visual intrusion of the BESS, the visual effects of the Scheme have been robustly assessed in **Chapter 8: Landscape and Visual [APP-060]**. Significant visual effects are recorded in **Appendix 8-3-2-2 Landscape and Visual Assessment Sheets (Significant) [APP-191].** The Scheme includes significant embedded mitigation measures to reduce the visual effects of the Scheme as set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060].** This includes landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time.
HPC-009	Noise and Vibration	Noise and Acoustic Pollution: The 'Incessant Hum' The tranquillity of the Hullavington area is currently defined by a very low ambient noise environment. The introduction of the BESS is expected to permanently (60 years) compromise this through continuous acoustic emissions.	The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being below levels considered significant. This provides assurance that operational noise from the Scheme will be in line with or below existing sound levels in the area, while allowing flexibility in how this is achieved. While it is true that substation transformers can produce a low-frequency hum, the **Outline Operational Environmental Management Plan [APP-278]** commits to these being over 400 m away from properties and therefore, as stated in Paragraph 14.6.29 **of ES Volume 1, Chapter 14: Noise and Vibration [APP-066],** transformers are not the dominant noise source at dwellings.
HPC-010	Noise and Vibration	The operation of the BESS is expected to result in higher noise levels at night than during the day from the BESS unit itself. However, when accounting for	With respect to daytime noise, the **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being below levels considered significant. This provides assurance that

		the entire site's operations, the highest noise levels overall will be during the daytime. Consequently, the surrounding area will experience constant noise disturbance, with no designated quiet respite period, including overnight.	operational noise from the Scheme will be in line with or below existing sound levels in the area, while allowing flexibility in how this is achieved. With reference to Table 7 of **ES Volume 3, Appendix 14-4 Noise Modelling [APP-237] and ES Volume 2, Figure 14-3 Night-time Operational Noise Contours [APP-161**], night-time noise levels from the Scheme are likely to be between 5 and 32 dB external to residential dwellings, broadly equivalent to a quiet library. Such levels are largely below the existing background sound and, with reference to WHO guidelines and BS8233 Guidance on sound insulation and noise reduction for buildings, conducive to a good night's sleep, even with the windows open.
HPC-011	Noise and Vibration	• Source and Nature of Noise: The noise is primarily generated by the BESS's essential operational components, specifically cooling systems (fans), inverters, and transformers. These components operate constantly to manage the temperature and flow of electricity within the batteries. The resulting sound profile is not a sudden, transient noise but an incessant, wide-frequency tonal noise often described as a "*humming*" or *"whine*."	Noise from the BESS containers, inverters and conversion units is relatively broadband as evidenced by Table 6 **of ES Volume 3, Appendix 14-4 Noise Modelling [APP-237**]. While it is true that substation transformers can produce a low-frequency hum, the **Outline Operational Environmental Management Plan [APP-278]** commits to these being over 400 m away from properties and therefore, as stated in Paragraph 14.6.29 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, transformers are not the dominant noise source at dwellings.

HPC-012	Noise and Vibration	• Impact on Residents: Given the BESS's placement only 300 meters from residential properties, this constant noise is predicted to be clearly audible day and night. The primary effects are a significant loss of amenity and the destruction of the local soundscape, leading to interference with sleep, reduced quality of life, and an inability to enjoy gardens or open windows without disturbance.	With reference to Table 8 and Table 9 of **ES Volume 3, Appendix 14-4 Noise Modelling [APP-237]** noise from the Scheme is expected to be around the background sound level during the day and below the existing background sound level at the vast majority of receptors at night. Considering that the background sound level is the level exceeded 90% of the time at the moment, the Scheme is unlikely to be audible throughout the day and night. With reference to Table 7 of **ES Volume 3, Appendix 14-4 Noise Modelling [APP-237]** and **ES Volume 2, Figure 14-3 Night-time Operational Noise Contours [APP-161**], night-time noise levels from the Scheme are likely to be between 5 and 32 dB external to residential dwellings. Such levels are largely below the existing background sound and, with reference to WHO guidelines and BS8233 Guidance on sound insulation and noise reduction for buildings, conducive to a good night's sleep, even with the windows open. **ES Volume 1, Chapter 18: Human Health [APP-070]** has relied upon the assessment outcomes in **ES Volume 1, Chapter 14: Noise and Vibration {APP-066]** to determine that noise effects during the operational lifetime of the Scheme are anticipated to be no greater than a long-term minor/negligible adverse effect to receptors of the highest sensitivity. This is not a significant effect and is not anticipated to generate any increased human health effect over the duration of the operational phase of the Scheme.
HPC-013	Noise and Vibration	What steps will IGP take to ensure residents are not impacted by noise from the BESS during the night?	With respect to night-time noise from BESS, the **Outline Operational Environmental Management Plan [APP-278**] commits to levels from the Scheme at residential dwellings being below levels presented in the ES. As described in Section 14.9 **of ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, this is likely to require silencer units on BESS Inverters and most of BESS Containers. With reference to Table 7 of **ES Volume 3, Appendix 14-4 Noise Modelling [APP-237**] and **ES Volume 2, Figure 14-3 Night-time Operational Noise Contours [APP-161**], these

			levels are likely to be between 5 and 32 dB external to residential dwellings and around 10 dB lower still internally. Such levels are largely below the existing background sound and, with reference to WHO guidelines and BS8233 Guidance on sound insulation and noise reduction for buildings, conducive to a good night's sleep, even with the windows open.
HPC-014	Noise and Vibration	What steps will IGP take to ensure residents are not impacted unduly by noise during the day, both during construction and during operation?	Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277].** With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277],** is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. Potential operational mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066],** and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft**

			Development Consent Order [APP-016], ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.

HPC-015	Other Environmental Matters	Visual Intrusion and Light Pollution • Visual Intrusion: The substation is estimated to reach a height of approximately 5 meters, which is entirely inappropriate for the local topography and will result in overwhelming visual intrusion.	With reference to the visual intrusion , the visual effects of the Scheme have been robustly assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. Significant visual effects are recorded in **Appendix 8-3-2-2 Landscape and Visual Assessment Sheets (Significant) [APP191]** and the visual effects of the Scheme are summarised in ES Volume 3, Appendix 8-3-3 **[APP-192].** Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience significant long term visual effects are listed in Table 8-30 of the LVIA **[APP-060].**

HPC-016	Other Environmental Matters	• Light Pollution: Operational lighting required for the BESS site will also create significant light spill, threatening to "*spoil the darkness*" of the clear night sky, further eroding the rural environment.	With reference to operational lighting: Lighting is not required within the Solar Arrays for the operational phase. Motion sensing security lighting will be provided within substations and within the BESS to be used only for maintenance and security purposes. Temporary site lighting during construction will be required to enable safe working during construction and decommissioning during hours of darkness and will be designed as far as reasonably practicable to minimise potential for light spillage outside the Scheme and Cable Corridor, particularly towards houses, traffic and ecological habitats. Standard good practice measures would be employed to minimise light spill, including glare during construction, operation and decommissioning. Refer to section 3.5.12 in Chapter 3 of the **ES Volume1, Chapter 3: The Scheme [APP-055]** for more information on operational lighting.
HPC-017	Other Environmental Matters	What steps will IGP take to ensure visual intrusion is reduced to the minimum and light pollution will not affect the rural, night sky? Operational Safety Concerns	With reference to the visual intrusion of the BESS, the visual effects of the Scheme have been robustly assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. Significant visual effects are recorded in Appendix 8-3-2-2 **Landscape and Visual Assessment Sheets (Significant) [APP191].** Through the iterative design process, the layout and positioning of infrastructure, including the BESS, has been refined to reduce visual influence. Embedded mitigation measures are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The LVIA identifies where significant visual effects would occur and reports residual effects following mitigation. It concludes that visual effects associated with the Scheme, including the BESS, are localised and would reduce over time as mitigation planting establishes.

			With reference to lighting: Lighting is not required within the Solar Arrays for the operational phase. Motion sensing security lighting will be provided within substations and within the BESS to be used only for maintenance and security purposes. Temporary site lighting during construction will be required to enable safe working during construction and decommissioning during hours of darkness and will be designed as far as reasonably practicable to minimise potential for light spillage outside the Scheme and Cable Corridor, particularly towards houses, traffic and ecological habitats. Standard good practice measures would be employed to minimise light spill, including glare during construction, operation and decommissioning. Refer to section 3.5.12 in Chapter 3 of the **ES Volume1, Chapter 3: The Scheme [APP-055]** for more information on operational lighting.
HPC-018	Transport and Access	Unacceptable Traffic and Highway Safety Risks: Active Travel Conflict The developer's plan for construction access relies on the local network of narrow, single-track rural lanes, which is deemed "*physically unfeasible"* for industrial volumes and creates a "*critical danger"* to the community.'	The proposed construction routes have been assessed in **ES Volume 1: Chapter 13: Transport and Access [APP-065]** and **ES Volume 3: Appendix 13-1: Transport Assessment [APP-233]**and are considered to be the most appropriate routes to the Scheme. As concluded in **ES Volume 1: Chapter 13: Transport and Access [APP-065]** Construction traffic would also be temporary and controlled through measures in a CTMP. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**

			demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle. To provide further comfort, additional information will be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and resubmitted at Deadline 1 of Examination to demonstrate that there is adequate carriageway width and/or passing place opportunity for two HGVs when accessing Lime Down Site D. An **oCTMP [APP-287]** and **oPRoWPPMP [APP-282]** support the DCO Application and includes outline measures to ensure impacts to NMU along highways and PRoW are minimised as far as practicable. The **oCTMP [APP-287]** confirms that construction deliveries will be managed to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads and restricted to outside of peak hours. With these measures in place, **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** concludes that the impact would be negligible to minor adverse. A final CTMP and PRoWPPMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and **oPRoWPPMP [APP-282]**, respectively, and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 and Requirement 16 in Schedule 2 of the **Draft DCO [APP-016]**.
HPC-019	Transport and Access	3.1. Construction Traffic Volume is Dangerously Underestimated The applicant's figures fail to reflect the true magnitude of traffic, creating a misleading picture of the disruption and risk.	The Applicant has predicted construction traffic flows for the Scheme based on a realistic breakdown of construction materials, such as aggregate and number of modules. Calculations are provided in Annex E of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. Further detail of trip generation will also be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and resubmitted at Deadline 1 of Examination. The transport and access assessment has been completed by competent experts, as detailed in **ES Volume 3, Appendix 1-1:**

			Statement of Competence [APP-180], and is considered to be a robust assessment of the Scheme. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority.

			The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
HPC-020	Transport and Access	Applicant's Prediction (Underestimated): The applicant's own data suggests a high number of truck movements, predicting 76 HGV movements per day south of Hullavington (one HGV every 9 minutes during an 11-hour shift).	The Applicant has predicted construction traffic flows for the Scheme based on a realistic breakdown of construction materials, such as aggregate and number of modules. Calculations are provided in Annex E of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. Further detail of trip generation will also be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and resubmitted at Deadline 1 of Examination. As explained in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average. It is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously for the whole two-year construction period and a 50% uplift. The average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route). Assuming a realistic construction programme as set out in Table 13.9 in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** where all parcels are not built out concurrently (and some parcels built out in less than 12 months), the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route).
HPC-021	Transport and Access	• Assessment of Actual Risk: Independent analysis indicates the developer's figures are over 40% too low. During peak periods, this equates to over 100 HGVs per day, or approximately one HGV every 6 minutes on average. This estimate	The Applicant has predicted construction traffic flows (trip generation) for the Scheme based on a realistic breakdown of construction materials, and the numbers and types of HGV's required to transport them. This is considered appropriate and accurate as it is based on the proposed bill of materials, including:

		does not even include traffic required for the cable connection through Area D.	• realistic aggregate volumes based on access track lengths and construction details; • number of proposed solar modules; • Number of mounting structures and associated footings; • Fencing and landscaping volumes; • Cabling; • Skid/Power Stations; and • Waste. Calculations are provided in Annex E of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. Further detail of trip generation will also be added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and resubmitted at Deadline 1 of Examination. The following should also be noted: • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); - assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); The Applicant notes that independent analysis of construction HGV trip generation has not been provided so is unable to comment on this at this stage.

HPC-022	Transport and Access	• Workers' vehicles: Along with the HGV traffic, this will be coincident with school drop off / pick up and normal commuting traffic.	An **oCTMP [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. This includes a booking system to manage construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads. and restricted hours of deliveries outside of peak hours. With these measures in place, the impact on driver delay caused by the temporary construction period would be negligible as shown in Table 13-27 in **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]**. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.
HPC-023	Transport and Access	3.2. Road Geometry Makes HGV Passing Unsafe No highway improvement works are proposed along this route, despite the road being critically narrow.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. An **oCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes. It also includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in

			opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. One specific measure provided for in the **oCTMP [APP-287]** is a booking system which will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes (including this route) and will be confirmed as part of the final CTMP. With this mitigation in place, **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** concludes that impacts would be negligible to minor adverse. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.
HPC-024	Transport and Access	• Safety Standard: We understand for two HGVs to pass safely; the road requires a minimum width of 5.5 meters. The route coincides with traffic for school from Wellington Place - a serious safety hazard for the children being brought to school	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits

			are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects in relation to accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely (with accident risks minimised) throughout the construction phase of the Scheme.

HPC-025	Transport and Access	• Actual Measurements: A section of the route in the vicinity of Hullavington is measured at significantly less than this. Buses, farm traffic and school coaches have little hope of passing safely when there is so much HGV traffic or without a significant prospect of getting stuck at these points.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits.The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects in relation to accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction

			traffic is managed safely (with accident risks minimised) throughout the construction phase of the Scheme.
HPC-026	Transport and Access	• Physical Impossibility: This sustained lack of width means the road is unable to safely accommodate significant numbers of HGVs, creating unavoidable conflict, particularly on sections exacerbated by tight bends that restrict forward visibility. What steps will IGP take to ensure the local traffic is unimpeded by construction traffic?	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits.The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance.

			The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.

HPC-027	Transport and Access	3.3. Severe Risk to Vulnerable Highway Users Directly Impacting Hullavington The high volume of HGV traffic is in direct conflict with the essential local and leisure use of the road network by Hullavington's residents, a conflict the applicant has failed to adequately assess. This issue is particularly acute for Hullavington because the road serves as a primary route for local active travel.	**ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assesses the impact on non-motorised user (NMU) delay and amenity, including fear and intimidation on links Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) <u>NMU Delay</u> NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that public rights of way (PRoW) which cross the Order Limits will generally remain open during the construction phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **Outline PRoW and Permissive Path Management Plan [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement and decommissioning. <u>NMU Amenity</u> Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic see IEMA guidelines; Environmental Assessment of Traffic and Movement , para 3.29 . The construction routes on Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) has noexisting pedestrian infrastructure and no footways, making them already unattractive as walking routes with no pedestrian amenity.

			Fear and intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**] and provide sufficient width for HGV traffic to comfortably pass cyclists. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that the level of flow change will not result in a step change in fear and intimidation as defined in the **IEMA guidance at Tables 3.1, 3.2** and **3.3**. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that on all links in the Study Area including Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) ,the significance of effect is Minor Adverse (temporary). <u>Mitigation</u> An **OCTMP [APP-287]** supports the DCO application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen to improve road safety, fencing , and dust and noise control to ensure public highway is free of debris and reduce any likely disruption . The final CTMP the measures summarised above are secured as a requirement of the DCO
HPC-028	Transport and Access	• Lack of safe places for active travel: Since there are no footways and limited verges along this section of road, vulnerable users are required to share the narrow carriageway directly with the continuous stream of construction vehicles.	**ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assesses the impact on non-motorised user (NMU) delay and amenity, including fear and intimidation on links Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) <u>NMU Delay</u> NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that public rights of way (PRoW) which cross the Order Limits will generally remain open during the construction

			phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **Outline PRoW and Permissive Path Management Plan [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement and decommissioning. <u>NMU Amenity</u> Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic see IEMA guidelines; Environmental Assessment of Traffic and Movement, para 3.29 . The construction routes on Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) has no existing pedestrian infrastructure and no footways, making them already unattractive as walking routes with no pedestrian amenity. Fear and intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**] and provide sufficient width for HGV traffic to comfortably pass cyclists. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that the level of flow change will not result in a step change in fear and intimidation as defined in the **IEMA guidance at Tables 3.1, 3.2** and **3.3**. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that on all links in the Study Area including Road

			East of Hullavington (ref 11) and Bradfield Cottages (ref 12) ,the significance of effect is Minor Adverse (temporary). <u>Mitigation</u> An **OCTMP [APP-287]** supports the DCO application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen to improve road safety, fencing , and dust and noise control to ensure public highway is free of debris and reduce any likely disruption . The final CTMP the measures summarised above are secured as a requirement of the DCO

HPC-029	Transport and Access	• Active Travel Conflict: o Cycling: The road connects with the Wiltshire Cycleway (Section 14) and an important route option (via Norton and Foxley) that cyclists use to avoid the hazardous A429. Large HGVs present a very real risk due to the narrowness and blind bends, making overtaking extremely dangerous. This is the route that cyclists take to get safely into Malmesbury. Residents of Hullavington walking to The Tap on this road must walk in the road. The Tap is the ONLY venue for hot meals and coffees for Hullavington residents.	**ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assesses the impact on non-motorised user (NMU) delay and amenity, including fear and intimidation on links Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) <u>NMU Delay</u> NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that public rights of way (PRoW) which cross the Order Limits will generally remain open during the construction phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **Outline PRoW and Permissive Path Management Plan [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement and decommissioning. <u>NMU Amenity</u> Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic see IEMA guidelines; Environmental Assessment of Traffic and Movement , para 3.29 . The construction routes on Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) has noexisting pedestrian infrastructure and no footways, making them already unattractive as walking routes with no pedestrian amenity.

			Fear and intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**] and provide sufficient width for HGV traffic to comfortably pass cyclists. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that the level of flow change will not result in a step change in fear and intimidation as defined in the **IEMA guidance at Tables 3.1, 3.2** and **3.3**. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that on all links in the Study Area including Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) ,the significance of effect is Minor Adverse (temporary). <u>Mitigation</u> An **OCTMP [APP-287]** supports the DCO application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen to improve road safety, fencing , and dust and noise control to ensure public highway is free of debris and reduce any likely disruption.The final CTMP the measures summarised above are secured as a requirement of the DCO.
HPC-030	Transport and Access	o Walking & Rights of Way: There are six public rights of way joining the unnamed road near Hullavington. Furthermore, recommended local walks include sections along this road, meaning the high numbers of HGVs will put vulnerable users at high risk. Dog	The Applicant confirms that existing PRoW are to be controlled within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**.

		walkers have to cross into the track designated for the HGV access point. It is inconceivable that this will be safe.	There are instances where the proposed internal access tracks cross PRoW within the Order Limits. In these instances, public access to the PRoW will be retained where practicable. However, the PRoW will be managed throughout the construction period, to ensure the safety of all users. PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PRoW and Permissive Paths MP) [EN010168/APP/7.17]**.
HPC-031	Transport and Access	• Amenity Impact (Fear and Intimidation): The high frequency of HGV movements (one every six minutes) will cause a significant adverse impact for vulnerable users. People will be deterred from undertaking these important local walks and cycle routes, and their enjoyment will be severely reduced by the fear and intimidation caused by industrial traffic. To understand the impact on residents more fully, refer to our local walks: walks 1,2,3,4,6,7, 8 and 9 are all severely impacted by this proposed project.	**ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assesses the impact on non-motorised user (NMU) delay and amenity, including fear and intimidation on links Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) <u>NMU Delay</u> NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that public rights of way (PRoW) which cross the Order Limits will generally remain open during the construction phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **Outline PRoW and Permissive Path Management Plan [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement and decommissioning. <u>NMU Amenity</u>

			Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic see IEMA guidelines; Environmental Assessment of Traffic and Movement , para 3.29 . The construction routes on Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) has noexisting pedestrian infrastructure and no footways, making them already unattractive as walking routes with no pedestrian amenity. Fear and intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**] and provide sufficient width for HGV traffic to comfortably pass cyclists. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that the level of flow change will not result in a step change in fear and intimidation as defined in the **IEMA guidance at Tables 3.1, 3.2** and **3.3**. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that on all links in the Study Area including Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) ,the significance of effect is Minor Adverse (temporary). <u>Mitigation</u> An **OCTMP [APP-287]** supports the DCO application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen to improve road safety, fencing , and dust and noise control to ensure public highway is free of debris and reduce any likely disruption . The final CTMP the measures summarised above are secured as a requirement of the DCO

HPC-032	Noise and Vibration	To understand the noise impact, listen to the recording here made a few years ago by a resident. This walk is 6 on the list. An audio version of one of the walks around Hullavington here Surrendell House road walk.wav This includes sounds of the Gauze Brook, one of the inverters on Hill Hays Lane (as an indicator of the nature of the noise these things make only. This one is a 2MW version recorded early on a March day so far from full power. There will be 92 4MW examples of these in the BESS site) and a train going past Happylands Bridge only a hundred meters or so from the BESS site. The train makes about 90dB; there are 159 90dB equipment across the solar panel sites plus far more in the BESS. The difference is the train goes away, the inverters stay on.	While it is true that the plant has sound power levels around 90 dB, as presented in Table 5 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, this is not a level that would ever be experienced either on a PRoW or in a house or garden. A sound power level of 90 dB for a static piece of plant drops to around 56 dB at 20m, the level of regular conversation, and around 35 dB at 300m, quieter than many household appliances.
HPC-033	Transport and Access	What mitigation and safety measures will IGP take to ensure the safety of road users sufficient to ensure that no injury or death can result from the Lime Down solar park construction and operation?	The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan**

			[APP-287], which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme.
HPC-034	Transport and Access	What steps will IGP take to ensure active travel is not avoided by residents in fear of safety issues?	**ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assess the impact on non-motorised user delay and amenity, including Fear and Intimidation. <u>NMU Delay</u> NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that PRoW which cross the Order Limits will generally remain open during the construction phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **Outline PRoW and Permissive Path Management Plan [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement and decommissioning. <u>NMU Amenity</u>

			Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic. The construction routes on the road network have little existing pedestrian infrastructure and no footways, making them already unattractive as walking routes with no pedestrian amenity so this cannot be assessed. Fear and Intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**] and provide sufficient width for HGV traffic to comfortably pass cyclists. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that the level of flow change will not result in a step change in fear and intimidation as defined in the **IEMA guidance at tables 3.1, 3.2** and **3.3**. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that on all links in the study area the significance of effect is Minor Adverse (temporary). <u>Mitigation</u> An **OCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen, fencing, and dust and noise control.
HPC-035	Decommissioning and Construction	3.4. Flawed Environmental Statement Assessment IGP's failure to identify significant adverse transport environmental effects is due to a failure to assess the use of the highway by vulnerable users and a systematic underestimation of HGV trip generation. This is still an omission despite these problems being raised in earlier consultation stages	See response to Paragraph **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assesses the impact on non-motorised user (NMU) delay and amenity, including fear and intimidation on links Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12). <u>NMU Delay</u>

			NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that public rights of way (PRoW) which cross the Order Limits will generally remain open during the construction phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **Outline PRoW and Permissive Path Management Plan [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement and decommissioning. <u>NMU Amenity</u> Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic see IEMA guidelines; Environmental Assessment of Traffic and Movement, para 3.29. The construction routes on Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12) has no existing pedestrian infrastructure and no footways, making them already unattractive as walking routes with no pedestrian amenity. Fear and intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and provide sufficient width for HGV traffic to comfortably pass cyclists.

			ES Volume 1, Appendix 13-1: Transport Assessment [APP-065] concludes that the level of flow change will not result in a step change in fear and intimidation as defined in the **IEMA guidance at Tables 3.1, 3.2** and **3.3**. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that on all links in the Study Area including Road East of Hullavington (ref 11) and Bradfield Cottages (ref 12), the significance of effect is Minor Adverse (temporary). **Mitigation** An **OCTMP [APP-287]** supports the DCO application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen to improve road safety, fencing , and dust and noise control to ensure public highway is free of debris and reduce any likely disruption . The final CTMP the measures summarised above are secured as a requirement of the DCO
HPC-036	Socio-Economics, Tourism and Recreation	Erosion of Community and Landscape Beyond the immediate visual and safety issues, the project is predicted to lead to a broader erosion of rural life for Hullavington residents and those residents in our wider parish.	The Applicant notes this comment. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts

			of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be controlled within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. With reference to visual issues, the visual effects of the Scheme have been robustly assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. Significant visual effects are recorded in **Appendix 8-3-2-2 Landscape and Visual Assessment Sheets (Significant) [APP191]** and the visual effects of the Scheme are summarised in ES Volume 3, Appendix

			8-3-3 .**[APP-192].** Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience significant long term visual effects are listed in Table 8-30 of the LVIA **[APP-060]**

HPC-037	Socio-Economics, Tourism and Recreation	Economic Damage to Local Tourism The destruction of the quiet lane network and tranquil rural environment will severely impact local businesses that rely on visitors utilizing the area for walking, cycling, and other tourism activities. Prolonged Construction Disruption The community faces the prospect of "*major and prolonged disruption*" for several years. This includes significant HGV movements, necessary road widening, and continuous noise and dust associated with the construction phase.	Further detail on the impact to walking and cycling is provided in the Applicant's response above. The Applicant has assessed that there is a likely worst-case temporary loss of 50 FTE tourism industry jobs as a result of the Scheme, as set out in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068**]. Where losses to tourism have been identified, these are worst-case estimates based on likely significant effects from the Scheme including increased HGV use of the local highway network and impacts on the use of PROWs for walking, wheeling, cycling and riding. This estimate does not account for additional mitigation measures being applied. This effect on GVA in tourism-dependent industries is not significant, accounting for less than 0.7% of tourism-based employment within 5 km of the Scheme (BRES, 2023 data), and approximately 0.17% of tourism employment across Wiltshire (29,000 estimate from Visit Wiltshire, 2021). This is also a temporary effect, anticipated to occur during construction, with recovery to tourism businesses anticipated to begin as soon as construction works are complete. During the Scheme's operational phase, the reduction in tourism compared to current conditions is anticipated to be equivalent to a loss of 11 FTE tourism-dependent jobs. Additional mitigation measures through the **OSSCEP [APP-285]** seek to reduce these losses through focusing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries. It is considered that these measures would help to reduce local losses in the local economy and help to generate additional GVA in the local economy in alternative industries. The OSSCEP is secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016].**
HPC-038	Ecology and Biodiversity	Conflict with Landscape Permeability and Wildlife Impact The requirement for extensive, high-security perimeter fencing fundamentally conflicts with the existing character of the rural landscape.	The Applicant notes this comment. Please see the Applicants responses below which respond to the specific issues raised regarding high-security perimeter fencing.

HPC-039	Ecology and Biodiversity	• Impermeable Barrier: The current field boundaries consist predominantly of traditional drystone walling and mature hedges, creating a highly permeable environment for wildlife with very few high fences. The proposed solar arrays and infrastructure, however, necessitate extensive, imposing security fencing (often 2-2.5 meters high) to secure the site. • Restriction on Wildlife: This large-scale fencing creates an impermeable barrier that restricts the natural migratory and foraging routes of local wildlife, including deer, badgers, and small mammals. The landscape becomes fragmented and caged, hindering the ability of animals to move freely between habitats and funnelling them along dangerous highways.	Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Scheme design incorporates fencing around the Solar PV Sites that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme.

HPC-040	Ecology and Biodiversity	• Breach of Landscape Strategy: The construction of such widespread barriers flies directly in the face of local, regional, and national commitments to Landscape Recovery strategies. These strategies are designed to enhance ecological connectivity and support nature's recovery on a large scale; the industrial fencing actively prevents this objective.	The Scheme design incorporates fencing around the Solar PV Sites that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The Scheme will create and enhance a range of habitats, such as grasslands, hedgerows and ponds, that will benefit a wide range of wildlife present in the area as well as strengthen connective links to habitats within the Scheme and in the wider landscape, which is entirely consistent with the principles of Local Nature Recovery Strategies. A comprehensive package of habitat creation and enhancement measures are shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**.
HPC-041	Ecology and Biodiversity	What steps will IGP take to ensure wildlife will not be restricted from their current habitat?	Measures designed to ensure wildlife can continue to use habitats within the Scheme throughout both the construction phase and operation and maintenance phase are detailed within the O**EPMS [APP-284]** and **OLEMP [APP-283]** respectively. These include the safeguarding of key habitat features and buffer zones throughout construction, as well as measures designed to ensure all retained habitats remain suitable for protected / notable wildlife species for the lifespan of the Scheme, including a comprehensive package of ecological monitoring.

HPC-042	Ecology and Biodiversity	What steps will IGP take to ensure they have fully taken into account the Landscape Recovery Strategy and that any steps are totally relevant to the local environment?	The draft Wiltshire Local Nature Recovery Strategy (LNRS) was consulted during the design on the habitat creation and enhancement measures shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. It is acknowledged that the full LNRS has been published in October 2025 subsequent to the preparation of these documents, although it is noted that the published LNRS does not considerably differ from the draft version and no changes to the measures set out within the **Landscape and Ecological Mitigation Plan [APP-084]** or the **OLEMP [APP-285]** are considered necessary as a result of the final LNRS having been published. The detailed Landscape and Ecological Management Plan, which willl need to be substantially in accordance with the **OLEMP [APP-283]** secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, will consult the published and most-up-to LNRS during its preparation.
HPC-043	Description and DCO Process	Conclusion The objections raised by the Hullavington community are comprehensive and centre on irreversible environmental damage, inappropriate industrial scale, and unacceptable public safety risks, particularly concerning the BESS and substation locations and construction accesses. These concerns underscore the parish's firm opposition to the current proposal, asserting that it would permanently destroy its rural character and quality of life.	The Applicant notes this comment. Please see the Applicant's responses above which respond to the specific issues raised throughout the representation made by Hullavington Parish Council.

5.14 Norton and Foxley Parish

Table 5-14 RR-3559

Reference	Theme	Comments/Issues Raised	Applicant's Response
NFP-001	Description and DCO Process	Relevant Representation - Norton and Foxley Parish For the reasons summarised below, Norton and Foxley Parish is firmly opposed to Lime Down Solar Park (LDSP).	The Applicant notes Norton and Foxley Parish's response and has responded in full below.
NFP-002	Landscape and Visual	Landscape and Visual LDSP would be to the south and readily visible from both villages. Currently, the views in that direction are idyllic and typically 'Cotswold' - unspoilt and far-reaching. Low hedges and occasional trees mark the field boundaries and the principal land use is arable/pastoral farming.	The visual effects of the Scheme on the villages of Norton (Receptor RS008) and Foxley (receptor RS007) have been assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060].** These receptors are assessed in Appendix 8-3-1: Visual Assessment Sheets (Not carried through to the **ES Assessment) [APP189]**. No significant effects were recorded due to the distance to infrastructure from the receptors.
NFP-003	Landscape and Visual	If approved, LDSP would blight the landscape. We would be confronted by a vast panorama of 4.5m high black plastic solar panels; 7.0m high 132kV substations and a 13m high 400kV substation. Any attempt to hide these 'eyesores' with high hedges would be out of keeping. The adverse impact of LDSP on the landscape must be evaluated.	**ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** robustly assesses both the landscape and visual effects of the Scheme independently to ensure both the impacts and effects on the fabric and character of the landscape are taken into account as well as the views and visibility. The **LVIA [APP-060]** recognises that there would be temporary Moderate Adverse effects on Landscape Character within the 1 km as a result of the change in land use from arable farmland to solar infrastructure. However, the Scheme proposes significant mitigation measures informed by Wiltshire's Nature Recovery Strategy to reduce the effects of the Scheme on landscape character which will provide significant beneficial effects to the fabric of the Sites and the legacy Landscape. In visual terms, the LVIA **[APP-060]** assesses effects on identified visual receptors, including residential properties, users of public rights of way and roads. The assessment identifies that there would be some significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths

Reference	Theme	Comments/Issues Raised	Applicant's Response
			diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects have been informed by Wiltshire's Nature Recovery Strategy and are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
NFP-004	Hydrology, Flood Risk and Drainage	Flooding All of the roads serving Norton and Foxley are susceptible to serious flooding and the hydrology of the area is quick to respond. Within a few hours of heavy rainfall the roads become impassable as was the case with Storm Claudia this November. Three or four times a year either one or both villages are cut off from the rest of the county and this can last for days. Properties are inundated and abandoned cars block the roads, preventing access to the vulnerable and for emergency vehicles. There is a fear that the introduction of large solar panels and concrete bases will accelerate the flow of water and, therefore, increase the intensity and frequency of flooding events, also during construction when the soils become compacted.	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].** The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Where supporting infrastructure is proposed, including the BESS, a different drainage strategy is applied with engineered controls and site specific mitigation appropriate to that infrastructure type, and these areas are assessed separately. **ES Volume 3, Appendix 11-6 Flood Risk Assessment and Drainage Strategy - Lime Down D BESS [APP-215].** **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that prior to the operation of the Scheme, a CEMP must be submitted to and approved by the relevant planning authority, the CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
NFP-005	Transport and Access	Road network The roads serving Norton and Foxley are entirely unsuited to existing local traffic, let alone any additional vehicles. IGP has not included Norton and Foxley as approved access routes to LDSP. However, we expect many site workers commuting in their private cars would, however, 'ratrun' through the two villages. The impact of this traffic and the risk of accidents would be a matter of great concern to local residents.	As presented in **ES Volume 2, Figure 13-1 and 13-2 [APP-146, APP-147]**, the Applicant can confirm that no construction traffic for the Scheme is proposed to be routed through Norton and Foxley. Whilst some construction works may travel to site via these areas, it is expected that the majority of trips will be via the strategic highway network (M4) so it is considered unlikely that these areas will become 'ratruns' as a result of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
NFP-006	Noise and Vibration	Noise We have doubts about the information and estimated noise contours provided by IGP. Based on evidence from other solar developments, noise is bound to be a big problem for the two villages during construction and a potential problem thereafter. Norton and Foxley want this to be assessed.	The information presented in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** is based on the current state of the Scheme as outlined in **ES Volume 1, Chapter 2: The Scheme [APP-055].** The noise contours presented in **ES Volume 2, Figure 14-2 Daytime Operational Noise Contours [APP-160]** and **Figure 14-3 Night-time Operational Noise Contours [APP-161]** are based on a series of reasonable worst-case assumptions, such as wind in the direction of the receptor, as well as a range of mitigation measures as described in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066].** Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277].** With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277],** is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring that construction noise and vibration are appropriately controlled. Potential operational mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066],** and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-278] commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
NFP-007	Landscape and Visual	Walking and Cycling Many of us in Norton and Foxley are keen dog owners, walkers, joggers, cyclists and horse riders. The prospect of using rights of way caged in by security fencing and unable to appreciate our surroundings is worrying. In practice, we would refuse to make use of such alien pathways and would be deprived of the familiar countryside we love. This reduction in our enjoyment and freedom to choose must be taken into account.	The Applicant has aimed to provide a robust assessment of impacts to tourism and recreation in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, taking into account assessment of the desirability of PROW for future users during the construction, operational, and decommissioning phases of the Scheme. Impacts to the social environment, on amenity, and access to open space and the countryside for leisure (and thus how this will impact upon both physical and mental wellbeing) have been assessed in **ES Volume 1 Chapter 18: Human Health [APP-070]**, with reliance on **ES Volume 1 Chapter 8: Landscape and Visual [APP-060]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however, the assessment identifies residual significant adverse effects to a small number of PROWs and unsurfaced highways during construction, and to long-distance recreation routes during all phases of the Scheme (due to their regional or national importance). The assessment of human health impacts identifies no residual significant adverse effects. The Applicant does however seek to clarify that PROWs are to be given a minimum 15 m offset from their centreline to the nearest onsite infrastructure. This buffer space would be planted with either hedgerows or low-level ground cover planting to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			encourage either visual screening, or improve biodiversity. These are shown on **ES Volume 2, Figures 3-4-1 to 3-4-5.2 [APP-084]** and secured through the **OLEMP [APP-283]** by Requirement 7 in Schedule 2 to the **Draft DCO [APP-016]**.
NFP-008	Socio-Economics, Tourism and Recreation	The loss in the value of our property Norton and Foxley are traditional Cotswolds villages, containing many characterful buildings of predominantly limestone construction. Up until recently the villages were sought after locations. However, the threat of Lime Down Solar Park (LDSP) has had a marked negative effect on property values and sales as borne out by recent transactions. For personal reasons, some vendors have sold and could not wait for a decision on LDSP. The degree of loss has varied from one property to the next depending on orientation and proximity to LDSP. Discussions with estate agents (who prefer not to go on the record for commercial reasons) indicate reductions in selling prices from 15% to 30%. It is an injustice that, should LDSP be approved, a handful of big landowners and foreign investors would make vast profits whilst the local community suffer both the environmental impact and financial loss. The possibility of this unfair outcome deserves detailed consideration.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181]**. Whilst the Applicant acknowledges that impacts to property prices is a concern for neighbouring residents and businesses, the Applicant has sought to assess potential effects to neighbouring properties and consult with local residents and provide sufficient information to ensure stakeholders have the best understanding of the likely impacts of the Scheme. Furthermore, published research and evidence to date does not indicate that solar farms have a significant adverse long-term effect to nearby property values.
NFP-009	Site Selection	NORTON VILLAGE - A very special case	There is no general requirement in NPS EN-1 to consider alternatives or establish that the proposed Scheme represents

Reference	Theme	Comments/Issues Raised	Applicant's Response
	and Alternatives	Island Green Power's (IGP) Site Selection report is flawed It is widely known that the proposed location of LDSP was not based on finding the least environmentally damaging site. The search was dominated by the willingness of a handful of major landowners to enter into secret and highly lucrative agreements. IGP's Site Selection report is no more than a post hoc attempt to justify its choice. Aspects of the report have been deliberately skewed to suggest that there is no better site than Lime Down within 20kms of the National Grid. Evidence will be provided at the Examination to challenge IGPs Site Selection report. Having committed itself to Lime Down, the developer has discovered that there is insufficient land to deliver a tolerable layout. The consequences of this are adverse cumulative effects and the concern described in the next paragraph.	the best option from a policy perspective. Although there is no general planning policy requirement to consider alternatives and show the proposals represent the best option, the requirement to describe the alternatives considered by the Applicant is required by the Infrastructure Planning (Environmental Impact Assessment) Regulations 2017 and in specific circumstances as set out in NPS EN-1. As discussed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185],** the Applicant has adopted a staged approach to site selection and the consideration of alternatives. The first stages of the process involved the identification of the point of connection at the Existing Melksham National Grid Substation and to establish an area of search in which to look for sites. At stages 2 and 3, various environmental constraints were excluded from the search area, and key operational criteria were applied, in order to focus the search on the least constrained areas of land within the search area that had the potential to meet the operational objectives of the Scheme. This revealed 4 potential development areas, which were then assessed against standardised assessment criteria such as land use, flood risk, impacts on cultural heritage and ecological impacts. None of these areas were deemed viable for the Scheme following assessment. Therefore, at stage 5 of the assessment, further constrained areas of land (Grade 3 agricultural land and Flood Zones 2 and 3) were added back into the search area and, with the help of land agents, further areas to assess were identified. However, those areas were assessed against the same standardised assessment criteria as used to assess PDAs 1-4. Further, additional land has been considered at a higher topographic gradient, and a check and balance exercise has been carried out across the search area to identify any other sections of land that should reasonably be considered for assessment. Therefore,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			whilst land agents assisted in identifying land for assessment, other areas of land have also been considered. Further all potential development areas identified have been assessed against a number of factors, not just land availability. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation.
NFP-010	Site Selection and Alternatives	Norton would be virtually surrounded by solar infrastructure. If LDSP were approved, life within the village would become intolerable! No respectable developer would contemplate locating major industrial development in such close proximity to an existing rural village community. Despite the obvious impact of LDSP on Norton and the views expressed during statutory consultation, the application's layout immediately adjacent to Norton remains unchanged.	The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** has considered the location specific impacts of onsite infrastructure, and has identified Norton as one of the communities most likely to be affected by the Scheme. Indeed, the assessment considers Norton as a community of greater sensitivity to changes in its visual surroundings due to its current rural setting, and the anticipated extent to which the Scheme will change that character and potentially the quality of life for residents and visitors. The assessment considers that whilst this effect would be long-term throughout the Scheme's construction, operational and decommissioning phases, it is not anticipated to be a significant adverse effect to mental health and wellbeing. Whilst the majority of the proposed illustrative layout has not been altered since statutory consultation, the Applicant points to the removal of the small solar areas between Norton and Ladyswood from the Scheme. This has been done to address comments about impacts to the Fosse Way and should help to maintain a more open visual aspect from Norton looking west. Additional landscape mitigation measures (shown on **ES Volume**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			2, Figures 3-4-1 to 3-4-5.2 [APP-084] and secured through the **Outline LEMP [APP-283]** by Requirement 7 in Schedule 2 to the **Draft DCO [APP-016]**) have also been implemented to reduce landscape and visual impacts from locations in, and on the approach to, Norton.

5.15 Easton Grey Parish Meeting

Table 5-15 RR-1220

Reference	Theme	Comments/Issues Raised	Applicant's Response
EGPM-001	Description and DCO Process	Parish of Easton Grey's Relevant Representations Those attending the July 2025 Easton Grey Parish AGM, or who, being unable to attend had expressed a view in advance were, (with one exception by an individual who has a family member with a business interest in the proposal and one abstention due to a professional conflict of interest) unanimously opposed to the Lime Down solar proposal. Easton Grey's submissions on the statutory consultation and targeted consultation have been substantively ignored by the applicant. The position remains unchanged following the submission of the application notwithstanding the minor changes made by the applicant. As a small parish we have no funds to obtain expert advice on the 250+ documents in the PINS Examination library and we are thus at a significant disadvantage in fact checking and/or correcting any misleading statements or omissions. Many of the grounds of opposition are intertwined and difficult to place under specific headings or the chapters used by the applicants in the Environmental Statement. Accordingly, as authorised and obligated by the Easton Grey Parish AGM, I make these representations to the Planning Inspectorate opposing	The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **Environmental Statement [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft Development Consent Order [APP-016].** The Applicant recognises that parish councils may not have access to specialist expertise and encourages the Parish to make use of **ES Volume 4, Non-Technical Summary (NTS) [APP-265],** which is specifically designed to summarise the ES in an accessible format for non-technical readers.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		the application but reserving the right to raise further issues by way of Written Representations.	
EGPM-002	Landscape and Visual	A. LANDSCAPE AND VISUAL The core of the Easton Grey Parish is a Conservation Area and almost the entirety of the Parish lies within the Cotswolds AONB/Natural Landscape. The village incudes an ancient monument in its bridge over the River Avon at the centre of the village. Easton Grey and the area of the Lime Down project are within the Cotswolds which is known internationally for its history and beauty. Lime Down lies in the setting of the AONB/Natural Landscape. As a rural area we rely in no small way on tourism and agriculture for employment. The former is very much reliant on maintaining the beauty of the area with uninterrupted views and historic walks including over bye ways and public rights of way. The applicants intend to use 4.5m tracking panels for the most part, or, if that is not possible, 3m panels. Despite statements about mitigation by planting, panels will be visible from properties within Easton Grey and the rolling long views for people using the road from the National Landscape of Easton Grey towards Norton (car drivers, cyclists, horse riders and walkers) will be severely impacted.	Landscape and Visual An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		For example panels in fields B6-9 will be clearly visible. While these are just examples specific to Easton Grey, the proximity of enormous panels protected by fences and CCTV and supported by noisy infrastructure (inverters and transformers) so close to country roads and Public Rights of Way in other areas of Lime Down would permanently change the landscape which is the reason so many people choose to live in and visit what is now an exceptionally beautiful and peaceful area. In addition to the panels and inverters there would be well one enormous 400kV transformer with a height of 13m and multiple 132kV transformers with a height of 7m all placed on concrete and piled to significant depths and surrounded by high security fences and a battery storage area on a concrete base over an area of up to 5.5 hectares (13.5 acres). Industrial equipment of this scale is wholly unsuited for this area. Many of these changes cannot be mitigated which appears to be accepted by the applicant.	The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 - Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The LVIA assesses the effectiveness of the mitigation measures over time and concludes that, in the majority of locations, where significant adverse visual effects are recorded, the visual effects would reduce to non-significant as mitigation planting establishes and matures. This demonstrates that the proposed mitigation is effective in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			reducing the visual effects of the Scheme. On this basis, a maximum panel height of 4.5m is not considered excessive. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060].** Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084].** The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Cultural Heritage</u> The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-8 [APP-219 to APP-232]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets

Reference	Theme	Comments/Issues Raised	Applicant's Response
			within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220] and [APP-221]**, **Appendix 12-4: Archaeological Geophysical Survey Reports [APP-223] and [APP-224]**, and **Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225] to [APP-229]**. The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is being discussed with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation for each part of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the Proposed Development, substantially in accordance with **Appendix 12-6 Outline Archaeological Mitigation Strategy [APP-230]**, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered during the relevant part of the Proposed Development. <u>Tourism</u> The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant

Reference	Theme	Comments/Issues Raised	Applicant's Response
			adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Agricultural Jobs The Applicant is cognisant of the impact the Scheme could have on wider agricultural employment associated with tenancies and contracts and so seeks to source ways of retaining agricultural workers, providing reskilling opportunities, or providing re-employment as supported by the measures secured in the **Outline Skills, Supply Chain and Employment Plan [APP-285].** The Applicant has been in discussions with landowners and these discussions have included arrangements regarding existing tenancies. Whilst a worst case could involve the termination of an agricultural tenancy or contract in its current form, alternative operational and management opportunities are available connected to the scheme should consent be granted. Public Rights of Way A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Development Consent Order [APP-016]. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. <u>Noise and Vibration</u> An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The conclusions of the assessment in relation to each phase of the Scheme are set out below. The conclusions of the assessments are made for the Scheme as a whole (i.e. all of its components combined, including the BESS), and therefore any specific component will not have any greater effects than those that have been assessed. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. In addition, further meetings have been held over the approach to the management plans, and a Statement of Common Ground will be issued and updated throughout examination Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity, such as temporary screens and advanced warning of works, are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction, as committed to in the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration effects are appropriately controlled. Operational phase

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The predicted noise levels from the Solar PV Sites have been artificially increased by 3 dB to account for the increased likelihood that the noise from the Scheme would be perceived as distinct from the existing background sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. <u>Decommissioning</u> The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, as well as in Section 2 of the **Outline Decommissioning Strategy [APP 279]** which is secured under Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**, all land will be returned to its original

Reference	Theme	Comments/Issues Raised	Applicant's Response
			use and condition as far as practicable and returned to the landowner. Should the Scheme change ownership before the decommissioning phase, any new owner remains bound by the commitments and obligations set out within the DCO and associated management plans. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the disturbance to the land and soil would be less than that likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Strategy [APP-279] and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. The Applicant confirms that none of the land will be considered brownfield after decommissioning. The expectation is that the land will return to farming, but the Applicant cannot dictate what will happen to the land post-decommissioning when the Applicant no longer has an interest in the land. <u>Mitigation</u> The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267].** Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies.
EGPM-003	Hydrology, Flood Risk and Drainage	FLOOD AND RIVER POLLUTION Easton Grey is particularly sensitive to flooding. The bridge in Easton Grey (which is an Ancient Monument) does, if the river rises, act as a dam and will	**ES Volume 1, Chapter: 11 Hydrology, Flood Risk and Drainage [APP-063]** provides an assessment of the Scheme for fluvial and surface water flood risk beyond the Order limits, including potential effects on downstream communities along the River Avon and Gauze Brook, and the assessment

Reference	Theme	Comments/Issues Raised	Applicant's Response
		potentially flood properties and the sewage treatment plant which serves 12 of the houses in the village. The gardens of the properties adjoining the river are already subject to flooding. Several buildings in the village are very sensitive to any change in the water flow through the bridge. The applicant's ES Chapter 11 seems almost solely concerned on whether the infrastructure within the red line would be flooded and does not address the risks to Easton Grey and indeed other villages and towns on the Avon and Gauzebrook which rise dramatically and quickly in the event of heavy rain as surface water cannot be absorbed quickly enough and runs into those water channels. There appears to be no proper analysis as to the effect of thousands of enormous panels, which would be horizontal at night. These panels would, by acting like a "*roof*", reduce the absorption capacity of the soil below and increase concentration of the water which would run straight into the Avon and Gauzebrook in times of significant and/or sustained rainfall. As a matter of common sense, solar panels on this scale will have the effect identified above. See plate 3.3 in APP055 for image of panel in horizontal position and the areas of ground below which would be covered by this kind of	concludes that the Scheme would not increase flood risk or alter flood behaviour at Easton Grey. The assessment considers catchment response, existing flood mechanisms and downstream receptors, and confirms that the Scheme does not increase runoff rates or volumes leaving the Order Limits. The representation raises concern that solar panels would act as a roof, reduce infiltration and concentrate runoff into receiving watercourses. The submitted assessment presented in **ES Volume 3, Appendix 11-1 Flood Risk Assessment and Drainage Strategy - Lime Down Covering Report [APP-210]** reflects established hydrological evidence that the addition of solar panels over a vegetated field does not materially increase runoff volumes, peak discharges or response times, and that changes in hydrologic response are primarily associated with alterations to ground cover beneath the panels rather than the panels themselves. Panelled areas are therefore designed so rainfall continues to drain to ground, with no creation of extensive impermeable surfaces and with controls in place to avoid any increase in discharge to watercourses. Construction and operational risks are addressed separately within **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069].** Construction phase controls to manage soil compaction, sediment laden runoff and pollution risk are secured through the **Outline Construction Environmental Management Plan [APP-277],** while supporting infrastructure is subject to site specific engineered drainage and pollution control measures where appropriate. The assessment concludes that there would be no increased risk of flooding or pollution at Easton Grey, including effects on constrained features and wastewater assets.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		panel. The development will make what is already a difficult situation far worse as a result. So far as we are aware there is no solar development of this size using this kind of panel, and certainly not in an area with this kind of geology and so it is unclear how any proper assessments of increased flood risk could be made. We cannot overemphasise the lack of tolerance and susceptibility to serious flood issues if changes to the river flow occur. In the recent Storm Claudia the Easton Grey bridge coped but the river rose from 0.4m to over 1.06 m to within in a few hours as a result of surface run off. The impact of huge numbers of panels, not to mention the compacted soil from construction and the vast amount of concrete needed for the infrastructure and risk to current drainage channels which have worked so well for centuries does not appear to have been considered adequately and is a serious and unacceptable new risk to Easton Grey and other villages and towns downstream from Lime Down. The threat to the village is exacerbated by the fact that the sewage treatment plant that serves most of the village sits beside the Green in the centre of the village before discharging into the river. The location and levels are shown in a	

Reference	Theme	Comments/Issues Raised	Applicant's Response
		measured plan done by D&H surveys. The position in this regard is noted in the Easton Grey Flood Plan. The result of increased risk and magnitude of flood will not only be to properties but to rainwater entering the sewage system. It is of note that the licence granted by the Environment Agency South West Region (consent number 101899 and dated 13th May 2002) has a condition that surface water will be kept separate from domestic effluent. It is not apparent that the applicants have given any consideration to the risk of increased surface water and its effect on flooding and pollution nor how the affected householders in Easton Grey would be held harmless from such effects and potential legal or other action arising from a breach of the EA licence where the causation is, with advance knowledge, the fault of others involved with promoting and constructing Lime Down Solar Park.	
EGPM-004	Cumulative Effects	CUMULATIVE EFFECT Lime Down is of an industrial scale. Each of the 5 areas A-E would itself be considered an NSIP. The cumulative effect of those 5 separate areas would effectively change for ever an area of 46 square kilometre. It is noted that despite reference to mitigation it has been acknowledged that the panels and other infrastructure will remain	Regarding cumulative effects of the Scheme, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Chapter 21: Cumulative and In-Combination Effects [APP-073]** and **Appendix 21-1 Long List of In-Combination Effects and Cumulative Developments [APP-264]**. In-combination effect interactions during the construction, operation and decommissioning phase do not increase the significance of

Reference	Theme	Comments/Issues Raised	Applicant's Response
		visible. The proposal is completely inappropriate to our area with its AONB/National Landscape, Conservation Areas, listed buildings and ancient monuments, including the historic unmade up areas of the Roman Fosse Way. The area that is a gateway from the M4 to the Cotswolds and, not least to Easton Grey, will be changed from a welcoming rural landscape into an industrialised zone. The size and scale of the panels and the associated inverters, BESS and transformers is unlike anything which has been built in the UK let alone in an area of exceptional landscapes and heritage. Statements in the ES that assumptions have been based on similar projects are misleading since no similar projects have ever been built, certainly not in England or in an area so close to the National Landscape. There are already many smaller and more sensitively located solar developments in the area.	effects. No significant inter project cumulative effects are identified other than Skylark at a District Level during the operational phase and on four PRoWs and Corsham Park (tourism and recreation) during the construction phase. The Applicant is confident that the management and mitigation measures proposed are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267].** The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **Environmental Statement [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft DCO [APP-016].** The potential effects of the Scheme on the Roman Roads (i.e. the Fosse Way), as well as other Roman archaeological assets are fully assessed **in ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices **in ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. Where an adverse effect has been identified, mitigation is proposed. See Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation and Section 12.11 for additional mitigation. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12.6 Archaeological Mitigation Strategy [APP-230]**. Mitigation will be secured through requirement 12 of the DCO.

Reference	Theme	Comments/Issues Raised	Applicant's Response
EGPM-005	Noise and Vibration	NOISE The noise from infrastructure will be constant and intrusive. This is particularly the case for those who live or work near the transformers and the BESS. This will also have an adverse effect on the mental well being of our community. During the construction phase there will be pile driving on a scale which is almost unimaginable. The applicant's documents say each panel would be secured via metal posts driven into ground to an approximate depth of 1.5 m to 4 m. The 132kV and 400kV substations will have piled foundations to a depth of 12 m. The noise from that would be appalling. It is likely that many of the piles will be into bedrock.	The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066],** with supporting modelling provided **in ES Volume 3, Appendix 14-4: Noise Modelling [APP-237**]. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066],** and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The noise and vibration impacts arising from construction activities are assessed in Section 14.10 **of ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The assessment includes the piling activities described, however solar PV piling uses small mini-piling rigs which are quieter than the worst-case assumption in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and the duration of noise events from such activity would be short. With appropriate mitigation measures as committed to in the **Outline Construction Environmental Management Plan [APP-277],** including prior warning to local residents of any noisy works, no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction.

Reference	Theme	Comments/Issues Raised	Applicant's Response
EGPM-006	Other Environmental Matters	BESS Apart from the inappropriate size of the BESS (with up to 270 huge BESS containers to house vast numbers of lithium batteries) it is far larger than required to store energy produced by the panels at virtually all times and is, we understand, a profit generating aspect of the scheme. Indeed, we understand that the scheme has an input capacity from the National Grid of 250MW which shows what is really intended. We also have serious concerns about the risk posed by the BESS were a fire to break out. The fumes from lithium batteries are toxic. Such fires are notoriously difficult to extinguish. The BESS is very close to Hullavington and to the mainline railway from London to Bristol and on to Wales.	The Applicant notes that lithium-ion technology is currently the industry standard for utility-scale battery energy storage due to its proven efficiency, reliability and operational safety. Potential environmental and safety effects associated Building Failure, Fire and Associated Explosions (including risk posed by the BESS) are assessed in **ES Volume 1, Chapter 20: Other Environmental Matters, Section 20.7: Major Accidents and Disasters [APP-072].** This assessment considers credible worst-case accident scenarios and concludes that, with embedded mitigation and appropriate management measures, no significant adverse effects are anticipated. The Applicant notes that the approach to BESS safety is under discussion with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been submitted with the Application. The OBSMP confirms that a robust and validated Emergency Response Plan (ERP) will be developed at the detailed design stage in consultation with Dorset & Wiltshire Fire and Rescue Service. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation, and decommissioning. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for

Reference	Theme	Comments/Issues Raised	Applicant's Response
			DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166].** The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **OBSMP [APP-286]**. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			produced at the detailed design stage (template outlined in Section 5.4.4) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider." As now mandated under NFPA 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the **OBSMP [APP-286]** pre-construction requirements. Section 5 of the **OBSMP [APP-286]** covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the **OBSMP [APP-286].** The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. On this basis, the Applicant considers that the Scheme incorporates appropriate safety and mitigation measures to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			manage BESS-related risks and would not give rise to significant adverse environmental or safety effects.
EGPM-007	Ecology and Biodiversity	ECOLOGY AND BIODIVERSITY There are many assurances in the documents of how Lime Down Solar Park will improve biodiversity. None appears to take proper account of the impact that 2 years of construction and the addition of fences would have, nor how birds and bats will be impacted by vast swathes of shiny surfaces and noise. There is no adequate information about who will be responsible for maintenance of the proposed ecological mitigation zones or who will be responsible for the ongoing welfare of the trees and hedges which are said by the applicant to be necessary to mitigate the harm. Easton Grey as a small community has absolutely no funds available to give any assistance and/or take on any obligation or liability. Further, given the scheme is supposedly 'temporary' (which is a dubious suggestion because of its length), it seems all of these benefits said to come with the scheme will be left to go into disrepair and lost anyway. There is a significant lack of detail in relation to the destruction of hedgerows and trees which will be necessary to allow access by HGVs to the access points identified. The lack of detail in relation to the panels and	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. These includes potential effects arising from the impact of noise and lighting on sensitive wildlife during both the construction phase and operation and maintenance phase, as well as impacts from permanent or temporary hedgerow removal required for site access. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. A comprehensive package of habitat creation and enhancement measures are shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**.The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, will be secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified habitat creation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. Either the Applicant or (should the Applicant transfer the Scheme to a suitably qualified party) the future Scheme owner will be responsible for appointing land managers / contractors to ensure all measures within the detailed LEMP are delivered. Any breach of development consent order or failure to comply with Requirements can result in enforcement action.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		the glint from them and security lights, and the noise from the motors and other infrastructure makes any assessment of the impact on sensitive animals and insects, during the operative period of the scheme, let alone during construction, impossible to judge and something which needs to be carefully considered during the Examination.	
EGPM-008	Cultural Heritage	HERITAGE We are concerned that there are to be panels on fields close to the Fosse Way where important artefacts have been found e.g. field B6. Many archaeological remains have been found by local enthusiasts. At Easton Grey there is an important Roman settlement	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by appendices in **Volume 3 (12.2 to 12.5) [APP-220 to APP-230]** has assessed the potential impact of the scheme on archaeological assets. Desk-based research (**Volume 3, Appendix 12.2: Archaeological Desk-Based Assessments [APP-220 to APP-221]**) and archaeological evaluation (Appendix 12.3: Air Photo and LiDAR Mapping and Interpretation, Appendix 12.4, Archaeological Geophysical Survey Reports, and **Appendix 12.5: Interim Evaluation Trial Trenching Reports [APP-222 to APP-229]**) have successfully been used to identify archaeological sites and have informed the overarching archaeological mitigation strategy is provided in **ES Volume 3 Appendix 12.6 Archaeological Mitigation Strategy (AMS) [APP-230]**. Iron Age and/or Roman features were identified in Field B6, which as detailed in Table 6.1.1 of the **AMS [APP-230]** are proposed to be preserved in situ preservation using a non-intrusive construction methodology.
EGPM-009	Transport and Access	ROADS AND TRAFFIC The local roads are wholly unsuited to the number and size of vehicles which would be required to construct Lime	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** includes an analysis of accident collisions in the study area and construction routes **ES Volume 1, Chapter 13: Transport and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Down. For those in Easton Grey (and there are issues for others not addressed in these representations) the number of HGVs (even on the applicant's figures) which would use the road towards Hullavington, which is the main route from Easton Grey to Exit 17 M4 or Chippenham is 76 per day. These are the applicant's numbers and are believed to be significantly underestimated. The road is not capable of taking HGVs passing each other. It would make the road effectively unusable and/or dangerous for drivers, let alone cyclists who use this road in large groups. The road is simply unsuitable for this level and type of traffic. For other areas of Lime Down there are also serious traffic issues and the narrow country roads with dangerous bends used by horse riders, pedestrians and cyclists, as well as cars could not cope with the increased traffic. The suggestion that most of the construction workers would come in minivans seems fanciful. It is inevitable that cars will try to cut through Easton Grey to get to Lime Down sites and the road is already dangerous with regular accidents. Any increase in traffic will further damage the verges to what is, in Easton Grey's case, on the road from the B4040 to Norton, a single track road with passing places. The	**Access [APP-065]** concludes The low level of construction traffic associated with the Scheme is unlikely to materially affect road safety on the links in the Study Area, and the effects on accidents and safety from the Scheme's construction phase on all links will be temporary and negligible (not significant). This is summarised in Table 13-31 of this chapter. Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** , demonstrates adequate carriageway width and/or adequate frequency of passing places providing opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres, for example, the HS2 Rural Road Design Criteria stated visible passing places must be provided on single-track roads at a maximum spacing of 200 metres. No roads are proposed to be closed for the construction of Lime Down. In regard to car trips routing through Easton Grey this is unlikely to be significant during the temporary construction period due to measures committed to and secured through and the **OCTMP [APP-287]** such as: • a construction worker travel plan;

Reference	Theme	Comments/Issues Raised	Applicant's Response
		increase in usage of the roads leading to Lime Down will be caused by closures of other roads to facilitate the construction of Lime Down and will be a further detriment to the residents of Easton Grey and neighbouring villages. Alternative routes will already be affected by other elements of Lime Down, particularly the A429 between Corston and the "*Go Karting*" roundabout. Further disruption to traffic will be caused by the works to create the cable route, details of which have not yet been provided.	• Shuttle Bus - The location where staff will travel from is unknown at this stage as it will depend on the appointed contractor. However, it is envisaged that the majority of non-local workforce will stay at local accommodation and be transported to the Order Limits by shuttle bus to minimise the impact on the strategic and local highway network; • Car sharing – A car sharing scheme will be set up. This will match construction workers who live in a similar area, or who follow a similar route to the Order Limits and encourage them to car share to save costs and reduce their impact on the environment • Excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); - assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **OCTMP [APP-287]**. There

Reference	Theme	Comments/Issues Raised	Applicant's Response
			will be no HGV construction trips outside of these hours; • there would be a much greater impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down D (average number of existing HGV movements is only 46 per day, with some of these movements occurring outside of proposed construction hours set out in the **OCTMP [APP-287].** Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. An **oCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes. It also includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. With this mitigation in place, **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** concludes that impacts would be negligible to minor adverse. One specific measure provided for in the **oCTMP [APP-287]** is a booking system which will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction routes (including this route) and will be confirmed as part of the final CTMP. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.
EGPM-010	Decommissioning and Construction	MAINTENTANCE AND DECOMMISSIONING There is no information about who and how the responsibility for maintaining the biodiversity areas, new planting or the clean up costs will be met and secured. Reliance on there being a criminal sanction for failure to comply is of no use when the owner of Lime Down is a single purpose company and likely to be owned by foreign investors.	The DCO process itself incorporates enforceable mechanisms to regulate Scheme delivery. Any breach of development consent order or failure to comply with Requirements can result in enforcement action. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
EGPM-011	Description and DCO Process	PROCUREMENT There is no explanation of where the panels will be manufactured. How can there be a guarantee that the solar panels and the lithium for the batteries will not be from sources which use (Redacted) or that there will not be security issues for infrastructure sourced from China.	**The ES Chapter 7: Climate Change [APP-059]** assessment has used a reasonable conservative assumption that materials will be sourced from China for the purposes of estimating GHG emissions. This does not obligate the developer to use materials from any particular supplier or country of origin but represents a reasonable assessment scenario given that China is the largest manufacturer of solar panels.

Reference	Theme	Comments/Issues Raised	Applicant's Response
EGPM-012	Site selection and Alternatives	ALTERNATIVES The justification given by the applicant for selecting this area seems to be that the land was offered on a voluntary basis. The terms on which landowners have granted options over land, including the duration of the applicant's rights is a closely guarded secret with a refusal to provide details due to (Redacted) imposed by the applicant. It is far from clear that the applicant does have rights over the land for the 60+ years it seeks. It certainly does not have rights over the cable route where dozens of farmers and landowners are being threatened with compulsory acquisition if they do not grant options for easements for the cable. The selection criteria used by the applicant should not be accepted at face value. This is the wrong scheme in the wrong area and far too far from the grid connection.	As detailed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056] and ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185],** the Applicant has followed a staged approach to assessment of potential sites, taking into consideration a range of planning, environmental and operational factors. Potentially willing landowners with large scale land holdings within the search area was a consideration, however it is not the only consideration in the site selection process. As set out in the **Statement of Reasons [APP-018]** the Applicant has been seeking to acquire the relevant land, new rights and use of land by voluntary agreement, in order to ensure implementation of the Scheme. Whilst the Applicant is seeking compulsory acquisition powers as part of the DCO Application, the Applicant will continue to seek to acquire the land, the rights and other interests in, on and over the land, the temporary use of land, as well as secure the removal of matters affecting the Order land that may impede the Scheme, by agreement wherever possible. the **Land Rights Negotiations Tracker [APP-021]** sets out the position in relation to the negotiations undertaken to date with affected owners.
EGPM-013	Community Benefits	COMMUNITY BENEFIT As far as we are aware no benefit will accrue to the local community. All electricity generated will go to the main grid and all profits from the power generated and from the BESS trading will go to the owner of Lime Down Solar Park Limited. The ultimate ownership is very likely to be foreign. The local community and its businesses will most certainly suffer detriment and increased risk of flooding, reduction in	The Applicant acknowledges that many of the benefits of the Scheme are felt over a wider area than the adverse effects from the Scheme. As highlighted, this includes energy generation, and so is a nationwide benefit. Employment and economic benefits from direct employment, maintenance and supply chains will likely be county-level or regional, albeit measures secured through the **OSSCEP [APP-285]** seek to improve local economic prosperity from the Scheme. Locally specific benefits largely are based around landscape and ecological enhancements, and the provision of permissive paths to improve PROW access and connectivity. The proposed landscape and ecological enhancement measures are

Reference	Theme	Comments/Issues Raised	Applicant's Response
		property prices and the ruination of areas of particular natural beauty and historic interest, right beside an area of Natural Landscape. During construction the roads will be impassable preventing people from getting to work on time or getting to schools. No new jobs will be created for locals. The community loses in every way. The only people to benefit are the landowners who have contracted on unknown terms to allow their land to be used.	illustrated in Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]**, and details of creation, management and monitoring of such measures are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283].** The assessment in the ES has sought to assess the likely significance of effects in relation to economic environment, flooding, landscape, heritage, and transport, with any required mitigation measures secured through the requirements in Schedule 2 to the **Draft DCO [APP-016].** While landowners are to benefit directly from the option agreements on the land proposed for above-ground infrastructure, the general community is also able to benefit from the Community Benefit Fund, which can be used towards local infrastructure and benefits as decided by local stakeholders. The Community Benefit Fund is however agreed under a separate process to the DCO and so does not form part of the assessment of whether the DCO should be consented or not.
EGPM-014	Climate Change and Energy Need	CARBON BENEFIT AND GREEN CREDENTIALS So far as we are aware there is no material to explain how the panels and lithium batteries which will have to be replaced on a number of occasions will be recycled. There is clearly a huge carbon footprint in sourcing materials from (probably) China and in the construction of the infrastructure over the 5 sites and the very long cable route to Melksham.	Details of the disposal and end-of-life management of the Battery Energy Storage System (BESS), including lithium-ion batteries, are provided in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072], Section 20.3: Materials and Waste**. This section confirms that recycling routes for solar PV panels and BESS components are generally available at present, and that these routes are expected to expand further over the lifetime of the Scheme as the recycling market grows in response to increasing deployment of renewable energy infrastructure. The Materials and Waste assessment also confirms that the Scheme will follow the waste hierarchy, prioritising reuse and recycling wherever reasonably practicable, with disposal as a

Reference	Theme	Comments/Issues Raised	Applicant's Response
			last resort. **An Outline Site Waste Management Plan (SWMP) [APP-281], Outline CEMP [APP-277], Outline OEMP [APP-278]** and **Outline Decommissioning Strategy [APP-279]** have been submitted with the Application, which set out how waste — including BESS components — will be managed during construction, operation and decommissioning. These documents commit to segregation of materials on-site and to the use of appropriately licensed waste contractors and facilities. On this basis, the assessment concludes that the Scheme would not give rise to significant adverse effects in relation to materials use or waste management, and that appropriate recycling and disposal routes for lithium-ion batteries are available and expected to improve further over time. Notably Requirement 19 in **Schedule 2 of the Draft DCO [APP-016]** secures that, prior to commencement of construction, a detailed SWMP must be submitted to and approved by the relevant planning authority, and that construction must be carried out in accordance with the approved plan. Moreover, Requirement 20 secures that, prior to decommissioning of the Scheme, a Decommissioning Strategy must be submitted to and approved by the relevant planning authority. The Decommissioning Strategy must detail removal of above-ground infrastructure and appropriate management of all resulting waste, including recycling of BESS components where practicable. The 'carbon footprint' of sourcing materials is considered within **ES Volume 1, Chapter Climate Change [APP-059]** and it is concluded that the potential savings from the scheme outweigh the emissions required from products associated with the development.

Reference	Theme	Comments/Issues Raised	Applicant's Response
EGPM-015	Description and DCO Process	CONCLUSION Easton Grey Parish opposes Lime Down for the reasons given above and reserves the right to raise further points as the missing details of the scheme are developed and further details of what is planned are assessed from the tens of thousands of pages of material which have been submitted by the applicant.	The Applicant notes this comment. Please see the Applicant's responses above which respond to the specific issues raised throughout the representation made by Easton Grey Parish Council.

5.16 Malmesbury Town Council

Table 5-16 RR-2932

Reference	Theme	Comments/Issues Raised	Applicant's Response
MTC-001	Description and DCO Process	Proposed Objection – Lime Down Solar Park Malmesbury Town Council is committed to a sustainable future for our town and surrounding area. We have worked extensively with a range of interested parties, including home builders and developers, to ensure sustainability is a key consideration in the development and growth of our town. This has included specific measures, including EV and Solar inclusion for new development. Whilst the above demonstrates our support for the principal of renewable energy, including solar, it is not a blanket approval. In the case of significant solar development, Lime Down Solar Park, this committee strongly opposes the development in principle, as well as several mechanisms around the consultation process.	The Applicant notes this comment and responds to each of Malmesbury Town Council's specific concerns below.
MTC-002	Landscape and Visual	At 11 Square Miles, Lime Down is a significant development which will have a negative, material impact on both the immediate and surrounding areas, including Malmesbury. We share the concerns of Wiltshire Council relating to the sites current Agricultural Status (30% of which is significantly favourable and versatile arable land), impact on the cherished AONB status of the area and far ranging impact on land health. There is a statutory duty to conserve	The effects of the Scheme on agricultural land, including Best and Most Versatile (BMV) agricultural land and soil resources, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, supported by **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. That assessment identifies that the Scheme will result in significant adverse effects on BMV agricultural land, but that this will be a temporary and reversible loss of land during the operational period, with land reinstated and returned to agricultural use as far as practicable following decommissioning. The assessment also explains that reduced disturbance during operation allows soils to recover from

Reference	Theme	Comments/Issues Raised	Applicant's Response
		and enhance national landscapes and this development contradicts this principle.	previous intensive agricultural use, with benefits to soil structure and soil biology. National planning policy recognises the benefits of BMV agricultural land and encourages the use of lower quality land where possible; however, agricultural land quality is one of a number of sustainability considerations to be weighed in the planning balance. <u>Cotswolds National Landscape</u> The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures such as the avoidance measures to remove panels from the boundary of CNL are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
MTC-003	Consultation and Engagement	Impact to Malmesbury In the most recent round of consultation, residents of Malmesbury were excluded from information provided by Lime Down. This is a blatant and inexcusable omission, with residents metres from the town boundary in Malmesbury St Paul Without included in distribution. We believe the process to date has not provided a rounded view on the impact of visual impact, glare and noise.	Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
MTC-004	Socio-Economics, Tourism and Recreation	This committee has already raised and detailed concerns to Malmesbury directly from this development, which include issues around Traffic, Flooding, Water Run-Off & Health, Emergency Preparedness and Construction Pollutants. One issue that has once again been omitted from consideration is the material impact on Tourism – a sector vital to the economic status of the town. It is also evident no consideration has been given to the Emotional and Physical Health and Wellbeing of residents in the wider community who will suffer from the loss of amenity associated with living in a rural or semi-rural setting.	The Applicant has aimed to provide a robust assessment of impacts to tourism and recreation **in ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068].** Therein, the Applicant has assessed that there is a likely worst-case temporary loss of 50 FTE tourism industry jobs as a result of the Scheme. This is based on likely construction impacts including increased HGV use of the local highway network, visual and amenity impacts, and impacts on the use of PROWs. This estimate does not account for additional mitigation measures being applied. This effect on GVA in tourism-dependent industries is not significant, accounting for less than 0.7% of tourism-based employment within 5 km of the Scheme (BRES, 2023 data), and approximately 0.17% of tourism employment across Wiltshire (29,000 estimate from Visit Wiltshire, 2021). This is also a temporary effect, anticipated to occur during construction, with recovery to tourism businesses anticipated to begin as soon as construction works are complete. During the Scheme's operational phase, the reduction in tourism compared to current conditions is anticipated to be equivalent to a loss of 11 FTE tourism-dependent jobs. Additional mitigation measures have been secured through the **OCTMP [APP-287], OPROWPPMP [APP-282]** and the **OSSCEP [APP-285].** Together these seek to reduce these losses to tourism through mitigating traffic impacts, impact to PROWs, and focusing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries. These measures are secured by the relevant requirements in Schedule 2 to the **Draft DCO [APP-016].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Impacts to the social environment, on amenity, and access to open space and the countryside for leisure (and thus how this will impact upon both physical and mental wellbeing) have been assessed in **ES Volume 1, Chapter 18: Human Health [APP-070],** taking into account environmental impacts assessed in other technical chapters of the ES. This has focused on a 2 km Study Area around the Scheme's Order Limits, and within that area finds there are no anticipated significant adverse effects to human health resulting from the Scheme.
MTC-005	Description and DCO process	Summary Our opposition to the Lime Down Solar Park stands, as does our call for a robust consultation process with local stakeholders. Many of the points raised above have yet, in our opinion, to be comprehensively considered and we would support Wiltshire Council's call for a supplementary public consultation." ENDS Cllr Phil Exton Chair, Planning & Environment Committee Malmesbury Town Council – 01/12/25	The Applicant confirms that it has responded in detail above to the points raised in Malmesbury Town Council's Representation. To confirm, the Applicant considers that the statutory consultation has been robust, thorough and undertaken in accordance with the requirements of the Planning Act 2008, the Environmental Impact Assessment (EIA) regulations, and the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009. The **Consultation Report [APP-022]** sets out the Applicant's approach to pre-application consultation. The Applicant notes that the examination process provides a further opportunity for interested parties to comment on the Scheme. This examination is managed by an independently appointed Examining Authority. Further to this, the Applicant provided an extended relevant representation period beyond the minimum statutory timeframe to allow sufficient time to review the submitted application documents and register as an interested party. The Applicant will continue to engage constructively with stakeholders throughout the Examination and will respond to issues raised through the formal Examination process.

5.17 Tormarton Parish Council

Table 5-17 RR-4776

Reference	Theme	Comments/Issues Raised	Applicant's Response
TPC-001	Description and DCO process	Tormarton Parish Council strongly objects to the Lime Down Solar Park development. There are so many reasons why this site is totally inappropriate for such a large solar park development.	The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **ES [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft DCO [APP-016]**. The Applicant has responded to each of Tormarton Parish Council's specific concerns below.
TPC-002	Landscape and Visual	The proposed site lies in a quiet, rural location, surrounded by farmland and small villages. It lies within the Cotswolds National Landscape and is renowned for its tranquillity and charm. The site can be seen from higher ground from miles around and will have a huge impact in the region.	The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures such as the avoidance measures to remove panels from the boundary of CNL are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Plan [APP-084] and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
TPC-003	Human Health	At a time when so much emphasis is placed on wellbeing and mental health, it is totally illogical to destroy an environment that provides wellbeing in its widest sense for so many people, residents and tourists alike. Some of the villages will be surrounded by solar panels, hedgerows and footpaths will be lost and for many residents, the main reason for choosing a rural environment will be destroyed. Who will want to walk in dark corridors of 4.5 metre solar panels and security fences?	**ES Chapter 18: Human Health [APP-070]** has relied upon the assessment outcomes in other technical chapters and sections of the ES to determine the likely effects of the Scheme on physical and mental health and wellbeing. Subject to the implementation of all mitigation measures as secured through the requirements in **Schedule 2 to the Draft DCO [APP-016]**, there are no residual significant adverse effects on human health. In support of this, the Applicant has aimed to provide a robust assessment of impacts to tourism and recreation in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068],** taking into account assessment of the desirability of PROW for future users during the construction, operational, and decommissioning phases of the Scheme. The Applicant confirms that the majority of significant adverse effects can be mitigated through the measures set out in the **OLEMP [APP-283]**, **OCEMP [APP-277]**, **OCTMP [APP-287]**, and **OPROWPPMP [APP-282]**,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			secured by Requirements 7, 13, 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. However, the assessment in **ES Chapter 16 [APP-068]** identifies residual significant adverse effects to a small number of PROWs and unsurfaced highways during construction, and to long-distance recreation routes during all phases of the Scheme (due to their regional or national importance). The Applicant does however seek wish to clarify that PROWs are to be given a minimum of 15 m offset from their centerline to the nearest onsite infrastructure. This buffer space would be planted with either hedgerows or low-level ground cover planting to encourage either visual screening or improve biodiversity. These are shown on **ES Volume 2, Figures 3-4-1 to 3-4-5.2 [APP-084]** and secured through the **OLEMP [APP-283]** by Requirement 7 in Schedule 2 to the **Draft DCO [APP-016].**
TPC-004	Ecology and Biodiversity	The natural habitat will be destroyed – hedges and habitats removed. The area is home to a wide and diverse range of wildlife and it is estimated that, for example, over 70% of the skylarks currently on-site will no longer inhabit the area.	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The assessment identifies skylarks as a key species of conservation interest within the Scheme area. It concludes that a proportion of the current skylark population will be displaced from the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large open set-aside and grassland areas habitats, retention of field boundary features, and the creation of habitat areas designed to provide appropriate breeding and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The Scheme will create and enhance a wide range of habitats, such as grasslands, hedgerows and ponds, that will benefit a wide range wildlife present in the area. Details of habitat creation and enhancements are set out in the **OLEMP [APP-283]**.
TPC-005	Socio-Economics, Tourism and Recreation	Tourism and farming are the main industries in this region. Large numbers of cyclists and walkers visit throughout the year. Tourism-dependent businesses such as cafes, pubs, holiday rentals and hotels will be severely affected, especially through the construction phase.It is anticipated that some 2000 acres of our best agricultural land for food production will be lost. This will no doubt lead to loss of farming livelihoods and job losses within the agricultural industry.	The Applicant has aimed to provide a robust assessment of impacts to tourism and recreation, and to agricultural employment in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. Therein, the Applicant has assessed that there is a likely worst-case temporary loss of 50 FTE tourism industry jobs as a result of the Scheme's construction phase, and a long-term loss of up to 20 FTE agricultural jobs as a result of the Scheme. These impacts are not considered significant, accounting for approximately 0.17% of tourism employment across Wiltshire (29,000 estimate from Visit Wiltshire, 2021) and less than 0.29% of agricultural employment in Wiltshire (BRES, 2023). Additional mitigation measures have been secured through the **OCTMP [APP-287], OPROWPPMP [APP-282**] and the **OSSCEP [APP-285**]. Together these seek to reduce these losses to tourism through mitigating traffic impacts, impact to PROWs, and focusing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers in tourism-dependent industries. These measures are secured by the relevant requirements in Schedule 2 to the **Draft DCO [APP-016].**
TPC-006	Cultural Heritage	The area in question consists of 118 archaeological assets, 761 listed buildings and many roman and medieval roads. Surely there are other	The Applicant notes the comment. The Scheme site has been selected following a robust site selection process which considered technical, environmental, and planning constraints (see **ES Volume 1, Chapter 4 Alternatives and Design**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		sites more suitable for this level of development.	**Evolution [APP-056]**). **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]** has assessed the potential impact of the scheme on identified archaeological and built heritage assets. There is the potential for construction groundworks to cause physical damage to archaeological and built heritage assets as well as indirect impacts to the setting of built heritage assets. Where required appropriate mitigation is proposed. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064],** with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230].** Following mitigation, the residual effects range between Neutral and Minor/Moderate Adverse, not significant.
TPC-007	Description and DCO Process	We are concerned about the long-term influence of this development. The overseas business will own the land and have the right to use it as they see fit at the end of the 60 year solar facility. Will this large-scale industrial site revert to agricultural use, or will it just be a grim legacy for future generations?	The **Statement of Reasons [APP-018]** provides further details of the possession, rights and powers required by the Applicant in order to build, operate, maintain and decommission the Scheme. The Scheme is temporary in nature, and, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055],** when the operation and maintenance phase ends, the Solar PV Sites would be decommissioned and the land returned to its original use and condition as far as practicable and returned to the landowner. Post-decommissioning, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits. Permissive paths would be

Reference	Theme	Comments/Issues Raised	Applicant's Response
			removed during decommissioning. Further details are provided in the **Outline Decommissioning Strategy [APP-279].**
TPC-008	Soils and Agriculture	The cabling operation from the site to Melksham will cross through valuable farmland and rural landscapes and will destroy the tranquil nature of the existing landscape, as well as causing disruption within the villages and towns it travels through.	The landscape and visual effects of the Cable Route Corridor will be temporary in nature and are set out in Appendix 8-3-4 of the **ES: Landscape and Visual Assessment Sheets - Cable Route Corridor [APP-193].**
TPC-009	Transport and Access	But it is the communication and road infrastructure around the proposed development and southwards towards Melksham that concerns us most. Our lanes and roads are not suitable for the large HGVs travelling daily (148 daily) and AILs during the peak construction phase.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **OCTMP [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be confirmed as part of the final CTMP.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Regarding routes through the Hulavington area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **OCTMP [APP-287]**. There will be no HGV construction trips outside of these hours; • there would be a much greater impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down D (average number of existing HGV movements is only 46 per day, with some of these movements occurring outside of proposed construction hours set out in the **OCTMP [APP-287]**).

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Regarding routes through the Foss Way area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 16 HGVs on the route to Lime Down A is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 16 HGVs on the route to Lime Down A is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV movements along the route to Lime Down A is only 10 per day/less than 2 per hour/one every 42 minutes (less than the journey time along the route), with the construction phase for Lime Down Site A only lasting 9 months • delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287].** There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A (average number of existing HGV movements is only 40 per day, with some of these movements occurring outside of proposed construction hours set out in the **oCTMP [APP-287]**). Regarding routes through the Alderton area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A-C (average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **oCTMP [APP-287]**. Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate

Reference	Theme	Comments/Issues Raised	Applicant's Response
			carriageway width and/or passing place opportunity for two HGVs.
TPC-010	Transport and Access	Being so close to the Lime Down site and sited next to the M4 at Junction 18 and the A46, Tormarton Parish council is very concerned regarding the increased levels of traffic during the 2-year construction phase. It is reasonable to suggest that a large percentage of traffic will be from Junction 18 of the M4 – HGVs, buses (for staff) and private vehicles.	The impact on Driver delay is negligible as shown in Table 13-24 of **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]**
TPC-011	Transport and Access	We note that it is proposed that traffic to the site is routed from Junction 18 to the Old Sodbury crossroad and onto Acton Turville, Burton, Littleton Drew, etc. Tormarton is a small village and is already used by large numbers of commuters to 'park & share' on our narrow road verges, passing places and anywhere there is space! Cars are often parked dangerously. As well as verges, cars are parked in the village as well, causing parking and speeding issues to residents.	The construction traffic routes are assessed within **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, this includes highway links routing through Acton Turville and Burton. The assessment concludes that there is no significant impact on these links. Construction traffic will not route through Tormarton.
TPC-012	Transport and Access	The Tormarton to Acton Turville Road (Acton Turville Road) is a long straight rural road and is used as a shortcut to Acton Turville, rather than the Old Sodbury route. VAR speed signs show the large majority of road users exceed the speed limit of 40mph. It is totally unsuitable for large vehicles, buses, etc. and particularly unsuitable for HGVs. Already, multiple accidents have	The impact of the Scheme on driver delay and road safety is negligible as shown in **ES Volume 1, Chapter 13-1: Transport and Access [APP-065].** The Tormarton to Acton Turville Road (Acton Turville Road) does not form part of the general construction routes. Instead, the specified construction route is to/from the A46 via the B4040 and B4039**.**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		taken place on this road within the village area and a new Casualty Reduction Scheme has been implemented at the Tormarton crossroads in a bid to make the road safer. The Cotswolds Way (used by thousands of walkers each year) crosses the Acton Turville Road and a large increase in traffic will increase the risk to pedestrians.	
TPC-013	Other Environmental Matters	In addition to the concerns outlined above, there is concern regarding potential BESS fires and contamination.	The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081],** the battery containers will be located more than 200m from the nearest Public Right of Way and more than 500m from any residential receptors. The Applicant notes that the approach to BESS safety is under discussion with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either

Reference	Theme	Comments/Issues Raised	Applicant's Response
			prevented or fully mitigated if a BESS failure occurs. Section 5.4 of the **OBSMP [APP-286]** specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation, and decommissioning. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166].** The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286].** The Plume Assessment Study has concluded that there are no

Reference	Theme	Comments/Issues Raised	Applicant's Response
			significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the **OBSMP [APP-286]** and secured through Requirement 6 of the **Draft DCO [APP-016].** The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. As now mandated under NFPA 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP (Section 6.1.1) pre-construction requirements. Section 5 of the **OBSMP [APP-286]** covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. Potential effects of the Scheme on water quality and contamination risk are addressed **in ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063],** which sets out mitigation and management measures to protect water quality during construction and operation. These measures include pollution prevention controls, containment systems, emergency response protocols, and site-specific drainage measures, particularly around the Battery Energy Storage

Reference	Theme	Comments/Issues Raised	Applicant's Response
			System (BESS) and substations where lined drainage and automatically actuating valves are proposed. The Applicant notes that the approach to pollution resulting from battery fire is under discussion with both the Environment Agency and the Lead Local Flood Authority (LLFA) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Mitigation measures to control contamination risk during construction are set out in the **Outline CEMP [APP-277].** Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a detailed CEMP substantially in accordance with the **Outline CEMP [APP-277]** is secured through Requirement 13 in Schedule 2 of **the Draft DCO [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are appropriately managed throughout construction of the Scheme.
TPC-014	Description and DCO Process	We believe the Lime Down site is in a totally inappropriate location for such a large solar site, with the additional cable route corridor to Melksham. We hope you will give serious consideration to the concerns we have raised.	As to size, the Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. Regarding the distance between the Solar PV Sites and the point of connection at Melksham, the Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available

Reference	Theme	Comments/Issues Raised	Applicant's Response
			capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185].** Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered such as taking as direct a route as possible, whilst following existing features, such as roads; and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts.

5.18 Dauntsey Parish Council

Table 5-18 RR-0979

Reference	Theme	Comments/Issues Raised	Applicant's Response
DPC-001	Description and DCO Process	The Parish Council will be submitting a comprehensive letter of objections to this proposal. These will include the overall size and scale of the project. The significant negative impact on the rural scene and landscapes, the surrounding village settings, ecology and biodiversity, hydrology, flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, highways and socio-economics, tourism and recreation all to be balanced against the potential gains of renewable energy generation and carbon reduction. In addition the concentration of solar farms, battery storage and associated infrastructure within the County of Wiltshire that represents a significant cumulative impact and industrialisation of the countryside destroying food production and the farming industry	The Applicant notes the Council's intention to submit a detailed letter of objections covering a range of topics including landscape and visual effects, setting, ecology and biodiversity, hydrology and flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, socio-economics, tourism and recreation, as well as concerns relating to cumulative development and the scale of the Scheme. The Applicant confirms that these matters have been assessed as part of the Environmental Impact Assessment (EIA) and are reported within the Environmental Statement (ES), including **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061], ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063], ES Volume 1, Chapter 14: Noise and Vibration [APP-066], ES Volume 1, Chapter 12: Cultural Heritage [APP-064], ES Volume 1, Chapter 13: Transport and Access [APP-065], ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073].** The Applicant's **Statement of Need [APP-266]** provides evidence that an unprecedented capacity of new low-carbon generation schemes is urgently needed for the UK to meet its legally binding climate change targets. The government has confirmed that solar energy is at the heart of the Clean Power 2030 Mission [NPS EN-3 (2025) Paras 2.10.1 & 2.10.2]. The Statement of Need confirms that the need for the Scheme is urgent and that substantial weight should be given to the need for the Scheme [NPS EN-1 (2023) Para 3.2.9-3.2.10]. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies. The Applicant recognises that the Council intends to provide further detailed submissions on these matters. The Applicant will continue to engage constructively with stakeholders throughout the Examination and will respond to issues raised through the formal Examination process.

5.19 Seagrey Parish Council

Table 5-19 RR-4303

Reference	Theme	Comments/Issues Raised	Applicant's Response
SGPC-001	Description and DCO Process	The Parish Council will be submitting a comprehensive letter of objections to this proposal. These will include the overall size and scale of the project. The significant negative impact on the rural scene and landscapes, the surrounding village settings, ecology and biodiversity, hydrology, flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, highways and socio-economics, tourism and recreation all to be balanced against the potential gains of renewable energy generation and carbon reduction. In addition the concentration of solar farms, battery storage and associated infrastructure within the County of Wiltshire that represents a significant cumulative impact and industrialisation of the countryside destroying food production and the farming industry	The Applicant notes the Council's intention to submit a detailed letter of objections covering a range of topics including landscape and visual effects, setting, ecology and biodiversity, hydrology and flood risk and drainage, soils and agriculture, noise and vibration, cultural heritage, transport, socio-economics, tourism and recreation, as well as concerns relating to cumulative development and the scale of the Scheme. The Applicant confirms that these matters have been assessed as part of the Environmental Impact Assessment (EIA) and are reported within the Environmental Statement (ES), including **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061], ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063], ES Volume 1, Chapter 14: Noise and Vibration [APP-066], ES Volume 1, Chapter 12: Cultural Heritage [APP-064], ES Volume 1, Chapter 13: Transport and Access [APP-065], ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073].** The Applicant's **Statement of Need [APP-266]** provides evidence that an unprecedented capacity of new low-carbon generation schemes is urgently needed for the UK to meet its legally binding climate change targets. The government has confirmed that solar energy is at the heart of the Clean Power 2030 Mission [NPS EN-3 (2025) Paras 2.10.1 & 2.10.2]. The Statement of Need confirms that the need for the Scheme is urgent and that substantial weight should be given to the need for the Scheme [NPS EN-1 (2023) Para 3.2.9-3.2.10]. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies. The Applicant recognises that the Council intends to provide further detailed submissions on these matters. The Applicant will continue to engage constructively with stakeholders throughout the Examination and will respond to issues raised through the formal Examination process.

5.20 Sopworth Parish Meeting

Table 5-20 RR-4429

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPM-001	Description and DCO Process	I write on behalf of Sopworth Parish Meeting, in order to strongly object to the proposals, for the following reasons; Sopworth is a small hamlet located some 3 miles from the proposals. Whilst we do not have an in principle objection to the use of Solar as a source of renewable energy, we feel that Brownfield sites should be developed, and not agricultural land. Our way of life will be adversely affected for a number of reasons, including; Significant disruption to access to and from the M4 Motorway will be caused both during and after the construction phase.	An assessment of transport and access effects during the construction, operation and maintenance, and decommissioning of the Scheme is presented in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. This concludes there would be no significant transport and access impacts as a result of the Scheme. The alternatives explored by the Applicant, including consideration of Brownfield Sites, is set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056] and ES Volume 3, Appendix 4 1: Site Selection Assessment Report [APP 185].** As set out in the Site Selection Assessment Report, Brownfield Sites were considered, but no brownfield land was identified which would be of an adequate area to facilitate a large solar project, either individually or in combination with other sites. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered such as taking as direct a route as possible, whilst following existing features, such as roads; and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests.
SPM-002	Socio-Economics, Tourism and Recreation	Negative effect on Tourism	The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
SPM-003	Hydrology, Flood Risk and Drainage	Flood risk and Groundwater contamination.	Potential effects of the Scheme on flood risk, including fluvial, surface water and groundwater sources, are assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting detail provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment considers flood risk within the Order Limits and to surrounding receptors. It concludes that the Scheme would not increase flood risk elsewhere and would remain safe and operable for its lifetime, having regard to embedded design measures, greenfield runoff control, exceedance management and floodplain considerations where relevant. Potential effects of the Scheme on water quality and contamination risk are also addressed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, which sets out mitigation and management measures to protect water quality during construction and operation. These include pollution prevention controls, containment systems, emergency response protocols and site-specific drainage measures, particularly around the BESS and substations where lined and isolatable drainage systems with automatically actuating valves are proposed. The Applicant notes that the approach to pollution resulting from a battery fire is under discussion with the Environment Agency and the Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Mitigation measures to control contamination risk during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]**. Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents. The cessation of agricultural activities will remove existing agrichemical inputs and therefore reduce baseline contamination pressures. The preparation, approval and implementation of a detailed CEMP substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277]**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			is secured through Requirement 13 in Schedule 2 to the **Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that both flood risk and contamination risks are appropriately managed throughout construction.
SPM-004	Other Environmental Matters	Light and noise polution.	Potential effects relating to lighting are considered within the LVIA in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. No significant effects of lighting, above those recorded for landscape and visual receptors, were recorded. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The mitigation measures to control construction lighting stated above are secured within the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls (also referenced above) form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme. An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The conclusions of the assessment in relation to each phase of the Scheme are set out below. The conclusions of the assessments are made for the Scheme as a whole (i.e. all of its components combined, including the BESS), and therefore any specific component will not have any greater effects than those that have been assessed. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. In addition, further meetings have been held over the approach to the management plans, and a Statement of Common Ground will be issued and updated throughout examination

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity, such as temporary screens and advanced warning of works, are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction, as committed to in the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration effects are appropriately controlled. Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The predicted noise levels from the Solar PV Sites have been artificially increased by 3 dB to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			account for the increased likelihood that the noise from the Scheme would be perceived as distinct from the existing background sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
SPM-005	Other Environmental Matters	Risk of fire from Battery Storage System.	The BESS containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081],** the battery containers will be located more than 200 metres from the nearest Public Right of Way and 500 m from the nearest dwelling from any residential receptors. The Applicant notes that the approach to BESS safety is under discussion with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the OBSMP. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 5.4 of the **OBSMP [APP-286]** specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation and decommissioning. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **OBSMP [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the **OBSMP [APP-286]** and secured through Requirement 6 of the **Draft DCO [APP-016].** As now mandated under NFPA 855 (2026) the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the **OBSMP [APP-286]** (Section 6.1.1) pre-construction requirements. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-016], which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
SPM-006	Landscape and Visual	Massively negative visual impact.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
SPM-007	Cultural Heritage	Destruction of Heritage and Historic landscape.	The Applicant notes the comment. **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]** has assessed the potential impact of the Scheme on identified archaeological and built heritage assets. There is the potential for construction groundworks to cause physical damage to archaeological and built heritage assets as well as indirect impacts to the setting of built heritage assets. Where required appropriate mitigation is proposed. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064],** with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230].**
SPM-008	Ecology and Biodiversity	Biodiversity loss.	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated.
SPM-009	Decommissioning and Construction	Immeasurable disruption from works associated with connection to the grid.	The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the likely significant construction effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277].** **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
SPM-010	Socio-Economics, Tourism and Recreation	Negative impact on local house prices.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].**

5.21 Yatton Keynell Parish Council

Table 5-21 RR-4941

Reference	Theme	Comments/Issues Raised	Applicant's Response
YKPC-001	Transport and Access	In appropriate access routes for construction traffic In appropriate access routes for construction workers Transport Plan unenforceable and not realistic	Measures committed to and secured through the **OCTMP [APP-287]** to manage construction workers trips include: • a construction worker travel plan: • Shuttle Bus - The location where staff will travel from is unknown at this stage as it will depend on the appointed contractor. However, it is envisaged that the majority of non-local workforce will stay at local accommodation and be transported to the Order Limits by shuttle bus to minimise the impact on the strategic and local highway network; • Car sharing – A car sharing scheme will be set up. This will match construction workers who live in a similar area, or who follow a similar route to the Order Limits and encourage them to car share to save costs and reduce their impact on the environment These measures are realistic and will be monitored through the Highway Authority. Construction route suitability is assessed by examining the potential effects of construction traffic on the local highway network. These effects are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the CTMP in place, there would be no

Reference	Theme	Comments/Issues Raised	Applicant's Response
			significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.
YKPC-002	Soils and Agriculture	Loss of agricultural land	The effects of the Scheme on agricultural land, including Best and Most Versatile (BMV) agricultural land, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, supported by **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. That assessment identifies that the Scheme will result in significant adverse effects on BMV agricultural land, but that this will be a temporary and reversible loss of BMV land during the operational period. All land would be reinstated and returned to agricultural use as far as practicable following decommissioning. National planning policy recognises the economic and other benefits of BMV agricultural land and encourages the use of lower quality land where possible; however, agricultural land quality is one of a number of sustainability considerations to be weighed in the planning balance. The consideration of alternative sites, including the availability and suitability of land of lower agricultural quality, is set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP 056]** and **ES Volume 3, Appendix 4 1: Site Selection Assessment Report [APP 185]**.
YKPC-003	Landscape and Visual	Loss of amenity due to industrialization of countryside	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant

Reference	Theme	Comments/Issues Raised	Applicant's Response
			confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of **ES Chapter 16 [APP-068]**. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of **ES Chapter 16 [APP-068].** The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
YKPC-004	Cumulative Effects	Cumulative impact of solar farms in North Wiltshire - South Gloustershire Damage caused to local economy as a result of reduced tourism	In terms of the Scheme, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In combination Effects [APP-073]** and associated **Appendices [APP-264]**. The assessment in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** have assessed the likely impacts of the Scheme at construction, operation, peak replacement, and decommissioning on tourism and recreation receptors, including all PROWs within 2 km of the Scheme. Whilst the Scheme is anticipated to lead to some employment and economic losses to the tourism industry, these are not identified as significant adverse effects to the assessed 20 km economic Study Area.

5.22 Shipton Moyne Parish Council

Table 5-22 RR-4352

Reference	Theme	Comments/Issues Raised	Applicant's Response
SHPC-001	Decommissioning and Construction	The inadequacy of narrow local roads for the anticipated volume of construction traffic and daily workers which will affect the village. Current estimates are for 104 HGV trips, 24 bus trips, and 334 car trips PER DAY during construction, with up to 622 workers on site. The construction phase is expected to last 2 years causing major problems on the roads.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** includes an analysis of accident collisions in the study area and on construction routes. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that the low level of construction traffic associated with the Scheme is unlikely to materially affect road safety on the links in the Study Area, and the effects on accidents and safety from the Scheme's construction phase on all links will be temporary and negligible (not significant). This is summarised in Table 13-31 of this chapter. Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** , demonstrates adequate carriageway width and/or adequate frequency of passing places providing opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in RR4934 Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres, for example, the HS2 Rural Road Design Criteria stated visible passing places must be provided on single-track roads at a maximum spacing of 200 metres. In regard to construction worker car trips, these are managed through measures committed to and secured through and the **OCTMP [APP-287]** listed below. Construction worker vehicle trips through the village are likely to be negligible because of these measures**:** • a construction worker travel plan;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• Shuttle Bus - The location where staff will travel from is unknown at this stage as it will depend on the appointed contractor. However, it is envisaged that the majority of non-local workforce will stay at local accommodation and be transported to the Order Limits by shuttle bus to minimise the impact on the strategic and local highway network; • Car sharing – A car sharing scheme will be set up. This will match construction workers who live in a similar area, or who follow a similar route to the Order Limits and encourage them to car share to save costs and reduce their impact on the environment An **oCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes. It also includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. With this mitigation in place, **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** concludes that impacts would be negligible to minor adverse. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**.
SHPC-002	Transport and Access	The main route for the traffic will be from Cirencester due to the low bridge at Corston. This will push more traffic onto our inadequate roads.	The main construction routes are assessed in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which demonstrates that the construction routes are suitable. Standard 16.5m articulated vehicles are on average 4m high

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and can pass under the low bridge at Corston as it has a height restriction of 4.2m. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.

5.23 Great Somerford Parish Council

Table 5-23 RR-1732

Reference	Theme	Comments/Issues Raised	Applicant's Response
GSPC-001	Description and DCO Process	Lime Down Solar Park response from Great Somerford Parish Council. Great Somerford Parish Council boundary adjoins Site E with water from the whole development (excluding the cable route to Melksham) discharging into the Bristol Avon from the Sherston Avon, Gausebrook and Rodbourne Brook, upstream of Great Somerford. Great Somerford Parish Council object to the application for the following reasons.	The Applicant notes Great Somerford Parish Council's objection and its concern regarding the Scheme's hydrological connectivity to the Sherston Avon, Gausebrook and Rodbourne Brook. Detailed responses to specific queries have been presented below.
GSPC-002	Hydrology, Flood Risk and Drainage	• Climate Change. Considering recent significant weather events and the increase in severe flooding within the Parish of Great Somerford there are concerns the increasing risk from this development has not been adequately addressed in the proposals submitted by the developer. The Environment Agency provided data to DEFRA to track high river levels during Storm Babet (Oct. 2023) and Storm Henk(Jan.24) for payments made by the Rural Payments Agency from the Farming Recovery Fund. Brook Farm, Great Somerford had a Land Parcel Hectarage of124.9 Has. eligible for payment. With the above concerns a Level 2 Strategic Flood Risk assessment should be provided to ensure the mitigation measures reduce the downstream flooding.	Flood risk has been assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with detailed parcel-level assessment provided in **ES Volume 3, Appendix 11-8: Flood Risk Assessment and Drainage Strategy – Lime Down E2 [APP-217]** and the supporting Flood Risk Assessment suite **[APP-210 to APP-218]**. For Lime Down E2, the Site lies predominantly within Flood Zone 1. Limited areas of Flood Zones 2 and 3 are present within discrete fields (E23, E24, E26 and E27) associated with the floodplain of Gabriel's Well. The substation area remains outside mapped flood extents. Flood depths affecting panel areas are generally shallow, predominantly below 0.5 m during the 1% and 0.1% AEP events, and inundation is confined to established low-lying floodplain corridors. Floodplain storage displacement has been quantified within **Appendix 11-8 [APP-217]**. The total potential displaced volume within Lime Down E2 is calculated as 2.09 m^3. When distributed across the downstream floodplain extent, the theoretical increase in flood depth is approximately 0.000012 mm. This is considered de minimis and does not require compensatory storage.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Climate change has been assessed using the Environment Agency's current allowances for peak river flows and rainfall intensity within the hydraulic modelling and drainage design, as reported in **ES Volume 1, Chapter 11 [APP-063]**. The assessment concludes that the Scheme would not increase flood risk elsewhere and would remain safe and operable for its lifetime. Detailed drainage design and construction controls are secured through the **Draft Development Consent Order [APP-016]**.
GSPC-003	Hydrology, Flood Risk and Drainage	Hydrology, flood risk and drainage. With no evidence of existing flow rates from watercourses within the overall site, no data on ground water levels and nor details of land drainage systems there is concern that proposed mitigation measures cannot be evaluated. There is no consideration of maintenance of existing watercourses nor indications of modelling of SuDS. The recent rapid rise in flood levels in the River Avon and the Brinkworth Brook indicate that sustainable drainage schemes on recent developments in Malmesbury and Royal Wooton Bassett are not mitigating the flooding downstream. When recent floods reach the soffit of the road bridge immediately upstream of the Great Somerford measuring weir,	The Applicant does not agree that the assessment lacks evidence or that mitigation cannot be evaluated. **ES Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** has been undertaken in accordance with national and local policy and guidance, using available baseline datasets and site information appropriate to the scale and nature of the Scheme, and informed through consultation with the relevant technical consultees. The Applicant acknowledges the flooding mechanisms described at Great Somerford, including bridge capacity effects, floodplain backing up and the influence of channel condition and sedimentation on local flood levels. These are baseline catchment constraints and are not caused by the Scheme. The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		flood water backs up quickly across the flood plain beyond the Rodbourne Brook increasing the flooding along the Rodbourne Brook. The river levels recorded in these flooding incidents may not be giving a true reading until there is free flow under the bridge. When there is maximum unrestricted flow at the bridge flood water is held up by narrow channels where sediment has reduced the channel width in areas where the river was realigned by the Environment Agency or its predecessor resulting in more flooding in the flood plain onto the access roads	The **Outline CEMP [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that prior to the operation of the Scheme, a CEMP must be submitted to and approved by the relevant planning authority, the CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
GSPC-004	Transport and Access	Transport and access. Access roads to the village have been flooded each winter for the last three years, including C 82 in Rodbourne to the north and south of main railway line by the Gausebrook and the Rodbourne Brook. During the last three winters access to Great Somerford has also been restricted on the C66, C77 and C45 by flooding particularly when intense periods of rain fall on saturated ground. The roads within the parish already suffer from diversion routes when M4 and Kingway bridge are closed. The village will suffer from use of Sat Navs	The Applicant can confirm that access to Lime Down E will be made via the A429, as presented in **ES Volume 2, Figure 13-1 [APP-146]**. Therefore, the routes mentioned do not form part of the construction routes and would not be impacted by the Scheme. In addition, the **oCTMP [APP-287]** includes measures to manage the routes used by construction traffic which are secured under Requirement 15 of Schedule 2 of the **Draft DCO [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		by workers and delivery lorries, who do not follow the traffic management plan.	
GSPC-005	Cumulative Effects	Cumulative and in-combination effects. The parish of Great Somerford has not objected to the solar panel installations in neighbouring parishes (Sutton Benger, Corston and Lyneham). This proposal for five additional sites with huge panels, battery storage and the necessary infrastructure concern many parishioners. Eight sites in this corner of North Wiltshire will dominate the open countryside for future generations.	Wiltshire is not unusual in terms of the number of solar developments that have either been built or are consented or proposed. In terms of the Scheme, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **Environmental Statement Chapter 21: Cumulative and In combination Effects [APP-073]** and associated **Appendices [APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments [**APP-059 - APP-072**] with a summary of each of these assessments provided within Environmental Statement Chapter 21 In-Combination and Cumulative Effects [**APP-073**]. Existing schemes are captured within the baseline environment. The four stage cumulative assessment methodology is described within **ES Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the Long List [**APP-264**]. 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce

Reference	Theme	Comments/Issues Raised	Applicant's Response
			effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.
GSPC-006	Soils and Agriculture	Loss of Best Most Versatile Agricultural land, return after 60 years not credible. People within the village have concerns that not only will large areas of good quality land be lost to food production for 60 years, but also returning the land to the present grade will be highly unlikely. The proposals to grow grass under the panels is unlikely to be successful as the rain and sun falling under panels of this size will be limited.	The effects of the Scheme on agricultural land, including Best and Most Versatile (BMV) land, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. The assessment identifies that land would be removed from arable rotation for the operational life of the Scheme, anticipated to be approximately 60 years. Although the primary agricultural use would cease during this period, the soil and land resource would be retained and would continue to fulfil ecological functions. Reduced disturbance during operation allows soils to recover from previous intensive agricultural use, with benefits to soil structure and soil biology over time. A detailed Soil Resource Management Plan (SRMP) will be prepared post consent and will be required to be in substantial accordance with the **Outline Soil Resource Management Plan [APP-280]** and is secured through Requirement 17 in Schedule 2 of the **draft DCO [APP-016].** The detailed SRMP will establish soil conditions at the time of decommissioning and set out how any requirement for remedial works will be identified. As best practice measures may evolve over the lifetime of the Scheme, the SRMP does not prescribe detailed remediation measures at this stage. Further detail on decommissioning activities will be

Reference	Theme	Comments/Issues Raised	Applicant's Response
			provided within the detailed Decommissioning Environmental Management Plan (DEMP). The Scheme design is described in **ES Volume 1, Chapter 3: The Scheme [APP 055],** which confirms that the solar PV panels are designed to allow sunlight to reach the ground beneath. Grass establishment beneath panels has been demonstrated on solar farms on agricultural land, and where grazing occurs it relies on adequate grass growth. Specific shade tolerant and low growing grass seed mixes are commercially available and have been used at solar sites. Grazing beneath panels is not relied upon as mitigation within the assessment.
GSPC-007	Description and DCO Process	Great Somerford Parish Council has more detailed evidence on the above objections and will make them available when requested. The submission of these objections was delegated to Cllr, Sturgis at the meeting on 7th January. 2026	The Applicant notes Great Somerford Parish Council's intention to provide further detailed evidence relating to its objections. The Applicant will review any additional evidence the Parish Council provides during the Examination.

5.24 Lea, Garsdon and Cleverton Parish Council

Table 5-24 RR-2750

Reference	Theme	Comments/Issues Raised	Applicant's Response
LGCPC-001	Description and DCO Process	Lea, Garsdon & Cleverton Parish Council fully recognises that the development of renewable energy resources is essential to mitigating the impacts of climate change, and that solar energy will play an important role in meeting national and global decarbonisation targets. The Parish Council is not opposed in principle to the generation of electricity by this method. However, the Council does not agree with the construction of a project of this scale on high-quality agricultural land in the heart of open countryside.	The effects of the Scheme on agricultural land, including Best and Most Versatile (BMV) agricultural land, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. That assessment identifies that approximately one third of the agricultural land within the Order Limits is BMV land, the majority of which is Subgrade 3a, the lowest of the BMV grades. The assessment concludes that the Scheme will not result in significant adverse effects on BMV agricultural land, arising from the temporary and reversible loss of land during the operational period, with land reinstated and returned to agricultural use as far as practicable following decommissioning. The consideration of alternative sites and design evolution, including the availability and suitability of land of differing agricultural quality, is set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP 056]** and **ES Volume 3, Appendix 4 1: Site Selection Assessment Report [APP 185]**.
LGCPC-002	Soils and Agriculture	The loss of productive agricultural land raises serious concerns in relation to food security, agricultural resilience, and long-term land use sustainability. At a time of increasing pressure on domestic food production—driven by climate change, geopolitical instability, supply chain vulnerability, and rising global demand—the permanent or long-term removal of high-quality farmland from agricultural use is a matter of significant public interest.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP 069]**, supported by **ES Volume 3, Appendix 17 1: Agricultural Land Classification and Soil Resource Survey Report [APP 243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered high quality agricultural land in planning terms. The ES considers food production and agricultural sustainability within the wider policy context. Government led agricultural initiatives in recent years have prioritised soil health, environmental enhancement and climate resilience, recognising that long term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate Whilst there is an environmental and economic cost to importing food, and it is recognised the UK imports a far greater amount of food than it exports, the impact of the Scheme on food import requirements or the food and drinks economy is not material at a national scale and has therefore not been assessed.
LGCPC-003	Soils and Agriculture	The parish council considers that the protection of such land is essential to maintaining the UK's ability to produce food domestically and to reduce reliance on imports.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered high-quality agricultural land in planning terms. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural

Reference	Theme	Comments/Issues Raised	Applicant's Response
			land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. The consideration of alternatives, including the availability and suitability of land of lower agricultural quality, is set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP 056]** and **ES Volume 3, Appendix 4 1: Site Selection Assessment Report [APP 185]**. This assessment explains how alternative sites, including areas of brownfield land and lower grade agricultural land, were considered in accordance with planning policy.
LGCPC-004	Site Selection and Alternatives	Greater priority should be given to brownfield sites, industrial land, existing buildings, large warehouse and logistics roofs, and transport or infrastructure corridors, all of which would allow renewable energy generation while safeguarding productive farmland and supporting food security objectives.	**ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** explains how brownfield land, industrial land, previously developed land, and low-grade agricultural land were considered, in accordance with policy. Paragraph 2.10.31 of NPS EN-3 recognises that "*at this scale, it is likely that applicant's developments will use some agricultural land. Applicants should explain their choice of site, noting the preference for development to be on suitable brownfield, industrial and low and medium grade agricultural land*". As set out in **ES Volume 3, Appendix 4-1: Site Selection**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Assessment Report [APP-185] the Applicant reviewed brownfield land register for local authorities within the area of search including Wiltshire Council, South Gloucestershire Council, Bath and Northeast Somerset Council, and Somerset Council. The assessment concluded that there were no brownfield sites within the search area of sufficient size to accommodate a large-scale solar development, either individually or cumulatively. The sites assessed were too small to support the proposed Scheme and were largely allocated for housing or mixed-use development, in line with local planning policies, thereby creating a conflict with the intended use for renewable energy infrastructure. Therefore, it was concluded that there was no available or suitable brownfield land for the purposes of the Scheme.
LGCPC-005	Soils and Agriculture	The Parish Council also questions the apparent principle underpinning this proposal: that national and global benefits should be delivered at the expense of significant local harm, with little or no local benefit in return. Whilst we recognise that concentrating infrastructure across large contiguous areas of farmland may simplify delivery and maximise commercial returns, this cannot justify imposing substantial adverse impacts on rural communities. Development should not proceed on the basis of convenience and profit where the costs are borne disproportionately by local residents and landscapes.	The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267].** Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068], and Chapter 18: Human Health [APP-070]**, all of which consider potential impacts on residential properties and local communities. The **Statement of Need [APP-266]** describes that there is an urgent and unprecedented need for new low carbon generation in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the UK to meet our climate change, energy security and affordability targets. Further, the Government considers that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Further, Section 2.9 of the **Statement of Need [APP-266]** describes that the government is seeking a large capacity of new low carbon schemes to come forwards to prioritise projects needed for 2030, while maintaining a robust pipeline of projects beyond 2030 towards meeting net zero by 2050. National Policy Statement EN-1 also states that the Secretary of State should assess all applications for development consent for the types of infrastructure included by the NPS (including solar) on the basis that there is demonstrated urgent need for them, that substantial weight should be given to this need, and that the Secretary of State is not required to consider the specific contribution of any individual project to be satisfied that need is established [EN-1 Paras 3.2.6 - 3.2.8]. The Applicant has assessed matters relating to people's lives and livelihoods in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, and to their health and wellbeing in **ES Volume 1, Chapter 18: Human Health [APP-070]**. These assessments find no significant adverse effects to the local population with respect to social or health effects, subject to the implementation of mitigation measures secured through the Requirements in Schedule 2 to the **Draft DCO [APP-016]**. With respect to human health, the assessment outcome that there is no significant adverse effect to health generated by the Scheme has been agreed by the UK Health Security Agency in their relevant representation **[RR-4798]**. The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The benefits of the Scheme are set out in Section 5.3 of the **Planning Statement [APP-267]** and include the delivery of large amounts of cheap, secure, and low carbon electricity which will help the UK to achieve net zero by 2050, ecological and landscape enhancements, biodiversity net gain, permissive paths, employment generation, economic benefits and skills training. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.
LGCPC-006	Site Selection and Alternatives	The Council also has serious concerns regarding the efficiency and sustainability of the proposed location. Large-scale solar developments situated far from existing grid infrastructure necessitate extensive enabling works, including significant alterations to the local road network to accommodate abnormal loads, heavy goods vehicles, and sustained construction traffic. These works would result in substantial disruption to rural roads that are not designed for industrial-scale use, leading to landscape harm, loss of rural character, traffic safety risks, and prolonged disturbance to local communities. Such impacts further undermine the sustainability of the proposal while offering limited local benefit.	Details on the Applicant's site selection process and alternatives considered are set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. In terms of traffic safety, the assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** includes an analysis of accident collisions in the study area and on construction routes. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that the low level of construction traffic associated with the Scheme is unlikely to materially affect road safety on the links in the Study Area, and the effects on accidents and safety from the Scheme's construction phase on all links will be temporary and negligible (not significant). This is summarised in Table 13-31 of this chapter. In regard to traffic impacts and construction worker car trips, these are managed through measures committed to and secured through and the **OCTMP [APP-287]** listed below. Construction worker vehicle trips through the village are likely to be negligible because of these measures**:** • a construction worker travel plan; • Shuttle Bus - The location where staff will travel from is unknown at this stage as it will depend on the appointed contractor. However, it is envisaged that the majority of non-local workforce will stay at local accommodation and be transported to the Order Limits by shuttle bus to minimise the impact on the strategic and local highway network; and • Car sharing – A car sharing scheme will be set up. This will match construction workers who live in a similar area, or who follow a similar route to the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Order Limits and encourage them to car share to save costs and reduce their impact on the environment. An **oCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes. It also includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. With this mitigation in place, **ES Volume 1, Chapter 13-1: Transport and Access [APP-065]** concludes that impacts would be negligible to minor adverse. A final CTMP would be prepared post consent and must be substantially in accordance with the **oCTMP [APP-287]** and approved by the relevant local planning authorities (in consultation with the relevant highway authorities), as secured by Requirement 15 in Schedule 2 of the **Draft DCO [APP-016]**. <u>Landscape and Visual</u> An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
LGCPC-007	Landscape and Visual	In summary, while Lea, Garsdon & Cleverton Parish Council supports the principle of renewable electricity generation, it objects strongly to the Lime Down Solar Park proposal due to: · the excessive scale and intensity of development in open countryside;	The Applicant notes this comment. The Project has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			maximise opportunities for environmental enhancement and community benefits. An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
LGCPC-008	Soils and Agriculture	· the loss of high-quality agricultural land and the associated risks to food security and agricultural resilience;	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered high-quality agricultural land in planning terms. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly

Reference	Theme	Comments/Issues Raised	Applicant's Response
			helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Whilst there is an environmental and economic cost to importing food, and it is recognised the UK imports a far greater amount of food than it exports, the impact of the Scheme on food import requirements or the food and drinks economy is not material at a national scale and has therefore not been assessed.
LGCPC-009	Community Benefits	· the imbalance between the substantial impacts on local communities and the limited local benefits delivered.	The Applicant acknowledges that many of the benefits of the Scheme are felt over a wider area than the adverse effects from the Scheme. As highlighted, this includes energy generation, and so is a nationwide benefit. Employment and economic benefits from direct employment, maintenance and supply chains will likely be county-level or regional, albeit measures secured through the **OSSCEP [APP-285]** seek to improve local economic prosperity from the Scheme. Locally specific benefits largely are based around landscape and ecological enhancements, and the provision of permissive paths to improve PROW access and connectivity. The general community is also able to benefit from the Community Benefit Fund, which can be used towards local infrastructure and benefits as decided by local stakeholders. The Community Benefit Fund is however agreed under a separate process to the DCO and so does not form part of the assessment of whether the DCO should be consented or not.

6 The Applicant's responses to parties listed within the Book of Reference

6.1 Steven Purvis

Table 6-1 RR-4489

Reference	Theme	Comments/Issues Raised	Applicant's Response
SP-001	Landscape and Visual Construction and Decommissioning Ecology and Biodiversity Socio-Economics, Tourism and Recreation Soils and Agriculture Site Selection Transport and Access Community Benefit	While I support renewable energy in principle, putting a massive industrial-scale solar farm at Lime Down, in the heart of the Cotswolds, feels fundamentally wrong. The area is designated as an Area of Outstanding Natural Beauty precisely because its landscape, tranquillity and historic character are considered nationally important, and once that character is industrialised it can't realistically be restored. A development of this scale would inevitably alter long-established views, harm biodiversity through land clearance and fencing, and undermine the visitor economy that many local businesses depend on. It's also hard to justify choosing protected countryside when there are so many alternatives - brownfield land, rooftops, former quarries, or lower-grade farmland outside the AONB - that wouldn't carry the same permanent cost. Construction traffic, grid infrastructure and access works would further strain narrow rural roads, while the benefits of the electricity generated are unlikely to flow directly to local communities.	<u>Landscape and Visual</u> An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential receptors as a consequence of the Scheme. The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has

Reference	Theme	Comments/Issues Raised	Applicant's Response
			matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements

Reference	Theme	Comments/Issues Raised	Applicant's Response
			ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. <u>Decommissioning</u> Regarding the restoration of land, the effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, all land will be returned to its original use and condition as far as practicable and returned to the landowner. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the effects would be less than those likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. The Applicant confirms that none of the land will be considered brownfield after decommissioning. The expectation is that the land will return to farming, but the Applicant cannot dictate what will happen to the land post-decommissioning when the Applicant no longer has an interest in the land. <u>Ecology and Biodiversity</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061],** this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Tourism</u> An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the team is . This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. Soils and Agriculture An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Volume 1 Chapter 17: Soils and Agriculture [APP-069]**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where

Reference	Theme	Comments/Issues Raised	Applicant's Response
			practicable, to locate infrastructure on lower quality land, as detailed in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/ brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. <u>Transport and Access</u> The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme. Cable Route

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the likely significant construction effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are secured in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. <u>Community Benefit</u> The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme will make a contribution to meeting the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The benefits of the Scheme are set out in Section 5.3 of the **Planning**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Statement [APP-267] and include the delivery of large amounts of cheap, secure, and low carbon electricity which will help the UK to achieve net zero by 2050, ecological and landscape enhancements, biodiversity net gain, permissive paths, employment generation, economic benefits and skills training. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The Community Benefit Fund does not form part of the DCO application and this funding is not required to mitigate the impacts of the Scheme. Therefore it cannot be taken into account in the decision making process for determining the DCO application, however it will be available to fund local projects.
SP-002	Description and DCO Process	Approving a project like this would also set a worrying precedent, making it harder to defend the Cotswolds against similar proposals in the future.	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated appendices**, ES Volume 3, Appendix 21-1 Long List of In-Combination Effects and Cumulative Developments [APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 In-Combination and Cumulative Effects [APP-073].** Existing schemes are captured within the baseline environment. The four stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6: EIA Methodology [APP-058].** 358 developments were included in the **Long List [APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.
SP-003	General	In short, tackling climate change is essential, but doing it by sacrificing one of the country's most protected and valued landscapes is neither necessary nor proportionate.	The Applicant notes that these matters have been responded to in detail in the responses to this Interested Party above.

6.2 Robin Gerald Hill

Table 6-2 RR-4032

Reference	Theme	Comments/Issues Raised	Applicant's Response
RGH-001	Climate Change and Energy Need Site Selection Soils and Agriculture Transport and Access	I'm heavily in favour of green initiatives, but in the right places where they have maximum efficiency and the lowest impact on lives and the Countryside. All new builds, Commercial buildings, Government buildings Public buildings and brown field sites should have solar panels or be able to demonstrate they are doing everything they can for environmental benefits. Perhaps down the sides of train tracks. The traffic and construction implications will be massive and after 40-years or so, the land will be open to development of all kinds of things - there will be no protection for our glorious countryside. Increased flood risks.	Solar energy is at the heart of the Clean Power 2030 Mission (January 2026 revised NPS EN-3, Para 2.10.2) and it is the Government's view that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Sunlight, the input energy source for solar, is abundant, predictable, renewable, low carbon and free. Figure 16 of the **Statement of Need [APP-266]** and related text (Section 7.4) demonstrates that there are many viable areas of solar irradiation in the UK. Figures 28 and 29 of the **Statement of Need [APP-266**and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level. The inclusion of a Battery Energy Storage System as part of the Scheme will enable energy generated by the Scheme to be stored and exported to the grid when it is needed, which will provide flexibility and improve grid reliability. The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies. <u>Agricultural Land</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant confirms that none of the land will be considered brownfield after decommissioning. The expectation is that the land will return to farming, but the Applicant cannot dictate what

Reference	Theme	Comments/Issues Raised	Applicant's Response
			will happen to the land post-decommissioning when the Applicant no longer has an interest in the land. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12). <u>Site Selection</u> In terms of site selection, the Applicant followed a staged approach to assessment, taking into consideration a range of planning, environmental and operational factors. **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** explains the methodology that has been applied when identifying and evaluating potential sites for the Scheme. It identifies a number of potential development

Reference	Theme	Comments/Issues Raised	Applicant's Response
			areas for the Scheme and presents how each of those areas perform against a range of planning, environmental and operational constraints and opportunities. This report concludes that there are no more suitable and available locations within the search area than the proposed location for the Scheme, based on the criteria identified. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185], ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/ brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. <u>Transport and Access</u> The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and Access [APP-065], which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. The potential effects of operational traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. This chapter is supported by **ES Volume 2 Figures, including Figure 13-13: Operational Only Access Locations: Solar PV Sites [APP-158]**, and **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. The assessment considers day-to-day movements associated with maintenance and security of the Scheme, and for the replacement of Solar PV Panels, Conversion Units and BESS Batteries. Assumptions have been made based on similar projects, and the number of vehicle trips for replacement activities will be less than those during the construction phase. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that operation and maintenance vehicle types and movements are quantified in this chapter and will not give rise to any residual significant effects, in line with relevant thresholds set out in the ISEP Guidelines 2023. Embedded mitigation measures include providing suitable access points for operation and maintenance phase vehicles with turning areas. Where replacement activities are required, measures set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]** will be implemented as appropriate. In addition, the **Outline Public Rights of Way (PRoW) and Permissive Path Management Plan [APP-288]** includes measures, such as signage, path repairs and temporary diversions, to manage vehicle interactions with PRoW users and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			minimise effects on existing users. The preparation, approval, and implementation of the CTMP and the PRoW and Permissive Path Management Plan are secured through Schedule 2, Requirements 15 and 16 respectively, of the **Draft Development Consent Order [APP-016]**. <u>Flood Risk</u> An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].** The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statements of Common Grounds to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.843.10.75).

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Requirement 13 in Schedule 2 of the **Draft DCO [APP-016]** secures that no part of the authorized development can commence until a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the CEMP.

6.3 Victoria Knox

Table 6-3 RR-4846

Reference	Theme	Comments/Issues Raised	Applicant's Response
VK-001	General Landscape and Visual	I object to the Lime Down Solar project due to the huge impact it will have on a ANOB.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The Cotswolds National Landscape (CNL) (formally Area of Cotswolds Outstanding Natural Beauty) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be

Reference	Theme	Comments/Issues Raised	Applicant's Response
			beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
VK-002	Construction and Decommissioning Air Quality Noise and Vibration Human Health	The construction process will increase the traffic in the area, impacting narrow country roads not designed to take large traffic volumes or heavy loads. The increase in traffic will also have a detrimental impact on air quality in the area, which will directly impact the health of residents on the main roads, including our (Redacted). The increased traffic will also increase noise in a very peaceful area of the Cotswolds, impacting the mental health and wellbeing of residents, who have specifically chosen to live in a secluded, peaceful area of the UK.	<u>Traffic</u> The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. <u>Air Quality</u> An assessment of the effects of construction activities on air quality is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. The assessment considers potential emissions from construction dust, construction vehicle exhausts and Non-Road Mobile Machinery (NRMM), and has been undertaken in accordance with relevant best practice guidance. Further detail on the construction dust assessment is provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and Assessment [APP-238]**. The assessment concludes that, with embedded mitigation measures in place, construction-phase air quality effects would

Reference	Theme	Comments/Issues Raised	Applicant's Response
			not be significant. Mitigation measures to control dust and emissions during construction are secured in the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Construction Traffic Management Plan [APP-287]**. These include measures such as dust suppression, site management controls, routing and scheduling of construction traffic, and management of plant and machinery. The preparation, approval and implementation of detailed construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts during construction are appropriately controlled. <u>Noise and Vibration</u> The Applicant has assessed the impacts of construction noise and operational noise from the Scheme in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, which demonstrates that estimated construction noise levels at residential property are no greater than the SOAEL, indicating that while an adverse effect is likely to be experienced, it is not anticipated to be significant. This assessment outcome has been directly translated to assumptions on the likely effects to human health as a result of noise and vibration in **ES Volume 1, Chapter 18: Human Health [APP-070].** While it is considered likely that the construction of the Scheme will have up to a moderate-minor adverse effect on residential properties closest to construction routes and construction works areas, this is expected to be a medium-term temporary effect, and therefore is not a significant, nor long-term effect.

Reference	Theme	Comments/Issues Raised	Applicant's Response
VK-003	Landscape and Visual	Due to this, and the visual impact the project will have on the area, I strongly object to the proposal.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public

Reference	Theme	Comments/Issues Raised	Applicant's Response
			rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060].** Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

6.4 Joel Knox

Table 6-4 RR-2329

Reference	Theme	Comments/Issues Raised	Applicant's Response
JK-001	Landscape and Visual Soils and Agriculture	I object to the proposed solar farm primarily due to its inappropriate location within the Cotswolds Area of Outstanding Natural Beauty (AONB). This large-scale industrial development would cause significant harm to a nationally protected landscape, contrary to the purpose of AONB designation and national planning policy. The site also comprises high-quality arable land, the loss of which is unjustified given its agricultural value.	The Cotswolds National Landscape (CNL) (Area of Outstanding Natural Beauty) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (oEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the lifetime of the Scheme. An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will

Reference	Theme	Comments/Issues Raised	Applicant's Response
			be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1, Chapter 17: Soils and Agriculture,** Sections 17.10 and 17.12).
JK-002	Transport and Access	The development would have serious transport and construction impacts on the nearby village of Grittleton, through which construction traffic and heavy goods vehicles would be routed. The village's narrow, historic roads are unsuitable for such traffic, and any required road alterations would further damage the character of this heritage	The roads in the vicinity of Grittleton along the construction route will serve the construction of Lime Down A-C . These roads are suitable for use as a construction route given the level of construction traffic and road widths. The likely level of construction traffic and road width overview along this route is summarised below - • the average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per

Reference	Theme	Comments/Issues Raised	Applicant's Response
		settlement. Increased construction traffic would significantly harm residential amenity, road safety and the quiet rural environment that residents value, particularly for young families and children. For these reasons, the proposal would result in unacceptable landscape, agricultural, transport and community impacts and should be refused.	day/7 per hour/one every 8 minutes (less than the journey time along the route); • low level of existing HGVs on the route to Lime Down A-C means two HGV's less likely, (the average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**. • Road widths outside of the order limits are wide enough for at least a car and HGV to pass; and • Any widening works required in the highway within the order limits are minor and would benefit existing users of these routes The **ES Volume 1, Chapter 13: Transport and Access [APP-065]** provides an assessment of the construction impact on highway network and its users and concludes that there is a non-significant impact on: • Road vehicle driver and passenger delay • Non-motorised user delay • Non-motorised amenity • Fear and intimidation on and by road users • Road user and pedestrian safety • Hazardous/large loads As set out in the **Outline CTMP [APP-287]** a booking system will be set up to manage arrivals and departures to the Site. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes (including this route) and will be confirmed as part of the final CTMP.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The **Outline CTMP [APP-287]** includes measures to manage deliveries and restricted hours of deliveries outside of peak hours in order to minimise any detrimental impacts on the local highway network. Construction traffic would be temporary with the whole construction period being 2 years but individual phases shorter than this depending on the final construction programme. The construction traffic is managed through a Final CTMP which is secured via a requirement of the DCO. Road condition surveys will ensure any damage to the highway network caused by construction traffic is rectified and secured in the **Outline CTMP [APP-287]** . The Applicant confirms that detailed responses in respect of landscape, agricultural and community impacts are set out above.

6.5 James Howarth

Table 6-5 RR-2050

Reference	Theme	Comments/Issues Raised	Applicant's Response
JH-001	General	The countryside around Grittleton is defined by open agricultural fields, hedgerows, long views and a strong sense of tranquillity. I am a resident of Grittleton, a small rural village located within the area affected by the Lime Down Solar Park both during construction and the long term.	The Applicant notes this comment and has responded to these points in detail in the Applicant's responses provided below.
JH-002	Transport and Access Socio-Economics, Tourism and Recreation	I have a young family and we use the local countryside and road network on a daily basis as residents taking family walks or cycles together. The lanes around Grittleton, including Alderton Road, are narrow, rural roads with limited visibility and no pavements in places. In addition to my family they are heavily used by walkers, horse riders and cyclists, including cyclists using a National Cycle Network route that runs through this area.	Please see the response above. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assess the impact on Non-motorised user delay and amenity, including Fear and Intimidation and concluded a minor adverse temporary impact and therefore non significant. <u>NMU Delay</u> NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that PRoW which cross the Order Limits will generally remain open during the construction phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan (oPROWPPMP) [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **oPROWPPMP [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement, and decommissioning.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			NMU Amenity Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic. The construction routes on the road network have little existing pedestrian infrastructure and no footways, making them already unattractive as walking routes with no pedestrian amenity so this cannot be assessed. Fear and Intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** and provide sufficient width for HGV traffic to comfortably pass cyclists. Mitigation An **OCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen, fencing, and dust and noise control. The Applicant confirms that consideration of impacts to PROWs, unsurfaced roads, and the recreational use of the highway network has been assessed in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E or regionally important long-distance recreational routes cannot be mitigated further during construction, and as such will have to be considered as part of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the planning balance in determining whether or not consent should be granted. The assessment has considered the impacts to individual routes to build a picture of the likely impact on the overall PROW and highway network, determining that the overall effects within the 2 km Study Area is not a significant adverse effect at any stage of the Scheme. This is largely owing to the large number of PROWs and rural routes, given a great level of optionality to users, even in the presence of the Scheme. The Applicant has assessed the likely effects on The Wiltshire Way in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers transport matters (safety and delay) but also user experience, amenity and desirability. As a result of the Scheme, and the implementation of mitigation measures to protect cyclist on this route, the Scheme is anticipated to generate a significant adverse effect to users of the Wiltshire Way during construction and decommissioning. The Scheme is however not anticipated to generate any long-term significant adverse effect on users of The Wiltshire Way during the Scheme's operational phase. The mitigation measures include providing banksmen and speed limits where accesses interact with PROWs and The Wiltshire Way, and through specifying HGV access routes to the Scheme. These are secured through the **Outline CTMP [APP-287]** and **Outline PROWPPMP [APP-282]** by Requirements 15 and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**.
JH-003	Description and DCO Process Landscape and Visual	I am not opposed to renewable energy in principle. However, I object to this proposal because its scale, delivery method and location would fundamentally alter the character of the countryside around Grittleton forever and impose significant harm on residents, with no meaningful local benefit.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around

Reference	Theme	Comments/Issues Raised	Applicant's Response
			479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more

Reference	Theme	Comments/Issues Raised	Applicant's Response
			specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent. The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.
JH-004	General	The countryside around Grittleton is defined by open agricultural fields, hedgerows, long views and a strong sense of tranquillity. I am a resident of Grittleton, a small rural village located within the area affected by the Lime Down Solar Park both during construction and the long term.	The Applicant notes this comment and has responded to these points in detail in the Applicant's responses provided below.

6.6 Anna Pitt

Table 6-6 RR-0345

Reference	Theme	Comments/Issues Raised	Applicant's Response
AP-001	Socio-Economics, Tourism and Recreation Landscape and Visual Human Health	Dear Sirs Thank you for the opportunity to register my feedback on the proposed Lime Down Scheme. Let me start this feedback by saying that personally, having installed a solar scheme of 64 panels in the field attached to our home, we are clearly not opposed to using solar panels to generate clean energy. In fact, patently, quite the opposite. As a resident of Norton, I have five major concerns regarding this scheme. The first is that our tiny Norton village is going to be surrounded and drowning in fields of solar panels. Where are the open spaces for people to enjoy going for a walk or cycle ride? This development is overwhelmingly concentrated in the immediate village area, it will completely ruin the quality of the lives of the people living in the village and doesn't take into account their mental health as a consequence of living in an enclosed area of steel panels.	The Applicant has sought to minimise impacts upon neighbouring properties and amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**. Specifically at Norton, this has included ensuring the Scheme design at Lime Down B is buffered considerably from residential buildings in Norton (around The Vine Tree and church) to minimise visual impacts, while traffic impacts are mitigated through the use of a haul route parallel to the Fosse Way to access Lime Down B for construction, rather than using the local highway network through Norton, and the use of traffic mitigation measures to reduce impacts on the Norton-Hullavington road. These measures seek to mitigate against significant effects to residents and to visitors. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction

Reference	Theme	Comments/Issues Raised	Applicant's Response
			traffic impacts are appropriately managed throughout the construction phase of the Scheme. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant understands the importance of PROWs for recreation and their benefit to physical and mental wellbeing. Whilst the user experience will be different to current conditions, the planting of landscape and ecological mitigation, and the provision of permissive paths to improve connectivity is anticipated to go a substantial way to improve user experience and maintain the number of users of the affected PROWs. These measures are shown on **ES Volume 2, Figures 3-4-1 to 3-4-5.2 [APP-084]** and secured through the **OLEMP [APP-283]**. Protection and maintenance of public rights of way on the Scheme is controlled through the **OPROWPPMP [APP-282]**. These documents, and the mitigation measures they contain, are secured by Requirements 7 and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**. Furthermore, the likely effects from the Scheme on communities

Reference	Theme	Comments/Issues Raised	Applicant's Response
			with respect to access to the countryside and open space for recreation, and to social changes and community wellbeing have been assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]** under the headings 'open space, leisure and play' and 'community identity, culture, resilience and influence'. This assessment has considered access to the countryside, physical health from environmental changes, and community wellbeing and mental health through assessment of changes to community sense of place and community pride and character. The assessment finds no significant adverse effects to health and wellbeing at any phase of the Scheme.
AP-002	Hydrology, Flood Risk and Drainage	The second concern is flooding. The proposed Lime Down plan has a mass of fields of solar panels starting just two small fields behind our home. Our home is on a significant slope right above the Splash ford. When it rains, all the water in the area behind our home drains into the ford, including from the fields. Currently, the water from the fields behind our property is able to drain successfully through piping laid under our field and home and to date, our home has never flooded. However, the heavy rains in in the past couple of years have had the ground water so high that the garden behind our home was pooled with water. Lime Down solar panels in the fields behind our home are expected to massively exacerbate this problem with sheets of water running off the panels not having time to soak into the land underneath them and drain into the land. I anticipate flooding of our home. I have	The Applicant acknowledges the concern regarding existing surface water and groundwater conditions in the vicinity of the Splash ford, including pooling in gardens during recent wet periods. The assessment in **Environmental Statement Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** considers baseline drainage pathways and the mechanisms by which the Scheme could influence runoff generation and flow routing, including during extreme rainfall events, and concludes that the Scheme would not increase flood risk elsewhere, including residential properties The Applicant does not agree that solar PV panels would give rise to *sheets of water*" that cannot soak into the ground or that the Scheme would materially increase runoff to the ford or increase flood risk at nearby properties. The solar PV arrays are elevated and distributed, with drip gaps and rainfall draining to ground beneath and between panels rather than being conveyed as concentrated surface flow. This accords with NPS EN-3 paragraph 3.10.75, which recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained. Embedded mitigation includes establishment and management of permanent grass cover, which supports infiltration and reduces erosion relative to the existing arable baseline. Scheme-specific drainage

Reference	Theme	Comments/Issues Raised	Applicant's Response
		contacted Lime Down during the consulting period regarding the same but have had no reply and flooding has not been properly addressed in their proposal.	controls are secured through Requirement 11 of the **Draft Development Consent Order [APP-016].** Construction-phase controls to manage temporary drainage, protect existing field drainage, and prevent mobilisation of sediment are set out in the **Outline Construction Environmental Management Plan [APP-277]** and secured through the **Draft Development Consent Order [APP-016]**, with detailed construction arrangements approved through the discharge process. On this basis, the assessment concludes there would be no significant adverse effects on hydrology, flood risk and drainage receptors. The Applicant confirms that feedback was received from this party by email on 04/03/2025 during the statutory consultation period. This representation was considered and responded to in **Consultation Report Appendices – Appendix F-7 Statutory Consultation under Section 47 [APP-040]**, under the unique reference **LD2_CLE_068.** An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].**
AP-003	Hydrology, Flood Risk and Drainage Soils and Agriculture	My third concern is the tenant farmers who form a longstanding (some of several generations) part of our community. Not only will they lose their livelihoods but this country as a whole will lose the food production from these farms. Our community will also lose all the additional contributions the farmers make to the area. These include but not	The Applicant confirms that land agreements are being made with landowners who have their own contractual arrangements with tenant farmers. This may therefore involve the termination of agricultural tenancies at the discretion of the landowner. The Applicant is, however, cognisant of the impact this may have and so seeks to source ways of retaining agricultural workers, providing reskilling opportunities, or providing re-employment as supported by the measures secured in the **Outline Skills,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		exclusively, the digging out and clearing of ditches on the sides of the roads to help with flooding in the area, clearing trees blown down by storms etc etc. Overall, a significant loss to our communities.	**Supply Chain and Employment Plan [APP-285]**. The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF).

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. The Applicant notes that local farmers currently undertake routine maintenance of field drains and drainage ditches as part of normal agricultural land management. The hydrology and flood risk assessment presented in **Environmental Statement Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** concludes that the Scheme would not increase runoff rates or volumes leaving the Site. As such, the Scheme would not be expected to increase the need for roadside ditch maintenance beyond existing baseline conditions, and drainage features within the Order Limits would continue to be managed as part of routine operational land management.
AP-004	Socio-Economics, Tourism and Recreation	My fourth concern is that a number of country hospitality businesses around this area survive on the busy time during the tourist season. Why would tourists elect to spend time visiting an industrial complex. These businesses are likely to fail. Similarly, the stud	The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		farms in the area will not survive given the issues around horses and solar.	The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. Equestrian facilities, including private stables, paddocks, stud farms, riding schools, have been considered as specific recreational receptors within **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on these receptors are individually assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**, which consider impacts from construction activities, traffic, impacts on nearby PROWs and changes in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			views and landscape character. With the exception of Park Farm, Yatton Keynell (the equestrian facilities of which are likely to be directly affected by cable route construction) assessment identifies that, with embedded mitigation in place, including construction traffic management, embedded design measures to offset infrastructure from highways and public rights of way, and site-specific safety measures for cabling works, no significant residual effects on the operation or use of equestrian facilities are expected, subject to implementation of the committed mitigation measures. The effect on Park Farm, Yatton Keynell has been fully reported in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and its supporting appendix **[APP-241]** will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits.
AP-005	Transport and Access	Finally, anyone who has driven around this area will have noticed that the roads are mostly narrow lanes and the edges are in a critically bad condition. The traffic into and through the villages is already challenging at times of the day but this development would create a traffic nightmare for locals (and the developers). A stream of heavy vehicles will also likely destroy what is, to a greater extent, a crumbling road infrastructure in the area.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The **CTMP [APP-287]** is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.

6.7 Mr David Akerman

Table 6-7 RR-3267

Reference	Theme	Comments/Issues Raised	Applicant's Response
MDA-001	Site selection and Alternatives Transport and Access	I object to the lime down proposal for these reasons The project is too large for a site so far from the electricity distribution unit The construction of the new site will greatly impact the local area as the country lanes are not suitable for the huge transporters of the massive equipment. The value of houses in the locality will be significantly reduced as they will be unsaleable. The position of this project envelopes the historic Fosse Way.	The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts. The effects of construction traffic on the local highway network

Reference	Theme	Comments/Issues Raised	Applicant's Response
			are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The **CTMP [APP-287]** has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline **CTMP [APP-297]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme. Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].** The potential effects of the Scheme on the cultural heritage of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Fosse Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The assessment identifies known Roman heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identifies that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation for each part of the Proposed Development, substantially in accordance with the **Appendix 12-6 Outline Archaeological Mitigation Strategy [APP-230]**, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered during the relevant part of the Proposed Development.

Table 6-8 RR-3812

Reference	Theme	Comments/Issues Raised	Applicant's Response
PG-001	Socio-Economics, Tourism and Recreation Noise and Vibration	Lime Down Solar Project Objection I object to the proposals for Lime Down Solar Project both as a member of the wider local community and owner of a residence that will experience a permanent adverse impact on our way of life given its proximity to the development. My objection is in 2 parts Objection to the development - impact on my residence and way of life - I live at 3 Grain Store Barn. I own the property and live here with my wife and 2 older children. Grain Store Barn is made up of 4 properties which are all lived in by their owners. It is at the end of a single-track lane (Pig Lane) in Farleaze. This is a rural property surrounded by fields that are all currently farmed by local farmers. - The Lime Down C section of the Lime Down Solar Park development will engulf our residence enclosing the property on 3 sides with fields now containing 4.5-meter solar panels, and 7-meter-high transformers. The fields will be surrounded by industrial fencing and security equipment. The residents of all the Grain Store Barn properties will in effect now be living in an industrial facility. Our quality of life will be severely and adversely impacted.	Grain Store Barn is identified as receptor RG020 and has been fully assessed in **ES Volume 3, Appendix 8-3-2-2: Landscape and Visual Assessment Sheets (Significant) [APP-191].** The assessment recognises that there would be Major/Moderate Adverse effects which are Significant during Construction and Year 1. The assessment notes: The Scheme has been designed to accommodate these residential properties, and infrastructure has been set back to allow separation and space for mitigation. Views of construction activity would be visible in open views across the surrounding fields, where visible, this would be set back from the properties by at least 150m. There is no proposed infrastructure within field C16 and open views are maintained to the south. The level of change in views would be High. Proposed mitigation includes reinforced roadside screening, new sections of hedgerow, hedgerow reinforcement and enhancement is proposed throughout the surrounding Site. Although this would have a limited effect initially, by Year 15 mitigation planting would filter views of the proposed infrastructure and reduce visibility of the Scheme reducing the effect to Moderate/ Minor adverse which is non-significant.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		- The documents submitted by the developer recognise that Grain Store Barn residences will be adversely impacted by the development, Grain Store Barn is noted in the following documents o APP - 66 - Noise and Vibration (residence R45) o APP - 60 - Landscape and Visual Impact o APP - 73 - Cumulative and In-Combination Effects - I object to the development of Lime Down Solar Park for the following reasons specific to my own property, - Industrialisation of Farleaze - Despite recognising that our residence will be adversely impacted by the development in these specific areas, no amendments to any of the developers plans or actions have been taken despite these concerns being raised in the consultation process held by the developer throughout 2025.	
PG-002	Consultation and Engagement	Consultation Process - The Consultation Process followed by the developers has provided no confidence to me that my or other residents of Grain Store Barn have been taken into consideration. This has often felt like a 'tick box' exercise and despite Grain Store Barn raising significant and material concerns, the developer's approach has been to either dismiss them or refer us to the current process	The Applicant places significant value on local knowledge and confirms that the concerns of Grain Store Barn residents were afforded consideration through direct engagement including residents' participation in statutory consultation events, a dedicated site visit and a meeting with the Applicant where specific plans and localised impacts were discussed. As a direct result of this active dialogue and the iterative design process, the Applicant confirmed amendments to the Scheme to include a further setback of panel infrastructure away from these properties. These changes were confirmed to residents in writing

Reference	Theme	Comments/Issues Raised	Applicant's Response
		with the Government Inspectorate. I have seen no material amendment to any plans or provision of additional information or mitigations to recognise our concerns. I do not believe the developer has shown any interest in actively listening to Grain Store Barn residents or entering any serious dialogue on the impact on our property and the local environment. At one stage documents were being produced by the developer that showed our property as an 'ancient woodland' with no recognition that Grain Store Barn even existed. Many of the consultation documents did not acknowledge the existence of Grain Store Barn but did mention the Farleaze cottages further down Pig Lane and the amendments to the Lime Down C plans to consider the potential impact on their properties. We are and certainly feel like an inconvenience to the developers and collateral in their pursuit of completing this development.	and are reflected in the final application design, specifically within **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]** and the **Landscape and Ecology Mitigation Plan [APP-084]**. The Applicant confirms that the final application documentation accurately identifies residential receptors, including the Grain Store Barn, and acknowledges that a correction to a layer on one map during Statutory Consultation was corrected to show the property had been excluded from the project boundary. The proposed design incorporates screening and substantial buffers beyond the 50m minimum distance, to beyond a nearby telecoms line, to maintain the privacy and amenity of residents, as detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The Applicant remains committed to working collaboratively residents and does not consider members of the community or residents an inconvenience. The Applicant is confident that the consultation process has led to an improved Scheme that balances local sensitivities with the urgent national need for renewable infrastructure. Engagement with local communities has been a key part of the Scheme's development, as detailed in the **Consultation Report [APP-022].** The Applicant welcomes ongoing engagement during the Examination.
PG-003	Site selection and Alternatives Soils and Agriculture Landscape and Visual	Objection to the overall Lime Down Solar Park development in principle - The sheer scale of the development (2000 acres) will mean a current rural location in the Cotswolds with its network of small villages will have their quality of life adversely impacted forever. The rich cultural heritage of this part of the Cotswolds will be lost.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. The total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, around 479.5 ha of land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation;

Reference	Theme	Comments/Issues Raised	Applicant's Response
	Description and DCO Process	- The Lime Down Solar Farm Project development is not on unused land; it is using good arable land and will be cover across 9 villages and the communities that live in them. The development makes no concessions for the residents of the 9 villages and those in even more rural locations. If the development goes ahead, they will now be living in an industrial zone. Their way (and quality) of life will be adversely impacted. - Farming is at the heart of this community; removal of good arable land will impact local farming production and benefit to local economies. There seems to be no consideration over removal of land for food production (vital to the sustainment of the UK) in any part of Government policy when considering developments such as Lime Down Solar Farm. - It represents the industrialisation of the Cotswolds with no trade off benefits for the local community or local economy. This project does not provide jobs or any sustainable benefits to the local area, if anything it will mean replacement of land currently used for farming (key sector in local economy) and have a negative impact on other	measurable Biodiversity Net Gain (BNG) delivery, landscaping, and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. <u>Cultural Heritage</u> The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		sectors such as tourism. Local economy and residents will suffer as a result. - There is NO local support for this, whether it is the residents, businesses, or elected members of parish councils and Wiltshire County Council. There is no local support for this development as it provides no benefit to the local community and will adversely impact the way (and quality) of life forever.	The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction. <u>Soils and Agriculture and Site Selection</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Volume 1, Chapter**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			17: Soils and Agriculture [APP-069], Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1 Chapter 17: Soils and Agriculture [APP-069]**, Sections 17.10 and 17.12). Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF).

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Local Economy and Employment An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not

Reference	Theme	Comments/Issues Raised	Applicant's Response
			result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. <u>Tourism and Recreation</u> The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11

Reference	Theme	Comments/Issues Raised	Applicant's Response
			tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. <u>Community Benefit</u> The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more

Reference	Theme	Comments/Issues Raised	Applicant's Response
			specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent. The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.
PG-004	Cumulative Effects	We already have Solar Farms within the local vicinity (e.g. Hullavington). Residents have had to deal with the visual impact, noise, glint and glare and noise generated by these small-scale developments compared to the Lime Down Project proposals. In this way the local area and its residents have already supported the development of solar farm projects contributing to UK Net Zero targets. This raises the question as to why other alternative sites have not been considered and why a scheme the size of Lime Down	As a direct result of this active dialogue and the iterative design process, the Applicant confirmed amendments to the Scheme to include a further setback of panel infrastructure away from these properties. These changes were confirmed to residents in writing and are reflected in the final application design, specifically within **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]** and the **Landscape and Ecology Mitigation Plan [APP-084]**. A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **Environmental Statement Volume 1, Chapter 21: Cumulative**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		should be imposed on local communities when the area already had to tolerate the adverse impacts of several other solar farm developments.	**and In-Combination Effects [APP-073]** and **ES Volume 3, Appendix 21-1: Long List of In-Combination Effects and Cumulative Developments [APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the **technical assessments [APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Chapter 21 In-Combination and Cumulative Effects [APP-073]**. Existing schemes are captured within the baseline environment. The four stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6 EIA Methodology [APP-058]**. 358 developments were included in the **Long List [APP-264]**. 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			As set out in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme.
PG-005	Landscape and Visual	Adverse impact on Landscape and Visual Impact - imposition of 4.5-meter-high solar panels, a BESS and all the security and fencing materials - the beautiful countryside we enjoy today will be lost. No amount of mitigation will be able to hide or blend the sheer scale of this development into the landscape. Residents and visitors will see and hear this Solar Farm. I notice the very limited pictures or drawings in the developers reports showing how the mitigation will work and help residents visualise how their local area will be impacted. - Residents and visitors currently enjoy an array of footpaths and bridleways in the local area providing opportunity to enjoy the beautiful Cotswolds countryside experiencing the local wildlife and surroundings. This will be lost as they will now have to negotiate and walk through or around the solar panels, invertors, transformers and the associated fencing and security cameras. Again, no amount of	<u>Landscape and Visual</u> An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, during construction, operation and decommissioning, using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**, to ensure a robust assessment. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to

Reference	Theme	Comments/Issues Raised	Applicant's Response
		mitigation will be able to hide the solar project due to the size of the scheme and the equipment used. Another key attraction of the local area will be lost.	further limit visual impacts. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, including Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The approach to presenting information and supporting material during consultation is described within the **Consultation Report [APP-022]**. The Applicant considers that the visual material submitted is proportionate to the stage of design and sufficient to support the assessment of landscape and visual effects. The Applicant welcomes ongoing engagement during the Examination should Interested Parties require clarification on any of the visual material submitted.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Noise and Vibration An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure, with conclusions set out below. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Development Consent Order [APP-016], ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. <u>Operational phase</u> The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			PRoW and Recreational Access A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
PG-006	Noise and Vibration	Adverse impact of Noise both during construction, operation and decommissioning. The developers acknowledge there will be an increase in noise because of this development. Whether it is the violent noise of pile driving during construction or the drone of the continued cooling of the electronic infrastructure at the BESS or various inverters and transformers in each of the locations. I believe the	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. As a reasonable worst-case this assessment includes the noise from piling rigs that will be larger and louder than those used in practice. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
		studies completed by the developers on noise significantly underestimate the impact the Lime Down Project will have on increased noise in the area especially with the strong winds in some locations. The sheer size of the development will mean the residents will have to endure the drone of the Solar Farm for 60 years.	Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As shown in Table 8 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, levels would typically be below or slightly above the existing background sound in the area. The levels have been calculated, using the appropriate international standard, on a worst-case assumption that wind is blowing from the source of the noise to the receptor locations, as stated in paragraph 14.4.15 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The **ES [APP-052 to APP-265]** and environmental and ecological surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details of qualifications, experience and professional institute membership are provided within **ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]**.
PG-007	Transport and Access	Infrastructure - The area covered by the Lime Down Solar Park is not set up for industrial development. The country lanes and local infrastructure simply cannot actively support this type of development. This will mean great imposition on the local residents through road congestion, noise and material inconvenience.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme. The noise effects associated with construction traffic are assessed in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, which considers noise from construction vehicles, HGV movements and associated changes in traffic flows on the local road network. Supporting technical information is provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment concludes that, with embedded mitigation in place, noise effects from construction traffic would be negligible or low in magnitude and no significant adverse effects are predicted. The Applicant notes that the approach to construction noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures to manage construction traffic and minimise associated noise are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority to reduce impacts on sensitive receptors. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction

Reference	Theme	Comments/Issues Raised	Applicant's Response
			traffic noise is appropriately managed throughout the construction phase of the Scheme.
PG-008	Human Health Other Environmental Matters	Public Safety - The risks of the imposition of this industrial electrical development to public safety are significant. The risk of potential fire, release of poisonous gases and a major accident or disaster are significant. This then allies to the point above; the local infrastructure simply cannot cope with this type of potential public safety event and has potential to threaten lives of residents. This may seem a bit extreme and sensationalist, but I do not believe the developers have not given this the attention it deserves, especially regarding the concerns of residents around the BESS.	The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant notes that the approach to BESS safety is under discussion with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and the latest position is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the **OBSMP [APP-286]** confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and/or can be safely constrained. As set out in **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067].** This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]** — including advice to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before

Reference	Theme	Comments/Issues Raised	Applicant's Response
			determining the application, and that the Battery Safety Management Plan must be implemented as approved.
PG-009	Hydrology, Flood Risk and Drainage	Flood Risk - The area covered by the Lime Down Solar Park already suffers from local flooding with several roads and lanes impassable due to flood water. This has the potential to be made worse with the development of the Solar Farm.	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].** The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the **Outline CEMP [APP-277]**, and all construction works associated must be carried out in accordance with the approved CEMP.
PG-010	Hydrology, Flood Risk and Drainage Transport and Access Socio-Economics, Tourism and Recreation	Water Supply - One of the chief concerns expressed by all the residents of the Grain Store Barn was regarding our water supply. All our water comes direct from our dedicated bore hole next to the property. We expressed concerns to the developers I our written consultation processes as to impact of construction and operation on the bore hole given our proximity to the solar farm development to the developers during the consultation. Our concern being if water supply would be impacted by the development. This was repeated in a meeting held with the developers during the process also. Again, the developers simply said this should not be an issue with no real evidence provided. As Grain Store Barn residents, we do not have any other water supply so at very least would expect some evidence this has been looked at and evidence produced to support there should be no issue on this. This remains a major concern for me and the Grain Store Barn residents. - Traffic Disruption - As Pig Lane is a	With respect to PROWs and access to the countryside, this has been assessed in **ES Volume 1,Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. Consideration of the likely impact on views, character and the desirability of these routes to users has been fundamental to the assessment of likely significant effects. The Applicant confirms that no significant residual adverse effects to PROWs surrounding Grain Store Barn are anticipated at any phase of the Scheme, subject to implementation of mitigation measures. Furthermore, the resultant likely effects from the Scheme on access to the countryside and open space for recreation as a metric of wellbeing has been assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]** under the headings 'open space, leisure and play'. The assessment finds no significant adverse effects to health and wellbeing at any phase of the Scheme. The Applicant acknowledges the concern regarding reliance on a private borehole water supply. The assessment of groundwater and potential pollutant pathways is set out in **Environmental Statement Volume 1, Chapter 19 Ground Conditions [APP-071]**, with control measures for construction activities secured through the **Outline Construction Environmental**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		single-track lane, we were told by the developers that this would not be used during the construction phase. There would be a crossing point on Pig Lane for the developer's vehicles to transfer between fields the Lie Down C Solar Panels would be situated in. On review of the 'Streets Plan' in the developers plans it now states that the part of Pig Lane we use to access our residence will now be subject to both 'Street works / Street subject to traffic regulation measures' and 'Street with use temporarily suspended or restricted'. This again is of major concern to me as the details are not clear on the impact on residents and our ability to freely move in and out of our property or access for emergency vehicles. As far as I am aware these restrictions were not notified during the consultation process. - Footpaths and Bridleways - around Grain Store Barn, we currently enjoy access to footpaths and bridleways enabling us to enjoy the local countryside and rural locations. These footpaths will now include having to walk through a Solar Farm. A key element of country life will again be taken away as we now walk through an industrial landscape. - Flood Risk - I believe the potential flood risk from the imposition of the Solar Farm has not properly been	**Management Plan [APP-277]** and the **Draft Development Consent Order [APP-016]**. In hydrology and flood risk terms, the Scheme does not require operational abstraction and is not expected to affect groundwater availability to private supplies. Potential construction-phase risks to groundwater quality are managed through embedded mitigation, including pollution prevention and incident response measures, and the requirement for detailed construction controls to be approved at discharge. The concern regarding local road flooding is considered within **Environmental Statement Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**, which assesses surface water runoff mechanisms and concludes that, with embedded mitigation and secured controls, the Scheme would not increase flood risk elsewhere or give rise to significant adverse effects on hydrology receptors.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		considered. The roads in around Farleaze flood as rain comes of the fields. The Solar Farm presents itself as potential flood risk.	
PG-010	Ecology and Biodiversity Landscape and Visual Noise and Vibration Other Environmental Matters	Environmental Impact - As a result, if this development goes forward, we are effectively being told by the developers that the Solar Farm will not impact Grain Store Barn by any of these factors. Given the direct proximity of the development to Grain Store Barn, I struggle to understand how this can be allowed and that the developer believes the combined and cumulative impact of Noise, Glint and Glare and Landscape and Visual Impact plus all the other environmental considerations will not adversely impact the way of life we enjoy today. We will just have to live with the recognised adverse environmental impacts. - Landscape and Visual Impact - It is clear, our views and landscape will be forever changed and the rural environment we currently enjoy will be forever removed. It estimated it would take at least 15-years for any tree and hedgerow planting to take any sort of effect. I believe this is also optimistic especially when trying to shield 4.5-meter solar panels and 7m transformers plus all the associated security equipment. The developer has not been able to provide us with any pictures or illustrations of what our new	The landscape and visual effects of the Scheme have been robustly assessed in the **ES Chapter Volume 3, LVIA [APP-060]** has been undertaken with consideration of the appropriate and relevant guidance and robustly assesses both the landscape and visual effects of the Scheme independently to ensure both the impacts and effects on the fabric and character of the landscape are taken into account as well as the views and visibility. A detailed LVIA methodology is included within **ES Appendix 8.1 [APP-187],** which has been progressed and agreed with the Local Planning Authorities. The Applicant confirms that consideration of impacts to PROWs, unsurfaced roads, and the recreational use of the highway network has been assessed in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E or regionally important long-ditance recreational routes cannot be mitigated further during construction. The assessment has considered the impacts to individual routes to build a picture of the likely impact on the overall PROW and highway network, determining that the overall effects within the 2 km Study Area is not a significant adverse effect at any stage of the Scheme. This is largely owing to the large number of PROWs and rural routes, given a great level of optionality to users, even in the presence of the Scheme. The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		environment will look like and how this will mitigate the impacts of the development. In the one meeting the residents of Grain Store Barn had with the developers during the consultation process, the only concession they made was to move the development very slightly back on one side. The only other comments from the developer were to make sure we make representations to yourselves (Government Inspectorate) as and when this happens. - Noise - The proximity of the Solar Farm development to Grain Store Barn will mean there will be material noise pollution from both the construction, operation and decommissioning of the solar farm but also the BESS facility in nearby Hullavington. The noise will travel especially with the strong winds we experience in Farleaze. I object to the findings of the Noise studies conducted by the developer. I believe the noise pollution from this development will be intrusive and adversely impact the residents of Grain Store Barn. I am not an expert in the 'noise' measurements used or how they have been calculated but for the noise survey's conducted to result in no significant impact on Grain Store Barn environment and the developer needing to amend their plans as a result is startling. During the	**Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. As a reasonable worst-case this assessment includes the noise from piling rigs that will be larger and louder than those used in practice. With these measures in place, the assessment concludes that daily noise exposure levels would not breach significant effect thresholds. Piling associated with the closest solar PV panels will be audible at Grain Store Barn but will be relatively short-lived in comparison to the overall construction programme. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As shown in Table 8 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, noise levels from the Scheme at Grain Store Barn, which would be primarily from the BESS facility, would typically be around the existing background sound in the area. The levels have been calculated, using the appropriate international standard, on a worst-case assumption that wind is blowing from the source of the noise to the receptor locations, as stated in paragraph 14.4.15 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. Grain Store Barn has been considered within the **ES Volume 3, Appendix 20-4: Solar Photovoltaic Glint and Glare Study**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		construction phase the noise impact of the constant pile driving will be very intrusive. In our one meeting with the developers during the consultation process, the comment was made it would probably be advisable if you could find somewhere else to live during the months of construction. - Glint and Glare - Again the proximity of the proposed development to Grain Store Barn will mean the Glint and Glare from the Solar Farms will impact the residents of Grain Store Barn. The volume and proximity of the Solar Farms to Grain Store Barn means this must be an environmental impact on the residents. Another environmental impact that has been dismissed by the developers for Grain Store Barn.	**[APP-261]** as dwelling receptor 249. A low impact is predicted, as effects are predicted to occur for less than 3 months per year and less than 60 minutes on any given day in practice.

6.9 Melanie Hill

Table 6-9 RR-3127

Reference	Theme	Comments/Issues Raised	Applicant's Response
MH-001	Site selection and Alternatives Ecology and Biodiversity	The proposed Lime Down development is wholly inappropriate - the wrong type, the wrong size, and in the wrong place. Having read the consultation documents in detail, it is clear that the scheme will have a significant adverse impact on the local wildlife in the fields around this village (including protected bird species such as **linnets** and skylarks), and the mitigation proposals that have been offered to date are totally inadequate.	Type Chapter 6 of the **Statement of Need [APP-266]** provides an analysis of many different low carbon generation technologies which are being developed as part of the UK's fight against climate change. The Statement of Need concludes, in Section 6.12, that a large capacity of many low carbon technologies is required to meet the Government's energy objectives. While the need for unprecedented capacity growth is urgent, some technologies (e.g. nuclear, SMRs, tidal) are either unproven at scale, unconsented, unfunded or have long development timescales (and therefore do not meet the urgent need identified in EN-1 Para 3.1.1 and following). These technologies and indeed other technologies may not be suitable to connect to Melksham substation and therefore would not support the need to use existing and available infrastructure to minimise the cost and timescales associated with connecting to the grid, the large capacities of low carbon generation needed to meet net zero. Section 7.7 of the Statement of Need compares the annual energy generated per square kilometre from solar, from onshore wind and from crop-to-energy (biofuels) technology. The analysis shows that large-scale ground-mount solar schemes which maximise their annual output, are likely to produce a greater quantity of low carbon electricity per acre than the output from a crop-to-biogas application; and that the energy production from land under solar is of a similar order of magnitude to the energy production from land under onshore wind, while the environmental effects of solar schemes may be significantly lower. The Applicant therefore agrees that other low carbon

Reference	Theme	Comments/Issues Raised	Applicant's Response
			technologies are urgently needed in the UK to meet the UK's climate legal targets; however, none of those technologies are more suitable at the proposed location than the Scheme, and none listed in this Representation are viable alternatives to the Scheme, because they will all be needed too. <u>Size</u> The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Cable Route Corridor, which stretches approximately 22 km from 'Lime Down D' to Melksham Substation and links together the Solar PV Sites, covers approximately 463.2 ha. Approximately 17.8 ha (of which 5.9 ha overlap with the Cable Route Corridor) is proposed for Highway Improvement Areas within which improvements to sections of the existing highway network will be completed to facilitate access to the Scheme, such as improvements to road edge and traffic management. Work will be undertaken by the Applicant and National Grid within the Existing National Grid Melksham Substation, requiring a total area of 12.8 ha.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. Location National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. Ecology and Biodiversity

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The assessment identifies skylarks as a key species of conservation interest within the Scheme area. It concludes that a proportion of the current skylark population will be displaced from the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large, open set-aside and grassland habitats designed to provide appropriate breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The impacts of the Scheme on linnets are assessed within **ES Volume 1, Chapter 9: Ecology and Biodiversity[APP-061]** under the broader grouping of breeding birds. Unlike skylarks, linnets are not expected to be displaced by solar panels and typically nest in dense cover such as scrub and hedgerows. This species, along with most other bird species currently using the land within the Order Limits, can be expected to benefit from the creation and enhancement of a wide range of habitats including grasslands and hedgerows across the Solar PV Sites, which are shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Landscape and Ecological Management Plan (OLEMP) [APP-283]. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies.
MH-002	Landscape and Visual Socio-Economics, Tourism and Recreation	The effect that this would have on the landscape, amenity land and the important cultural and historical heritage of this lovely part of North Wiltshire would be highly detrimental, and it would be bound to have a negative impact on the county's valuable tourism industry, with both social and economic consequences. We owe it to ourselves as Wiltshire residents, and to future generations, to prevent this dreadful proposal going through.	<u>Landscape and Visual</u> An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Cultural Heritage</u> The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any

Reference	Theme	Comments/Issues Raised	Applicant's Response
			archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered

Reference	Theme	Comments/Issues Raised	Applicant's Response
			before and during construction. <u>Tourism and recreation</u> The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and Regeneration Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.

6.10 Karen Hallam

Table 6-10 RR-2568

Reference	Theme	Comments/Issues Raised	Applicant's Response
KH-001	Description and DCO Process Soils and Agriculture Landscape and Visual	I am not in support of the proposed Lime Down solar 'farm'. I object to the misnomer of the name 'Lime Down' as this suggests a single area whereas it is 5 separate areas totalling 2,000 acres. This, therefore, not only removes this area of farmland from producing food but all the land between them is affected too. So the area taken up by this oversized monstrosity covers an area of approximately 7x3 sq miles. This does not include miles of cable corridor. The panels themselves are not to be discretely concealed behind hedges but are 4m tall. That is more than1/2 the height of telegraph poles and will therefore be looming over hedges along several miles of country lanes bordering 6 villages and encroaching on the South Cotswolds, an area of outstanding natural beauty.	As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant undertook an initial review which did not identify a single site of the appropriate size (1,100 ha) within the area of search. Therefore, the Applicant considered both contiguous land parcels and land parcels near one another. The **Statement of Need [APP-266]** explains at Section 7.4 that NSIP proposals may comprise adjoining or separate parcels of land and that "*the connection of separate parcels of suitable land together into a single scheme may, subject to analysis, enable those parcels of land to connect economically to the electricity system*" which is the case for this scheme. Section 8.2 of the **Statement of Need [APP-266]** explains that by bringing the parcels together into a single scheme, the Scheme is able to carry a connection to the National Electricity Transmission System (NETS), thus providing a local source of low carbon electricity and also enabling the efficient bulk transfer of energy generated at the Scheme so that any surplus can be used to cover shortfalls elsewhere. By connecting to the NETS, the Scheme will not impact the feasibility or timing of distribution network connections for either new generation or consumption connections which among other things are required to support the delivery of Wiltshire County Council's growth plans. <u>Food security</u> The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Cable Route The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			likely significant construction effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. <u>Landscape and Visual</u> The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Ecological Management Plan (OLEMP) [APP-283]. These include new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The LVIA assesses the effectiveness of the mitigation measures over time and concludes that, in the majority of locations, where significant adverse visual effects are recorded, the visual effects would reduce to non-significant as mitigation planting establishes and matures. This demonstrates that the proposed mitigation is effective in reducing the visual effects of the Scheme. On this basis, a maximum panel height of 4.5m is not considered excessive. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Cotswolds National Landscape</u> The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures such as the avoidance measures to remove panels from the boundary of CNL are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1** to **3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**.
KH-002	Other Environmental Matters	I object to the battery storage plant which is to be erected over several acres near the village of Hullavington and 3 fields away from Farleaze. Safety has not been established. At the consultations set up by Island Green Power this question was not/could not be answered. If it catches fire it is left to burn. Do we leave our homes for days while this happens? Will the houses and land be covered by a coating of toxic and carcinogenic chemicals after the fire? What about livestock?	An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been submitted with the Application. The OBSMP confirms that a robust and validated Emergency Response Plan (ERP) will be developed at the detailed design stage in consultation with Dorset & Wiltshire Fire and Rescue Service. Section 5.4 of the OBSMP sets out the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply across all phases of the Scheme, including construction, operation and decommissioning. The potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]**, which models potential emissions and evaluates impacts on sensitive receptors within a 1 km radius of the BESS area, including residential properties and Public Rights of Way. The assessment concludes that no significant off-site air quality impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the OBSMP, such as advice to remain indoors and close windows would further reduce potential effects on nearby residents. As a result of updated Scheme design for DCO submission, BESS infrastructure is proposed more than 500 m away from the nearest dwelling. At this distance, impact to health and wellbeing from air quality, fire or explosion impacts are minimal. As such, there are no significant adverse effects to human health anticipated as a result of the Scheme, as assessed in **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 18: Human Health [APP-070]. On this basis, the Applicant considers that the Scheme incorporates appropriate safety and mitigation measures to manage BESS-related risks and would not give rise to significant adverse environmental or safety effects. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. The Applicant notes that the approach to BESS safety is under discussion with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and this will be set out in the relevant Statement of Common Ground. The Applicant notes that concerns regarding BESS safety were raised during the statutory consultation and responded to in the **Consultation Report [APP-022].** The Applicant welcomes ongoing engagement during the Examination should Interested Parties require clarification on any aspect of BESS safety.
KH-003	Noise and Vibration	I object to the fact that there will be a consistent humming produced	An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		by this battery storage plant. The solar panels themselves are to be motorised to track the sun and fold to vertical at night. More continuous noise during daylight hours.	**and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The conclusions of the assessment in relation to each phase of the Scheme are set out below. The conclusions of the assessments are made for the Scheme as a whole (i.e. all of its components combined, including the BESS), and therefore any specific component will not have any greater effects than those that have been assessed. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. In addition, further meetings have been held over the approach to the management plans, and a Statement of Common Ground will be issued and updated throughout examination The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The predicted noise levels from the Solar PV Sites have been artificially increased by 3 dB to account for the increased likelihood that the noise from the Scheme would be perceived as distinct from the existing background sound. Potential mitigation measures are detailed in Section 14.9

Reference	Theme	Comments/Issues Raised	Applicant's Response
			of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
KH-004	Other Environmental Matters	I object to the lack of knowledge concerning heat generated by solar panels. This question was not answered satisfactorily. I was told that the solar panels 'are designed to absorb heat, not reflect it'. Hold your hand near the surface of a black car in the sun and feel the heat generated. Then multiply this by over a million huge black panels.	While there may be a microclimate generated above the panels, it is not anticipated this will have an impact on any receptor. Evidence from published research indicates that large-scale solar arrays do not give rise to significant or widespread 'heat island effects'. An 18-month study by Fthenakis and Yu (2013) found that solar arrays are typically fully cooled during night-time hours, meaning that sustained heat retention and associated heat island effects are unlikely to occur. Further research by Barron-Gafford et al. (2016) concluded that any temperature increases associated with solar PV installations are localised and do not extend

Reference	Theme	Comments/Issues Raised	Applicant's Response
			beyond the immediate boundary of the solar farm. As such, any microclimatic effects are limited in extent and rapidly dissipate with distance from the panels. On this basis, the microclimate and heat island effects associated with the Scheme are not considered to be significant, and no meaningful thermal stress, discomfort or change in local weather conditions is anticipated for nearby residents or surrounding land uses
KH-005	Transport and Access Construction and Decommissioning	I object that during the 2 year construction period the country lanes will be bearing hundreds of hgv movements. At the consultation I was told that the lanes would need to be widened and extra passing places built . Double the width of the existing lanes? Really? Lanes and villages are not meant to withstand such vehicular onslaught. What about 'normal' users? The Wiltshire Cycleway will be swamped by construction traffic. Public rights of way are put in danger: Footpaths, bridleways, byways. I object to the vast disturbance to all of the residents of villages, farms and other private residences that will occur during 2 years of construction and forever afterwards.	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The Outline CTMP also includes a road condition and dilapidation survey of minor roads not typically used by HGV traffic. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. In addition, the Outline CTMP includes community liaison measures to keep local communities informed of construction activity and to provide a contact point for feedback should any issues arise. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. The Applicant confirms that consideration of impacts to the recreational use of the highway network has been assessed in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that around Farleaze, significant adverse effects to the Wiltshire Way cycle route and Fosse Way are anticipated during construction and decommissioning. This assessment considers transport matters (safety and delay) but also user experience, amenity and desirability. The assessment does not consider that any other significant adverse effects to PROWs or to recreational users of the public highway are anticipated to occur at any phase of the Scheme. Mitigation measures to protect recreational highway users are set out in the **OCTMP [APP-287]**, which is secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. The mitigation measures include providing banksmen and speed limits where accesses interact with PROWs and The Wiltshire Way, and through specifying HGV access routes to the Scheme. These are secured through the **Outline CTMP [APP-287]** and **Outline PROWPPMP [APP-282]** by Requirements 15 and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (oPROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. <u>Decommissioning</u> The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, as well as in Section 2 of the **Outline Decommissioning Strategy [APP 279]** which is secured under Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**, all land will be returned to its original use and condition as far as practicable and returned to the landowner. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**.
KH-006	Hydrology, Flood Risk and Drainage	I object to the lack of a) clarity regarding water runoff and the effect on already overloaded drainage systems that cannot cope with heavy rain resulting in road 'closures'.	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063],** with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].** The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no

Reference	Theme	Comments/Issues Raised	Applicant's Response
			material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the **Outline CEMP [APP-277]**, and all construction works associated must be carried out in accordance with the approved CEMP.
KH-007	Hydrology, Flood Risk and Drainage	b). Lack of safety data given concerning leach of toxic chemical from panels/damaged panels	Potential effects of the Scheme on water quality and contamination risk are assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, which sets out mitigation and management measures to protect water quality during construction and operation. These measures include pollution prevention controls, containment systems, emergency response protocols, and site-specific drainage measures, particularly around the Battery Energy Storage System (BESS) and substations where lined drainage and automatically actuating valves are proposed.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			In addition, further design specifications have been incorporated to reduce potential risk to groundwater and drinking water resources, including the use of photovoltaic panels that have not involved PFAS in their manufacture and a commitment that fluid-filled cables will not be used within the Scheme. The Applicant notes that the approach to pollution resulting from battery fire is under discussion with both the Environment Agency and the Lead Local Flood Authority (LLFA) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Mitigation measures to control contamination risk during construction are set out in **the Outline Construction Environmental Management Plan [APP-277]**. Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a Construction Environmental Management Plan substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277]** is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			appropriately managed throughout construction of the Scheme.
KH-008	Construction and Decommissioning	c). Lack of definitive information/answers on just how thousand of tonnes of metal and concrete will be removed from the ground after being pile driven there.	The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, all land will be returned to its original use and condition as far as practicable and returned to the landowner. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the effects would be less than those likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. The Applicant confirms that none of the land will be considered brownfield after decommissioning. The expectation is that the land will return to farming, but the Applicant cannot dictate what will happen to the land post-decommissioning when the Applicant no longer has an interest in the land.
KH-009	Socio-Economics, Tourism and Recreation Description and DCO Process	On a personal level: my house will be devalued, my mental health is going to be greatly disturbed (I am already suffering sleepless nights and stress in other forms), and my way of life destroyed by the presence of these panels over all rights of way near me. On a local level: 6 villages are	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181]**. <u>Mental Health and Wellbeing</u> Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		affected/surrounded by towering, motorised solar panels and there will be no local benefit to any of these villages whatsoever	This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the relevant Statement of Common Ground to be submitted at Deadline 1. Public Rights of Way and Recreational Access A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation measures in Section 16.9 of ES Chapter 16.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283],** considered as additional mitigation and enhancement measures in Section 16.11 of ES Volume 1, Chapter 16: Socio Economics, Tourism and Recreation [AP**P-073]**. The PRoW and Permissive Paths MP is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. <u>Landscape and Visual</u> An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**, including proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. Community Benefit

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3, benefiting the national population rather than just the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, and providing biodiversity net gains through habitat improvements. The Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself, to recognise local community needs in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.
KH-010	Soils and Agriculture Climate Change and Energy Need Description and DCO Process	On a national level: we will lose square miles of high grade, food producing, farmland. This country already imports 40% of its food. The carbon footprint of construction and delivering/shipping thousand of tonnes is massive. What about the mining costs and manufacturing costs of the materials? It will take many years just to offset this. Electricity prices are set to go up until the £millions laid out are recouped. Island Green Power and (Redacted)? Do we need a repeat of this? This is not 'green'. This is a business run for profit.	Food Security The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise

Reference	Theme	Comments/Issues Raised	Applicant's Response
			food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. <u>Embodied Carbon</u> **ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses the greenhouse gas (GHG) emissions associated with the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components such as solar PV panels, inverters, transformers and battery storage infrastructure. This includes consideration of embodied carbon arising from the production of rare earth materials and components, which reflects the upstream environmental impacts associated with their manufacture. The assessment recognises that the manufacture and transport of solar PV panels and batteries represent a notable proportion of the Scheme's lifecycle GHG emissions. These impacts are considered within the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			context of national carbon budgets and the UK's transition to net zero, with the assessment concluding that the Scheme would make a meaningful contribution to reducing greenhouse gas emissions over its operational lifetime when compared to a 'without Scheme' scenario. In addition, **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** considers the use of materials and natural resources, including minerals, materials supply This chapter confirms that the Scheme would not give rise to significant effects in relation to minerals, materials or waste, and that embedded mitigation measures and good practice would be applied throughout the construction, operation. The ES also identifies embedded mitigation measures across the Scheme, including the use of durable components with long operational lifespans, allowances for replacement over time, and the recyclability of key components such as solar panels, batteries and electrical equipment. These measures reduce the need for ongoing extraction of virgin materials and limit long-term environmental impacts. The Applicant acknowledges the expression of distrust towards the Scheme and has demonstrated compliance with all statutory requirements under the Planning Act 2008 and applicable legislation such as The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. The Applicant is subject to legally binding DCO requirements. The Planning Act 2008 also contains

Reference	Theme	Comments/Issues Raised	Applicant's Response
			enforcement provisions regarding compliance with the terms of a DCO. The DCO process itself incorporates enforceable mechanisms to regulate Scheme delivery. Any breach of the development consent order or failure to comply with Requirements is a criminal offence and can result in enforcement action. The **Statement of Need [APP-266]** explains, at Section 10.2, how increasing the capacity of renewable assets in GB reduces the traded price of power. Renewables also provide a shield against volatile international energy markets. The inclusion of energy storage as associated development to the main solar scheme will support the operation of the main solar scheme and will be able to store energy generated by the main solar scheme and export it to the grid when it is needed and so reduce the cost of electricity at those times.
KH-011	Landscape and Visual	Unanswered questions The whole scheme is flawed by its enormity. It will adversely affect several square miles of countryside. This is prime food producing farmland. It is an area of Outstanding Natural Beauty in the Cotswolds.	<u>Scale</u> The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery

Reference	Theme	Comments/Issues Raised	Applicant's Response
			storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. <u>Agricultural Land</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069],** Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately

Reference	Theme	Comments/Issues Raised	Applicant's Response
			209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Sections 17.10 and 17.12). <u>Cotswolds National Landscape</u> The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
KH-012	Landscape and Visual	As well as destroying farmland the 3m high motorised panels will be visible along both sides of country lanes surrounding 9 badly affected villages.	An assessment of visual effects on transport receptors, including users of local roads, lanes and strategic routes and Public Rights of Way receptors, is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The full assessments are located in **Appendix 8-3-2-1 Visual Assessment Sheets (Non-Significant) [APP-190]** and **Appendix 8-3-2-2 Landscape and Visual Assessment Sheets (Significant) [APP-191]** and evaluates the magnitude and significance of visual effects during construction, operation and decommissioning. The assessment confirms that visual effects on road users have been considered in accordance with recognised guidance, including the identification of specific transport routes and viewpoints. Where significant effects are identified, these are typically limited to the construction phase and early years of operation and reduce over time as proposed mitigation planting establishes. Mitigation measures, including the retention and reinforcement of existing hedgerows, provision of new native planting, and appropriate set-back distances from site boundaries, are secured through the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These measures are designed to filter and screen views of the Scheme from surrounding roads and to integrate the Scheme into the receiving landscape. The preparation, approval and implementation of detailed landscape and ecological management plans,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant notes that matters relating to the use of agricultural land have been addressed in the Applicant's responses to this Interested Party above.
KH-013	Climate Change and Energy Need Transport and Access	During the two year construction phase, which involves the transport from China of 1000's of tonnes of metal and glass impregnated with toxic chemicals, the single track country lanes will be widened to accommodate heavy lorries. The lanes will be modified to have especially built passing places. These lanes run through villages not equipped to deal with volumes of heavy traffic. There will be a lasting negative effect on communities.	Island Green Power is part of the Solar Energy UK Supply Chain Commitment. As part of this, the solar sector in the UK and Europe has launched the Solar Stewardship Initiative, which independently inspects and certifies individual factories for sustainable and ethical practices. The Applicant would expect to source panels from factories that are SSI-accredited. The effects of emissions generated from embodied carbon within products to be used on site (as well as construction, operation and decommissioning emissions) are all considered in **ES Volume 1, Chapter 7: Climate Change [APP-059].** The CO2e figures are included in detail within the ES chapter. The chapter concludes that the emissions from these sources would be outweighed by the reduced emissions as a result of the Scheme contributing to decarbonisation of energy from the National Grid. The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential

Reference	Theme	Comments/Issues Raised	Applicant's Response
			impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **outline CTMP [APP-287],** are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme.
KH-014	Socio-Economics, Tourism and Recreation	I asked Island Green Power, in one obligatory consultation, what their plans are for maintaining public rights of way. I was not given any answer except it will be	The Applicant confirms that consideration of impacts to PROWs have been assessed in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. No significant

Reference	Theme	Comments/Issues Raised	Applicant's Response
		'looked into'. This is hardly definitive when bridleways, footpaths and byways will be either lined by, covered by, or surrounded by solar panels and security fencing.	adverse effects are considered likely to occur at any phase of the Scheme, subject to the construction, transport, PROW, and landscape mitigation measures being implemented, set out in the various control documents and management plans and as secured by the relevant requirements in Schedule 2 to the **Draft DCO [APP-016]**. Specific control measures to protect and maintain PROWs are set out in the **OPROWPPMP [APP-282].** The Scheme design retains the alignment of all PROWs, all of which have been given minimum 15 m offsets from their centrelines to the nearest onsite infrastructure, such as security fencing. This buffer space would be planted with either hedgerows or low-level ground cover planting to encourage either visual screening, or improve biodiversity. These are shown on **ES Volume 2, Figures 3-4-1 to 3-4-5.2 [APP-084]** and secured through the **OLEMP [APP-283]**.
KH-015	Noise and Vibration	The whole construction has motorised panels. They will be audible every time the 1000's of them rotate to track the sun.	An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The conclusions of the assessment in relation to each phase of the Scheme are set out below. The conclusions of the assessments are made for the Scheme as a whole (i.e. all of its components combined, including the BESS), and therefore any specific

Reference	Theme	Comments/Issues Raised	Applicant's Response
			component will not have any greater effects than those that have been assessed. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. In addition, further meetings have been held over the approach to the management plans, and a Statement of Common Ground will be issued and updated throughout examination. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The predicted noise levels from the Solar PV Sites have been artificially increased by 3 dB to account for the increased likelihood that the noise from the Scheme would be perceived as distinct from the existing background sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
KH-016	Noise and Vibration	The massive battery storage system -acres of combustible batteries - are within far too close proximity (as close as 500m) of one village and many other dwellings.	As a result of updated Scheme design for DCO submission, BESS infrastructure is proposed more than 500 m away from the nearest dwelling. At this distance, impact to health and wellbeing from air quality, fire or explosion impacts are minimal. As such, there are no significant adverse effects to human health anticipated as a result of the Scheme, as assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. The location of the BESS has been informed by a detailed site selection and design evolution process, as set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. This chapter explains that land at Lime Down D was identified as an appropriate location for the BESS due to its proximity to the solar PV arrays and the on-site substation, providing operational benefits including minimising transmission losses, maximising storage efficiency, and enabling rapid and reliable grid response. In considering options for co-locating the BESS with the solar PV Sites, Lime Down D was selected as the preferred location due to its central position within the Scheme, effective natural and proposed screening, limited proximity to residential properties, and closeness to existing infrastructure corridors, including the railway line. Locating the BESS within an existing infrastructure

Reference	Theme	Comments/Issues Raised	Applicant's Response
			corridor reduces the need for additional land take and avoids introducing new isolated infrastructure into undeveloped areas. The assessment concludes that siting the BESS at Lime Down D presents the lowest potential for significant adverse environmental effects. Accordingly, the proximity of the BESS to the railway line does not give rise to significant safety or environmental concerns. The potential effects of toxic gases arising in the unlikely event of a BESS fire, are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]**, which models potential emissions and evaluates impacts on sensitive receptors within a 1 km radius of the BESS area, including residential properties and Public Rights of Way. The assessment concludes that no significant off-site air quality impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan [APP-286]**, such as advice to remain indoors and close windows, would further reduce potential effects on nearby residents. The Applicant has followed guidance from the National Fire Chiefs Council (NFCC) and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area (**ES Volume 3, Appendix 15-2: BESS Fire Emissions Modelling [APP-239])**. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions [APP-166]**. The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286]**. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage of the project as stipulated in Section 5.5.9 of the OBSMP and secured through Requirement 6 of the **Draft DCO [APP-016]**. As now mandated under National Fire Protection Association (NFPA) 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency

Reference	Theme	Comments/Issues Raised	Applicant's Response
			response safety audit – this is secured in the OBSMP via pre-construction requirements. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme, including fire service access, firefighting water supply, and emergency planning requirements. The Applicant notes that the approach to BESS safety is under discussion with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and this will be set out in the relevant Statement of Common Ground.
KH-017	Climate Change and Energy Need	This construction is hiding under the banner of providing 'green' energy. It will, I understand, take 15 years to offset the damage done during shipping/construction.	The effects of emissions generated from embodied carbon within products to be used on site, as well as construction, operation and decommissioning emissions, are assessed in **ES Volume 1, Chapter 7: Climate Change [APP-059].** The CO_2e figures are included in detail within this ES chapter. Emissions from production of the required cables are included within the assessment. The chapter concludes that the emissions from these sources would be outweighed by the reduced emissions resulting from the Scheme contributing to decarbonisation of energy from the National Grid. Further, as outlined in the chapter, the emissions of replacing the solar panels, inclusive of the embodied carbon (manufacturing and transportation emissions), are considered in the assessment. The DESNZ conversion factors used for the assessment of embodied carbon cover the extraction, primary processing, manufacture and transportation of materials.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment recognises that the manufacture and transport of solar PV panels and batteries represent a notable proportion of the Scheme's lifecycle GHG emissions. These impacts are considered within the context of national carbon budgets and the UK's transition to net zero, with the assessment concluding that the Scheme would make a meaningful contribution to reducing greenhouse gas emissions over its operational lifetime when compared to a 'without Scheme' scenario. In addition, **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** considers the use of materials and natural resources, including minerals, materials supply. Baseline and future conditions are set out in Section 7.7 of the assessment. Although it is expected there will be some baseline emissions from the Site's current use and some carbon sequestration from the grassland once the Scheme is in place, as a conservative approach the baseline emissions and the grassland sequestration were considered zero. The Applicant's **Statement of Need [APP-266]** provides evidence that an unprecedented capacity of new low-carbon generation schemes is urgently needed for the UK to meet its legally binding climate change targets. The government has confirmed that solar energy is at the heart of the Clean Power 2030 Mission [NPS EN-3 (2025) Paras 2.10.1 & 2.10.2]. The Statement of Need confirms that the need for the Scheme is urgent and that substantial weight should be given to the need for the Scheme [NPS EN-1 (2023) Para 3.2.9-3.2.10]. The Applicant is confident that

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies.
KH-018	Hydrology, Flood Risk and Drainage	This area has its water run off managed by drainage ditches. We get flooding here and impassable roads when rain is heavy. The run off will be increased by over a million solar panels.	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063],** with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Plan (CEMP) [APP-277] has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
KH-019	Other Environmental Matters	The panels have a black surface. IGP say they 'should not' generate heat.	Evidence from published research indicates that large-scale solar arrays do not give rise to significant or widespread heat island effects. An 18-month study by Fthenakis and Yu (2013) found that solar arrays are typically fully cooled during night-time hours, meaning that sustained heat retention and associated heat island effects are unlikely to occur. Further research by Barron-Gafford et al. (2016) concluded that any temperature increases associated with

Reference	Theme	Comments/Issues Raised	Applicant's Response
			solar PV installations are localised and do not extend beyond the immediate boundary of the solar farm. As such, any microclimatic effects are limited in extent and rapidly dissipate with distance from the panels. On this basis, the microclimate and heat island effects associated with the Scheme are not considered to be significant, and no meaningful thermal stress, discomfort or change in local weather conditions is anticipated for nearby residents or surrounding land uses.
KH-020	Ecology and Biodiversity	Pathways used by wildlife will be blocked by fencing. This is not the odd field affected - the panels alone will cover one hundred 20 acre fields. The whole affected area, once building is complete will be 7x2 miles. Industrial sites of this mega size do not belong in the countryside utilising farmland. Panels belong on roofs. We have 100's of acres of factory roofs near the M4 junction 17 alone. Why don't these have panels?	Wildlife Movement Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and secured in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance, including re. fencing, are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. <u>Agricultural Land and Site Selection</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Volume 1, Chapter 17:Soils and Agriculture [APP-069]**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as

Reference	Theme	Comments/Issues Raised	Applicant's Response
			practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1 Chapter 17: Soils and Agriculture [APP-069]**, Sections 17.10 and 17.12). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-056 and APP-266]. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/ brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
KH-021	Community Benefits	There is no benefit to the local community as all power will go to the national grid. This is via underground cables for 10k. More destruction. It will pass around towns and under the M4.	The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent. The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			<u>Cable Route Corridor</u> The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the likely significant construction effects

Reference	Theme	Comments/Issues Raised	Applicant's Response
			associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
KH-022	Description and DCO Process	Every day I have difficulty believing this outlandish plan is even being considered. It is a foreign company - the same company invited here to bankrupt (Redacted) - so you can expect profits to go abroad.	The Applicant, Lime Down Solar Park Limited is a 100% subsidiary of IGP UK Projects Limited. Both are registered in England and Wales and subject to UK tax law and regulations. Investment may come from a range of sources, including international ones. This is common practice with UK infrastructure Schemes and helps fund the transition to clean energy at the scale required. The **Funding Statement [APP-019]** submitted with the DCO application demonstrates that the Scheme is financially viable and adequately funded to deliver the Scheme in full.

Reference	Theme	Comments/Issues Raised	Applicant's Response
KH-023	Description and DCO Process	Please accept that this scheme is not wanted by Wiltshire Council nor any of the residents whose way of life will be destroyed. No one is against solar power but not like this.	The DCO process anticipates that differing views may be expressed by consultees, including local authorities, and such representations will be considered by the Examining Authority alongside all other evidence submitted. The Applicant engaged with Wiltshire Council, the host local planning authority, throughout the pre-application process and will continue to do so during Examination. Matters raised by the authority have informed the development of the Scheme and the accompanying assessments, and are addressed within the application documents. The Applicant will respond in detail to the local planning authority's representations through the Examination process, including via Written Representations, Statements of Common Ground and, where appropriate, at Examination hearings, to assist the Examining Authority in its consideration of the application.
KH-024	Description and DCO Process Soils and Agriculture Landscape and Visual	I am not in support of the proposed Lime Down solar 'farm'. I object to the misnomer of the name 'Lime Down' as this suggests a single area whereas it is 5 separate areas totalling 2,000 acres. This, therefore, not only removes this area of farmland from producing food but all the land between them is affected too. So the area taken up by this oversized monstrosity covers an	As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant undertook an initial review which did not identify a single site of the appropriate size (1,100 ha) within the area of search. Therefore, the Applicant considered both contiguous land parcels and land parcels near one another. The **Statement of Need [APP-266]** explains at Section 7.4 that NSIP proposals may comprise adjoining or separate parcels of land and that "*the connection of separate parcels of suitable land together into a single scheme may, subject to analysis, enable those parcels of land to connect economically to the electricity system*" which is the case

Reference	Theme	Comments/Issues Raised	Applicant's Response
		area of approximately 7x3 sq miles. This does not include miles of cable corridor. The panels themselves are not to be discretely concealed behind hedges but are 4m tall. That is more than1/2 the height of telegraph poles and will therefore be looming over hedges along several miles of country lanes bordering 6 villages and encroaching on the South Cotswolds, an area of outstanding natural beauty.	for this scheme. Section 8.2 of the **Statement of Need [APP-266]** explains that by bringing the parcels together into a single scheme, the Scheme is able to carry a connection to the National Electricity Transmission System (NETS), thus providing a local source of low carbon electricity and also enabling the efficient bulk transfer of energy generated at the Scheme so that any surplus can be used to cover shortfalls elsewhere. By connecting to the NETS, the Scheme will not impact the feasibility or timing of distribution network connections for either new generation or consumption connections which among other things are required to support the delivery of Wiltshire County Council's growth plans. Food security The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Cable Route The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the likely significant construction effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. <u>Landscape and Visual</u> The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			(OLEMP) [APP-283]. These include new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The LVIA assesses the effectiveness of the mitigation measures over time and concludes that, in the majority of locations, where significant adverse visual effects are recorded, the visual effects would reduce to non-significant as mitigation planting establishes and matures. This demonstrates that the proposed mitigation is effective in reducing the visual effects of the Scheme. On this basis, a maximum panel height of 4.5m is not considered excessive. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Cotswolds National Landscape</u> The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			designation. Details of the proposed landscape and ecological mitigation and enhancement measures such as the avoidance measures to remove panels from the boundary of CNL are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**.

6.11 Gary Hill

Table 6-11 RR-1494

Reference	Theme	Comments/Issues Raised	Applicant's Response
GH-001	Socio-Economics, Tourism and Recreation	My property will be within a 100M of impacted land and this will have a significant impact (potentially unsaleable impact) on the value of my property, I am retired and have spent my entire life saving and investing in my family home so that I could eventually downsize and realise capital in order to be able to retire, this will destroy the value I have saved for across decades and puts my entire retirement in jeopardy. This simply isnt fair and punishes hard working people in modest houses that are simply in the Lime Down firing line, there has been no offer of compensation and conversations with Lime Down representatives simply end with a shrug of shoulders and an attitude of "*thats tough*"!!	The potential for the Scheme to impact residential amenity has been assessed in **ES Chapter 8: Landscape and Visual [APP-060]** and **ES Chapter 18: Human Health [APP-072]**. Impacts on property values are not an Environmental Impact Assessment (EIA) topic and were scoped out of the assessment as there is no empirical evidence that large-scale solar farms cause significant long-term adverse effects on property prices. To protect the amenity of residents, the Scheme design incorporates substantial embedded mitigation, including a minimum offset of 50m between property boundaries and solar panels. The Landscape and Visual Impact Assessment (LVIA) found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. In the case of Pig Lane Cottages, the minimum distance between the property boundary and panel infrastructure is approximately 450m. Between panels and the property boundary there will be screening vegetation and ecological enhancements to maintain privacy and visual separation, as detailed in the **Outline Landscape and Ecological Management Plan (LEMP) [APP-283]**. The Applicant places a high value on constructive local dialogue and confirms that, following the resident's engagement at statutory events, a bespoke site visit and meeting with the developer took place to discuss the project's relationship with

Reference	Theme	Comments/Issues Raised	Applicant's Response
			their property where the extended offsets and proposed land use nearby were discussed.
GH-002	Other Environmental Matters Noise and Vibration Socio-Economics, Tourism and Recreation	I object to the BESS for additional reasons: continuous noise emissions, visual intrusion, and operational lighting that would permanently destroy the tranquillity of the area. The predicted 'incessant hum' from cooling fans, inverters, and transformers would severely impact residents' ability to sleep, enjoy their homes, or use their gardens.	Noise and Vibration An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The conclusions of the assessment in relation to each phase of the Scheme are set out below. The conclusions of the assessments are made for the Scheme as a whole (i.e. all of its components combined, including the BESS), and therefore any specific component will not have any greater effects than those that have been assessed. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. In addition, further meetings have been held over the approach to the management plans, and a Statement of Common Ground will be issued and updated throughout examination. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The predicted noise levels from the Solar PV Sites have been artificially increased by 3 dB to account for the increased likelihood that the noise from the Scheme would be perceived as distinct from the existing background sound. Potential mitigation measures are detailed in Section 14.9 of **ES**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Volume 1, Chapter 14: Noise and Vibration [APP-066], and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. <u>Landscape and Visual Impact</u> An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. Potential effects relating to lighting are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning

Reference	Theme	Comments/Issues Raised	Applicant's Response
			lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** and further discussed in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072].** Lighting Potential effects relating to lighting are considered within the LVIA in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. No significant effects of lighting, above those recorded for landscape and visual receptors, were recorded. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on

Reference	Theme	Comments/Issues Raised	Applicant's Response
			perimeter fencing. These measures to control construction lighting are set out in the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme.
GH-003	Transport and Access Socio-Economics, Tourism and Recreation Landscape and Visual Human Health	I object to the construction traffic proposals, which rely on narrow rural lanes that are physically incapable of safely accommodating the volume of HGVs required. Independent analysis shows the applicant has underestimated traffic by over 40%, meaning more than 100 HGV movements per day on single-'track roads used by schoolchildren, walkers, cyclists, and local residents. This creates an unacceptable and unmanageable safety risk, particularly where there are no pavements, limited verges, blind bends, and multiple public rights of way. This level & size of traffic on rural lanes will cause absolute chaos, damage and poses significant risk to users of already narrow/blind bend lanes that simply are not capable of taking this volume of HGVs etc. Additionally residents heading out to work will be significantly impacted as	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the

Reference	Theme	Comments/Issues Raised	Applicant's Response
		these vehicles will be causing the chaos described and thousands of tradesman will be looking to find short cuts/rat runs to get onto the various sites across the vast development. A Limedown representative stated that the "build period which they estimate to be c2 years will be chaos and we should look to move away for as much of this period of time as possible because it will be carnage"! Additionally this impacts on active travel, local walks, and the Wiltshire Cycleway. The frequency of HGVs -" one every six minutes -" would intimidate vulnerable users, deter people from walking and cycling, and destroy the amenity value of routes that are central to community life and local tourism. This proposal will destroy the tranquillity, open views, wildlife, and quiet lanes that define this landscape. Many local walking/riding routes use the very lanes and rights of way that would be dominated by HGV traffic, construction noise, dust, and industrial fencing. What are currently peaceful, restorative walks would become unpleasant, unsafe, and in some cases effectively unusable. These walks are not incidental; they	DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. The Applicant confirms that impacts to PROWs, unsurfaced roads, and the recreational use of the highway network have been assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3, Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. Consideration of the likely impact on views, character and the desirability of these routes to users has been fundamental to the assessment of likely significant effects. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. Otherwise, no significant adverse effects to PROW

Reference	Theme	Comments/Issues Raised	Applicant's Response
		are part of the parish's identity, wellbeing, and social fabric. They connect residents to nature, link villages, support local businesses, and attract visitors. The proposal would destroy the qualities that make these routes special, replacing them with noise, intimidation, and industrialisation. I fear there will be serious injury or worse case deaths caused by this volume and size of additional traffic, nobody wants this on their conscience!	and recreational highway users are anticipated at any phase of the Scheme. With specific regard to long-distance recreational routes such as the Wiltshire Way cycle route, a residual significant effect to the Wiltshire Way cycle route and Fosse Way during construction and decommissioning is anticipated. This assessment considers transport matters (safety and delay) but also user experience, amenity and desirability. As a result of the Scheme, and the implementation of mitigation measures to protect cyclist on this route, the Scheme is anticipated to generate a significant adverse effect to users of the Wiltshire Way during construction and decommissioning. The Scheme is however not anticipated to generate any long-term significant adverse effect on users of The Wiltshire Way during the Scheme's operational phase. The mitigation measures include providing banksmen and speed limits where accesses interact with PROWs and The Wiltshire Way, and through specifying HGV access routes to the Scheme. These are secured through the **Outline CTMP [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan (oPROWPPMP) [APP-282]** by Requirements 15 and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design, with management measures set out in the **oPROWPPMP [APP-282]**, confirmed as embedded mitigation in Section 16.9 **of ES**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. <u>Tourism and Recreation</u> The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. <u>Landscape and Visual</u> An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The **LVIA [APP-060]** found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and **Figure 3-4-1** to **3-4-5.2 Landscape and Ecology Mitigation Plan (OEMPS) [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			<u>Wildlife</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284**]. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing

Reference	Theme	Comments/Issues Raised	Applicant's Response
			arable land within the Solar PV Sites to predominantly grasslands habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Construction Noise and Vibration</u> An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated

Reference	Theme	Comments/Issues Raised	Applicant's Response
			infrastructure. The conclusions of the assessment in relation to each phase of the Scheme are set out below. The conclusions of the assessments are made for the Scheme as a whole (i.e. all of its components combined, including the BESS), and therefore any specific component will not have any greater effects than those that have been assessed. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. In addition, further meetings have been held over the approach to the management plans, and a **Statement of Common Ground** will be issued and updated throughout examination. <u>Construction phase</u> The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity, such as temporary screens and advanced warning of works, are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction, as committed to in the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration effects are appropriately controlled. <u>Dust</u> An assessment of the effects of the Scheme on air quality (including the risk of increased pollution) is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**, which considers potential air quality impacts during construction, operation and decommissioning. The assessment examines dust emissions, vehicle emissions, non-road mobile machinery emissions, back-up generator emissions and emissions associated with a the unlikely event of a potential BESS fire. Supporting technical assessments are provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and Assessment [APP-238]** and **ES Volume 3, Appendix 15-2: BESS Fire Emissions Modelling [APP-239]**. The assessment concludes that, with embedded mitigation measures in place, the Scheme would not give rise to significant adverse air quality effects at human or ecological receptors. Mitigation measures to control construction dust, vehicle emissions and plant emissions are set out in the **Outline Construction Environmental Management Plan [APP-277]**, which includes measures such as dust suppression and site management controls. Additional measures to control construction vehicle emissions are set out in the **Outline Construction Traffic Management Plan [APP-287],** which includes restrictions on construction traffic routing and timing.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the detailed Construction Environmental Management Plan, Construction Traffic Management Plan, Operational Environmental Management Plan and Battery Safety Management Plan, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts are appropriately controlled throughout the construction and operation of the Scheme.
GH-004	Landscape and Visual Ecology and Biodiversity	I also object to the environmental and landscape harm caused by industrial fencing, large-'scale visual structures, and the fragmentation of wildlife habitats. The proposal contradicts local and national Landscape Recovery objectives by creating impermeable barriers that block natural wildlife movement and erode the rural character of the area.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include

Reference	Theme	Comments/Issues Raised	Applicant's Response
			proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies.
GH-005	Socio-Economics, Tourism and Recreation Ecology and Biodiversity	Crucially, I object because the impacts are wide spread. The land within and around the proposed site is a shared rural asset used daily by residents from Norton, Farleaze, Foxley, Corston, Rodbourne, Sherston, Grittleton, and many other communities. They rely on this landscape for its rights of way, tranquillity, open views, wildlife, and the sense of separation between settlements. The proposal would industrialise these shared spaces, replacing a permeable, wildlife rich environment with fencing, noise, traffic, and infrastructure that	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The assessment finds no significant residual effects to individual PROWs or the PROW network overall. However, residual significant effects are anticipated to some long-distance recreation routes during all phases of the Scheme due to their regional or national importance. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under

Reference	Theme	Comments/Issues Raised	Applicant's Response
		would degrade the experience for every community around the site	the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is currently being discussed with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The Applicant furthermore refers to the commitment for the provision of a community liaison group to be set up prior to construction commencing, who will act as the go-to body for queries, complaints or communication between members of the public and the construction contractors. This is secured through Requirement 4 of Schedule 2 to the **Draft DCO [APP-016]**. The Applicant also notes that these matters have been addressed in the Applicant's responses to this Relevant Representation above.

Reference	Theme	Comments/Issues Raised	Applicant's Response
GH-006	Socio-Economics, Tourism and Recreation Description and DCO Process Ecology and Biodiversity	This is not a localised impact. It is a regional loss of amenity, affecting thousands of people who walk, cycle, ride, and enjoy this landscape as part of their daily lives. The proposal would erase the rural qualities that bind these communities together and define this part of the South Cotswolds. In summary, the so-called 'Lime Down Solar Park' is a misnamed, inappropriate, and fundamentally unacceptable industrial proposal. It places an intolerable burden on the entire area and its neighbouring villages, industrialises a cherished landscape, endangers residents, fragments wildlife habitats, and permanently damages the environment and community life across the wider area. For these reasons, I strongly object to the proposal in its entirety.	The Applicant notes that these matters have been addressed in the Applicant's responses to this Relevant Representation above.
GH-007	Soils and Agriculture	This proposed development is enormous and covers circa 2,500 acres of agricultural land and placing major infrastructure - including a Battery Energy Storage System (BESS), substation, and solar arrays - just 300 metres from many homes. The entire village of Hullavington and Farleaze would lie within one mile of the proposed BESS itself, meaning every resident would be directly exposed to the risks, impacts, and consequences of this installation.	The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study methodology and results.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: *"..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.9 -5.4.11) will incorporate all necessary emergency response procedures*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and actions based upon thermal runaway test data supplied by the BESS system provider." As now mandated under NFPA 855 (2026) the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP pre-construction requirements (Section 6). An **OBSMP [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the OBSMP. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 2.4.2 of the OBSMP stipulates that: *"Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing (LSFT) and rigorous consequence modelling to minimise the requirement for any D&WFRS intervention in a thermal runaway incident. LSFT must establish minimum equipment spacing distances that demonstrate there is no fire propagation to adjacent BESS enclosures or ESS equipment. D&WFRS intervention in worst case scenarios would typically be limited to boundary cooling of adjacent BESS and Energy Storage System (ESS) units to prevent the fire from spreading. This strategy will be finalised with D&WFRS and be clearly communicated in the Emergency Response Plan (ERP);*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• *To ensure that fire, smoke, and any release of toxic gases does not significantly impact site operatives, first responders, and the local community; and* • *To ensure that firewater run-off is contained and tested before release or, if necessary, removed by tanker and treated offsite."* As set out in the **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation and decommissioning. The Applicant's ERP template includes all requirements specified in both NFCC and NFPA 855 guidance and recommendations. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant is currently drafting a **Statement of Common Ground** with the Environment Agency (EA) on Scheme environmental protection issues including the BESS area drainage strategy. The agreed strategy document will be appended to the OBSMP at Deadline 1, to provide further assurance that all water pollution risks from a BESS fire are fully mitigated. The EA is a statutory consultee for the OBSMP and drainage strategies and must approve the final BSMP and drainage design at detailed design before construction of the BESS commences. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
GH-008	Hydrology, Flood Risk and Drainage	This proximity is not merely a matter of visual or acoustic intrusion. It represents a civil-'contingency-'level risk too serious to contemplate. Large-'scale lithium battery systems carry internationally recognised hazards associated with thermal runaway, fire, explosion, and toxic plume generation. These events are rare but catastrophic, and emergency planners treat them with extreme caution. No credible mitigation has been proposed for a failure event of this nature - and in reality, none could be envisaged. The applicant has not demonstrated how a major incident could be contained, controlled, or prevented from affecting the village, the school, the surrounding communities, or the nearby mainline railway. The siting of the BESS so close to homes and critical infrastructure is wholly inappropriate and represents an unacceptable and unmanageable risk to public safety.	The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study methodology and results. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.9 -5.4.11) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider*." As now mandated under NFPA 855 (2026) the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP pre-construction requirements (Section 6). An **OBSMP [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the OBSMP. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 2.4.2 of the OBSMP stipulates that: *"Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing (LSFT) and rigorous consequence modelling to minimise the requirement for any D&WFRS intervention in a thermal runaway incident. LSFT must establish minimum equipment spacing distances that demonstrate there is no fire propagation to adjacent BESS enclosures or ESS equipment. D&WFRS intervention in worst case scenarios would typically be limited to boundary cooling of adjacent BESS and Energy Storage System (ESS) units to prevent the fire from spreading. This strategy will be finalised with D&WFRS and be clearly communicated in the Emergency Response Plan (ERP);* *• To ensure that fire, smoke, and any release of toxic gases does not significantly impact site operatives, first responders, and the local community; and* *• To ensure that firewater run-off is contained and tested before release or, if necessary, removed by tanker and treated offsite."* As set out in **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation and decommissioning. The Applicant's ERP template includes all requirements specified in both NFCC and NFPA 855 guidance and recommendations.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant is currently drafting a **Statement of Common Ground** with the Environment Agency (EA) on Scheme environmental protection issues including the BESS area drainage strategy. The agreed strategy document will be appended to the OBSMP at Deadline 1, to provide further assurance that all water pollution risks from a BESS fire are fully mitigated. The EA is a statutory consultee for the OBSMP and drainage strategies and must approve the final BSMP and drainage design at detailed design before construction of the BESS commences. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.

Table 6-12 RR-4076

Reference	Theme	Comments/Issues Raised	Applicant's Response
RST-001	Site selection and Alternatives Climate Change and Energy Need	This development is completely inappropriate in location and should be in an industrial area or along motorways instead of beautiful countryside. The whole net zero concept is flawed anyway and all this is doing is reducing the value of our properties and ruining the countryside it is a disgrace.	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explains that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation (being the grid connection location for this Scheme) has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Selection Assessment Report [APP-185], the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. In terms of the contribution of the Scheme to net zero, **ES Volume 1, Chapter 7: Climate Change [APP-059]** concludes that during the different stages of the Scheme (construction, operation and decommissioning), inevitable greenhouse gas (GHG) emissions will be generated with associated products, transport, energy and fuel-use. However, the GHG assessment shows that the emissions generated during construction of the Scheme will be totally offset by the clean energy generated during the operational phase, and the Scheme itself will provide beneficial impacts through a net reduction in GHG emissions compared to a scenario without the Scheme where energy must be generated by the baseline grid means and without the capacity for energy storage. Therefore, overall, there are beneficial significant residual effects on climate change anticipated as a result of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
VB-001	Human Health	We specifically moved to the middle of nowhere from a city for the mental health benefits - the fields of solar panels surrounding us will seriously impact this in a negative way.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
VB-002	Socio-Economics, Tourism and Recreation	The value of my home has already decreased, and sale timeframe lengthened to goodness knows how long.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].**.
VB-003	Socio-Economics, Tourism and Recreation	Our home is at the end of a dead end track with no passing places, that is a haven for families of walkers / cyclists / riders who want or need to avoid traffic - again, the constant construction traffic	The closest construction route/link to this location is Fosse Way, and an assessment of this link is included at Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
	Transport and Access	poses a serious risk - the death or injury of a dog or horse is significant in the face of months of large construction vehicles.	In regard to NMU users**, ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** at 13.10.42 assess the impact on Non-motorised user delay and amenity, including Fear and Intimidation. <u>NMU Delay</u> NMU delay is considered negligible given there is no existing pedestrian or cycle infrastructure on the construction routes and likely low numbers of existing NMU users. It is anticipated that PRoW which cross the Order Limits will generally remain open during the construction phase of the Scheme. There may be some slight perceptible delay to NMU movement if a construction vehicle is crossing a PRoW within the Order Limits. An **Outline PRoW and Permissive Path Management Plan [APP-282]** forms an embedded mitigation and will provide measures to ensure the effects of the construction phase on PRoW users is minimised. The **Outline PRoW and Permissive Path Management Plan [APP-282]** contain specific measures for the temporary diversion of footpath WT|GRIT|20 and bridleway WT|MALW|54, where access to Cable Route Corridor works east of Grittleton, and HGV access to Lime Down E are taken respectively. These diversions are proposed to ensure unreasonable effects to PROW users are not experienced during construction, replacement and decommissioning. <u>NMU Amenity</u> Pedestrian amenity is broadly defined as the relative pleasantness of a journey, and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic. The construction routes on the road network have little existing pedestrian infrastructure and no footways, making

Reference	Theme	Comments/Issues Raised	Applicant's Response
			them already unattractive as walking routes with no pedestrian amenity so this cannot be assessed. Fear and Intimidation for other NMU's can be assessed. Highway widths of construction routes have been assessed **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**] and provide sufficient width for HGV traffic to comfortably pass cyclists. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that the level of flow change will not result in a step change in fear and intimidation as defined in the **IEMA guidance at tables 3.1, 3.2** and **3.3**. **ES Volume 1, Appendix 13-1: Transport Assessment [APP-065]** concludes that on all links in the study area the significance of effect is Minor Adverse (temporary). <u>Mitigation</u> An **OCTMP [APP-287]** supports the DCO Application and presents outline measures which restrict construction deliveries to the proposed construction routes and separates the public and recreational users from hazards, including, traffic management measures such as signage and banksmen, fencing, and dust and noise control. An **OCTMP [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. This includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. A final CTMP would be prepared post consent and must be substantially in accordance with the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			OCTMP [APP-287] and approved by the relevant local planning authorities. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
VB-004	Landscape and Visual Transport and Access	On the original Lime Down applications the failed to recognise our home as a dwelling! It has since been recognised but AFTER the fields immediately adjacent to us have been selected for development. Lime Down Assessment documents confirm that the impact on our home of the construction and 1st year of operation will be "Major / Moderate / Adverse / Significant." There will be visible panels on both sides of our homes, less than 50m from our windows, which are currently completely rural with long views and incredible sunsets over Farmland and	The Applicant places significant value on local knowledge and confirms that the concerns of Grain Store Barn residents were afforded consideration through direct engagement including residents' participation in statutory consultation events, a dedicated site visit and a meeting with the Applicant where specific plans and localised impacts were discussed. As a direct result of this active dialogue and the iterative design process, the Applicant confirmed amendments to the Scheme to include a further setback of panel infrastructure away from these properties. These changes were confirmed to residents in writing and are reflected in the final application design, specifically within **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]** and the **Landscape and Ecology Mitigation Plan [APP-084]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		the Fosse Way. Increased construction traffic on local single lane roads and tiny villages will pose a serious danger and risk of death or injury to local road users - dog walkers, horse riders, cyclists and school children. The Lime Down documentation confirms they will be impacted and will be high risk.	The Applicant confirms that the final application documentation accurately identifies residential receptors, including the Grain Store Barn, and acknowledges that a correction to a layer on one map during Statutory Consultation was corrected to show the property had been excluded from the project boundary. The proposed design incorporates screening and substantial buffers beyond the 50m minimum distance, to beyond a nearby telecoms line, to maintain the privacy and amenity of residents, as detailed in the **Outline Landscape and Ecological Management Plan (LEMP) [APP-283]**. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads

Reference	Theme	Comments/Issues Raised	Applicant's Response
			forming part of the construction routes and will be confirmed as part of the final CTMP. Excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route) • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A-C (average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.
VB-005	Human Health	We specifically moved to the middle of nowhere from a city for the mental health benefits - the fields of solar panels surrounding us will seriously impact this in a negative way.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens"

Reference	Theme	Comments/Issues Raised	Applicant's Response
			to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

6.14 Mostyn Neil Hamilton

MNH-001	Cultural Heritage	IN THE MATTER OF THE PLANNING ACT 2008 PINS Ref: EN010168 Application by Lime Down Solar Park Limited for an Order granting Development Consent for the 'Lime Down Solar Project' RELEVANT REPRESENTATIONS of NEIL HAMILTON, (Redacted) HERITAGE - ESPECIALLY, GRADE I LISTED BRADFIELD MANOR (Redacted) It is a medieval Gothic building dating back to the 14th century. From Domesday, until it was sold in 1992 by Mr John Branston, the manor was the centre of an agricultural unit, stretching northwards to the ancient woodland, Bradfield Wood. Mr Branston has put 180 acres of farm-land immediately surrounding Bradfield Manor into the Lime Down Solar (LDS) industrial complex. Lime Down is an invented name designed to sound 'cuddly' and it is the polar opposite of a 'park,' as it is misleadingly described. This 180 acres extends in an arc around Bradfield Manor from NE to SW, obliterating the landscape and filling virtually all the space between Bradfield Manor and Bradfield Wood. If LDS were built, it would completely wreck the setting of this Grade I listed building.	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **Appendix 12.1: Heritage Statement [APP-219],** identified that there was a potential for a moderate / minor adverse effect on Bradfield Manor Farmhouse, which is not significant (less than substantial harm at the lower end in NPPF terms). Site visits were undertaken with Historic England on the 28th March 2025, which included visiting land adjacent to Grade I Listed Bradfield Manor Farmhouse and Rodbourne Conservation Area. A second site visit with Historic England was undertaken in the grounds of Bradfield Manor Farmhouse on the 22nd May 2025 (see table 12-2 in **Chapter 12: Cultural Heritage [APP-064]**). Feedback provided during the site visits was used to inform the Scheme design and assessment provided in **Chapter 12: Cultural Heritage [APP-064].** As stated in **Appendix 12.1: Heritage Statement [APP-219]** when considering the contribution of setting to the significance of the Grade I Listed Bradfield Manor Farmhouse (NHLE: 1198808), the asset is largely defined and experienced from within the Bradfield Manor Farmhouse grounds, in particular the walled courtyard to the south-west of the asset, where the full architectural interest of its south-facing primary elevation can be appreciated. Lime Down D is located within agricultural land to the north of asset. Following advice provided by Historic England panels in Field D5 were set back away from Grade I Listed Bradfield Manor Farmhouse and enhanced screening is proposed along existing hedgerows. Views of the proposed BESS and 400 kV Substation from Bradfield Manor Farmhouse will be largely mitigated by the proposed new woodland belt along the south-eastern boundary of Field D3 which, in combination with the existing woodland block west of D1 and south of D22, provides extensive screening in views to and from Bradfield Manor Farmhouse. It was identified that there would be a moderate / minor (not significant) adverse effect to

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Grade I listed buildings are exceptionally rare; there are only 9380 in the whole of England, 295 of which are in Wiltshire. They constitute less than 2.5% of all listed buildings. Most Grade I listings are for major national landmarks like Buckingham Palace, Westminster Abbey or, in Wiltshire, Salisbury Cathedral, Malmesbury Abbey and major stately homes like Longleat, Wilton House and Lacock Abbey. There are very few Grade I listed smaller residential dwellings like Bradfield Manor, which is a rare surviving medieval hall house. It is, therefore, a building of exceptional historic and architectural interest even within the category of Grade I buildings. The setting of which, and the views from its rooms above the ground floor, will be completely ruined by the proposed footprint of LD. LDS is a 'nationally significant infrastructure project'. But Grade I listed buildings are also 'nationally significant' and great weight should be given to preserving and protecting them from the kind of vandalism proposed here. In addition to the acres of solar panels, LDS has (Redacted) us with proposals for the BESS and a 400 kV transmission station. The former will include up to 200 shipping-container	the asset (less than substantial harm at the lower end in NPPF terms) as a result of indirect (i.e. setting) impacts. The Applicant wishes to clarify that there are no 50ft high pylons proposed in the application. The maximum possible envelope of the busbars associated with the 400kv substation have been assessed using clearly defined design parameters, up to a maximum height of 13 metres to the top of the busbars, as set out in **Table 3-1 of ES Volume 1, Chapter 3: The Scheme [APP-055]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		sized battery units, with associated noise impact from the cooling fans, and the latter will include a 50ft high pylon. The effect of LDS on Bradfield Manor (and other listed buildings, landscapes etc) should be a major part of the Inquiry.	
MNH-002	Cultural Heritage	IN THE MATTER OF THE PLANNING ACT 2008 PINS Ref: EN010168 Application by Lime Down Solar Park Limited for an Order granting Development Consent for the 'Lime Down Solar Project' RELEVANT REPRESENTATIONS of NEIL HAMILTON, (Redacted) HERITAGE - ESPECIALLY, GRADE I LISTED BRADFIELD MANOR (Redacted) It is a medieval Gothic building dating back to the 14th century. MNH-003	Landscape and Visual Site selection and Alternatives Climate Change and Energy Need	2. DISPROPORTIONATE QUANTITIES OF LAND REQUIRED TO GENERATE A GIVEN AMOUNT OF ELECTRICITY BY SOLAR I accept that Government policy is to achieve 'net zero' by 2050; a timescale which is physically impossible to achieve, considering that only 20% of CO2 emissions derive from power generation. However, there is still a balancing exercise to be carried out by PINS. Were it not so, there would be no point in an Inquiry. It is legitimate for PINS to consider in this balancing exercise, the disproportionately small actual output of solar power from the proposed panels and the disproportionate	The **Statement of Need [APP-266]** describes that there is an urgent and unprecedented need for new low carbon generation in the UK to meet our climate change, energy security and affordability targets. Further, the Government considers that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Further, Section 2.9 of the **Statement of Need [APP-266]** describes that the government is seeking a large capacity of new low carbon schemes to come forwards to prioritise projects needed for 2030, while maintaining a robust pipeline of projects beyond 2030 towards meeting net zero by 2050. Figures 28 and 29 of the Statement of Need and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		substantial damage caused to other legitimate interests (like Grade I listed buildings and the landscape) by the monumental scale of the scheme. The public presentations of LDS have been deliberately misleading. According to the developer, 'the project is designed to deliver approximately 500 megawatts (MW) of renewable electricity, which is enough to power roughly 115,000 homes annually.' This disguises the reality that, in the winter, very little solar generation is possible because none can be generated in the dark or with low light levels during the day. On the 8 January as I write this, solar power generated 0.00% of its theoretical capacity during the early hours (GMT), as it was nighttime. The UK's total solar capacity reached 21.50 GW by this date, but its annual average capacity factor remains approximately 10% due to the northern climate. So, to reach LDS's claimed output figures, vast quantities of land are required compared with other forms of power generation (including other renewables). In my submission, in the balancing of interests by PINS, this should weigh in favour of the objections and against the scheme.	Section 9.4 of the **Planning Statement [APP-267]** sets out the planning balance, considering the positive, neutral and negative impacts of the Scheme. Taking these into account and having regard to all important and relevant matters, it is concluded that there are no adverse impacts of sufficient weight, either on their own or collectively, that would mean the DCO should not be made. The adverse impacts identified are clearly outweighed by the substantial public benefits that would arise from the provision of low carbon energy to meet the need identified in NPS EN-1. The Applicant also notes the comment regarding output figures and land requirements. **Section 6.7.6 and 6.7.7 of The Statement of Need [APP-266]** set out that large-scale solar schemes are efficient in comparison to other technologies in terms of the energy they generate over their lifetime on a per unit area basis. Furthermore, solar technology can also generate more energy per hectare of land than other existing low carbon electricity generation technologies. For example, solar can generate between 25 and 50 times the energy output per unit area of growing crops for energy. By following good design principles, solar schemes can generate a similar amount of energy per hectare of land as onshore wind. provides a comparative analysis of energy generation per unit of land, demonstrating that large-scale ground-mounted solar schemes are highly efficient. **Section 6.7.1 of the Statement of Need [APP-266]** also sets out that NPS EN-3 indicates that along with associated infrastructure, a solar farm typically requires between 2 to 4 acres for each MW output. Different configurations have different performance characteristics in terms of acres/MW(p). The illustrative design for the Scheme lies within that range. However, while MW(p) is an important measure in relation to the maximum power which can be generated from a scheme, it is not the only metric by which the decarbonisation and energy

Reference	Theme	Comments/Issues Raised	Applicant's Response
			security benefits brought forwards by solar schemes can or should be measured.
MNH-004	Description and DCO Process Site selection and Alternatives	3. STRATEGIC PLANNING Given the scale of solar NSIPs, they should be as compact as possible and near to a grid connection. I believe that the dispersed footprint of LDS and its 20km distance from the grid connection at Melksham make this project unprecedented in its unsuitability. It seems that the disparate sites (each of which qualifies as an NSIP in its own right), have been stitched together without any strategic planning and derive solely from a random collection of landowners prepared to sign option agreements to line their own pockets at the expense of their neighbours. This kind of development occurred in the 1930s as 'ribbon development' and led to the Town & Country Planning Act 1947, introduced to replace random despoliation of the countryside with strategic planning, including the introduction of green belts and other public goods. As a matter of general policy, given the rash of solar NSIP proposals currently being promoted, PINS should promote compaction in site design and proximity to a grid	The Applicant's approach to site selection is set out in detail in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report (The SSAR) [APP-185]**. This includes how the Applicant has sought to prefer contiguous land parcels or land parcels close to one another when selecting the Solar PV Sites. The **SSAR [APP-185]** also explains how sites closer to the point of connection were initially considered, before the search area was expanded on the basis that no suitable sites closer to the point of connection were identified.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		connection as a desirable feature for recommending consent. A project design like LDS, 2 miles long and 4 miles wide, with 5 random parcels of land, connected by cable and connected to the grid by a cable requiring 15 miles of trench over land which will be acquired by CPOs, or the threat of CPOs, is flawed in principle. PINS should make recommendations which are consistent with best practice planning principles and not those which fly in their face.	
MNH-005	Landscape and Visual	LANDSCAPE The monumental scale of the proposed solar panels is unprecedented. Disgracefully, LDS has not yet announced definitively the exact specification of the panels which will be used but we know that they will be up to 4.5m (15ft) high and there are likely to be at least 650,000 of them. LDS say that they will be well-screened but this is impossible given the undulating nature of the landscape and the fact that the 4.5m panels are the height of a double-decker bus. Proper screening will take a generation to grow naturally but, even then, the nature of the landscape will have changed, eliminating the current vistas from, for example, Bradfield Manor, where the imposition of 180 acres of giant solar panels will completely wreck its	The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. The landscape and visual effects of the Scheme, including the effects of the maximum panel height, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors during construction, operation and decommissioning, using the maximum design parameters to ensure a robust assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These include new

Reference	Theme	Comments/Issues Raised	Applicant's Response
		setting Nine Cotswolds villages will be adversely affected by the scheme, which has been randomly developed according to which landowners have been willing to line their own pockets at the expense of their neighbours, whose homes and neighbourhoods will be severely damaged financially as well as in terms of quality of life.	and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The landscape and visual effects of the Scheme, including the effectiveness and phasing of proposed screening and planting, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA considers landscape and visual effects over time, including during the early years of the Scheme before planting is fully established, and identifies where significant effects may occur. NPS EN-1 recognises at para 5.10.5 that *"Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation.*" The full assessment of effects of the Scheme on Bradfield Manor Farmhouse (receptor No RI068) is set out ES Chapter Volume 3, Appendix 8-3-2-2: Landscape and Visual Assessment Sheets (Significant) (APP-191). The assessment finds that there would be Moderate (Significant) effects during Construction and Year 1 and effects would reduce to Moderate/ Minor (non-significant by Year 15 and No effect following Decommissioning. Mitigation measures are detailed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			(OLEMP) [APP-283]. Proposed planting comprises a mix of native species designed to enhance biodiversity and resilience, with planting design prioritising long-term effectiveness and landscape integration. The **OLEMP [APP-283]** sets out the approach to establishment, maintenance and management of planting to ensure its effectiveness over the lifetime of the Scheme. The LVIA includes verified viewpoints with both summer and winter photography to demonstrate year-round changes to the landscape. Photomontages at Year 15 illustrate the effectiveness of established planting, while also demonstrating the intended retention of openness across the receiving landscape. It is recognised that from upper floors of this property, there would be filtered views of construction of proposed solar array within southern fields of Lime Down D, (D5, D3, D2 and D1) and that views would be filtered through existing hedgerow vegetation located between the Scheme and the dwelling. There would be glimpsed filtered views of construction of the BESS within D1. Views of the 400kv substation would be screened by the existing woodland to the west of D1 and south of D22. Vegetation within the curtilage of the property would screen ground floor and immediate garden views. The assessment also notes the proposals include for a green corridor along the southern boundary of D3 and hedgerow reinforcement along the boundaries of D1, D2, D3, D5 and the wider Site. And that although the effect of this would be limited initially, by Year 15 mitigation planting would screen views of proposed infrastructure in southern fields of Lime Down D and would integrate with the existing vegetated field margins. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that mitigation planting

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and screening measures are delivered and maintained throughout the lifetime of the Scheme.
MNH-006	Climate Change and Energy Need Construction and Decommissioning	CARBON FOOTPRINT The dispersed nature of the site design, referred to in point 3 above, also has implications for LDS's carbon footprint, which should be exhaustively examined in every particular. The sole justification of the scheme is its alleged contribution to achieving net zero objectives. It has no commercial justification without enormous subsidies from taxpayers and consumers, largely extracted via consumers' bills, which recoup the extra costs imposed through renewables obligations, carbon taxes and manipulated contracts for differences to favour intermittent suppliers. In order to balance the competing policy objectives inherent in such large projects, the public needs to have a transparent and reliable evaluation of their individual carbon footprint. As of early 2026, it is estimated that 68% of solar panels imported by the UK come directly from China. This represents an increase from 61% in 2023. The reliance on Chinese production is even more pronounced when examining the underlying	The **ES Volume 1, Chapter 7: Climate Change [APP-059]** assessment has used a reasonable conservative assumption that materials will be sourced from China for the purposes of estimating GHG emissions. This does not obligate the developer to use materials from any particular supplier or country of origin but represents a reasonable assessment scenario given that China are the largest manufacturer of solar panels. The equipment proposed for Lime Down Solar Park will be sourced from established and responsible supply chains. Island Green Power is part of the Solar Energy UK Supply Chain Commitment, which binds the Applicant to ensuring that our supply chains are free of slavery. As part of this, the solar sector in the UK and Europe has launched the Solar Stewardship Initiative, which independently inspects and certifies individual factories for sustainable and ethical practices. **ES Volume 1, Chapter 7: Climate Change [APP-059]** demonstrates that there is an overall net saving as a result of the scheme on GHG emissions compared to a without scheme scenario. Regarding commercial justification, the Scheme is entirely funded by the Applicant, and not via subsidies. As set out in Section 2,3 of the **Funding Statement [APP-019]**, the Applicant has the ability to procure the financial resources necessary to fund the works to be authorised by the DCO. The Applicant's **Statement of Need [APP-266]** provides evidence that an unprecedented capacity of new low-carbon generation schemes is urgently needed for the UK to meet its legally binding climate change targets. The government has confirmed that solar energy is at the heart of the Clean Power 2030 Mission [NPS EN-3 (2025) Paras 2.10.1 & 2.10.2]. The

Reference	Theme	Comments/Issues Raised	Applicant's Response
		components and materials rather than just final assembly: Polysilicon Sourcing: An investigation found that 97% of solar panels installed in the UK contain polysilicon sourced from China. Regional Concentration: Roughly 40% of the materials used in UK solar panels are estimated to originate from a single region,(Redacted), which has faced international scrutiny regarding ethical sourcing and forced labour. This is relevant because of the obligations imposed by the UK's Modern Slavery Act. Market Components: Chinese firms also account for approximately 60% of the market for power inverters (the devices that convert solar energy into usable electricity) in the UK. Much of the reduction in the UK's CO2 emissions has resulted from the collapse of energy-intensive heavy industry, caused by the UK having the highest industrial energy prices in the world (4 times the USA's and twice those in France). A major factor in this is the inherent need to double generating capacity to cope with the intermittency of renewables. This de-industrialisation of the UK has contributed almost nothing to reducing global emissions. It has merely shifted the accounting for CO2 emissions from the UK's carbon	Statement of Need confirms that the need for the Scheme is urgent and that substantial weight should be given to the need for the Scheme [NPS EN-1 (2023) Para 3.2.9-3.2.10]. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		balance sheet to China, India etc. and other countries whose commitment to emissions reductions is merely performative and whose top priority is economic growth. China produces over 30% of global CO2 emissions; the UK, less than 1%. Yet China is still massively expanding coal-fired generative capacity. The Finland-based Centre for Research on Energy and Clean Air (CREA) and Global Energy Monitor (GEM) in the United States, reported that China began construction on 94.5 GW of coal power projects in 2024; 93% of the global total. For Lime Down Solar to be justified, it must make a real, not an illusory, contribution to reducing the UK's CO2 emissions. This requires a full audit of the CO2 emissions created during the construction and transport of solar panels, the construction of the site infrastructure, the mining of the chemicals used in the manufacture of the panels, mostly deriving from countries with very poor environmental records etc. Without reliable information on the true carbon cost of LDS, all its claims of producing 'green' energy are meaningless. One of Wiltshire Council's primary technical objections is that construction emissions would delay	

Reference	Theme	Comments/Issues Raised	Applicant's Response
		the project's 'carbon break-even' point until 2076, meaning it would take approximately 50 years to offset the carbon footprint of its building phase. Clearly, if there is only a minimal real reduction in CO2 emissions over the 60-year maximum lifetime of the scheme, the harms caused to other desirable policy objectives e.g. heritage and landscape protection, food security, etc, need to be given far greater weight in the balancing exercise of the decision-making process. This aspect needs to be exhaustively examined with expert evidence.	
MNH-007	Noise and Vibration Other Environmental Matters	6. NOISE North Wiltshire is still very rural and relatively tranquil. Traffic noise is minimal for most residents, apart from agricultural activity at certain times of year. Bradfield Manor is affected by the main rail link from Paddington to South Wales but the few trains per hour flash past in about 25 seconds so the impact is negligible. By contrast, the noise of LDS BESS cooling systems will be audible 24 hours a day for up to 60 years. Furthermore, extreme noise disruption will be caused during the lengthy construction period, with hundreds of huge lorries carrying	An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** supports the DCO Application and includes outline measures to minimise transport and access impacts as far as practicable. This includes road condition surveys to ensure any damage to the highway network caused by construction traffic is identified and rectified, management of construction deliveries to avoid the requirement for HGVs generated by the Scheme passing each other in opposite directions on the local roads, and restricted hours of deliveries outside of peak hours. A final CTMP would be prepared post consent and must be substantially in accordance with the **Outline CTMP [APP-287]** and approved by the relevant local planning authorities. The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		heavy loads on roads unsuited to such traffic. Perhaps worse still, will be the intolerable noise nuisance caused by the scheme's colossal piling requirements for securing in the ground its 650,000 panels. This promises to make our lives at (Redacted)(and others affected elsewhere) a living hell. Noise can travel long distances depending on atmospheric conditions. For example, on certain days noise from the M4 and the motor racing track at Castle Combe can clearly be heard from Bradfield Manor, which is up to 4 miles distant. The constant hum of inverters and the sound of cooling fans for the BESS will originate only a few hundred metres from Bradfield Manor and are bound to affect it adversely. All this needs to be exhaustively examined during the Inquiry.	**Environmental Management Plan (Outline CEMP) [APP-277]**. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. The Applicant also notes that noise from the installation of solar PV panels will be spread across the site over the course of the construction period and therefore will only be at the predicted levels presented in Table 14-18 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** for relevant sensitive receptors when works are occurring at the relevant associated site. As a reasonable worst-case this assessment includes the noise from piling rigs that are larger and louder than those used in practice. The assessment also includes the noise from construction traffic. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As shown in Table 8 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, levels would typically be below or slightly above the existing background sound in the area. The levels have been calculated, using the appropriate international standard, on a worst-case assumption that wind is blowing from the source of the noise to the receptor locations, as stated in paragraph 14.4.15 of **ES Volume 1, Chapter 14: Noise and Vibration**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-066]. Due to its length, noise from the M4 will travel further than noise from static plant within the Scheme. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that, while operational noise will occasionally be audible, it will be close to the existing background sound level at Bradfield Manor Farmhouse. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, is secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
MNH-008	Site selection and Alternatives Construction and Decommissioning	7.CABLING This is one of the most bizarre features of LDS's scheme. 400kV of electricity will need to be transmitted by underground cable buried in a wide trench, filled with insulation and heat-dispersing stones, for a distance of 15 miles. The Cable Route Corridor has a footprint of 50 metres along most of its length in order to accommodate construction activities, increasing to 665 metres in specific locations. This is an unprecedented feature not found in any other UK NSIP. In addition, the cabling will have to go: (a) under the main railway line from Paddington to South Wales, (b) under the M4 and (c) under the main railway line from	The Applicant's approach to site selection is set out in further detail in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** (The SSAR). The SSAR explains how sites closer to the point of connection were initially considered, before the search area was expanded on the basis no suitable sites closer to the point of connection were identified. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study methodology and results.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Paddington to Bath and Bristol. The BESS is also proposed to be sited immediately adjacent to the London-South Wales railway, where the line is in a 10 metres deep cutting, which has implications for dispersal of the vast quantities of water which would be used in response to thermal runaway and also act as a sink for heavier-than-air gases which would be released. The BESS does not have to be near the panels; it could be anywhere accessible to the cable route. (LDS rejected a site adjacent to the grid connection at Whitley in favour of the current proposed site). A more suitable BESS site needs to be found, not least because of the possibility of thermal runaway disrupting transport links and the impossibility of extinguishing such chemical reactions, not to mention the colossal quantities of water needed to cool the batteries if such a disaster occurred. There is no natural water anywhere near the proposed site. It would need to be brought in by tanker and stored in a reservoir. There is also nowhere for water to go naturally if it had to be used - except possibly into the railway cutting, which is 10 metres deep at this point. There are clear public safety issues which need to be exhaustively examined, as illustrated by the thermal runaway at Moss Landing in	Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.9 -5.4.11) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider.*"

Reference	Theme	Comments/Issues Raised	Applicant's Response
		California a year ago. There can be no justification for taking ANY risks with the siting of the BESS, given the CPO powers which a DCO grants. It should be sited near the grid connection, with good access for fire services, sufficient water supply and infrastructure to carry it away without creating unacceptable flooding risks.	As now mandated under NFPA 855 (2026) the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP pre-construction requirements (Section 6). An **OBSMP [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the OBSMP. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 2.4.2 of the OBSMP stipulates that: *"Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing (LSFT) and rigorous consequence modelling to minimise the requirement for any D&WFRS intervention in a thermal runaway incident. LSFT must establish minimum equipment spacing distances that demonstrate there is no fire propagation to adjacent BESS enclosures or ESS equipment. D&WFRS intervention in worst case scenarios would typically be limited to boundary cooling of adjacent BESS and Energy Storage System (ESS) units to prevent the fire from spreading. This strategy will be finalised*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			with D&WFRS and be clearly communicated in the Emergency Response Plan (ERP); *• To ensure that fire, smoke, and any release of toxic gases does not significantly impact site operatives, first responders, and the local community; and* *• To ensure that firewater run-off is contained and tested before release or, if necessary, removed by tanker and treated offsite."* As set out in the **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation, and decommissioning. The Applicant's ERP template includes all requirements specified in both NFCC and NFPA 855 guidance and recommendations. Section 5.4.9 – 5.4.11 of the OBSMP stipulates that the ERP will follow NFCC and NFPA 855 (2026) guidelines and stipulates the minimum content that an ERP must contain, including: *"Emergency procedures for all credible hazards and risks, including building, infrastructure and vehicle fire, wildfires, impacts on local respondents, impacts on transport infrastructure."*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			All risk assessments to be conducted at detailed design for BESS projects required by the Health and Safety Executive (HSE) to assess fire and explosion risk are stipulated in Section 6.1.5. Further explosion prevention, mitigation, and safety requirements for the Scheme are stipulated in the OBSMP Sections: 1.1.6 – 1.1.7, 4.1.3 – 4.1.10, 4.1.18, 4.1.27, 4.1.30 - 4.1.33, 4.1.36 – 4.1.39, 5.1.3, and 5.1.6. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant is in the process of agreeing a Statement of Common Ground (SOCG) with D&WFRS to provide assurance that all safety and emergency response requirements are fulfilled. The Applicant is currently drafting a Statement of Common Ground (SOCG) with the Environment Agency (EA) on Scheme environmental protection issues including the BESS area drainage strategy. The agreed strategy document will be appended to the OBSMP at Deadline 1, to provide further assurance that all water pollution risks from a BESS fire are fully mitigated. The EA is a statutory consultee for the OBSMP and drainage strategies and must approve the final BSMP and drainage design at detailed design before construction of the BESS commences. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-016], which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
MNH-009	Hydrology, Flood Risk and Drainage	8. FLOODING The lane between Bradfield Manor and the adjacent fields selected for solar panels floods badly every year. Similar problems occur elsewhere in the dispersed LDS site. Malmesbury, in particular, regularly experiences severe flooding. The river catchment system is barely capable of accommodating flash floods now, let alone the exacerbated water flows which the inherent nature of massive impermeable ceramic panels will cause, as a result of water concentration at the point of run-off and soil compaction. No strategic approach to solar NSIPs would reasonably countenance the configuration of the LDS scheme, quite apart from its distance from the grid connection. Given the constricted nature of the streams which connect to the River Avon, severe flooding seems likely to be exacerbated without any substantial alleviation	The Applicant acknowledges that local flooding affects lanes and settlements in the area, including Malmesbury, and that this is a matter of concern to local people. The potential effects of the Scheme on hydrology and flood risk have been assessed in **Environmental Statement Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**, supported by the **Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. These assessments consider all relevant sources of flood risk and construction phase mechanisms and conclude that the Scheme would not increase flood risk elsewhere or give rise to significant adverse effects on flood risk receptors. The Applicant does not agree that solar PV arrays are "massive impermeable" surfaces that inherently exacerbate runoff. National policy recognises that ground mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (**NPS EN-3 paragraph 3.10.75**). The design approach distinguishes between panelled areas and hardstanding associated with supporting electrical infrastructure. Panelled areas allow rainfall to drain to the existing ground surface, while engineered and controlled drainage is provided where infrastructure such as access tracks, substations or the BESS introduces impermeable surfaces. These drainage controls are secured through the **Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]** and the **Draft Development Consent Order [APP-016]** discharge process.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		being possible through an engineering solution. This also needs to be exhaustively examined.	
MNH-010	Transport and Access	9. TRAFFIC Traffic on our country lanes has increased significantly in the last 20 years since we moved to the area. I used to be a keen runner but was forced to give up running on the lanes for reasons of safety. The verges are unsuitable as refuges and the narrowness of the lanes conspires with the volume of traffic to make the experience now both unpleasant and risky. In the narrowest parts of the lanes the verges are regularly damaged by vehicles trying to pass each other, producing ruts and potholes. With increased water flows from the fields covered with thousands of solar panels, this problem can only get worse. Little alleviation is possible without changing the character of the country lanes through widening, straightening and replacing our rural country character by a soul-less urbanised wilderness.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. In relation to the concern that solar panels would increase runoff affecting local lanes and verges, the assessment presented in **Environmental Statement Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** concludes that the Scheme would not increase surface water runoff rates or volumes leaving the Site. Solar PV panels drain to the existing ground surface and maintain infiltration and overland flow processes, and therefore would not be expected to increase water flows affecting surrounding roads or drainage pathways. As set out in the **OCTMP [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any

Reference	Theme	Comments/Issues Raised	Applicant's Response
			delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be confirmed as part of the final CTMP. In response to paragraph 14.7, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); - assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **OCTMP [APP-287]**. There will be no HGV construction trips outside of these hours;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• there would be a much greater impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down D (average number of existing HGV movements is only 46 per day, with some of these movements occurring outside of proposed construction hours set out in the **OCTMP [APP-287]**) Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.
MNH-011	Description and DCO Process Cultural Heritage	10. ENVIRONMENTAL STATEMENT NATIONAL POLICY STATEMENT FOR ENERGY NATIONAL PLANNING POLICY FRAMEWORK The Environmental Statement (ES) plays down the potential for 'Likely Significant Impacts' and does not allow a reasonable determination of the planning balance in accordance with National Policy Statement for Energy (EN-1) and the National Planning Policy Framework. The reasons for this conclusion can be summarised as follows: The ES concludes the impact of	The potential effects of the Scheme on cultural heritage assets, including cumulative effects, are assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]**. The assessment identifies heritage assets, considers their significance and the contribution of setting, and evaluates effects during construction, operation and decommissioning phases of the Scheme. The cumulative impacts have been assessed with consideration to the Scheme and other proposed and identified developments are assessed in Section 12.12 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**. This approach is in line with the methodology detailed in Section 6.8 of **ES Volume 1, Chapter 6: Environmental Impact Assessment Methodology [APP-058]**, consultation undertaken with Wilshire Council (see Section 12.2 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, as well as guidance and

Reference	Theme	Comments/Issues Raised	Applicant's Response
		development would give rise to 'less than substantial harm' to cultural heritage assets based on an assessment of each asset in isolation. Lime Down affects a substantial number of assets and their settings, including Grade I assets like Bradfield Manor whose setting is substantially impacted by the proposed BESS and associated security infrastructure. Furthermore, the ES does not assess the cumulative impact the proposals have across the quantum of heritage assets, which collectively results in substantial harm. The cumulative impact across such a wide range of heritage assets that make up the historic character of this part of Wiltshire, and the magnitude of the collective impacts, is significant and should be considered as such especially when applying Regulation 3 of The Infrastructure Planning (Decisions) Regulations 2010. The cumulative magnitude of the effects on heritage assets weighs significantly against the proposals in any balancing exercise and has been downplayed. There is also no evidence of how harm has sought to be avoided in accordance with S.66 of the Planning (Listed Buildings and Conservation Areas) Act 1990. Paragraph 5.9.28 of National Policy Statement for Energy (EN-1) also tells decision makers that substantial	policy (i.e. Paragraph 56 of Historic England Advice Note 15: Commercial Renewable Energy Development and the Historic Environment and Nationally Significant Infrastructure Projects: Advice on Cumulative Effects Assessment). The Applicant notes that regulation 3 of the Infrastructure Planning (Decisions) Regulations 2010 relevantly requires that the Secretary of State must have regard to the desirability of preserving a listed building or its setting or any features of special architectural or historic interest which it possesses when deciding an application which affects a listed building or its setting. The Applicant considers that the assessment in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]** appropriately enables the Secretary of State to consider those elements in respect of the Scheme. As detailed in Section 12.3 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, the cultural heritage assessment has been undertaken in accordance with relevant legislation, policy and guidance, including the Planning (Listed Buildings and Conservation Areas) Act 1990 and Overarching National Policy Statement for Energy (EN-1) (January 2024). Where harm to heritage assets has been identified this has been assessed to comprise 'less than substantial harm' (see **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]**). The Applicant highlights paragraph 5.9.33 of NPS EN-1 which states that "*Where the proposed development will lead to less than substantial harm to the significance of the designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate securing its optimum viable use*." The public benefits of the scheme are detailed in **ES Volume 1, Chapter 5: Energy Need, Legislative Context and Energy Policy [APP-057]**. Paragraphs 8.2.127 to 8.3.124 of the **Planning Statement [APP-267]** provide an appraisal of the Scheme in relation to the historic environment, specifically those assets where there

Reference	Theme	Comments/Issues Raised	Applicant's Response
		harm to the setting of listed buildings, especially Grade I buildings should be wholly exceptional. This is a very high bar to pass. 5.9.29 of EN-1 also asks decision makers to refuse DCOs unless all four criteria (a-d) are met. The applicant has not responded to any of the criteria, and it stands that permission should be refused.	is less than substantial harm, as confirmed in **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]**. Paragraph 8.3.131 of the **Planning Statement [APP-267]** confirms that as there is no anticipated substantial harm to, or loss of, designated heritage assets as a result of the Scheme, the policy tests regarding substantial harm set out in NPS EN-1 paragraphs 5.9.29 to 5.9.31 do not apply. Paragraph 8.3.138 of the **Planning Statement [APP-267]** concludes that as the Scheme complies with the relevant policies in relation to historic environment and no residual significant effects are anticipated, it is considered that the historic environment should be given neutral weight in the planning balance. Section 9.4 of the **Planning Statement [APP-267]** sets out the planning balance, considering the positive, neutral and negative impacts of the Scheme. Taking these into account and having regard to all important and relevant matters, it is concluded that there are no adverse impacts of sufficient weight, either on their own or collectively, that would mean the DCO should not be made. The adverse impacts identified are clearly outweighed by the substantial public benefits that would arise from the provision of low carbon energy to meet the need identified in NPS EN-1.
MNH-012	Hydrology, Flood Risk and Drainage	Paragraph 174 of the National Planning Policy is concerned with flood risk. It explains flooding from any source, including fluvial and surface water should not be permitted if there are reasonably available sites appropriate for the proposed development in areas with a lower risk of flooding. Section 5.8 of the corresponding National Policy Statement for Energy (EN-1) supports the NPPF in this regard, noting the requirement to apply the sequential test where relevant.	The Applicant confirms that the Sequential Test has been undertaken in accordance with national policy, including consideration of flood risk constraints and the ability to locate supporting infrastructure in areas at lowest flood risk. The Sequential Test and associated justification are reported in the **Planning Statement [APP-574]** and demonstrate that the Scheme has applied a sequential approach to siting, including locating critical infrastructure such as BESS and substations within Flood Zone 1. Section 8 of the **Planning Statement [APP-267]** provides an appraisal of the Scheme against planning policy. Furthermore, **Annex A: National Policy Accordance Tables** and **Annex B: Local Policy Accordance Tables of the Planning Statement [APP-267]** set out in detail how the Scheme complies with

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Parts of Lime Down are within both the fluvial and surface water flood zones where there is a high likelihood of flooding. The Sequential Test was therefore applied and presented as Annex C to the Planning Statement. The Sequential Test is very limited in the number of sites and options it tests. For example, it does not consider whether within the alternative sites tested, areas liable to flood risk could be avoided as compared with Lime Down where the applicant confirms flood risk areas cannot be avoided. As such the sequential test has not been met.	national and local planning policy. This includes Paragraph 174 of the National Planning Policy Framework which is considered from pages 625 to 632 of **Annex B: Local Policy Accordance Tables of the Planning Statement [APP-267]**.
MNH-013	Ecology and Biodiversity	Section 9 of the ES addresses ecology and biodiversity. It indicates that before mitigation there is a wide range of likely significant adverse effects at a Site, Local and District level. It suggests, through additional rather than embedded mitigation, these effects can be reduced to two likely significant effects: Hedgerows - adverse significant at local level in the short term and neutral not significant in the medium to long term. Breeding birds - adverse significant at a local level (skylark), adverse significant at a site level (yellow wagtail, corn bunting, grey partridge, and quail) A landscape and ecological management plan [LEMP] is the proposed method of mitigation leading to an apparent reduction of	The flood risk and drainage assessment recognises the presence of Flood Zones within parts of the Order Limits and applies Scheme design measures and controls so the Scheme would be safe for its lifetime and would not increase flood risk elsewhere, with mitigation secured through the DCO. **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**. No amendments to the application documents are required. The Applicant acknowledges that some adverse ecological effects are unavoidable as a result of the Scheme. These are transparently reported within **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and are summarised within the residual effects summary tables (Table 9-14 and 9-15). The Chapter provides a balanced assessment of likely significant effects, identifying residual effects where these remain after mitigation. Unavoidable adverse impacts, including displacement of ground-nesting birds and loss of hedgerows, have been minimised through careful design and are subsequently addressed through mitigation, compensation and long-term management to be secured via DCO Requirements including the **Outline Landscape and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		significant ecological effects down to the two listed above. However, these two significant impacts are not avoided, adequately mitigated or compensated for. This is contrary to paragraph 5.4.42 of National Policy EN-1. In accordance with paragraph 5.4.43 of EN-1, the Secretary of State shall give significant weight to residual harm and consent may be refused on this ground alone. In summary, the National Policy for Energy EN-1 is clear on matters of heritage, flood risk and ecology. In each case matters can individually represent a reason to refuse a DCO such as Lime Down. Likewise, the cumulative impact would further justify a refusal. Expanding this further, paragraph 4.1.3 of EN-1 explains 'Given the level and urgency of need for infrastructure of the types covered by the energy NPSs set out in Part 3 of this NPS, the Secretary of State will start with a presumption in favour of granting consent to applications for energy NSIPs. That presumption applies unless any more specific and relevant policies set out in the relevant NPSs clearly indicate that consent should be refused.' As demonstrated above, policies in respect of heritage, ecology and flood risk set out in NPS EN-1 confirm on	**Ecological Management Plan (Outline LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (Outline EPMS) [APP-284].** Residual significant effects on habitats and species are clearly set out within **ES Chapter 9 [APP-061]** and are limited to short-term loss of hedgerows and displacement of ground nesting birds, which have been mitigated for as far as possible within the Scheme in the Applicant's view. **ES Chapter 9 [APP-061]** also identifies significant residual beneficial benefits during the Operation and Maintenance phase of the Scheme for a range of ecological features, including other neutral grassland, woodland, ponds, hedgerows, watercourses, badgers, bats, dormice, brown hare, harvest mouse, hedgehog, polecat, amphibians, reptiles, breeding birds, overwintering birds and terrestrial invertebrates. In accordance with Policy EN-1 the residual adverse effects of the Scheme will be balanced against the Scheme's benefits in decision making by the Secretary of State. Section 8 of the **Planning Statement [APP-267]** provides an appraisal of the Scheme against planning policy, including heritage, flood risk and ecology policies. Paragraphs 8.3.26 to 8.3.67 of the **Planning Statement [APP-267]** consider ecology, concluding that it has been demonstrated that the majority of adverse effects on biodiversity as a result of the Scheme are avoided through the careful use of embedded (including overall Scheme design) and additional mitigation. Whilst two residual significant adverse effects are identified in relation to hedgerows and 'breeding birds - ground nesting birds of open habitat', the effects are localised and the Scheme also delivers ecological enhancements in accordance with national and local policy. Paragraphs 8.3.86 to 8.3.105 of the **Planning Statement [APP-267]** consider flood risk and conclude that the Scheme complies with the relevant policies. Paragraphs 8.3.106 to 8.3.138 of the **Planning Statement [APP-267]** consider the historic environment and conclude that the Scheme complies with the relevant policies in relation to

Reference	Theme	Comments/Issues Raised	Applicant's Response
		each matter that consent should be refused.	historic environment. Furthermore, **Annex A: National Policy Accordance Tables** and **Annex B: Local Policy Accordance Tables of the Planning Statement [APP-267]** set out in detail how the Scheme complies with national and local planning policy, including heritage, flood risk and ecology policies. Section 9.4 of the **Planning Statement [APP-267]** sets out the planning balance, considering the positive, neutral and negative impacts of the Scheme. Taking these into account and having regard to all important and relevant matters, it is concluded that there are no adverse impacts of sufficient weight, either on their own or collectively, that would mean the DCO should not be made. The adverse impacts identified are clearly outweighed by the substantial public benefits that would arise from the provision of low carbon energy to meet the need identified in NPS EN-1. Section 9.5 of the **Planning Statement [APP-267]** considers the critical national priority presumption and how the Scheme complies with the tests set out in NPS EN-1 and therefore why the CNP presumption applies to the Scheme. As set out in paragraph 9.5.6 of the **Planning Statement [APP-267]**, it is considered that even without applying the CNP presumption, the planning case is firmly in favour of development consent being granted.
MNH-014	Soils and Agriculture	CONCLUSION I request the Examining Authority to give the deepest possible consideration to all the points made above, which are far from exhaustive of all the possible objections to this dystopian scheme. 8 January 2026	The Applicant notes that matters have been addressed in the Applicant's responses to this Relevant Representation above.

6.15 Naomi Reynolds

Table 6-15 RR-3411

Reference	Theme	Comments/Issues Raised	Applicant's Response
NR-001	Soils and Agriculture Transport and Access Ecology and Biodiversity	I oppose the use of productive agricultural land and green field sites for large scale solar farms as I am concerned about our countries national security and our ability to be able to feed ourselves. As well as the impact this development will have on my local community and area particularly during the building works. The disruption in the lanes and villages surrounding the development will be severe as these lanes and villages already receive a lot of through traffic and the lanes are already in a poor state, the number of lorries having to use the lanes to access the development will cause further damage to the roads and verges, increase the risk of accidents and delays and damage the wildlife in the hedgerows and fields bordering the roads.	<u>Use of Agricultural Land</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on

Reference	Theme	Comments/Issues Raised	Applicant's Response
			agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. Food Security The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000

Reference	Theme	Comments/Issues Raised	Applicant's Response
			ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025 UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the but that the climate and nature crisis and nature crisis poses the greatest long-term risk to food security security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Construction Phase The likely significant effects of the Scheme during the construction phase are assessed throughout the **ES [APP-052 to APP-265]**, including effects on traffic and transport, noise and vibration, air quality, landscape and visual amenity, ecology, and local communities.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Where likely significant effects are identified, appropriate mitigation measures are incorporated into the Scheme. Measures to limit disruption during construction are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that no part of the authorised development may commence until a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the **Outline CEMP [APP-277]**, and all construction works associated must be carried out in accordance with the approved CEMP. <u>Transport and Access</u> The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**. The **Outline CTMP [APP-287]** has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Outline CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. <u>Ecology and Biodiversity</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant is discussing the approach to the assessment in relation to ecology and biodiversity in general with Wiltshire Council and Natural England and this discussion is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9:**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Ecology and Biodiversity [APP-061]. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
DB-001	Ecology and Biodiversity Soils and Agriculture	I object to this project for the following reasons Loss of arable land is a threat to biodiversity. Loss of this land is a threat to our future food security , once it's lost it's gone forever.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated The Applicant is discussing the approach to the assessment in relation to ecology and biodiversity in general with Wiltshire Council and Natural England and this discussion is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Soils and Agriculture</u> The effects of the Scheme on agricultural land and food production are assessed in **ES Volume 1, Chapter 17: Soils**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and Agriculture [APP-069], with supporting agricultural land classification data provided in **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243].** The assessment confirms that land would be removed from arable rotation for the operational life of the Scheme, anticipated to be approximately 60 years. While the primary agricultural use would cease during this period, the soil resource would be retained and would continue to perform its ecological functions. The assessment notes that reduced disturbance associated with the Scheme allows soils to recover from previous intensive agricultural use, with benefits to soil structure and soil biology over time. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable

Reference	Theme	Comments/Issues Raised	Applicant's Response
			use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
DB-002	Other Environmental Matters	Risk to our dark skies due to industrial type security lighting .	TRhe effects of ighting is considered in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers its implications during construction, operational and decommissioning on landscape and visual receptors. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** and further discussed in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072].** The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. Measures to control construction lighting are set out in the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls form part of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Outline Operational Environmental Management Plan [APP-278]. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme.
DB-003	Hydrology, Flood Risk and Drainage	Increased risk to flooding in an area already vulnerable. Our country lanes are not suitable for such heavy industry traffic . Why not retro fit all warehouses in the local area (near junction 17 for example) not just solar panels on the roof but cladding the walls, save the land for our children and future generations.	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that no part of the authorised development can commence until a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Mitigation measures to manage construction traffic are set out in the **Outline CTMP [APP-287]**. The Outline CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme. In relation to suggestions that brownfield land or alternative locations should be used, including rooftops, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.

6.17 Christopher Smith

Table 6-17 RR-0841

Reference	Theme	Comments/Issues Raised	Applicant's Response
CS-001	Description and DCO Process	I object to the Lime Down Solar Park proposal for a number of reasons. TECHNOLOGY AND COST Efficiency I object because the solar photovoltaic (PV) technology being proposed is inherently inefficient compared with other forms of energy generation. Solar panels convert roughly 15-22 % of sunlight into electricity and this relatively low conversion rate means solar farms require vast amounts of land to produce the same energy that a smaller footprint of fossil fuel or nuclear can generate. Solar farms in Britain are particularly poor in this regard and the World Bank, in its Photovoltaic Power Potential report from 2020, has found the UK to be the second-worst country for solar power.	Solar energy is at the heart of the Clean Power 2030 Mission (January 2026 revised NPS EN-3, Para 2.10.2) and it is the Government's view that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Sunlight, the input energy source for solar, is abundant, predictable, renewable, low carbon and free. Solar PV is a well-established and widely deployed form of renewable electricity generation that is capable of delivering reliable, large-scale low-carbon power over the lifetime of the Scheme. While technological efficiencies are expected to continue to improve over time, this does not reduce the effectiveness of solar PV as a means of reducing greenhouse gas emissions either now or in the future. The Scheme has been designed to allow for the replacement and upgrading of components during its operational life, enabling the use of more efficient technology as it becomes available, within the parameters assessed. This approach ensures that the Scheme remains effective and adaptable while continuing to deliver meaningful carbon savings Section 7.7 of the **Statement of Need [APP-266]** compares the annual energy generated per square kilometre from solar, from onshore wind and from crop-to-energy (biofuels) technology. The analysis shows that large-scale ground-mount solar schemes which maximise their annual output, are likely to produce a greater quantity of low carbon electricity per acre than the output from a crop-to-biogas application; and that the energy production from land under solar is of a similar order of magnitude to the energy production from land under onshore wind. Finally, the fact that other countries may experience higher

Reference	Theme	Comments/Issues Raised	Applicant's Response
			solar irradiation levels than the UK, means that they too could pursue solar generation to support their climate change plans. However, any such statistic cannot be used to demonstrate that solar in the UK does not work or should not be pursued. Government policy is clear that solar should be pursued in the UK with urgency because of the significant benefits it will bring to the UK energy system, consumers and to help meet UK clean power targets
CS-002	Climate Change and Energy Need	Reliability Solar energy is also intermittent and unreliable -" it only generates power when the sun is shining. Clouds, seasons, and night-time reduce production. This intermittency reduces reliability and increases the need for backup power sources. This a particular problem in Britain as, when it is most needed, in winter with low temperatures, there are/can be long periods of little sun and no wind again leading to the need for backup power sources. Such conditions can simultaneously prevail across Europe leading to a loss of interconnection supplies.	Figures 28 and 29 of the **Statement of Need [APP-266]** and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level.
CS-003	Description and DCO Process Climate Change and Energy Need Site selection and Alternatives	Cost It is an expensive source of electricity. Solar power using Feed-in-Tariffs cost £229/MWh in FY2024/25 and with the cost of grid balancing and backup added, gives a total of £262/MWh, or more than three times the cost of gas-fired electricity, which is currently around £80/MWh including carbon costs of about £28/MWh. ROC-funded	Section 9.3 of the **Statement of Need [APP-266]** provides analysis of government data which show that solar is now a leading low-cost generation technology. Further, solar generation provides price protection for GB consumers by shielding them from the effects of volatile international energy markets, including gas. NPS EN-3 states that the government has "*committed to sustained growth in solar capacity to ensure that we are on a pathway that allows us to meet net zero emissions. As such*

Reference	Theme	Comments/Issues Raised	Applicant's Response
		solar, with a market value of around £67/MWh so far in 2025/26 plus an average of 1.44 Renewables Obligations certificates which have a buy-out value of ~£97/MWh, giving a basic cost of £163/MWh. Adding the grid balancing and backup costs gives a total of £196/MWh. Many new solar farms have come online this year and have brought down the average strike price for active Contracts-for Difference in 2025/26 to ~£69/MWh, of which about £67/MWh is the market price and about £2/MWh is subsidies. This looks competitive until the extra balancing and backup costs are added, bringing the total to ~£102/MWh. It is unlikely that solar is going to get any cheaper, because new projects were awarded at £72/MWh in AR6, higher than the current weighted average, and 20-year index-linked contracts at £78/MWh are being offered in AR7. In short, the full cost of even the cheapest solar projects is more expensive than gas.	*solar is a key part of the government's strategy for low-cost decarbonisation of the energy sector*" (Para 2.10.9). The Feed in Tariff scheme and the Renewables Obligation scheme are both closed to new entrants (such as the Scheme). The awarding, or mechanics of a Contract for Difference(CfD) is not a matter for this application, as it is a competitive process managed by a Government owned entity. The Applicant confirms that while the Scheme may be eligible to apply in future should it be consented, developers must submit bids into wider allocation rounds, where various technologies compete to secure an agreement for a set electricity price. This industry-standard mechanism is designed to provide necessary certainties that low-carbon energy is delivered at the least cost to the consumer.
CS-004	Ecology and Biodiversity	ENVIRONMENTAL IMPACT Habitat Disruption I object to this proposal due to habitat disruption. The extensive land area required will lead to ecosystem disruption and wildlife displacement. The conversion of land will disrupt natural processes. Clearing and	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		grading during construction will cause soil erosion and increase sediment runoff into waterways. This area already floods, and covering the land with panels, tracks and infrastructure increases runoff and reduces natural absorption. There are serious questions about the drainage, water protection and downstream impacts. Solar panels create shading effects, altering ground temperature and moisture, which impacts plant growth and soil fertility. Fencing can impede animal movement, fragmenting habitats and limiting access to resources. This fragmentation can make it harder for species to find food, migrate, or reproduce. Highly reflective surfaces can disorient birds and insects, increasing collision risks. This can all contribute to local declines in vulnerable species. Large arrays of dark panels can create localized heat islands, potentially altering microclimates and there are concerns about unintended consequences on flora and fauna.	Potential effects relating to surface water runoff are assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting detail provided in the Flood Risk Assessment and Drainage Strategy appendices. The assessment considers how ground disturbance, construction traffic and installation of infrastructure could affect infiltration and runoff, and evaluates the implications for flood risk both within the Site and in surrounding areas. The assessment concludes that, with appropriate mitigation in place, the Scheme would not increase surface water runoff or flood risk. Surface water management and construction-phase controls to prevent increased runoff are secured through the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Drainage Strategy [APP-281]**, which include measures to control sediment, runoff and pollution during earthworks and infrastructure installation. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Evidence from published research indicates that large-scale solar arrays do not give rise to significant or widespread heat island effects. An 18-month study by Fthenakis and Yu (2013) found that solar arrays are typically fully cooled during night-time hours, meaning that sustained heat retention and associated heat island effects are unlikely to occur.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Further research by Barron-Gafford et al. (2016) concluded that any temperature increases associated with solar PV installations are localised and do not extend beyond the immediate boundary of the solar farm. As such, any microclimatic effects are limited in extent and rapidly dissipate with distance from the panels. On this basis, the microclimate and heat island effects associated with the Scheme are not considered to be significant, and no meaningful thermal stress, discomfort or change in local weather conditions is anticipated for nearby residents or surrounding land uses.
CS-005	Soils and Agriculture	Adverse Effect on Agriculture and Food Security I object to this proposal due to its detrimental effect on farmland. The development will displace valuable agricultural land which is a short-sighted approach in an uncertain world where food security should be a priority for every nation.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.7 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land, as detailed in **ES Volume 3, Appendix 4-1 Site Selection**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Assessment Report. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17 Soils and Agriculture [APP 069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant is discussing the approach to assessing the quality of the agricultural land with Natural England and this discussion is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through Schedule 2, Requirement 17 of the **Draft DCO [APP-016]** which includes the preparation and implementation of a Soil Resources Management Plan (SRMP) in accordance with the **Outline SRMP [APP-280].** The SRMP will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279],** which is secured by Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**. Through the establishment and maintenance of long-term

Reference	Theme	Comments/Issues Raised	Applicant's Response
			grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**). The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

Reference	Theme	Comments/Issues Raised	Applicant's Response
CS-006	Landscape and Visual	Adverse Effect on Landscape I object to this proposal because of the adverse visual effect on the local landscape. Large solar installations fundamentally alter landscapes. The panels, inverters, transformers, BESSs and fencing will create an industrial appearance that is very unattractive and completely out of place in the countryside; this will worsen the daily living experience for residents and will diminish the appeal of this area for visitors, with a knock-on effect on local businesses.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA **[APP-060]** recognises there would be Significant adverse effects on the Landscape character within the 1 km Study Area of the Site initially as a result of the change in land use from agricultural land to solar infrastucture. However, these effects would reduce to non-significant once the extensive mitigation measures mature. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. **ES Volume 3, Appendix 8-3-3: Summary of Visual Effects [APP-192]** provides a summary of the visual effects on Private Receptors. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. These measures are set out in Section 8.9 of the **LVIA [APP-060].** Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Ecology Mitigation Plan [APP-084] and detailed within the **Outline Landscape and Ecological Mitigation Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation

Reference	Theme	Comments/Issues Raised	Applicant's Response
			contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
CS-007	Cultural Heritage	The proposed site is rich in history with Roman roads, medieval landscapes, listed buildings and archaeological assets, all within or beside the site. There are 118 archaeological assets, of which at least 23 will be damaged, according to Island Green Power, the applicant. Once disturbed or damaged, this heritage cannot be replaced.	The potential effects of the Scheme on archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-2 to 12-5 [APP-220 to APP-229]**. The assessment considers baseline archaeological conditions, identifies known and potential archaeological assets within the study area, and evaluates likely effects during construction, operation and decommissioning. The chapter concluded that, following mitigation, the residual effects on any archaeological assets, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is informed by desk-based research, geophysical surveys and evaluation trenching, which have been undertaken to identify areas of archaeological potential and to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			refine the Scheme design where practicable to avoid harm. Where impacts cannot be avoided, embedded mitigation measures are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. The Applicant notes that the approach to the assessment in relation to archaeological sites has been agreed with Historic England and Wiltshire Council and the methodology for the mitigation strategy is under discussion and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1**.** An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance is required. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation for each part of the Proposed Development, substantially in accordance with the **Appendix 12-6 Outline Archaeological Mitigation Strategy [APP-230]**, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered during the relevant part of the Proposed Development.
CS-008	Noise and Vibration	Noise Pollution I object because of the noise pollution that it will produce. We have a very small solar farm (tiny in comparison to Lime Down) north of Hullavington which can be heard from some	The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As explained in Section 14.4 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** noise from moveable panels would not be audible at residential properties. As shown in Table 8 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, levels

Reference	Theme	Comments/Issues Raised	Applicant's Response
		hundreds of yards away given the right atmospheric conditions. Given the size of Lime Down and, in particular, its BESSs and movable panels, the noise levels will be a lot higher and affect many more houses and villages. The predicted 'incessant hum' from cooling fans, inverters, and transformers would severely impact residents' ability to sleep, enjoy their homes, or use their gardens. The models used to simulate likely noise levels are known to be flawed and it is highly likely that noise levels will be much higher than modelled.	would typically be below or slightly above the existing background sound in the area. The levels have been calculated, using the appropriate international standard, on a worst-case assumption that wind is blowing from the source of the noise to the receptor locations, as stated in paragraph 14.4.15 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This is likely to include a significant number of silencer units and enclosures and provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
CS-009	Construction and Decommissioning	Manufacture and Disposal I object because solar farms are environmentally destructive, firstly in their construction due to the mining and other activities required to produce the materials to make solar panels and lithium batteries. Their life is relatively limited and there are significant concerns about the disposal of them, particularly that companies are not putting aside sufficient funding to cover eventual disposal costs.	The environmental effects associated with the manufacture, resource extraction, and disposal of Scheme components are assessed in **ES Volume 1, Chapter 7: Climate Change [APP-059]** and **Chapter 20: Other Environmental Matters [APP-072]**. The Applicant confirms that the Scheme would not give rise to significant effects in relation to minerals, materials or waste, and that embedded mitigation measures and good practice would be applied throughout the construction, operation & decommissioning phases. The ES also identifies embedded mitigation measures across the Scheme, including the use of durable components with long operational lifespans, allowances for replacement over time, and the recyclability of key components such as solar panels, batteries and electrical equipment. These measures reduce the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			need for ongoing extraction of virgin materials and limit long-term environmental impacts. The Materials and Waste assessment also confirms that the Scheme will follow the waste hierarchy, prioritising reuse and recycling wherever reasonably practicable, with disposal as a last resort. An **Outline Site Waste Management Plan [APP-281]**, **Outline Construction Environmental Management Plan [APP-277]**, **Outline Operational Environmental Management Plan [APP-278]** and **Outline Decommissioning Strategy [APP-279]** have been submitted with the Application, which set out how waste — including BESS components — will be managed during construction, operation and decommissioning. These documents commit to segregation of materials on-site and to the use of appropriately licensed waste contractors and facilities.
CS-010	Other Environmental Matters	SAFETY HAZARDS I object to this proposal due to its inherent safety risks. Although rare, battery storage systems can experience thermal runaway, leading to fires that are difficult to extinguish and can produce toxic smoke. Globally there have been many instances of such fires in recent years and they represent a significant safety risk when, as will be the case for Lime Down, they are sited near homes and schools. From my own perspective, as a Hullavington resident, the village will be within a mile of the proposed BESS, meaning I and every other resident will be directly exposed to the risks, impacts, and consequences of this installation. The applicant has not	The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area, as detailed in **ES Volume 3, Appendix 15-2: BESS Fire Emissions Modelling [APP-239]**. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study methodology and results. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The concentrations of carbon monoxide (CO), formaldehyde,

Reference	Theme	Comments/Issues Raised	Applicant's Response
		demonstrated how a major incident could be contained, controlled, or prevented from affecting the village, the school, the surrounding communities, or the nearby mainline railway. The siting of the BESS so close to homes and critical infrastructure is wholly inappropriate and represents an unacceptable and unmanageable risk to public safety.	hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO_2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.9 -5.4.11) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider*." The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire

Reference	Theme	Comments/Issues Raised	Applicant's Response
			would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The **Outline Battery Safety Management Plan (OBSMP) [APP-286]** was prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant is in the process of agreeing a Statement of Common Ground (SOCG) with D&WFRS to provide assurance that all safety and emergency response requirements are fulfilled, details are set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Section 6.1.1 of the OBSMP confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under National Fire Protection Association- NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. All risk assessments to be conducted at detailed design for BESS projects required by the Health and Safety Executive (HSE) to assess fire and explosion risk are stipulated in Section

Reference	Theme	Comments/Issues Raised	Applicant's Response
			6.1.5 of the OBSMP. As set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation, and decommissioning. Section 5.4.9 – 5.4.11 of the OBSMP stipulates that the ERP will follow NFCC and NFPA 855 (2026) guidelines and stipulates the minimum content that an ERP must contain, including: *"Emergency procedures for all credible hazards and risks, including building, infrastructure and vehicle fire, wildfires, impacts on local respondents, impacts on transport infrastructure."* The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 (which relates to works required to construct the BESS) must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application for approval of the Battery Safety Management Plan, and that the Battery Safety Management Plan must be implemented as approved.
CS-011	Transport and Access	CONSTRUCTION TRAFFIC I object to the construction traffic	The trip generation for the construction phase has been calculated based on a detailed and realistic breakdown of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
		proposals, which rely on narrow rural lanes that are physically incapable of safely accommodating the volume of HGVs required. Independent analysis shows the applicant has underestimated traffic by over 40%, meaning more than 100 HGV movements per day on single track roads used by schoolchildren, walkers, cyclists, and local residents. This creates an unacceptable and unmanageable safety risk, particularly where there are no pavements, limited verges, blind bends, and multiple public rights of way. Many of the local cycling and walking routes use the very lanes and rights of way that would be dominated by HGV traffic, construction noise, dust, and industrial fencing. What are currently peaceful, restorative walks and cycle rides will become unpleasant, unsafe, and in some cases effectively unusable. These walks connect residents to nature, link villages, support local businesses, and attract visitors. The proposal would destroy the qualities that make these routes special, replacing them with noise, intimidation, and industrialisation.	likely quantities and material volumes required to build out the various sites and cable routes. A breakdown of Solar PV Sites Trip Generation Calculations is provided at **Annex E to ES Vol 3, 6.3 Appendix 13-1 Transport Assessment [APP-233].** This presents specific assessed quantities of material volumes and component type/numbers for each Lime Down Solar PV Site. Further notes have been added for clarity, with an additional breakdown of Trip Generation based on construction phasing. In relation to modules and mounting structures a1.2 'Ratio' factor is included, and this figure represents a reduced loading factor per HGV, based on the difference in size between a High Cube and a standard container. The assessments assume standard sized containers, presenting a reasonable-worst case assessment. In practice a majority of modules and mounting structures will be delivered by HQ containers, reducing the assumed number of HGVs, with the exception of Lime Down Site E and the eastern section of Site D, which are accessible via the low bridge on the A429. Aggregate volumes for access tracks for example have been assessed on a site-by site basis in accordance with each sites relative size. This is included within the calculations at **Annex E to ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**]. There will be no site wide reprofiling required. It has been assumed that any excavated material will be reused on site. In the event of any spoil being taken off site, this will be undertaken by the same tippers used for incoming supply of aggregate. This has been clarified at Paragraph XX of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**].

Reference	Theme	Comments/Issues Raised	Applicant's Response
			In addition, the impact of these trips in the ES and Transport Assessment has been assessed based on worst case assumptions, including all phases and Solar PV Sites being constructed simultaneously and a 50% uplift to represent a peak day. This approach overestimates the trip generation in the construction period. The worked example below illustrates this: The construction route to Lime Down A-C included in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233**] includes a peak day trip generation of 50 HGVs based on the worst-case assumptions, assuming all phases and Solar PV Sites being constructed simultaneously, plus a 50% uplift; 50 HGVs represents an estimate of the deliveries on a peak day, so does not represent a daily average; The daily average number of HGV construction movements is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route) In summary the trip generation and assessment work included in the DCO application is robust. An assessment of the effects of construction activities on air quality is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. The assessment considers potential emissions from construction dust, construction vehicle exhausts and Non-Road Mobile Machinery (NRMM), and has been undertaken in accordance with relevant best practice guidance. Further detail on the construction dust assessment is provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Assessment [APP-238]. The assessment concludes that, with embedded mitigation measures in place, construction-phase air quality effects would not be significant. Mitigation measures to control dust and emissions during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Construction Traffic Management Plan [APP-287]**. These include measures such as dust suppression, site management controls, routing and scheduling of construction traffic, and management of plant and machinery. The preparation, approval and implementation of detailed construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts during construction are appropriately controlled. The Applicant confirms that impacts to PROWs, unsurfaced roads, and the recreational use of the highway network have been assessed in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. Consideration of the likely impact on views, character and the desirability of these routes to users has been fundamental to the assessment of likely significant effects. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. Otherwise, no significant adverse effects to PROW and recreational highway users are anticipated at any phase of the Scheme Mitigation

Reference	Theme	Comments/Issues Raised	Applicant's Response
			measures as set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**, are deemed to be sufficient to ensure user safety, and maintain functional access to highways and PROWs for recreational use.
CS-012	Ecology and Biodiversity Landscape and Visual Socio-Economics, Tourism and Recreation	SUMMARY The Lime Down Solar Park is an inappropriate, and unacceptable industrial proposal that is going to devastate a large area of Wiltshire countryside. It will cause severe and lasting adverse effects on the inhabitants of the many villages in its footprint; it will industrialise a large area of unspoilt and historic countryside; it will fragment wildlife habitats and permanently damage the local environment, and it will endanger residents and wildlife both in its construction, subsequent operation and eventual disposal. For all of the above reasons, I strongly object to the proposal.	The Applicant notes that these matters have been addressed in the Applicant's responses to this Relevant Representation above.

6.18 Eva Elisabeth Sweet

Table 6-18 RR-1409

Reference	Theme	Comments/Issues Raised	Applicant's Response
EES-001	Socio-Economics, Tourism and Recreation	I own an equine facility that sits right in the middle of a proposed solar project, which will severely impact how the property can be used. It would completely prevent the proper exercise of the horses, forcing me to spend money to move them elsewhere for this purpose. I'm also trying to sell my property, and like many of my neighbours, I know this large-scale solar development will drastically reduce the value of the house, land, and associated assets. On a personal level, it's tearing apart a close-knit community that has always been supportive of one another.	The equestrian facilities at Ladyswood Farm & Stud have been assessed as a specific receptor in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. During construction, a medium-term temporary moderate-minor adverse effect is anticipated, as a result of proximity to Solar PV Arrays, a construction compound, cabling works, and HGV traffic on access and hacking routes. The Applicant has sought to mitigate these as much as possible through removing Solar PV Array areas (fields designated B2-B4 and A11-A12), and embedding design, transport, and PROW mitigation into the Scheme ahead of DCO submission. This has included providing landscape screening around Solar PV infrastructure, siting the construction compound in B1 as far as practicable from the paddocks at Ladyswood Farm & Stud, providing banksmen and speed limits where accesses interact with PROWs, through specifying HGV access routes to the Scheme, and through ensuring PROWs are kept open as much as practicable through construction, and entirely during the operational phase of the Scheme. These measures are secured through the **Works Plan [APP-007]**, **Outline LEMP [APP-283]**, **Outline CEMP[APP-0277]**, **Outline CTMP [APP-287]** and **oPROWPPMP [APP-282]** by Requirements 5, 7, 13, 15, and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**. As a result, it is not anticipate that the effects on Ladyswood Farm & Stud are anticipated to be significant. This also applied to individually assessed PROWs around Ladyswood, which subject to implementation of mitigation are not anticipated to experience significant adverse effects at any phase of the Scheme. Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2 Scoping Opinion Response Table [APP-181]**. Resultantly, other impacts on the local property

Reference	Theme	Comments/Issues Raised	Applicant's Response
			market have not been assessed either. That notwithstanding, the Applicant has sought to minimise impacts upon residential properties and residential amenity through the mitigation measures secured by requirements in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant has also assessed likely impacts on community and social wellbeing, and on the impacts of the Scheme on sense of community and sense of place (under then assessment category 'community identity, culture, resilience and influence') in **ES Chapter 18: Human Health [APP-070].** The assessment concludes that there are no significant adverse effects anticipated to population and community or social health and wellbeing. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**
EES-002	Landscape and Visual	It's simply unacceptable that such a massive project is even being considered, as it would scar one of the UK's most diverse rural landscapes.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Scheme [APP-055] the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.

6.19 Isobel Blackett

Table 6-19 RR-1961

Reference	Theme	Comments/Issues Raised	Applicant's Response
IB-001	Site selection and Alternatives Landscape and Visual	The Location is Fundamentally Wrong Poor Site Selection: The applicant chose this site primarily for commercial convenience (dealing with a few large landowners), not because it's the best environmental or community location. Better, less harmful locations closer to the grid connection were ignored. Harm to a Protected Landscape: The scheme borders the Cotswolds National Landscape (an Area of Outstanding Natural Beauty). Large parts of it are in the "*setting*" of this protected area. Industrial solar panels will damage the views, character, and tranquillity that the designation is meant to protect. Surrounding Villages: For residents in places like Norton, the scheme will mean being almost surrounded by solar development, turning their rural setting into an "*industrialised energy-generating landscape*."	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Cotswolds National Landscape and its Special Qualities [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL including tranquillity. It is recognised that Sites A, B and C are within the settting of the CNL because of its proximity and visual relationship. In respect of visual amenity, some short-term

Reference	Theme	Comments/Issues Raised	Applicant's Response
			adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment found that there would be some short term harm to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. **ES Volume 3, Appendix 8-3-3: Summary of Visual Effects [APP-192]** provides a summary of the visual effects on Private Receptors Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of the detailed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **Outline EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
IB-002	Landscape and Visual	Major Impact on the Countryside Understated Harm: The applicant's own assessment admits significant visual harm for 15 years, but claims it gets better after that. Objectors argue the harm will be worse and longer-lasting because: They underestimate how sensitive the landscape is. They over-rely on new tree planting to screen views, which is unreliable (trees die, get felled) and itself changes the historic character of the area with its open views and low hedges. The visual simulations are misleading-"they don't show the worst-case (winter), don't show the view from footpaths crossing the site, and don't show the effects of glint and glare from the panels.	The Applicant notes that matters relating to landscape and visual impact have been addressed in the Applicant's responses to this Relevant Representation above. The landscape and visual effects of the Scheme, including the effectiveness and phasing of proposed screening and planting, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The **LVIA [APP-060]** considers landscape and visual effects over time, including during the early years of the Scheme before planting is fully established, and identifies where significant effects may occur. NPS EN-1 recognises at para 5.10.5 that "*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation*." Mitigation measures are detailed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Proposed planting comprises a mix of native species designed to enhance biodiversity and resilience, with planting design prioritising long-term effectiveness and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape integration. The **OLEMP [APP-283]** sets out the approach to establishment, maintenance and management of planting to ensure its effectiveness over the lifetime of the Scheme. The LVIA includes verified viewpoints with both summer and winter photography to demonstrate year-round changes to the landscape. Photomontages at Year 15 illustrate the effectiveness of established planting, while also demonstrating the intended retention of openness across the receiving landscape. Hedgerows on the western edge of fields within Lime Down C, which border the Cotswolds National Landscape, are proposed to be maintained at approximately 1.5 metres (or as existing if greater) to retain open views within the setting of the Cotswolds National Landscape. This management approach is set out in the **OLEMP [APP-283]**. The photomontages in APP-103-105 for selected viewpoints agreed with Wiltshire Council show the proposals at Year 1 in winter which represents the worst-case scenario in terms of screening and Year 5 Summer which represents the best-case scenario. The photomontages are representative of the landscape and visual changes in the landscape and not glint and glare. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that mitigation planting and screening measures are delivered and maintained throughout the lifetime of the Scheme.

6.20 Alexander Frost

Table 6-20 RR-0098

Reference	Theme	Comments/Issues Raised	Applicant's Response
AF-001	Climate Change and Energy Need	I strongly object to the Lime Down proposal. We have yet to see genuinely independent evidence of material net carbon savings for the Lime Down proposal. I read Wilts County Council's Climate Team's calculation that carbon neutrality will not be achieved until 2076. Indeed will even carbon neutral impact may never be reached? The IGP team never offered me any assurances here when directly questioned.	It is not clear how the 2076 year of offset conclusion has been reached. **ES Volume 1, Chapter 7 Climate Change [APP-059]** demonstrates that there is an overall net saving as a result of the scheme on GHG emissions compared to a without scheme scenario. As the Scheme will require replacement of components, and will generate some minimal emissions during operation, it is not considered that a 'break-even' date is a useful measure of the Scheme's beneficial effect. However, as the GHG electricity generation intensity figure for the Scheme is anticipated to sit continually below the forecast grid average for 2029, GHG emissions savings are expected to be achieved throughout the lifetime of the Scheme compared to a generation scenario in the absence of the Scheme. Therefore, the GHG emissions during construction, operation, and decommissioning of the Scheme can be considered to be 'offset' by the net positive impact of the Scheme on GHG emissions and the UK's ability to meet its carbon targets. The **ES [APP-052 to APP-265]** and environmental and ecological surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details of qualifications, experience and professional institute membership are provided within **ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]**.
AF-002	Description and DCO Process	Note they are reported to have paid £9.2m in a process of research across the project that has been very selective in the evidence they have drawn. This is held to massive inconsistencies with other reports produced with genuine neutrality such as that of Wiltshire County Council.	The **ES [APP-052 to APP-265]** and environmental and ecological surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details are provided within **ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]**. The assessments contained in the ES are appropriately detailed and robust. The Applicant stands by the conclusions contained in these assessments and supporting documents.

Reference	Theme	Comments/Issues Raised	Applicant's Response
AF-003	Description and DCO Process Site selection and Alternatives	In terms of alternative sites across Wiltshire, (Redacted) have been very clear they can only make big money on cheaply acquired land from troubled farmers. This has nothing to do with this being the most appropriate site. Please consider the endless studies which aren't being considered here such at UKWA's Walking on Sunshine - "*Just five percent of warehouses in the UK have solar panels on the roof. That means there is at least 18,500 acres of untapped potential*.' Why are reports like Walking on Sunshine (UKWA) which highlight far more appropriate sites for solar being ignored?	In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. In terms of site selection, the Applicant followed a staged approach to assessment, taking into consideration a range of planning, environmental and operational factors. **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** explains the methodology that has been applied when identifying and evaluating potential sites for the Scheme. It identifies a number of potential development areas for the Scheme and presents how each of those areas perform against a range of planning, environmental and operational constraints and opportunities. This report concludes that there are no more suitable and available locations within the search area than the proposed location for the Scheme, based on the criteria identified. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
AF-004	Hydrology, Flood Risk and Drainage	Our farm and the surrounding area have been flooded on repeated occasions in recent years. The clay-based soil makes the area highly	The Applicant acknowledges the experience of localised flooding on roads and farmland and recognises that flooding is an existing issue within the area. Assessments in **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		vulnerable. The waterways can handle substantial water levels but the heightened run-off caused by the solar panels would make this a very much higher risk situation. Not least in that the run-off may well be contaminated by the solar panels. There are a number of reports to suggest that the chemicals in a degenerating panel will pollute the water supplies in a devastating way.	have been undertaken in accordance with national and local policy and guidance and conclude that the Scheme would not increase flood risk at the Site or elsewhere or give rise to significant adverse effects on flood risk receptors, including downstream communities. The assessment considers fluvial, surface water and construction-phase mechanisms and is informed by site-specific hydraulic modelling, topographic data and historic flood information. The Applicant does not agree that the Scheme would inevitably increase runoff or exacerbate flooding. National policy recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (NPS EN-3 paragraph 3.10.75). The assessment distinguishes between panelled areas, where rainfall drains to ground beneath and between panels, and hardstanding associated with supporting electrical infrastructure, where engineered and controlled drainage is provided. The existing baseline comprises intensively managed agricultural land subject to trafficking, compaction and periods of bare ground, while the Scheme introduces permanent grass cover and reduced trafficking, improving infiltration capacity relative to baseline conditions. Scheme-specific drainage controls are secured through Requirement 11 of the **Draft Development Consent Order [APP-016].** In relation to private boreholes and groundwater resources, the Applicant does not agree that construction vibration or operation would pose a catastrophic risk to water supply. Groundwater receptors, pollution pathways and abstraction sensitivities are assessed through the hydrology and ground conditions assessments, with mitigation secured to avoid significant adverse effects on controlled waters. Construction-phase pollution prevention, incident response and emergency planning measures are secured through the construction management

Reference	Theme	Comments/Issues Raised	Applicant's Response
			framework, and firefighting water collection and containment for BESS is addressed through the battery safety and drainage controls. **Outline Construction Environmental Management Plan [APP-277]**. The Applicant does not agree that the Scheme would inevitably increase runoff or exacerbate flooding. National policy recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (NPS EN-3 paragraph 3.10.75). The assessment distinguishes between panelled areas, where rainfall drains to ground beneath and between panels, and hardstanding associated with supporting electrical infrastructure, where engineered and controlled drainage is provided. The existing baseline comprises intensively managed agricultural land subject to trafficking, compaction and periods of bare ground, while the Scheme introduces permanent grass cover and reduced trafficking, improving infiltration capacity relative to baseline conditions. Scheme-specific drainage controls are secured through the DCO discharge process. **Draft Development Consent Order [APP-016]**.
AF-005	Other Environmental Matters	The Battery Energy Storage System introduces the danger of toxic gas emissions and fires, which are notoriously difficult to extinguish. Such incidents have already caused multiday evacuations elsewhere. We would be just 1 mile away from the BESS and would fear for our lives if another fire was to occur. I'm sure the trainline that borders the proposed site would also be one that GWR might fear posses a high-risk situation. At times like these you start to think of	The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant notes that the approach to BESS safety is being discussed with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant **Statement of**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		the lack of risk assessment in Grenfell Tower as reference points.	**Common Ground** to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the OBSMP confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out in **Outline Battery Safety Management Plan (OBSMP) [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]** — including advice to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 (relating to the construction of the BESS) must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. The Applicant is confident that the assessment and proposed mitigation and safety measures set out above are appropriate, proportionate and robust.
AF-006	Transport and Access	We have 4 children we get to school from our house situated outside Sherston and are dependent on the road networks. Given the construction stage will last up to two years and will bring more than 20,000 articulated lorries, HGVs and vans transporting materials to site creating noise and	Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate

Reference	Theme	Comments/Issues Raised	Applicant's Response
		pollution, and endangering pedestrians, cyclists and horse riders it will make it almost impossible to lead ordinary lives.	construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the CTMP in place, there would be no significant adverse impacts on the local highway network during the construction, operation and maintenance, and decommissioning phases of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
AF-007	Cultural Heritage	We moved to Sherston in 2018 and have endeavoured to treasure and protect the local heritage in what is a popular tourist location. We have reopened and maintained footpaths along the historical Fosse Way for local people to enjoy, and all this will be destroyed by a foreign corporate monetising the area and turning it into industrial wasteland.	The Applicant has provided a robust assessment of impacts to tourism and recreation in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, while impacts to the social environment, on amenity, and access to the countryside for leisure have been assessed in **ES Chapter 18: Human Health [APP-070]**, with reliance on **ES Chapter 8: Landscape and Visual [APP-060]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however, the assessment identifies residual significant adverse effects to a small number of PROWs and unsurfaced highways during construction, and to long-distance recreation routes during all phases of the Scheme (due to their regional or national importance). The assessment of human health impacts identifies no residual significant adverse effects from the Scheme. The assessment in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** have assessed the likely impacts of the Scheme at construction, operation, peak replacement, and decommissioning on tourism and recreation receptors, including all PROWs within 2 km of the Scheme. Assessment of the likely impact on the Cotswolds National Landscape (given Sherston's location at the NL edge) has been considered separately as both a landscape and visual impact in **ES Chapter 8: Landscape and Visual [APP-060]**, and as a tourism destination in in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The assessment in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** concludes that there is no residual significant adverse effect to the Cotswolds National Landscape as a tourism destination.
AF-008	Human Health	This raises the ugly spectre of mental health. Macquarie themselves have	Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as

Reference	Theme	Comments/Issues Raised	Applicant's Response
		reportedly refused to fund support for the mental health issues this process is creating. Meanwhile, local residents are being forced to raise their own funds to secure basic legal representation -" an extraordinary situation when people are facing threats of compulsory purchase orders. Many simply do not have the resources to respond fairly or independently. We have reports that mental health issues have risen sharply in the past 18 months across the area. Why has there been so little acknowledgement of mental health issues by IGP and specifically declining to set aside funds for the impacts here?	documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The Applicant notes the relevant representation made by The UK Health Security Agency (UKHSA) **[RR-4798]**. This confirms that they acknowledge that the Environmental Statement (ES) has not identified any issues which could significantly affect public health and that the Scheme should not result in any significant adverse impact on public health. This follows previous engagements between the Applicant and both the UKHSA itself (written correspondence only) and the supporting Office for Health Improvements and Disparities (written correspondence and a meeting) during statutory consultation,
AF-009	Soils and Agriculture	We rely on local food production for ourselves and our livestock. The farmland planned for development is 30% best quality farm land (BMV). All feed for our horses comes locally. Losing such land will worsen our reliance on imports at a time when resilience is critical.	The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. As detailed in **Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, and **Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Survey Report [APP-243],** a majority (around two-thirds) of the site area is non-BMV in Subgrade 3b

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and Grade 4, which is not considered high quality in planning terms. Around 29% of the agricultural land is classified as Subgrade 3a quality, which is the lowest of the BMV grades. Around 4% of the agricultural land is high quality Grade 2. Agricultural land quality has been considered in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP 056**]. **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP 185]** details how the Applicant initially sought to avoid use of BMV agricultural land, only considering Grade 3 and above from Stage 5 of the selection process. Although the primary agricultural use of the land will be temporarily lost, all other ecological functions of the land will continue. There is not anticipated to be any permanent loss of agricultural land. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
AF-010	Description and DCO Process Consultation and Engagement	I hope you will explore the due process of the consultation which has to date been a liturgy of concerning malpractice for local people. The implication is IGP/Macquarie will stop at nothing to drive revenues for the MGREF2 fund. Some examples include: Paying locals to be silent: (Redacted)	The Applicant confirms that consultation for the Scheme has been conducted in strict accordance with the Planning Act 2008 and is documented in the **Consultation Report [APP-022]**. The adequacy of the Applicant's conduct and the consultation process has been reviewed and accepted by the Planning Inspectorate as part of the application procedure. The Applicant implemented a multi-phased approach, including a non-statutory Stage One consultation (March–April 2024) and a statutory Stage Two consultation (January–March 2025), followed by a supplementary phase of targeted Consultation (June - July 2025) to ensure the design was influenced by local knowledge from an early stage and throughout the pre-application stage. The Applicant's approach exceeded statutory requirements by providing a 49-day response period for Stage Two, reaching over 14,000 local properties via direct mail, and holding eight in-person community information events and two online webinars. Detailed evidence of how the Applicant has had regard to feedback received during these phases is presented in the **Consultation Report Appendices [APP-023 to APP-051]**, including responses to specific community concerns regarding the design and location of infrastructure. Regarding concerns over developer motivation and accountability, the **Funding Statement [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			019] demonstrates that the Scheme is financially viable and adequately funded to be delivered in full as a privately financed development. The Applicant acknowledges the expressions of distrust in this representation, but confirms that all negotiations with identified land interests are conducted within established frameworks to ensure fairness and legal compliance.
AF-011	Description and DCO Process	Legal representation of locals being withdrawn after (Redacted) from developers. Please enquire with the SRA to find out details as to how (Redacted) reportedly (Redacted) our lawyers (Redacted) to the point they withdrew from representing us only two months into the process. (Redacted) the individual who was handling our case reported that (Redacted) had (Redacted) to take business away from (Redacted) if they continued to represent local people challenging the proposal.	The Applicant confirms that it had no involvement with the appointment or cessation of any legal representation in relation to the Scheme, other than the appointment of the Applicant's own legal counsel. The Applicant took proactive steps to address these specific allegations when they first arose, providing written confirmation to the Stop Lime Down (SLD) group in May 2024 that the Applicant had played no part in any legal representative's decision to withdraw. At that time, the Applicant further offered to provide a formal letter to SLD's appointed counsel to explicitly confirm that no conflict of interest existed with the Applicant or their own legal team, though no request for this was received. The Applicant notes that this position has since been re-confirmed in writing to the author of this representation.
AF-012	Description and DCO Process Consultation and Engagement	I would also highlight the highly inappropriate ways in which (Redacted) are using their CPO powers. These have terrified local residents and forced a number of people into panicked decisions. On 9th May 2024 we held a meeting at Ladyswood Stud with the then IGP management team. In a recorded conversation they admitted the process to that point had been poorly handled and a major restoration of confidence in their due process was required claiming they had	The Applicant remains committed to meaningful engagement with all land interests and confirms that negotiations are tracked in the **Land and Rights Negotiations Tracker [APP-021]**. The Applicant acknowledges that the meeting on 9 May 2024 with representatives from Stop Lime Down (SLD) and the developer's project and management team provided a constructive environment for engagement and allowed for the discussion regarding a restoration of confidence during the non-statutory phase of the Scheme. This dialogue continued through subsequent meetings in February 2025 between the Applicant and (SLD), which were beneficial in shaping the Scheme's development and are documented as part of the iterative design process in the **Consultation Report [APP-022]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		'underestimated the sale of the situation'. The management team were then replaced. (Redacted) is one of few remaining, but has since refused to directly engage with myself despite repeated requests.	Following a restructuring of the business, the Applicant confirms that while one senior leader and one project-level employee have since departed, the core project development team has remained in place, alongside consistent members of the environmental, planning and legal teams. This continuity has ensured that the technical expertise and commitments made during early engagement are carried through the Examination and into the delivery of the Scheme. The Applicant confirms that consultation & engagement for the Scheme has been conducted in strict accordance with the Planning Act 2008 and is documented in the **Consultation Report [APP-022]** and remains committed to its engagement strategy. The Applicant welcomes the opportunity to discuss potential impacts on local businesses, with ongoing dialogue being facilitated through a Community Liaison Group (CLG), which is intended to provide a formal channel for community representatives to monitor and influence the construction, operational, and decommissioning aspects of the Scheme, should it be consented.
AF-013	Construction and Decommissioning	There are so many unanswered questions - who pays for the clear-up after a company who has zero track record of ever managing a site such as this leaves after the life-cycle of the project?	At the end of the Scheme's operational life, all Solar PV Sites would be decommissioned and the land restored to its original use and condition as far as practicable. The Applicant expects that most of the solar equipment, including panels, cabling, inverters, BESS and substations, to be recycled and disposed of, in line with industry practice. The Applicant expects there to be even greater opportunities for recycling at the end of the Scheme's design life. There will be opportunities for the retention of a range of biodiversity improvements, including established habitats, hedgerows and woodland, beyond the decommissioning of the Scheme, ultimately enhancing the ecological value of the area.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			A requirement to decommission the Scheme is part of the DCO application; failing to comply with that requirement would be a criminal offence. Decommissioning is also covered in agreements with landowners, which includes decommissioning securities to cover the cost of decommissioning in the event of any breach by the Applicant or in the event of the insolvency of the Applicant. The amount of such decommissioning security is regularly re-valued throughout the lifecycle of the Scheme and topped up if necessary to ensure the Scheme can be decommissioned and the land restored back to its existing use. Decommissioning is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The Applicant has produced an **Outline Decommissioning Strategy [APP-279]** which was submitted with the DCO Application. A final decommissioning plan will be prepared and agreed with the relevant authorities at that time of decommissioning and will include detailed measures and timescales. As set out in the **Funding Statement [APP-019]** submitted with the DCO Application, the Applicant is committed to ensuring that appropriate financial provisions are in place to cover decommissioning costs at the end of the operational life of the Scheme.
AF-014	Description and DCO Process	Are (Redacted) here merely because the MGREF2 fund they are using that was set up for a global investment mandate now has so few options as Italy, France, Germany, Australia (ironically!) wake up to the devastating impacts of large-scale solar projects on inappropriate sites?	As set out in the **Funding Statement [APP-019]**, the Scheme is a privately financed development, which is the standard model for delivering large-scale energy infrastructure in Great Britain. This model enables the development of essential low-carbon infrastructure without reliance on public funds. The Applicant notes that the siting of renewable energy projects is governed by specific national policy frameworks. While certain restrictions were proposed in Italy in 2024 for example, these have been subject to subsequent legal challenge and partial invalidation. To restrict ground-mounted solar in the UK

Reference	Theme	Comments/Issues Raised	Applicant's Response
			in a similar manner would contradict current National Policy Statements (NPS EN-1 and EN-3), which identify such projects as Critical National Priority infrastructure essential for achieving net zero and energy security. The Applicant's approach to site selection has focused on balancing the urgent national need for low-carbon generation whilst minimising impacts to the local environment by ensuring that the Scheme avoids the most sensitive designations. Full details of this methodology and the evaluation of potential alternative locations are provided in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1 [APP-185**]. These site selection parameters and the resulting design refinements are documented in the **Consultation Report [APP-022]** and are legally secured through the Requirements in Schedule 2 of the **Draft DCO [APP-016]**.
AF-015	Description and DCO Process Socio-Economics, Tourism and Recreation	Why are (Redacted) powers being used so inappropriately? Without a regulator who will protect local people in the development stage of the project by a company who have never done anything on this scale before? Who will pay for their legal representation? Who will compensate them for the devastating impact on house prices as the area turns into an industrial site during construction phase?	The Applicant's goal is to deliver Lime Down Solar Park on land where the owner has voluntarily agreed to its use. Meaningful conversations with identified land interests have helped inform the design which in turn assists in avoiding certain elements of land holdings, including homes or gardens. Lime Down Solar Park is defined as a Nationally Significant Infrastructure Project (NSIP) under the Planning Act 2008, and the **Draft Development Consent Order [APP-016]** contains provisions for the compulsory acquisition of land, property and rights. These rights are sought to ensure the ability to deliver the Scheme and are subject to strict controls and limitations that will be thoroughly tested throughout the examination process by the Examining Authority to ensure that they are both proportionate and necessary. The Applicant remains committed to meaningful engagement with all land interests and confirms that negotiations, including the provision of legal fees for affected parties, are tracked in the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Land and Rights Negotiations Tracker [APP-021]. Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2 Scoping Opinion Response Table [APP-181]**. The Applicant has a proven track record in developing projects of this scale, including the consented Cottom Solar Project and West Burton Solar Project, alongside a number of other NSIP scale schemes currently being progressed by Island Green Power.
AF-016	Description and DCO Process	What deal did (Redacted) do with the UK government to give them such a strong hand in these situations? (Redacted)	The Applicant confirms that it has not entered into any private 'deal' or arrangement with the UK Government regarding the Scheme, nor received any subsidies in the Scheme's development. The Scheme is a privately financed development, which is the standard model for delivering large-scale energy infrastructure in Great Britain; this model enables the development of essential low-carbon generation without reliance on public funds. The Scheme's designation as Critical National Priority (CNP) infrastructure is a status defined within the National Policy Statement for Energy (EN-1). This classification is not derived from any private arrangement but is instead a direct response to the urgent national need for renewable energy to bolster UK energy security and meet net zero targets, as established in government policy.
AF-017	Description and DCO Process	I hope this analysis will form part of your due process. I am a passionately believer in green energy and conserving the environment. This proposal however simply has none of	The Applicant notes that the concerns raised by this Interested Party have been responded to in detail in the responses above.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		these priorities in mind, and its impact has already been devastating.	
AF-018	Description and DCO Process	IGP/Macquarie have openly admitted that have made plenty of mistakes in the due process to date, but there are no repercussions and local people are being quashed. The track record of (Redacted) in these situations has typically been one of financial (Redacted) with scant regard for their implications. We have yet to witness anything that suggests Lime Down is any different, indeed all evidence to date suggests this is a more extreme version of their track record of malpractice (Redacted), and why they have been long afforded the seemingly highly appropriate but distasteful name, the Vampire Kangaroo.	The adequacy and transparency of the Applicant's approach during the pre-application stage is set out in the **Consultation Report [APP-022].** This document evidences compliance with the statutory requirements of the Planning Act 2008 and records a multi-stage engagement process through which local knowledge informed the evolution of the Scheme. That process led to material design refinements, including measures to protect residential amenity and landscape character. The Applicant will remain subject to ongoing legal obligations secured through the Requirements contained within Schedule 2 of the **Draft DCO [APP-016]**. These Requirements are enforceable by the Secretary of State throughout the operational life of the Scheme. Any failure to comply would constitute a criminal offence, providing a clear and robust mechanism to ensure continued adherence to environmental and community commitments. As set out in the **Funding Statement [APP-019]**, the Scheme is a privately financed development, which is the standard model for delivering large-scale energy infrastructure in Great Britain. This model enables the development of essential low-carbon infrastructure without reliance on public funds. The Applicant does not seek to override local interests but operates within a transparent and regulated planning framework. The Scheme's designation as Critical National Priority infrastructure is derived from national policy set out in NPS EN-1, reflecting the urgent need for energy security and low-carbon generation, rather than any private arrangement. The Applicant evidences the experience Island Green Power (IGP) holds in developing projects of this scale, demonstrated through the consent of Cottom Solar Project and West Burton

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Solar Project. These projects were progressed in full accordance with all relevant regulatory and procedural requirements. In addition, IGP is currently advancing several other NSIP scale developments through the DCO process.
AF-019	Socio-Economics, Tourism and Recreation	We would very probably be forced to close down our stud business which employs 5 people directly and contributes £300,000/year to the local economy in veterinary bills, feed, staff wages and other contributions. The financial contribution to the broader economy in stallion fees, insurance and bloodstock production is materially more with the UK's racing industry employing 85,000 people. In 2018 we were a top 10 consignor of foals at Tattersalls and have maintained a strong position within the industry ever since with 45 horses now on the farm. Please consider a number of studies including "*Large Scale Infrastructure Projects and Their Impacts on Studfarms*" by W.M. Bayly, D.R. Hodgson, and D.P. Leadon. Here independent veterinary and scientific evidence shows that industrial-scale solar and wind developments cause serious welfare risks to horses, especially pregnant mares and foals. The report is detailed and cites a broad section of other studies that are backed up by long-standing evidence. Extracts include citing issues such as: "*Severe noise anxiety is reported to*	The equestrian facilities at Ladyswood Farm & Stud have been assessed as a specific receptor in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. During construction, a medium-term temporary moderate-minor adverse effect is anticipated, as a result of proximity to Solar PV Arrays, a construction compound, cabling works, and HGV traffic on access and hacking routes. The Applicant has sought to mitigate these as much as possible through removing Solar PV Array areas (fields designated B2-B4 and A11-A12), and embedding design, transport, and PROW mitigation into the Scheme ahead of DCO submission. This has included providing landscape screening around Solar PV infrastructure, siting the construction compound in B1 as far as practicable from the paddocks at Ladyswood Farm & Stud, providing banksmen and speed limits where accesses interact with PROWs, through specifying HGV access routes to the Scheme, and through ensuring PROWs are kept open as much as practicable through construction, and entirely during the operational phase of the Scheme. These measures are secured through the **Works Plan [APP-007]**, **Outline LEMP [APP-283]**, **Outline CEMP[APP-0277]**, **Outline CTMP [APP-287]** and **Outline PROWPPMP [APP-282]** by Requirements 5, 7, 13, 15, and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**. As a result, it is not anticipate that the effects on Ladyswood Farm & Stud are anticipated to be significant. This also applied to individually assessed PROWs around Ladyswood, which subject to implementation of mitigation are not anticipated to

Reference	Theme	Comments/Issues Raised	Applicant's Response
		cause serious welfare consequences, impacting both the physiology (e.g. gastrointestinal signs/colic, sweating) and behaviour (e.g. frantic running, collisions with and breaking fences) of the horse (Riva et al. 2022). " *"The result will inevitably be closure of studfarms, an unnecessary loss of rural employment and reduced net inward investment and reputational damage*.'	experience significant adverse effects at any phase of the Scheme.
AF-020	Landscape and Visual	The Cotswolds is one of the UK's most treasured landscapes, drawing visitors from around the world. Towering panels, industrial structures, and fencing will destroy unspoiled countryside views, replacing them with an industrial wasteland. Every morning we are privileged to wake up to remarkable view of the cherish local landscape. This will all be lost to 4.5 metre high panels - never installed in the UK at this scale. This is totally unprecedented, and its impact has never been considered, let alone tested.	The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. An assessment of landscape and visual effects, including the effects of the maximum panel height, is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors during construction, operation and decommissioning, including residential properties and users of public rights of way, using the maximum design parameters to ensure a robust assessment, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. Ladyswood Farm is identified as as Receptor RG017 and has been fully assessed in ES Volume 3, Appendix 8-3-2-1-1: Visual Assessment Sheets (Non-Significant) [APP 190]. In response to consultation a significant number of fields along the Fosse Way close to Ladyswood Farm were removed from the Scheme. As

Reference	Theme	Comments/Issues Raised	Applicant's Response
			a result of the removal of panels in fields B2-B5 and fields B1 and C27, there would be no change to views. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

6.21 James Turner

Table 6-21 RR-2078

Reference	Theme	Comments/Issues Raised	Applicant's Response
JT-001	Site selection and Alternatives	I think all solar farms should be located along major motorways as this is unusable land. Also lime down will become a brown site after 20 years I believe, so a stealth way of being able to build yet more houses in this area	In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, all land will be returned to its original use and condition as far as practicable and returned to the landowner. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most

Reference	Theme	Comments/Issues Raised	Applicant's Response
			environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the effects would be less than those likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Plan will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. The Applicant does not expect that the land will be considered brownfield after decommissioning. The expectation is that the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			land will return to farming. However, the Applicant notes that it cannot dictate what will happen to the land post-decommissioning when the Applicant no longer has an interest in the land. Post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed, the landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

6.22 Carter Jonas on behalf of Messer Nicholas

Table 6-22 RR-3146

Reference	Theme	Comments/Issues Raised	Applicant's Response
CJMN-001	Site selection and Alternatives	Carter Jonas acts on behalf of Messrs Nicholas in relation to the proposed Lime Down Solar Project DCO. We wish to raise the following points: Excessive Land Requirement- The acquiring authority has requested an option over 18.22 acres of our client's land, citing uncertainty regarding the location of the grid connection to the adjacent substation. This area is wholly disproportionate to the requirements for the proposed works on my clients land. The applicant has also stated in their Needs Case (Section 7.6.11): 'The land included in the Scheme's proposals will support an optimisation of the available grid connection secured at Melksham from the proposed layout and BESS configuration, while being sympathetic to planning issues and respecting identified constraints.' However, the land included within the scheme limits only supports an available grid connection, as land has been included surrounding the entire substation, rather than the minimum land that is necessary to deliver the scheme. Lack of Realistic Proposal- Due to excessive land requirements as outlined above our client has not been provided with a clear or realistic	The Applicant acknowledges that the Book of Reference does not currently list Messrs Nicholas' relevant Category 1 interest in Plot 16014 within the Lessee or Tenant section. This omission has now been identified, and the Book of Reference will be updated to include the relevant interest at Deadline 1. The Applicant acknowledges the option area is greater than the final easement width, however this is to allow flexibility around the point of connection at the substation which is governed by National Grid which is common practice for these types of projects. The Applicant is in discussions with Messer' Nicholas' and their professional representation to enable proper consideration to the final area where the Applicant seeks rights over the land. The Applicant is engaging with National Grid regarding their non-operational land where Messers' Nicholas' have occupation. As part of this, the Applicant is following the internal governance process set out by National Grid, the engagement is highlighted in the **Land Rights Negotiations Tracker [APP-021]** and confirms the Applicant has submitted the Developer Enquiry Form and is progressing through the stages. The Environmental Statement (**ES Volume 2, Appendix 3-2: Cable Route Construction Method Statement [APP-183]**) confirms that the widest cable trench is anticipated to be 7m, therefore on completion of the aforementioned process, the cable area and subsequently option area, is to be reduced accordingly. The Applicant will continue to engage with Messrs' Nicholas' and their professional representation to enable proper consideration of any voluntary agreement.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		proposal. This prevents proper consideration of the offer put forward due to rights being asked for over significantly more land than is required for the proposed works on my clients land. If compulsory acquisition powers are granted, there is concern that they may not be used as a means of last resort. Omission from Book of Reference- The Book of Reference fails to list our client's Category 1 interest in Plot 16-014. The acquiring authority is aware of their interest and there agents have said "*Heads of Terms will be issued once they have been through National Grid's six-step process*", in so doing, not allowing my client to properly consider a voluntary agreement.	

6.23 Craig Lance Newton Fuller

Table 6-23 RR-0949

Reference	Theme	Comments/Issues Raised	Applicant's Response
CLNF-001	Cultural Heritage Landscape and Visual	Relevant Representation: FORCEFUL OBJECTION to Lime Down Solar and BESS NSIP Introduction: Core Position and Context 1.1 This representation articulates unwavering and forceful opposition to the Lime Down Solar and Battery Energy Storage System (BESS) Nationally Significant Infrastructure Project (NSIP). The project is considered to be fundamentally and demonstrably incompatible with Wiltshire's historic landscape and existing local infrastructure. 1.2 The context of the proposal is a historic Wiltshire setting along the Fosse Way and Wessex Way, where fields and hedgerows have been maintained for livestock for over 500 years. This area possesses an irreplaceable heritage value. 1.3 The site features long-protected views from Areas of Outstanding Natural Beauty (AONB) and national landscapes. The proposal is an unacceptable and damaging imposition, wholly out of character with this sensitive and historically significant environment.	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. The potential effects of the Scheme on the cultural heritage of the Fosse Way, Wessex Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The assessment identifies known Roman heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have

Reference	Theme	Comments/Issues Raised	Applicant's Response
			also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**. The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Cotswolds National Landscape and its Special Qualities [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL. The assessment found that there would be some short term harm to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these

Reference	Theme	Comments/Issues Raised	Applicant's Response
			effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
CLNF-002	Site selection and Alternatives Landscape and Visual	Site Selection and NSIP Process Concerns 2.1 The attribution of the site choice is evidently driven solely by landowner willingness, not by technical suitability, starkly highlighted by its excessive distance from the national grid. This demonstrates a fundamental flaw in the project's conception. 2.2 Numerous brownfield alternatives, including disused power station sites nationwide with existing grid connections, are incontrovertibly more appropriate and sustainable locations for such a project compared to this pristine greenfield site. The developer has failed to justify this inappropriate greenfield selection. 2.3 The NSIP process in this instance is critically opaque. Furthermore, there is an absolute lack of directly comparable UK precedent for NSIP-scale solar projects, rendering the Cleve Hill example entirely irrelevant for a meaningful comparison to the scale and specific characteristics of this proposal. 2.4 Relevant Policy: NPS EN-3 (Renewable Energy Infrastructure) explicitly states developers should prioritize brownfield sites where possible.	As detailed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056] and ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185] (SSAR)**, the Applicant has followed a staged approach to assessment, taking into consideration a range of planning, environmental and operational factors. Potentially willing landowners with large scale land holdings within the search area was a consideration, however it is not the only consideration in the site selection process. As to consideration of brownfield sites, the SSAR sets out how brownfield sites have been considered in line with policy. None of the brownfield sites identified within the 20 km search area are considered viable for the Scheme. The Applicant considers that **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056] and ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** appropriately justify the site selection for the Scheme. Regarding impacts on Best and Most Versatile (BMV) agricultural land, NPS EN-3 paragraph 2.10.23 recognises that solar developments at this scale are likely to use some agricultural land and applicants should explain their choice of site, noting the preference for development to be on suitable brownfield, industrial and low and medium grade agricultural land.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		The developer has failed to adequately demonstrate why this greenfield site is acceptable given the availability of brownfield alternatives. 2.5 Relevant Policy: Wiltshire Core Strategy Policy 42 demands that standalone renewable energy installations must not have significant adverse impacts on Best and Most Versatile (BMV) agricultural land, supporting a preference for brownfield alternatives. This proposal directly contradicts this policy by occupying valuable agricultural land without compelling justification. Action Items and Demands 17.1 Compile and submit a comprehensive and independent comparative assessment of brownfield sites with existing grid connections as superior alternatives to Lime Down.	NPS EN-1 paragraph 5.11.34 provides that use of BMV land should be justified. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out **in ES Volume 1, Chapter 17, Section 17.7 [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17, Section 17.10 [APP-069]**, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land

Reference	Theme	Comments/Issues Raised	Applicant's Response
			are embedded within the Scheme design and secured through Schedule 2, Requirement 17 of the **Draft DCO [APP-016]** which includes the preparation and implementation of a Soil Resources Management Plan (SRMP) in accordance with the **Outline SRMP [APP-280].** The SRMP will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279],** which is secured by Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**. The **Outline Landscape and Ecological Management Plan [APP-283]** details how grassland and other habitat will be established beneath and between the solar panels. The detailed LEMP will be secured through Schedule 2, Requirement 7 of the **Draft DCO [APP-016]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1, Chapter 17, Sections 17.10 and 17.12 [APP-069]**). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056] and in the Statement of Need [APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land / brownfield land over 1 hectare within the area of search, based on the brownfield land registers of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development.
CLNF-003	Cultural Heritage	Heritage and Landscape Impacts 3.1 Sections A, B, and C of the proposal are situated on boundaries with national landscapes, with the historic Fosse Way prominently bisecting all three sections. 3.2 The visualizations provided within the application are wholly inadequate and fail utterly to provide a clear and comprehensive understanding of the devastating proposed landscape impact. 3.3 Visual impacts from viewpoints such as Sherston and Easton Grey will undoubtedly include extensive solar arrays and a massive BESS, visible across many miles, fundamentally altering the rural vista. 3.4 Bradfield Manor, a Grade I listed building located near the railway, is situated within hundreds of metres of the proposed BESS. This proximity will irrevocably compromise its heritage views and setting. 3.5 Farleaze Farm (Grade II), which used to have the art studio for Raoul Millais, set within 60 acres, possesses a highly valued setting that will suffer irreparable harm from the proposed development. 3.6 Norton Manor (Grade II*), central to Norton village and a highly regarded building, will experience severe and unacceptable adverse impacts on its setting from multiple approaches, as well	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by appendices in **ES Volume 3 (12.1 to 12.8) [APP-219 to APP-232]** has assessed the potential impact of the scheme on heritage assets. The assessments consider the significance and setting of heritage assets, including Bradfield Manor Farmhouse, Farleaze Farm and Norton Manor. As stated in **Appendix 12.1: Heritage Statement [APP-219]** when considering the contribution of setting to the significance of the Grade I Listed Bradfield Manor Farmhouse (NHLE: 1198808), the asset is largely defined and experienced from within the Bradfield Manor Farmhouse grounds, in particular the walled courtyard to the south-west of the asset, where the full architectural interest of its south-facing primary elevation can be appreciated. Lime Down D is located within agricultural land to the north of asset. Following advice provided by Historic England, panels in Field D5 were set back away from Grade I Listed Bradfield Manor Farmhouse and enhanced screening is proposed along existing hedgerows. Views of the proposed BESS and 400 kV Substation from Bradfield Manor Farmhouse will be largely mitigated by the proposed new woodland belt along the south-eastern boundary of Field D3 which, in combination with the existing woodland block west of D1 and south of D22, provides extensive screening in views to and from Bradfield Manor Farmhouse. It was identified that there would be a moderate / minor (not significant) adverse effect to the asset (less than substantial harm at the lower end in NPPF terms) as a result of indirect (i.e. setting) impacts.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		as significant and very damaging effects resulting from the noise of the BESS particularly at night; all local residents will be directly effected by noise which is completely out of keeping with the character of the area. 3.7 The suggested mitigation strategy, relying on the growth of new hedges over an unrealistic estimated 15 years, is demonstrably insufficient and fundamentally inappropriate for the existing landscape character. Many established hedgerows in the area, some of considerable age, are typically around 2m high, defining the long views. Creating "*tunnels*" of taller, incongruous hedging to screen these industrial structures would be entirely out of keeping and destroy the established rural aesthetic. 3.8 Relevant Policy: NPS EN-1 Section 5.8 (Historic Environment) unequivocally states that infrastructure can have adverse impacts on heritage assets. It requires the applicant to describe the significance of any heritage assets affected, including their setting, and demands that great weight must be given to the asset's conservation. This proposal fails to meet these stringent requirements. 3.9 Relevant Policy: NPPF Chapter 16 Paragraph 205 insists that "*great weight should be given to the asset's conservation*" regarding designated heritage assets. This project plainly disregards this fundamental principle. 3.10 Relevant Policy: Wiltshire Core	Following embedded mitigation (see Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**) no impacts have been identified to Grade II* Listed Norton Manor (NHLE: 1023215) and Grade II Listed Farleaze Farmhouse (NHLE: 1251985). Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. As detailed in Section 12.3 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, the cultural heritage assessment has been undertaken in accordance with relevant legislation, policy and guidance, including the Planning (Listed Buildings and Conservation Areas) Act 1990 and Overarching National Policy Statement for Energy (EN-1) (January 2024). Where harm to heritage assets has been identified this has been assessed to comprise 'less than substantial harm' (see **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]**). The Applicant highlights paragraph 5.9.33 of NPS EN-1 "*Where the proposed development will lead to less than substantial harm to the significance of the designated heritage asset, this harm should be weighed against the public benefits of the proposal, including, where appropriate securing its optimum viable use.*" The public benefits of the scheme are detailed in **ES Volume 1, Chapter 5: Energy Need, Legislative Context and Energy Policy [APP-057].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Strategy Policy 58 (Ensuring the Conservation of the Historic Environment) requires that development must not adversely affect the significance of heritage assets, including their setting. This proposal violates this core policy. 3.11 Relevant Policy: Wiltshire Core Strategy Policy 51 (Landscape) mandates that development must protect, conserve, and enhance Wiltshire's distinctive landscape character and requires proposals to demonstrate they have taken into account the Wiltshire Landscape Character Assessment. The proposed mitigation is unacceptable and fails to meet this policy.	With reference to point 3.2, baseline photography and photomontages of the Scheme supports the Landscape and Visual impact Assessment (LVIA) and is presented in ES Volume 3, Figure 8-14 **[APP103- 105]** and revision [**APP AS001].** Figure 8-14 includes photography from 55 Viewpoints and is representative of range of receptors including residential properties, Public Rights of Way and roads. Visualisation or photomontages were prepared from a number of Viewpoints and were agreed with Wiltshire Council and the CNL Board. Viewpoint 5 is located on a footpath on the southeastern edge of Sherston. There are no viewpoints from Easton Grey as there is no intervisibility between the village and the Scheme due to intervening vegetation and topography. The selection of viewpoints where photomontages were agreed was based on the PEIR layout and informed the final layout following consultation. Additional visualisations from Bradfield Manor Farmhouse will be produced at Deadline 1. With reference to point 3.7, the proposed mitigation planting includes for substantial areas of new woodland, hedgerow and meadow planting, which once established would provide positive contributions to the countryside in line with the Wiltshire's Nature Recovery Strategy. It is agreed that the mitigation planting, particularly allowing hedgerows to become taller and maintained to a height of 4.5m would cause a change in landscape character and loss of longer views over the landscape in some places. However, it is noted that not all of Wiltshire's hedgerows are maintained to a low height and this change would not be significant or permanent as hedgerows could be clipped low again following decommissioning. The defining legacy of the landscape would be the robust framework of features that have improved through the mitigation and landscape enhancements. This mitigation in turn would give rise to long-term wider benefits, including maintaining and enhancing biodiversity and in promoting the resilience of ecosystems. NPS EN-1 recognises at para 5.10.5 that

Reference	Theme	Comments/Issues Raised	Applicant's Response
			"*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation*." The industry standard of assessing The Guidelines for Landscape and Visual Impact Assessment notes that "W*here planting is intended to provide a visual screen for the development it may be appropriate to assess the effects for different seasons and periods of time (for example, at year 1, representing the start of the operational stage, year 5 and year 15) in order to demonstrate the contribution to reducing the adverse effects of the scheme at different stages. In such projections the assumptions made about growth rates of planting should be clearly stated*." Page 31 of the LVIA in ES Volume 1, Chapter 8: Landscape and Visual **[APP-060]** every 1 year sets out the assumptions made about growth rates and states: "*A uniform rate of growth is allowed for trees, shelterbelts, and woodland mitigation planting of 0.4m every 1 year. At Year 15 this will result in new trees, shelterbelts, and woodland plantings having reached a minimum height of 7.5m. A uniform growth rate is allowed for new hedgerows of 0.4m every 1 year. This would result in hedgerows being able to be maintained at a height of between 3 - 5m by Year 15*." With reference to point 3.8, compliance with national and local heritage policy, including the requirements of NPS EN-1, is set out in Annex A (National Policy) and Annex B (Local Policy) of the **Planning Statement [APP-574]**. Those tables specifically address Section 5.8 of NPS EN-1 and demonstrate how **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** and its supporting appendices identify heritage assets, assess their significance (including setting), evaluate potential impacts, and apply appropriate mitigation.

Reference	Theme	Comments/Issues Raised	Applicant's Response
CLNF-004	Noise and Vibration	Noise and Vibration 4.1 The baseline environment is characterised by profound rural tranquillity, with numerous equestrian centres and studs located within metres of the proposed BESS and solar arrays. 4.2 Solar arrays are planned at a height of approximately 4.5 metres, with tracking motors predicted to generate a continuous and pervasive low-level hum day and night, fundamentally altering the soundscape. 4.3 Irrefutable concerns exist regarding the widespread and severe adverse impacts on mental health and well-being due directly to the incessant noise and vibration, which will be experienced over a vast area. 4.4 Construction impacts are projected to last two years and will cause unacceptable and intolerable disruption for local residents. 4.5 While Cleve Hill is cited, questions regarding the robustness of developer assurances are paramount, as relevant noise and vibration studies conspicuously lack UK validation or professional qualification for this specific type of project. Their assurances are therefore unfounded and unreliable. 4.6 Ongoing noise sources will include incessant piling and thumping during infrastructure installation and continuous, disruptive transport movements throughout the entire construction phase.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. Noise from the installation of solar PV panels will be spread across the site over the course of the construction period and therefore will only be at the levels presented for each relevant sensitive receptor in Table 14-18 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** for the closest set of works to that receptor rather than the full two years. As a reasonable worst-case, the assessment includes the noise from piling rigs that are larger and louder than those used in practice. The assessment also includes the noise from construction traffic. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. Noise levels from construction activity are listed in Table 1 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]** and are derived from well validated data contained in BS5228:2009+A1:2014. These source levels form the basis of a reasonable worst-case construction assessment conducted by experienced and suitably qualified professionals, as summarised in **ES Volume 3, Appendix 1-1: Statement of Competence [APP-180].** The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		4.7 The developer has failed to provide sufficiently clear details on the exact specification of the solar panels and tracking mechanisms. This critical lack of precise information precludes a thorough and accurate assessment of the potential noise and vibration effects. 4.8 Relevant Policy: NPS EN-1 Section 5.11 (Noise and Vibration) demands noise assessments to comply with British Standards. It categorically states that development consent should not be granted if significant adverse noise impacts cannot be mitigated. The developer has failed to demonstrate effective mitigation. 4.9 Relevant Policy: Wiltshire Core Strategy Policy 42 specifically requires that renewable energy proposals demonstrate no significant adverse impacts on residential amenity, including noise. This proposal will undoubtedly inflict significant adverse impacts. Action Items and Demands 17.3 Commission independent, UK-qualified noise and vibration studies for 4.5 m rotating arrays and large BESS near equestrian and residential areas.	The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As explained in Section 14.4 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** noise from moveable panels would not be audible at residential properties. As shown in Table 8 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, levels would typically be below or slightly above the existing background sound in the area. The levels have been calculated, using the appropriate international standard, on a worst-case assumption that wind is blowing from the source of the noise to the receptor locations, as stated in paragraph 14.4.15 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This is likely to include a significant number of silencer units and enclosures and provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. Impacts on mental health and wellbeing in respect of noise and vibration have been assessed in **ES Chapter 18: Human Health [APP-070]** and find that no significant effects are anticipated as a result of any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the **Outline Operational Environmental Management Plan [APP-278]**, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. A summary of how the application meets the requirements of NPS EN-1 is provided in Table 1 of **ES Volume 3, Appendix 14-1: Noise and Vibration Legislation, Policy and Guidance [APP-234].** By avoiding significant adverse effects on health and quality of life the Scheme also aligns with Wiltshire Core Strategy. The relevant parts of the Wiltshire Core Strategy are also presented in **ES Volume 3, Appendix 14-1: Noise and Vibration Legislation, Policy and Guidance [APP-234]**.
CLNF-005	Noise and Vibration	Noise and Vibration 4.1 The baseline environment is characterised by profound rural tranquillity, with numerous equestrian centres and studs located within metres of the proposed BESS and solar arrays. 4.2 Solar arrays are planned at a height of approximately 4.5 metres, with tracking motors predicted to generate a continuous and pervasive low-level hum day and night, fundamentally altering the soundscape. 4.3 Irrefutable concerns exist regarding the widespread and severe adverse impacts on mental health and well-being due directly to the incessant noise and vibration, which will be experienced over a vast area. 4.4 Construction impacts are projected to last two years and will cause	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The relevant parts of the Wiltshire Core Strategy are also presented in **ES Volume 3, Appendix 14-1: Noise and Vibration Legislation, Policy and Guidance [APP-234]**.
CLNF-006	Other Environmental Matters	Glint and Glare 6.1 There is no directly comparable UK precedent for 4.5-metre rotating solar panels at this scale, meaning potential	Glint and Glare impacts from single-axis tracking panels can be suitably modelled using specialist software. Impacts upon at-risk groups have been considered within **ES Volume 3, Appendix 20-4**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		impacts remain entirely untested and unknown. 6.2 At-risk groups include horses (including breeders and riders), local residents, drivers, and train drivers, will be severely affected due to the railway bisecting potential glare corridors. This presents an unacceptable safety hazard. 6.3 A critical assurance gap exists, as reliable mitigation strategies or precedent-based reassurances for this specific technology configuration are simply not provided. 6.4 The developer has failed to provide sufficiently clear details on the exact specification of the solar panels, which is vital for an accurate assessment of glint and glare effects. 6.5 Relevant Policy: NPS EN-3 explicitly addresses solar photovoltaic generation and requires the assessment of visual impact, including glint and glare on neighboring uses and transport infrastructure. The current assessment is deficient. 6.6 Relevant Policy: Wiltshire Core Strategy Policy 42 requires proposals to demonstrate no significant adverse impacts on residential amenity, specifically referencing glint and glare. This proposal will undoubtedly impose significant adverse impacts.	**Solar Photovoltaic Glint and Glare Study [APP-261]** and no significant impacts are predicted. No further mitigation is recommended, however mitigation measures for glint and glare are well-understood and have been successfully implemented on many solar farms in the UK and internationally. The exact specification of solar panels is a minor consideration for glint and glare modelling and would not be considered to significantly affect the results. A worst-case assumption of smooth glass with anti-reflective coating has been used for the solar panel material within glint and glare modelling. To confirm, a Glint and Glare Assessment has been produced in line with NPS EN-3 (**ES Volume 3, Appendix 20-4 Solar Photovoltaic Glint and Glare Study [APP-261]**), which considers nearby receptors and no significant impacts are predicted from glint and glare including upon residential amenity. This complies with Wiltshire Core Strategy Policy 42. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies.
CLNF-007	Ecology and Biodiversity	Ecology 7.1 Species present on site include skylarks, great crested newts (pond tests positive), field mice, and wood mice,	The assessment in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** identifies skylarks as a key species of conservation interest within the Scheme area. It concludes that a proportion of the current skylark and population will be displaced from

Reference	Theme	Comments/Issues Raised	Applicant's Response
		which will be directly impacted. 7.2 Outcomes will include the long-term or permanent loss of skylarks from several fields, representing an unacceptable loss of biodiversity. 7.3 Concerns are grave that proposed policy changes will actively undermine ecological protections rather than ensuring the preservation of existing biodiversity. 7.4 The unprecedented scale and specific nature of tracking solar panels of this size raise concerns that the effects on ecology and nature are grossly underestimated and inadequately understood. This area must not be used as an experimental testing ground for a project whose long-term environmental impacts are unproven and potentially catastrophic. 7.5 Relevant Policy: NPPF Chapter 15 (Conserving and enhancing the natural environment) demands protecting biodiversity and achieving Biodiversity Net Gain. This project fails to demonstrate how it will achieve this; instead, it promises significant loss. 7.6 Relevant Policy: Wiltshire Core Strategy Policy 50 (Biodiversity and Geodiversity) requires development to demonstrate no net loss of biodiversity and protection of protected species. This proposal directly contravenes this fundamental policy. Action Items and Demands 17.9 Update and validate ecology surveys for skylarks, great crested newts,	the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large, open set-aside and grassland habitats designed to provide appropriate breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283**]. Skylarks have been observed gathering food from within operational solar farms and leading young into them, indicating they are valuable foraging resources. Whilst it is assumed that skylarks will typically avoid nesting in solar farms, skylark foraging habitat requirements are less strict. **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** provides a balanced assessment of likely significant effects, identifying residual effects where these remain after mitigation. The Chapter has considered the use of tracking panels as part of the assessment. Unavoidable adverse impacts have been minimised through careful design and are subsequently addressed through mitigation, compensation and long-term management to be secured via DCO Requirements including the **Outline Landscape and Ecological Management Plan (Outline LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (Outline EPMS) [APP-284].** This is in accordance with The Applicant considers that residual significant effects on habitats and species are clearly set out within **ES Chapter 9 [APP-061]** in line with EIA guidance and are limited to short-term loss of hedgerows and displacement of ground nesting birds, which have been mitigated

Reference	Theme	Comments/Issues Raised	Applicant's Response
		field/wood mice; prepare robust and independently verifiable mitigation/no net loss strategies.	for as far as possible within the Scheme in the Applicant's view. **ES Chapter 9 [APP-061]** also identifies significant residual beneficial benefits during the Operation and Maintenance phase of the Scheme for a range of ecological features, including other neutral grassland, woodland, ponds, hedgerows, watercourses, badgers, bats, dormice, brown hare, harvest mouse, hedgehog, polecat, amphibians, reptiles, breeding birds, overwintering birds and terrestrial invertebrates. Field mice and wood mice are not explicitly assessed within **ES Chapter 9 [APP-061].** The Scheme's baseline biodiversity units have been calculated with the use of the DEFRA published standardised Statutory Biodiversity Metric ('the Metric') and based on comprehensive habitat surveys undertaken by the Applicant's professional ecologists. The Metric has been used to compare the baseline biodiversity units with the projected post-development units. The projected post-development units have been calculated based on the habitat creation and enhancement measures shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Details of the Scheme's approach to BNG are provided in the **Biodiversity Net Gain Report [APP-273]** and the full BNG calculations are provided in a copy of the Metric **[APP-274]**. These calculations demonstrate the Scheme will result in a considerable net gain for biodiversity and can thus be considered in accordance with NPPF section 15 and Wiltshire Core Strategy Policy 50.
CLNF-008	Human Health	Community and Mental Health 8.1 The project has already generated profound local distress and pervasive anxiety, with reports of severe impacts on family well-being and an unacceptable degradation of quality of life over the anticipated two-year construction	8.1 and 8.2. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public

Reference	Theme	Comments/Issues Raised	Applicant's Response
		period. 8.2 Social dynamics indicate that while collective opposition has strengthened community cohesion, the overall process has undeniably caused deep division and severe upset within the community. 8.3 There is no directly comparable UK-scale BESS-solar development in a similar rural setting. Therefore, any assurances regarding post-project normality are baseless and entirely without validity, leading to profound concerns about their sincerity.	Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant is confident that the assessment undertaken in **ES Volume 1, Chapter 18: Human Health [APP-070]** is robust and adequately addresses the likely impacts on human health that are expected as a result of the Scheme, including those that have implications across multiple assessed topic areas. The Applicant highlights that the assessment of human health specifically relies upon the assessment outcomes for matters including but not limited to transport, noise, air quality, and recreation, to ensure that a holistic approach to assessing health and wellbeing has been undertaken in accordance with national and local policy requirements. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. 8.3 The potential visual effects associated with the proposed Battery Energy Storage System (BESS) have been assessed as part of the Landscape and Visual Impact Assessment (LVIA) in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. This assessment identifies where visual changes may occur, evaluates the sensitivity of receptors, and considers the magnitude of change resulting from the Scheme. The LVIA assesses the likely significant effects of the Scheme, including the BESS, during construction, operation and decommissioning on identified landscape and visual receptors. This includes residential properties, users of public rights of way and transport receptors. The assessment considers the sensitivity of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			receptors, the magnitude of change and the resulting significance of effect. The BESS has been assessed as part of the worst-case parameters for above-ground infrastructure, including through Zone of Theoretical Visibility analysis and representative viewpoints agreed through consultation with Wiltshire Council and the Cotswolds National Landscape Board. Photomontages **[APP103 – 105]** have been prepared where significant effects were anticipated to assist in understanding how the BESS and other infrastructure would appear in the landscape. Through the iterative design process, the layout and positioning of infrastructure, including the BESS, has been refined to reduce visual influence. Embedded mitigation measures are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. These measures are secured via DCO Requirement 5 Detailed Design Approval and Requirement 7 Landscape and Ecological Management Plan. The LVIA identifies where significant visual effects would occur and reports residual effects following mitigation. It concludes that visual effects associated with the Scheme, including the BESS, are localised and would reduce over time as mitigation planting establishes. The decommissioning of the Scheme has been assessed within the **ES [APP-052 to APP-265]** which considers the effects associated with decommissioning activities. As part of the assessment, appropriate mitigation measures are incorporated into the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Information on decommissioning activities is provided within the **ES [APP-052 to APP-265]** and within the **Outline Decommissioning Strategy [APP-279]**. The information is provided in accordance with the requirements of Part 1 of Schedule 4 of the EIA Regulations 2017 (as amended). Schedule 4 of the EIA Regulations 2017 (as amended) set out the information for inclusion in an ES. **ES Volume 1 Chapter 1 Introduction [APP-053]** Table 1-2 identifies where the requirements of Schedule 4 of the EIA Regulations 2017 (as amended) have been addressed. At the end of the Scheme's operational life, all Solar PV Sites, including BESS, would be decommissioned and the land restored to its original use and condition as far as practicable. There will be opportunities for the retention of a range of biodiversity improvements, including established habitats, hedgerows and woodland, beyond the decommissioning of the Scheme, ultimately enhancing the ecological value of the area. Measures to manage and minimise disruption during decommissioning are set out in the **Outline Decommissioning Strategy [APP-279]**. This explains how mitigation measures identified in the **ES [APP-052 to APP-265]** will be implemented during decommissioning and includes controls for working hours, noise, lighting, traffic management, pollution prevention, waste management and community liaison. The **Outline Decommissioning Strategy [APP-279]** also confirms that decommissioning activities will be undertaken in phases over an anticipated 12–24-month period, with measures to coordinate traffic movements, control noise and vibration in accordance with best practicable means and manage temporary lighting to minimise effects on nearby receptors.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**.
CLNF-009	Human Health	Community and Mental Health 8.1 The project has already generated profound local distress and pervasive anxiety, with reports of severe impacts on family well-being and an unacceptable degradation of quality of life over the anticipated two-year construction period. 8.2 Social dynamics indicate that while collective opposition has strengthened community cohesion, the overall process has undeniably caused deep division and severe upset within the community. 8.3 There is no directly comparable UK-scale BESS-solar development in a similar rural setting. Therefore, any assurances regarding post-project normality are baseless and entirely without validity, leading to profound concerns about their sincerity.	8.1 and 8.2. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant is confident that the assessment undertaken in **ES Volume 1, Chapter 18: Human Health [APP-070]** is robust and adequately addresses the likely impacts on human health that are expected as a result of the Scheme, including those that have implications across multiple assessed topic areas. The Applicant highlights that the assessment of human health specifically relies upon the assessment outcomes for matters including but not limited to transport, noise, air quality, and recreation, to ensure that a holistic approach to assessing health and wellbeing has been undertaken in accordance with national and local policy requirements. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.

The **Outline Decommissioning Strategy [APP-279]** also confirms that decommissioning activities will be undertaken in phases over an anticipated 12–24-month period, with measures to coordinate traffic movements, control noise and vibration in accordance with best practicable means and manage temporary lighting to minimise effects on nearby receptors. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**.
CLNF-010	Hydrology, Flood Risk and Drainage	Flooding and Water Supply 10.1 Local road networks, including Hullavington to Norton road, Stanton St Quinton to Corston road, Norton to Sherston road, and Pig Lane, currently suffer severely from regular flash flooding and surface water runoff from surrounding fields, frequently rendering them impassable. Extensive evidence of these events exists. 10.2 Personal experience irrefutably demonstrates significant localized flooding from field runoff, critically impacting local access. 10.3 The two-year construction period, involving extensive ground disturbance,	The Applicant acknowledges that local roads and land within the area experience surface water flooding under baseline conditions and does not dispute residents' experience of flash flooding during recent storm events. Flood risk has been assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and the supporting Flood Risk Assessment and Drainage Strategy suite **[APP-210 to APP-218]**, including consideration of construction-phase mechanisms and climate change allowances for both peak river flows and peak rainfall intensity. The assessment concludes that the Scheme would not increase flood risk elsewhere, including downstream settlements such as Malmesbury, Chippenham and Melksham, subject to embedded mitigation and the control framework secured through the Draft Development Consent Order.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		will undoubtedly exacerbate existing flood risks across all sections. The introduction of numerous large tracking and fixed solar panels will inevitably increase the speed of surface water runoff, thereby significantly heightening flood risk. The developer has failed to provide sufficiently clear details on the exact specification and placement of solar panels, which precludes a thorough and accurate assessment of their impact on surface water runoff. 10.4 Approximately 27 local properties, including the submitter's, depend entirely on private borehole water supplies. Profound concerns exist regarding the catastrophic potential impact of continuous vibration from construction and operational activities on the quality and sustainability of these vital water sources. 10.5 The unprecedented scale of this solar landscape in this specific rural context means there is no existing precedent to reliably ascertain the actual impact on groundwater resources and boreholes. This area must not be used as an experimental site. 10.6 The potential for increased runoff and altered hydrological patterns will have severe and wide-ranging implications, inevitably contributing to significantly increased flood risk in downstream areas including Malmesbury, Chippenham, and Melksham, particularly given that the proposed grid connection point at Melksham is already identified as a	The Applicant does not agree that the introduction of solar PV arrays would inevitably increase the speed or volume of surface water runoff. The operational drainage approach distinguishes between panelled areas, where rainfall drains to ground beneath and between elevated arrays, and supporting infrastructure such as substations and BESS, where runoff is managed through engineered and controlled drainage systems. This is consistent with NPS EN-3 paragraph 3.10.75, which recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained. Peer reviewed research (including Cook and McCuen, 2013, and subsequent studies) demonstrates that maintained vegetated ground cover beneath arrays does not result in material increases in runoff volume or peak discharge, and that soil compaction and bare ground, rather than panel presence alone, are the principal drivers of increased runoff response. Construction-phase risks arising from ground disturbance, temporary works and potential compaction are assessed in Chapter 11 and controlled through the **Outline Construction Environmental Management Plan [APP-277]**, secured by the **Draft Development Consent Order [APP-016]**, including measures for temporary drainage, protection of existing land drainage, soil management, reinstatement and pollution prevention. On this basis, the assessment does not identify a mechanism by which the Scheme would materially exacerbate existing road flooding. Concerns relating to private borehole supplies and groundwater protection are addressed in **Environmental Statement Volume 1, Chapter 19 Ground Conditions [APP-071]**, which assesses aquifers, Source Protection Zones and potential pollutant linkages. The Scheme does not require operational abstraction and is assessed on the basis that it would not adversely affect groundwater availability

Reference	Theme	Comments/Issues Raised	Applicant's Response
		significant flood-prone area. 10.7 The flood risk and hydrological studies presented to date are demonstrably insufficient and woefully inadequate to accurately model the full implications of the proposed development. 10.8 Critical concerns remain unresolved regarding th e detailed plans for water supply for fire suppression at the BESS, including storage on site. Furthermore, comprehensive details on the collection and containment of contaminated wastewater post-fire incident are entirely lacking. This is absolutely critical to prevent widespread contamination of local and wider water supplies, particularly given the reliance on boreholes and the area's designation as a major water source. 10.9 The site's location above one of the major water sources for the South West underscores the paramount importance of robust contamination prevention measures, which are conspicuously absent and inadequately detailed within the proposal. 10.10 Relevant Policy: NPS EN-1 Section 5.10 (Water Quality and Resources, Flood Risk) requires applicants to assess flood risk and propose mitigation, ensuring development is safe and does not increase flood risk elsewhere. It also demands assessment of impacts on water quality, abstraction, and groundwater resources. The developer has	or create new contaminant pathways, with construction controls secured through the CEMP process. The Applicant considers that the flood risk and hydrological assessments are proportionate, policy aligned and technically robust, and that the Scheme complies with the requirements of NPS EN-1, the NPPF and relevant Wiltshire Core Strategy policies in demonstrating that development would be safe for its lifetime and would not increase flood risk elsewhere.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		demonstrably failed to meet these requirements. 10.11 Relevant Policy: NPPF Chapter 14 (Meeting the challenge of climate change, flooding and coastal change) emphasizes avoiding inappropriate development in areas at risk of flooding, directing development away from highest risk areas, and promoting Sustainable Drainage Systems (SuDS). This proposal contradicts these principles. 10.12 Relevant Policy: Wiltshire Core Strategy Policy 42 (Standalone Renewable Energy Installations) requires that proposals consider flood risk. The consideration provided is manifestly insufficient. 10.13 Relevant Policy: Wiltshire Core Strategy Policy 46 (Flood Risk and Water Management) requires development to demonstrate it does not increase flood risk and incorporates SuDS, and protects water quality. This proposal fails to provide any credible assurance of meeting these demands.	
CLNF-011	Socio-Economics, Tourism and Recreation	Property Values 13.1 Market analysis conclusively demonstrates a strong expectation of devastating devaluation for properties located near large-scale solar/BESS and electrical infrastructure, comparable to the severe and proven impact associated with electricity pylons. 13.2 Concerns are grave that the developer's visibility radius modeling grossly understates the	The Applicant notes the concerns around the impacts on property prices and confirms that this matter has been scoped out of the assessment, a position agreed upon by the Planning Inspectorate in the EIA Scoping Opinion as set out in the **Consultation Report Appendix B: EIA Scoping [APP-024]**. The Scheme has been designed to minimise direct impacts on residential properties by offsetting a minimum of 50m between the property boundaries of any residence or residential areas and where solar panels & associated infrastructure are to be placed as set out

Reference	Theme	Comments/Issues Raised	Applicant's Response
		visual impact by allegedly using 1 km instead of 2 km for line-of-sight calculations. This constitutes a deliberate misrepresentation of impact. 13.3 A nearby bungalow near a Grade I building is reportedly unsellable due to the proposal, a clear indicator of immediate blight. 13.4 The Grade I building itself is considered to have no immediate marketability. 13.5 Farleaze Farm (Grade II listed) is expected to face significantly reduced saleability, impacting livelihoods. 13.6 Fox Cross has reportedly suffered a devastating value reduction from £2.5m to £1.75m due directly to project-related blight. 13.7 Personal homes are estimated to face catastrophic undervaluation exceeding 30%, with similar severe impacts anticipated across the entire region. Action Items and Demands 17.10 Document property value impacts with local comparables (including the Fox Cross case) and prepare a comprehensive and fair compensation framework proposal.	in **Section 2.2.1,Table 2-1 of ES 7.4 Design Principles and Parameters [APP269]**. Furthermore, the Applicant has implemented further offsets where appropriate to protect long term privacy and amenity for residential properties. To acknowledge the comments raised around property prices, the Applicant considers there is a lack of empirical evidence to suggest that solar farms result in significant long-term adverse effects on property values. While there have been studies from the USA and Netherlands, they indicate that external factors, such as broader property market trends, are more influential drivers of property price fluctuations. Furthermore, the Applicant points to a need to differentiate between potential short-term impacts on property saleability ie. during a construction peak, and the maintained long-term value once the Scheme is operational and scenarios such as the planned landscape mitigation have matured. The Applicant notes that consent has not been given to the Scheme, and therefore no construction or operational phase has taken place. The potential effects of the Scheme on listed buildings and other built heritage assets are assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]**. The assessment identifies baseline heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. The assessment concludes that no direct physical impacts to listed buildings are required to facilitate the Scheme. Any identified effects on listed buildings are indirect and relate to changes in elements of their setting that contribute to their significance. After mitigation, residual effects to the setting of the listed buildings range between Neutral and Minor/Moderate Adverse, and therefore not

Reference	Theme	Comments/Issues Raised	Applicant's Response
			significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The Applicant notes that the approach to the assessment in relation to heritage assets (including designated assets) has been agreed with Historic England and Wiltshire Council and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**.
CLNF-012	Socio-Economics, Tourism and Recreation	Local Economy and Tourism 14.1 The region serves as a vital gateway to the Cotswolds, with established and cherished routes from Junction 17-18 to Tetbury, Malmesbury (the oldest borough), Nailsworth, and the Stroud valleys. 14.2 There are overwhelming concerns that the visitor experience will be irrevocably destroyed, leading to a catastrophic diminished perception of the landscape quality and the appeal of cycling routes. 14.3 Businesses such as cafes, restaurants, Hotels, golf courses and pubs are expected to suffer severely during construction and beyond due to the unacceptable visual impact of 4.5-metre panels, motors, and the overall industrial mass of the development. 14.4 While acknowledging the need for renewable energy, serious questions are raised regarding the true efficiency of solar generation in the UK (ranked	Likely significant effects of the Scheme on tourism and recreation, including to the Cotswolds National Landscape, have been assessed in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. No significant effects are anticipated: the Applicant has assessed that there is a likely worst-case temporary loss of 50 FTE tourism industry jobs as a result of the Scheme. This accounts for less than 0.7% of tourism-based employment within 5 km of the Scheme (BRES, 2023 data), and approximately 0.17% of tourism employment across Wiltshire (29,000 estimate from Visit Wiltshire, 2021). Additional mitigation measures have been secured through the **Outline Construction Traffic Management Plan (oCTMP) [APP-287]**, **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]** and the OSSCEP **Outline Skills, Supply Chain and Employment Plan [APP-285].** Together these seek to reduce these losses to tourism through mitigating traffic impacts, impact to PROWs, and focussing on local recruitment, promoting local suppliers where practicable, and through providing retraining opportunities for workers tourism-dependent industries. These measures are secured by the relevant requirements in Schedule 2 to the **Draft DCO [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		approximately 209th globally) and the long-term viability of this technology. There is a strong belief that it will be superseded by cleaner, more effective energy solutions within 10-15 years, rendering this project obsolete. 14.5 Questions are forcefully raised about the ultimate beneficiaries and the grossly exaggerated local economic benefits of the project, with compelling concerns that it will primarily benefit overseas interests and that claims of local job creation are nothing more than a farce. 14.6 Relevant Policy: NPS EN-1 acknowledges the potential for socio-economic impacts and demands these to be assessed, including impacts on tourism and local businesses. The developer's assessment is fundamentally flawed and fails to address the devastating negative impacts. Action Items and Demands 17.11 Prepare a thorough and independent tourism and local business impact assessment, including projected visitor declines and robust mitigation options for cafes, pubs, and cycle routes.	The **oCTMP [APP-287]** includes measures to manage deliveries, such as a booking system, restricted hours of deliveries and specified routes to minimise any detrimental impacts on the local highway network. A final CTMP will be prepared for each site, specifying the construction routes to be used by construction traffic. This is secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]** and is enforceable. An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. 14.4 Solar energy is at the heart of the Clean Power 2030 Mission (January 2026 revised NPS EN-3, Para 2.10.2) and it is the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Government's view that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Sunlight, the input energy source for solar, is abundant, predictable, renewable, low carbon and free. Figure 16 of the **Statement of Need [APP-266]** and related text (Section 7.4) demonstrates that there are many viable areas of solar irradiation in the UK. Figures 28 and 29 of the Statement of Need and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level. The inclusion of a Battery Energy Storage System as part of the Scheme will enable energy generated by the Scheme to be stored and exported to the grid when it is needed, which will provide flexibility and improve grid reliability. Finally, that other countries may experience higher solar irradiation levels than the UK, means that they too could pursue solar generation to support their climate change plans. However, any such statistic cannot be used to demonstrate that solar in the UK does not work or should not be pursued. Government policy is clear that solar should be pursued in the UK with urgency because of the significant benefits it will bring to the UK energy system, consumers and to help meet UK clean power targets.
CLNF-013	Construction and Decommissioning	Project Sustainability and Ethical Sourcing Concerns 15.1 The overall "*green credentials*" of this project are fundamentally flawed and highly questionable. Given the extensive environmental impacts anticipated, there are profound doubts as to whether the project will achieve a carbon payback within its entire lifetime, thereby negating any claim of net environmental benefit. 15.2 The source of the solar panels, highly likely to be from China, has not been clearly stated. Absolute clarity is	Island Green Power is part of the Solar Energy UK Supply Chain Commitment, which binds the Applicant to ensuring that our supply chains are free of slavery. As part of this, the solar sector in the UK and Europe has launched the Solar Stewardship Initiative, which independently inspects and certifies individual factories for sustainable and ethical practices. The Applicant would expect to source our panels from factories that are SSI-accredited, free from issues such as modern slavery as the respondent requests. The effects of emissions generated from embodied carbon within products to be used on site (as well as construction, operation and decommissioning emissions) are all considered in **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		demanded regarding the manufacturing locations and the sourcing of raw materials. 15.3 Extremely serious concerns are raised regarding the high potential for unethical sourcing, including the abhorrent use of forced labour in the supply chain. Comprehensive explanations and robust, legally binding undertakings are imperatively required from the developer to demonstrate unequivocally that all components are ethically sourced and comply with international human rights standards. 15.4 Relevant Policy: While specific planning policies on ethical sourcing are less explicit, NPS EN-1 requires assessment of socio-economic impacts and broader sustainability considerations. The examination process for NSIPs must consider wider national policy objectives, including the UK's unwavering commitment to combat modern slavery and promote ethical supply chains. Action Items and Demands 17.14 Provide a comprehensive and independently verified assessment of the project's carbon payback and overall environmental benefits, including embodied carbon considerations. 17.15 Provide clear, legally binding statements and undertakings regarding the ethical sourcing of all project components, including detailed supply chain	**Chapter 7: Climate Change [APP-059].** The CO2e figures are included in detail within the chapter, which concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero. The **ES [APP-052 to APP-265]** and environmental and ecological surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details of qualifications, experience and professional institute membership are provided within **ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		transparency, to unequivocally address concerns about forced labour and other unethical practices.	
CLNF-014	Description and DCO Process	Action Items and Demands 17.13 Provide transparent and comprehensive information on the exact specifications, layout, and placement of all solar panels, trackers, and associated infrastructure to facilitate accurate impact assessments.	The Applicant confirms that it has provided transparent and comprehensive information in the Environmental Statement which sets out worst-case scenarios including the design parameters and locations for the solar panels and associated infrastructure. The impact assessments are informed using the "Rochdale Envelope" approach, which is an industry standard for Nationally Significant Infrastructure Projects, and defines the maximum envelope of the Scheme's parameters and design optionality. As established in the **Statement of Need [APP-266],** this approach allows the Applicant to secure necessary design flexibility to incorporate technological innovation and improvements, such as more efficient solar panel models, that may be available at the time of construction. A full description of the Scheme and its associated physical parameters are provided in **Table 3-1** of **ES Chapter 3: The Scheme [APP-055],** and throughout **Section 2: "Design Parameters and Commitments" of 7.4: Design Principles and Parameters [APP-269]** where details of the technical specifications and maximum dimensions used to inform these worst-case scenarios for the environmental assessment are set out.
CLNF-015	Landscape and Visual	1.4 Relevant Policy: Wiltshire Core Strategy Policy 51 (Landscape) mandates that development must protect, conserve, and enhance Wiltshire's distinctive landscape character. This proposal fails to adhere to this requirement, as it contradicts the Wiltshire Landscape Character Assessment.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The proposed mitigation is sensitive to the existing landscape and has been informed by the Landscape Character Assessment Guidelines

Reference	Theme	Comments/Issues Raised	Applicant's Response
			as set out in **ES Volume 3, Appendix 8-4 Landscape Character Area Descriptions [APP-195]** and Wiltshire's Nature Recovery Strategy to protect and enhance the landscape . The proposals and the defining legacy of the landscape would be the robust framework of features that have improved through the mitigation and landscape enhancements embedded within the Scheme. This mitigation in turn would give rise to long-term wider benefits, including maintaining and enhancing biodiversity and in promoting the resilience of ecosystems. The comprehensive package of habitat creation and enhancement measures are shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, The Applicant considers that although there are some short-term significant effects to the character of the landscape due to the change in land use caused by the infrastructure, there would also be permanent beneficial effects to the fabric of the Site as a result of the embedded mitigation measures which would contribute positively to the legacy landscape and be in line with Core Policy 51 and Wiltshire's Nature Recovery Strategy.
CLNF-016	Other Environmental Matters Description and DCO Process	Battery Energy Storage System (BESS) 11.1 The technology choice is a proposed chemical BESS, which is critically contrasted with alternative sand-based systems reportedly used elsewhere in Europe for superior safety reasons. The	As set out in the **oCTMP [APP-287]** pre-construction, interim and post-construction Road Condition Surveys will be undertaken to repair any damage caused to verges during the construction period. The details of these surveys will be confirmed as part of the Final CTMP.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		developer has failed to justify this inferior choice. 11.2 The stated primary purpose is unequivocally characterized as arbitrage trading for profit, not directly contributing to energy generation or security of supply in the immediate vicinity. This undermines the public benefit claims. 11.3 The proposed scale of the BESS is unprecedented for the area, raising grave concerns about its regulation, proven safety record at this scale, and the catastrophic potential for significant consequences. 11.4 Proximity risks are unacceptably high and considerable, with the site being adjacent to a major railway, near a Grade I listed building, close to new housing, within 650 metres of a livery, and 800 metres of a stud. 11.5 The need for government-underwritten insurance is absolutely paramount to cover residents, animals, livelihoods, and health in the inevitable event of an incident. 11.6 Emergency access via the back lane between Hullavington and Sherston over the railway bridge is demonstrably unsafe and critically inadequate. 11.7 Prior livery planning conditions mandated left-turn only due to lane constraints, and fire service access via these routes is evidently insufficient for the scale of potential emergency, posing an unacceptable public safety risk. 11.8 Relevant Policy: NPS EN-1 (Overarching Energy) explicitly requires	The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study methodology and results. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The emergency access is a secondary access and an alternative to the main access. It will be used very occasionally, and the road widths

Reference	Theme	Comments/Issues Raised	Applicant's Response
		the consideration of safety and the potential for accidents/disasters, particularly regarding new technologies and proximity to sensitive receptors. This proposal demonstrates a profound failure to adequately address these critical safety requirements. Action Items and Demands 17.6 Demand a complete BESS risk assessment and irrefutable justification for the chemical vs. sand-based storage technology choice; secure irrefutable evidence of compliance with fire service requirements. 17.7 Secure government-underwritten insurance commitments covering health, property, animals, and livelihoods in the event of BESS incidents or project harms.	are wide enough to allow access with very good forward visibility and low trafficked, making it suitable for emergency access. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.9 -5.4.11) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider*." An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the OBSMP. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 2.4.2 of the OBSMP stipulates that: *"Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing (LSFT) and rigorous consequence modelling to minimise the requirement for any D&WFRS intervention in a thermal runaway incident. LSFT must establish minimum equipment*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			spacing distances that demonstrate there is no fire propagation to adjacent BESS enclosures or ESS equipment. D&WFRS intervention in worst case scenarios would typically be limited to boundary cooling of adjacent BESS and Energy Storage System (ESS) units to prevent the fire from spreading. This strategy will be finalised with D&WFRS and be clearly communicated in the Emergency Response Plan (ERP); *• To ensure that fire, smoke, and any release of toxic gases does not significantly impact site operatives, first responders, and the local community; and* *• To ensure that firewater run-off is contained and tested before release or, if necessary, removed by tanker and treated offsite."* As now mandated under NFPA 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP pre-construction requirements (Section 6). Section 6.1.3 – 6.1.7 of the OBSMP defines key risk assessments and consequence modelling reports required by NFPA 855, NFCC guidance, and HSE BESS safety requirements. These risk assessment tools minimize BESS failure risks, mitigate BESS failure scenarios, and minimize fire propagation risks. Section 1.1.14 of the OBSMP stipulates: *"This document details the types of safety systems available on the market at present, along with risk reduction barriers which are likely to be incorporated into the system to be installed at Lime Down D. It is possible that by the time of construction that a new battery chemistry may be integrated but this would be fully tested and certified to the latest BESS safety standards and this will be reflected in the final BSMP approved by the*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			relevant local planning authority in consultation with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and the Environment Agency (EA)." As set out in the OBSMP, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation, and decommissioning. The Applicant's ERP template includes all requirements specified in both NFCC and NFPA 855 guidance and recommendations. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant is in the process of agreeing a Statement of Common Ground (SOCG) with D&WFRS to provide assurance that all safety and emergency response requirements are fulfilled. Site design ensures that D&WFRS would not have to travel or operate in a smoke plume / vapour cloud. The Applicant is currently drafting a Statement of Common Ground (SOCG) with the Environment Agency (EA) on Scheme environmental protection issues including the BESS area drainage strategy. The agreed strategy document will be appended to the OBSMP at Deadline 1, to provide further assurance that all water pollution risks from a BESS fire are fully mitigated. The EA is a statutory consultee for the OBSMP and drainage strategies and must approve the final BSMP and drainage design at detailed design before construction of the BESS commences.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
CLNF-017	Noise and Vibration Ecology and Biodiversity Construction and Decommissioning Cultural Heritage	Key Assertions and Conclusions 16.1 The core conclusion is that the project is demonstrably unfit for purpose due to insurmountable and substantial concerns regarding heritage harm, ecological loss, unacceptable noise and vibration impacts, catastrophic transport and logistics failures, profound safety risks associated with the BESS, critically weak decommissioning safeguards, devastating property blight, severe adverse economic effects, and grave questions regarding its overall sustainability and ethical sourcing. 16.2 Precedent claims highlight an absolute lack of directly comparable UK precedent for a project of this exact nature and scale, which renders developer assurances entirely baseless and unfounded. 16.3 A clear and absolute cancellation threshold is demanded, establishing specific and non-negotiable parameters and commitments	The Applicant does not agree that the project is unfit for purpose. Detailed responses to the queries raised in this conclusion have been provided in the responses above in Sections 1-15 raised by the respondent.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		that if logistics and traffic, or other critical environmental, safety, and heritage criteria, are not unequivocally met, the project must be cancelled without hesitation. Action Items and Demands 17.12 Establish and agree binding cancellation criteria tied to logistics/traffic performance and environmental, safety, and heritage thresholds.	

6.24 Jane Andrews

Table 6-24 RR-2095

Reference	Theme	Comments/Issues Raised	Applicant's Response
JAS-001	Site selection and Alternatives	I feel very strongly that such a project on an industrial scale such as this is inappropriate in this area. Using farmland instead of rooftops or already designated brownfield sites is not environmentally friendly. Land is precious and cannot be replaced. Wildlife will be impacted as will the people who live, work and enjoy this beautiful part of the countryside	Use of Agricultural Land An assessment of the likely significant effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.7 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in Section 17.10 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will

Reference	Theme	Comments/Issues Raised	Applicant's Response
			be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is being discussed with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has

Reference	Theme	Comments/Issues Raised	Applicant's Response
			considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. <u>Ecology and Biodiversity</u> Likely significant effects of the Scheme on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			relation to ecology and biodiversity in general is being discussed with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified **in ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. Recreational Access and Human Health A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design, with management measures set out in the **Outline Public Rights of Way and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Permissive Paths Management Plan (oPROWPPMP) [APP-282], confirmed as embedded mitigation in Section 16.9 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**
JAS-002	Hydrology, Flood Risk and Drainage	I am very concerned about the already alarming issue of flooding in this area. It's clear from the experts this will only increase and impact many homes and businesses in the area. Due to the location of the site my	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		(Redacted) business will be adversely affected.	The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the team. This is set out in the **Statement of Common Ground with Wiltshire Council** to be submitted at Deadline 1.

6.25 James Gay

Table 6-25 RR-2041

Reference	Theme	Comments/Issues Raised	Applicant's Response
JG-001	Socio-Economics, Tourism and Recreation Noise and Vibration Cumulative Effects	Principal Grounds of Objection Disproportionate Impact on Residential Amenity (Redacted) is located between two proposed areas of solar development, resulting in a level of cumulative impact that is materially greater than that experienced by properties affected on only one side or at greater distance. The combined effects would include: - Loss of rural outlook and openness - Visual enclosure from multiple directions - Noise from inverters and associated infrastructure - Glint and glare affecting the dwelling and its setting - Prolonged construction disturbance followed by permanent operational impact Taken together, these impacts would result in a fundamental change to the residential environment that cannot be adequately mitigated. Scale and Cumulative Impact While the layout of the scheme has evolved, including the omission of land adjacent to my property, the proposal continues to result in significant cumulative impact at this location due to the scale of development and the	The Applicant confirms that the assessment of impacts to PROWs, unsurfaced roads, and the recreational use of the highway network during construction in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3, Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** take into account the construction duration, and the impact on accessibility to the PROW network and its desirability for users. The Applicant is confident that the majority of these are able to be mitigated so they are not significant adverse effects. This includes keeping PROWs open as much as possible during construction to ensure those who do use the PROWs are not physically hindered from doing so. Lordswood House, is identified as Receptor RI019 and has been fully assessed in ES Volume 3, Appendix 8-3-2-1-1: Visual Assessment Sheets (Non-Significant) [APP 190]. In response to consultation a significant number of fields were removed from the Scheme. As a result of the removal of panels in fields C20 the property is no longer has infrastructure on two sides. The assessment notes Moderate/ Minor effects during construction and Year 1 on views from the property as there would be filtered views from upper stories of construction of proposed infrastructure within Lime Down A. Construction activities would be visible in open views towards rising land in A10 and A9 due to limited intervening vegetation. A8 is located on an area of slightly lower landform between A10 and A9 and is not proposed for panels boundary of the receptor. The effects reduce to Minor Adverse by Year 15 as a result of the proposed mitigation.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		relationship of multiple solar areas to my home. The harm arises not from any single parcel of land, but from the combined and reinforcing effects of the development as a whole.	
JG-002	Landscape and Visual	Reliance on Long-Term Landscape Mitigation The proposal relies heavily on landscape planting that may take many years to become effective. This approach fails to address: - Immediate harm from the outset of development - Winter visibility when deciduous planting provides limited screening - The need for mitigation to be effective from day one, not at some point in the future The reliance on long-term planting does not adequately mitigate the impacts on nearby residential properties.	The landscape and visual effects of the Scheme, including the effectiveness and phasing of proposed screening and planting, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The **LVIA [APP-060]** considers landscape and visual effects over time, including during the early years of the Scheme before planting is fully established, and identifies where significant effects may occur. NPS EN-1 recognises at para 5.10.5 that "*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation*." Mitigation measures are detailed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Proposed planting comprises a mix of native species designed to enhance biodiversity and resilience, with planting design prioritising long-term effectiveness and landscape integration. The **OLEMP [APP-283]** sets out the approach to establishment, maintenance and management of planting to ensure its effectiveness over the lifetime of the Scheme. The LVIA includes verified viewpoints with both summer and winter photography to demonstrate year-round changes to the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape. Photomontages at Year 15 illustrate the effectiveness of established planting, while also demonstrating the intended retention of openness across the receiving landscape. Hedgerows on the western edge of fields within Lime Down C, which border the Cotswolds National Landscape, are proposed to be maintained at approximately 1.5 metres (or as existing if greater) to retain open views within the setting of the Cotswolds National Landscape. This management approach is set out in the **OLEMP [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that mitigation planting and screening measures are delivered and maintained throughout the lifetime of the Scheme. With specific reference to the Lordswood House which is identified as Receptor RI019, the assessment in ES Volume 3, Appendix 8-3-2-1-1: Visual Assessment Sheets (Non-Significant) [APP 190] sets out the proposed mitigation to reduce long term effects. A green corridor is proposed along the southern boundary of boundaries of A10. Although this would have a limited effect initially and the level of change would remain Low. By Year 15 proposed the proposed planting would screen views of proposed infrastructure and integrate with the existing hedgerow vegetation. The level of change to views would reduce to Very Low with Minor Adverse effects..
JG-002	Cultural Heritage	Historic Environment, Archaeological Sensitivity and Landscape Character The proposed development lies within a landscape of recognised historic	The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		sensitivity associated with Roman-era activity and long-established historic land use in the Sherston, Alderton and Grittleton area. Archaeological interest in this part of north-west Wiltshire is not confined to designated or recorded assets but extends across the wider historic landscape. The omission of an adjacent field in the latest iteration of the scheme indicates that site-specific constraints exist in the immediate area, reinforcing the need for a precautionary approach to development at this scale. Given the extent of ground disturbance required for solar arrays, cabling, access tracks and associated infrastructure, there remains a risk of harm to below-ground archaeology and historic landscape character that has not been satisfactorily addressed through desk-based assessment or post-consent mitigation alone.	**[APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is being discussed with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. As set out in **ES**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Volume 1, Chapter 4: Alternatives and Design Evolution Field C20 of Lime Down C was removed from the Scheme due to the presence of possible heritage assets. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction. <u>Landscape and Visual Impact</u> An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
JG-003	Ecology and Biodiversity	Ecology and Wildlife Connectivity The surrounding countryside supports connected habitats and wildlife movement corridors, including hedgerows, woodland and rural lanes and byways. The scale and continuity of the proposed development, including fencing, lighting and ancillary infrastructure, risk: - Fragmentation of ecological networks - Disturbance to wildlife movement	<u>Fencing</u> Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need

Reference	Theme	Comments/Issues Raised	Applicant's Response
		- Harm from lighting, glint and glare These impacts would be cumulative and long-term.	for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **OEPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme. <u>Lighting</u> Potential effects relating to lighting are considered within the LVIA in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. No significant effects of lighting, above those recorded for landscape and visual receptors, were recorded.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. The mitigation measures to control construction lighting stated above are secured within the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls (also referenced above) form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Glint and Glare An assessment of glint and glare effects arising from the Scheme is provided in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.5: Glint and Glare. The assessment considers potential effects on surrounding receptors, including road and rail users, residential properties, public rights of way, aerodromes and sensitive viewpoints within the Cotswolds National Landscape. The assessment concludes that, with embedded mitigation measures, including the use of fixed-tilt panels at a maximum height of 2.5 metres where required, no significant glint or glare effects are predicted to occur as a result of the Scheme
JG-004	Soils and Agriculture	Loss of Productive Agricultural Land The land proposed for development has been actively farmed for food production for decades, supported by ongoing agricultural management and soil improvement practices. While parts of the site are described by the applicant as lower-quality farmland, this does not reflect its continued productive use. The long-term loss of a substantial area of working agricultural land raises legitimate concerns regarding food production, land stewardship and cumulative impact, particularly at the scale proposed. Given the availability of alternative	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.10 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		locations for solar generation, including rooftops, commercial estates and previously developed land, the use of extensive areas of productive farmland in this location requires a more robust justification than has been provided.	The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17, Section 17.10 [APP-069]**, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through Schedule 2, Requirement 17 of the **Draft DCO [APP-016]** which includes the preparation and implementation of a Soil Resources Management Plan (SRMP) in accordance with the **Outline SRMP [APP-280].** The SRMP will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			279], which is secured by Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**. The **Outline Landscape and Ecological Management Plan [APP-283]** details how grassland and other habitat will be established beneath and between the solar panels. The detailed LEMP will be secured through Schedule 2, Requirement 7 of the **Draft DCO [APP-016]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1, Chapter 17, Sections 17.10 and 17.12 [APP-069]**). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056] and in the Statement of Need [APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land / brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			With regard to siting the Scheme alongside existing infrastructure corridors such as motorways, major roads and railways, **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the accompanying **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** set out the alternatives considered by the Applicant. The assessment did not identify any unconstrained, suitable and available land that could utilise existing infrastructure corridors. As set out in, **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056],** discussions were had with Wiltshire Council regarding routeing the Cable Route Corridor to follow the A350, but this was discounted due to concerns of potential disruptions to road traffic associated with installation of the cable immediately adjacent to the A350. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
JG-005	Transport and Access	Construction Traffic and Rural Roads The local highway network consists primarily of narrow rural lanes serving small villages and individual dwellings. Extended construction traffic associated with the development would: - Exacerbate existing road damage - Raise highway safety concerns - Cause sustained disruption to local residents These impacts have not been adequately addressed.	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the CTMP in place, there would be no significant adverse impacts on the local highway network during

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the construction, operation and maintenance, and decommissioning phases of the Scheme. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be confirmed as part of the final CTMP. Regarding routes through the Hulavington area , excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); - assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV construction trips outside of these hours; • there would be a much greater impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down D (average number of existing HGV movements is only 46 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]**) Regarding routes through the Foss Way area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 16 HGVs on the route to Lime Down A is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 16 HGVs on the route to Lime Down A is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV movements along the route to Lime Down A is only 10 per day/less than 2 per hour/one every 42 minutes (less than the journey time along the route), with the construction phase for Lime Down Site A only lasting 9 months • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A (average number of existing HGV movements is only 40 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]**) Regarding routes through the Alderton area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route) • delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A-C (average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **oCTMP [APP-287]** Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.
JG-006	Landscape and Visual	Conclusion Taken together, the impacts on residential amenity, landscape character, historic environment, ecology, agricultural land and rural infrastructure outweigh the benefits of the proposal in this location.	The Applicant notes this comment and has responded to the impacts in detail above.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		For these reasons, I request that development consent for the Lime Down Solar Project be refused.	

6.26 Andrew Greenhill

Table 6-26 RR-0252

Reference	Theme	Comments/Issues Raised	Applicant's Response
AG-001	Socio-Economics, Tourism and Recreation	I object to the proposed Lime Down development for a number of important reasons I am a tenant farmer in (Redacted), of which appoximately 85 acres of the land I rent is included in the proposed scheme. For the viability of my mixed farm these fields are crucial. They are the best agricultural fields(Grade 2) in the village and provide both cereals for animal feed and straw for winter bedding. Much of the local land available is only suitable for grazing so to take away great arable land makes any cattle enterprise less viable with the need to buy in straw etc from further afield. It is short sighted to limit a farm or village's ability to be self sufficient. Beware in a wet winter these fields in Rodbourne (sand over clay) can become very unstable and unworkable for long periods.	The assessment of effects on agricultural land and farming operations, including temporary land take associated with the cable route, is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, with detailed construction methodology set out in **ES Volume 3, Appendix 3 2: Cable Route Construction Method Statement [APP-183]**. The cable trench required for installation of underground cables would have a maximum anticipated working width of approximately 7 metres. This equates to a temporary disturbance of approximately 0.07 hectares per hectare of land crossed. Disturbance associated with cable installation would be short term and localised, and following reinstatement, agricultural operations within the affected fields would be able to recommence. Accordingly, land take associated with cable installation would not permanently remove the affected land from agricultural use, and the extent and duration of disturbance have been assessed as limited. The **Outline Soil Resources Management Plan (SRMP) [APP-280]** sets out suitable handling windows for soils and details field tests to be undertaken to ensure soils are not worked when they are too wet.
AG-002	Landscape and Visual Ecology and Biodiversity	Creeping industrialisation of the countryside. Major roads such as the M4 and A429 and railways are part of the landscape in the Lime down project but it is so important to keep the countryside spaces intact between these major transport routes. This is just as important for the wildlife as it is for the residents quality of life.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Wildlife. Farmers have engaged in many schemes in recent years to improve biodiversity and help wildlife. The addition of fenced in solar panels to the landscape is not going to help the wildlife in any way. Normal animal routes across the landscape will be compromised.	The **LVIA [APP-060]** found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds

Reference	Theme	Comments/Issues Raised	Applicant's Response
			National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Draft Development Consent Order [APP-016], ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is being discussed with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **OEPMS [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable

Reference	Theme	Comments/Issues Raised	Applicant's Response
			farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **OLEMP [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing, through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			transport and connectivity, climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, inbound workers are accommodated in the most suitable locations for housing and health service access, community liaison and engagement is maintained, and construction impacts on waterways, soils, noise and air quality are regulated. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**
AG-003	Ecology and Biodiversity	Hares thrive in the big open fields and skylarks nest in cereal crops,	Potential impacts of the Scheme on brown hares are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		providing them with cover protection from predators.	**061]**, which considers baseline conditions and evaluates likely effects on mammals during construction, operation and decommissioning. The assessment concludes that, with embedded mitigation in place, no significant adverse effects on brown hares are anticipated. The Scheme design retains extensive areas of grassland and field margin habitats, which provide suitable foraging and shelter opportunities for hares. The Applicant notes that the approach to the assessment in relation to brown hares has been agreed with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The assessment also notes that brown hares are known to take shelter beneath solar panels on operational solar sites, where the retention of grassland beneath and between arrays can provide suitable habitat conditions. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring habitat management measures benefiting hares are delivered and maintained throughout the lifetime of the Scheme. Potential impacts of the Scheme on skylarks are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline bird assemblages and evaluates likely effects on breeding farmland bird species during construction, operation and decommissioning. The assessment identifies skylarks as a key species of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			conservation interest within the Scheme area. It concludes that a proportion of the current skylark population will be displaced from the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. The Applicant notes that the approach to the assessment with relation to skylark is being discussed with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large, open set-aside and grassland habitats designed to provide appropriate breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **OLEMP [APP-283]**. Measures to safeguard nesting skylarks during construction, including timing restrictions on vegetation clearance and pre-construction ecological checks, are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring skylark mitigation and long-term habitat management measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
AG-004	Landscape and Visual	4.Visual impact. It,s hard to accept that 2000 acres of beautiful countryside is going to be covered in huge solar panels and battery storage facilities. It is a special and historic landscape to the people that live nearby, and for that to be compromised by this development would be tragic.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The **LVIA [APP-060]** found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
AG-005	Transport and Access	5. Construction traffic. The impact of the construction of the Lime down project is going to have such a dreadful impact on everyone that lives in the area. All the construction lorries and cars overloading our narrow country roads during the installation will severely impact the residents. Many of the country lanes are simply not big enough to deal with the number of lorries proposed.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison

Reference	Theme	Comments/Issues Raised	Applicant's Response
			with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
AG-006	Human Health	Mental health. It's hard to think of anything that has had such a detrimental effect on people's mental health since the Lime down proposal was announced. It has cast a very dark cloud over the community as it is threatening the quality of life of so many people that live and work in this part of the world. If this vandalisation of beautiful countryside is allowed to go ahead it will be a very sad day indeed and one where the joy of living in small village community such as ours will be lost forever.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-016] through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set

Reference	Theme	Comments/Issues Raised	Applicant's Response
			out in the relevant Statement of Common Ground to be submitted at Deadline 1.
AG-007	Construction and Decommissioning	6.Pollution. Noise pollution from the constuction of the development will severely impact the quality of life of those living nearby the site for a long period. Pollution of the land and surrounding waterways is likely to be significant. Pouring so much concrete into agricultural land can never be environmentally sound. One can only imagine the scale of pollution when something goes wrong with one of the battery storage sites.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. The Applicant notes that the approach to construction noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, are secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled throughout the construction phase of the Scheme. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			An assessment of potential contamination risks is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and **ES Volume 1, Chapter 19: Ground Conditions [APP-071]**, which consider risks to surface water, groundwater and sensitive receptors during construction, operation and decommissioning of the Scheme. These assessments conclude that, with appropriate mitigation and management measures in place, no significant contamination effects are anticipated. The Applicant notes that the approach to risk of contamination of groundwater and surface water has been agreed with Wiltshire Council and is being discussed with the Environment Agency. This approach is set out in the relevant Statement of Common Ground with Wiltshire to be submitted at Deadline 1 and will be included in a future Statement of Common Ground with the Environment Agency. Mitigation and management measures to protect water and ground conditions are set out in the **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]** and supporting management plans. These include pollution prevention controls, containment measures, emergency response procedures, and site-specific drainage design. In particular, drainage within substation and Battery Energy Storage System (BESS) areas will incorporate lined drainage and automatically actuating shut-off valves to contain any accidental spills or firewater, preventing release to surrounding land or watercourses. Routine maintenance and panel cleaning will use minimal water and will not require detergents or chemical cleaning products, in line with standard industry practice, meaning there is no expected risk of chemical runoff from panel washing. In addition, the cessation of agricultural activity within the Solar PV

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Sites will remove routine inputs of fertilisers, pesticides and herbicides, thereby reducing existing sources of diffuse contamination. The preparation, approval and implementation of the detailed CEMP, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that contamination risks are appropriately managed throughout construction and operation of the Scheme. An assessment of the effects of the Scheme on air quality is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**, which considers potential air quality impacts during construction, operation and decommissioning. The assessment examines dust emissions, vehicle emissions, non-road mobile machinery emissions, back-up generator emissions and emissions associated with a potential BESS fire. Supporting technical assessments are provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and Assessment [APP-238]** and **ES Volume 3, Appendix 15-2: BESS Fire Emissions Modelling [APP-239]**. The assessment concludes that, with embedded mitigation measures in place, the Scheme would not give rise to significant adverse air quality effects at human or ecological receptors. Measures to control operational emissions, including maintenance activities and back-up generator testing, are set out in the **Outline Operational Environmental Management Plan [APP-278]**. Measures to control BESS fire emissions are outlined in the **Outline Battery Safety Management Plan [APP-286]**. This includes measures to limit human exposure to air pollution in the event of a fire.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the detailed Construction Environmental Management Plan, Construction Traffic Management Plan, Operational Environmental Management Plan and Battery Safety Management Plan, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts are appropriately controlled throughout the construction and operation of the Scheme.

6.27 Kenneth T Blackmore

Table 6-27 RR-2674

Reference	Theme	Comments/Issues Raised	Applicant's Response
KTB-001	Landscape and Visual Human Health	I object to the proposed plans for the Lime Down Solar Park on the following grounds;- 1/ The industrialisation on such a large scale in an area of Outstanding Natural Beauty will directly affect at least 20 villages and their surroundings causing lasting distress and upheaval to scores of people who settled here and have lived here for many years in peace and quiet. Those who own property will see values deteriorate rapidly and our way of life changed forever.	The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures such as the avoidance measures to remove panels from the boundary of CNL are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (PEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the Draft Development Consent Order [APP-016]. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures

Reference	Theme	Comments/Issues Raised	Applicant's Response
			are delivered and maintained throughout the lifetime of the Scheme. Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
KTB-002	Transport and Access	2/ Irreparable damage will be caused to the roads and lanes that were not designed or constructed for the volume and weight of the forecast HGV traffic. 3/ Changes to various junctions including the crossroads at Grittleton to allow heavy traffic to manoeuvre will totally ruin the approach to the village	The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment includes links in the Grittleton area and at the crossroads with Alderton Road. Any carriageway widening will be limited and minor in nature and will not include hedgerow, minor widening will benefit existing road users. The assessment concludes that, with appropriate management

Reference	Theme	Comments/Issues Raised	Applicant's Response
		and other areas, and will probably never be reinstated.	measures in place, construction traffic effects can be appropriately controlled and through road condition surveys pre and post construction, any damage caused to the highway by the construction vehicles will be rectified as set out in Section 6.12 of the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic pre and post construction is committed to within the CTMP. The CTMP will also secure, as set out in the outline CTMP, that any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme.

6.28 Susan Russell

Table 6-28 RR-4575

Reference	Theme	Comments/Issues Raised	Applicant's Response
SR-001	Transport and Access Landscape and Visual	I am totally against this project, I am lucky to live in a beautiful village surrounded by beautiful countryside this is farming land surrounded by minor roads. Not only would this be an horrendous eye sore on our beautiful countryside I am extremely concerned about the heavy traffic on these country roads, especially as...	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An Outline Construction Traffic Management Plan (CTMP) [APP-287] has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
SR-002	Transport and Access	... I live on Alderton Road where hundreds of Lorry's will be using this road.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **OCTMP [APP-287]**, a booking system will be

Reference	Theme	Comments/Issues Raised	Applicant's Response
			set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be confirmed as part of the final CTMP. Regarding routes through the Alderton area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route)

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A-C (average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **oCTMP [APP-287]** Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.

6.29 Mr Stephen Challis

Table 6-29 RR-3301

Reference	Theme	Comments/Issues Raised	Applicant's Response
MSC-001	Soils and Agriculture	I am strongly against the industrialisation of our countryside. Wiltshire has a number of large solar projects built or have been granted permission but not yet constructed. With the addition of this 2000 acres, Wiltshire will become an industrial county, at the expense of homegrown food production and wildlife. Its a lazy government policy that allows farm land to be covered in solar panels, there are many more suitable places to put solar panels that don't compromise food production or wildlife.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. Cumulative effects with other projects has been carefully considered as part of the Scheme with other projects, both existing and proposed, taken into account. In terms of the Lime Down project, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated appendices**, ES Volume 3, Appendix 21-1: Long List of In-Combination Effects and Cumulative Developments [APP-264]**. Interaction with proposed or consented but not yet built

Reference	Theme	Comments/Issues Raised	Applicant's Response
			developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21: In-Combination and Cumulative Effects [APP-073]**. Existing schemes are captured within the baseline environment. The four-stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6: EIA Methodology [APP-058]**. 358 developments were included in the **Long List [APP-264]**. 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 9: Ecology and Biodiversity [APP-061], this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** explains how brownfield land, industrial land, previously developed land, and low-grade agricultural land were considered, in accordance with policy. As set out in **ES Volume 3, Appendix 4-1: Site Selection**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Assessment Report [APP-185] the Applicant reviewed brownfield land register for local authorities within the area of search including Wiltshire Council, South Gloucestershire Council, Bath and Northeast Somerset Council, and Somerset Council. The assessment concluded that there were no brownfield sites within the search area of sufficient size to accommodate a large-scale solar development, either individually or cumulatively. The sites assessed were too small to support the proposed Scheme and were largely allocated for housing or mixed-use development, in line with local planning policies, thereby creating a conflict with the intended use for renewable energy infrastructure. Therefore, it was concluded that there was no available or suitable brownfield land for the purposes of the Scheme.

Table 6-30 RR-0976

Reference	Theme	Comments/Issues Raised	Applicant's Response
DR-001	Hydrology, Flood Risk and Drainage	If permission were to be granted the risk of flooding to my own home would become such that it would be uninhabitable. In the 22 years I have lived here we have already had to leave the property for 3 winters. I am not unique in being put at jeopardy. I have carefully considered whether jeopardy is an inappropriately emotional word to use before typing it. It is not inappropriate. We are on the absolute cusp of sustainability and pouring acres of hardstanding upstream without facilitating the rapid egress of water or better retention and slower dispersal is unconscionable. I see no such provision in the application. A few attenuation pools won't cut it. More land needs to be acquired and used for pooling and controlled release if the plan is to go ahead.	The Applicant acknowledges the lived experience of flooding affecting the property and understands the seriousness of the concern raised. Existing flooding occurs under baseline conditions and is recognised within the assessment. The flood risk and drainage assessment has been undertaken in accordance with national and local policy and concludes that the Scheme would not increase flood risk elsewhere or render existing properties more vulnerable to flooding. The assessment considers fluvial, surface water and construction-phase mechanisms and does not rely on Flood Zone mapping alone. **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**. The Applicant does not agree that the Scheme introduces "*acres of hardstanding*" that would accelerate runoff. The drainage strategy distinguishes between panelled areas, where rainfall drains to ground beneath and between panels, and limited areas of hardstanding associated with supporting electrical infrastructure, where engineered and controlled drainage is provided. National policy recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (NPS EN-3 paragraph 3.10.75). The Scheme is designed on the basis that there can be no increase in off-site flood risk, with drainage controls secured through the DCO Requirements. **Draft Development Consent Order [APP-016]**. Measures to manage surface water runoff and drainage are set out in the outline drainage and construction management plans (**ES Volume 3, Appendix 11: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218] and Outline Construction Environmental Management Plan [APP-277]** accompanying the Application. Where drainage measures are necessary, these include permeable surfacing, infiltration

Reference	Theme	Comments/Issues Raised	Applicant's Response
			features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Consistent with NPS EN-3 paragraph 2.10.84, these controls distinguish between solar PV panel areas, which drain to the existing ground and do not generally give rise to significant drainage effects, and associated infrastructure where runoff controls are required. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**. This secures delivery and maintenance of the drainage strategy for Scheme infrastructure, together with soil and water management controls during construction, ensuring there is no material increase in off-site flood risk over the lifetime of the Scheme. The Applicant does not agree that additional land acquisition or large-scale flood storage is required. The assessment demonstrates that attenuation, flow routing and infiltration measures within the Site are sufficient to ensure no increase in downstream flood risk, subject to detailed design approval at discharge. No amendments to the application documents are required.
DR-002	Soils and Agriculture	Clearly this would have the effect of rendering the nation even less food secure but I understand the balance that needs to be struck between achieving food security and energy security. If we are to have this application approved for the sake of energy security we need to be prepared to write off enough agricultural production to enable the extant built	The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		environment to be put at no more risk than it already is at.	The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

Table 6-31 RR-1069

Reference	Theme	Comments/Issues Raised	Applicant's Response
DT-001	Landscape and Visual	The area where Lime Down is proposed is an area of outstanding natural beauty. The scale of the project in this area is absolutely ridiculous and will destroy the beauty of the area for decades to come. As a keen cyclist the roads are narrow; the HGVs using the lanes around the site will endanger the lives of cyclists who like me enjoy the beauty of this area.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The **LVIA [APP-060]** found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network, including non-motorised users. Links experiencing traffic

Reference	Theme	Comments/Issues Raised	Applicant's Response
			increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme.

6.32 Johnathan T Seymour-Williams

Table 6-32 RR-2245

Reference	Theme	Comments/Issues Raised	Applicant's Response
JTS-001	Climate Change and Energy Need	The project is ill conceived financially questionable and in any event is carbon positive over the first 50 years	It is not clear how the 2076 year of offset conclusion has been reached. **ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero.

MAH-001	Description and DCO Process	Registering my dissatisfaction and horror at the proposed solar development at Lime Down	The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

6.34 Graham Lee

Table 6-34 RR-1717

Reference	Theme	Comments/Issues Raised	Applicant's Response
GL-001	Soils and Agriculture	I wish to object to this solar park project on the basis of its size and the damage it will cause to good agricultural land. It will destroy the beautiful and historic area. Solar panels should be limited to installations on existing industrial buildings.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The **LVIA [APP-060]** found no significant long term visual effects to residential properties as a consequence of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			(LEMP) [APP-283] and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17 [APP-069]**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17 [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is being discussed with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12). In relation to suggestions that brownfield land or alternative locations should be used, including on the rooftops of existing industrial buildings, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is being discussed with Wiltshire Council, as is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction.

6.35 Clyde Stanley Burgess

Table 6-35 RR-0916

Reference	Theme	Comments/Issues Raised	Applicant's Response
CSB-001	Soils and Agriculture	I object to the proposed Lime Down project for the following reasons: Loss of prime agricultural land and impact on public footpath The proposed development is located on prime agricultural land that is currently used productively for farming. A public footpath runs through the centre of our field and is used daily by local villagers. Development of this site would permanently alter the land, resulting in the loss of its agricultural value. Once disturbed, the land will not be able to be restored to its current condition, directly impacting the our ability to grow crops, feed livestock, and earn a living from our land. The disruption to the public footpath will also negatively affect regular village use and access.	<u>Use of Agricultural Land</u> An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17 [APP-069]**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17 [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is being discussed with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12). <u>Public Rights of Way and Recreational Access</u> A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the **Statement of Common Ground with Wiltshire Council** to be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (oPROWPPMP) [APP-282]**. These are confirmed as embedded mitigation measures in Section 16.9 of ES Chapter 16. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283]**. These are considered as additional mitigation and enhancement measures in Section 16.11 of **ES Chapter 16 [APP-068]**. The **oPROWPPMP [APP-282]** is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			016], ensuring that impacts on PRoW and recreational routes are appropriately managed during construction.
CSB-002	Transport and Access	Unsuitability of the village and road network for heavy construction traffic: The village is not equipped to accommodate the volume or size of heavy machinery and construction vehicles associated with this project. Roads through the village are narrow, lack clear road markings, and were not designed for frequent use by large vehicles. In addition, there is a lack of off-street parking throughout the village, which will significantly worsen congestion and create safety concerns for residents, pedestrians, and other road users. In summary, the proposed Lime Down project would cause permanent harm to valuable agricultural land, disrupt a well-used public footpath, and place unacceptable strain on village infrastructure and road safety. For these reasons, I strongly object.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be confirmed as part of the final CTMP. Regarding routes through the Hulavington area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); - assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV construction trips outside of these hours; • there would be a much greater impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down D (average number of existing HGV movements is only 46 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]**). Regarding routes through the Foss Way area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 16 HGVs on the route to Lime Down A is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 16 HGVs on the route to Lime Down A is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV movements along the route to Lime Down A is only 10 per day/less than 2 per hour/one every 42 minutes (less than the journey time along the route), with the construction phase for Lime Down Site A only lasting 9 months • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A (average number of existing HGV movements is only 40 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]**) Regarding routes through the Alderton area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A-C (average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **oCTMP [APP-287]**. Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.

Table 6-36 RR-3823

Reference	Theme	Comments/Issues Raised	Applicant's Response
PD-001	Cultural Heritage Transport and Access	-Rodbourne is a conservation area, with the countryside around the village being of key importance to its setting and importance. It is described in as the jewell in teh Crown in the Malmesbury Town Plan. To ruin the setting is to destroy the value of its conservation status. (Redacted) of limedown E EVERY day. It is a beautiful drovers track used for 100's o years by people, farm animals, and the general farming practice of the time. It is not designed nor appropriate for large lorries and machinary on a daily basis - any value as a track for people will be destroyed. The distance of E to the eventual Melksham station is over 22km. The destruction and chaos of digging the cable this far is simply out of proportion to the benefit it will bring. The overall setting of the limedown project is wrong. Its an historic area with numerous sites of national architectural inportance. There is loads more i can say, but will keep this for the further comments part of the process.	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064],** supported by **Appendix 12.1: Heritage Statement [APP-219]**, has assessed the potential impact of the scheme on Rodbourne Conservation Area, and where required appropriate mitigation has been proposed (see Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]** for embedded mitigation). As stated in **Appendix 12.1: Heritage Statement [APP-219]**, embedded mitigation including the removal of Fields E5 and E8 from the Scheme Order Limits, removal of panels from Fields E7, E9 and E10, offsets to the PROW and enhanced screening of existing hedgerows are considered sufficient mitigation to remove any adverse impacts to the Conservation Area. The potential effects of the Scheme on cultural heritage, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, and the assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** These investigations specifically consider areas of known archaeological potential, including along the cable route corridor, and inform the identification of mitigation where required. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Kind regards Piers Dibben	The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation for each part of the Proposed Development, substantially in accordance with **Appendix 12-6 Outline Archaeological Mitigation Strategy [APP-230]**, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered during the relevant part of the Proposed Development. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between

Reference	Theme	Comments/Issues Raised	Applicant's Response
			09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 4: Alternatives and Design Evolution [APP-056]. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts.

6.37 Katherine Ruth Brunt

Table 6-37 RR-2611

Reference	Theme	Comments/Issues Raised	Applicant's Response
KRB-001	Socio-Economics, Tourism and Recreation	I am a working farmer and am deeply saddened by the potential loss of working farmland ,which would include the ability to plant trees and biodiverse crops in the future!	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17 [APP-069]**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17 [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17 [APP-069]**, Sections 17.10 and 17.12).
KRB-002	Landscape and Visual Cultural Heritage	This proposal is situated in part of the very important " *Cotswolds Landscape* " and adjacent to the ancient " *Fosse Way* " Roman Road.	The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2, **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. The potential effects of the Scheme on the cultural heritage of the Fosse Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The assessment identifies known Roman heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**.
KRB-003	Climate Change and Energy Need Landscape and Visual Human Health	This flawed scheme is based around Old Technology , manufactured overseas, and rather than being GREEN it is , in fact, completely the opposite when you consider the potential scarring of the landscape during its construction let alone the effect on the local communities and the lives of the people who live in this area.	Solar PV is a well-established and widely deployed form of renewable electricity generation that is capable of delivering reliable, large-scale low-carbon power over the lifetime of the Scheme. While technological efficiencies are expected to continue to improve over time, this does not reduce the effectiveness of solar PV as a means of reducing greenhouse gas emissions either now or in the future. The Scheme has been designed to allow for the replacement and upgrading of components during its operational life, enabling the use of more efficient technology as it becomes available, within the parameters assessed. This approach ensures that the Scheme remains effective and adaptable while continuing to deliver meaningful carbon savings.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			ES Volume 1, Chapter 7: Climate Change [APP-059] assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero. <u>Landscape and Visual</u> An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents

Reference	Theme	Comments/Issues Raised	Applicant's Response
			include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Human Health</u> Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing, through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation, transport and connectivity,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, inbound workers are accommodated in the most suitable locations for housing and health service access, community liaison and engagement is maintained, and construction impacts on waterways, soils, noise and air quality are regulated. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**
KRB-004	Landscape and Visual	I am extremely concerned that in the future years, when this technology and site becomes redundant , that rather than reverting to its original state it will instead be classed as a BROWNFIELD SITE and therefore not regulated as	The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, all land will be returned to its original use and condition as far as practicable and returned to the landowner. The effect on agricultural land quality at decommissioning would be influenced by the extent of

Reference	Theme	Comments/Issues Raised	Applicant's Response
		countryside anymore. Our future generations will inherit possible urban sprawl and industrialisation of our Beautiful Countryside.	disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the effects would be less than those likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant confirms that none of the land will be considered brownfield after decommissioning. The expectation is that the land will return to farming, but the Applicant cannot dictate what will happen to the land post-decommissioning when the Applicant no longer has an interest in the land.

6.38 Simon Gaskell

Table 6-38 RR-4377

Reference	Theme	Comments/Issues Raised	Applicant's Response
SG-001	Noise and Vibration Landscape and Visual Cultural Heritage Human Health	The noise is disruptive and in this case the area is wrong in many ways as previously covered by many locals and tourists alike who see a Roman road and British countryside which will be altered for a great deal of time.	Noise and Vibration An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Development Consent Order [APP-016], ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. <u>Operational phase</u> The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan (Outline OEMP) [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Landscape and Visual and the Fosse Way The landscape and visual effects of the Scheme, including effects on the Fosse Way and its setting, are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) identifies users of the Fosse Way as visual receptors and evaluates likely effects during construction, operation and decommissioning using realistic worst-case design parameters. The Scheme design has been refined through an iterative design process to avoid and reduce visual effects on the Fosse Way. This includes the removal of solar panels from fields adjacent to the Fosse Way where significant visual effects were identified, together with the introduction of landscape buffers and new planting to further reduce visibility of infrastructure from the road and its surrounding landscape. The potential effects of the Scheme on the cultural heritage of the Fosse Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. The Applicant notes that the approach to the assessment in relation to the Fosse Way has been agreed with Historic England and the methodology for the mitigation strategy is being discussed with Historic England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Details of the proposed landscape mitigation measures are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that visual mitigation measures are delivered and maintained throughout the lifetime of the Scheme. In addition, effects on the setting of the Fosse Way as a heritage asset are assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, which concludes that, with the design refinements and secured mitigation in place, effects on the setting of the Fosse Way are appropriately managed. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape. Consequently, no significant effects were identified to the asset. Public Rights of Way and Recreational Access A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (oPROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-007] and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The **oPROWPPMP [APP-282]** is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. <u>Human Health</u> The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is being discussed with Wiltshire Council's Countryside Access Team. This is set out in the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
SG-002	Soils and Agriculture	This project should be done in brown areas in sensitive positions, smaller areas no doubt, factory roof tops not virgin countryside.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.10 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17 [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is being discussed with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Section 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1

Reference	Theme	Comments/Issues Raised	Applicant's Response
			hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
SG-003	Socio-Economics, Tourism and Recreation	This will seriously impact the area life of many locals, tourism	Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing, through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation, transport and connectivity, climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, inbound workers are accommodated in the most suitable locations for housing and health service access, community liaison and engagement is maintained, and construction impacts on waterways, soils, noise and air quality are regulated. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is being discussed with Wiltshire Council's Economic and Regeneration Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
SG-004	Landscape and Visual Ecology and Biodiversity	This project should not go ahead for many reasons and here are just a few. I have previous experience of a nearby solar farm and the replanting is something that does not live up to what they say with intermittent planting and dying trees not replanted. The area changes majorly.	The landscape and visual effects of the Scheme, including the effectiveness and phasing of proposed screening and planting, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA considers landscape and visual effects over time, including during the early years of the Scheme before planting is fully established, and identifies where significant effects may occur. NPS EN-1 recognises at para 5.10.5 that "*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation*." Mitigation measures are detailed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Proposed planting comprises a mix of native species designed to enhance biodiversity and resilience, with planting design prioritising long-term effectiveness and landscape integration. The **OLEMP [APP-283]** sets out the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			approach to establishment, maintenance and management of planting to ensure its effectiveness over the lifetime of the Scheme. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that mitigation planting and screening measures are delivered and maintained throughout the lifetime of the Scheme. Details of tree protection, replacement planting and long-term management are set out in the **Outline Landscape and Ecological Management Plan [APP-283]** and the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that arboricultural mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

6.39 Sheralyn Blackett

Table 6-39 RR-4345

Reference	Theme	Comments/Issues Raised	Applicant's Response
SB-001	Ecology and Biodiversity Hydrology, Flood Risk and Drainage	I vehemently object to this submission and think that the development consent order should be refused. Below are a very few of the reasons why: As a tax payer I do not want any of my money paid as subsidies to the overseas developers who are proposing this monstrous industrialisation of our country side. It is not efficient or reliable or safe and the only reason it is proposed is because the developers will make alot of money from the uk subsidies that they will be paid at the huge detriment of numerous communities, wildlife and wildlife corridors as well as other immeasurable consequences such as increased flood risks through rain run off danger to health and safety through fire risk of the BESS (with no safe way of fires being extinguished leading to air pollution and contamination of the water table) and possibly damage of the solar panels by birds thinking they are water. If the panels are broken this also leads to contamination of the land.	The Applicant confirms that Lime Down Solar Park is being developed solely through private sector financing and that it has not received, and is not receiving any public money, subsidy or funding in the development of the Scheme. Wildlife Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is being discussed with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **OEPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** Mitigation and enhancement measures are detailed in the **OLEMP [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Flood Risk</u> An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-063], with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218].** The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant

Reference	Theme	Comments/Issues Raised	Applicant's Response
			planning authority. The CEMP must be substantially in accordance with the **Outline CEMP [APP-277]**, and all construction works associated must be carried out in accordance with the approved CEMP. Fire Risk The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant notes that the approach to BESS safety is being discussed with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The **OBSMP [APP-286]** ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the **OBSMP [APP-286]** confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out in the **OBSMP [APP-286]** the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the **OBSMP [APP-286]** specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072], Section 20.7: Major Accidents and Disasters.** An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067].** This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **OBSMP [APP-286]** — including advice to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not

Reference	Theme	Comments/Issues Raised	Applicant's Response
			commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The **Draft Development Consent Order [APP-016]** also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. <u>Birds</u> Potential impacts of the Scheme on birds, including breeding and wintering species within and around the Order Limits, are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. The assessment considers baseline bird assemblages and evaluates likely effects during construction, operation and decommissioning, including habitat loss, disturbance and displacement. It concludes that, with embedded mitigation in place, no unacceptable significant adverse effects on bird populations are anticipated. The assessment also notes that there is very limited evidence that solar PV panels present a risk of bird collision or fatality. The Scheme design and mitigation measures are therefore focused on avoiding / mitigating habitat loss and disturbance, rather than collision risk. The Applicant notes that the approach to the assessment in relation to birds in general is being discussed with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Habitat creation and enhancement measures to support bird species are incorporated into the Scheme, including areas

Reference	Theme	Comments/Issues Raised	Applicant's Response
			provided for skylark mitigation and wider grassland and hedgerow enhancement. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Measures to safeguard nesting and foraging birds during construction and operation, including timing of vegetation clearance, pre-construction checks and species-specific protection measures, are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring bird protection and habitat enhancement measures are delivered and maintained throughout the lifetime of the Scheme. <u>Contamination</u> Potential effects of the Scheme on water quality and contamination risk are addressed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063],** which sets out mitigation and management measures to protect water quality during construction and operation. These measures include pollution prevention controls, containment systems, emergency response protocols, and site-specific drainage measures, particularly around the Battery Energy Storage System (BESS) and substations where lined drainage and automatically actuating valves are proposed. The Applicant notes that the approach to pollution resulting from battery fire is being discussed with both the Environment

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Agency and the Lead Local Flood Authority (LLFA) and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Mitigation measures to control contamination risk during construction are set out in the **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]**. Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a Construction Environmental Management Plan substantially in accordance with the **Outline CEMP [APP-277]** is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are appropriately managed throughout construction of the Scheme.
SB-002	Ecology and Biodiversity	Other consequences of this development if it were allowed would be: Blocking of wild life corridors would lead to increased accidents on roads with animals being forced to cross. Because the proposed development is long and narrow it would affect a far greater number of wildlife corridors than a square block of land.	Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for

Reference	Theme	Comments/Issues Raised	Applicant's Response
			wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**.
SB-003	Landscape and Visual	The development should not be allowed to go ahead. The applicant admits that there would be significant visual harm for 15 years but I consider that it would be far longer with storm damage to newly planted trees and no shielding through winter	The landscape and visual effects of the Scheme, including the effectiveness and phasing of proposed screening and planting, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA considers landscape and visual effects over time, including during the early years of the Scheme before planting is fully established, and identifies where significant effects may occur. NPS EN-1 recognises at para 5.10.5 that "*Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation*." Mitigation measures are detailed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Proposed planting comprises a mix of native species designed to enhance biodiversity and resilience, with planting design prioritising long-term effectiveness and landscape integration. The **OLEMP [APP-283]** sets out the approach to establishment, maintenance and management of planting to ensure its effectiveness over the lifetime of the Scheme. The LVIA includes verified viewpoints with both summer and winter photography to demonstrate year-round changes to the landscape. Photomontages at Year 15 illustrate the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			effectiveness of established planting, while also demonstrating the intended retention of openness across the receiving landscape. Hedgerows on the western edge of fields within Lime Down C, which border the Cotswolds National Landscape, are proposed to be maintained at approximately 1.5 metres (or as existing if greater) to retain open views within the setting of the Cotswolds National Landscape. This management approach is set out in the **OLEMP [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that mitigation planting and screening measures are delivered and maintained throughout the lifetime of the Scheme.
SB-004	Site Selection	It is poor site selection that would destroy farmland forever. The idea that after 60 years the land would be bought back into agricultural production is naive and misleading. The land would be contaminated by rain run off from the solar panels. It would be an industrial wasteland. This is not a temporary development and should not be described as one.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.7 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-172]. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is being discussed with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through Schedule 2, Requirement 17 of the **Draft DCO [APP-016]** which includes the preparation and implementation of a Soil Resources Management Plan (SRMP) in accordance with the **Outline SRMP [APP-280].** The SRMP will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279],** which is secured by Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Sections 17.10 and 17.12). Potential effects of the Scheme on water quality and contamination risk are addressed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, which sets out mitigation and management measures to protect water quality during construction and operation. These measures include pollution prevention controls, containment systems, emergency response protocols, and site-specific drainage measures, particularly around the Battery Energy Storage System (BESS) and substations where lined drainage and automatically actuating valves are proposed. Mitigation measures to control contamination risk during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]**. Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a Construction Environmental Management Plan substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277]** is secured through Requirement 13 in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are appropriately managed throughout construction of the Scheme.
SB-005	Other Environmental Matters Noise and Vibration	Noise pollution from the trackers on the solar panels and the BESS Light pollution from the security lights	The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The Applicant notes that the approach to noise from BESS has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Scheme. Potential effects relating to lighting are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** and further discussed in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072].** The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. Measures to control construction lighting are set out in the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls form part of the **Outline Operational Environmental Management Plan [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			278]. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme
SB-006	Landscape and Visual	Visual pollution with 4.5m high tracker panels and BESS stations	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060],** including the BESS. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The BESS has been assessed as part of the worst-case parameters for above-ground infrastructure, including through Zone of Theoretical Visibility analysis and representative viewpoints agreed through consultation with Wiltshire Council and the Cotswolds National Landscape Board. Photomontages **[APP103 – 105]** have been prepared where significant effects were anticipated to assist in understanding how the BESS and other infrastructure would appear in the landscape. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these

Reference	Theme	Comments/Issues Raised	Applicant's Response
			receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents

Reference	Theme	Comments/Issues Raised	Applicant's Response
			include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
SB-007	Socio-Economics, Tourism and Recreation	Loss of amenities for thousands of people such a footpaths, countryside views, quietness, being able to hear birdsong which are all essential for the well-being of communities Communities are being broken up by this proposal it is divisive and puts a	Noise, and landscape and visual impacts have been addressed in detail in the Applicant's responses to this Party above. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		huge mental strain on thousands of people as would the building of the site if it were allowed.	**[APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Development Consent Order [APP-016]. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** This chapter provides a comprehensive assessment of the Scheme's potential effects on human health through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "*lens*" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the **Statement of Common Ground with Wiltshire Council** to be submitted at Deadline 1.
SB-008	Construction and Decommissioning	The panels would possibly be bought over from China, and their construction is not 'Green'	The effects of emissions generated from embodied carbon within products to be used on site (as well as construction, operation and decommissioning emissions) are all considered **in ES Volume 1, Chapter 7: Climate Change [APP-059].** The CO2e figures are included in detail within the chapter, which concludes that the emissions from these sources would be outweighed by the reduced emissions as a result of the Scheme contributing to decarbonisation of energy from the National Grid.
SB-009	Transport and Access	the narrow roads are not safe for large lorries and valuable hedgerows and verges would be destroyed which are	The Scheme has been designed through an iterative design process to retain existing hedgerows and grassland habitats as far as practicable. Potential impacts on hedgerows are

Reference	Theme	Comments/Issues Raised	Applicant's Response
		critical habitats for numerous wildlife and wildflowers. The roads would be congested and an increase in accidents would be likely and this would be continual over the 60 year period as upgrades , repairs and renewal of the various elements	assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and **ES Volume 1, Chapter 10: Arboriculture [APP-062]**, which consider baseline conditions and evaluate likely effects on hedgerow features during construction, operation and decommissioning. The assessments identify that some hedgerow loss is required to facilitate access and infrastructure. However, anticipated hedgerow losses represent a small proportion of the existing hedgerow network within the Order Limits. With embedded mitigation in place, no significant adverse effects on hedgerow features are anticipated. Compensatory planting and enhancement measures are proposed which will significantly exceed the extent of hedgerow loss. Proposed new hedgerows and habitat enhancements are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the Draft Development Consent Order [APP-016], ensuring hedgerow retention, replacement planting and long-term management are delivered and maintained throughout the lifetime of the Scheme. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. The effects of construction traffic on the local highway network are also assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The **Outline CTMP [APP-287]** also includes a road condition and dilapidation survey of minor roads not typically used by HGV traffic. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. In addition, the **Outline CTMP [APP-287]** includes community liaison measures to keep local communities informed of construction activity and to provide a contact point for feedback should any issues arise. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]** , are secured through Requirement 15 of Schedule 2

Reference	Theme	Comments/Issues Raised	Applicant's Response
			of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme.
SB-010	Human Health	The disruption to everyday life would have a huge impact of numerous communities across the area leading to increased stress and possible mental illness through loss of value of people most valuable asset - their home, through noise, light and site pollution.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].**

Reference	Theme	Comments/Issues Raised	Applicant's Response
SB-011	Soils and Agriculture	The loss of essential farmland makes us more reliant on Imports, this together with the import of the panels and the construction of the site (which will possible have to be renewed/upgraded/repaired numerous times over the 60 year period) and destruction of unique countryside makes it very hard for this proposal to be described as' Green'. I consider it to be driven by greed. Give each village a small Solar area to power the village...	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.10 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to assessing the quality of the agricultural land is being discussed with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280],** which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**). National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. **ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero. The Applicant notes the concerns about the reasons behind the Scheme. The Scheme aims to help meet national targets for clean energy and net zero targets set out in legislation and policy. The aim is to deliver long term environmental benefit alongside a secure energy supply. The Applicant is committed to meeting all planning, environmental, and construction policies and standards. The Scheme is being developed in line with legal and regulatory requirements, with engagement with all statutory and non-statutory bodies, ensuring quality and accountability throughout.
SB-012	Description and DCO Process	...don't pour this bankrupt countries tax payers funds into the purse of a foreign developer to the detriment of local communities who will lose all they hold dear and the reason for them choosing to live in the countryside. Please don't let this go	The Applicant confirms that Lime Down Solar Park is being developed solely through private sector financing and that it has not received, and is not receiving any public money, subsidy or funding in the development of the Scheme. The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		ahead. Stand up for what is important for our irreplaceable land	are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular reliance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

6.40 Anna Kate Fuller

Table 6-40 RR-0339

Reference	Theme	Comments/Issues Raised	Applicant's Response
AKF-001	Description and DCO Process Landscape and Visual	I object to the Lime Down Solar plans and urge the Planning Inspectorate to thoroughly examine the numerous harms that these plans would cause and to recommend rejection. Inappropriate Location & Loss of Countryside a) I have lived here since I was 11. This is a rural, unspoilt, peaceful, and beautiful area that I love deeply. b) The open countryside, where we enjoy seeing the crops grow with the seasons, forms the vital setting for the Cotswolds National Landscape. Industrialising it fundamentally undermines the protection this designation is meant to guarantee.	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. The landscape and visual effects of the Scheme, including effects on the Fosse Way and its setting, are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) identifies users of the Fosse Way as visual receptors and evaluates likely effects during construction, operation and decommissioning using realistic worst-case design parameters. The Fosse Way runs adjacent to Sites B and C through the Scheme and is made of seven separate receptors which have been assessed in full. The Sequential effects for users of the Fosse Way are not considered to be any greater than those effects identified for the individual sections as set out within **ES Volume 3, Appendix 8.3 ES LVIA Assessment Sheets [APP-189-194]**. Moderate Adverse effects on Receptor No TR145: Fosse Way were identified as a result of Site C with no greater effects identified as a result of Site B. Refer to **ES Chapter**, **Appendix 8-3-2-2-1 - Landscape and Visual Assessment Sheets [APP-191].** The assessment found that there would be temporary Moderate Adverse effects during the construction and Year 1 on views from The Fosse Way which would reduce Minor at Year

Reference	Theme	Comments/Issues Raised	Applicant's Response
			15 and No effect at Decommissioning as a result of the proposed mitigation planting. The Scheme design has been refined through an iterative design process to avoid and reduce visual effects on the Fosse Way. This includes the removal of solar panels from fields adjacent to the Fosse Way where significant visual effects were identified, together with the introduction of landscape buffers and new planting to further reduce visibility of infrastructure from the route and its surrounding landscape. The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. Details of the proposed landscape mitigation measures are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], ES Volume 2, Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of detailed landscape and ecological management plans, (substantially in accordance with the **OLEMP**) and a detailed ecological protection and mitigation strategy (substantially in accordance with the **OEPMS**) are secured through Requirements 7 and 8 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that visual mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
AKF-002	Soils and Agriculture	c) Solar farms should be sited on brownfield land, industrial estates, rooftops, or near motorways-"not on our valuable farmland. This proposal would change the landscape forever.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.7 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through Schedule 2, Requirement 17 of the **Draft DCO [APP-016]** which includes the preparation and implementation of a Soil Resources Management Plan (SRMP) in accordance with the **Outline SRMP [APP-280].** The SRMP will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279],** which is secured by Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			as significant (Section 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Sections 17.10 and 17.12). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
AKF-003	Human Health Noise and Vibration	Negative Impact on Residents a) Mental & Emotional Toll: The consultation process has already caused immense stress, anxiety, and exhaustion. I am deeply anxious about	<u>Mental Health and Wellbeing</u> Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's

Reference	Theme	Comments/Issues Raised	Applicant's Response
		the "*ghastly*" construction noise, constant drilling, and increased traffic. I am also very concerned about the constant hum of cooling fans once operational. At night, it is beautifully quiet-"I hear owls hooting. I do not believe the noise impact has been sufficiently assessed.	potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline

Reference	Theme	Comments/Issues Raised	Applicant's Response
			analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. <u>Construction noise</u> The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Environmental Management Plan [APP-277]. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. <u>Construction traffic</u> The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. <u>Operational noise</u> The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Modelling [APP-237]. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
AKF-004	Socio-Economics, Tourism and Recreation	b) Financial Impact: Our property value has been reduced since this proposal was announced. A (Redacted)house in Alderton is failing to sell due to the plans. This is a real concern that local estate agents are afraid to discuss openly, but it must be properly addressed.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181]**.
AKF-005	Soils and Agriculture	Food Security & Destruction of Irreplaceable Habitats a) This land has been successfully farmed for generations. Using 30%	The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Best and Most Versatile (BMV) agricultural land for solar panels directly undermines UK food security. b) There is a glaring legal contradiction: they propose taking fertile land out of production for 60 years for 'biodiversity', yet promise to restore it to agriculture. Their 30-year Biodiversity Net Gain (BNG) commitment conflicts with the 60-year lease. Which legal obligation will be abandoned? c) The site contains ancient hedgerows and habitats. These are irreplaceable. Promises to 'translocate' them show a fundamental misunderstanding-"they are complex ecosystems, not just plants. Their loss would be permanent.	the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Potential impacts of the Scheme on ecology and biodiversity

Reference	Theme	Comments/Issues Raised	Applicant's Response
			are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to identifying and securing mitigation measures is under discussion with Wiltshire Council, Natural England and the Environment Agency and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. A comprehensive package of habitat retention, creation, enhancement and long-term management measures is proposed to avoid, reduce and mitigate impacts and to deliver Biodiversity Net Gain. These include the protection of existing habitats, restoration of lost features such as historic ponds, creation of new habitats, and long-term ecological management to improve habitat quality over the lifetime of the Scheme. The ecological mitigation and enhancement proposals are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The **OLEMP [APP-283]** includes provisions for habitat establishment, maintenance and ecological monitoring to confirm that mitigation and enhancement measures are functioning as intended and to identify and implement remedial measures where required. The preparation, approval and implementation of the detailed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that ecological mitigation and enhancement measures are delivered, monitored and maintained throughout the lifetime of the Scheme. In the context of Biodiversity Net Gain (BNG), biodiversity units delivered by the Scheme as calculated by the Statutory Biodiversity Metric must be secured for a minimum of 30 years in accordance with relevant legislation requirements pertaining to BNG. Although BNG for NSIPs is not yet mandatory, the Applicant has sought to meet the requirements as if it were. After 30 years post-development, it is likely that all retained, newly-created and enhanced habitats will continue to be managed to maximise ecological benefit for the remaining lifespan of the Scheme, in accordance with the OLEMP [APP-283] The Scheme has been designed through an iterative design process to retain existing hedgerows and grassland habitats as far as practicable. Potential impacts on hedgerows are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and **ES Volume 1, Chapter 10 Arboriculture [APP-062]**, which consider baseline conditions and evaluate likely effects on hedgerow features during construction, operation and decommissioning. The assessments identify that some hedgerow loss is required to facilitate access and infrastructure. However, anticipated hedgerow losses represent a small proportion of the existing hedgerow network within the Order Limits. With embedded

Reference	Theme	Comments/Issues Raised	Applicant's Response
			mitigation in place, no significant adverse effects on hedgerow features are anticipated. Compensatory planting and enhancement measures are proposed which will significantly exceed the extent of hedgerow loss. Proposed new hedgerows and habitat enhancements are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **OLEMP [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring hedgerow retention, replacement planting and long-term management are delivered and maintained throughout the lifetime of the Scheme.
AKF-006	Ecology and Biodiversity Site selection and Alternatives	Inadequate Surveys & Lack of Evidence a) The ecological evidence is fundamentally flawed. Surveys for key protected species (e.g., dormice, reptiles, otters) are absent, out-of-date, or insufficient. b) The cable route is a particular blind spot with almost no species-specific surveys. You cannot assume species aren't there; you must survey. c) The applicant lacks the material evidence needed for a competent decision on environmental impacts.	The scope of ecological and species-specific survey within the Cable Route Corridor (CRC) was defined using a proportionate, risk-based approach. Survey scope and effort across the Order Limits were targeted to areas and features where there was a reasonable likelihood of significant effects, rather than applied uniformly across the Order Limits irrespective of risk. The assessment has had regard to the short-term, temporary and construction-phase nature of works within the CRC, the absence of permanent operational effects, and a robust appraisal of habitat suitability for species based on baseline habitats data collected through surveys. Based on this a reduced survey effort within the CRC has been undertaken compared to the Solar PV Sites. Potential impacts within the CRC, including temporary habitat loss, disturbance and fragmentation, have been assessed on a precautionary reasonable worst-case basis. This assumes that

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction works within the CRC will be progressive over the approximate 18-month period. Embedded mitigation and further controls secured through the **OEPMS [APP-284]**, including pre-construction surveys and inspections, micro-siting of cabling works, appointment of an Ecological Clerk of Works and species-specific protection measures, where appropriate, provide a recognised mechanism for managing residual risk. Furthermore, reinstatement of any disturbed habitats will take place as a priority following construction within the CRC. Is it the Applicant's view that the baseline information is considered sufficient to support a robust and proportionate assessment of likely significant effects within the CRC, and the conclusions of **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** remain appropriate and justified. Potential impacts of the Scheme on dormice, reptiles and otters are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates the likely effects during construction, operation and decommissioning. The **ES [APP-052 to APP-265]** and environmental and ecological surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details of qualifications, experience and professional institute membership are provided within **ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]**.
AKF-007	Construction and Decommissioning Transport and Access	Construction Chaos, Safety Risks & Habitat Fragmentation a) Over 20,000 additional vehicle movements will bring chaos and danger to our narrow country lanes, which are used by cyclists, horse riders, and residents. The roads are	Impacts on Non-motorised Users has been assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. This has concluded no significant impact. Highway widths of construction routes have been assessed and provide sufficient width for HGV traffic to comfortably pass cyclists. Given the nature of the routes, there is a lack of

Reference	Theme	Comments/Issues Raised	Applicant's Response
	Ecology and Biodiversity	already hazardous when lorries pass. b) This traffic will sever vital wildlife corridors. The plan lacks a proper strategy for wildlife crossings, which will lead to animal deaths and further habitat fragmentation. c) As someone who drives between villages to teach, I fear the high risk of accidents and potential loss of life this traffic will cause. d) Local medical services (GPs, hospitals) are already stretched and will struggle to cope with hundreds of additional workers.	pedestrian infrastructure making it already unattractive as a walking route. The increase in HGV construction traffic will therefore not make a significant impact on the routes attractiveness for pedestrians. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects in relation to accident risk are anticipated. As set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, a booking system will be set up to manage arrivals and departures to the Site. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be confirmed as part of the final CTMP. The **Outline CTMP [APP-287]** includes measures to manage deliveries and restricted hours of deliveries outside of peak

Reference	Theme	Comments/Issues Raised	Applicant's Response
			hours in order to minimise any detrimental impacts on the local highway network. Construction traffic would be temporary. The construction traffic is managed through a Final CTMP which is a requirement of the DCO. Road condition surveys will ensure any damage to the highway network caused by construction traffic is rectified. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that the impact would be negligible to minor adverse. Construction routes will utilise existing highways suitable for vehicle movements. **ES Chapter 9: Ecology and Biodiversity [APP-061]** considers the potential for effects on protected and notable species of wildlife through fragmentation of habitat as a result of the Scheme. The assessment concludes there would not be any significant residual effects from this potential impact. The Applicant confirms that consideration of impacts to PROWs, unsurfaced roads, and the recreational use of the highway network has been assessed in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E or regionally important long-distance recreational routes cannot be mitigated further during construction. The assessment has considered the impacts to individual routes to build a picture of the likely impact on the overall PROW and highway network, determining that the overall effects within the 2 km Study Area is not a significant adverse effect at any stage of the Scheme. This is largely owing to the large number of PROWs and rural routes, given a great level of optionality to users, even in the presence of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant has assessed the likely effect of inbound workers during construction on local medical services in **ES Chapter 18: Human Health [APP-070]** under the assessment heading 'Health and social care services'. The assessment has considered existing GP patient lists within 5 km of the Scheme, accessibility to primary healthcare services across the same area, and hospital A&E performance times at Swindon, Bath and Bristol, as well as understanding the health characteristics of the existing population to determine the likely effect inbound workers would have on these receptors. Additionally, the Applicant has committed to supporting construction workers in finding and registering with GPs across a wider 20 km area in reasonable proximity to their temporary or full-time accommodation, and where such GP surgeries have reasonable capacity to take on additional patients. This is secured through the **Outline CEMP [APP-277]** by Requirement 13 of Schedule 2 to the **Draft DCO [APP-016]**. The assessment concludes that during the construction phase, the residual level of effect on human health is up to a minor/negligible adverse effect as a result of predicted increased demand on healthcare services. This is not a significant effect.
AKF-008	Climate Change and Energy Need	Questionable Environmental & Carbon Credentials a) Has the project's full carbon footprint been examined? I am concerned it will not be carbon neutral once infrastructure, transport, and decommissioning are accounted for. b) What safeguards will ensure solar panels and batteries are free from modern slavery in their supply chains?	**ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived

Reference	Theme	Comments/Issues Raised	Applicant's Response
			electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero. Island Green Power is part of the Solar Energy UK Supply Chain Commitment, which binds the Applicant to ensuring that our supply chains are free of slavery. As part of this, the solar sector in the UK and Europe has launched the Solar Stewardship Initiative, which independently inspects and certifies individual factories for sustainable and ethical practices. The Applicant would expect to source our panels from factories that are SSI-accredited.
AKF-009	Construction and Decommissioning	Lack of Long-Term Accountability & "*Temporary*" Myth a) A 60-year project, with a high likelihood of repowering, is permanent for our community. It is not "*temporary*". b) Will there be a legally binding bond for decommissioning and full restoration? Who will be responsible? c) How will the panels be recycled? Without a legally secured fund (a commuted sum) and a detailed, binding management plan, promises of restoration and biodiversity gain are meaningless.	A requirement to decommission the Scheme is part of the DCO application; failing to comply with that requirement would be a criminal offence. Decommissioning is also covered in agreements with landowners, which includes decommissioning securities to cover the cost of decommissioning in the event of any breach. Such securities are regularly revalued and topped up if necessary to ensure the solar farm would be fully removed and land restored. Should the operating company become insolvent before decommissioning, the solar farm would be an asset that would be sold or would pass to creditors, along with the obligation to decommission it. The company cannot be wound up voluntarily if there are outstanding obligations, which would include the decommissioning commitments made to landowners. Decommissioning is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The Applicant has produced an **Outline Decommissioning Strategy [APP-279]** as part of the EIA submitted with the DCO Application. A final decommissioning strategy will be prepared and agreed with the relevant

Reference	Theme	Comments/Issues Raised	Applicant's Response
			authorities at that time of decommissioning and will include detailed measures and timescales. As set out in the **Funding Statement [APP-019]** submitted with the DCO Application, the Applicant is committed to ensuring that appropriate financial provisions are in place to cover decommissioning costs at the end of the operational life of the Scheme. The **Outline Operational Environmental Management Plan (Outline OEMP) [APP-278],** secured by Schedule 2, Requirement 14 of the **Draft DCO [APP-016]**, sets out the commitment of the Applicant to maximise recycling and reuse of the Scheme components at the end of their life. Section 4 of **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** sets out that due to the market and policy trends, it is assumed that specialist regional or national facilities would be in place at the time of component replacement e.g. solar panels and batteries and decommissioning, and these would be developed in response to demand generated by the UK-wide solar PV panel industry and would be reused, recycled, or recovered and not disposed of to landfill. Details of how the panels and Battery Energy Storage System (BESS) will be disposed of are provided within Section 4 of **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** which states that recycling routes are generally available for component replacement waste at present, and it is likely that there will be even greater opportunities for recycling in the future, not least because the recycling market will have expanded to meet demand as solar PV installations increase. It is likely that the solar PV panels and battery waste generated by the Scheme, during operation and maintenance and decommissioning phases, would be managed by specialist

Reference	Theme	Comments/Issues Raised	Applicant's Response
			regional or national facilities; these facilities would be developed over the operation and maintenance phase of the Scheme in response to demand generated by the UK-wide solar energy industry. The capacity of such facilities is not expected to be influenced by other non-solar farm projects in the surrounding area; this is because the facilities will only be managing specific solar PV panel waste. In addition, private sector waste companies will develop these facilities to respond to market demands. At present, solar PV panel waste generation is low, therefore there is a limited demand for facilities and their associated limited available capacity. It is therefore expected that the facilities which reuse, recycle, or recover end of-life solar PV panels will be developed as the quantities of this waste stream increase. The Waste Electrical and Electronic Equipment (WEEE) Regulations and The Waste Batteries and Accumulators (Amendment) Regulations place obligations on companies who place solar PV panels and batteries on the market to finance the costs of collection, treatment, recovery and environmentally sound disposal; and the landfill tax strongly incentivise reuse, recycling and recovery. The preparation and implementation of the detailed Operational Environmental Management Plan, substantially in accordance with the **Outline OEMP [APP-278]**, is secured through Requirement 14 in Schedule 2 of the **Draft Development Consent Order [APP-016]**.
AKF-010	Socio-Economics, Tourism and Recreation Landscape and Visual	Damage to Tourism, Recreation & Visual Impact a) Tourism is vital to our local economy. The area is popular with walkers and cyclists, including those on the historic Fosse Way. b) The industrialisation of this	The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		landscape will destroy the rural tranquillity and historic character that visitors seek. People will not come to walk past miles of solar panels.	The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The landscape and visual effects of the Scheme, including effects on the Fosse Way and its setting, are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) identifies users of the Fosse Way as visual receptors and evaluates likely effects during construction, operation and decommissioning

Reference	Theme	Comments/Issues Raised	Applicant's Response
			using realistic worst-case design parameters. The Scheme design has been refined through an iterative design process to avoid and reduce visual effects on the Fosse Way. This includes the removal of solar panels from fields adjacent to the Fosse Way where significant visual effects were identified, together with the introduction of landscape buffers and new planting to further reduce visibility of infrastructure from the road and its surrounding landscape. The potential effects of the Scheme on the cultural heritage of the Fosse Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. The Applicant notes that the approach to the assessment in relation to the Fosse Way has been agreed with Historic England and the methodology for the mitigation strategy is under discussion with Historic England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Details of the proposed landscape mitigation measures are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the OLEMP, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that visual mitigation measures are delivered and maintained throughout the lifetime of the Scheme. In addition, effects on the setting of the Fosse Way as a heritage asset are assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, which concludes that, with the design refinements and secured mitigation in place, effects on the setting of the Fosse Way are appropriately managed. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational

Reference	Theme	Comments/Issues Raised	Applicant's Response
			routes, including their practical use, enjoyment and desirability. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
AKF-011	Description and DCO Process	Final point. The applicant's case is built on insufficient evidence, vague plans, and unresolved contradictions. The profound harm to our community's health, safety, wellbeing, and irreplaceable environment is clear. I ask the Examining Authority to recognise these fundamental flaws and recommend that development consent is REFUSED.	The **ES [APP-052 to APP-265]** and environmental and ecological surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details are provided within ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]. The Applicant is confident that the management and mitigation measures proposed are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **ES [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft Development Consent Order [APP-016]**. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Visual [APP-060], **Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068],** and **Chapter 18: Human Health [APP-070]**, all of which consider potential impacts on residential properties and local communities. Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing, through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation, transport and connectivity, climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, inbound workers are accommodated in the most suitable locations for housing and health service access, community liaison and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			engagement is maintained, and construction impacts on waterways, soils, noise and air quality are regulated. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
AKF-013	Hydrology, Flood Risk and Drainage Transport and Access Other Environmental Matters	Flooding, Water Contamination & Pollution a) Local roads already flood, causing chaos. I am very worried that cable route work in the field behind our property will increase flood risk, as water from that field already encroaches on our land. b) We rely on two boreholes for drinking water. How can we be certain they will not be contaminated? Who will pay for the clean up if it is? c) The proposed 8m buffers for watercourses are inadequate. Experts state 10-20m are needed to protect water quality and species like otters. d) A battery fire could cause toxic runoff to leach into the aquifer, contaminating the wider water supply. Battery Energy Storage System	The Applicant acknowledges concerns regarding existing localised flooding and the proximity of works to residential land. The flood risk assessment has been undertaken in accordance with national and local policy and concludes that the Scheme would not increase flood risk elsewhere, including during construction. Construction activities along the cable route are subject to controlled methods, pollution prevention and temporary drainage measures secured through the construction management framework, with works near watercourses subject to approval and oversight. **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and **Outline Construction Environmental Management Plan [APP-277]**. In relation to private boreholes, groundwater receptors and pollution pathways are assessed using a source–pathway–receptor approach, and no credible mechanism has been identified by which the Scheme would contaminate groundwater or drinking water supplies. Construction and operational controls are secured to prevent pollution, with incident response measures in place. **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**. Matters of liability and

Reference	Theme	Comments/Issues Raised	Applicant's Response
		(BESS) - Unacceptable Risks a) A BESS fire would pose an enormous risk to wildlife, residents, and the environment. Multiple homes are within 1,220 metres. b) What specific safeguards are in place? Are Dorset & Wiltshire Fire Service prepared and equipped for such a fire? What will happen to the polluted firefighting water?	remediation are governed by existing environmental permitting and pollution control regimes rather than the planning process. The Applicant does not agree that the proposed watercourse buffers are inadequate from a flood risk or water quality perspective. The standard flood risk buffer is applied to protect conveyance and allow maintenance access, while wider buffers are provided where required for ecological or access reasons and are secured through the Scheme design. Flood risk conclusions do not rely on buffer width alone but on the overall drainage strategy and controls. **Design Principles and Parameters [APP-269]**. In relation to BESS fire risk and firefighting water, the hydrological assessment does not identify an unacceptable risk of contamination to groundwater or surface waters. Firefighting water and any potentially contaminated runoff would be contained within sealed and controlled drainage systems associated with the BESS, with isolation, containment and controlled removal or discharge secured through the battery safety and drainage controls. These measures prevent uncontrolled release to ground or watercourses. **Outline Battery Safety Management Plan (OBSMP) [APP-286]**. No amendments to the application documents are required. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. The UKHSA is a statutory consultee for the Scheme and has

Reference	Theme	Comments/Issues Raised	Applicant's Response
			confirmed that they are satisfied with the Applicant's submitted documentation and Plume Assessment Study methodology and results. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **OBSMP [APP-286].** The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the **OBSMP [APP-286]** and secured through the DCO: "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health exposure limit guidelines when the battery system of a BESS is*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.9 -5.4.11) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider." An **OBSMP [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The safety objectives for the design of the BESS site are listed in Section 2.4 of the **OBSMP [APP-286]**. The **OBSMP [APP-286]** will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 2.4.2 of the OBSMP stipulates that: *"Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing (LSFT) and rigorous consequence modelling to minimise the requirement for any D&WFRS intervention in a thermal runaway incident. LSFT must establish minimum equipment spacing distances that demonstrate there is no fire propagation to adjacent BESS enclosures or ESS equipment. D&WFRS intervention in worst case scenarios would typically be limited to boundary cooling of adjacent BESS and Energy Storage System (ESS) units to prevent the fire from spreading. This strategy will be finalised with D&WFRS and be clearly communicated in the Emergency Response Plan (ERP);*

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• *To ensure that fire, smoke, and any release of toxic gases does not significantly impact site operatives, first responders, and the local community; and* • *To ensure that firewater run-off is contained and tested before release or, if necessary, removed by tanker and treated offsite."* As set out in the **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in ERPs. ERPs will be drafted and approved for all stages of the Scheme, including construction, operation, and decommissioning. The Applicant's ERP template includes all requirements specified in both NFCC and NFPA 855 guidance and recommendations. Section 5.4.9 – 5.4.11 of the **OBSMP [APP-286]** stipulates that the ERP will follow NFCC and NFPA 855 (2026) guidelines and stipulates the minimum content that an ERP must contain, including: *"Emergency procedures for all credible hazards and risks, including building, infrastructure and vehicle fire, wildfires, impacts on local respondents, impacts on transport infrastructure."* All risk assessments to be conducted at detailed design for BESS projects required by the Health and Safety Executive (HSE) to assess fire and explosion risk are stipulated in Section 6.1.5. Section 5 of the **OBSMP [APP-286]** covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. The Applicant is in the process of agreeing a **Statement of Common Ground** (SOCG) with D&WFRS to provide assurance that all safety and emergency response requirements are fulfilled. Site design ensures that D&WFRS

Reference	Theme	Comments/Issues Raised	Applicant's Response
			would not have to travel or operate in a smoke plume / vapor cloud. As now mandated under NFPA 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilized together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit, this is stipulated in the OBSMP pre-construction requirements (Section 6). Section 6.1.3 – 6.1.7 of the **OBSMP [APP-286]**defines key risk assessments and consequence modelling reports required by NFPA 855, NFCC guidance, and HSE BESS safety requirements. These risk assessment tools minimize BESS failure risks, mitigate BESS failure scenarios, and minimize fire propagation risks. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.

Table 6-41 RR-4280

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPE-001	Noise and Vibration Socio-Economics, Tourism and Recreation	I strongly object to the Lime Down proposal. Noise The batteries storage will destroy my life I relish the peaceful part of the world that we live,myself and my family spend all our leisure time outside in the garden and the countryside. The noise from the pilers, will equally disrupt my life for the months or years it takes these panels to be installed. Batteries noisy at night, so will disrupt my sleep- leading to sleep deprivation.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. In particular, as presented in Table 14-18 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, average levels at Surrendel are expected to be around 54 dB which while audible is well below levels likely to give rise to significant adverse effects on health or quality of life. Additionally, noise from the installation of solar PV panels will be spread across the site over the course of the construction period and therefore will only be at the levels presented in Table 14-18 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** for the closest set of works. As a reasonable worst-case this assessment includes the noise from piling rigs that will be larger and louder than those used in practice. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As shown in Table 9 of **ES Volume 3, Appendix 14-4: Noise Modelling**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-237], night-time noise levels at Surrendel would be at the typical existing background sound level. With reference to WHO guidelines on night-time noise, this means that, even with windows open, they would be conducive to a good night's sleep. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
SPE-002	Ecology and Biodiversity	2.Environmental: The Habitat for hedgehogs and badgers hates and Skylarks will be destroyed by the installation and the fencing of the solar panels.	Potential impacts of the Scheme on hedgehog are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Paragraphs 9.10.232 to 9.10.234 conclude that the cessation of intensive agriculture, together with habitat creation and enhancement measures (including tussocky grassland, hedgerow planting and buffer zones), would result in a beneficial effect for hedgehog, significant at the Local level. Mitigation and enhancement measures are secured through the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, secured by Requirements 7 and 8 of the **Draft Development Consent Order [APP-016]**. Potential impacts of the Scheme on skylarks are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			061], which considers baseline bird assemblages and evaluates likely effects on breeding farmland bird species during construction, operation and decommissioning. The assessment identifies skylarks as a key species of conservation interest within the Scheme area. It concludes that a proportion of the current skylark population will be displaced from the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. The Applicant notes that the approach to the assessment with relation to skylark is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large, open set-aside and grassland habitats designed to provide appropriate breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **OLEMP [APP-283]**. Measures to safeguard nesting skylarks during construction, including timing restrictions on vegetation clearance and pre-construction ecological checks, are set out in the **OEPMS [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring

Reference	Theme	Comments/Issues Raised	Applicant's Response
			skylark mitigation and long-term habitat management measures are delivered and maintained throughout the lifetime of the Scheme. Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy OEPMS [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **OLEMP [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **OEPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures

Reference	Theme	Comments/Issues Raised	Applicant's Response
			are delivered and maintained throughout the lifetime of the Scheme.
SPE-003	Construction and Decommissioning Transport and Access	3.Cable construction site will destroy our life at Surrendell, our lane is a single track lane and only two passing places on the one mile track , if lorries and workers van were to accidentally drive up our lane it would be chaos .All the lanes locally are very narrow , it's already tight to pass a lorry when driving a car, so two HGV s passing will be dangerous and completely destroy the verges , the heavy Lorrie's will undoubtably destroy the roads. It seems ridiculous to me that the solar panels are over 20 km from the grid connection- Who will police the traffic ?	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be confirmed as part of the final CTMP. Regarding routes through the Hulavington area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV construction trips outside of these hours; • there would be a much greater impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down D (average number of existing HGV movements is only 46 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]**) Regarding routes through the Foss Way area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 16 HGVs on the route to Lime Down A is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 16 HGVs on the route to Lime Down A is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV movements along the route to Lime Down A is only 10 per day/less than 2 per hour/one every 42 minutes (less than the journey time along the route), with the construction phase for Lime Down Site A only lasting 9 months • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A (average number of existing HGV movements is only 40 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]**) Regarding routes through the Alderton area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including

Reference	Theme	Comments/Issues Raised	Applicant's Response
			but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7 per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route) • delivery times during the construction phase are limited to those times set out in the **Outline CTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A-C (average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **Outline CTMP [APP-287]** Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The **Outline CTMP [APP-287]** includes measures to manage routes, deliveries and restricted hours of deliveries outside of peak hours in order to minimise any detrimental impacts on the local highway network. Construction traffic would be temporary. The construction traffic is managed through a Final CTMP which is a requirement of the DCO. Road condition surveys will ensure any damage to the highway network caused by construction traffic is rectified. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that the impact would be negligible to minor adverse. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline CTMP [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPE-004	Human Health	4.Mental well being:As for the inverters and battery storage this will be a huge hazard for horse riders in the area. We live in the countryside for a reason to enjoy country pursuits for our mental and physical health . No cycling no walking no riding will lead to unhealthy and unhappy residents of this tranquil beautiful countryside we choose to live.No one in their right mind would choose to live next to or surrounded by thousands of 4.5 meter solar panels.	Public rights of way such as bridleways and byways and the use of the highway network for recreational users have been considered as specific recreational receptors in the assessment in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on individual PROWs are specifically assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of PROWs is protected as much as possible through the implementation of embedded and additional mitigation measures set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. An assessment on safety and accidents is provided in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. Links with traffic increases above identified thresholds, were taken forward for further assessment. As part of the assessment, it is concluded that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on the links in the Study Area. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational

Reference	Theme	Comments/Issues Raised	Applicant's Response
			routes, including their practical use, enjoyment and desirability. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			maximise opportunities for environmental enhancement and community benefits
SPE-005		The hedgerow is habitat for a diverse number of forna and flora	The Scheme has been designed through an iterative design process to retain existing hedgerows and grassland habitats as far as practicable. Potential impacts on hedgerows are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and **ES Volume 1, Chapter 10: Arboriculture [APP-062]**, which consider baseline conditions and evaluate likely effects on hedgerow features during construction, operation and decommissioning. The assessments identify that some hedgerow loss is required to facilitate access and infrastructure. However, anticipated hedgerow losses represent a small proportion of the existing hedgerow network within the Order Limits. With embedded mitigation in place, no significant adverse effects on hedgerow features are anticipated. Compensatory planting and enhancement measures are proposed which will significantly exceed the extent of hedgerow loss. Proposed new hedgerows and habitat enhancements are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring hedgerow retention, replacement planting and long-term management are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPE-006	Hydrology, Flood Risk and Drainage	5. Flooding. The Gauze brook floods now some roads are in passable , the panels will make it worse.	An assessment of the effects of the Scheme on watercourses and flood risk, including potential impacts on Gauze Brook, is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting detail contained in the Flood Risk Assessment and Drainage Strategy appendices, including Appendix 11: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]. The Applicant notes that the approach to Gauze Brook is under discussion with the Environment Agency and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The Flood Risk Assessment includes site-specific hydraulic modelling of Gauze Brook to understand existing flood behaviour and to assess potential changes arising from the Scheme. The assessment concludes that, with the proposed drainage design and mitigation in place, the Scheme would not increase the rate or volume of runoff entering Gauze Brook compared to pre-development conditions, and would not increase flood risk to downstream watercourses, infrastructure or communities. Measures to control runoff and manage surface water during construction and operation are set out in the outline drainage and construction management plans accompanying the Application. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring flood risk to Gauze Brook is appropriately managed throughout the lifetime of the Scheme.
SPE-007	Cultural Heritage	6. Heritage:The Roman road, Fosse	The potential effects of the Scheme on the cultural heritage of the Fosse Way and associated Roman archaeological assets

Reference	Theme	Comments/Issues Raised	Applicant's Response
		way might be destroyed forever-leaving no heritage for our children and future generations.	are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The assessment identifies known Roman heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
SPE-008	Description and DCO Process	7. Funding: It worries me that (Redacted) track record with (Redacted), entrusting such a scheme to some one with that track record	The Applicant acknowledges the expression of distrust towards the Scheme and has demonstrated compliance with all statutory requirements under the Planning Act 2008 and applicable legislation such as The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. The Applicant is subject to legally binding DCO requirements. The Planning Act 2008 also contains enforcement provisions regarding compliance with the terms of a DCO. The DCO process itself incorporates enforceable mechanisms to regulate Scheme delivery. Any breach of development consent order or failure to comply with Requirements can result in enforcement action.
SPE-009	Landscape and Visual Ecology and Biodiversity	8. Lifestyle: I was born in Wiltshire and have lived at Surrendell, Grittleton for over 15 years- we moved here purely because the house was surrounded by beautiful peaceful countryside and I feel the country way of life will be completely changed by Lime Down Solar . 9. Visual / landscape : Myself and my friends and family regularly walk and cycle the roads and tracks around our home- it is important to all of us to spend quality time outside in the countryside we love, enjoying the views the wildlife and listening to the skylarks. The views will not only ruined by the miles of solar panels but the inverters and battery storage will turn the green scape into an industrial landscape .	The LVIA assessed Surrendel House as receptor RI028.- refer to **Appendix Volume 3, Appendix 8.3.1: Visual Assessment Sheets (Not carried through to the ES Assessment) [APP-189].** The Property was not taken forward to a full assessment due to the distance of approximately 548m and rising topography to the north of the property, meaning there is no intervisibility between Surrendell House and Lime Down Site C. The LVIA has fully assessed the effects of the Scheme on Public Rights of Way and Roads and recognises there are some Major/Moderate Adverse effects which cannot be mitigated – refer to Tables 8-20 and 8-21 Chapter 8: Landscape and Visual [APP-060]. The effects which cannot be mitigated predominantly relatates to footpaths which diagonally cross fields and where mitigation planting would not be appropriate in terms of landscape character and the legacy landscape. The Applicant has assessed the likely effects on the PROW network and the rural road network as a result of the Scheme in **ES Volume 1 Chapter 16: Socio-Economics, Tourism and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Recreation [APP-068] with individual PROWs assessed in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. No significant adverse effects to PROWs surrounding Surrendel House, Grittleton, or Hullavington, are anticipated as a result of the Scheme, subject to implementation of embedded and additional mitigation measures as secured through the **Outline Construction Traffic Management Plan [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** has considered the location specific impacts of onsite infrastructure. Therein, the assessment considers settlements like Grittleton and Hullavington as communities of greater sensitivity to changes in its visual surroundings due to its current rural setting, and the anticipated extent to which the Scheme will change that character and potentially the quality of life for residents and visitors. The assessment considers that whilst this effect would be long-term throughout the Scheme's construction, operational and decommissioning phases, it is not anticipated to be a significant adverse effect to mental health and wellbeing.
SPE-010	Transport and Access	10. Myself and many of my friends enjoy riding horses , the a number of lorries that are required to build Lime down really worries me as horses often can be spooked by lorries passing to close , and I fear they is a significant risk of an accident involving horses and lorries.This is also true for cyclist and runners.	Public rights of way such as bridleways and byways and the use of the highway network for recreational users have been considered as specific recreational receptors in the assessment in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on individual PROWs are specifically assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of routes in Lime Down E

Reference	Theme	Comments/Issues Raised	Applicant's Response
			cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of PROWs is protected as much as possible through the implementation of embedded and additional mitigation measures set out in the **Outline Construction Traffic Management Plan [APP-287]** and **Outline Public Rights of Way and Permissive Paths Management Plan [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. An assessment on safety and accidents is provided in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. Links with traffic increases above identified thresholds, were taken forward for further assessment. As part of the assessment, it is concluded that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on the links in the Study Area.

6.42 Richard Tanner

Table 6-42 RR-3970

Reference	Theme	Comments/Issues Raised	Applicant's Response
RT-001	Climate Change and Energy Need	I find this scheme very confused in concept. It destroys a large amount of the very countryside we are trying to protect. The very UK centric approach of solving global warming, seems mad. It leads us to instal massive solar schemes in the uk, where solar isn't particularly efficient. Further it ignores that most of our roofs and car parks don't have solar, which could be used first to provide this type of energy.	Solar energy is at the heart of the Clean Power 2030 Mission (January 2026 revised NPS EN-3, Para 2.10.2) and it is the Government's view that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Sunlight, the input energy source for solar, is abundant, predictable, renewable, low carbon and free. Figure 16 of the **Statement of Need [APP-266]** and related text (Section 7.4) demonstrates that there are many viable areas of solar irradiation in the UK. Figures 28 and 29 of the Statement of Need and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level. The inclusion of a Battery Energy Storage System as part of the Scheme will enable energy generated by the Scheme to be stored and exported to the grid when it is needed, which will provide flexibility and improve grid reliability. That other countries may experience higher solar irradiation levels than the UK, means that they too could pursue solar generation to support their climate change plans. However, any such statistic cannot be used to demonstrate that solar in the UK does not work or should not be pursued. Government policy is clear that solar should be pursued in the UK with urgency because of the significant benefits it will bring to the UK energy system, consumers and to help meet UK clean power targets. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As

Reference	Theme	Comments/Issues Raised	Applicant's Response
			shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.
RT-002	Site selection and Alternatives	The location of this scheme seems confused too. Not only is it very large, but nowhere near the grid connections required some 20 miles away. This means in addition to the impact of the panels the cabling route will be massively disruptive	The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts.
RT-003	Socio-Economics, Tourism and Recreation Soils and Agriculture	We farm on the cable route, and this will be a nightmare for our third generation family farm. The farm is surrounded by the cable route and eliminates our home pastures during construction. This means that our rare breed sheep flock would need to be sold and the equestrian business closed down during construction. Something we have spent 20 years building. The house itself would be virtually uninhabitable during construction.	The assessment of effects on agricultural land and farming operations, including temporary land take associated with the cable route, is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, with detailed construction methodology set out in **ES Volume 3, Appendix 3 2: Cable Route Construction Method Statement [APP-183]**. The cable trench required for installation of underground cables would have a maximum anticipated working width of approximately 7 metres. This equates to a temporary disturbance of approximately 0.07 hectares per hectare of land crossed. Disturbance associated with cable installation would be short term and localised, and following reinstatement, agricultural operations within the affected fields would be able to recommence. Accordingly, land take associated with cable installation would not permanently remove the affected land from agricultural use,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and the extent and duration of disturbance have been assessed as limited. Loss of agricultural revenue as a result of temporary works to construct the Cable Route Corridor will be managed through negotiations with the affected owners. The Applicant continues to seek voluntary agreement for the acquisition of land and rights, including temporary rights, needed for the implementation of the Cable Route Corridor and the status of ongoing negotiations with affected owners is recorded in the **Land Rights Tracker [APP-021]**. Where there are reasonable and demonstrable damages experienced from the exercising of Project works, appropriate compensation will be available to those entitled under the Compensation Code. The **Funding Statement [APP-019]** confirms that the Applicant has sufficient funds to provide this compensation. The Applicant has assessed the likely impact to the equestrian business at Park Farm in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** as likely to experience a significant adverse effect due to the location of the cable route crossing the business' paddocks. This effect is however temporary, with the land committed to be restored following completion of cable construction works. Similarly, the Applicant acknowledges that the grazing pastures south of Park Farm are directly affected by the routing of the Cable Route Corridor and there will be substantial, albeit temporary disruption to grazing on this land. This disruption to the grazing land can however can be restricted to the width required for cable trenching works and any associated haul route. Where fields have been bisected, working practices around cable laying works should allow for access to be maintained to both sides of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Cable Route Corridor to allow for some grazing to be continued even during construction. The **OCEMP [APP-277]** furthermore commits to the reinstatement of land affected by cabling works as soon as practicable to allow for agricultural use of the land to recommence as soon as construction of that section of cable route is complete.
RT-004	Soils and Agriculture	We have solar on our farm roofs already and would do more, but we are prohibited by the grid connection. If the country wants to be green, which I support, use roofs and car parks first and solve the connection issues that mean that much of our existing wind power is wasted	The Applicant notes that this matter has been responded to in detail in the Applicant's responses to this Party above.
RT-005	Site selection and Alternatives	The location is poor and too large. The location requires extensive cabling to connect to the grid which would cause massive extra disruption to thousands of people's lives	The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and commercial properties, heritage assets, and a large number of land interests. The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the likely significant construction effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.

6.43 Paul Martin Gatland

Table 6-43 RR-3675

Reference	Theme	Comments/Issues Raised	Applicant's Response
PMG-001	Climate Change and Energy Need	As we approach WWIII I consider it foolish to be replacing farmland with environmentally unfriendly solar farms. The UK has one of richest oil and gas deposits in the world and our government has decided to choose NetZero with the associated poverty for our poorest citizens. I've been a keen observer of Global Warming since 1980 when I wrote my degree dissertation on the subject. None on the United Nations predictions made at the have come true.	Section 2.8 of the **Statement of Need [APP-266]** explains that solar generation provides price protection for GB consumers by shielding them from the effects of volatile international energy markets, including gas. Government's 2025 Carbon Budget and Growth Delivery Plan (available at https://www.gov.uk/government/publications/carbon-budget-and-growth-delivery-plan) explains that "*Around 30% of inflation in 2022, at the peak of the cost-of-living crisis, came directly from rising energy costs as a result of the gas price spike ... reducing the UK's reliance on fossil fuels will protect our economy in the future*".
PMG-002	Description and DCO Process	I strongly object to the new Solar Farm because it is a complete waste of time and money, except for those building it, because they will sell it in a few years for a large profit and the local residents will get nothing.	The Applicant notes the concerns about the reasons behind the Scheme. The Scheme aims to help meet national targets for clean energy and net zero targets set out in legislation and policy. The aim is to deliver long term environmental benefit alongside a secure energy supply. The Applicant recognises that both landowners and the local community are key stakeholders. The Scheme also aims to deliver wider benefits, including biodiversity enhancements, opportunities for local supply chain involvement, and onsite and offsite community benefit initiatives, which will be developed in consultation with local representatives. The Applicant is committed to meeting all planning, environmental, and construction policies and standards. The Scheme is being developed in line with legal and regulatory requirements, with engagement with all statutory and non-statutory bodies, ensuring quality and accountability throughout.

6.44 Rebecca Gay

Table 6-44 RR-3896

Reference	Theme	Comments/Issues Raised	Applicant's Response
RG-001	Transport and Access	I am concerned about the following issues concerning Lime Down Solar Farm and the impact it will have on us and our local community. The volume of lorries on our local country roads and lanes. The volume of employees and all their vehicles during construction. The impact on the local wildlife and their habitats. The level of noise during construction and once the solar farm is up and running. The views of the countryside. The impact on the value of our beautiful family home that we have living restored over a 10 year period. It's heart breaking.	Traffic Impacts The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback

Reference	Theme	Comments/Issues Raised	Applicant's Response
			should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The potential effects of operational traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. This chapter is supported by **ES Volume 2 Figures,** including **Figure 13-13: Operational Only Access Locations: Solar PV Sites [APP-158]**, and **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**. The assessment considers day-to-day movements associated with maintenance and security of the Scheme, and for the replacement of Solar PV Panels, Conversion Units and BESS Batteries. Assumptions have been made based on similar projects, and the number of vehicle trips for replacement activities will be less than those during the construction phase. **ES Volume 1, Chapter 13 [APP-060]** concludes that operation and maintenance vehicle types and movements are quantified in this chapter and will not give rise to any residual significant effects, in line with relevant thresholds set out in the ISEP Guidelines 2023. Embedded mitigation measures include providing suitable access points for operation and maintenance phase vehicles with turning areas. Where replacement activities are required, measures set out in the **Outline CTMP [APP-287]** will be implemented as appropriate. In addition, the Outline Public Rights of Way (PRoW) and Permissive Path Management Plan [APP-288] includes measures to manage vehicle interactions with PRoW users and minimise effects on existing users. The preparation, approval, and implementation of the CTMP and the PRoW and Permissive Path Management Plan are secured through Schedule 2, Requirements 15 and 16 respectively, of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Draft Development Consent Order [APP-016]. <u>Widlife and habitats</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable

Reference	Theme	Comments/Issues Raised	Applicant's Response
			farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Noise</u> An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information

Reference	Theme	Comments/Issues Raised	Applicant's Response
			supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. <u>Construction phase</u> The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. Visual Impact An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public

Reference	Theme	Comments/Issues Raised	Applicant's Response
			rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181]**.

6.45 Philip Miles

Table 6-45 RR-3794

Reference	Theme	Comments/Issues Raised	Applicant's Response
PM-001	Other Environmental Matters	There may be electrical interference from inverters, motors, and switch gear affecting TV and communications.	The effects of electromagnetic fields (EMF) arising from the Scheme are assessed in Section 20:6: Electromagnetic Fields of **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**. The assessment considers EMF emissions from the Scheme's electrical infrastructure and evaluates potential effects on surrounding receptors. The assessment concludes that no significant impacts are likely to occur as a result of any of the Scheme's infrastructure. It also confirms that predicted EMF levels are below the reference levels set by the International Commission on Non-Ionizing Radiation Protection.
PM-002	Ecology and Biodiversity	Environmental Damage. My water supply is from a borehole. There is no guarantee that it will not be affected by pollutants from panel installation, cleaning, and the result of a fire in the BESS and other units.	The Applicant acknowledges the concern regarding private borehole water supply. The hydrology and water environment assessment considers groundwater receptors and pollution pathways and does not identify a credible mechanism by which installation or operation of solar PV panels would pollute groundwater or affect private water supplies. National policy recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (NPS EN-3 paragraph 3.10.75). **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**. Construction-phase pollution prevention, including control of fuels, oils, sediment and concrete, is secured through the construction management framework, with incident response measures in place to avoid pollution of controlled waters. **Outline Construction Environmental Management Plan [APP-277]**. In relation to BESS fire scenarios, firefighting water and any potentially contaminated runoff would be contained within sealed and controlled drainage systems associated with the BESS, with isolation and containment measures secured through the battery safety and drainage controls to prevent uncontrolled release to ground or watercourses. **Outline Battery Safety Management**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Plan [APP-286]. No amendments to the application documents are required.
PM-003	Ecology and Biodiversity	Biodiversity. Covering farmland with panels etc. and putting a cage around them is going to reduce the wildlife population and prevent Deer, foxes, badgers from free movement between areas.	Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the O**EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
PM-004	Soils and Agriculture	Loss of farmland will affect our country's ability to provide food for itself.	The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential

Reference	Theme	Comments/Issues Raised	Applicant's Response
			benefits to agricultural land and the wider farming estate. Post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed, the landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. a national scale and has therefore not been assessed.
PM-005	Transport and Access	Construction Traffic Causing more damage to already potholed roads, and verges. More accidents and disruption from multitudes of HGV's in competition with cyclists, walkers, and motorists who normally peacefully use the area.	The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**. The CTMP has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			appropriately managed throughout the construction phase of the Scheme. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline CTMP [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme
PM-006	Transport and Access	Emergency vehicle response times will be slowed and possibly put lives and property in danger.	The BESS site is located within a seven minute journey of the Strategic Road Network and is accessible to emergency vehicles. A separate emergency access to the BESS site is also

Reference	Theme	Comments/Issues Raised	Applicant's Response
			provided in accordance with guidance set out by the National Fire Chiefs Council.
PM-007	Socio-Economics, Tourism and Recreation Human Health	This Development will seriously affect my life: Visually I will be looking out of my home at fields of grotesque panels instead of open countryside. Devaluing my property. It will affect my mental health both during construction and operation.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181]**. Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "*lens*" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as

Reference	Theme	Comments/Issues Raised	Applicant's Response
			documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. Grain Store Barn is identified as receptor RG020 and has been fully assessed in **ES Volume 3, Appendix 8-3-2-2: Landscape and Visual Assessment Sheets (Significant) [APP-191]**. The assessment recognises that there would be Major/Moderate Adverse effects which are Significant during Construction and Year 1. The assessment notes: The scheme has been designed to accommodate these residential properties, and infrastructure has been set back to allow separation and space for mitigation. Views of construction activity would be visible in open views across the surrounding fields, where visible, this would be set back from the properties by at least 150m. There is no proposed infrastructure within field C16 and open views are maintained to the south. The level of change in views would be High. Proposed mitigation includes reinforced roadside screening, new sections of hedgerow, hedgerow reinforcement and enhancement is proposed throughout the surrounding Site. Although this would have a limited effect initially, by Year 15 mitigation planting would filter views of the proposed infrastructure and reduce visibility of the Scheme reducing the effect to Moderate/ Minor adverse which is non-significant.

Reference	Theme	Comments/Issues Raised	Applicant's Response
PM-008	Noise and Vibration	The peace and tranquility will be shattered by noise. (a) From construction (b) From operation, where the noise figures from the developer are an optimistic guess.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. As a reasonable worst-case this assessment includes the noise from piling rigs that will be larger and louder than those used in practice. With these measures in place, the assessment concludes that daily noise exposure levels would not breach significant effect thresholds. Piling associated with the closest solar PV panels will be audible at Grain Store Barn but will be relatively short-lived in comparison to the overall construction programme. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As shown in Table 8 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, noise levels from the Scheme at Grain Store Barn, which would be primarily from the BESS facility, would typically be around the existing background sound in the area. The levels have been calculated, using the appropriate international standard, on a worst-case assumption that wind is blowing from the source of the noise to the receptor locations, as stated in paragraph 14.4.15 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved.

6.46 Gillian Miles

Table 6-46 RR-1675

Reference	Theme	Comments/Issues Raised	Applicant's Response
GM-001	Other Environmental Matters Noise and Vibration	The Lime Down Project will have a massive impact on my life for someone who has retired from work, and spends considerable time at home. My concerns are:- Visually - The large solar panels that will border and surround my home, with the loss of green fields and extended views. The glint and glare effect from the panels. *Hearing - The noise from the moving panels. The 'Hum' from the Battery Storage that is proposed to be located nearby.	Grain Store Barn is identified as receptor RG020 and has been fully assessed in **ES Volume 3, Appendix 8-3-2-2: Landscape and Visual Assessment Sheets (Significant) [APP-191]**. The assessment recognises that there would be Major/Moderate Adverse effects which are Significant during Construction and Year 1. The assessment notes: The scheme has been designed to accommodate these residential properties, and infrastructure has been set back to allow separation and space for mitigation. Views of construction activity would be visible in open views across the surrounding fields, where visible, this would be set back from the properties by at least 150m. There is no proposed infrastructure within field C16 and open views are maintained to the south. The level of change in views would be High. Proposed mitigation includes reinforced roadside screening, new sections of hedgerow, hedgerow reinforcement and enhancement is proposed throughout the surrounding Site. Although this would have a limited effect initially, by Year 15 mitigation planting would filter views of the proposed infrastructure and reduce visibility of the Scheme reducing the effect to Moderate/ Minor adverse which is non-significant.
GM-002	Human Health Transport and Access	Mentally - Safety concerns from the huge Battery Storage. e.g.potential uncontrollable fire, pollution from damaged batteries. Concerns that Emergency Services will be unable to gain access quickly, due to narrow roads and potential lack of resources.	The BESS site is located within a seven minute journey of the Strategic Road Network and is accessible to emergency vehicles. A separate emergency access to the BESS site is also provided in accordance with guidance set out by the National Fire Chiefs Council.
GM-003	Ecology and Biodiversity	Loss of peace and tranquility, wild life Loss of countryside walks	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoWs and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment

Reference	Theme	Comments/Issues Raised	Applicant's Response
			considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** goes on to assess the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', finding that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant notes that the approach to recreation and access to the countryside has been agreed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statements of Common Ground to be submitted at

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme
GM-004	Hydrology, Flood Risk and Drainage	Concerns re:- water contamination to bore hole which supplies water to our property.	The Applicant acknowledges the concern regarding private borehole water supply. The hydrology and water environment assessment considers groundwater receptors and pollution pathways and does not identify a credible mechanism by which the installation or operation of solar PV infrastructure would contaminate groundwater or affect borehole water quality. Construction-phase pollution prevention and incident response measures are secured to avoid adverse effects on controlled waters. **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and **Outline Construction Environmental Management Plan [APP-277]**.
GM-005	Socio-Economics, Tourism and Recreation Landscape and Visual	*Financial - Extreme impact on property value. Location now open fields with extensive views to an Industrial Solar Site!	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181]**. The Applicant notes that visual impact has been addressed in detail in the Applicant's responses to this Party above.
GM-006	Noise and Vibration	*Building Process - Extreme piercing noise from drilling next to property.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]**. In particular, as presented in Table 14-18 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, average levels at Grain Store Barn are expected to be around 58 dB which while audible is well below levels likely to give rise to significant adverse effects on health or quality of life. Additionally, noise

Reference	Theme	Comments/Issues Raised	Applicant's Response
			from the installation of solar PV panels will be spread across the site over the course of the construction period and therefore will only be at the levels presented in Table 14-18 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** for the closest set of works. As a reasonable worst-case this assessment includes the noise from piling rigs that will be larger and louder than those used in practice. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected.
GM-007	Transport and Access	Traffic and large earth moving vehicles surrounding property.	The applicant make note of this comment.
GM-008	Landscape and Visual	Total destruction to land.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

6.47 Paul Gregory

Table 6-47 RR-3652

Reference	Theme	Comments/Issues Raised	Applicant's Response
PGY-001	Soils and Agriculture	Agricultural land is needed. Have NEVER seen a solar site being used with any form of farming. WE NEED FARMS. Why are we building housing without solar panel roofs.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.7 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in Section 17.10 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land

Reference	Theme	Comments/Issues Raised	Applicant's Response
			registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.

6.48 Tamsyn Attiwell

Table 6-48 RR-4617

Reference	Theme	Comments/Issues Raised	Applicant's Response
TA-001	Socio-Economics, Tourism and Recreation	I live on (Redacted), a designated Wiltshire Cycle Route set within an Area of Outstanding Natural Beauty and forming part of the historic landscape linked to the Roman Fosse Way. The Lime Down Solar Project will have a substantial and lasting impact on my daily life, my property, and the wider Grittleton community. During the construction phase, all residents along (Redacted) will experience a significant loss of amenities and local environmental quality.	The Applicant has responded to the matters raised in this Relevant Representation in detail below.
TA-002	Hydrology, Flood Risk and Drainage	The area already suffers from recognised flooding issues, and the proposed works are likely to increase this risk. The project documentation provides no credible flood alleviation measures, and without these, additional surface-water runoff and ground disturbance could directly affect water sources, properties, and highways. As a parent, I am extremely concerned about the resulting safety risks for my children, particularly during winter months when flooding is already at its highest.	The Applicant acknowledges that flooding occurs in the area under existing baseline conditions. The flood risk assessment has been undertaken in accordance with national and local policy and concludes that the Scheme would not increase flood risk elsewhere, including during construction. The assessment considers surface water, fluvial and construction-phase mechanisms and is supported by embedded mitigation secured through the DCO discharge process. **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]**.
TA-003	Transport and Access	The local road network is not suitable for the level of construction traffic predicted. (Redacted) and the Grittleton crossroads are narrow, historic lanes with limited visibility and restricted passing points. The anticipated traffic	An assessment of the effects of construction activities on air quality is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. The assessment considers potential emissions from construction dust, construction vehicle exhausts and Non-Road Mobile Machinery (NRMM), and has been undertaken in accordance with relevant best practice guidance. Further detail

Reference	Theme	Comments/Issues Raised	Applicant's Response
		levels-"*104 HGV movements, 24 bus trips, and 334 car trips per day*-"will fundamentally alter the safety, noise levels, and air quality outside my front door for the duration of the project. Working from home will become extremely difficult, and the increased pollution from idling or slow-moving construction vehicles creates clear health concerns for my household. These impacts will not be temporary inconveniences; they will affect my daily life, my ability to work, and the wellbeing of my family.	on the construction dust assessment is provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and Assessment [APP-238]**. The assessment concludes that, with embedded mitigation measures in place, construction-phase air quality effects would not be significant. Mitigation measures to control dust and emissions during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Construction Traffic Management Plan [APP-287]**. These include measures such as dust suppression, site management controls, routing and scheduling of construction traffic, and management of plant and machinery. The preparation, approval and implementation of detailed construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts during construction are appropriately controlled.
TA-004	Socio-Economics, Tourism and Recreation	I have lived in Grittleton for 25 years and have been actively involved in supporting and improving our rural community. I helped develop the Multi-Use Games Area (MUGA), a facility we built collectively to create local sports opportunities. I was proud to represent our parish as part of the Olympic Torch relay in recognition of this achievement. The proposed cable route for this development will directly damage or destroy the MUGA, leaving the community without essential facilities	The Village Hall at Grittleton has been assessed as a specific recreational receptor in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. This identifies that during construction, a residual medium-term temporary moderate-minor adverse effect is anticipated to users of these facilities. This is not a significant effect, subject to the implementation of additional mitigation measures to control HGV movements to and from the construction compound. These measures are set out in the **OCTMP [APP-287]**, secured by Requirement 15 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant has responded in full to the comments made by the Grittleton, Sevington and Leigh Delamere Village Hall and

Reference	Theme	Comments/Issues Raised	Applicant's Response
		and creating a financial deficit of £50,000-"the amount we collectively raised to build it. This represents not only the loss of a physical asset but the loss of a community effort that brought people together and significantly enhanced local wellbeing.	Recreation Ground in their Relevant Representation [RR-1743] above.
TA-005	Cumulative Effects Ecology and Biodiversity Transport and Access	The cumulative effects of environmental disruption, increased flooding risk, heavy construction traffic, loss of community facilities, and long-term damage to a nationally recognised landscape will have a profound impact on me personally and on the fabric of Grittleton. These issues cannot be dismissed as minor or temporary; they will affect the health, safety, daily routines, and social cohesion of residents for years to come. For these reasons, I urge the decision-makers to fully consider the significant and long-lasting personal and community impacts of the Lime Down Solar Project as currently proposed.	An intra- project effects assessment has been undertaken whereby all overlapping effects across all technical disciplines are considered to determine where effects in one discipline (such as glint and glare) together with effects from another discipline (such as noise) could combine to generate a significant effect. The **In-Combination Effects Matrix [APP-264]** sets out all receptors and technical disciplines considered. The assessment is then reported in Table 21-6 and Table 21-7 of **ES Volume 1, Chapter 21 In-Combination and Cumulative Effects [APP-073]**. With implementation of the secured management and mitigation measures, effect interactions do not increase the significance of effects identified in the Environmental Statement

6.49 Janice Parker

Table 6-49 RR-2178

Reference	Theme	Comments/Issues Raised	Applicant's Response
JP-001	Ecology and Biodiversity	My main concern is the impact on nature and the disregard for anything other than 'progress' for the human race.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **OEPMS [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.

6.50 Stephen Booty

Table 6-50 RR-4455

Reference	Theme	Comments/Issues Raised	Applicant's Response
SBY-001	Hydrology, Flood Risk and Drainage	I live in the area of concern. I currently experience significant flooding both in my fields and in one of my cottages - where in periods of heavy rainfall water floods up through the floor. The significant amount of concrete used in this installation and the concentrated run off from the panels this will hugely increase the damage caused by water.	The Applicant acknowledges the experience of flooding affecting land and property. The Scheme is designed such that it would not increase flood risk elsewhere. The assessment, provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, distinguishes between panelled areas, where rainfall drains to ground beneath and between panels, and limited areas of hardstanding associated with supporting electrical infrastructure, where engineered and controlled drainage is provided. National policy recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (NPS EN-3 paragraph 3.10.75).
SBY-002	Ecology and Biodiversity Landscape and Visual	Additionally the loss of all the natural habitats and agricultural land will destroy the area for generations. Destroying food producing land and amenity land forever. The narrow road infrastructure will not cope - it does not cope now. As a farm owner i applied to have solar installed on my barn roofs but i was extremely surprised to have been refused permission ! How can it be that the use of existing roof space is refused but the destruction of rural land and landscapes is allowed ? The permanent loss of such a scenic and productive rural area to an industrial scale development will destroy the communities within this development forever.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing

Reference	Theme	Comments/Issues Raised	Applicant's Response
			restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement

Reference	Theme	Comments/Issues Raised	Applicant's Response
			measures are delivered and maintained throughout construction and operation of the Scheme. The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed, the landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. a national scale and has therefore not been assessed. The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

6.51 Edward King

Table 6-51 RR-1248

Reference	Theme	Comments/Issues Raised	Applicant's Response
EK-001	Soils and Agriculture Construction and Decommissioning Transport and Access	I object to the Lime Down proposal for the following reasons: 1 It takes out of food production some valuable hectares when the world is starving. 2 Solar power is not the most efficient way to produce electricity in this country. 3 The site is too far from the area that can effectively utilise it, causing upset for many thousands of people. 4 The construction will cause considerable damage to neighbouring properties and infrastructure. First-hand experience of the M4 construction has given me an insight into this. Lorries will have to use roads not designed to take the weight nor numbers and go through villages that are not wide enough. 5 The impact that this proposal will have on the area is negative in the extreme and the ruination of it.	1. The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their

Reference	Theme	Comments/Issues Raised	Applicant's Response
			potential benefits to agricultural land and the wider farming estate. 2. Solar energy is at the heart of the Clean Power 2030 Mission (January 2026 revised NPS EN-3, Para 2.10.2) and it is the Government's view that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Sunlight, the input energy source for solar, is abundant, predictable, renewable, low carbon and free. Figure 16 of the **Statement of Need [APP-266]** and related text (Section 7.4) demonstrates that there are many viable areas of solar irradiation in the UK. Figures 28 and 29 of the Statement of Need and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level. The inclusion of a Battery Energy Storage System as part of the Scheme will enable energy generated by the Scheme to be stored and exported to the grid when it is needed, which will provide flexibility and improve grid reliability. That other countries may experience higher solar irradiation levels than the UK, means that they too could pursue solar generation to support their climate change plans. However, any such statistic cannot be used to demonstrate that solar in the UK does not work or should not be pursued. Government policy is clear that solar should be pursued in the UK with urgency because of the significant benefits it will bring to the UK energy system, consumers and to help meet UK clean power targets. 3. The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts. 4. The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			1, Chapter 13: Transport and Access [APP-065], which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme. 5. The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

6.52 John Baillie

Table 6-52 RR-2342

Reference	Theme	Comments/Issues Raised	Applicant's Response
JB-001	Hydrology, Flood Risk and Drainage	This project neighbours land that I farm. My field drains pass through one of the solar fields to get to a waterway, I have had no assurance about how this is going to be addressed.	The Applicant acknowledges the presence of existing agricultural drainage systems. The assessment does not rely on alteration or severance of third-party field drains, and construction activities are required to maintain or reinstate existing drainage functionality where affected. Construction-phase controls for drainage protection and reinstatement are secured through the construction management framework, such as the **Outline Construction Environmental Management Plan [APP-277]**, and approval at discharge.
JB-002	Hydrology, Flood Risk and Drainage	They wish to put a cable linking two of the sites across my land. I have opened negotiations about this via an agent but only because it was pointed out they would be able to get compulsory access at minimal recompense to me. They are very vague about drainage repairs which will be on going as the ground settles after the cable installation. They are only mentioning a one off payment for a cable which will restrict my use of that land for 40 to 60 years. I feel there should be compulsory annual way leave payments to compensate for their restrictions.	The Applicant acknowledges the comments made and the applicant is actively engaging with the respondent's professional representative to reach an amicable solution, updates of which will be captured in the **Land and Rights Negotiations Tracker [APP-021]**. Drainage reinstatement following cable installation is addressed through construction controls requiring appropriate repair and reinstatement of land drainage, where affected, by trenching or settlement. These matters are secured through the construction management framework, for example, the **Outline Construction Environmental Management Plan [APP-277]** and do not give rise to increased flood risk or long-term drainage effects.

6.53 Matthew Gerard Newman

Table 6-53 RR-3090

Reference	Theme	Comments/Issues Raised	Applicant's Response
MGN-001	Site selection and Alternatives Transport and Access	1). Wrong project, wrong place Any project that is 20km from a grid connection is in the wrong location. The extensive road/highway alterations proves the local infrastructure is unsuitable for the development and as proposed would alter the character of the communities irrevocably.	The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the POC, however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts. The capacity of local roads and infrastructure to accommodate

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			substantially in accordance with the **Outline CTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
MGN-002	Ecology and Biodiversity	2).Environmental BESS systems usually require some kind of on demand energy supply to ensure the safety and lifespan of batteries. This is often provided for by the least Environmental source i.e. diesel generators. Can we be assured this will not be the case? If not then the green credentials disappear.	The Applicant's proposals do not include on-site diesel generation facilities to provide an energy supply to the BESS.
MGN-003	Ecology and Biodiversity	3). Personal It is proposed that we are to be directly affected by being on the proposed cable route. We have reluctantly complied with the company to allow numerous surveys of our land. But we have been denied access to the results despite requesting them several times. Why? I don't think it unreasonable to know if they are aware of any environmental issues or underground infrastructure before any damage is done.	The Applicant acknowledges the comments made and the applicant is actively engaging with the respondent's professional representative to reach an amicable solution, updates of which will be captured in the **Land and Rights Negotiations Tracker [APP-021]**.
MGN-004	Soils and Agriculture Socio-Economics, Tourism and Recreation	As is evident from previous infrastructure projects agricultural land takes decades to recover productivity despite assurances to the contrary. That is another bodyblow to our business. If the project were sited next to the grid connection they wouldn't need to compromise a 20km swathe of	The Applicant acknowledges the comments made and is actively engaging with the respondent's professional representative to agree appropriate and reasonable accommodation works and to reach an amicable solution for all parties. Notwithstanding this, under the provisions of the Land Compensation Act 1961 and the Land Compensation Act 1973, reasonable losses incurred by the landowner or occupier as a result of the Applicant's works are

Reference	Theme	Comments/Issues Raised	Applicant's Response
		good agricultural land. In return for our reluctant compliance with the demands of the process, we have been issued with terms (Redacted) This was (Redacted) and have been forced to be withdrawn.	recoverable following claims to the Applicant upon a loss being incurred.
MGN-005	Description and DCO Process	The motive behind this project is (Redacted) of course for the developers. Driven by an overtly political decision but which will be funded over many years by the bill payers and communities despoiled and/or destroyed by it. We ask you to protect us from these two vested interests and decide in the interests of us all and reject the application.	The Applicant confirms that Lime Down Solar Park is being developed solely through private sector financing and that it has not received, and is not receiving any public money, subsidy or funding in the development of the Scheme. The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

6.54 Rachael Baker

Table 6-54 RR-3849

Reference	Theme	Comments/Issues Raised	Applicant's Response
RB-001	Site selection and Alternatives Noise and Vibration Socio-Economics, Tourism and Recreation Cumulative and In-Combination Effects	The scale of the Lime Down solar project is disproportionate to its location. By completely encircling residential areas, the proposal causes an unacceptable loss of residential amenity. The cumulative impact of operational noise, coupled with the irreversible degradation of the local environment and biodiversity, makes this site fundamentally unsuitable. We urge the developers to seek more appropriate, non-residential locations that do not impose such a detrimental footprint on existing communities.	Scale The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. Landscape and Visual An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Noise and Vibration</u> An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 14: Noise and Vibration [APP-066], with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. <u>Ecology and Biodiversity</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Cumulative and In-Combination Effects</u> A comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated appendices**, ES Volume 3, Appendix 21-1 Long List of In-Combination Effects and Cumulative Developments [APP-264]**. Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 In-Combination and Cumulative Effects [APP-073]**. Existing schemes are captured within the baseline environment. The four stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6: EIA Methodology [APP-058]**. 358 developments were included in the **Long List [APP-264]**. 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.

6.55 Joyce Kirk

Table 6-55 RR-2469

Reference	Theme	Comments/Issues Raised	Applicant's Response
JKK-001	Human Health	I object for the following reasons : Mental wellbeing will suffer greatly due to the extreme changes to the beautiful countryside and the extreme disruption this scheme will cause.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
JKK-002	Transport and Access	The volume of traffic and size of transporters required will pose a huge risk and extreme danger to other road users as these are country roads and not at all suitable for such a scheme.	The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse

Reference	Theme	Comments/Issues Raised	Applicant's Response
			effects on accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely throughout the construction phase of the Scheme.
JKK-003	Landscape and Visual	Decimation of the countryside and AONB as it will be turned into an industrial area.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Cotswolds National Landscape [APP-197]. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels

Reference	Theme	Comments/Issues Raised	Applicant's Response
			within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
JKK-004	Noise and Vibration	The noise, disruption and safety hazards during the years of construction and beyond.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to construction noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, are secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled throughout the construction phase of the Scheme. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing, through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation, transport and connectivity, climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with

Reference	Theme	Comments/Issues Raised	Applicant's Response
			embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1.
JKK-005	Noise and Vibration	Noise from panels as they follow the sun and from substations and battery storage units.	The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
JKK-006	Other Environmental Matters	Fire risk from battery storage units.	The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant notes that the approach to BESS safety is under discussion with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the OBSMP confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out in **Outline Battery Safety Management Plan (OBSMP) [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]** — including advice to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
JKK-007	Hydrology, Flood Risk and Drainage	Increased flooding risks.	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Drainage Strategy [APP-210 to APP-218]. The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
JKK-008	Soils and Agriculture	The loss of farm land for growing crops and grazing animals.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Soils and Agriculture [APP-069]. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12).
JKK-009	Construction and Decommissioning	The damage, disruption and safety threats outweigh significantly any possible benefits of this proposed solar farm in this area.	The Applicant has responded to the matters raised in this Relevant Representation in detail above.

6.56 Olivia Frost

Table 6-56 RR-3583

Reference	Theme	Comments/Issues Raised	Applicant's Response
OF-001	Construction and Decommissioning Ecology and Biodiversity Socio-Economics, Tourism and Recreation Transport and Access	In bullet form: Construction - Widespread disruption from lengthy construction of the sites, damage and danger to our narrow roads and countryside lanes - widening of turning areas for HGVs and demolition of hedgerows and bridle/footpaths - I ride on the roads at least three times a week and will be unable to do so due to the danger and noise from construction traffic on usually quiet and picturesque roads	The likely significant effects of the Scheme during the construction phase are assessed throughout the **ES [APP-052 to APP-265]**, including effects on traffic and transport, noise and vibration, air quality, landscape and visual amenity, ecology, and local communities. Where likely significant effects are identified, appropriate mitigation measures are incorporated into the Scheme. Measures to limit disruption during construction are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme. The Scheme has been designed through an iterative design process to retain existing hedgerows and grassland habitats as far as practicable. Potential impacts on hedgerows are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and **ES Volume 1, Chapter 10 Arboriculture [APP-062]**, which consider baseline conditions and evaluate likely effects on hedgerow features during construction, operation and decommissioning. The assessments identify that some hedgerow loss is required to facilitate access and infrastructure. However, anticipated hedgerow losses represent a small proportion of the existing hedgerow network within the Order Limits. With embedded mitigation in place, no significant adverse effects on hedgerow features are anticipated. Compensatory planting and enhancement measures are proposed which will significantly exceed the extent of hedgerow loss. Proposed new hedgerows and habitat enhancements are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring hedgerow retention, replacement planting and long-term management are delivered and maintained throughout the lifetime of the Scheme. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (oPROWPPMP) [APP-282]**. These are confirmed as embedded mitigation measures in Section

Reference	Theme	Comments/Issues Raised	Applicant's Response
			16.9 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283]**. These are considered as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The **oPROWPPMP [APP-282]**is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction.
OF-002	Landscape and Visual	Landscape - the obliteration of our countryside and agricultural land and vista's, all will be destroyed for years to come	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%)

Reference	Theme	Comments/Issues Raised	Applicant's Response
			of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial

Reference	Theme	Comments/Issues Raised	Applicant's Response
			effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12).
OF-003	Socio-Economics, Tourism and Recreation	Quality of life - our livelihood, a stud farm breeding horses, will be under serious threat given the proven negative impact to the wellbeing of horses living in close proximity to solar sites	The equestrian facilities at Ladyswood Farm & Stud have been assessed as a specific receptor in **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]**. During construction, a medium-term temporary moderate-minor adverse effect is anticipated, as a result of proximity to Solar PV Arrays, a construction compound, cabling works, and HGV traffic on access and hacking routes. The Applicant has sought to mitigate these as much as possible through removing Solar PV Array areas (fields designated B2-B4 and A11-A12), and embedding design, transport, and PROW mitigation into the Scheme ahead of DCO submission. This has included providing landscape screening around Solar PV infrastructure, siting the construction compound in B1 as far as practicable from the paddocks at Ladyswood Farm & Stud, providing banksmen and speed limits where accesses interact with PROWs, through specifying HGV access routes to the Scheme, and through ensuring PROWs are kept open as much as practicable through construction, and entirely during the operational phase of the Scheme. These measures are secured through the **Works Plan [APP-007]**, **Outline LEMP [APP-283]**, **Outline CEMP[APP-0277]**, **Outline CTMP [APP-287]** and **Outline PROWPPMP [APP-282]** by Requirements 5, 7, 13, 15, and 16 respectively in Schedule 2 to the **Draft DCO [APP-016]**. As a result, it is not anticipate that the effects on Ladyswood Farm & Stud are anticipated to be significant. This also applied to individually assessed PROWs around Ladyswood, which subject to implementation of mitigation are not anticipated to experience significant adverse effects at any phase of the Scheme.
OF-004	Hydrology, Flood Risk and Drainage	Flood Risks - our area floods badly during adverse weather - recently storm Claudia stranded cars on our lanes and this will only be increased with water flow running off the thousands of 4.5m panels	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (Outline CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP.
OF-005	Site selection and Alternatives	Cable Route - the construction disruption and CPO's requiring access	The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the

Reference	Theme	Comments/Issues Raised	Applicant's Response
		for the cable route to Melksham - this is so damaging to landowners involved under duress and is a frankly alarming distance to justify connecting the solar site to the grid - industrialising more of our beautiful area	likely significant construction effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. The Applicant's goal is to deliver Lime Down Solar Park on land where the owner has voluntarily agreed to its use. Meaningful conversations with identified land interests have helped inform the design which in turn assists in avoiding people's land, including homes or gardens. As is standard in NSIP solar schemes, the **Draft Development Consent Order [APP-016]** includes provision for compulsory acquisition of land and rights but these are subject to controls and limitations. These powers sought are necessary and proportionate to ensure the deliverability of the Scheme.

Reference	Theme	Comments/Issues Raised	Applicant's Response
OF-006	Other Environmental Matters	Batteries - battery storage facilities and electrical substations scattered through the project will create fire hazards and irreversable industrialisation of agricultural areas	Potential environmental and safety effects associated with the Battery Energy Storage System (BESS), including fire risk, are assessed in **ES Volume 1, Chapter 20: Other Environmental Matters, Section 20.7: Major Accidents and Disasters [APP-072]**. This assessment considers credible worst-case accident scenarios and concludes that, with embedded mitigation and appropriate management measures, no significant adverse effects are anticipated. The Applicant notes that the approach to BESS safety is under discussion with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been submitted with the Application. The OBSMP confirms that a robust and validated Emergency Response Plan (ERP) will be developed at the detailed design stage in consultation with Dorset & Wiltshire Fire and Rescue Service. Section 5.4 of the OBSMP sets out the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply across all phases of the Scheme, including construction, operation and decommissioning. The potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]**, which models potential emissions and evaluates impacts on sensitive receptors within a 1 km radius of the BESS area, including residential properties and Public Rights of Way. The assessment concludes that no significant off-site air quality impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the OBSMP — such as advice to remain indoors and close windows — would further reduce potential effects on nearby residents. On this basis, the Applicant considers that the Scheme incorporates appropriate safety and mitigation measures to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			manage BESS-related risks and would not give rise to significant adverse environmental or safety effects.
OF-007	Site selection and Alternatives	Suitability - we are all pro green energy and solar in the RIGHT place but it is very difficult to see any positive angle as to why these proposed sties can be considered suitable for solar on such a large and damaging scale. Agricultural land and beautiful landscapes, local walks and rides, historic areas and beautiful quaint villages surely cannot be considered as apporiate to destroy I cannot see how this project has been proposed in such an inappropriate area, the last thing it should be considered for is mass industrialisation for off shore gain - our beautiful countryside would be lost forever	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. The Applicant notes that matters relating to the use of agricultural land and visual impact have been addressed in the Applicant's responses to this Party above. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This

Reference	Theme	Comments/Issues Raised	Applicant's Response
			assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**. These are confirmed as embedded mitigation measures in Section 16.9 of ES Chapter 16. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283]**. These are considered as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths MP is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			recreational routes are appropriately managed during construction. The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground**to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further

Reference	Theme	Comments/Issues Raised	Applicant's Response
			archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction.

Reference	Theme	Comments/Issues Raised	Applicant's Response
VS-001	Cultural Heritage	Objection to the Proposed Lime Down Solar Park in Grittleton I wish to register my strong objection to the proposed Lime Down Solar Park in the village of Grittleton. While the transition to renewable energy is important, this particular development is wholly inappropriate for its chosen location and poses significant harm to the character, heritage, environment, businesses, and infrastructure of our community.	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme. The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **ES [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft Development Consent Order [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Chapter 13: Transport and Access [APP-065]**, **Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067]**, **Chapter 16: Socioeconomics, Tourism and Recreation [APP-068]**, **and Chapter 18: Human Health [APP-070]**, all of which consider potential impacts on residential properties and local communities.
VS-002	Landscape and Visual	An Area of Outstanding Natural Beauty Grittleton sits within an area recognised for its exceptional rural landscape. The sweeping views, open farmland, and historic character are precisely what the Area of Outstanding Natural Beauty (AONB) designation seeks to protect. A large-scale industrial solar installation would create a permanent visual scar on this landscape, undermining the very qualities that make the area special.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
VS-003	Cultural Heritage	Historic Environment & Listed Properties Most properties in Grittleton are listed or sit within designated conservation areas. These protections exist because the village holds significant architectural and historic value. Planning laws in such areas are deliberately strict to prevent inappropriate or harmful development. Installing an industrial solar park here directly conflicts with the principles of conservation and heritage protection, and would fundamentally alter the setting of these historic buildings. Impact on [REDACTED] (Grade II* Listed) As the owners of [REDACTED], a Grade II* listed property at the heart of the village, we feel this development would have a severe and lasting impact on both our business and the heritage value of the estate. The proposed	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **Appendix 12.1: Heritage Statement [APP-219]**, has assessed the potential impact of the scheme on Grittleton Conservation Area. The cable route corridor is proposed to pass to the east of Grittleton Conservation Area (Fields F107-F114). While the Scheme will comprise temporary and localised construction activity as part of the installation of cabling, the assessment identified that will be no impact to the character and appearance of Grittleton Conservation Area. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently no significant effects were identified to the asset.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		compound will be in full view from [REDACTED], meaning that guests, visitors, and wedding parties-"*who come specifically for the unspoilt historic setting*-"will face a large industrial installation dominating the landscape. [REDACTED] is not only a significant heritage asset but also a vital anchor for the village. As a thriving business and community hub, any decline in its appeal or viability would have a profound negative effect on the wider local economy. The presence of a solar compound would be a substantial eyesore and could jeopardise the long-term sustainability of the house.	
VS-004	Ecology and Biodiversity	Wildlife & Ecological Impact The proposed site is home to a wide variety of wildlife, including protected species whose habitats could be destroyed or severely disrupted. Solar farms introduce extensive fencing, cabling, and land disturbance, fragmenting habitats and limiting movement for animals. This is especially concerning in a rural area where interconnected ecosystems are vital for biodiversity.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid

Reference	Theme	Comments/Issues Raised	Applicant's Response
			disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement

Reference	Theme	Comments/Issues Raised	Applicant's Response
			measures are delivered and maintained throughout construction and operation of the Scheme.
VS-005	Cultural Heritage	The Fosse Way - An Ancient Roman Road The Fosse Way is not merely a local footpath-"it is an important archaeological and historical asset dating back to Roman Britain. Any development near this ancient route risks disturbing archaeology, damaging the historic landscape, and diminishing the cultural significance of this unique heritage feature.	The potential effects of the Scheme on the cultural heritage of the Fosse Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The assessment identifies known Roman heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
VS-006	Transport and Access	Unsuitable Rural Roads & Vehicle Impact Grittleton's narrow rural lanes were never designed to accommodate the heavy goods vehicles, construction machinery, and frequent lorry traffic required for a development of this scale. Increased traffic poses serious safety risks for residents, walkers, cyclists, and horse riders. It would also lead to deterioration of the road surfaces, congestion, and noise disruption in an otherwise peaceful village.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The noise effects associated with construction traffic are assessed in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, which considers noise from construction vehicles, HGV movements and associated changes in traffic flows on the local road network. Supporting technical information is provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment concludes that, with embedded mitigation in place, noise effects from construction traffic would be negligible or low in magnitude and no significant adverse effects are predicted. The Applicant notes that the approach to construction noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures to manage construction traffic and minimise associated noise are set out in the **Outline Construction Traffic**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Management Plan (Outline CTMP) [APP-287], which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority to reduce impacts on sensitive receptors. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]** are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
VS-007	Community Benefits	Energy Not Used Locally - No Community Benefit One of the most troubling aspects of the proposal is that the energy generated will not benefit Grittleton or its surrounding villages. Local residents would bear the environmental and visual cost without receiving any meaningful advantage in return. A development that provides no local energy security or economic benefit cannot be justified when the impact is so high.	The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community

Reference	Theme	Comments/Issues Raised	Applicant's Response
			needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent. The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.
VS-008	Landscape and Visual	Industrialisation of a Rural Landscape Solar farms of this size introduce industrial infrastructure-"metal panels, security fencing, lighting, substations, and service buildings. This is entirely at odds with the character of a rural, heritage-rich landscape. Once lost, the countryside cannot be restored to its former state.	The Applicant notes that visual impact has been responded to in detail in the Applicant's responses to this Party above. The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, all land will be returned to its original use and condition as far as practicable and returned to the landowner. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the effects would be less than those likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**.
VS-009		Precedent for Further Development Approving this project would set a dangerous precedent for further industrial or large-scale energy developments in the area. This undermines the long-term preservation of both the AONB and the village's historical identity.	Each Development Consent Order application must be determined on its own merits, having regard to the relevant National Policy Statements and the specific environmental effects identified in the Environmental Statement. The determination of this Scheme would not automatically set a precedent for other developments, as any future proposals would be subject to their own separate assessment, consultation and examination under the Planning Act 2008.
VS-010	Climate Change and Energy Need	While renewable energy is vital, it must be pursued responsibly and in locations where it does not irreversibly damage landscapes, heritage, wildlife, or community wellbeing. The proposed Lime Down Solar Park is wholly incompatible with the protected and historically significant environment of Grittleton. It threatens local businesses-"including [REDACTED]-"disrupts the AONB, and offers no meaningful benefit to the community.	The Applicant notes that matters relating to landscape and visual impact, heritage and wildlife have been addressed in detail in the Applicant's responses above. Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as

Reference	Theme	Comments/Issues Raised	Applicant's Response
			documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the team. This is set out in the Statement of Common Ground with Wiltshire Council.
VS-011	Description and DCO Process	I urge planners to reject this application and to prioritise solutions that respect both the needs of the environment and the communities who live within it.	The Applicant notes that the matters raised have been addressed in detail in the Applicant's responses above.

6.58 Tim Reynolds

TR-001	Landscape and Visual	I object to this development, this is going to destroy a massive area of beautiful countryside.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

6.59 Jason Clark

Table 6-59 RR-2186

Reference	Theme	Comments/Issues Raised	Applicant's Response
JC-001	Landscape and Visual Transport and Access	This project will have significant detriment to my family's life within the village of Grittleton. There will be significant increase in traffic flow during the build stage, causing damage to or way of life and danger to the community. In addition the use of rural land within an AONB for a solar farm is the most brutal and ridiculous strategy which will blight nature and the area for years to come. This has to be stopped!	Transport and Access The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065],** which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the **Outline CTMP [APP-287]**. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The preparation, approval and implementation of the final CTMP, substantially in accordance with the **Outline CTMP [APP-287]**, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. <u>The Cotswolds National Landscape</u> The Cotswolds National Landscape (CNL) (formally AoNB) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies.

6.60 Sir Michael Edward Pitt

Table 6-60 RR-4397

Reference	Theme	Comments/Issues Raised	Applicant's Response
SMEP-001	Landscape and Visual Socio-Economics, Tourism and Recreation	Approximately 30 years ago we purchased our home known as [REDACTED]. We sold our house in Kent and, after very careful consideration, chose to retire to the Cotswolds. The reasons for choosing the Cotswolds above all other possible locations were the beauty and tranquility of the landscape. This area lived up to all of our expectations until Island Green Power (IGP) announced their proposals to develop Lime Down Solar Park (LDSP) during 2024. The threat has been hanging over us ever since and if approved LDSP would destroy the quality of our lives. My reasons are summarised below and I am asking the Examining Authority to take all of them fully into account:	The Applicant confirms that the matters raised within this Representation have been addressed in detail in the Applicant's responses below.
SMEP-002	Cumulative Effects Site selection and Alternatives	The cumulative effect. We have learned to live with the small solar parks (less than 50MW) approved by Wiltshire Council. They have been carefully located, taking account of the contours of the land and critical viewpoints. In contrast, LDSP is effectively five NSIPs squashed between nine villages and surrounding the village of Norton. LDSP would be approximately 10km (west to east) and 5km (north to south) forming a 'footprint' of some 50 sq kms of the Cotswolds. Just the thought of LDSP gives rise to feelings of sadness, nausea and disgust. No wonder literally thousands of people are protesting, communicating their feelings and attending public meetings. We are	Overlapping effects and cumulative effects are acknowledged as a key matter. Full consideration, assessment and reporting of intra- and inter-project cumulative effects has been undertaken. An intra- project effects assessment has been undertaken whereby all overlapping effects across all technical disciplines are considered to determine where effects in one discipline (such as glint and glare) together with effects from another discipline (such as noise) could combine to generate a significant effect. The assessment is reported in Table 21-6 and Table 21-7 of **ES Volume 1, Chapter 21: In-Combination and Cumulative Effects [APP-073]**. With implementation of the secured management and mitigation measures, effect interactions do not increase the significance of effects identified in the Environmental Statement. With regard to inter project effects, a full assessment has been undertaken, considering 358 long list developments and 41 short-list developments. This is set out in **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		appalled by both the scale of LDSP and the great variety of harms it represents.	
SMEP-003	Hydrology, Flood Risk and Drainage	Severe Flooding. I mention this because, at the time of writing, my wife and I have just experienced another flood, this time caused by Storm Claudia. Unluckily, we had arranged a large celebratory dinner for family and friends. Once again all three roads serving the village of Foxley were impassable, something that now happens at least three or four times a year. By 7.00pm it was pitch dark and we received desperate phone calls from our guests. They had reached the margins of Foxley but could go no further. I ventured out on foot to see if I could assist only to be confronted by fast moving flood water, numerous abandoned cars and passengers in a state of anxiety. To add to the misery, the mountain of food we had prepared found its way into the recycling! I mention this because the local area is highly vulnerable to flooding and this is bound to be exacerbated by the rapid runoff of rainfall from over half a million giant solar panels and other infrastructure.	The Applicant acknowledges the experience of severe flooding associated with recent storm events, including Storm Claudia. These events reflect existing baseline flood risk conditions. The flood risk assessment has been undertaken on the basis that the Scheme must not increase flood risk elsewhere and concludes that it would avoid significant adverse effects on flood risk receptors. The assessment distinguishes between panelled areas and controlled drainage associated with supporting infrastructure and is consistent with national policy and is set out in **ES Volume 1, Chapter 11 Hydrology: Flood Risk and Drainage [APP-063]**. No amendments to the application documents are required.
SMEP-004	Socio-Economics, Tourism and Recreation Landscape and Visual	Walking, Cycling and critical viewpoints We enjoy the countryside and walk or cycle for an average of at least one hour a day in the areas that would be affected by LDSP. For example we use the PROW serving the Vine Tree pub at Norton or cycle to the Neeld Arms at	The assessment in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** have assessed the likely impacts of the Scheme at construction, operation, peak replacement, and decommissioning on tourism and recreation receptors, including individual PROWs within 2 km of the Scheme. No significant adverse effects are anticipated to individual PROWs at any phase of the Scheme,

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Grittleton, combining trips with refreshments. These journeys and numerous other outings made locally would become a thing of the past if channeled between security fencing and 4.5m high panels or affected by views of batteries, substations and other infrastructure. One major viewpoint that must be considered is from NORT2 adjacent to Foxley Grove. This is within the National Landscape/former AONB where the view to the south will be adversely affected by LDSP.	subject to implementation of mitigation measures secured through the Requirements in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant has not individually assessed bridleway NORT2 as it was not considered likely to have any significant effect from the Scheme when first screened. This was determined as views of the Scheme are likely to be largely screened by existing vegetation and topography, even from the fields adjacent to the Fosse Way where the nearest Solar PV Array area would be more than 1.1 km away. NORT2 furthermore does not connect to any highway that is proposed to have construction traffic routed along it, further reducing the likelihood of any significant adverse effect.
SMEP-005	Transport and Access	Road network and road safety The local road network is totally unsuited to the imposition of LDSP. The introduction of heavy traffic and abnormal loads would turn local roads into a nightmare! They are already too narrow to cope with even existing traffic. Vehicles travelling in opposite directions force each other to the edges of the carriageway causing soft verges to form deep ruts and puddles. Informal, muddy and rutted passing places have formed. Frequently opposing vehicles make contact and side mirrors are smashed. At busy times, travel is stressful and the local network is already at saturation point. Furthermore IGP's traffic figures are serious under estimates and should be challenged.	The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council in its response (August 2025) to the Transport Assessment Scoping Note and confirmed in Paragraph 4 of 'Appendix A - Highways and Transport Document Review - Detailed Comments'. This confirms that no passing bay or widening improvements are needed to accommodate these movements on the construction route outside of the Order Limits. The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond. This is within the generally accepted distance of 200 metres. As set out in the **OCTMP [APP-287]**, a booking system will be set up to manage arrivals and departures to the Order Limits. This will be implemented in coordination with banksmen, which will be able to hold back any cross-over, should there be any delays on the roads. This will prevent HGVs generated by the Scheme passing each other in opposite directions on the local roads forming part of the construction routes and will be

Reference	Theme	Comments/Issues Raised	Applicant's Response
			confirmed as part of the final CTMP. Regarding routes through the Hulavington area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 76 HGVs on the route to Lime Down D is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 76 HGVs on the route to Lime Down D is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the route to Lime Down D is only 50 per day/7 per hour/one every 8 minutes (less than the journey time along the route); - assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down D is only 32 per day/5 per hour/one every 13 minutes (less than the journey time along the route); • delivery times during the construction phase are limited to those times set out in the **OCTMP [APP-287]**. There will be no HGV construction trips outside of these hours; • there would be a much greater impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down D (average number of existing HGV movements is only 46 per day, with some of these movements occurring outside of proposed construction hours set out in the **OCTMP [APP-287]**) Regarding routes through the Foss Way area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period;

Reference	Theme	Comments/Issues Raised	Applicant's Response
			• trip generation of 16 HGVs on the route to Lime Down A is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 16 HGVs on the route to Lime Down A is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV movements along the route to Lime Down A is only 10 per day/less than 2 per hour/one every 42 minutes (less than the journey time along the route), with the construction phase for Lime Down Site A only lasting 9 months • delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A (average number of existing HGV movements is only 40 per day, with some of these movements occurring outside of proposed construction hours set out in the **oCTMP [APP-287]**) Regarding routes through the Alderton area, excessive widening of existing rural routes to allow two HGVs to pass would be over engineering, because of the following reasons: • temporary nature of the construction period; • trip generation of 50 HGVs on the route to Lime Down A-C is an estimate of the deliveries on a peak day, so does not represent a daily average; • trip generation of 50 HGVs on the route to Lime Down A-C is based on the worst-case assumptions, including but not limited to, all phases and Solar PV Sites being constructed simultaneously and a 50% uplift; • average number of HGV construction movements along the Route to Lime Down A-C route is only 32 per day/7

Reference	Theme	Comments/Issues Raised	Applicant's Response
			per hour/one every 8 minutes (less than the journey time along the route); • assuming a realistic construction programme, the average number of HGV construction movements along the route to Lime Down A-C is only 17 per day/less than 3 per hour/one every 25 minutes (less than the journey time along the route) • delivery times during the construction phase are limited to those times set out in the **oCTMP [APP-287]**. There will be no HGV trips outside of these hours; • impact on hedgerow, trees and character; and • low level of existing HGVs on the route to Lime Down A-C (average number of existing HGV movements is only 20 per day, with some of these movements occurring outside of proposed construction hours set out in the **oCTMP [APP-287]** Further detail of trip generation has also been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. To provide further comfort, additional information has been added to **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** which will be submitted at Deadline 1 of Examination. This demonstrates that there is adequate carriageway width and/or passing place opportunity for two HGVs.
SMEP-006	Landscape and Visual	Landscape and Visual Impact The height and scale of the proposed industrial infrastructure will transform the landscape over a vast area. The existing topography does not lend itself to this sort of development which would be far too close to the nine Cotswolds villages. Furthermore, LDSP (as amended) and the proposed routing of	**ES Volume 1, Chapter 13: Transport and Access [APP-065]** identifies the links in the CNL. The links are identified as 'medium' sensitivity as agreed with WC. Construction traffic would be temporary. The construction traffic is managed through a Final CTMP which is a requirement of the DCO. Road condition surveys will ensure any damage to the highway network caused by construction traffic is rectified. **ES Volume 1, Chapter 13: Transport and Access [APP-065]** concludes that the impact would be negligible to minor adverse.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		HGVs would cause unacceptable damage to the Cotswolds National Landscape	
SMEP-007	Noise and Vibration	Noise The area is quiet except for the noise of local traffic and the occasional agricultural tractor. The increase in noise needs to be properly evaluated both during construction and after completion. For example, the BETT's cooling fans would operate day and night and other sources would be too close to residential development. This too is a major concern.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. As shown in Table 8 and Table 9 of **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**, levels would typically be below or slightly above the existing background sound in the area during the day and night. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational

Reference	Theme	Comments/Issues Raised	Applicant's Response
			noise is appropriately controlled throughout the lifetime of the Scheme.
SMEP-008	Climate Change and Energy Need	Carbon Balance Preliminary calculations are suggesting that LDSP would increase the level of carbon in the atmosphere once the emissions from the manufacture of the industrial infrastructure is properly taken into account. In other words, assessed over its total lifetime, LDSP (with an exceptional length of underground cabling) may not be a 'green' project. I request the Examining Authority to fully evaluate all of the above.	**ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero.
SMEP-009	Site selection and Alternatives	Underground cabling LDSP would be the most disruptive of all solar NSIPs. It requires a 20km long underground 400kV connection to the National Grid including crossings of the M4 motorway and two mainline railways. Its sprawling layout also requires about 15km of underground 125kV cable. The underground cabling would seriously disrupt at least 40 farm/landowners who would be forced to enter into contracts with the developer. IGP has attempted to hide this disruption by offering substantial financial inducements not to object to	The Applicant's approach to site selection is set out in further detail in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report (The SARR) [APP-185]**. The **SSAR [APP-185]** explains how sites closer to the point of connection were initially considered, before the search area was expanded on the basis no suitable sites closer to the point of connection were identified. The construction of the cable route has been assessed throughout the **ES [APP-052 to APP-265]**, which considers the likely significant construction effects associated with these works. The **ES [APP-052 to APP-265]** assesses the cable route within defined parameters, including limits on working width and trench dimensions, to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route would be undertaken within the parameters assessed and authorised by

Reference	Theme	Comments/Issues Raised	Applicant's Response
		LDSP thereby distorting the evaluation of the impact of the development.	the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Agreements reached with the relevant landowners are detailed in the **Statement of Reasons [APP-018]**, the **Book of Reference [APP-020]** and the **Land and Rights Negotiations Tracker [APP-021]**.

6.61 Anna Maria Pitt

Table 6-61 RR-0342

Reference	Theme	Comments/Issues Raised	Applicant's Response
AMP-001	Transport and Access Landscape and Visual	We live in the tiny Hamlet of Foxley. There are approximately 25 houses and at present we are lucky enough to have a handful of families with very young children. We walk daily and we encounter the young families, many cyclists dog walkers, children being picked up to and from school farm traffic, workers to and from the local business units and passing traffic. Our lanes are narrow, cars are unable to pass each other but need to back up or mount the banks. We all have the right to use the road safely this project will place an unsafe and unfair burden on our community. I can feel that it will change in character to the extent that families will need to leave, we will not be able to enjoy our immediate landscape and turn this lovely diverse country landscape into a sterile dangerous and impossible setting.	The applicant make note of this comment. The proposed construction route does not route through Foxley.
AMP-002	Transport and Access	Added to this our road net works are very prone to flooding as seen on Friday 14th with storm Claudia. Each road in to Foxley and surrounding village was cut off by flood water, this project with all the run off from the panels will make an already regular problem many times worse. This project need to be placed in a suitable environment well away from daily living, where there are proper ,safe road networks, where life is not endangered by unsuitable traffic and risk of flooding. Solar farms are already an obsolete way of raising energy, despoiling this	The Applicant acknowledges that local roads and villages experience flooding under existing baseline conditions. The flood risk and drainage assessment concludes that the Scheme would not exacerbate these conditions or increase flood risk elsewhere. National policy recognises that ground-mounted solar PV generally drains to ground and does not create significant drainage impacts where ground cover is maintained (NPS EN-3 paragraph 3.10.75). Scheme-specific drainage controls are secured through the DCO discharge process. **Draft Development Consent Order [APP-016]**. No amendments to the application documents are required.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		beautiful area which can never be returned to its natural state would be a tragic act of vandalism.	

6.62 Philip Charles Davey

Table 6-62 RR-3782

Reference	Theme	Comments/Issues Raised	Applicant's Response
PCD-001	Cumulative Effects Landscape and Visual	My principal objections to the proposed development are as follows: Cumulative impact - the area in north Wiltshire around the proposed development is already the subject of a large number of other solar projects. These include large scale solar installations at Minety, Kemble, Rodbourne, Castle Combe, Battens Farm, Hill Hayes Lane and Beanacre. Planning permission has recently been granted for three more large scale solar installations at Leigh Delamere, Red Barn and Forest Gate. Construction works are expected to commence on these developments in the next 24 months. The clustering of so many large scale solar installations across one area is having a significant and adverse environmental impact in terms of visual amenity and changes to the character of the landscape Lime Down will only contribute massively to this.	Overlapping effects and cumulative effects are acknowledged as a key matter. Full consideration, assessment and reporting of intra- and inter-project cumulative effects has been undertaken. An intra- project effects assessment has been undertaken whereby all overlapping effects across all technical disciplines are considered to determine where effects in one discipline (such as glint and glare) together with effects from another discipline (such as noise) could combine to generate a significant effect. The **In-Combination Effects Matrix [APP-264]** sets out all receptors and technical disciplines considered. The assessment is then reported in Table 21-6 and Table 21-7 of **ES Volume 1, Chapter 21 In-Combination and Cumulative Effects [APP-073]**. With implementation of the secured management and mitigation measures, effect interactions do not increase the significance of effects identified in the Environmental Statement. With regard to inter project effects, a full assessment has been undertaken, considering 358 long list developments and 41 short-list developments. This is set out in **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-073].**
PCD-002	Site selection and Alternatives	Scale of the development - the acreage that will be directly and indirectly affected by this development is disproportionate to the claimed benefits. The configuration of the development means that the area that will be impacted will extend to over four miles from east to west and will be situated in close proximity to over ten villages/towns. It appears to be a patchwork of sites linked by major cabling works that extend the footprint of the development over an area that	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		will disproportionately and adversely impact a large part of north Wiltshire.	The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant undertook an initial review which did not identify a single site of the appropriate size (1,100 ha) within the area of search. Therefore, the Applicant considered both contiguous land parcels and land parcels near one another. The **Statement of Need [APP-266]** explains at Section 7.4 that NSIP proposals may comprise adjoining or separate parcels of land and that "*the connection of separate parcels of suitable land together into a single scheme may, subject to analysis, enable those parcels of land to connect economically to the electricity system*" which is the case for this Scheme. Section 8.2 of the **Statement of Need [APP-266]** explains that by bringing the parcels together into a single scheme, the Scheme is able to carry a connection to the National Electricity Transmission System (NETS), thus providing a local source of low carbon electricity and also enabling the efficient bulk transfer of energy generated at the Scheme so that any surplus can be used to cover shortfalls elsewhere. By connecting to the NETS, the Scheme will not impact the feasibility or timing of distribution network connections for either new generation or consumption connections which among other things are required to support the delivery of Wiltshire County Council's growth plans.
PCD-003	Site selection and Alternatives Transport and Access	Cabling route - this will cover over 20 kilometres and will require traversing or tunnelling a large number of major and minor transport routes including the M4, the A420 and the A4. These are critical transport arteries and crucial to the local and national economies. It will also cross the main train line between London and South Wales. The transport plan also fails to address the	The level of traffic generated by cable route construction will be well within daily fluctuations of routes such as M4, A350, A4 and A420. The construction routes for Red Barn or Forest Gate solar development do not share any unclassified roads with the Scheme. There is a small cross over with the Leigh Delamere construction route for Cable Corridor Access Locations 105, 106 and 107. This crossover relates to the initial 220 metres of Sevington Lane, where passing places which allow two HGVs to pass are being provided as part of the Leigh Delamare scheme and small 200 metre section of The Street in Yatton Keynall.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		fact that the transport movements will share routes already earmarked for use by the proposed solar developments at Leigh Delamere, Red Barn and Forest Gate. These include the M4, A350, A4, A420 and unclassified roads around Yatton Keynell, Kington St Michael and Grittleton. There is no aggregation of the impact of these will have if the Lime Down project takes place during the construction phases of these other projects.	Each cable route corridor construction access point which will be in operation for a temporary period of approximately 90 day, generating a low level of construction traffic as set out in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**.

6.63 Mary Cole on behalf of Peter Cole

Table 6-63 RR-3056

Reference	Theme	Comments/Issues Raised	Applicant's Response
MCPC-001	Soils and Agriculture Description and DCO Process Transport and Access	I object to 1. Agricultural land being used for solar panels anywhere. 2 .Macquarieof Thames water and from Australia disrupting our ecology community and all our livelihoods. 3.Potentially dividing the grazing ground for my animals and also my crops. 4.the danger [traffic congestion] for our daughter [REDACTED] when and wherever she cycles to as her means of independance and not least to visit her Doctor in [REDACTED]	The assessment of effects on agricultural land and farming operations, including temporary land take associated with the cable route, is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, with detailed construction methodology set out in **ES Volume 3, Appendix 3-2: Cable Route Construction Method Statement [APP-183].** The cable trench required for installation of underground cables would have a maximum anticipated working width of approximately 7 metres. This equates to a temporary disturbance of approximately 0.07 hectares per hectare of land crossed. Disturbance associated with cable installation would be short-term and localised, and following reinstatement, agricultural operations within the affected fields would be able to recommence. Accordingly, land take associated with cable installation would not permanently remove the affected land from agricultural use, and the extent and duration of disturbance have been assessed as limited. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These

Reference	Theme	Comments/Issues Raised	Applicant's Response
			requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation - Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. The potential effects of construction traffic on the local highway network, including the Fosse Way, are assessed in **ES Volume**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			1, Chapter 13: Transport and Access [APP-065]. The assessment considers construction vehicle routing, traffic volumes, road safety and effects on road users, and non-motor users, and concludes that, with appropriate mitigation in place, construction traffic would not give rise to unacceptable impacts on the operation or safety of the Fosse Way. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-277]** has been prepared and submitted with the Application. The CTMP sets out measures to ensure that the effect of construction traffic on the local highway network is minimised, including defined construction access points, approved HGV routes, coordination of deliveries, and timing restrictions to avoid peak traffic periods where practicable. The CTMP also includes a road condition and dilapidation survey of minor roads not typically used by HGV traffic. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. In addition, the CTMP includes community liaison measures to keep local communities informed on construction activity and to provide a contact point for feedback should any issues arise. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic effects on the Fosse Way are appropriately managed throughout the construction phase. The Applicant acknowledges the comments made and is actively engaging with respondent to agree appropriate and reasonable accommodation works and to reach an amicable solution for all parties. Updates of these discussions are captured in the **Land and Rights Negotiations Tracker [APP-021]**. Notwithstanding this, under the provisions of the Land Compensation Act 1961

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and the Land Compensation Act 1973, reasonable losses incurred by the landowner or occupier as a result of the Applicant's works are recoverable following claims to the Applicant upon a loss being incurred.

6.64 James Cole

Table 6-64 RR-2028

Reference	Theme	Comments/Issues Raised	Applicant's Response
JCE-001	Soils and Agriculture	Dear Planning Inspectors, Please reject this planning application for the following reasons. Nationally- It is a foolish idea to industrialise arable land when it is getting increasingly difficult to maintain yields, when the population is growing and when the geopolitical situation is more and more unstable. Energy can be derived from different sources. There is one finite source of arable land. Food security is vital. 2). Pound for pound investment, this is a highly inefficient way of producing energy. It is well documented that such schemes deliver negligible net positive environmental gain.	The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Solar energy is at the heart of the Clean Power 2030 Mission (January 2026 revised NPS EN-3, Para 2.10.2) and it is the Government's view that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Sunlight, the input energy source for solar, is abundant, predictable, renewable, low carbon and free. Figure 16 of the **Statement of Need [APP-266]** and related text (Section 7.4) demonstrates that there are many viable areas of solar irradiation in the UK. Figures 28 and 29 of the Statement of Need and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level. The inclusion of a Battery Energy Storage System as part of the Scheme will enable energy generated by the Scheme to be stored and exported to the grid when it is needed, which will provide flexibility and improve grid reliability.
JCE-002	Construction and Decommissioning Description and DCO Process Socio-Economics, Tourism and Recreation Hydrology, Flood Risk and Drainage Noise and Vibration	Locally- This project will cause a huge amount of local upheaval both during construction and long term. There is likely to be significant traffic disruption, noise pollution and the increased risk of flooding, which will impact local businesses and the rural economy. It will also dramatically visually spoil a significant area of historic heritage. I can see no benefit to the local area in any shape or form.	<u>Construction Phase</u> The likely significant effects of the Scheme during the construction phase are assessed throughout the **ES [APP-052 to APP-265]**, including effects on traffic and transport, noise and vibration, air quality, landscape and visual amenity, ecology, and local communities. Where likely significant effects are identified, appropriate mitigation measures are incorporated into the Scheme. Measures to limit disruption during construction are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in

Reference	Theme	Comments/Issues Raised	Applicant's Response
			accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. Transport and Access The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. <u>Noise and Vibration</u> An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. <u>Construction phase</u> The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Environmental Management Plan [APP-277]. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. <u>Operational phase</u> The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. Flood Risk An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration

Reference	Theme	Comments/Issues Raised	Applicant's Response
			features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. <u>Socio-Economics</u> An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which the Applicant is discussing with the team. This is set out in the Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1. <u>Landscape and Visual</u> An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents

Reference	Theme	Comments/Issues Raised	Applicant's Response
			include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Community Benefits</u> The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The benefits of the Scheme are set out in Section 5.3 of the Planning Statement [APP-267] and include the delivery of large amounts of cheap, secure, and low carbon electricity which will help the UK to achieve net zero by 2050, ecological and landscape enhancements, biodiversity net gain, permissive paths, employment generation, economic benefits and skills training. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training

Reference	Theme	Comments/Issues Raised	Applicant's Response
			opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent. The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.
JCE-003	Construction and Decommissioning Site selection and Alternatives Soils and Agriculture	Personally- This project will cause significant disruption. The proposed cable route bisects our pasture land causing access and grazing issues. It will entail the destruction of historic pasture land, the removal of mature trees and it cuts through established permanent crops. If the cable needs to be joined we will lose productive land. Any disturbance of soil no matter how carefully done will lead to years of	The assessment of effects on agricultural land and farming operations, including temporary land take associated with the cable route, is provided in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, with detailed construction methodology set out in **ES Volume 3, Appendix 3 2: Cable Route Construction Method Statement [APP-183]**. The cable trench required for installation of underground cables would have a maximum anticipated working width of approximately 7 metres. This equates to a temporary disturbance of approximately 0.07 hectares per hectare of land crossed. Disturbance associated with cable installation would

Reference	Theme	Comments/Issues Raised	Applicant's Response
		underproduction. (We had a sewer pipe laid across our land (by compulsory order) in 2017. It is still only producing about 50% of what it did 8 years ago).	be short term and localised, and following reinstatement, agricultural operations within the affected fields would be able to recommence. Accordingly, land take associated with cable installation would not permanently remove the affected land from agricultural use, and the extent and duration of disturbance have been assessed as limited.
JCE-004	Description and DCO Process	If recent dealings with IGP and its representatives are anything to go by, I have very little faith that this project can be efficiently delivered. They have demonstrated a level of incompetence that I have not experienced in over 30 years of business. I am seriously not looking forward to having to deal with them. This project only benefits 5 landowners, IGP and Macquarie. Thank you your time in considering this. Kind regards, James Cole	The Applicant notes the comments made, and the Applicant will continue to engage throughout the process on the land rights sought from the respondent, updates of which will be captured in the **Land and Rights Negotiations Tracker [APP-021]**.

6.65 Mark Sturgess

Table 6-65 RR-3018

Reference	Theme	Comments/Issues Raised	Applicant's Response
MS-001	Description and DCO Process Socio-Economics, Tourism and Recreation Hydrology, Flood Risk and Drainage Noise and Vibration Ecology and Biodiversity	I feel strongly that this industrial sized solar scheme should not be granted planning approved, my main objections and concerns are as follows. I enjoy cycling and walks in the affected areas and these would be adversely affected during the construction and operation of the solar farm, permanently destroying the views and the sound of the surrounding wildlife. In Corston where I live we already suffer from flooding and I am sure that the addition of acres of solar panels increasing the rainfall run off from the surrounding fields will only increase the severity and frequency of future flooding. The local wildlife's ability to move through the country side in the affected area will be adversely affected first by the construction phase works and then due to fencing surrounding the solar panes and other infrastructure buildings and equipment. The noise generated by the equipment may also negatively affect wildlife.	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (oPROWPPMP) [APP-282]**. These are confirmed as embedded mitigation measures in Section 16.9 of ES Chapter 16. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283]**. These are considered as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The **oPROWPPMP [APP-282]** is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant **Statement of Common Ground**to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.84), the assessment differentiates between solar PV panel areas, which drain to the existing ground and therefore do not generally give rise to significant drainage effects, and associated infrastructure (for example access tracks, temporary construction compounds, substations and the BESS) where runoff controls are required. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation

Reference	Theme	Comments/Issues Raised	Applicant's Response
			storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that part of the authorised development can commence until, a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.

6.66 Paul Kirk

Table 6-66 RR-3669

Reference	Theme	Comments/Issues Raised	Applicant's Response
PK-001	Description and DCO Process Landscape and Visual Transport and Access	I object to the plans and the project. This project will scar our beautiful countryside for generations. The traffic cannot be safely carried on our narrow country lanes and everlasting damage will be caused.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies. The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
PK-002	Soils and Agriculture Ecology and Biodiversity	The Project will take out of agricultural production thousands of acres, much of which is top quality productive land. There will be unquantifiable fire risks and contamination from Battery stores. The impact on wildlife will be immense and permanent.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade

Reference	Theme	Comments/Issues Raised	Applicant's Response
			affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement

Reference	Theme	Comments/Issues Raised	Applicant's Response
			a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12).
PK-003	Other Environmental Matters	There will be unquantifiable fire risks and contamination from Battery stores.	The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant notes that the approach to BESS safety is under discussion with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the OBSMP confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory

Reference	Theme	Comments/Issues Raised	Applicant's Response
			requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out in **Outline Battery Safety Management Plan (OBSMP) [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]** — including advice to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
PK-004	Ecology and Biodiversity	The impact on wildlife will be immense and permanent.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.

6.67 Julian Philip Edwin Brunt

Table 6-67 RR-2517

Reference	Theme	Comments/Issues Raised	Applicant's Response
JPEB-001	Cumulative Effects Landscape and Visual Transport and Access	1/ DESTRUCTION OF THE COUNTRYSIDE 2/ CUMULATIVE IMPACT - HIGH CONCENTRATION OF SOLAR PARKS IN THIS AREA! 3/ TRANSPORT ROUTES HAVE A DETRIMENTAL IMPACT ON HERITAGE ASSETS - TRABSPORT PLANS UNENFORCABLE.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies. Cumulative effects with other projects has been carefully considered as part of the Scheme with other projects, both existing and proposed, taken into account. In terms of the Lime Down project, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated appendices**, ES Volume 3, Appendix 21-1 Long List of In-Combination Effects and Cumulative Developments [APP-264]**. Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 In-Combination and Cumulative Effects [APP-073]**. Existing schemes are captured within the baseline environment. The four stage cumulative assessment methodology is described within **ES Volume 1, Chapter 6: EIA Methodology [APP-058]**. 358 developments were included in the **Long List [APP-264]**. 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Taking a conservative worse case approach, significant cumulative effects are identified at a limited and discrete number

Reference	Theme	Comments/Issues Raised	Applicant's Response
			of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance. The potential effects of the Scheme on the cultural heritage of the Fosse Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The assessment identifies known Roman heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**. The potential effects of construction traffic on the local highway network, including the Fosse Way, are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. The assessment considers construction vehicle routing, traffic volumes, road safety and effects on road users, and concludes that, with appropriate mitigation in place, construction traffic would not give rise to unacceptable impacts on the operation or safety of the Fosse Way. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (CTMP) [APP-277]** has been prepared and submitted with the Application. The CTMP sets out measures to ensure that the effect of construction traffic on the local highway network is minimised, including defined construction access points, approved HGV routes, coordination of deliveries, and timing restrictions to avoid peak traffic periods where practicable. The CTMP also includes a road condition and dilapidation survey of minor roads not typically used by HGV traffic. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			In addition, the CTMP includes community liaison measures to keep local communities informed on construction activity and to provide a contact point for feedback should any issues arise. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic effects on the Fosse Way are appropriately managed throughout the construction phase.

6.68 Melanie Sturgess

Table 6-68 RR-3131

Reference	Theme	Comments/Issues Raised	Applicant's Response
MSS-001	Hydrology, Flood Risk and Drainage Landscape and Visual Transport and Access	I believe the ground will become contaminated and leach into the water table and rivers. There will be and adverse affect the ecology and biodiversity including the wildlife not being able to move as normal due to high fences surrounding the solar panels. Lastly the amount of extra heavy traffic in the construction phase.	Potential effects of the Scheme on water quality and contamination risk are addressed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, which sets out mitigation and management measures to protect water quality during construction and operation. These measures include pollution prevention controls, containment systems, emergency response protocols, and site-specific drainage measures, particularly around the Battery Energy Storage System (BESS) and substations where lined drainage and automatically actuating valves are proposed. The Applicant notes that the approach to pollution resulting from battery fire is under discussion with both the Environment Agency and the Lead Local Flood Authority (LLFA) and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Mitigation measures to control contamination risk during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]**. Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a Construction Environmental Management Plan substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277]** is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are appropriately managed throughout construction of the Scheme. Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9:**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Ecology and Biodiversity [APP-061], which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure **that the effect of the construction phase on the local highway network is minimised.** The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.

6.69 Brendan Leo McCarron

Table 6-69 RR-0524

Reference	Theme	Comments/Issues Raised	Applicant's Response
BLMC-001	Site selection and Alternatives	I am completely opposed to the scale of this development on good farmland.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environment. An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in Section 17.7 of **ES Volume 1 Chapter 17: Soils and Agriculture [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			17-2: Agricultural Land Classification Mapping [APP-172]. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground**to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial

Reference	Theme	Comments/Issues Raised	Applicant's Response
			effect on soil resources at decommissioning, which is assessed as significant (Sections 17.10 and 17.12 of **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**).
BLMC-002	Climate Change and Energy Need Description and DCO Process	I have not seen a proper cost benefit analysis including externalities for this project created in accordance with Treasury Green Book principles but I believe that it will have a Net Present Social Cost when the negative externalities are considered.	The Applicant notes this comment. The socio-economic effects of the Scheme, including its costs and benefits, are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and justified within the **Statement of Need [APP-266]** and the **Planning Statement [APP-267]**. There is no statutory requirement within the National Policy Statements (NPS) for a privately funded Nationally Significant Infrastructure Project (NSIP) to provide a cost-benefit analysis in accordance with Treasury Green Book principles. The **Funding Statement [APP-019]** submitted with the DCO application demonstrates that the Scheme is financially viable and adequately funded to deliver the Scheme in full.

6.70 Jessica Phillips

Table 6-70 RR-2261

Reference	Theme	Comments/Issues Raised	Applicant's Response
JP-001	Description and DCO Process Ecology and Biodiversity Transport and Access Socio-Economics, Tourism and Recreation	I object to the lime down solar project and the impact this will have on wildlife, traffic, tourism and day to day life for everyone living in the villages which undoubtably will be affected by this monstrosity of an idea.	Wildlife Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground** to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing

Reference	Theme	Comments/Issues Raised	Applicant's Response
			arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Traffic</u> The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road

Reference	Theme	Comments/Issues Raised	Applicant's Response
			safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** sets out measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme. <u>Tourism</u> The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1. <u>Community</u> The Applicant acknowledges that there will be impacts on the community as a result of the Scheme, which may be a source of concern for local residents. The Secretary of State will balance those potential impacts and changes against the urgent need and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			critical national priority for the Scheme as set out in Government policy. The Applicant has assessed adverse impacts arising from the Scheme and has also set out within the **Environmental Statement [APP-052 – APP-065]** the steps taken to avoid, mitigate and minimise these impacts as far as possible, and has prepared a number of management plans that will ensure that impacts are kept to a minimum. These management plans are secured in the **Draft Development Consent Order [APP-016]**. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068], and Chapter 18: Human Health [APP-070]**, all of which consider potential impact
JP-002	Site selection and Alternatives Landscape and Visual	The sheer size and scale of this project along with the noise and height of the panels will significantly impact the environment. To be clear I do support solar (on roofs!)	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environment. The noise impacts from the operation of the Scheme and its

Reference	Theme	Comments/Issues Raised	Applicant's Response
			components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. The landscape and visual effects of the Scheme, including the effects of the maximum panel height, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors during construction, operation and decommissioning, using the maximum design parameters to ensure a robust

Reference	Theme	Comments/Issues Raised	Applicant's Response
			assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These include new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.

Table 6-71 RR-4591

Reference	Theme	Comments/Issues Raised	Applicant's Response
SD-001	Site selection and Alternatives Soils and Agriculture Transport and Access	The huge scale and sprawling nature of the Limedown proposed scheme means that the transforming effect it will have on the area I have lived in for 28 years will be massive and this causes me great anguish. This pocket of North Wiltshire is rural and agricultural with plenty of character and charm - this will be destroyed. The lanes are already under pressure from growing car use and delivery drivers alongside the essential farm traffic. The Limedown logistics will bring this situation to breaking point.	The Applicant is confident that the proposed management and mitigation measures set out in the **ES [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against the policies. The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.
SD-002	Cultural Heritage	Our local cultural heritage is rich - Malmesbury Abbey, the Athelstan Way, the Fosse Way, various Medieval sites - these will be smothered by a bleak industrial landscape that is totally at odds with the Area's historical importance.	The potential effects of the Scheme on cultural heritage, including the Fosse Way and archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground**to be submitted at Deadline 1. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1:**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Heritage Statement [APP-219] identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction.
SD-003	Ecology and Biodiversity	In Area E, where I live, the ancient woodlands, hedgerows, undulating ridge and furrow fields are home to a plethora of English wildlife - including hares, deer, foxes, Barn, Little and Tawny owls, otters. There are wild orchids in the spring and carpets of cowslips after the snowdrops and bluebells. Indeed, the area is so rich and vital as an ecological haven that one of the ancient pastures is a registered SSI site. To witness the destruction of this habitat will be soul-destroying.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			As described in paragraphs 9.10.58 to 9.10.65 of **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, a buffer zone of at least 15 m will be maintained between the Harries Ground, Rodbourne SSSI boundary and any development. This is greater than the existing field margin which lies between the cultivated arable habitat and the SSSI boundary, which is approximately 5 m wide. The establishment of diverse grassland habitat within this buffer zone, as well as the general reversion of the arable fields which dominate the Solar PV Sites to grassland (for the lifetime of the Scheme) is considered likely to result in a significant beneficial effect in the extent and quality of grassland habitats within the Solar PV Sites which may provide supporting habitat for species associated with the SSSI, and thus strengthen the ecological integrity of the designated site.

6.72 Susan Hunt

Table 6-72 RR-4557

Reference	Theme	Comments/Issues Raised	Applicant's Response
SH-001	Landscape and Visual	I am very concerned about the effect if granted this monstrous invasion of the local countryside will bring. As a landowner that limedown wish to carry out cable surveys on my land I am upset of the tone of their communication almost threatening I comply, I am a pensioner and my late husband worked hard for this land and his ashes were spread within and Linedown show no redirect or consideration and selfishly want to attack the solar site and surrounding villages jot only with the blight on the countryside landscape but also on the infrastructure surrounding.	The Applicant notes the comments made. For clarification, the Respondent's land is no longer affected by the Scheme and no works are proposed on their land. Regarding the landscape and visual impact of the Scheme, an assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

6.73 Edward Hall

Table 6-73 RR-1241

Reference	Theme	Comments/Issues Raised	Applicant's Response
EH-001	Ecology and Biodiversity Description and DCO Process	This project will permanently damage a very beautiful part of England's countryside. It will have a lasting detrimental impact on residents in the area, wildlife, and the natural beauty of this part of the Cotswolds. This is a profit motivated scheme, with almost no regard the real welfare of the locality.	Landscape and Visual An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Ecology and Biodiversity</u> Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Community Welfare</u> Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation, transport and connectivity, climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, inbound workers are accommodated in the most suitable locations for housing and health service access, community liaison and engagement is maintained, and construction impacts on waterways, soils, noise and air quality are regulated. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.

6.74 Peter Cole

PCE-001	Description and DCO Process	It's an abomination.	The Applicant notes this comment.

6.75 Mark Robert Michel

Table 6-75 RR-3012

Reference	Theme	Comments/Issues Raised	Applicant's Response
MRM-001	Landscape and Visual	Concerned by the vast scale ruining an area of national beauty. Concerned by the fact it surrounds my house on 3 sides ruining all of the views. Concerned that it comes right up to the boundary of my property. Concerned for the vast numbers of wildlife that will be adversely impacted. Concerned that the planners have not understood the areas they have planned the development in, for example, my house has been marked as an ancient woodland on their maps through all of the stages of communication despite my correcting them.	Grain Store Barn is identified as receptor RG020 and has been fully assessed in **ES Volume 3, Appendix 8-3-2-2: Landscape and Visual Assessment Sheets (Significant) [APP-191]**. The assessment recognises that there would be Major/Moderate Adverse effects which are Significant during Construction and Year 1. The assessment notes: The scheme has been designed to accommodate these residential properties, and infrastructure has been set back to allow separation and space for mitigation. Views of construction activity would be visible in open views across the surrounding fields, where visible, this would be set back from the properties by at least 150m. There is no proposed infrastructure within field C16 and open views are maintained to the south. The level of change in views would be High. Proposed mitigation includes reinforced roadside screening, new sections of hedgerow, hedgerow reinforcement and enhancement is proposed throughout the surrounding Site. Although this would have a limited effect initially, by Year 15 mitigation planting would filter views of the proposed infrastructure and reduce visibility of the Scheme reducing the effect to Moderate/ Minor adverse which is non-significant.

6.76 John Eavis

Table 6-76 RR-2358

Reference	Theme	Comments/Issues Raised	Applicant's Response
JE-001	Transport and Access	The impact on my farm is colossal There is no proper process for vehicle movement through to Rodbourne The Roads are not big enough	The construction route is not proposed to route through Rodbourne. Access to Lime Down E will be provided via the A429.
JE-002	Climate Change and Energy Need	Carbon and climate considerations: While the scheme could deliver net carbon savings over its lifetime, construction emissions mean carbon break-even would not occur until 2076.	It is not clear how the 2076 year of offset conclusion has been reached. **ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero. As the scheme will require replacement of components, and will generate some minimal emissions during operation, it is not considered that a 'break-even' date is a useful measure of the scheme's beneficial effect. i.e. the scheme's beneficial effect will not in itself directly result in negative emissions but it will in comparison to a scenario where the scheme is not developed. However, as the GHG electricity generation intensity figure for the Scheme is anticipated to sit continually below the forecast grid average for 2029, GHG emissions savings are expected to be achieved throughout the lifetime of the Scheme compared to a generation scenario in the absence of the Scheme. Therefore, the GHG emissions during construction, operation, and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			decommissioning of the Scheme can be considered to be 'offset' by the net positive impact of the Scheme on GHG emissions and the UK's ability to meet its carbon targets.
JE-003	Cultural Heritage	Heritage and archaeology: Potential harm to heritage assets such as Bradfield Manor and Rodbourne Conservation Area has been under-assessed and archaeological mitigation strategies remain incomplete.	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by Volume 3, **Appendix 12.1: Heritage Statement [APP-219]**, assessed the potential impacts of the Scheme on Rodbourne Conservation Area and the Grade I Listed Bradfield Manor Farmhouse (NHLE: 1198808). With consideration to Rodbourne Conservation Area, embedded mitigation including the removal of Fields E5 and E8 from the Scheme Order Limits, removal of panels from Fields E7, E9 and E10, offsets to the PROW and enhanced screening of existing hedgerows are considered sufficient mitigation to remove any adverse impacts to the Conservation Area. Therefore no impact was identified as a result of the Scheme to the Conservation Area. As stated in **Appendix 12.1: Heritage Statement [APP-219]** when considering the contribution of setting to the significance of Bradfield Manor Farmhouse, the asset is largely defined and experienced from within the Bradfield Manor Farmhouse grounds, in particular the walled courtyard to the south-west of the asset, where the full architectural interest of its south-facing primary elevation can be appreciated. Lime Down D is located within agricultural land to the north of asset. Following advise provided by Historic England panels in Field D5 were set back away from Grade I Listed Bradfield Manor Farm house and enhanced screening is proposed along existing hedgerows. Views of the proposed BESS and 400 kV Substation from Bradfield Manor Farmhouse will be largely mitigated by the proposed new woodland belt along the south-eastern boundary of Field D3 which, in combination with the existing woodland block west of D1 and south of D22, provides extensive screening in views to and from Bradfield Manor Farmhouse. It was identified that there would be a moderate / minor (not significant) adverse effect to the asset (less than substantial harm at the lower end in NPPF terms) as a result of indirect (i.e. setting) impacts.
JE-004	Transport and Access	Highways and transport: Concerns include inadequate mitigation for HGV	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13:**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		movements on narrow rural roads and insufficient commitments for passing places. There is insufficient control over the works on the public highway.	**Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
JE-005	Socio-Economics, Tourism and Recreation	Economic and community impact: The scheme risks the loss of agricultural and tourism jobs, removal of 878 hectares of land from food production,	The Applicant confirms that land agreements are being made with landowners who have their own contractual arrangements with tenant farmers. This may therefore involve the termination of agricultural tenancies at the discretion of the landowner.

Reference	Theme	Comments/Issues Raised	Applicant's Response
	Soils and Agriculture	as well as adverse effects on local businesses and communities.	The Applicant is however cognisant of the impact this may have and so seeks to source ways of retaining agricultural workers, providing reskilling opportunities, or providing re-employment as supported by the measures secured in the **Outline Skills, Supply Chain and Employment Plan [APP-285]**. The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the Statement of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Common Ground with Wiltshire Councilto be submitted at Deadline 1. The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**, which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			agricultural land and the wider farming estate. An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-242]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economic and Regeneration Team, with the exception of matters relating to agricultural employment, which is still under discussion. This is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1.
JE-006	Landscape and Visual	We also concur with the following information Landscape and visual impact: The project would cause substantial, long-term harm to landscape character over 749 hectares in a sensitive location	The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character,

Reference	Theme	Comments/Issues Raised	Applicant's Response
		near the Cotswolds National Landscape. We consider compliance with Core Policy 51 ("*protect and enhance landscape character*") is impossible at this scale.	visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. With reference to Core Policy 51, the Applicant considers that although there are some short-term significant effects to the character of the landscape due to the change in land use caused by the infrastructure, there would also be permanent beneficial effects to the fabric of the Site as a result of the embedded mitigation measures which would contribute positively to the legacy landscape and be in line with Core Policy 51 and Wiltshire's Nature Recovery Strategy.

Reference	Theme	Comments/Issues Raised	Applicant's Response
JE-007	Ecology and Biodiversity	Ecology and biodiversity: Surveys for key species and habitats are incomplete, particularly along the cable route corridor. It is vital to take is a precautionary approach and enforceable commitments for biodiversity net gain and habitat protection.	The Applicant notes this comment. The scope of ecological and species-specific survey were defined using a proportionate, risk-based approach. Survey scope and effort across the Order Limits were targeted to areas and species where there was a reasonable likelihood of significant effects, rather than applied uniformly across the Order Limits irrespective of risk. The baseline information is considered sufficient to support a robust and proportionate assessment of likely significant effects of the Scheme, and the conclusions of **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** are appropriate and justified.

6.77 Christopher Smith

Table 6-77 RR-0842

Reference	Theme	Comments/Issues Raised	Applicant's Response
CSH-001	Climate Change and Energy Need Ecology and Biodiversity	I object strongly to the entire Lime Down project. It is not green and is in reality an industrial development which will have a huge negative impact on the local and surrounding area. I object to the installation of the BESS due to the risks and impact on local people, the school, wildlife, flora and fauna. I object to the traffic increase and road disruption that will result from this project. I object to the negative impact on local wildlife, walks, views, noise, loss of amenity and historical sites due to this industrialisation.	**ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation. The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero. The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			community benefits. BESS Safety The Battery Energy Storage System (BESS) containers proposed for the Scheme will incorporate built-in safety features for fire avoidance, detection and suppression. The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident. As shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. The Applicant notes that the approach to BESS safety is under discussion with Dorset and Wiltshire Fire and Rescue Service (D&WFRS) and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. Section 6.1.1 of the OBSMP confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			As set out in **Outline Battery Safety Management Plan (OBSMP) [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no significant off-site impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan (OBSMP) [APP-286]** — including advice to remain indoors and close windows — would further reduce potential impacts to residents. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Wildlife, flora and fauna Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing

Reference	Theme	Comments/Issues Raised	Applicant's Response
			arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. <u>Traffic</u> The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP has been

Reference	Theme	Comments/Issues Raised	Applicant's Response
			developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme. <u>Walks and amenity</u> A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the Statement of

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Common Ground with Wiltshire Councilto be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**. These are confirmed as embedded mitigation measures in Section 16.9 of ES Chapter 16. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-283]**. These are considered as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths MP is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. <u>Noise</u> An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning, including from solar PV panels and associated infrastructure.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive

Reference	Theme	Comments/Issues Raised	Applicant's Response
			nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. <u>Historical sites</u> The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225]. The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground**to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction.

Table 6-78 RR-0542

Reference	Theme	Comments/Issues Raised	Applicant's Response
BMG-001	Construction and Decommissioning Noise and Vibration Socio-Economics, Tourism and Recreation	I oppose this project for the following reasons: 1)The cable route will pass directly through several fields of our farm including one only metres from the farm buildings and slurry lagoon which is due to be built this Spring; the associated cable laying construction work and noise will therefore considerably disrupt our business regarding crops and livestock grazing.	The anticipated effects to the farming business affected by cable routing are likely to be temporary, and restricted to the width of the Cable Route Corridor. Where fields have been bisected, working practices around cable laying works should allow for access to be maintained to both sides of the Cable Route Corridor to allow for agricultural work to be continued even during construction. The **OCEMP [APP-277]** furthermore commits to the reinstatement of land affected by cabling works as soon as practicable to allow for agricultural work on the land to recommence as soon as construction of that section of cable route is complete. Loss of agricultural revenue as a result of temporary works to construct the Cable Route Corridor can be compensated either through voluntary agreement with the Applicant, or through the application of compulsory acquisition powers.
BMG-002	Ecology and Biodiversity	2) During the ecological and geophysical surveys of our land the contractors advised us that they had only been instructed to survey the one, now proposed, route, even though at that time the developers were stating that three routes were being considered. I question whether alternative cable routes were genuinely considered.	Details regarding the alternative cable routes considered are set out in Section 4.6 of **ES Volume 1, Chapter 4 Alternatives and Design Evolution [APP-056]** where it explains the design evolution of the Cable Route Corridor and the alternatives that have been considered from non-statutory consultation up to DCO Application submission. In summary, four routes were initially considered, as shown on **ES Volume 2, Figure 4-5: Indicative Cable Route Corridors [APP-089]** which were assessed against a range of criteria such as the length of the route, the number of rail and road crossings etc. The cable route corridor has also been also informed through technical discussions and by feedback from statutory consultation. In refining the cable route corridor to a final alignment for the DCO application, a range of constraints was considered, including landscape and visual, ecology and biodiversity, arboriculture, cultural heritage, transport and access, air quality, soils and agriculture etc in order to minimise potential impacts.
BMG-003	Landscape and Visual	3) The proposed siting of the panels and battery storage areas would cover a large area of the Cotswolds Area of Outstanding Natural Beauty, which needs to be protected and preserved for future generations to enjoy. By	The Applicant confirms that no solar PV panels, Battery Energy Storage System infrastructure or associated built development are proposed within the Cotswolds National Landscape (formerly the Cotswolds Area of Outstanding Natural Beauty). The Cotswolds National Landscape (CNL) is fully assessed as

Reference	Theme	Comments/Issues Raised	Applicant's Response
		definition important flora and fauna inhabit the area and the solar farm development would destroy unique habitats and important ecosystems. There is no evidence to prove that the land covered by the project, because it is already an AONB, would be left in an improved state after the 60 years of its life.	a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and

Reference	Theme	Comments/Issues Raised	Applicant's Response
			the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Outline Landscape and Ecological Management Plan (OLEMP) [APP-283] and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.
BMG-004	Transport and Access	4) The local roads which would be used by frequent, large and heavy construction traffic are not suitable for this and would become eroded and damaged with a negative impact for local residents	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in Annex H of **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to

Reference	Theme	Comments/Issues Raised	Applicant's Response
			allow two HGVs to pass. Mitigation measures to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic is included as a measure within the CTMP. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.
BMG-005	Construction and Decommissioning Hydrology, Flood Risk and Drainage	5) Currently there is no plan for the decommissioning of the cable therefore it would be left in the ground. There is no reassurance against potential future soil toxicity or physical obstruction to working the land.	The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, all land will be returned to its original use and condition as far as practicable and returned to the landowner. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the effects would be less than those likely to occur during the construction phase.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. An assessment of the effects of the Scheme on soils and agricultural land quality is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline soil conditions and agricultural land quality and assesses the likely significant effects arising from construction, operation, maintenance and decommissioning of the Scheme. The assessment identifies appropriate embedded mitigation measures to avoid, reduce and manage effects on soils and land quality. The Applicant notes that the approach to characterising the soil resource was agreed in principle but is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to control soil handling, storage and reinstatement

Reference	Theme	Comments/Issues Raised	Applicant's Response
			are set out in the Outline **Soil Resources Management Plan (SRMP) [APP-280]**, which accompanies the DCO application. The SRMP provides the framework for detailed soil management methods to be implemented during construction, operation and decommissioning, ensuring that soil structure, quality and function are protected and restored. The assessment in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]** concludes that the removal of land from intensive arable cultivation during the operational phase is expected to lead to improvements in soil health, quality and structure. This results in a temporary, moderate beneficial effect on soil resources during the operational and decommissioning phases of the Scheme, which is assessed as significant (see Chapter 17, Section 17.12). Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soils within the Solar PV Sites are anticipated to improve over the lifetime of the Scheme. This would constitute a low magnitude of change to high sensitivity soils, giving rise to a temporary, moderate beneficial effect on soil resources during the decommissioning phase.

CC-001	Transport and Access Noise and Vibration	Apart from the obvious inconvenience our village will suffer due to congestion from Lorrie's on roads that aren't even fit for cars (pot holes is for another day!) noise pollution of the Lorrie's passing on our roads morning, noon and night general pollution from Lorrie's passing through the village with dust particles effecting out health	An assessment of the effects of construction activities on air quality is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. The assessment considers potential emissions from construction dust, construction vehicle exhausts and Non-Road Mobile Machinery (NRMM), and has been undertaken in accordance with relevant best practice guidance. Further detail on the construction dust assessment is provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and Assessment [APP-238]**. The assessment concludes that, with embedded mitigation measures in place, construction-phase air quality effects would not be significant. Mitigation measures to control dust and emissions during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Construction Traffic Management Plan [APP-287]**. These include measures such as dust suppression, site management controls, routing and scheduling of construction traffic, and management of plant and machinery. The preparation, approval and implementation of detailed construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts during construction are appropriately controlled.
CC-002	Ecology and Biodiversity Soils and Agriculture	Of which all the above will effect my family personally But also the effect this solar park will have on our beautiful wildlife and the nature that surrounds us is nothing short of tragic. Killing hundreds of species of wildlife is surely not ok It simply does not make sense to rip up this farmland that has been providing food for the nation to provide solar energy for a small	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional

Reference	Theme	Comments/Issues Raised	Applicant's Response
		amount, when it could be provided from other sources such as industrial park roof tops, alongside motorways and general housing estates It's disgraceful to think that people are willing to go for the cheapest easiest option at the sacrifice of our beautiful countryside	mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on

Reference	Theme	Comments/Issues Raised	Applicant's Response
			agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4 Alternatives and Design Evolution** and in the **Statement of Need [APP-056 and APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As

Reference	Theme	Comments/Issues Raised	Applicant's Response
			shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land/brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.

6.80 Ashton Hawker

Table 6-80 RR-0431

Reference	Theme	Comments/Issues Raised	Applicant's Response
AH-001	Socio-Economics, Tourism and Recreation	I am writing to register my strongest possible objection to the proposed Lime Down Solar scheme. As a lifelong resident, award-winning farmer, and business owner in Hullavington, I believe this industrial-scale development would inflict profound and irreversible damage on our community, landscape, and way of life. My objections are rooted in deep personal commitment and factual evidence, as outlined below:	The Applicant notes this Relevant Representation and confirms that the matters raised have been addressed in detail in the Applicant's responses below.
AH-002	Soils and Agriculture	Existential Threat to a Viable Local Business and Livelihoods This scheme poses a potentially direct threat to the ongoing viability of my farm business, which I have built over a lifetime. The loss of such a significant area of productive agricultural land that I currently farm would not only disrupt but could potentially destroy my enterprise. The consequence would be the unnecessary redundancy of direct and self-employed local people, undermining the local economy this project claims to support. It is contradictory to sacrifice existing, sustainable rural businesses for speculative energy gain.	The Applicant has responded in full to the comments made by the Hawker Farms regarding impacts on agricultural business in their Relevant Representation [RR-0431] above.
AH-003	Landscape and Visual Ecology and Biodiversity	The Permanent Industrialisation of a Precious, Historic Landscape Having been born, lived, and worked my entire life here, I can attest that this area is a truly rural, traditionally farmed landscape of immense value. It is rich in archaeology, heritage, and a cohesive ecological network. The proposal to industrialise it with vast	Landscape and Visual An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		arrays of panels, substations, and high fencing would shatter its character forever. The description of the area from a local walking book-"a "*timeless scene*" of a traveller's caravan and grazing horses on Foxley Common-"captures exactly what we cherish and stand to lose irrevocably. This is not NIMBYism; it is the defence of a unique and irreplaceable environment.	The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. <u>Cultural Heritage</u>

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225].** The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground**to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction. Ecology and Biodiversity Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Chapter 10 Arboriculture [APP-062]. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.
AH-004	Ecology and Biodiversity	Direct Contradiction of Ecological Excellence and Net Gain Principles For decades, I have dedicated myself to enhancing the ecology of my land, efforts recognised with national awards. This proposal is in direct and shocking	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these

Reference	Theme	Comments/Issues Raised	Applicant's Response
		conflict with all good environmental practice. The developer's own assessment admits to a 73% loss of skylarks-"a key biodiversity indicator species. The installation of miles of high fencing will fragment habitats, block wildlife corridors, and confuse fauna. This scheme does not represent a "*green*" solution; it is an ecological retrograde step that replaces a living, managed landscape with a sterile industrial site.	measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The assessment identifies skylarks as a key species of conservation interest within the Scheme area. It concludes that a proportion of the current skylark population will be displaced from the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large, open set-aside and grassland habitats designed to provide appropriate breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**.
AH-005	Hydrology, Flood Risk and Drainage	Unacceptable Risk to Essential Water Resources My farm is served by three boreholes providing water for a household and livestock. The construction phase (with potential for chemical spills, lubricant leaks, and soil compaction) and the long-term presence of this infrastructure pose a clear contamination risk to the aquifer. No credible, long-term guarantee can be	The Applicant acknowledges the importance of private boreholes for domestic and agricultural use. Groundwater receptors and pollution pathways have been assessed using a source–pathway–receptor approach and no credible mechanism has been identified by which the Scheme would contaminate groundwater or adversely affect borehole supplies. Construction-phase pollution risks are controlled through embedded mitigation and secured construction management measures, avoiding significant adverse effects on controlled waters. **ES Volume 1, Chapter 11 Hydrology, Flood Risk and Drainage [APP-063]** and **Outline Construction Environmental Management Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		offered to mitigate this threat to a fundamental resource. The precautionary principle must apply.	**[APP-277]**. No amendments to the application documents are required.
AH-006	Human Health	Severe Detriment to Community Wellbeing and Mental Health The mental wellbeing and quality of life for hundreds of residents in directly affected villages will suffer immensely. Our network of public rights of way, constantly used for recreation and mental respite, would become routes through an industrial facility.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "*lens*" to the findings of relevant technical chapters and concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. The assessment focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244]**. Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local

Reference	Theme	Comments/Issues Raised	Applicant's Response
			support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1. A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW, and recreational access to the countryside, has been included in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes – be that practically in their use, and their enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some significant adverse effects to users of PROWs and unsurfaced roads in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant notes that the assessment of PROW impacts and mitigation is under discussion with Wiltshire Council's Countryside Access Team and is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1. The Applicant confirms that existing PRoW are to be controlled within the Scheme design with PRoW management strategies set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282].** These are confirmed as embedded mitigation measures in Section 16.9 of **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. New permissive access routes have been included in the Scheme design, shown as Work No.10 on the **Works Plan [APP-007]** and shown on **ES Volume 2, Figure 3-4: Landscape**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			and Ecology Mitigation Plan [APP-283]. These are considered as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths MP is secured through Requirement 16 of Schedule 2 of the **Draft DCO [APP-016]**. The preparation, approval and implementation of the detailed CEMP and CTMP, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction
AH-007	Other Environmental Matters	The profound visual blight, potential for glint and glare, ambient noise from inverters, and the unnatural light pollution will shatter the peace and dark skies that define our countryside. The harm to community health is a material planning consideration that cannot be dismissed.	The Applicant notes that visual impact has been addressed in detail in the Applicant's responses above. <u>Noise</u> The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. A penalty has been applied to predicted noise levels from the Solar PV Sites to account for the distinctive nature of the sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected. The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are

Reference	Theme	Comments/Issues Raised	Applicant's Response
			secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme. Light pollution Potential effects relating to lighting are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. The Landscape and Visual Impact Assessment (LVIA) has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** and further discussed in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. Measures to control construction lighting are set out in the **Outline Construction Environmental Management Plan**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-277], and operational lighting controls form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme. <u>Health</u> Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing, through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation, transport and connectivity, climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with embedded mitigation and additional measures secured, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the Statement of Common Ground with Wiltshire Councilto be submitted at Deadline 1.
AH-008	Soils and Agriculture	Conclusion The Lime Down Solar scheme is	The Applicant has responded in full to the comments made by Hawker Farms regarding impacts on their agricultural business,

Reference	Theme	Comments/Issues Raised	Applicant's Response
	Ecology and Biodiversity Cultural Heritage Community Benefits	fundamentally the wrong development in the wrong place. It would: - Potentially destroy a thriving agricultural business and the jobs it supports. - Permanently industrialise a historic, cherished, and visually coherent rural landscape. - Cause significant ecological harm, directly contradicting national and local biodiversity policies. - Threaten essential water resources. - Severely degrade the wellbeing of a settled community. This is not about opposition to renewable energy, but about the critical importance of appropriate size and siting with community benefit. This proposal prioritises developer convenience over true sustainability, which must balance energy needs with the protection of our best agricultural land, our most valued landscapes, and the communities that sustain them. I urge you to reject this application outright.	and to the other matters raised in their Relevant Representation [RR-872], above.

6.81 Matthew Dominik Shipp

Reference	Theme	Comments/Issues Raised	Applicant's Response
MDS-001	Ecology and Biodiversity	Formal Objection to the Proposed Lime Down Project Submission to Central Government Review Body I submit this representation as a formal and principled objection to the proposed Lime Down project and its associated compound. I have lived in the village of Grittleton since infancy and am now (Redacted). My connection to this place is lifelong and deeply rooted. I grew up as a countryside boy, spending much of my childhood outdoors and learning responsible land management, wildlife protection, and respect for the land from the local farm manager and farming community. From an early age I understood that the countryside is not simply a backdrop, but a living, working landscape that must be actively cared for if it is to endure. That connection remains today. I am deeply invested in the protection of the land, the wildlife it supports, and the people who rely on it for their livelihoods. This proposal threatens all three.	The Applicant notes this comment and has responded to the matters raised in Relevant Representation [RR-3086] detail below.
MDS-002	Landscape and Visual Socio-Economics, Tourism and Recreation	Grittleton is a small, historic village set within a protected landscape of outstanding natural beauty. The village's built environment is predominantly listed, and the surrounding land is designated Green Belt and Area of Outstanding Natural Beauty. These protections recognise that this landscape is visually exceptional, ecologically rich,	**ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **Appendix 12.1: Heritage Statement [APP-219]**, has assessed the potential impact of the scheme on Grittleton Conservation Area. The cable route corridor is proposed to pass to the east of Grittleton Conservation Area (Fields F107-F114). While the Scheme will comprise temporary and localised construction activity as part of the installation of cabling, the assessment identified that will be no impact to the character and appearance of Grittleton Conservation Area. Since the design presented at PEIR stage, Field C26, the westernmost part of

Reference	Theme	Comments/Issues Raised	Applicant's Response
	Cultural Heritage	agriculturally productive, and historically significant. This is not merely a settlement of houses, but a functioning and resilient rural community. The village is inclusive and intergenerational, caring for both its youngest and oldest residents. We collectively fund, maintain, and manage many of our own amenities, including a cricket pitch and pavilion, children's playground, and multi-use games area, alongside ongoing fundraising for our church. We strive to be largely self-sufficient and make minimal demands on public resources. My wife and I are the joint owners of (Redacted) a Grade II* listed Victorian mansion located at the centre of the village. The house has been in my family's custodianship for nearly 60 years and is now entering its third generation, soon to pass to the fourth. We regard ourselves not as owners in the conventional sense, but as custodians of a nationally important heritage asset. (Redacted) is integral to village life. Its grounds provide open space used by villagers for recreation and community events, including tennis, football, netball, volleyball, and fundraising activities. The house and estate form a key part of the village's historic setting and social fabric. Impact on Landscape, Agriculture, and Rural Livelihoods Historic Landscape and Archaeological	Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently no significant effects were identified to the asset. Annex 1 of **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]** details assets scoped in for assessment and was used during consultation with Historic England and Wiltshire Council. Scoped in assets are considered to be agreed with both stakeholders. Grade II* Grittleton House (NHLE: 1022310) was scoped out of the assessment as there was no potential for any impact as a result of the Scheme. While direct impacts on Grittleton House have not been assessed, the assessment of tourism and recreation impacts in **ES Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and the supporting **ES Volume 3 Appendix 16-2 Tourism and Recreation Receptor Tables [APP-241]** have assessed the likely impacts of the Scheme at construction, operation, peak replacement, and decommissioning on Grittleton Conservation Area as a tourism and visitor destination, and on individual PROWs connecting to Grittleton village that are affected by the Scheme. The assessment therein identifies up to a medium-term temporary moderate-minor adverse effect due to views of cable construction works, the construction compound, and HGV traffic within the conservation area. The Applicant has committed to the mitigation measures set out in the extremely important to local people, and has committed to the mitigation measures in the **OCEMP [APP-277]**, **OOEMP [APP-278]**, **OCTMP [APP-287]**, and **OPROWPPMP [APP-282]** (each secured by requirement in Schedule 2 to the **Draft DCO [APP-**

Reference	Theme	Comments/Issues Raised	Applicant's Response
		Sensitivity The area is historically significant, containing ancient routes including the Roman Fosse Way, which forms part of the historic framework of the region. The value of such features lies not only in their physical remains, but in their setting and legibility within the wider landscape. Large-scale industrial development risks eroding this historic coherence and diminishing the ability to understand and appreciate the area's archaeological significance. Impact on Heritage Assets, Setting, and Venue Viability The proposed Lime Down compound would be located in direct and uninterrupted view of Grittleton House, including its principal wedding and events areas such as outdoor ceremony spaces, reception terraces, arrival routes, and photographic settings. (Redacted) operates as a wedding and events venue precisely because of its historic architecture, tranquillity, and unspoilt rural outlook. Couples choose the venue for its sense of arrival, visual harmony, and immersion in a protected countryside setting. The presence of an industrial compound -" *including fencing, plant, lighting, security infrastructure, and vehicle movements* -" would fundamentally undermine this experience. This harm is neither abstract nor speculative. Wedding venues operate in a highly competitive market where	**016]**) to ensure these impacts are minimised as much as practicable.

Reference	Theme	Comments/Issues Raised	Applicant's Response
		setting, photography, and guest experience are critical. A visually intrusive compound in constant view would act as a clear deterrent to prospective couples, resulting in lost bookings, reputational damage, and reduced income. This directly threatens the long-term viability of a use that actively sustains the conservation and maintenance of a Grade II* listed building. National planning policy recognises that the optimal viable use of heritage assets is often essential to their preservation. A development that compromises that viability must be regarded as causing serious harm, even where the building's fabric remains untouched. Should (Redacted) become unviable, it would likely be sold to a commercial operator with no local or community connection, resulting in the permanent loss of a valued community asset. Any comparable development proposed by us within the curtilage of the estate would be refused outright under existing planning controls. Even minor changes are subject to rigorous and costly scrutiny. This raises a fundamental issue of consistency and proportionality in decision-making. Conclusion The village, its listed buildings, farmland, wildlife habitats, and historic landscape are protected precisely to prevent this form of cumulative harm. Allowing the Lime Down development would undermine confidence in national	

Reference	Theme	Comments/Issues Raised	Applicant's Response
		protections for heritage assets, biodiversity, rural communities, and food-producing land. I respectfully ask the Review Body to consider how this proposal aligns with statutory heritage duties, environmental protections, and the long-term public interest. I cannot understand how a development of this scale has been allowed to reach such an advanced stage in such a sensitive location. For reasons of fairness, consistency, and responsible stewardship, the Lime Down proposal should be refused.	
MDS-003	Soils and Agriculture	The Lime Down proposal extends far beyond a single compound. The planned solar infrastructure is expected to cover over 2,000 acres across the local area, representing a profound and lasting change to the character and function of the countryside. This land is actively farmed and supports local food production. Farmers will be directly affected through the loss of grazing land and productive agricultural use at a time when domestic food security and sustainable local supply chains are of increasing national importance. This is not marginal or low-value land, but part of a long-established working landscape supporting rural employment and stewardship.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. The potential effects of the Scheme on agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			[APP-069], which considers baseline agricultural land use and quality and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that the Scheme will result in a temporary and reversible loss of agricultural land during the operational period, with all land to be returned to its original use and condition as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Chapter 17**, Section 17.10, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural

Reference	Theme	Comments/Issues Raised	Applicant's Response
			England and is set out in the relevant **Statement of Common Ground**. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12). The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate.
MDS-004	Ecology and Biodiversity	Ecological Harm and Loss of Biodiversity The countryside surrounding Grittleton supports a rich and interconnected ecosystem. Hedgerows, field margins, and pasture provide essential nesting, foraging, and movement corridors. Their removal or fragmentation would result in permanent habitat loss. Protected species known to be present include skylarks, bats, and badgers. Skylarks rely on open farmland for breeding and are highly sensitive to disturbance. Bats depend on hedgerows and dark corridors for navigation and feeding, while badgers require undisturbed land for sett integrity and foraging. The scale of the Lime Down development presents a clear risk of cumulative ecological harm that mitigation measures cannot adequately offset.	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The assessment identifies skylarks as a key species of conservation interest within the Scheme area. It concludes that a proportion of the current skylark population will be displaced from the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large, open set-aside and grassland habitats designed to provide appropriate breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**.

Reference	Theme	Comments/Issues Raised	Applicant's Response
			The impacts of the Scheme on bats and badgers are assessed within **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. No significant adverse effects on either species group are anticipated, and badgers are likely to benefit from enhanced foraging and sett buildings opportunities as a result of considerably increased grassland and other habitat creation and enhancement measures shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**.

6.82 Martin Genner

Table 6-82 RR-3034

Reference	Theme	Comments/Issues Raised	Applicant's Response
MG-001	Ecology and Biodiversity	I am concerned about the industrialisation of the rural environment, and the potential negative impacts on agriculture and biodiversity. I have seen no information on the likely environmental impact of the proposed development.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits. An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out in **ES Chapter 17**, Section 17.7. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES**

There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under further discussion with Natural England and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through the DCO. These include the preparation and implementation of a **Soil Resources Management Plan (SRMP) [APP-280]**, which will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial

Reference	Theme	Comments/Issues Raised	Applicant's Response
			effect on soil resources at decommissioning, which is assessed as significant (**ES Chapter 17**, Sections 17.10 and 17.12). Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The assessment concludes that, with the identified embedded and additional mitigation measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant **Statements of Common Ground**to be submitted at Deadline 1. During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10 Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the

Reference	Theme	Comments/Issues Raised	Applicant's Response
			operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the O**EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme. Information on the likely environmental effects of the proposed development is provided in the Environmental Statement (ES) [APP-052 to APP-265], which accompanies the DCO Application. The ES includes topic-specific assessments of the Scheme's likely significant effects during construction, operation and decommissioning, including landscape and visual effects, ecology and biodiversity, cultural heritage, hydrology and flood risk, air quality, noise, traffic and transport, soils and agriculture, climate change and human health. The approach to consultation and the materials made available to the public are set out in the Consultation Report [APP-022]. The

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Consultation Report confirms that environmental information was made available during the statutory consultation and that feedback received informed the ongoing design evolution and assessment of the Scheme. The Applicant considers that the statutory consultation has been robust, thorough and undertaken in accordance with the requirements of the Planning Act 2008, the Environmental Impact Assessment Regulations and the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009, and that the information provided was adequate and informative.

CK-001	Landscape and Visual	Having family living in this area and as such a regular visitor I want to object strongly to these plans. I believe they are totally out of keeping with this area of outstanding natural beauty with very picturesque villages. It is our duty to protect these areas and their history for future generations to enjoy. This would just be the tip of an iceberg as once this form of industrialisation is introduced it would set the precedent for any kind of industries in this wonderful area which needs to be preserved at all costs. Too much of our beautiful countryside is being sacrificed and lost to future generations.	An assessment of landscape and visual effects is provided in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on identified landscape and visual receptors, including residential properties and users of public rights of way, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to Residential Properties as a consequence of the Scheme. The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, Figure 3-4-1 to 3-4-5.2 **Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Mitigation Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**,

Reference	Theme	Comments/Issues Raised	Applicant's Response
			are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220], Appendix 12-4: Archaeological Geophysical Survey Reports [APP-224], and Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225]**. The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is under discussion with Wiltshire Council and is set out in the relevant **Statement of Common Ground** to be submitted at Deadline 1. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3,**

Reference	Theme	Comments/Issues Raised	Applicant's Response
			Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230], which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation, substantially in accordance with the Outline Archaeological Mitigation Strategy, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered before and during construction. Each application for development consent is required to be considered on its own merits, based on its individual characteristics, environmental effects and compliance with relevant national policy. Any future proposal would be subject to its own site selection process, Environmental Impact Assessment, consultation and examination in accordance with the Planning Act 2008 and the relevant National Policy Statements. The Applicant's Environmental Statement [APP-052 to APP-265] includes an assessment of cumulative effects, which considers the interaction of the Scheme with other existing and reasonably foreseeable developments. This ensures that the potential for incremental or combined effects is transparently assessed and reported.

7 The Applicant's response to a summary of key themes arising from RRs submitted by members of the public

1.1.10 At the time of submitting this document, the Applicant is continuing to consider and respond to all of the published RRs.

1.1.11 The Applicant will submit its responses to the RRs submitted by members of the public and any non-statutory parties not responded to in this document at Procedural Deadline B.

1.1.12 The table below sets out common themes that have arisen from the Applicant's consideration of RRs to date, and the Applicant's response to these themes.

Table 7-1: The Applicant's response to key themes arising from RRs

Summary of issues raised	Applicant's Response
Description and DCO Process	
Respondents expressed an objection to the Scheme.	The Applicant's **Statement of Need [APP-266]** provides evidence that an unprecedented capacity of new low-carbon generation schemes is urgently needed for the UK to meet its legally binding climate change targets. The government has confirmed that solar energy is at the heart of the Clean Power 2030 Mission [NPS EN-3 (2025) Paras 2.10.1 & 2.10.2]. The Statement of Need confirms that the need for the Scheme is urgent and that substantial weight should be given to the need for the Scheme [NPS EN-1 (2023) Para 3.2.9-3.2.10]. The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement (ES) [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267]**. Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies.

Some respondents expressed general support for the Scheme.	The Applicant notes these comments. The **Environmental Statement (ES) [APP-052 to APP-265]**, **Statement of Need [APP-266]**, and **Planning Statement [APP-267]** provide an assessment of the adverse and beneficial effects associated with the Scheme, an explanation of why the Scheme is needed and the benefits of solar energy generation, and the other benefits proposed by the Scheme.
Some respondents noted that Wiltshire Council has objected to the Scheme.	The Development Consent Order (DCO) process anticipates that differing views may be expressed by consultees, including local authorities, and such representations will be considered by the Examining Authority alongside all other evidence submitted. The Applicant engaged with Wiltshire Council, a host local planning authority, throughout the pre-application process and will continue to do so during Examination. Matters raised by Wiltshire Council have informed the development of the Scheme and the accompanying assessments and are addressed within the application documents. The Applicant will respond in detail to Wiltshire Council's representations through the Examination process, including via the Statements of Common Ground and, where appropriate, at Examination hearings, to assist the Examining Authority in its consideration of the application.
Respondents expressed concern about the decision on the Scheme being taken by the Secretary of State or government rather than Wiltshire Council or local residents.	Lime Down Solar Park has an anticipated generating capacity of approximately 500 MW and therefore exceeds the 100 MW threshold for a Nationally Significant Infrastructure Project (NSIP). As a result, the Scheme is subject to the Planning Act 2008 and must be consented through a Development Consent Order (DCO), examined by the Planning Inspectorate on behalf of the Secretary of State for Energy Security and Net Zero, rather than determined by the local planning authority. A full description of the Scheme is provided in the **ES Volume 1, Chapter 3: The Scheme [APP-055]**.

Respondents expressed general scepticism about the effectiveness of the Scheme's proposed mitigation measures and / or ability to reduce impact to local communities.	The Applicant is confident that the proposed management and mitigation measures set out in the **Environmental Statement [APP-052 to APP-265]** are comprehensive and robust and that the Scheme aligns with national and local planning policy; this is outlined in the **Planning Statement [APP-267].** Of particular relevance are Annex A: National Policy Statement Accordance Tables and Annex B: Local Policy Accordance Tables, of the Planning Statement which set out an appraisal of the Scheme against national and local planning policies. Of particular relevance to the assessment of effects on local communities are **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Chapter 13: Transport and Access [APP-065], Chapter 14: Noise and Vibration [APP-066], Chapter 15: Air Quality [APP-067], Chapter 16: Socioeconomics, Tourism and Recreation [APP-068], and Chapter 18: Human Health [APP-070]**, all of which consider potential impacts on residential properties and local communities.
Respondents expressed general support for and/or welcome the Scheme's proposed mitigation measures.	The Applicant makes note of these comments and welcomes continued constructive dialogue.
Some respondents expressed concern about whether the specialists carrying out the environmental assessments are fully independent and impartial, and questioned the reliability of the findings. A number of respondents suggested that independent specialists should undertake environmental and ecological surveys.	The Applicant disagrees that the team undertaking the environmental assessments are biased. The **Environmental Statement (ES) [APP-052 to APP-265]** and environmental and ecological surveys have been undertaken by competent experts with considerable experience assessing similar schemes. Details of qualifications, experience and professional institute membership are provided within **ES Volume 3, Appendix 1-1 Statement of Competence [APP-180]**.

Some respondents expressed concerns that the Scheme does not align with, or would not deliver against, its stated design principles.	The Applicant has prepared a **Design Approach Document (DAD) [APP-268]** which explains how the design principles developed for the Scheme (as detailed in Appendix B Design Vision and Principles) have influenced the design of the Scheme and been a key consideration in decisions by the Applicant. The Applicant has dedicated significant resource both internally and through appointment of an experienced team of consultants to develop a high-quality design for the Scheme. The design principles developed for the Scheme were informed by national and local policy, government guidance, and the local context. The design of the Scheme has been Landscape Led, and gives due weight to the intrinsic character and beauty of the surrounding countryside as demonstrated in the DAD which explains that numerous field parcels have been removed or had solar PV panels removed from them as part of the design evolution of the Scheme, to reduce impacts on the setting of the Cotswolds National Landscape, with some parcels being replaced with environmental mitigation and enhancement, to further enhance the value of the Cotswolds National Landscape. These changes have been made in discussion with the Cotswolds National Landscape Board, landscape officers at Wiltshire Council and engagement with other stakeholders. The DAD also explains how the mitigation hierarchy has been a key consideration from the outset of the Scheme design, and that various changes have been made to the Scheme including removal of infrastructure and fields to minimise impacts on heritage.
Respondents expressed general support for the Scheme's design principles.	The Applicant makes note of these comments and welcomes support from these representations.

Some respondents expressed concern that the primary motivation for bringing forward the Scheme is financial profit. A number of respondents also referred to "greenwashing" or questioned the developer's commitment to tackling climate change and supporting Net Zero objectives.	The Applicant notes the concerns about the reasons behind the Scheme. The Applicant's **Statement of Need [APP-266]** provides evidence that the Scheme aims to help meet national targets for clean energy and net zero targets set out in legislation and policy. The aim is to deliver long term environmental benefit alongside a secure energy supply. The Applicant is committed to meeting all planning, environmental, and construction policies and standards. The Scheme is being developed in line with legal and regulatory requirements, with engagement with all statutory and non-statutory bodies, ensuring quality and accountability throughout.
Some respondents expressed general distrust towards the Applicant. Some respondents raised specific concern regarding the involvement of Macquarie.	The Applicant acknowledges the expression of distrust towards the Scheme and has demonstrated the Scheme's compliance with all statutory requirements under the Planning Act 2008 and applicable legislation such as The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. The Applicant is subject to legally binding Development Consent Order (DCO) requirements. The Planning Act 2008 also contains enforcement provisions regarding compliance with the terms of a DCO. The Applicant has a strong track record of developing Nationally Significant Infrastructure Project (NSIP) scale projects, notably the consented Cottom Solar Project and West Burton Solar Project, alongside a strong pipeline of further applications coming forward. The Applicant confirms that the owners of Island Green Power, Macquarie, has a strong record of long-term UK investment. Since 1999, Macquarie has invested more than £65 billion into UK infrastructure, including energy projects, supporting more than 33,000 UK jobs. **The Funding Statement [APP-019]** in the Application provides details of the corporate structure of Lime Down Solar Park Limited and how the Scheme is being funded.

Some respondents raised concerns about foreign investment in the Scheme and whether profits would be distributed outside the UK. A number of respondents also expressed concerns relating to national security, including the potential involvement of hostile or malicious state actors. Some respondents questioned whether the Applicant would pay appropriate taxes in the UK.	The Applicant, Lime Down Solar Park Limited is a 100% subsidiary of IGP UK Projects Limited. Both are registered in England and Wales and subject to UK tax law and regulations. Investment may come from a range of sources, including international ones. This is common practice with UK infrastructure projects and helps fund the transition to clean energy at the scale required. The Applicant highlights Island Green Power's Cottam and West Burton projects which have received Development Consent Orders (DCOs). The Cottam Solar Project was granted development consent by the Secretary of State on 5 September 2024. The West Burton Solar Project was granted development consent by Secretary of State on 24 January 2025. **Funding Statement [APP-019]** submitted with the DCO application demonstrates that the Scheme is financially viable and adequately funded to deliver the Scheme in full.
Some respondents expressed concern that the Applicant may not fully comply with the requirements of the Development Consent Order (DCO), if granted. In particular, some respondents highlighted concerns about compliance with decommissioning requirements at the end of the Scheme's operational life. A number of respondents also raised concerns that, if ownership of the Scheme were to change in the future, compliance with DCO requirements may not be maintained.	The Applicant confirms that, if consent is granted, it has the capability to build, own, and operate the Scheme. The Applicant may also consider the option to sell or transfer the Scheme to another suitably qualified party. Regardless of any future ownership, the undertaker as defined in the **draft Development Consent Order (DCO) [APP-016]** will remain bound by the legally enforceable requirements of the DCO.

Some respondents expressed general concern about the overall cost of the Scheme and whether sufficient funding has been secured. A number of respondents also questioned whether the Scheme would be cost-effective or financially viable in the long term.	The Applicant acknowledges comments regarding the cost effectiveness and profitability of the Scheme. However, it is important to clarify that Lime Down Solar Park is a privately financed development. All financial risks associated with the construction, operation, and maintenance of the Scheme, including those related to the cable route, are borne entirely by the developer. The commercial viability of the Scheme has been assessed as part of the developer's investment decision, including the length of the cable and associated infrastructure. The **Funding Statement [APP-019]** submitted with the Development Consent Order (DCO) application demonstrates that the Scheme is financially viable and adequately funded to deliver the Scheme in full.
Some respondents expressed concern about the potential use of taxpayer funding or government subsidies in relation to the Scheme.	The Applicant confirms that Lime Down Solar Park is being developed solely through private sector financing and that it has not received, and is not receiving any public money, subsidy or funding in the development of the Scheme.
Some respondents expressed concern about the proposed use of compulsory purchase or compulsory acquisition powers as part of the Scheme.	The Applicant's goal is to deliver Lime Down Solar Park on land where the owner has voluntarily agreed to its use. Meaningful conversations with identified land interests have helped inform the design which in turn assists in avoiding people's land, including homes or gardens. As is standard in Nationally Significant Infrastructure Project (NSIP) solar schemes, the **draft Development Consent Order [APP-016]** includes provision for compulsory acquisition of land and rights, but these are subject to controls and limitations. These powers sought are necessary and proportionate to ensure the deliverability of the Scheme.
Some respondents expressed dissatisfaction with the consultation process undertaken for the Scheme.	The Applicant considers that the statutory consultation has been robust, thorough and undertaken in accordance with the requirements of the Planning Act 2008, the Environmental Impact Assessment (EIA) regulations, and the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009. The **Consultation Report [APP-022]** sets out the Applicant's approach to pre-application consultation. The Applicant also notes that the examination process provides a further opportunity for interested parties to comment on the Scheme. This examination is managed by an independently appointed Examining Authority. Further to this, the Applicant provided an extended relevant representation period beyond the minimum statutory timeframe to allow

	sufficient time for members of the public to review the submitted application documents and register as an interested party. The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme.
Site Selection and Alternatives	
Respondents expressed concern about the scale of the Scheme, with some stating that it is too big.	The Scheme has been designed to deliver the greatest possible benefit from the available land and the available grid connection, whilst avoiding, minimising and/or mitigating harmful environmental effects. As per the description set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]** the total area within the DCO Order Limits encompasses approximately 1,237 hectares (ha). Of this, the 'Solar PV Sites' comprise approximately 749.1 ha of land. Around 479.5 ha of this land is proposed as being required for installation of solar PV, battery storage, and associated infrastructure. The remaining 269.5 ha would provide areas dedicated to ecological mitigation, measurable Biodiversity Net Gain (BNG) delivery, landscaping, offsets and agricultural land managed for environmental enhancement and habitat creation. These mitigation measures are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and detailed within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The Cable Route Corridor, which stretches approximately 22 km from 'Lime Down D' to Melksham Substation and links together the Solar PV Sites, covers approximately 463.2 ha. Approximately 17.8 ha (of which 5.9 ha overlap with the Cable Route Corridor) is proposed for Highway Improvement Areas within which improvements to sections of the existing highway

	network will be completed to facilitate access to the Scheme, such as improvements to road edge and traffic management. Work will be undertaken by the Applicant and National Grid within the Existing National Grid Melksham Substation, requiring a total area of 12.8 ha. This is set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. The Applicant remains committed to delivering a Scheme that makes a meaningful contribution to the UK's transition to net zero, while also seeking to minimise adverse impacts and maximise opportunities for environmental enhancement and community benefits.
Some respondents expressed concern that the Solar PV Sites are located a considerable distance from the grid connection point at Melksham Substation, and that the proposed cable route is too long. Some respondents suggested that a site closer to Melksham Substation should be selected instead. A number of respondents also referred to the potential for energy losses over the length of the cable route and questioned whether this would affect overall efficiency or cost effectiveness.	The Applicant confirms that the existing National Grid Melksham substation has been identified as the point of connection. This decision was based on available capacity, network resilience, and strategic grid planning. As explained in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, an initial search area was identified at a 5 km radius from the point of connection (POC), however this was later expanded as no suitable and available sites within 5 km were identified. The search area was enlarged incrementally to a 20 km radius which is considered by the Applicant to be a viable cable connection distance for a solar project of this scale. The POC and 20 km search area is shown on Figure 1, Annex C of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Further, from an operational perspective, high voltage electricity transmission at 400kV in this case, is specifically designed to minimise energy losses over long distances. As such, the approximate 20km distance involved results in negligible losses. More details on how the Cable Route Corridor has been located and designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **ES [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts.

Some respondents expressed concern that the solar areas are too fragmented or spread across a wide area. Some respondents also questioned the need for multiple land parcels within the Scheme.	As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant undertook an initial review which did not identify a single site of the appropriate size (1,100 ha) within the area of search. Therefore, the Applicant considered both contiguous land parcels and land parcels near one another. The **Statement of Need [APP-266]** explains at Section 7.4 that NSIP proposals may comprise adjoining or separate parcels of land and that "*the connection of separate parcels of suitable land together into a single scheme may, subject to analysis, enable those parcels of land to connect economically to the electricity system*" which is the case for this scheme. Section 8.2 of the **Statement of Need [APP-266]** explains that by bringing the parcels together into a single scheme, the Scheme is able to carry a connection to the National Electricity Transmission System (NETS), thus providing a local source of low carbon electricity and also enabling the efficient bulk transfer of energy generated at the Scheme so that any surplus can be used to cover shortfalls elsewhere. By connecting to the NETS, the Scheme will not impact the feasibility or timing of distribution network connections for either new generation or consumption connections which among other things are required to support the delivery of Wiltshire County Council's growth plans.
Some respondents expressed general opposition to the Scheme on the basis that they consider it to be in the wrong location.	National Policy Statement EN-3 Paras 2.10.11 and 2.10.18 explain that the availability of grid connection, suitable irradiance levels, and local topography are key inputs to the selection of sites suitable for large-scale solar generation developments. The number of locations within the UK at which large-scale solar generation is suitable is therefore likely to be limited, and this is a material issue when considering how the UK is to meet the urgent need for low carbon generation as is set out in the NPSs. This point is expanded upon in the **Statement of Need [APP-266]** in particular in Section 4.3. Chapter 8 of the **Statement of Need [APP-266]** provides evidence to support the suitability of the proposed location of the Scheme for large-scale solar plus storage in relation to the timeliness and availability of the grid connection, transmission system operability and the decarbonisation and energy security benefits the Scheme will bring forward from this location. As set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the Site Selection Assessment Report at **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** an appraisal of alternative sites within a 20km radius of the Existing National Grid Melksham Substation has been undertaken, which concludes that there are no more suitable locations within the 20km search area than the proposed location for the Scheme.

Some respondents raised general concerns about the site selection process and the suitability of the sites chosen for the Scheme.	Site selection is addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**. Paragraph 2.10.31: *"…at this scale, it is likely that applicant's developments will use some agricultural land. Applicants should explain their choice of site, noting the preference for development to be on suitable brownfield, industrial and low and medium grade agricultural land".* **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** explains how brownfield land, industrial land, previously developed land, and low-grade agricultural land were considered, policy. As set out in **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** the Applicant reviewed brownfield land registers for local authorities within the area of search including Wiltshire Council, South Gloucestershire Council, Bath and Northeast Somerset Council, and Somerset Council. The assessment concluded that there were no sites within the search area of sufficient size to accommodate a large-scale solar development, either individually or cumulatively. The sites assessed were too small to support the proposed Scheme and were largely allocated for housing or mixed-use development, in line with local planning policies, thereby creating a conflict with the intended use for renewable energy infrastructure. Therefore, it was concluded that there was no available or suitable brownfield land for the purposes of the Scheme.

Some respondents expressed scepticism that other suitable sites had not been properly considered. Some respondents also expressed dissatisfaction that alternative sites were not subject to consultation.	There is no general requirement in NPS EN-1 to consider alternatives or establish that the proposed Scheme represents the best option from a policy perspective. Although there is no general planning policy requirement to consider alternatives and show the proposals represent the best option, the requirement to describe the alternatives considered by the Applicant is required by the Infrastructure Planning (Environmental Impact Assessment) Regulations 2017 and in specific circumstances as set out in NPS EN-1. The Applicant followed a staged approach to assessment, taking into consideration a range of planning, environmental and operational factors. **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** explains the methodology that has been applied when identifying and evaluating potential sites for the Scheme. It identifies a number of potential development areas for the Scheme and presents how each of those areas perform against a range of planning, environmental and operational constraints and opportunities. This report concludes that there are no more suitable and available locations within the search area than the proposed location for the Scheme, based on the criteria identified. Further, as described in the **Statement of Need [APP-266]**, in particular in Section 2.9, the government is seeking a large capacity of new low carbon schemes to come forwards to prioritise projects needed for 2030, while maintaining a robust pipeline of projects beyond 2030 towards meeting net zero by 2050. The urgent and unprecedented requirement for new large scale solar schemes supports the view that any other suitable and available sites, if such sites had been found, would likely also be needed.
Some respondents expressed concern that the site was selected primarily on a commercial basis, particularly through identifying landowners willing to make land available, rather than on wider planning, environmental or technical considerations.	As detailed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has followed a staged approach to assessment, taking into consideration a range of planning, environmental and operational factors. Potentially willing landowners with large scale land holdings within the search area was a consideration, however it is not the only consideration in the site selection process.
Some respondents expressed general concern or opposition regarding the proposed location of the Battery Energy Storage System (BESS).	The location of the BESS was determined through an options appraisal and iterative design process, having regard to technical requirements, environmental constraints and potential effects on nearby receptors. The BESS Area is located at Lime Down D, close to the Solar PV Sites and the on-site substation, which provides operational and efficiency benefits, including minimising transmission losses, maximising storage efficiency, supporting grid balancing, and enabling a rapid and reliable response to network fluctuations. Among the options considered for co-locating the BESS with the Solar PV Sites, Lime Down D was identified as the preferred location due to its central position within the Scheme, the

	presence of existing and proposed screening, its limited proximity to many residential properties, and its relationship with existing infrastructure, including the adjacent railway line. The various chapters of the **Environmental Statement (ES) [APP-052 to APP-265]** assess the likely significant effects arising from the BESS at this location and identify mitigation measures where necessary. Overall, the assessment concludes that the siting of the BESS at Lime Down D presents the lowest potential for significant adverse effects when compared with reasonable alternatives. Further detail on the consideration of alternatives, the design evolution of the Scheme and the assessment of potential effects is provided in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**, which sets out the iterative process undertaken to identify the preferred location and layout for the Scheme, including the BESS Area in Section 4.7.
Some respondents expressed general concern regarding the proposed location of the cable route.	Details on how the design of the Cable Route Corridor has evolved and been designed can be found in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. Several factors were considered designed to take a direct route whilst following existing features, such as roads, and avoiding sensitive receptors as far as practicable, such as habitat designations, residential and commercial properties, heritage assets, and a large number of land interests. The assessments set out in the various chapters of the **Environmental Statement (ES) [APP-052 to APP-265]** detail what impacts are expected as a result of the Scheme based on the minimum and maximum parameters of the Scheme, and the mitigation and enhancement measures that are proposed to reduce these impacts.
Construction and Decommissioning	

Some respondents raised ethical concerns about solar panels being procured from China or other overseas countries, including whether panels would be responsibly sourced. A number of respondents also expressed concern about the potential for modern slavery within the supply chain. Some respondents further raised environmental concerns relating to the importation of panels from overseas, including the associated carbon footprint.	Island Green Power is part of the Solar Energy UK Supply Chain Commitment, which binds the Applicant to ensuring that its supply chains are free of slavery. As part of this, the solar sector in the UK and Europe has launched the Solar Stewardship Initiative (SSI), which independently inspects and certifies individual factories for sustainable and ethical practices. The Applicant expects to source its panels from factories within countries that are SSI-accredited. The effects of emissions generated from embodied carbon within products including importation from panels sourced overseas to be used on site (as well as construction, operation and decommissioning emissions) are all considered in **ES Volume 1, Chapter 7: Climate Change [APP-059]**. The CO2e figures are included in detail within the ES chapter. The chapter concludes that the emissions from these sources would be outweighed by the reduced emissions as a result of the Scheme contributing to decarbonisation of energy from the National Grid.
Some respondents expressed general concern about potential disruption during the construction phase of the Scheme.	The likely significant effects of the Scheme during the construction phase are assessed throughout the **ES [APP-052 to APP-265]**, including effects on traffic and transport, noise and vibration, air quality, landscape and visual amenity, ecology, and local communities. As part of the assessment, appropriate mitigation measures have been developed and are incorporated into the Scheme. Measures to limit disruption during construction are secured in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that a CEMP must be submitted to and approved by the relevant planning authority, and that CEMP must be substantially in accordance with the **Outline CEMP [APP-277].** All construction works must be carried out in accordance with the approved CEMP.
Respondents expressed concerns about the construction of the cable route. In particular, some respondents raised questions about the proposed width and depth of the cable trench.	The construction of the cable route has been assessed throughout the **Environmental Statement (ES) [APP-052 to APP-265]**, which considers the effects associated with these works. The ES assesses the cable route within defined parameters, including limits on working width and trench dimensions (as identified within **ES Volume 1 Chapter 3 The Scheme [APP-055]** to ensure that a reasonable worst-case scenario is assessed. The detailed design and construction of the cable route will be undertaken within the parameters (including in relation to width and depth of the cable trench) assessed and

	authorised by the DCO. Measures to manage and minimise construction effects, including reinstatement of land following installation, are set out in the **Outline Construction Environmental Management Plan (CEMP) [APP-277]**. Requirement 13 in Schedule 2 to the **Draft DCO [APP-016]** secures that prior to construction, a CEMP must be submitted to and approved by the relevant planning authority, and that CEMP must be substantially in accordance with the **Outline CEMP [APP-277].** All construction works will be carried out in accordance with the approved CEMP.
Some respondents expressed general concern about the operation and maintenance phase of the Scheme, including how it would be managed over its lifetime.	The operation and maintenance of the Scheme have been assessed throughout the **Environmental Statement (ES) [APP-052 to APP-265]** which considers operational effects across relevant topic areas. As part of the assessment, appropriate mitigation measures are incorporated into the Scheme and secured through the DCO and associated management plans. The framework for managing environmental effects during the operational phase is set out in the **Outline Operational Environmental Management Plan (OEMP) [APP-278]** which identifies how commitments made in the **ES [APP-052 to APP-265]** will be implemented during operation and maintenance, including control of lighting, operational traffic, noise, air quality, landscape and ecological management, soil protection, water management and community liaison. It also sets out monitoring and reporting arrangements to ensure mitigation measures remain effective throughout the operational life of the Scheme. The detailed Operational Environmental Management Plan will be prepared substantially in accordance with the **Outline OEMP [APP-278]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of operation. This requirement is secured through Requirement 14 of the **Draft Development Consent Order [APP-016]**.

Some respondents expressed general concern about potential disruption during the decommissioning phase of the Scheme. A number of respondents also requested further information about decommissioning, stating that insufficient detail had been provided.	The decommissioning of the Scheme has been assessed within the **Environmental Statement (ES) [APP-052 to APP-265]** which considers the effects associated with decommissioning activities. As part of the assessment, appropriate mitigation measures are incorporated into the Scheme. Information on decommissioning activities is provided within the **ES [APP-052 to APP-265]** and within the **Outline Decommissioning Strategy [APP-279]**. The information is provided in accordance with the requirements of Part 1 of Schedule 4 of the EIA Regulations 2017 (as amended). Schedule 4 of the EIA Regulations 2017 (as amended) set out the information for inclusion in an ES. **ES Volume 1, Chapter 1: Introduction [APP-053]** Table 1-2 identifies where the requirements of Schedule 4 of the EIA Regulations 2017 (as amended) have been addressed. At the end of the Scheme's operational life, all Solar PV Sites would be decommissioned and the land restored to its original use and condition as far as practicable. There will be opportunities for the retention of a range of biodiversity improvements, including established habitats, hedgerows and woodland, beyond the decommissioning of the Scheme, ultimately enhancing the ecological value of the area. Measures to manage and minimise disruption during decommissioning are set out in the **Outline Decommissioning Strategy [APP-279]**. This explains how mitigation measures identified in the **ES [APP-052 to APP-265]** will be implemented during decommissioning and includes controls for working hours, noise, lighting, traffic management, pollution prevention, waste management and community liaison. The **Outline Decommissioning Strategy [APP-279]** also confirms that decommissioning activities will be undertaken in phases over an anticipated 12–24-month period, with measures to coordinate traffic movements, control noise and vibration in accordance with best practicable means and manage temporary lighting to minimise effects on nearby receptors. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The land will be returned to the landowner as quickly as is practicable after decommissioning.

Some respondents expressed scepticism that the land would be returned to its original use, including agricultural use, following decommissioning of the Scheme. Some respondents suggested that this concern is heightened by the potential for the Scheme to change ownership before the decommissioning phase. Some respondents also stated that the land should not be classified as brownfield following decommissioning.	The effects of decommissioning on soils and agricultural land are assessed in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. As stated in this chapter, as well as in Section 2 of the **Outline Decommissioning Strategy [APP-279]** which is secured under Schedule 2, Requirement 20 of the **Draft Development Consent Order (DCO) [APP-016]**, all land will be returned to its original use and condition as far as practicable and returned to the landowner. Should the Scheme change ownership before the decommissioning phase, any new owner remains bound by the commitments and obligations set out within the DCO and associated management plans. The effect on agricultural land quality at decommissioning would be influenced by the extent of disturbance caused by the removal of the Solar PV Panels, for example the presence and dimensions of leftover voids or the depth of the remaining underground cables. Currently, the most environmentally acceptable option is to leave the cables in-situ, although the cables could be removed by excavating at regular intervals and pulling the cable through to the extraction point, thus avoiding the need to excavate the entire cable trench. In either case, the disturbance to the land and soil would be less than that likely to occur during the construction phase. Built aspects of the Scheme such as the BESS Area and substations are also subject to the proposal to return the land to its original use and condition, which is primarily agricultural land of Subgrade 3b quality, with some Subgrade 3a at the BESS Area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**. The Applicant confirms that none of the land will be considered brownfield after decommissioning. The expectation is that the land will return to farming, but the Applicant

	cannot dictate what will happen to the land post-decommissioning when the Applicant no longer has an interest in the land.
Some respondents expressed general support for the restoration of the land to its original use following decommissioning. Some respondents also emphasised that the land should be returned to its original condition, including agricultural use where applicable.	The Applicant recognises the importance of restoring the land following decommissioning and is committed to ensuring that appropriate measures are secured to achieve this. The Applicant welcomes the support received in this regard. At the end of the Scheme's operational life, all Solar PV Sites would be decommissioned and the land restored to its original use and condition as far as practicable. There will be opportunities for the retention of a range of biodiversity improvements, including established habitats, hedgerows and woodland, beyond the decommissioning of the Scheme, ultimately enhancing the ecological value of the area. Measures to manage decommissioning and reinstatement are set out in the **Outline Decommissioning Strategy [APP-279]**, which has been submitted as part of the DCO Application. The Decommissioning Strategy will include robust methodologies and control points to avoid contamination of the underlying land with physical or chemical contaminants and will be applied in conjunction with the Soil Resources Management Plan (SRMP) in order to promote successful reinstatement. A detailed Decommissioning Strategy will be prepared substantially in accordance with the **Outline Decommissioning Strategy [APP-279]** and must be submitted to and approved by the relevant local planning authority prior to the commencement of decommissioning. This is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. In addition, the Applicant is seeking a time-limited consent for the Scheme to have an operational period of 60 years, with decommissioning to take place following cessation of operation. This is secured by Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]**.
Some respondents requested further information about how decommissioning of the Scheme would be funded and who would be responsible for delivering it. Some respondents asked whether funds would be set aside to cover decommissioning costs in the event that the Applicant were to become insolvent.	A requirement to decommission the Scheme is part of the Development Consent Order (DCO); failing to comply with that requirement would be a criminal offence. The requirement to decommission the Scheme would sit with the owner at the time of decommissioning. Failing to comply with Requirement 20 would be a criminal offence. Decommissioning is also covered in agreements with landowners, which includes decommissioning securities to cover the cost of decommissioning in the event of any breach by the Applicant or in the event of the insolvency of the Applicant. The amount of such decommissioning security is regularly re-valued throughout the lifecycle of the Scheme and topped up if necessary.

A number of respondents also expressed concern that the cost of decommissioning could fall to taxpayers.	Decommissioning is secured through Requirement 20 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. As set out in the **Funding Statement [APP-019]** submitted with the DCO Application, the Applicant is committed to ensuring that appropriate financial provisions are in place to cover decommissioning costs at the end of the operational life of the Scheme.
Some respondents expressed scepticism that solar panels and other components of the Scheme would be appropriately recycled at the end of their operational life.	The **Outline Operational Environmental Management Plan (OEMP) [APP-278]**, secured by Schedule 2, Requirement 14 of the **Draft Development Consent Order (DCO) [APP-016]**, sets out the commitment of the Applicant to maximise recycling and reuse of Scheme components at the end of their life. Section 4 of **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** sets out that, due to the market and policy trends, it is assumed that specialist regional or national facilities would be in place at the time of component replacement (e.g. solar panels and batteries and decommissioning), and these would be developed in response to demand generated by the UK-wide solar PV panel industry and would be reused, recycled, or recovered and not disposed of to landfill. Details of how the panels and Battery Energy Storage System (BESS) will be disposed of are provided within Section 4 of **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, which states that recycling routes are generally available for component replacement waste at present, and it is likely that there will be even greater opportunities for recycling in the future, not least because the recycling market will have expanded to meet demand as solar PV installations increase.
Climate Change and Energy Need	
Some respondents expressed scepticism about climate change and questioned the scientific basis for climate policy and associated targets.	Climate change is recognised globally as a serious environmental threat by recognised experts. The methods used in the assessment of climate change in **ES Volume 1, Chapter 7: Climate Change [APP-059]** are standard methods for quantification of the effects of Climate Change based on information from UK government's Department for Security, Energy and Net Zero and applicable guidance such as the Institute of Environmental Management and Assessment.

Some respondents expressed concern about the environmental effects associated with the manufacture of components used in the Scheme.	The effects of emissions generated from embodied carbon within products to be used on site, as well as construction, operation and decommissioning emissions, are assessed in **ES Volume 1, Chapter 7: Climate Change [APP-059]**. The CO_2e figures are included in detail within this ES chapter. Emissions from production of the required cables are included within the assessment. The chapter concludes that the emissions from these sources would be outweighed by the reduced emissions resulting from the Scheme contributing to decarbonisation of energy from the National Grid. Further, as outlined in the chapter, the emissions of replacing the solar panels, inclusive of the embodied carbon (manufacturing and transportation emissions), are considered in the assessment. The DESNZ conversion factors used for the assessment of embodied carbon cover the extraction, primary processing, manufacture and transportation of materials. Baseline and future conditions are set out in Section 7.7 of the assessment. Although it is expected there will be some baseline emissions from the Site's current use and some carbon sequestration from the grassland once the Scheme is in place, as a conservative approach the baseline emissions and the grassland sequestration were considered zero.

Some respondents expressed concern about the environmental impacts associated with the extraction and use of rare earth elements and other critical minerals required for the Scheme.	**ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses the greenhouse gas (GHG) emissions associated with the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components such as solar PV panels, inverters, transformers and battery storage infrastructure. This includes consideration of embodied carbon arising from the production of rare earth materials and components, which reflects the upstream environmental impacts associated with their manufacture. The assessment recognises that the manufacture and transport of solar PV panels and batteries represent a notable proportion of the Scheme's lifecycle GHG emissions. These impacts are considered within the context of national carbon budgets and the UK's transition to net zero, with the assessment concluding that the Scheme would make a meaningful contribution to reducing greenhouse gas emissions over its operational lifetime when compared to a 'without Scheme' scenario. In addition, **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** considers the use of materials and natural resources, including minerals, materials supply. This chapter confirms that the Scheme would not give rise to significant effects in relation to minerals, materials or waste, and that embedded mitigation measures and good practice would be applied throughout the construction, operation. The ES also identifies embedded mitigation measures across the Scheme, including the use of durable components with long operational lifespans, allowances for replacement over time, and the recyclability of key components such as solar panels, batteries and electrical equipment. These measures reduce the need for ongoing extraction of virgin materials and limit long-term environmental impacts.
Some respondents expressed concern that the Scheme would cause greater environmental harm than environmental benefit, including suggestions that it	**ES Volume 1, Chapter 7: Climate Change [APP-059]** assesses greenhouse gas (GHG) emissions across the full life cycle of the Scheme, including the manufacture, transport, installation, operation, maintenance and decommissioning of Scheme components. This assessment includes embodied carbon associated with materials and components, as well as operational emissions savings arising from renewable electricity generation.

could result in higher carbon emissions than it would save. Some respondents also expressed scepticism about whether the Scheme should be described as 'green'.	The assessment concludes that, while emissions are associated with the manufacture and construction of the Scheme, these are outweighed over time by the carbon savings achieved through the displacement of fossil fuel-derived electricity generation. When considered over its operational lifetime, the Scheme would result in a net reduction in GHG emissions compared to a 'without Scheme' scenario and would make a meaningful contribution to the UK's legally binding carbon budgets and transition to net zero.
Some respondents expressed concern that the Scheme could alter local weather patterns or contribute to a localised heat island effect.	Evidence from published research indicates that large-scale solar arrays do not give rise to significant or widespread heat island effects. An 18-month study by Fthenakis and Yu (2013) found that solar arrays are typically fully cooled during night-time hours, meaning that sustained heat retention and associated heat island effects are unlikely to occur. Further research by Barron-Gafford et al. (2016) concluded that any temperature increases associated with solar PV installations are localised and do not extend beyond the immediate boundary of the solar farm. As such, any microclimatic effects are limited in extent and rapidly dissipate with distance from the panels. On this basis, the microclimate and heat island effects associated with the Scheme are not considered to be significant, and no meaningful thermal stress, discomfort or change in local weather conditions is anticipated for nearby residents or surrounding land uses.
Some respondents expressed the view that Wiltshire is already making a sufficient contribution towards reducing carbon emissions and generating renewable electricity.	The Applicant notes this comment and recognises the commitment of Wiltshire residents to addressing climate change and supporting renewable electricity generation. The Scheme would build on this existing progress by making a further contribution to renewable energy generation and carbon emissions reduction at both a local and national level.
Some respondents expressed general support for renewable energy, including solar power, with some indicating that they are not opposed to ground-mounted solar in principle.	The Applicant welcomes these comments recognising the importance of renewable energy and the role it can play in supporting the transition to a low-carbon energy system.

Some respondents questioned or doubted the need for the Scheme.	The **Statement of Need [APP-266]** describes that there is an urgent and unprecedented need for new low carbon generation in the UK to meet our climate change, energy security and affordability targets. Further, the Government considers that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Further, Section 2.9 of the **Statement of Need [APP-266]** describes that the government is seeking a large capacity of new low carbon schemes to come forwards to prioritise projects needed for 2030, while maintaining a robust pipeline of projects beyond 2030 towards meeting net zero by 2050. The Scheme has received notification that, as part of NESO's connection queue reprioritisation process, the solar component of the scheme has been re-prioritised as a Gate 2 Phase 1 connection (i.e. connecting in 2030 or earlier) and that the BESS component of the Scheme has been re-prioritised as a Gate 1 connection. The indicative connection date of the BESS has not yet been confirmed. National Policy Statement EN-1 also states that the Secretary of State should assess all applications for development consent for the types of infrastructure included by the NPS (including solar) on the basis that there is demonstrated urgent need for them, that substantial weight should be given to this need, and that the Secretary of State is not required to consider the specific contribution of any individual project to be satisfied that need is established (EN-1 Paras 3.2.6 - 3.2.8). This representation goes to the merits of the NPS, and to have regard to it would be directly in contradiction of NPS EN-1 (in particular the paragraphs cited above that make clear that the need is established and that there is no requirement to consider the contribution of individual projects). The determination of the Applicant's DCO Application is not the means by which to challenge the provisions of the NPS, and it is for this reason that the ExA and SoS are able to disregard this representation and any similar others, pursuant to sections 87, 94 and 106 of the Planning Act 2008 during the examination of the Application and when determining the Application.

Some respondents expressed concern that electricity generated by the Scheme would not be used locally, including within Wiltshire. Some respondents suggested that the electricity should be supplied directly to local households. A number of respondents also expressed concern that electricity generated by the Scheme could be used outside the UK.	Section 7.2 of the **Statement of Need [APP-266]** explains that the Scheme will connect to the National Electricity Transmission System (NETS) at Melksham. By connecting to the NETS, generation from the Scheme will be transmitted efficiently to both local consumers and across the country where it is required. This is a key benefit of the Scheme and helps the UK's electricity system operate efficiently. This is a benefit to all consumers, including local consumers, who, through their energy bills, pay for the operational costs of the UK's electricity networks. Interconnectors flow electricity between countries and are used to balance supply and demand. Government is supportive of increased interconnection for the economic and security of supply benefits they can bring. National Policy Statement for Energy (EN-1, paragraph 3.3.32) recognises that interconnection between national borders has an essential role in delivering a secure, low carbon electricity system at low cost.
Some respondents supported or acknowledged the Scheme's potential contribution to UK energy security.	The Applicant welcomes the support expressed and agrees that the Scheme would make a positive contribution.
Some respondents expressed the view that solar PV cells and solar panels are inefficient. Some respondents suggested that the UK is not a suitable location for solar generation due to limited sunlight and frequent cloud cover. A number of respondents also described solar energy as unreliable because generation depends on levels of sunlight.	Solar energy is at the heart of the Clean Power 2030 Mission (January 2026 revised NPS EN-3, Para 2.10.2) and it is the Government's view that a secure, reliable, affordable, net zero consistent system in 2050 is likely to be composed predominantly of wind and solar (NPS EN-1, Para 3.3.20). Sunlight, the input energy source for solar, is abundant, predictable, renewable, low carbon and free. Figure 16 of the **Statement of Need [APP-266]** and related text (Section 7.4) demonstrates that there are many viable areas of solar irradiation in the UK. Figures 28 and 29 of the Statement of Need and related text (Section 8.5) demonstrate that a multi-technology approach to electricity supply, including solar, can reduce the effects of weather variability on output and is capable of closely matching a future projection of national electricity demand on a month-average level. The inclusion of a Battery Energy Storage System as part of the Scheme will enable energy generated by the Scheme to be stored and exported to the grid when it is needed, which will provide flexibility and improve grid reliability. Finally, that other countries may experience higher solar irradiation levels than the UK, means that they too could pursue solar generation to support their climate change plans. However, any such statistic cannot be used to demonstrate that solar in the UK does not work or should not be pursued. Government policy is clear that solar should be pursued in the UK with urgency because of the significant benefits it will bring to the UK energy system, consumers and to help meet UK clean power targets.

Some respondents expressed the view that solar panels are outdated or may soon be superseded by more efficient technologies.	Solar PV is a well-established and widely deployed form of renewable electricity generation that is capable of delivering reliable, large-scale low-carbon power over the lifetime of the Scheme. While technological efficiencies are expected to continue to improve over time, this does not reduce the effectiveness of solar PV as a means of reducing greenhouse gas emissions either now or in the future. The Scheme has been designed to allow for the replacement and upgrading of components during its operational life, enabling the use of more efficient technology as it becomes available, within the parameters assessed. This approach ensures that the Scheme remains effective and adaptable while continuing to deliver meaningful carbon savings.

Some respondents expressed a preference for alternative forms of energy generation, including other renewable technologies or non-renewable sources, with some identifying specific options they would favour.	Chapter 6 of the **Statement of Need [APP-266]** provides an analysis of many different low carbon generation technologies which are being developed as part of the UK's fight against climate change. The Statement of Need concludes, in Section 6.12, that a large capacity of many low carbon technologies is required to meet the Government's energy objectives. While the need for unprecedented capacity growth is urgent, some technologies (e.g. nuclear, SMRs, tidal) are either unproven at scale, unconsented, unfunded or have long development timescales (and therefore do not meet the urgent need identified in EN-1 Para 3.1.1 and following). These technologies and indeed other technologies may not be suitable to connect to Melksham substation and therefore would not support the need to use existing and available infrastructure to minimise the cost and timescales associated with connecting to the grid, the large capacities of low carbon generation needed to meet net zero. Section 7.7 of the Statement of Need compares the annual energy generated per square kilometre from solar, from onshore wind and from crop-to-energy (biofuels) technology. The analysis shows that large-scale ground-mount solar schemes which maximise their annual output, are likely to produce a greater quantity of low carbon electricity per acre than the output from a crop-to-biogas application; and that the energy production from land under solar is of a similar order of magnitude to the energy production from land under onshore wind, while the environmental effects of solar schemes may be significantly lower. The Applicant therefore agrees that other low carbon technologies are urgently needed in the UK to meet the UK's climate legal targets; however, none of those technologies are more suitable at the proposed location than the Scheme, and none listed in this Representation are viable alternatives to the Scheme, because they will all be needed too.
Landscape and Visual	

Some respondents expressed general concern about the visual impact of the Scheme. Some respondents also raised concerns about potential effects on private views and views from nearby properties.	An assessment of landscape and visual effects are presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) assesses effects on identified landscape and visual receptors, including residential properties, users of public rights of way and roads, and identifies where significant effects may occur. The LVIA found no significant long term visual effects to residential properties as a consequence of the Scheme. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. Temporary Major/Moderate and Moderate Adverse effects on visual receptors have been recorded across the Scheme during construction and at Year 1. However, for the majority of these receptors, the effects reduce to non –significant levels as a result of the embedded mitigation measures which are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. The assessment also identifies that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Those receptors which would experience Significant Long Term Visual Effects are listed in Table 8-30 of the **LVIA [APP-060].** The scale of development within the Order Limits has been significantly reduced from the layout assessed in the Preliminary Environmental Information Report (PEIR) through an iterative design process undertaken in response to consultation and in accordance with the mitigation hierarchy to avoid, reduce and mitigate adverse effects. As part of this design evolution, panels along the edge of the Cotswolds National Landscape and along the Fosse Way have been removed. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (LEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. These documents include proposals for new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. In addition, the Scheme design incorporates minimum offsets from existing landscape features, including residential properties, ancient woodland, woodland, hedgerows, public rights of way and watercourses, to further limit visual impacts. Although these measures reduce the effects of

	the Scheme on nearly all receptors, as noted above there are 10 receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of the **LVIA [APP-060]**. Mitigation measures to address landscape and visual effects are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, **Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Some respondents raised specific concerns about the visual impact of the proposed Battery Energy Storage System (BESS).	The potential visual effects associated with the proposed Battery Energy Storage System (BESS) have been assessed as part of the Landscape and Visual Impact Assessment (LVIA) in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. This assessment identifies where visual changes may occur, evaluates the sensitivity of receptors, and considers the magnitude of change resulting from the Scheme. The LVIA assesses the likely significant effects of the Scheme, including the BESS, during construction, operation and decommissioning on identified landscape and visual receptors. This includes residential properties, users of public rights of way and transport receptors. The assessment considers the sensitivity of receptors, the magnitude of change and the resulting significance of effect. The BESS has been assessed as part of the worst-case parameters for above-ground infrastructure, including through Zone of Theoretical Visibility analysis and representative viewpoints agreed through consultation with Wiltshire Council and the Cotswolds National Landscape Board. Photomontages **[APP-103 – APP-105]** have been prepared where significant effects were anticipated to assist in understanding how the BESS and other infrastructure would appear in the landscape. Through the iterative design process, the layout and positioning of infrastructure, including the BESS, has been refined to reduce visual influence. Embedded mitigation measures are set out in Section 8.9 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** and include landscape buffers, retention of existing hedgerows and woodland, and new planting to provide screening and integration over time. These measures are secured via DCO Requirement 5 Detailed Design Approval and Requirement 7 Landscape and Ecological Management Plan. The LVIA identifies where significant visual effects would occur and reports residual effects following mitigation. It concludes that visual effects associated with the Scheme, including the BESS, are localised and would reduce over time as mitigation planting establishes.

Some respondents expressed concern about the proposed height of the solar panels, stating that they consider the panels to be too tall. Some respondents specifically referred to a height of 4.5 metres as being excessive.	The height of the solar PV panels has been assessed using clearly defined design parameters, including a maximum height of 4.5 metres above ground level at maximum tilt, as set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. These parameters represent a realistic worst-case scenario for the purposes of the Environmental Impact Assessment. Mitigation measures to address landscape and visual effects, including measures that reduce the perceived height and prominence of panels in views, are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. These include new and enhanced planting, retention of existing hedgerows and woodland, and landscape integration measures to reduce visual effects over time. The Landscape and Visual Impact Assessment (LVIA) set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]** assesses the effectiveness of the mitigation measures over time and concludes that, in the majority of locations, where significant adverse visual effects are recorded, the visual effects would reduce to non-significant as mitigation planting establishes and matures. This demonstrates that the proposed mitigation is effective in reducing the visual effects of the Scheme. On this basis, a maximum panel height of 4.5m is not considered excessive. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.

Some respondents expressed general scepticism about the effectiveness of the proposed visual mitigation measures. Some respondents stated that they consider no amount of visual mitigation would be sufficient to address their concerns.	The Scheme design has been informed by an iterative design process and incorporates a comprehensive package of embedded mitigation measures to avoid, reduce and mitigate landscape and visual effects. These measures include sensitive siting, reductions to the Scheme boundary, minimum offsets from key receptors, retention of existing vegetation, and the provision of new landscape planting and enhancement. The Landscape and Visual Impact Assessment (LVIA) assesses the effectiveness of the mitigation measures over time and concludes that, in the majority of locations, where significant adverse visual effects are recorded, the visual effects would reduce to non-significant as mitigation planting establishes and matures. This demonstrates that the proposed mitigation is effective in reducing the visual effects of the Scheme. NPS EN-1 recognises at para 5.10.5 that *"Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation."* The LVIA has identified that there would be some long-term significant effects on the visual amenity of users of some localised footpaths, as a result of the Scheme. This predominantly relates to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. There are 10 receptors which would experience Significant Long Term Visual Effects for the duration of the Scheme as set out in Table 8-30 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060].** Details of the mitigation measures and their long-term management are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents express support and / acknowledge the need for the proposed visual mitigation measures.	The Applicant notes this comment and welcomes the support for the visual mitigation measures proposed.

Some respondents expressed concern that proposed screening, including new planting, would take too long to establish and would not provide effective mitigation in the early years of operation. Some respondents also raised concerns that screening would be less effective during the winter months.	The landscape and visual effects of the Scheme, including the effectiveness and phasing of proposed screening and planting, are assessed in the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA considers landscape and visual effects over time, including during the early years of the Scheme before planting is fully established, and identifies where significant effects may occur. The LVIA acknowledges that it takes time for proposed new planting to establish and mature to provide the screening required to reduce the visual effect of the Scheme. The effects of the mitigation measures are assessed at Year 1 and Year 15. The proposed change in management of existing hedgerows to allow them to grow out and be maintained at 4.5m provides a quicker method of screening of the Scheme. The LVIA recognises that there would be Adverse effects on visual amenity in the early years of operation. The visual effects of the Scheme are summarised in **ES Volume 3, Appendix 8-3-3 [APP-192]**. For the majority of the receptors where significant adverse visual effects are recorded, the visual effects would reduce to non-significant as mitigation planting establishes and matures. NPS EN-1 recognises at para 5.10.5 that *"Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation."* Mitigation measures for such effects are detailed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Proposed planting comprises a mix of native species designed to enhance biodiversity and resilience, with planting design prioritising long-term effectiveness and landscape integration. The **OLEMP [APP-283]** sets out the approach to establishment, maintenance and management of planting to ensure its effectiveness over the lifetime of the Scheme, including in the early years of operation. The LVIA includes verified viewpoints with both summer and winter photography to demonstrate year-round changes to the landscape. Photomontages at Year 15 illustrate the effectiveness of established planting, including during the winter months, while also demonstrating the intended retention of openness across the receiving landscape. Hedgerows on the western edge of fields within Lime Down C, which border the Cotswolds National Landscape, are proposed to be maintained at approximately 1.5 metres (or as existing, if greater) to retain open views within the setting of the Cotswolds National Landscape. This management approach is set out in the **OLEMP [APP-283]**.

	The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that mitigation planting and screening measures are delivered and maintained throughout the lifetime of the Scheme.
Some respondents expressed concern that the proposed buffer zones are insufficient and should be increased.	The location and extent of buffer zones and minimum offsets have been informed by an iterative design process and are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) considers minimum offsets from residential properties, public rights of way, landscape features and designated areas, and assesses the resulting landscape and visual effects using realistic worst-case design parameters. NPS EN-1 recognises at para 5.10.5 that *"Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape, but there may also be beneficial landscape character impacts arising from mitigation."* The LVIA concludes that, with the proposed buffers and embedded mitigation in place, landscape and visual effects are appropriately mitigated. The effectiveness of these measures over time is also assessed, including the role of planting, retained vegetation and landscape integration in reducing visual effects. However as noted above, although these measures reduce the effects of the Scheme on nearly all receptors, there are 10 visual receptors which would experience Significant Visual Effects for the duration of the Scheme as set out Table 8-30 of **ES Volume 1, Chapter 8: Landscape and Visual [APP-060].** These effects predominantly

	relate to locations where footpaths diagonally cross fields and mitigation planting would be inappropriate to landscape character and the legacy landscape. Details of the buffer zones, landscape mitigation measures and their long-term management are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2** **Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that the identified mitigation measures, including buffers and planting, are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern that the Scheme will cause light pollution.	Potential effects relating to lighting are considered within the Landscape and Visual Impact Assessment (LVIA) in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**, which considers the implications of construction, operational and decommissioning lighting on landscape and visual receptors. No significant effects of lighting, above those recorded for landscape and visual receptors, were recorded. The LVIA has considered the construction, operational and decommissioning lighting proposals for the Scheme, with details of lighting design, directionality and intermittent lighting set out in **ES Volume 1, Chapter 3: The Scheme [APP-055]**. The Scheme has been designed to minimise the need for external lighting. Lighting is not required within the Solar PV Arrays during the operational phase. Motion-sensing security lighting will be provided within substations and the BESS Area and will be used only for maintenance and security purposes. Temporary site lighting during construction and decommissioning will be required to enable safe working during hours of darkness. This lighting will be designed, as far as reasonably practicable, to minimise light spill outside the Site and Cable Route Corridor, particularly towards residential properties, highways and ecological receptors. Standard good practice measures will be employed to minimise glare and light spill during construction, operation and decommissioning. There will be no lighting on perimeter fencing. The mitigation measures to control construction lighting stated above are secured within the **Outline Construction Environmental Management Plan [APP-277]**, and operational lighting controls (also referenced above) form part of the **Outline Operational Environmental Management Plan [APP-278]**. The preparation, approval and implementation of detailed

	management plans, substantially in accordance with these outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring lighting impacts are appropriately controlled throughout the lifetime of the Scheme.
Some respondents expressed support for the use of underground cables for the grid connection. Some respondents also expressed opposition to the use of overhead pylons.	The Applicant is proposing to construct the connection between the solar park, BESS and the existing National Grid substation by installing underground cables, as set out within **ES Volume 1 Chapter 3 The Scheme [APP-055**] so the Applicant welcomes the support for this method. The Applicant is not proposing to use pylons or overhead lines.
Some respondents expressed concern about the Scheme's proximity to the Cotswolds National Landscape (CNL), formally the Cotswolds Area of Natural Beauty (AoNB). Some respondents raised concerns about potential effects of the Scheme on the tranquillity of the Cotswolds National Landscape.	The Cotswolds National Landscape (CNL) is fully assessed as a standalone receptor within **ES Volume 3, Appendix 8.6: Assessment of Effects on the Special Qualities of the Cotswolds National Landscape [APP-197]**. This assessment considers the effects of the Scheme on landscape character, visual amenity and the special qualities of the CNL, including tranquillity. The assessment found that there would be some short term impact to landscape character within the setting of the CNL but due to the avoidance measures embedded within the Scheme, harm to the CNL itself would be minimal with beneficial effects in the long term which would further the purposes of the designation. In respect of visual amenity, some short-term adverse effects would be experienced by a small number of visual receptors with views to and from the CNL. However, these would reduce over time as a result of the proposed mitigation. The assessment of effects on the special qualities of the CNL scoped out 3 SQs as there is no association with the Site. The assessment found that there are no direct effects on the remaining SQs. There are some Minor/ Negligible short-term effects on a small number of

	visual receptors within the setting of the CNL which effect SQ7 -Tranquillity and SQ13 Archaeology and historic associations. However, these effects are mitigated by Year 15 when proposed vegetation has matured. The assessment also found that there would be beneficial effects on SQ 6 – Biodiversity and nature recovery as a result of the delivery of approximately 119.7 hectares of flower-rich neutral grassland (as defined in the BNG assessment) and SQ 12 - An accessible landscape as a result of the delivery of approximately 12.8km of new permissive paths within the setting of the CNL. The remaining SQs would remain entirely intact. The Scheme was refined through an iterative design process to avoid and reduce effects on the CNL and its setting. Panels along the edge of the CNL were removed from the Order Limits in fields C2, C3 and C4 where significant visual effects on receptors within the CNL were identified. Panels were also removed from fields C1, C6, C8, the western section of C9 and the majority of C10, with this land now proposed for ecological mitigation to protect the setting of the CNL. In addition, panels within fields A11 and A12 were removed and the land repurposed for ecological mitigation to protect the setting of the CNL towards Sherston. All land parcels adjacent to the CNL are proposed to deliver habitat enhancement, informed by the CNL Management Plan and the Cotswolds National Landscape Strategy and Guidelines, to further the purposes of the designation. Details of the proposed landscape and ecological mitigation and enhancement measures such as the avoidance measures to remove panels from the boundary of CNL are provided in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** and secured within the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the Draft Development Consent Order [APP-016]. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that the identified mitigation and enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
Ecology and Biodiversity, and Arboriculture	

Some respondents expressed concern about the Scheme's potential impact on the local environment, wildlife, biodiversity and ecology. Some respondents suggested that the Scheme would displace wildlife or result in the loss or reduction of habitats. Some respondents raised particular concerns about potential effects on wildlife during the construction phase.	Potential impacts on ecology and biodiversity are fully assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** This assessment considers baseline ecological conditions and evaluates likely significant effects arising during the construction, operation and decommissioning phases of the Scheme. It identifies avoidance, mitigation and enhancement measures to address potential impacts on habitats and protected and notable species. It also identifies opportunities for ecological enhancement, including the creation and long-term management of habitats, and delivery of biodiversity net gain. The Applicant notes that the approach to the assessment in relation to ecology and biodiversity in general is under discussion with Wiltshire Council and Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** During construction, specific measures are proposed to avoid disturbance and displacement of wildlife. These include protective buffers around sensitive habitats and features, timing restrictions on vegetation clearance, pre-construction ecological surveys, species-specific mitigation, and pollution prevention controls which are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284**]. Measures to protect trees and hedgerows are also set out in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**. The Scheme will also result in the cessation of intensive arable farming within the Solar PV Sites. As identified in **ES Volume 1, Chapter 9 [APP-061]**, this is expected to reduce the ongoing application of herbicides and pesticides, supporting improvements in habitat quality over the operational lifetime of the Scheme. The reversion of existing arable land within the Solar PV Sites to predominantly grassland habitats can be expected to benefit a wide range protected and notable species, as identified in **ES Volume 1, Chapter 9 [APP-061].** Mitigation and enhancement measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, which set out habitat creation, species protection measures, buffer zones and long-term ecological management. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **OEPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**. These requirements ensure that ecological protection and enhancement measures are delivered and maintained throughout construction and operation of the Scheme.

Respondents expressed concern for the Scheme's impact to ponds.	All existing ponds within the Order Limits will be retained and protected, as set out in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. Sections 9.10.127 to 9.10.132 confirm that no ponds are anticipated to be directly impacted through habitat loss or fragmentation as a result of the Scheme, and that a minimum 10 metre development-free buffer from all ponds will be maintained to ensure ponds and their immediate surrounding habitats remain unimpacted. With embedded mitigation in place, no significant effects on ponds are anticipated during construction or operation. In addition, opportunities to create new areas of standing water have been explored, including the restoration of historic farm ponds previously lost to agriculture (also known as 'ghost ponds'). Sections 9.10.133 to 9.10.134 confirm that nine historic ponds will be restored and new ponds created, managed for wildlife benefit over the lifetime of the Scheme. These proposed enhancements are shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. As a result, the ES concludes that the Scheme is expected to deliver a significant beneficial effect on standing water habitats and associated species. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that pond protection and enhancement measures are delivered and maintained throughout the lifetime of the Scheme. The Applicant notes that the approach to the assessment in relation to ponds has been discussed with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
Some respondents expressed concern that the proposed ecological mitigation measures are insufficient or would be ineffective. Some respondents also expressed scepticism that Biodiversity Net Gain (BNG) would be achieved.	Potential impacts of the Scheme on ecology and biodiversity are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment identifies embedded and additional mitigation measures and concludes that, with these measures in place, no unacceptable significant adverse effects on ecology and biodiversity are anticipated. The Applicant notes that the approach to identifying and securing mitigation measures is under discussion with Wiltshire Council, Natural England and the Environment Agency and is set out in the relevant Statement of Common Grounds to be submitted at Deadline 1, in accordance with the Rule 6 Letter [PD-006]

	A comprehensive package of habitat retention, creation, enhancement and long-term management measures is proposed to avoid, reduce and mitigate impacts and to deliver Biodiversity Net Gain. These include the protection of existing habitats, restoration of lost features such as historic ponds, creation of new habitats, and long-term ecological management to improve habitat quality over the lifetime of the Scheme. The ecological mitigation and enhancement proposals, including BNG measures, are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The **OLEMP [APP-283]** includes provisions for habitat establishment, maintenance and ecological monitoring to confirm that mitigation and enhancement measures are functioning as intended and to identify and implement remedial measures where required. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that ecological mitigation and enhancement measures are delivered, monitored and maintained throughout the lifetime of the Scheme.
Respondents expressed concern that the proposed security fencing could restrict wildlife movement and result in habitat fragmentation or loss.	Potential effects of boundary treatments and fencing on ecology and wildlife movement are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers impacts on habitats and species during construction, operation and decommissioning and identifies measures to avoid or mitigate barriers to wildlife movement. The Scheme design incorporates fencing around the Solar PV Arrays that is permeable to wildlife, with the exception of deer. This means animals (excluding deer only) will be able to freely access habitats within the Solar PV Sites without the need for wildlife gates. In addition, wide buffers are retained around the peripheries of the Solar PV Sites to allow wildlife, including deer, to move between favoured habitats. These measures are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and detailed in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. Fencing will be subject to regular inspection and maintenance to ensure continued permeability to wildlife and effective functioning over the lifetime of the Scheme. Measures for ongoing ecological management and maintenance are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in

	accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that fencing design and maintenance measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed general support for the Scheme's proposed environmental enhancements, including the delivery of Biodiversity Net Gain (BNG).	The Applicant makes note of this Representation and welcomes the support for the Scheme's environmental improvements and Biodiversity Net Gain (BNG).
Respondents expressed concern for the potential impacts on otters.	Potential impacts of the Scheme on otters are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects on protected species during construction, operation and decommissioning. The assessment of impacts on otters is set out in Paragraphs 9.10.207 to 9.10.220. It concludes that, with embedded mitigation in place, no significant adverse effects on otters are anticipated. The Applicant notes that the approach to the assessment in relation to otters is under discussion with Wiltshire Council, Natural England and the Environment Agency and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Measures to avoid disturbance to otters and protect riparian habitats during construction are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. These include pre-construction surveys, protective buffers to watercourses, controls on working practices near sensitive habitats, and pollution prevention measures. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy, substantially in accordance with the **EPMS [APP-284]**, are secured through Requirement 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring otter protection measures are delivered and maintained throughout construction and operation of the Scheme.
Respondents expressed concern for the potential impact on Great Crested Newts.	Potential impacts of the Scheme on amphibians, including great crested newts, are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. Sections 9.10.127 to 9.10.132 confirm that no ponds are anticipated to be directly impacted through habitat loss or fragmentation as a result of the Scheme. A minimum 10 metre development-free buffer from all ponds will be maintained to ensure ponds and their surrounding habitats remain unimpacted. Where ponds have confirmed or assumed presence of great crested newts, a 50-metre minimum buffer is applied. With embedded mitigation in place, no significant adverse effects on amphibians, including great crested newts, are anticipated during construction or operation.

	The Applicant notes that the approach to the assessment in relation to great crested newts has been agreed with Natural England and is under discussion with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1, in accordance with the Rule 6 Letter [PD-006] Measures to avoid disturbance to amphibians and protect aquatic habitats during construction are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**, including pre-construction surveys, species-specific mitigation, protective buffers and pollution prevention controls. All works within the Cable Route Corridor will be registered under Natural England's District Level Licensing (DLL) scheme. Under the DLL scheme, adequate compensation through strategic off-site habitat creation and maintenance will be provided to address all adverse impacts associated with works within the Cable Route Corridor and ensure legal compliance. In addition, Sections 9.10.133 and 9.10.134 confirm that opportunities to create new areas of standing water have been incorporated into the Scheme, including the restoration of historic 'ghost ponds' previously lost to agriculture. These enhancements are shown in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. As a result, the ES concludes that the Scheme is expected to deliver a significant beneficial effect on pond habitats and associated species, including amphibians. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the O**EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring amphibian protection and habitat enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern for the potential impact on deer.	Potential impacts of the Scheme on mammals, including deer, are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects on wildlife movement and habitat connectivity during construction, operation and decommissioning. The Scheme design incorporates perimeter fencing around the Solar PV Arrays that is permeable to all wildlife except deer. To ensure continued habitat connectivity for deer, wide buffers are retained around the peripheries of the Solar PV Sites, allowing deer to move between favoured habitats, field boundary features and woodlands without being forced onto surrounding roads. These measures are described in **ES Volume 1, Chapter 9: Ecology and**

	Biodiversity [APP-061] and detailed in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Long-term ecological management to maintain habitat connectivity is set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the Draft Development Consent Order [APP-016], ensuring mitigation measures for deer movement and habitat connectivity are delivered and maintained throughout the lifetime of the Scheme.
Some respondents expressed concern about potential impacts on birds. Some respondents raised specific concerns about the risk of birds colliding with solar panels. A number of respondents identified particular bird species of concern.	Potential impacts of the Scheme on birds, including breeding and wintering species within and around the Order Limits, are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. The assessment considers baseline bird assemblages and evaluates likely effects during construction, operation and decommissioning, including habitat loss, disturbance and displacement. It concludes that, with embedded mitigation in place, no unacceptable significant adverse effects on bird populations are anticipated. The assessment also notes that there is very limited evidence that solar PV panels present a risk of bird collision or fatality. The Scheme design and mitigation measures are therefore focused on avoiding / mitigating habitat loss and disturbance, rather than collision risk. The Applicant notes that the approach to the assessment in relation to birds in general is under discussion with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** Habitat creation and enhancement measures to support bird species are incorporated into the Scheme, including areas provided for skylark mitigation and wider grassland and hedgerow enhancement. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Measures to safeguard nesting and foraging birds during construction and operation, including timing of vegetation clearance, pre-construction checks and species-specific protection measures, are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **EPMS [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the Draft Development Consent Order [APP-

	016], ensuring bird protection and habitat enhancement measures are delivered and maintained throughout the lifetime of the Scheme.
Some respondents expressed concern about potential impacts on skylarks.	Potential impacts of the Scheme on skylarks are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline bird assemblages and evaluates likely effects on breeding farmland bird species during construction, operation and decommissioning. The assessment identifies skylarks as a key species of conservation interest within the Scheme area. It concludes that a proportion of the current skylark population will be displaced from the Solar PV Sites, which will give rise to an adverse residual effect at a Local level. The Applicant notes that the approach to the assessment with relation to skylark is under discussion with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects as far as practicable. These include the provision of suitably large, open set-aside and grassland habitats designed to provide appropriate breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**.

	Measures to safeguard nesting skylarks during construction, including timing restrictions on vegetation clearance and pre-construction ecological checks, are set out in the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan and Ecological Protection and Mitigation Strategy, substantially in accordance with the **OLEMP [APP-283]** and **OEPMS [APP-284]**, are secured through Requirements 7 and 8 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring skylark mitigation and long-term habitat management measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern for impact to bats.	Potential impacts of the Scheme on bats, including species associated with the Bath and Bradford-on-Avon Bats SAC, are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**. The assessment considers baseline bat activity, roosting, foraging and commuting habitats, and evaluates likely effects during construction, operation and decommissioning. The Applicant notes that the approach to the assessment in relation to bats is under discussion with Natural England and Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** The detailed assessment of likely significant impacts and effects on bats is set out in **Section 9.10** of **ES Volume 1, Chapter 9 [APP-061].** The assessment is underpinned by a comprehensive programme of bat surveys, with detailed survey methods and results provided in **ES Volume 3, Appendix 9-3: Bat Survey Report [APP-200]**. Using this evidence, the ES identifies potential impact pathways and appropriate avoidance and mitigation measures. The assessment concludes that, with embedded mitigation in place, no significant adverse effects on bat populations or on the integrity of the Bath and Bradford-on-Avon Bats SAC are anticipated. Mitigation measures for bats, including habitat retention, buffer distances, timing of works and protection of commuting corridors, are set out in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]** and long-term habitat management measures are detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order**

	[APP-016], ensuring bat protection and habitat management measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern for impact on hares.	Potential impacts of the Scheme on brown hares are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects on mammals during construction, operation and decommissioning. The assessment concludes that, with embedded mitigation in place, no significant adverse effects on brown hares are anticipated. The Scheme design retains extensive areas of grassland and field margin habitats, which provide suitable foraging and shelter opportunities for hares. The Applicant notes that the approach to the assessment in relation to brown hares has been agreed with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** Long-term habitat management measures are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The assessment also notes that brown hares are known to take shelter beneath solar panels on operational solar sites, where the retention of grassland beneath and between arrays can provide suitable habitat conditions. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring habitat management measures benefiting hares are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern for impact to badgers.	Potential impacts of the Scheme on badgers are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects on mammals during construction, operation and decommissioning.

	The assessment identifies the presence of badger setts and foraging habitats within and around the Scheme and evaluates potential effects from habitat disturbance, displacement and construction activities. It concludes that, with embedded mitigation in place, no significant adverse effects on badgers are anticipated. The Applicant notes that the approach to the assessment in relation to badgers has been with Wiltshire Council and is under discussion with Natural England and Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. Mitigation measures to protect badgers include the application of minimum buffer distances around setts, timing controls on works near sensitive locations, pre-construction surveys, and habitat retention to maintain foraging and movement corridors. These measures are detailed in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]** and long-term habitat management provisions are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring badger protection and habitat management measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern for impact to voles.	Potential impacts of the Scheme on water voles and other small mammals are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects on protected and notable species during construction, operation and decommissioning. The assessment identifies suitable habitats for water voles within and adjacent to the Scheme and evaluates potential impacts from habitat disturbance and construction activities. It concludes that, with embedded mitigation in place, no significant adverse effects on voles are anticipated. The Applicant notes that the approach to the assessment in relation to water voles is under discussion with Natural England, Wiltshire Council and the Environment Agency, and is set out in the relevant Statement of Common Grounds to be submitted at Deadline 1. Mitigation measures to protect vole habitats include the application of minimum buffer distances to ditches and watercourses, pre-construction ecological surveys, controls on working practices near sensitive habitats, and pollution prevention measures. These are detailed in the **Outline Ecological Protection and Mitigation Strategy (EPMS) [APP-284]**. Long-term habitat

	protection and management measures are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Ecological Protection and Mitigation Strategy and Landscape and Ecological Management Plan, substantially in accordance with the **EPMS [APP-284]** and **OLEMP [APP-283]**, are secured through Requirements 8 and 7 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring vole protection and habitat management measures are delivered and maintained throughout the lifetime of the Scheme.
Some respondents expressed concern about potential impacts on insects and other invertebrates.	Potential impacts of the Scheme on invertebrates are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]**, which considers baseline conditions and evaluates likely effects on invertebrate species and their habitats during construction, operation and decommissioning. The assessment identifies that existing habitats within and around the Scheme support a range of invertebrate species and evaluates potential impacts arising from habitat change and disturbance. It concludes that, with embedded mitigation in place, no significant adverse effects on invertebrate populations are anticipated. The Applicant notes that the approach to the assessment in relation to invertebrates is under discussion with Wiltshire Council and the Environment Agency and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** The Scheme includes habitat creation and enhancement measures designed to improve invertebrate habitat availability and connectivity, including species-rich grassland creation, hedgerow enhancement and pond restoration. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring habitat creation and management measures benefiting invertebrates are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern regarding the potential loss of trees as a result of the Scheme.	No veteran or ancient trees are proposed to be removed to facilitate the Scheme. The Scheme has been designed through an iterative process to retain existing arboricultural features as far as practicable and to avoid and reduce impacts on trees, groups of trees and woodland.

	Potential impacts on arboriculture are fully assessed in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**, which considers baseline arboricultural conditions and evaluates likely effects during construction, operation and decommissioning. This assessment identifies where tree removal or pruning may be required and concludes that, with embedded mitigation in place, no significant adverse residual effects on arboricultural features are anticipated. Embedded mitigation measures include sensitive siting of infrastructure, minimum offsets from retained trees, protection of root protection areas, supervision by an Arboricultural Clerk of Works, and the use of trenchless construction techniques where required to avoid impacts on high-value trees. Where any unavoidable tree losses are necessary, compensatory tree and woodland planting is proposed as part of the Scheme's landscape and ecological mitigation. Details of tree protection, replacement planting and long-term management are set out in the **Outline Landscape and Ecological Management Plan [APP-283]** and the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of detailed landscape and ecological management plans, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that arboricultural mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern regarding the potential loss of hedgerows as a result of the Scheme.	The Scheme has been designed through an iterative design process to retain existing hedgerows and grassland habitats as far as practicable. Potential impacts on hedgerows are assessed in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061]** and **ES Volume 1, Chapter 10: Arboriculture [APP-062]**, which consider baseline conditions and evaluate likely effects on hedgerow features during construction, operation and decommissioning. The assessments identify that some hedgerow loss is required to facilitate access and infrastructure. However, anticipated hedgerow losses represent a small proportion of the existing hedgerow network within the Order Limits. With embedded mitigation in place, no significant adverse effects on hedgerow features are anticipated. Compensatory planting and enhancement measures are proposed which will significantly exceed the extent of hedgerow loss. Proposed new hedgerows and habitat enhancements are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. The preparation, approval and implementation of the detailed Landscape and Ecological Management Plan, substantially in accordance with the **OLEMP [APP-283]**, are secured

	through Requirement 7 in Schedule 2 of the **Draft Development Consent Order [APP-016],** ensuring hedgerow retention, replacement planting and long-term management are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern regarding the potential loss of, and impacts to, ancient trees as a result of the Scheme.	Potential impacts on arboricultural features, including ancient and veteran trees, are assessed in **ES Volume 1, Chapter 10: Arboriculture [APP-062]**, which considers baseline conditions and evaluates likely effects during construction, operation and decommissioning. The assessment confirms that no ancient or veteran trees are proposed to be removed to facilitate the Scheme. The Scheme has been designed through an iterative process to retain existing arboricultural features as far as practicable and to avoid impacts on trees of high value. Embedded mitigation measures include minimum offsets from retained trees, protection of root protection areas, and supervision by an Arboricultural Clerk of Works during construction. These measures ensure that retained trees, including ancient and veteran specimens, are protected throughout construction and operation of the Scheme. Tree protection and long-term arboricultural management measures are set out in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**, with construction-phase protection measures detailed in the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of detailed management plans, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring ancient and veteran trees are protected throughout the lifetime of the Scheme.
Soils and Agriculture, and Ground Conditions	

Respondents expressed concern regarding the use and potential loss of agricultural land as a result of the Scheme. Some respondents considered that agricultural land should not be used for solar development, with particular reference to the use of high-grade or Best and Most Versatile (BMV) land. Some respondents indicated a preference for solar development to be located on previously developed (brownfield) land. Some respondents expressed a preference for rooftop solar over ground-mounted solar, suggesting that panels should instead be installed on existing buildings, including schools, industrial warehouses and residential properties. Some respondents also suggested that solar panels should be sited alongside existing infrastructure corridors, such as railway lines, motorways or other major roads.	An assessment of the potential effects of the Scheme on soils and agricultural land is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline agricultural land quality, including Best and Most Versatile (BMV) land, and assesses likely significant effects arising from construction, operation and decommissioning of the Scheme, together with embedded mitigation measures. The areas of each Agricultural Land Classification (ALC) grade affected by the Scheme are set out **in ES Volume 1, Chapter 17, Section 17.7 [APP-069]**. Of the agricultural land within the Solar PV Sites, approximately 477.4 hectares (around 67%) is classified as Subgrade 3b or Grade 4 and is therefore not BMV land. There is no Grade 1 land, around 30.8 hectares (approximately 4%) of Grade 2 land, and approximately 209.3 hectares (around 29%) of Subgrade 3a land. The distribution of ALC grades is shown in **ES Volume 2, Figure 17-2: Agricultural Land Classification Mapping [APP-172]**. The Applicant has had regard to agricultural land quality in the design and site selection process and has sought, where practicable, to locate infrastructure on lower quality land. The Scheme will result in a temporary but long-term and reversible loss of agricultural land for the operational life of the Scheme. As set out in **ES Volume 1, Chapter 17, Section 17.10 [APP-069]**, this gives rise to a temporary, long-term moderate adverse effect on agricultural land overall, and a temporary, long-term major/moderate adverse effect on BMV land, both of which are assessed as significant. These effects are fully reported in the ES and are a matter for the Secretary of State to weigh in the planning balance against the need for the Scheme and its wider benefits. There are no significant permanent effects on agricultural land, as all land will be returned to its original use and condition as far as practicable following decommissioning. The Applicant notes that the approach to assessing the quality of the agricultural land is under discussion with Natural England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** Measures to avoid and minimise effects on soils and agricultural land are embedded within the Scheme design and secured through Schedule 2, Requirement 17 of the **Draft DCO [APP-016]** which includes the preparation and implementation of a Soil Resources Management Plan (SRMP) in accordance with the **Outline SRMP [APP-280].** The SRMP will control soil handling, storage and reinstatement during construction, operation and decommissioning, and a requirement to prepare and implement a Decommissioning Strategy in accordance with the **Outline Decommissioning Strategy [APP-279],** which is secured by Schedule 2, Requirement 20 of the **Draft DCO [APP-016]**. The **Outline Landscape and Ecological Management Plan [APP-283]** details how grassland and other habitat will be established beneath and between the solar panels. The detailed LEMP

	will be secured through Schedule 2, Requirement 7 of the **Draft DCO [APP-016]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soil health, quality and structure are anticipated to improve over the lifetime of the Scheme, resulting in a temporary, moderate beneficial effect on soil resources at decommissioning, which is assessed as significant (**ES Volume 1, Chapter 17, Sections 17.10 and 17.12 [APP-069]**). In relation to suggestions that brownfield land or alternative locations should be used, including rooftop, these matters are addressed in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056] and in the Statement of Need [APP-266]**. The Applicant has considered alternatives, including previously developed land and other forms of solar deployment, as part of the site selection and design evolution process. As shown in Table 2-2 of **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]**, the Applicant has considered previously developed land / brownfield land over 1 hectare within the area of search, based on the brownfield land registers of the relevant Local Planning Authorities, and concluded that none of the sites are large enough to provide a viable land parcel of at least 40 ha and sites were not considered to be available as they have planning permission for residential development and/or are allocated for residential/mixed use development. With regard to siting the Scheme alongside existing infrastructure corridors such as motorways, major roads and railways, **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]** and the accompanying **ES Volume 3, Appendix 4-1: Site Selection Assessment Report [APP-185]** set out the alternatives considered by the Applicant. The assessment did not identify any unconstrained, suitable and available land that could utilise existing infrastructure corridors. As set out in, **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056],** discussions were had with Wiltshire Council regarding routeing the Cable Route Corridor to follow the A350, but this was discounted due to concerns of potential disruptions to road traffic associated with installation of the cable immediately adjacent to the A350. National policy and government guidance, as set out in the **Statement of Need [APP-266]**, recognise that while rooftop and smaller-scale solar installations are an important part of the energy mix, they cannot alone meet the scale of capacity required to achieve clean power and net zero objectives. Large-scale ground-mounted solar therefore remains necessary in addition to, not instead of, rooftop solar.

Respondents expressed concern that the Scheme could adversely affect UK food security and domestic food production.	The effects of the Scheme on agricultural land, including land quality and productivity, are assessed in **ES Volume 1, Chapter 17: Soils and Agriculture [APP-069]**, supported by **ES Volume 3, Appendix 17-1: Agricultural Land Classification and Soil Resource Survey Report [APP-243]**. That assessment identifies that the majority of agricultural land affected is not Best and Most Versatile (BMV) land, comprising predominantly Subgrade 3b and Grade 4 land, which is not considered high-quality agricultural land in planning terms. Government-led agricultural initiatives, such as the Sustainable Farming Incentive which is relaunching later in 2026, have prioritised soil health, environmental enhancement and climate resilience, recognising that long-term food security is influenced by a range of factors beyond land take alone, including soil condition, climate change and environmental pressures. The Scheme allows soils to remain in situ and undisturbed during operation, supporting soil recovery and long-term land health, with land reinstated and returned to agricultural use as far as practicable following decommissioning. No permanent loss of agricultural land is anticipated. The Applicant does not consider that food security will be compromised by the Scheme (or solar energy more widely). The latest figures to September 2024 indicate that solar occupied around 21,200 ha of agricultural land in the UK. In 2025, 545,000 ha of arable land in England were left uncropped (source: Department for Environment, Food & Rural Affairs, Agricultural land use in England at 1 June 2025). It should also be noted that food security is not identified as an issue within the suite of Energy National Policy Statements or the National Planning Policy Framework (NPPF). Further, the Government's UK Solar Roadmap (2025) states that solar development is not considered to compromise food security, but that the climate and nature crisis poses the greatest long-term risk to food security- a risk which the Scheme directly helps to address by providing a secure, low-carbon source of electricity. As set out in Section 2 of the **Outline Decommissioning Strategy [APP-279],** post-decommissioning of the Scheme, the landowners would choose how the land is to be used and managed. The landowner may return all of the land to arable use, although it is likely that established habitats such as hedgerows and woodland would be retained given their potential benefits to agricultural land and the wider farming estate. Whilst there is an environmental and economic cost to importing food, and it is recognised the UK imports a far greater amount of food than it exports, the impact of the Scheme on food import requirements or the food and drinks economy is not material at a national scale and has therefore not been assessed.

Respondents expressed dissatisfaction that sheep would not graze at the Site, or scepticism as to whether sheep grazing would in practice take place. Some respondents also considered that references to sheep grazing, including imagery used in consultation materials, were misleading.	The assessment of effects of the Scheme on agriculture in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]** recognises that agricultural production beneath the solar panels would not be the primary land use during the operational phase. For the purposes of the Environmental Impact Assessment, the Scheme has been assessed on a conservative basis assuming that grassland within the Solar PV Sites will be managed through mechanical cutting rather than relying on grazing. This ensures that the assessment does not depend on livestock grazing to mitigate agricultural effects. However, **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]** also identifies that there is potential for some agricultural use to resume during operation if land beneath the panels is grazed by livestock, including sheep. Specifically, the ES notes that during the operational lifetime of the Scheme "*some agricultural use may resume within the Solar PV Sites if the area beneath the panels is grazed by livestock*". Accordingly, sheep grazing is a potential future land management option rather than a guaranteed or required component of the Scheme. The Applicant has therefore not relied on sheep grazing in the Environmental Impact Assessment, and the Scheme remains acceptable on the basis of mechanical grassland management alone. Any future decision to introduce grazing would be at the discretion of the landowners and farm operators, subject to appropriate management controls, and would not alter the conclusions of the Environmental Impact Assessment.
Respondents expressed general concern regarding the potential effects of the Scheme on soil health and land quality.	An assessment of the effects of the Scheme on soils and agricultural land quality is provided in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]**. This chapter considers baseline soil conditions and agricultural land quality and assesses the likely significant effects arising from construction, operation, maintenance and decommissioning of the Scheme. The assessment identifies appropriate embedded mitigation measures to avoid, reduce and manage effects on soils and land quality. Measures to control soil handling, storage and reinstatement are set out in the **Outline Soil Resources Management Plan (SRMP) [APP-280]**, which is secured via Requirement 17 of the **Draft DCO [APP-016].** The SRMP provides the framework for detailed soil management methods to be implemented during construction, operation and decommissioning, ensuring that soil structure, quality and function are protected and restored. The assessment in **ES Volume 1, Chapter 17 Soils and Agriculture [APP-069]** concludes that the removal of land from intensive arable cultivation during the operational phase is expected to lead to improvements in soil health, quality and structure. This results in a temporary, moderate beneficial effect on soil resources during the operational and decommissioning phases of the Scheme, which is assessed as significant (see **ES Volume 1, Chapter 17, Section 17.12 [APP-069]**).

	The **Outline Landscape and Ecological Management Plan [APP-283]** details how grassland and other habitat will be established beneath and between the solar panels. The detailed LEMP will be secured through Schedule 2, Requirement 7 of the **Draft DCO [APP-016]**. Through the establishment and maintenance of long-term grassland beneath and between the solar arrays, soils within the Solar PV Sites are anticipated to improve over the lifetime of the Scheme. This would constitute a low magnitude of change to high sensitivity soils, giving rise to a temporary, moderate beneficial effect on soil resources during the decommissioning phase.
Hydrology, Flood Risk and Drainage	
Respondents expressed concern that the Scheme could increase flood risk, including concerns that the installation of solar panels would lead to increased flooding. Some respondents specified that this could occur as a result of increased surface water run-off from the panels. Some respondents noted that the area is already prone to flooding. Some respondents expressed that flood risk has not been adequately considered or assessed	An assessment of the effects of the Scheme on flood risk both within the Site and the surrounding area is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information provided in **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. The assessment concludes that, with the embedded mitigation measures secured, the Scheme would not result in a material increase in off-site flood risk, including to adjacent communities and downstream receptors, and that any on-site flood risk would be managed such that the Scheme remains safe and operable for its lifetime. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statements of Common Grounds to be submitted at Deadline 1. The **Outline Construction Environmental Management Plan (CEMP) [APP-277]** has been developed to control construction-phase risks and ensure there is no material increase in off-site flood risk. In accordance with NPS EN-3 (paragraph 2.10.843.10.75). **Requirement 13 in Schedule 2 to the Draft DCO [APP-016]** secures that no part of the authorised development can commence until a CEMP is submitted to and approved by the relevant planning authority. The CEMP must be substantially in accordance with the Outline CEMP, and all construction works associated must be carried out in accordance with the approved CEMP. Regarding specific concerns that panels will increase flooding, the submitted assessment presented in **ES Volume 3, Appendix 11-1 Flood Risk Assessment and Drainage Strategy - Lime Down Covering Report [APP-210]** reflects established hydrological evidence that the addition of solar panels over a vegetated field does not materially increase runoff volumes, peak

	discharges or response times, and that changes in hydrologic response are primarily associated with alterations to ground cover beneath the panels rather than the panels themselves. Panelled areas are therefore designed so rainfall continues to drain to ground, with no creation of extensive impermeable surfaces and with controls in place to avoid any increase in discharge to watercourses. Measures to manage surface water runoff and drainage are set out in the outline drainage and construction management plans (**ES Volume 3, Appendix 11: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218] and Outline Construction Environmental Management Plan [APP-277]** accompanying the Application. Where drainage measures are necessary, these include permeable surfacing, infiltration features, swales and attenuation storage to manage surface water and maintain greenfield runoff behaviour, as applicable. Consistent with NPS EN-3 paragraph 2.10.84, these controls distinguish between solar PV panel areas, which drain to the existing ground and do not generally give rise to significant drainage effects, and associated infrastructure where runoff controls are required. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**. This secures delivery and maintenance of the drainage strategy for Scheme infrastructure, together with soil and water management controls during construction, ensuring there is no material increase in off-site flood risk over the lifetime of the Scheme.
Respondents expressed concern that soil compaction resulting from surface water run-off could increase flood risk.	Potential effects relating to soil compaction and surface water runoff are assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting detail provided in the Flood Risk Assessment and Drainage Strategy appendices. The assessment considers how ground disturbance, construction traffic and installation of infrastructure could affect infiltration and runoff, and evaluates the implications for flood risk both within the Site and in surrounding areas. The assessment concludes that, with appropriate mitigation in place, the Scheme would not increase surface water runoff or result in a material increase in flood risk. The Applicant notes that the approach to compaction has been agreed with the Lead Local Flood Authority (LLFA) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** Soil handling, storage and reinstatement measures to protect soil structure and avoid compaction are set out in the **Outline Soil Resources Management Plan (SRMP) [APP-280]**, which accompanies the DCO Application. The Outline SRMP includes measures to control construction trafficking, manage soil stripping and storage, and ensure reinstatement of soils

	following construction, thereby maintaining soil permeability and reducing the potential for compaction-related runoff. Surface water management and construction-phase controls to prevent increased runoff are secured through the **Outline Construction Environmental Management Plan [APP-277]** and **ES Volume 3, Appendix 11-1 to 11-9: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**which include measures to control sediment, runoff and pollution during earthworks and infrastructure installation. The preparation, approval and implementation of the detailed SRMP and CEMP, substantially in accordance with the outline plans, are secured through Requirements 17 and 13 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that soil compaction is appropriately managed and that runoff and flood risk are not increased during construction or operation of the Scheme.
Respondents expressed scepticism as to whether the proposed flood mitigation measures would be effective.	An assessment of the effects of the Scheme on flood risk, including the effectiveness of proposed mitigation measures, is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting information contained in the Flood Risk Assessment and Drainage Strategy appendices. The assessment has been prepared in accordance with national policy and best practice guidance and in consultation with the Environment Agency and Lead Local Flood Authority and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1**.** It concludes that, with the mitigation measures in place, the Scheme would not result in a material increase flood risk within the Site or to the surrounding area. Measures to manage surface water runoff and drainage are set out in the outline drainage and construction management plans accompanying the Application (**ES Volume 3, Appendix 11: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]).** Consistent with NPS EN-3 paragraph 2.10.84, these controls distinguish between solar PV panel areas, which drain to the existing ground and do not generally give rise to significant drainage effects, and associated infrastructure where runoff controls are required. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**. This secures delivery and maintenance of the drainage strategy for scheme infrastructure, together with soil and water management controls during construction, ensuring there is no material increase in off-site flood risk over the lifetime of the Scheme.

Some respondents expressed concern that the Scheme could increase the risk of flooding in the surrounding area.	An assessment of the effects of the Scheme on flood risk within the Site and across the wider catchment is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting detail contained in The assessment considers surface water pathways, receiving watercourses and downstream receptors, including settlements and infrastructure. The Flood Risk Assessment specifically considers potential effects on settlements and locations identified by respondents. The assessment concludes that, with the embedded mitigation and the proposed drainage design in place, there would be no material increase in off-site flood risk, including to downstream communities, roads and other infrastructure. Consistent with NPS EN-3 paragraph 2.10.84, the drainage assessment differentiates between solar PV panel areas, which drain to the existing ground and do not generally give rise to significant drainage effects, and associated infrastructure where runoff controls are required. Where drainage measures are necessary, runoff rates and volumes would be controlled to maintain greenfield runoff behaviour, as applicable, using attenuation, infiltration and controlled discharge measures. Measures to implement and manage surface water controls during construction and operation are set out in the **Outline Construction Environmental Management Plan [APP-277]** and the **Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]** accompanying the Application. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that flood risk mitigation measures are delivered and maintained throughout the lifetime of the Scheme.
Respondents expressed concern for increase flood risk to the Gauze Brook.	An assessment of the effects of the Scheme on watercourses and flood risk, including potential impacts on Gauze Brook, is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, with supporting detail contained in **ES Volume 3, Appendix 11: Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. The Applicant has undertaken site-specific hydraulic modelling of Gauze Brook and is currently engaging with the Environment Agency through the technical review process. This engagement is reflected in the relevant Statement of Common Ground to be submitted at Deadline 1. The Flood Risk Assessment includes site-specific hydraulic modelling of Gauze Brook to understand existing flood behaviour and to assess potential changes arising from the Scheme. The assessment concludes that, with the proposed drainage design and mitigation in place, the Scheme would not increase the rate or volume of runoff entering Gauze Brook compared to pre-development conditions, and would not increase flood risk to downstream watercourses, infrastructure or communities.

	Measures to control runoff and manage surface water during construction and operation are set out in the **Outline Construction Environmental Management Plan [APP-131]** and the **Flood Risk Assessment and Drainage Strategy [APP-210 to APP-218]**. The preparation, approval and implementation of the detailed drainage and construction management plans, substantially in accordance with **Draft Development Consent Order [APP-016]**, ensuring flood risk to Gauze Brook is appropriately managed throughout the lifetime of the Scheme.
Respondents expressed general concern regarding the potential for contamination arising from the Scheme. Some respondents raised concerns about the use of cleaning products or other chemicals during operation. Some respondents also expressed concern that chemicals contained within the solar panels could leach or leak into the surrounding land.	Potential effects of the Scheme on water quality and contamination risk are assessed in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]**, which sets out mitigation and management measures to protect water quality during construction, operation and decommissioning. These measures include pollution prevention controls, containment systems, emergency response protocols, and site-specific drainage measures, particularly around the Battery Energy Storage System (BESS) and substations where lined drainage and automatically actuating valves are proposed. The Applicant notes that it is discussing the approach to pollution resulting from battery fire with both the Environment Agency and the Lead Local Flood Authority (LLFA) and this discussion is set out in the relevant Statements of Common Ground to be submitted at Deadline 1**.** Mitigation measures to control contamination risk during construction and decommissioning are set out in the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Decommissioning Strategy [APP-279].** Routine maintenance and panel cleaning will use minimal water and no detergents or chemical cleaning agents, in line with industry standards and best practice, so there is no expected risk from cleaning runoff. In addition, the removal of agrichemical inputs through the cessation of farming activities will further reduce contamination risks compared to existing use. The preparation, approval and implementation of a detailed Construction Environmental Management Plan (which must be substantially in accordance with the **Outline Construction Environmental Management Plan [APP-277]**) is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction works are carried out in accordance with the approved CEMP and that contamination risks are appropriately managed throughout construction of the Scheme.

Respondents expressed concern regarding the potential risk of contamination to groundwater and surface water as a result of the Scheme. Some respondents specifically referred to potential impacts on the water table and nearby waterbodies.	An assessment of potential contamination risks is provided in **ES Volume 1, Chapter 11: Hydrology, Flood Risk and Drainage [APP-063]** and **ES Volume 1, Chapter 19: Ground Conditions [APP-071]**, which consider risks to surface water, groundwater and sensitive receptors during construction, operation and decommissioning of the Scheme. These assessments conclude that, with appropriate mitigation and management measures in place, no significant contamination effects are anticipated. The Applicant notes that the approach to assessment of risk to groundwater and surface water arising from the Scheme has been agreed with Wiltshire Council and is currently being discussed with the Environment Agency. These discussions are set out in the relevant Statement of Common Ground with Wiltshire Council to be submitted at Deadline 1 and in the relevant Statement of Common Ground with the Environment Agency which will be submitted at a later Deadline. Mitigation and management measures to protect groundwater and surface water are set out in the **Outline Construction Environmental Management Plan [APP-277]** and supporting management plans. These include pollution prevention controls, containment measures, emergency response procedures, and site-specific drainage design. In particular, drainage within substation and Battery Energy Storage System (BESS) areas will incorporate lined drainage and automatically actuating shut-off valves to contain any accidental spills or firewater, preventing release to surrounding land or watercourses. Routine maintenance and panel cleaning will use minimal water and will not require detergents or chemical cleaning products, in line with standard industry practice, meaning there is no expected risk of chemical runoff from panel washing. In addition, the cessation of agricultural activity within the Solar PV Sites will remove routine inputs of fertilisers, pesticides and herbicides, thereby reducing existing sources of diffuse contamination. The preparation, approval and implementation of the detailed CEMP, substantially in accordance with the outline plan, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that contamination risks are appropriately managed throughout construction, operation and decommissioning of the Scheme.
Cultural Heritage	

Respondents expressed general concern regarding the potential effects of the Scheme on cultural heritage and the historic environment. Some respondents raised specific concerns in relation to potential impacts on Roman and medieval heritage assets.	The potential effects of the Scheme on cultural heritage, including archaeological assets dated to the Roman and medieval periods, are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-8 [APP-219 to APP-232]**. The chapter considers baseline conditions, identifies built and archaeological heritage assets within the study area, and assesses likely effects during construction, operation and decommissioning, including effects on setting. The chapter concluded that, following mitigation, the residual effects on any archaeological assets including Roman and medieval period remains, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is underpinned by extensive desk-based research, geophysical survey and evaluation trenching, as detailed in **ES Volume 3, Appendix 12-2: Archaeological Desk-Based Assessments [APP-220] and [APP-221]**, **Appendix 12-4: Archaeological Geophysical Survey Reports [APP-223] and [APP-224]**, and **Appendix 12-5: Interim Evaluation Trial Trenching Reports [APP-225] to [APP-229]**. The Applicant notes that the approach to the assessment has been agreed with Wiltshire Council and the methodology for the mitigation strategy is being discussed with Wiltshire Council and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.** Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation measures detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance cannot be avoided. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation for each part of the Proposed Development, substantially in accordance with **Appendix 12-6 Outline Archaeological Mitigation Strategy [APP-230]**, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered during the relevant part of the Proposed Development.

Respondents expressed concern regarding the potential effects of the Scheme on listed buildings.	The potential effects of the Scheme on listed buildings and other built heritage assets are assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by **ES Volume 3, Appendix 12-1: Heritage Statement [APP-219]**. The assessment identifies baseline heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. The assessment concludes that no direct physical impacts to listed buildings are required to facilitate the Scheme. Any identified effects on listed buildings are indirect and relate to changes in elements of their setting that contribute to their significance. After mitigation, residual effects to the setting of the listed buildings range between Neutral and Minor/Moderate Adverse, and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The Applicant notes that the approach to the assessment in relation to heritage assets (including designated assets) has been agreed with Historic England and Wiltshire Council and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1**.** Embedded mitigation measures to avoid or reduce harm are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**.
Respondents expressed general concern regarding the potential effects of the Scheme on archaeology, including the risk of damage to archaeological sites.	The potential effects of the Scheme on archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-2 to 12-5 [APP-220 to APP-229]**. The assessment considers baseline archaeological conditions, identifies known and potential archaeological assets within the study area, and evaluates likely effects during construction, operation and decommissioning. The chapter concluded that, following mitigation, the residual effects on any archaeological assets, would be neutral/negligible and therefore not significant (see **Volume 3, Appendix 12-8 Cultural Heritage Impact Assessment Tables [APP-232]**). The assessment is informed by desk-based research, geophysical surveys and evaluation trenching, which have been undertaken to identify areas of archaeological potential and to refine the Scheme design where practicable to avoid harm. Where impacts cannot be avoided, embedded mitigation measures are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. The Applicant notes that the approach to the assessment in relation to archaeological sites has been agreed with Historic England and Wiltshire Council and the methodology for the mitigation strategy is under discussion and is set out in the relevant Statements of Common Ground to be submitted at Deadline 1**.**

	An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**, which sets out the framework for further archaeological investigation, recording and protection where ground disturbance is required. The preparation, approval and implementation of detailed archaeological Written Schemes of Investigation for each part of the Scheme, substantially in accordance with the **Appendix 12-6 Outline Archaeological Mitigation Strategy [APP-230]**, are secured through Requirement 12 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that appropriate protection, recording and mitigation are delivered during the relevant part of the Proposed Development.

Respondents expressed general concern regarding the potential effects of the Scheme on the cultural heritage significance of the Fosse Way, including references to the 'Roman road'.	The potential effects of the Scheme on the cultural heritage of the Fosse Way and associated Roman archaeological assets are fully assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, supported by detailed technical appendices in **ES Volume 3, Appendices 12-1 to 12-7 [APP-219 to APP-231]**. The assessment identifies known Roman heritage assets, considers their significance, and evaluates likely effects during construction, operation and decommissioning, including effects on setting. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. Consequently, no significant effects were identified to the asset. Embedded mitigation measures to avoid or reduce harm to heritage assets are set out in Section 12.9 of **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, with additional mitigation detailed in Section 12.11. An overarching archaeological mitigation strategy is provided in **ES Volume 3, Appendix 12-6: Outline Archaeological Mitigation Strategy [APP-230]**. The Applicant notes that the approach to the assessment in relation to the Fosse Way has been agreed with Historic England and the methodology for the mitigation strategy is under discussion with Historic England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
Respondents expressed concern regarding the potential visual effects of the Scheme on the Fosse Way, including impacts on its setting.	The landscape and visual effects of the Scheme, including effects on the Fosse Way and its setting, are assessed in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The Landscape and Visual Impact Assessment (LVIA) identifies users of the Fosse Way as visual receptors and evaluates likely effects during construction, operation and decommissioning using realistic worst-case design parameters. The Fosse Way runs adjacent to Sites B and C through the Scheme and is made of seven separate receptors which have been assessed in full. The Sequential effects for users of the Fosse Way are not considered to be any greater than those effects identified for the individual sections as set out within **ES Volume 3, Appendix 8.3 ES LVIA Assessment Sheets [APP-189-194]**. Moderate Adverse

	effects on Receptor No TR145: Fosse Way were identified as a result of Site C with no greater effects identified as a result of Site B. Refer to **ES Chapter**, **Appendix 8-3-2-2-1 - Landscape and Visual Assessment Sheets [APP-191].** The assessment found that there would be temporary Moderate Adverse effects during the construction and Year 1 on views from The Fosse Way which would reduce Minor at Year 15 and No effect at Decommissioning as a result of the proposed mitigation planting. The Scheme design has been refined through an iterative design process to avoid and reduce visual effects on the Fosse Way. This includes the removal of solar panels from fields adjacent to the Fosse Way where significant visual effects were identified, together with the introduction of landscape buffers and new planting to further reduce visibility of infrastructure from the route and its surrounding landscape. Details of the proposed landscape mitigation measures are set out in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060], ES Volume 2, Figure 3-4-1 to 3-4-5.2 Landscape and Ecology Mitigation Plan [APP-084]** the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283],** and the **Outline Ecological Protection and Mitigation Strategy (OEPMS) [APP-284]**. The preparation, approval and implementation of detailed landscape and ecological management plans, (substantially in accordance with the **OLEMP**) and a detailed ecological protection and mitigation strategy (substantially in accordance with the **OEPMS**) are secured through Requirements 7 and 8 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that visual mitigation measures are delivered and maintained throughout the lifetime of the Scheme. The effects of the Scheme on the setting of the Fosse Way as a heritage asset are assessed in **ES Volume 1, Chapter 12: Cultural Heritage [APP-064]**, which concludes that, with the design refinements and secured mitigation in place, effects on the setting of the Fosse Way are appropriately managed and no significant effects were identified to the asset. Since the design presented at PEIR stage, Field C26, the westernmost part of Field C25, and the majority of Field C13 have been entirely removed from the Order Limits. Solar PV Panels have also been removed entirely from within Fields B1-B5, C24-C25, and C13. A number of fields abutting the Fosse Way within which Solar PV Panels will be erected have had offsets established with their boundaries with Fosse Way, including Fields B6, C10-C12, and C22-C23. **Appendix 12.1: Heritage Statement [APP-219]** identified that the overall setting and significance of the Fosse Way will remain intact, and the asset will retain its legibility as a roadway within a largely agrarian landscape. .

	The Applicant notes that the approach to the assessment in relation to the Fosse Way has been agreed with Historic England and the methodology for the mitigation strategy is under discussion with Historic England and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
Respondents expressed concern regarding the potential effects of construction traffic on the Fosse Way.	The potential effects of construction traffic on the local highway network, including the Fosse Way, are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. The assessment considers construction vehicle routing, traffic volumes, road safety and effects on road users, and concludes that, with appropriate mitigation in place, construction traffic would not give rise to unacceptable impacts on the operation or safety of the Fosse Way. Construction vehicle movements will be managed through a Construction Traffic Management Plan. An **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]** has been prepared and submitted with the Application. The Outline CTMP sets out measures to ensure that the effect of construction traffic on the local highway network is minimised, including defined construction access points, approved HGV routes, coordination of deliveries, and timing restrictions to avoid peak traffic periods where practicable. The Outline CTMP also includes a road condition and dilapidation survey of minor roads not typically used by HGV traffic. Any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority. In addition, the Outline CTMP includes community liaison measures to keep local communities informed of construction activity and to provide a contact point for feedback should any issues arise. The preparation, approval and implementation of the detailed CTMP, substantially in accordance with the Outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic effects on the Fosse Way are appropriately managed throughout the construction phase.
Air Quality	
Respondents expressed general concern regarding the potential effects of the Scheme on air quality, including the risk of increased pollution.	An assessment of the effects of the Scheme on air quality (including the risk of increased pollution) is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**, which considers potential air quality impacts during construction, operation and decommissioning. The assessment examines dust emissions, vehicle emissions, non-road mobile machinery

	emissions, back-up generator emissions and emissions associated with a the unlikely event of a potential BESS fire. Supporting technical assessments are provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and Assessment [APP-238]** and **ES Volume 3, Appendix 15-2: BESS Fire Emissions Modelling [APP-239]**. The assessment concludes that, with embedded mitigation measures in place, the Scheme would not give rise to significant adverse air quality effects at human or ecological receptors. Mitigation measures to control construction dust, vehicle emissions and plant emissions are set out in the **Outline Construction Environmental Management Plan [APP-277]**, which includes measures such as dust suppression and site management controls. Additional measures to control construction vehicle emissions are set out in the **Outline Construction Traffic Management Plan [APP-287],** which includes restrictions on construction traffic routing and timing. Measures to control operational emissions, including maintenance activities and back-up generator testing, are set out in the **Outline Operational Environmental Management Plan [APP-278]**. In the unlikely event of a BESS fire, measures to control fire emissions are outlined in the **Outline Battery Safety Management Plan [APP-286].** This includes measures to limit human exposure to air pollution in the event of a fire. The preparation, approval and implementation of the detailed Construction Environmental Management Plan, Construction Traffic Management Plan, Operational Environmental Management Plan and Battery Safety Management Plan, substantially in accordance with the outline plans, are secured through requirements in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts are appropriately controlled throughout the construction and operation of the Scheme.
Respondents raised concerns around the potential for toxic fumes in the event of a BESS fire and how that might impact nearby resident.	As a result of updated Scheme design for DCO submission, BESS infrastructure is proposed more than 500 m away from the nearest dwelling. At this distance, impact to health and wellbeing from air quality, fire or explosion impacts are minimal. As such, there are no significant adverse effects to human health anticipated as a result of the Scheme, as assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. The location of the BESS has been informed by a detailed site selection and design evolution process, as set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. This chapter explains that land at Lime Down D was identified as an appropriate location for the BESS due to its proximity to the solar PV arrays and the on-site substation, providing operational benefits including minimising transmission losses, maximising storage efficiency,

	and enabling rapid and reliable grid response. In considering options for co-locating the BESS with the solar PV Sites, Lime Down D was selected as the preferred location due to its central position within the Scheme, effective natural and proposed screening, limited proximity to residential properties, and closeness to existing infrastructure corridors, including the railway line. Locating the BESS within an existing infrastructure corridor reduces the need for additional land take and avoids introducing new isolated infrastructure into undeveloped areas. The assessment concludes that siting the BESS at Lime Down D presents the lowest potential for significant adverse environmental effects. Accordingly, the proximity of the BESS to the railway line does not give rise to significant safety or environmental concerns. The potential effects of toxic gases arising in the unlikely event of a BESS fire, are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]**, which models potential emissions and evaluates impacts on sensitive receptors within a 1 km radius of the BESS area, including residential properties and Public Rights of Way. The assessment concludes that no significant off-site air quality impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **Outline Battery Safety Management Plan [APP-286]**, such as advice to remain indoors and close windows, would further reduce potential effects on nearby residents. The Applicant has followed guidance from the National Fire Chiefs Council (NFCC) and commissioned a Plume Assessment Study to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area (**ES Volume 3, Appendix 15-2: BESS Fire Emissions Modelling [APP-239])**. The fire emissions modelled in the report were based upon recent UK Health Security Agency (UKHSA) requests for DCO BESS projects which explore both immediate air quality impacts together with annual UK air quality requirements. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions [APP-166]**. The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286]**. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage of the project as stipulated in Section 5.5.9 of the OBSMP and secured through Requirement 6 of the **Draft DCO [APP-016]**.

	As now mandated under National Fire Protection Association (NFPA) 855 (2026), the Applicant will only be able to select a BESS system that has undertaken Large Scale Fire Testing (LSFT). At the detailed design stage, the selected BESS LSFT data will be leveraged to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit – this is secured in the OBSMP via pre-construction requirements. Section 5 of the OBSMP covers all requisite firefighting requirements for the Scheme, including fire service access, firefighting water supply, and emergency planning requirements. The Applicant notes that the approach to BESS safety is under discussion with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and this will be set out in the relevant Statement of Common Ground.
Respondents expressed concern regarding potential impacts on air quality arising from construction activities, including construction dust and construction vehicle emissions.	An assessment of the effects of construction activities on air quality is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. The assessment considers potential emissions from construction dust, construction vehicle exhausts and Non-Road Mobile Machinery (NRMM), and has been undertaken in accordance with relevant best practice guidance. Further detail on the construction dust assessment is provided in **ES Volume 3, Appendix 15-1: Construction Dust Methodology and Assessment [APP-238]**. The assessment concludes that, with embedded mitigation measures in place, construction-phase air quality effects on receptors would not be significant. Mitigation measures to control dust and emissions during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Construction Traffic Management Plan [APP-287]**. These include measures such as dust suppression, site management controls, routing and scheduling of construction traffic, and management of plant and machinery. The preparation, approval and implementation of detailed construction management plans, substantially in accordance with the outline plans, are secured through Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that air quality impacts during construction are appropriately controlled.
Noise and Vibration	
Respondents expressed general concern regarding the potential for increased noise, including references to 'buzzing', and vibration arising from the Scheme.	An assessment of the effects of the Scheme on noise and vibration is provided in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information supplied in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment considers potential noise and vibration impacts during construction, operation and decommissioning,

Some respondents raised concerns regarding noise and vibration from specific components of the solar park, including the BESS.	including from solar PV panels and associated infrastructure. The conclusions of the assessment in relation to each phase of the Scheme are set out below. The conclusions of the assessments are made for the Scheme as a whole (i.e. all of its components combined, including the BESS), and therefore any specific component will not have any greater effects than those that have been assessed. The Applicant notes that the approach to noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. In addition, further meetings have been held over the approach to the management plans, and a Statement of Common Ground will be issued and updated throughout examination Construction phase The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. Mitigation measures associated with construction activity, such as temporary screens and advanced warning of works, are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction, as committed to in the **Outline Construction Environmental Management Plan [APP-277]**. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, is secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration effects are appropriately controlled. Operational phase The noise impacts from the operation of the Scheme and its components are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting modelling provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The predicted noise levels from the Solar PV Sites have been artificially increased by 3 dB to account for the increased likelihood that the noise from the Scheme would be perceived as distinct from the existing background sound. Potential mitigation measures are detailed in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, and with such measures in place, significant effects from operational noise are not expected.

	The **Outline Operational Environmental Management Plan [APP-278]** commits to noise levels from the Scheme at residential dwellings being the same as or below those modelled in the ES. This provides assurance that significant effects from operational noise will be avoided, while allowing flexibility in how this is achieved. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
Respondents expressed concern regarding potential increases in noise and vibration arising from construction activities associated with the Scheme.	The noise and vibration impacts arising from construction activities are assessed in Section 14.10 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, with supporting technical information provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. For the purposes of the assessment, a reasonable worst-case scenario assuming piling activities has been considered. The Applicant notes that the approach to construction noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures associated with construction activity are presented in Section 14.9 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]** and are committed to through the **Outline Construction Environmental Management Plan [APP-277]**. With these measures in place, the assessment concludes that no significant effects from construction noise or vibration are expected. A noise monitoring programme agreed with Wiltshire Council will be carried out during construction. The preparation, approval and implementation of the Construction Environmental Management Plan, substantially in accordance with the **Outline CEMP [APP-277]**, are secured through Requirement 13 in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that construction noise and vibration are appropriately controlled throughout the construction phase of the Scheme.
Transport and Access	

Respondents expressed concern that the Scheme would increase traffic and cause disruption to the local road network during the construction phase.	The potential effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle movements, traffic volumes, road safety and effects on road users. This included the capacity of local roads and infrastructure to accommodate construction vehicles with consideration of construction traffic volumes, vehicle types, route suitability, and network performance. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects on accident risk are anticipated. The assessment additionally concludes that with appropriate mitigation such as the Construction Traffic Management Plan in place to manage construction vehicle movements, there would be no significant adverse impacts on the local highway network during the construction, operation maintenance, and decommissioning phases of the Scheme. An **Outline Construction Traffic Management Plan (CTMP) [APP-287]** has been prepared and submitted with the DCO application. The aim of the CTMP is to ensure that the effect of the construction phase on the local highway network is minimised. The **Outline CTMP [APP-287]** secures measures to coordinate construction deliveries by HGVs to arrive and depart between 09:30 and 16:30 where possible, to avoid peak network hours of 08:00–09:00 and 17:00–18:00. It also includes a community liaison element to keep local communities informed about the construction process and to provide a contact for feedback should any issues arise. Compliance with the CTMP will be monitored by the Developer, Contractor and Wiltshire Council as local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts are appropriately managed throughout the construction phase of the Scheme.

Respondents expressed concern for increased traffic during the operational phase of the Scheme.	The potential effects of operational traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. This chapter is supported by **ES Volume 2 Figures, including ES Volume 2, Figure 13-13: Operational Only Access Locations: Solar PV Sites [APP-3]**, and **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233].** The assessment considers day-to-day movements associated with maintenance and security of the Scheme, and for the replacement of Solar PV Panels, Conversion Units and BESS Batteries. Assumptions have been made based on similar projects, and the number of vehicle trips for replacement activities will be less than those during the construction phase. The assessment concludes that operation and maintenance vehicles will not give rise to any residual significant effects in terms of traffic volumes, in line with relevant thresholds set out in the ISEP Guidelines 2023. Embedded mitigation measures include providing suitable access points for operation and maintenance phase vehicles with turning areas and this is secured in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]** at Table 2: Solar PV Sites - Access Points.. Where replacement activities are required, measures set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287], as stated in Section 7 under the heading Operational Traffic Management Plan (OTMP),** will be implemented as appropriate. An example of these measures include: • a review of all proposed routes and measures set out in the CTMP to ensure they remain suitable at the time of replacement activity; and • where practicable, vehicles bringing new replacement Solar PV Panels and BESS Containers to the Order Limits will also transport the replaced Solar PV Panels and BESS Containers out of the Order Limits. In addition, the **Outline Public Right of Way (PRoW) and Permissive Paths Management Plan [APP-288]** includes measures at section 4 of the report to manage vehicle interactions with PRoW users and minimise effects on existing users. Measures include all PRoW will have a 15m buffer to any infrastructure associated with the Scheme (including fencing). Operation and maintenance vehicles may cross PRoW during visits on an infrequent basis. During the operation and maintenance phase, there are anticipated to be around five visits to each Solar PV Site per month for

	maintenance purposes. These would typically be made by light van or 4x4 type vehicles. These movements will not generate any material effect on PRoW, however, in the unlikely circumstance that there is damage to the surface of the PRoW, it will be repaired as soon as practicable and returned to its previous condition. Not all of these visits will require vehicles to cross a PRoW The **Outline Public Right of Way (PRoW) and Permissive Paths Management Plan [APP-288]** includes additional proposed permissive paths. The permissive paths are to remain open up to 365 days per year throughout the proposed 60-year operational lifetime of the Scheme. The preparation, approval, and implementation of the final CTMP and PRoW and Permissive Paths Management Plan are secured through Schedule 2, Requirements 15 and 16, respectively, of the **Draft Development Consent Order [APP-016]**.
Respondents expressed concern that construction vehicles, including HGVs and Abnormal Indivisible Loads (AILs), could cause damage to local roads. Some respondents also queried whether any damage arising from construction traffic, including potholes, would be repaired.	The effects of construction traffic on the local highway network are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction vehicle routing, traffic volumes and potential impacts on highway safety and road condition. The assessment concludes that, with appropriate management measures in place, construction traffic effects can be appropriately controlled and through road condition surveys pre and post construction, any damage caused to the highway by the construction vehicles will be rectified as set out in Section 6.12 of the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. Mitigation measures to manage construction traffic and protect local roads are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP has been developed to minimise impacts on the local highway network and includes measures for routing, scheduling of deliveries and liaison with the local highway authority. A road condition and dilapidation survey of minor roads not typically used by HGV traffic pre and post construction is committed to within the CTMP. The CTMP will also secure, as set out in the outline CTMP, that any damage to verges or carriageway surfaces caused by construction vehicles will be rectified to the satisfaction of the local highway authority.

	The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts, including potential damage to local roads, are appropriately managed throughout the construction phase of the Scheme.
Respondents expressed concern regarding the capacity of the local road network and associated infrastructure to accommodate construction traffic.	The capacity of local roads and infrastructure to accommodate construction vehicles is assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers construction traffic volumes, vehicle types, route suitability and network performance. The assessment concludes that, with appropriate mitigation in place, there would be no significant adverse impacts on the local highway network and that the network can accommodate construction traffic. Supporting technical information is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which identifies specific locations where traffic management measures or passing arrangements may be required on narrower sections of construction routes. The assessment presented in **Annex H of ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]** demonstrates adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle as requested in comments provided by Wiltshire Council. All construction routes also include passing points to allow two HGVs to pass. Mitigation measures, including those referenced above, to manage construction traffic are set out in the **Outline Construction Traffic Management Plan (CTMP) [APP-287]**. The CTMP is designed to minimise the effects of construction traffic on local roads and includes measures for vehicle routing, delivery scheduling and liaison with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic impacts on local roads and infrastructure are appropriately managed throughout the construction phase of the Scheme.

Respondents expressed safety concerns regarding an increased risk of accidents and injury as a result of construction vehicles and increased traffic associated with the Scheme.	The potential effects of construction traffic on highway safety and accident risk are assessed in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**, which considers changes in traffic flows, HGV movements and accident risk on the local road network. Links experiencing traffic increases above defined assessment thresholds were taken forward for detailed analysis. Supporting technical evidence is provided in **ES Volume 3, Appendix 13-1: Transport Assessment [APP-233]**, which includes an assessment of baseline accident data and predicted changes in collision risk arising from construction traffic. The assessment concludes that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on links within the Study Area, and no significant adverse effects in relation to accident risk are anticipated. Mitigation measures to manage construction traffic safely are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority. The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic is managed safely (with accident risks minimised) throughout the construction phase of the Scheme.
Respondents expressed concern regarding increased noise arising from construction vehicles and associated traffic.	The noise effects associated with construction traffic are assessed in **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**, which considers noise from construction vehicles, HGV movements and associated changes in traffic flows on the local road network. Supporting technical information is provided in **ES Volume 3, Appendix 14-4: Noise Modelling [APP-237]**. The assessment concludes that, with embedded mitigation in place, noise effects from construction traffic would be negligible or low in magnitude and no significant adverse effects at any receptors are predicted. The Applicant notes that the approach to construction noise and vibration has been discussed with Wiltshire Council, as described in Section 14.2 of **ES Volume 1, Chapter 14: Noise and Vibration [APP-066]**. Mitigation measures to manage construction traffic and minimise associated noise are set out in the **Outline Construction Traffic Management Plan [APP-287]**, which includes defined vehicle routing, delivery scheduling and coordination with the local highway authority to reduce impacts on sensitive receptors.

	The preparation, approval and implementation of the final CTMP, substantially in accordance with the outline CTMP, are secured through Requirement 15 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring construction traffic noise is appropriately managed throughout the construction phase of the Scheme.
Respondents expressed concern regarding potential impacts on air quality arising from emissions associated with construction vehicles.	The effects of construction activities on air quality, including emissions from construction vehicles, construction dust and Non-Road Mobile Machinery (NRMM), are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. The assessment has been undertaken in accordance with best practice guidance and considers sensitive receptors within the Study Area. The assessment concludes that, with embedded mitigation in place, air quality effects on receptors arising from construction traffic and construction activities would not be significant. Mitigation measures to minimise emissions and dust during construction are set out in the **Outline Construction Environmental Management Plan [APP-277]** and the **Outline Construction Traffic Management Plan [APP-287]**. These include measures to control construction vehicle movements, manage site access, reduce dust generation and ensure appropriate maintenance of construction plant and vehicles. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and detailed Construction Traffic Management Plan, substantially in accordance with the corresponding outline plans, are secured through Requirement 13 and Requirement 15, respectively, in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring air quality impacts during construction are appropriately controlled throughout the construction phase of the Scheme.
Socio-Economics, Tourism and Recreation	

Respondents expressed general concern regarding the potential effects of the Scheme on the local economy and local businesses. Some respondents considered that the Scheme would not deliver meaningful socio-economic or economic benefits.	An assessment of the likely effects of the Scheme on the local economy and employment is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. This chapter considers potential impacts on construction and engineering sectors, agricultural activity, tourism-related businesses, and wider local economic conditions during construction, operation and decommissioning. Supporting evidence is provided in **ES Volume 3, Appendix 16-3: Socio-Economics, Tourism and Recreation – Summary of Non-Significant Effects [APP-239]**, which summarises that effects on the local economy and economic prosperity are assessed as negligible to minor beneficial, with construction expenditure and employment generation contributing positive, temporary effects on local economic activity. The assessment therefore concludes that the Scheme would not result in significant adverse effects on local businesses or the wider local economy, and that socio-economic benefits, including job creation and local supply-chain opportunities, are expected during the construction phase, with more modest economic and skills and supply chain opportunities during the operational phase. The Applicant has sought to minimise long-term adverse effects on local businesses through the mitigation measures set out in the **Outline Operational Environmental Management Plan (Outline OEMP) [APP-278]**, **Outline Construction Traffic Management Plan (Outline CTMP) [APP-287]**, and **Outline Public Rights of Way and Permissive Paths Management Plan (Outline PROWPPMP) [APP-282]**, secured respectively by Requirements 14, 15, and 16 in Schedule 2 to the **Draft DCO [APP-016]**. The Applicant is furthermore committed to skills, employment and business enhancement measures as set out in the **Outline Skills, Supply Chain and Employment Plan (OSSCEP) [APP-285]**, secured by Requirement 18 in Schedule 2 to the **Draft DCO [APP-016]**, to help increase business activity and local skill capabilities in Wiltshire during the operational lifetime of the Scheme. The Applicant notes that the approach to assessment of socio-economic effects has been agreed with Wiltshire Council's Economics and Regeneration Team, with the exception of matters relating to agricultural employment, which is still under discussion and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**

Respondents expressed general support for the socio-economic and economic benefits of the Scheme.	The Applicant agrees with and takes note of this comment. The Applicant confirms that the socio-economic benefits are set out in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068].**
Respondents expressed concern that the Scheme could have an adverse effect on local property values.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].**

Respondents expressed concern for the Scheme's impact to property prices during the pre-application / development phase. Some respondents expressed that they have been unable to sell their properties as a result of the proposals.	Impacts of the Scheme on property prices have not been assessed as these have been agreed by the Planning Inspectorate to be scoped out of assessment in the ES, as set out in **ES Volume 3, Appendix 1-2: Scoping Opinion Response Table [APP-181].** Whilst property values are not a material planning consideration and are therefore not assessed in the ES, the potential effects of the Scheme on residential receptors have been assessed where relevant, including through the Landscape and Visual Impact Assessment (LVIA) presented in **ES Volume 1, Chapter 8: Landscape and Visual [APP-060]**. The LVIA assesses effects on residential properties and identifies where significant visual effects may occur. The assessment concludes that there would be no Significant Long Term Visual Effects to Residential Properties as a consequence of the Scheme. The layout of the Scheme has been refined through an iterative design process to minimise effects on nearby properties. This includes embedded mitigation measures such as retaining existing hedgerows and woodland, providing new planting and landscape buffers, and incorporating minimum offsets from residential properties within the design.
Respondents expressed support for the jobs the Scheme would create.	The Applicant agrees with and takes note of this comment. The Applicant confirms that the socio-economic benefits including job creation are set out in **ES Volume 1, Chapter 16: Socioeconomics, Tourism and Recreation [APP-068]** and are supported by the measures secured in the **Outline Skills, Supply Chain and Employment Plan [APP-285]**.

Respondents expressed scepticism about the number of jobs the Scheme would create.	An assessment of the Scheme's employment effects is provided in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, which considers job creation during construction, operation and decommissioning, and the contribution of the Scheme to local and regional labour markets. A full breakdown of estimated employment figures for each phase of the Scheme's lifetime is provided in Section 1.4 of **ES Volume 3, Appendix 16-1: Socio-Economics, Tourism and Recreation – Legislation, Policy, Guidance and Supporting Information [APP-240]**. This supporting information sets out the methodology used to derive employment estimates and the anticipated scale of direct and indirect job creation. The socio-economic assessment concludes that the Scheme would generate temporary employment during construction, smaller-scale long-term operational employment, and opportunities for local supply-chain involvement. The Applicant notes that the approach to employment is under discussion with Wiltshire Council's Economics and Regeneration Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**
Respondents expressed concern regarding the potential effects of the Scheme on agricultural employment and tenant farmers. Some respondents specifically raised concerns about potential job losses for agricultural workers and tenant farmers as a result of agricultural land being included within the Scheme.	The Applicant is cognisant of the impact the Scheme could have on wider agricultural employment associated with tenancies and contracts and so seeks to source ways of retaining agricultural workers, providing reskilling opportunities, or providing re-employment as supported by the measures secured in the **Outline Skills, Supply Chain and Employment Plan [APP-285].** The Applicant has been in discussions with landowners and these discussions have included arrangements regarding existing tenancies. Whilst a worst case could involve the termination of an agricultural tenancy or contract in its current form, alternative operational and management opportunities are available connected to the scheme should consent be granted.

Respondents expressed concern regarding the potential effects of the Scheme on tourism. Some respondents specifically raised concerns that impacts on tourism could result in a loss of trade for local businesses, including the potential closure of businesses reliant on tourism.	The potential effects of the Scheme on tourism and recreation are assessed in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**, supported by **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The assessment considers baseline tourism activity, visitor attractions, recreational assets and tourism-dependent businesses within the study area. The assessment evaluates potential effects on the use, enjoyment and desirability of nearby tourism destinations, including impacts on individual visitor attractions, recreational routes, events and businesses reliant on tourism. It also considers whether changes to landscape character or visual amenity could influence visitor behaviour. The assessment identifies a worst-case scenario in which a temporary loss of up to 50 tourism-related jobs could occur locally during construction, and a long-term loss of up to 11 tourism-related jobs could occur during the operational phase of the Scheme. This represents a precautionary estimate based on conservative assumptions. The assessment concludes that, while some localised effects on tourism receptors are anticipated to occur, significant adverse effects on the wider tourism economy are not anticipated. These findings are fully reported in the ES and will be weighed in the planning balance alongside the Scheme's wider economic and environmental benefits. The Applicant notes that the approach to assessment of tourism impacts is under discussion with Wiltshire Council's Economic and Regeneration Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**
Respondents expressed concern about the Scheme's impact on horse-riders and bridleways.	Equestrian facilities, including private stables and paddocks, studs, riding schools, and on public rights of way such as bridleways and byways have been considered as specific recreational receptors in the assessment in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068].** The likely effects on these locations and receptors are specifically and individually assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. The Applicant confirms that the majority of significant adverse effects can be mitigated, however understands that some **significant adverse effects** to users of routes in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of equestrian facilities and PROWs is protected as much as possible through the implementation of embedded and additional mitigation measures set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**.

	The Applicant confirms that the approach to equestrian and PROW impacts is under discussion with Wiltshire Council's Countryside Access Team (as part of discussions with Wiltshire Council in general), the British Horse Society, and the Wiltshire Bridleway Association. Progress on each of these discussions is set out in the relevant Statements of Common Ground with each of these parties to be submitted at Deadline 1.
Respondents raised safety concerns that the Scheme, including construction vehicles associated with it, could endanger horse riders.	Public rights of way such as bridleways and byways and the use of the highway network for recreational users have been considered as specific recreational receptors in the assessment in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on individual PROWs are specifically assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241].** The Applicant confirms that the majority of significant adverse effects can be mitigated, however it understands that some **significant adverse effects** to users of routes in Lime Down E cannot be mitigated further during construction. No significant residual effects are anticipated during the operational phase of the Scheme. The Applicant has committed to ensuring the operation or recreational use of PROWs is protected as much as possible through the implementation of embedded and additional mitigation measures set out in the **OCTMP [APP-287]** and **OPROWPPMP [APP-282]**, secured respectively by Requirements 15 and 16 in Schedule 2 to the **Draft DCO [APP-016]**. An assessment on safety and accidents is provided in **ES Volume 1, Chapter 13: Transport and Access [APP-065]**. Links with traffic increases above identified thresholds, were taken forward for further assessment. As part of the assessment, it is concluded that the level of construction traffic associated with the Scheme is unlikely to materially affect road safety on the links in the Study Area. The Applicant confirms that the approach to equestrian and PROW impacts and highway safety are under discussion with Wiltshire Council's Countryside Access Team and Highways Team (as part of discussions with Wiltshire Council in general). Additional discussions specific to PROWs are being undertaken with the British Horse Society, and the Wiltshire Bridleway Association. Progress on each of these discussions is set out in the relevant Statements of Common Ground with each of these parties to be submitted at Deadline 1.

Respondents expressed concern regarding the potential effects of the Scheme on stud farms and other equine businesses in the area.	Equestrian facilities, including private stables, paddocks, stud farms, riding schools, have been considered as specific recreational receptors within **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]**. The likely effects on these receptors are individually assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**, which consider impacts from construction activities, traffic, impacts on nearby PROWs and changes in views and landscape character. With the exception of Park Farm, Yatton Keynell (the equestrian facilities of which are likely to be directly affected by cable route construction) the assessment identifies that, with embedded mitigation in place, including construction traffic management, embedded design measures to offset infrastructure from highways and public rights of way, and site-specific safety measures for cabling works, no significant residual effects on the operation or use of equestrian facilities are expected, subject to implementation of the committed mitigation measures.
Respondents expressed concern that construction noise could adversely affect horses at nearby stud farms and other equine businesses.	Equestrian facilities, including private stables and paddocks, studs, riding schools have been considered as specific recreational receptors in the assessment in the **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068].** The likely effects on these locations are specifically assessed in **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]** which identifies no significant residual effects to their operation or recreational use as a result of noise impacts, subject to implementation of embedded and additional mitigation measures with any mitigation requirements (such as noise screening and offsetting away from neighbouring paddocks) secured through the relevant management documents.

Some respondents expressed general concern about the Scheme's potential impact on recreation and access to the countryside. Some respondents raised specific concerns about potential effects on Public Rights of Way (PRoW), permissive paths, footpaths and cycle routes.	A detailed assessment of the likely significance of effects from the Scheme on the use and desirability of individual PRoW and recreational access to the countryside is included in **ES Volume 1, Chapter 16: Socio-Economics, Tourism and Recreation [APP-068]** and **ES Volume 3, Appendix 16-2: Tourism and Recreation Receptor Tables [APP-241]**. This assessment considers the impact on individual recreational routes, including their practical use, enjoyment and desirability. The Applicant confirms that the majority of significant adverse effects can be mitigated. However, some significant adverse effects to users of PRoW and unsurfaced roads in Lime Down E during construction cannot be mitigated further. No significant residual effects are anticipated during the operational phase of the Scheme. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** also considers the physical and mental health impacts of changes to recreation and countryside access under the assessment topic 'open space, leisure and play', and concludes that no significant adverse effects are anticipated at any phase of the Scheme. The Applicant confirms that existing PRoW are to be protected as far as practicable within the Scheme design, with management measures set out in the **Outline Public Rights of Way and Permissive Paths Management Plan (PROWPPMP) [APP-282]**, confirmed as embedded mitigation in Section 16.9 of ES Chapter 16. New permissive access routes have been incorporated into the Scheme design, shown as Work No. 10 on the **Works Plan [APP-007]** and illustrated on **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [APP-084]**. These are identified as additional mitigation and enhancement measures in Section 16.11 of ES Chapter 16. The PRoW and Permissive Paths Management Plan is secured through Requirement 16 of Schedule 2 of the **Draft Development Consent Order [APP-016]**. The preparation, approval and implementation of the detailed Construction Environmental Management Plan and Construction Traffic Management Plan, substantially in accordance with the outline plans, are secured through Requirements 13 and 15 respectively in Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring that impacts on PRoW and recreational routes are appropriately managed during construction. The approach to recreation and access has been discussed with Wiltshire Council's Public Health team and is under discussion with Wiltshire Council's Countryside Access Team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
Human Health	

Respondents expressed concern regarding the potential effects of the Scheme on the mental health and wellbeing of the community and local residents. Some respondents also stated that the local area, including access to it, is important for their mental health and wellbeing.	Impacts on mental health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including mental health and wellbeing, through consideration of a broad range of health determinants. These include access to open space and recreation, transport and connectivity, community identity and cohesion, employment and income, noise and vibration, air quality, and access to health and social care services. The assessment applies a health "lens" to the findings of relevant technical chapters and concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population health, including mental health and wellbeing. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, HGV movements are set to defined routes and within set hours, community liaison and engagement is maintained, and construction impacts on noise and air quality are regulated. With specific regard to community liaison, this is directly secured through Requirement 4 in Schedule 2 to the **Draft DCO [APP-016]** through the provision of a community liaison group. This group will act as an intermediary between the public and the onsite contractors to ensure community concerns and any information they need are communicated and responded to, so as to reduce community anxiety and impacts on mental wellbeing, and to assist in directing the public to mental health support if required. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** focuses on communities within a 2 km Study Area surrounding the Scheme, identified as those most likely to experience potential health-related effects. Baseline analysis demonstrates that rates of poor mental health within the Study Area are generally lower than national averages, and the assessment considers potential pathways by which the Scheme could influence mental wellbeing, including changes to environment, amenity, access and community factors. Residual effects of the Scheme on health following mitigation are assessed as not significant at any phase of the Scheme. Consultation with Wiltshire Council's Public Health Team has informed the approach to mental health considerations, as documented in **ES Volume 3, Appendix 18-1: Human Health Consultation [APP-244].** Through this engagement, the Applicant has committed to signposting locally available mental health and wellbeing resources to members of the public engaging with the Scheme, using information provided by Wiltshire Council's Public Health Team. The Applicant will continue to monitor consultation responses relating to mental health and will provide appropriate signposting to existing local support services where requested. The Applicant notes that the assessment methodology for health and wellbeing has been agreed

	with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1.
Respondents expressed concern regarding the potential effects of the Scheme on human health, including physical health.	Impacts on physical health and wellbeing are assessed in **ES Volume 1, Chapter 18: Human Health [APP-070].** This chapter provides a comprehensive assessment of the Scheme's potential effects on human health, including physical health and wellbeing, through consideration of a broad range of health determinants with physical health pathways. These include access to housing, access to open space and recreation, transport and connectivity, climate change, air quality, water quality, land quality, noise and vibration, and access to health and social care services. The assessment in **ES Volume 1, Chapter 18: Human Health [APP-070]** applies a health-based review of relevant technical chapters to identify potential pathways by which the Scheme could affect physical health. It concludes that, with the embedded mitigation and additional measures secured through the relevant management plans **[APP-277** to **APP-287]** secured by their respective requirements in Schedule 2 to the **Draft DCO [APP-016]**, the Scheme would not give rise to significant adverse effects on population physical health at any phase of the Scheme. Mitigation measures include (but are not limited to) ensuring PROWs remain open as much as is practicable, inbound workers are accommodated in the most suitable locations for housing and health service access, community liaison and engagement is maintained, and construction impacts on waterways, soils, noise and air quality are regulated. Priority has been given in the assessment to communities most likely to experience potential health-related effects, within the 2 km Study Area surrounding the Scheme. The Applicant notes that the assessment methodology for health and wellbeing has been agreed with Wiltshire Council's Public Health team and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1**.**

Other Environmental Matters	
Respondents expressed concern that lithium batteries cannot be recycled.	Details of the disposal and end-of-life management of the Battery Energy Storage System (BESS), including lithium-ion batteries, are provided in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.3: Materials and Waste. This section confirms that recycling routes for solar PV panels and BESS components, including lithium batteries, are generally available at present, and that these routes are expected to expand further over the lifetime of the Scheme as the recycling market grows in response to increasing deployment of renewable energy infrastructure. The Materials and Waste assessment in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** and **Outline Site Waste Management Plan [APP-281], Outline Construction Environmental Management Plan [APP-277], Outline Operational Environmental Management Plan [APP-278]** and **Outline Decommissioning Strategy [APP-279]** also outlines that the Scheme will follow the waste hierarchy, prioritising reuse and recycling wherever reasonably practicable, with disposal as a last resort. This is a legal requirement under The Waste (England and Wales) Regulations 2011. An **Outline Site Waste Management Plan [APP-281], Outline Construction Environmental Management Plan [APP-277], Outline Operational Environmental Management Plan [APP-278]** and **Outline Decommissioning Strategy [APP-279]** have been submitted with the Application, which set out how waste, including BESS components, will be managed during construction, operation and decommissioning.. On this basis, the Materials and Waste assessment **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]** concludes that the Scheme would not give rise to significant adverse effects in relation to materials use or waste management, and that appropriate recycling and disposal routes for lithium-ion batteries are available and expected to improve further over time. Requirement 19 in Schedule 2 of the **Draft DCO [APP-016]** secures that, prior to commencement of construction, a detailed Site Waste Management Plan must be submitted to and approved by the relevant planning authority, and that construction must be carried out in accordance with the approved plan. Requirement 13 in Schedule 2 of the **Draft DCO [APP-016]** secures that no part of the authorised development may commence until a construction environmental management plan for that part has been submitted to and approved by the relevant planning authority. Requirement 14 in Schedule 2 of the **Draft DCO [APP-016]** secure that, prior to the date of final commissioning for any part of the authorised development, an operational environmental

	management plan for that part must be submitted to and approved by the relevant planning authority. Requirement 20 in Schedule 2 of the **Draft DCO [APP-016]** secures that, prior to decommissioning of the Scheme, a Decommissioning Strategy must be submitted to and approved by the relevant planning authority. The Decommissioning Strategy must be substantially in accordance with the Outline Decommissioning Strategy and ensure removal of above-ground infrastructure and appropriate management of all resulting waste, including recycling of BESS components where practicable.
Respondents expressed concern regarding the use of lithium batteries within the Scheme. Some respondents raised environmental and safety concerns in relation to lithium batteries, including the risk of fire and the potential danger or harm in the event of a Battery Energy Storage System (BESS) fire.	The Applicant notes that lithium-ion technology is currently the industry standard for utility-scale battery energy storage due to its proven efficiency, reliability and operational safety. Potential environmental and safety effects associated with the Battery Energy Storage System (BESS), including fire risk, are assessed in **ES Volume 1, Chapter 20: Other Environmental Matters, Section 20.7: Major Accidents and Disasters [APP-072].** This assessment considers credible worst-case accident scenarios and concludes that, with embedded mitigation and appropriate management measures, no significant adverse off-site effects are anticipated. The Applicant notes that the approach to BESS safety is under discussion with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been submitted with the Application. The OBSMP confirms that a robust and validated Emergency Response Plan (ERP) will be developed at the detailed design stage in consultation with Dorset & Wiltshire Fire and Rescue Service. Section 5.4 of the OBSMP sets out the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply across all phases of the Scheme, including construction, operation and decommissioning. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved. The potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067],** which models potential emissions and evaluates impacts

	on sensitive receptors within a 1 km radius of the BESS area, including residential properties and Public Rights of Way. The assessment concludes that no significant off-site air quality impacts are predicted should a fire event occur. In the unlikely event of a fire, the precautionary measures set out in the **OBSMP [APP-286]**, such as advice to remain indoors and close windows, would further reduce potential effects on nearby residents. On this basis, the Applicant considers that the Scheme incorporates appropriate safety and mitigation measures to manage BESS-related risks and would not give rise to significant adverse environmental or safety effects.
Respondents expressed general concern regarding potential glint and glare effects arising from the Scheme.	An assessment of glint and glare effects arising from the Scheme is provided in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.5: Glint and Glare. The assessment considers potential effects on surrounding receptors, including road and rail users, residential properties, public rights of way, aerodromes and sensitive viewpoints within the Cotswolds National Landscape. The assessment concludes that, with embedded mitigation measures secured through Section 3.18 of the **Outline Operational Environmental Management Plan [APP-278]**, including the use of fixed-tilt panels at a maximum height of 2.5 metres where required, no significant glint or glare effects are predicted to occur as a result of the Scheme. The preparation, approval and implementation of the detailed OEMP, substantially in accordance with the outline plan, are secured through Requirement 14 of Schedule 2 of the **Draft Development Consent Order [APP-016]**, ensuring operational noise is appropriately controlled throughout the lifetime of the Scheme.
Respondents expressed concern regarding electromagnetic fields.	The effects of electromagnetic fields (EMF) arising from the Scheme are assessed in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.6: Electromagnetic Fields. The assessment considers EMF emissions from the Scheme's electrical infrastructure and evaluates potential effects on surrounding receptors. The assessment concludes that no significant impacts are likely to occur as a result of any of the Scheme's infrastructure. It also confirms that predicted EMF levels are below the reference levels set by the International Commission on Non-Ionizing Radiation Protection.
Respondents expressed concern that the BESS is located too close to a railway line.	The location of the Battery Energy Storage System (BESS) has been informed by a detailed site selection and design evolution process, as set out in **ES Volume 1, Chapter 4: Alternatives and Design Evolution [APP-056]**. This chapter explains that land at Lime Down D was identified as an appropriate location due to its proximity to the solar PV arrays and the on-site substation, providing operational benefits including minimising transmission losses, maximising storage efficiency, and enabling rapid and reliable grid response.

	In considering options for co-locating the BESS with the solar PV Sites, Lime Down D was selected as the preferred location due to its central position within the Scheme, effective natural and proposed screening, limited proximity to residential properties, and closeness to existing infrastructure corridors, including the railway line. Locating the BESS within an existing infrastructure corridor reduces the need for additional land take and avoids introducing new isolated infrastructure into undeveloped areas. The assessment concludes that siting the BESS at Lime Down D presents the lowest potential for significant adverse environmental effects. Accordingly, the proximity of the BESS to the railway line does not give rise to significant safety or environmental concerns. Furthermore, during an emergency event, Network Rail can be made aware of the incident and halt trains from passing the site if it is deemed necessary to do so. As such, there are no significant adverse effects to human health anticipated as a result of the Scheme, as assessed in **ES Volume 1, Chapter 18: Human Health [APP-070]**. The Applicant has followed National Fire Chiefs Council (NFCC) guidance and commissioned a Plume Assessment Study (**ES Volume 3, Appendix 15-2 APP/6.3**) to model toxic gas emissions and visibility impacts from a BESS fire on all sensitive receptors within a 1km radius of the BESS area. Six worst case BESS fire locations (i.e. locations within the BESS Area closest to sensitive receptors) have been modelled as depicted in **ES Volume 2, Figure 15-5: Battery Energy Storage System Fire Emissions Study Area [APP-166]**. The Concentrations of carbon monoxide (CO), formaldehyde, hydrogen chloride (HCl), hydrogen cyanide (HCN), hydrogen fluoride (HF), ammonia (NH_3), nitrogen dioxide (NO2) and particulates from a potential BESS fire have been modelled using an air quality dispersion model to determine the likely effects on human health. A high-level visibility assessment has also been undertaken using the modelled particulates results to determine the effect of BESS fire emissions on visibility on the local road and rail network to inform the **Outline Battery Safety Management Plan (OBSMP) [APP-286]**. The Plume Assessment Study has concluded that there are no significant toxic emission or visibility impacts at all sensitive receptor locations. The Applicant has also committed to commissioning an additional Plume Analysis Study at the detailed design stage as stipulated in Section 5.5.9 of the OBSMP and secured through the DCO: "*..at the detailed design stage a BESS system and site specific Plume Analysis study will be conducted to assess the environmental impact of a site incident to sensitive receptors within a 1 km radius. Toxic gas emissions to sensitive receptors must be below relevant public health*

	exposure limit guidelines when the battery system of a BESS is fully consumed (burnt out), production of Particulate Matter (PM) and a visibility impact assessment on any transport links within a 1 km radius of the BESS area will also be included. The ERP produced at the detailed design stage (template outlined in Section 5.4.4) will incorporate all necessary emergency response procedures and actions based upon thermal runaway test data supplied by the BESS system provider." The Applicant notes that the approach to BESS safety is under discussion with Dorset & Wiltshire Fire & Rescue Service (D&WFRS) and is set out in the relevant Statement of Common Ground to be submitted at Deadline 1. The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
Respondents expressed concern about the risk of a BESS fire.	The Scheme layout also incorporates separation distances between battery containers to ensure that any isolated fire would not become widespread or lead to a major incident – as shown on **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [APP-081]**, the battery containers will be located more than 200 metres from the nearest Public Right of Way and more than 500 metres from any residential receptors. An **Outline Battery Safety Management Plan (OBSMP) [APP-286]** has been prepared for the Scheme using guidance from Dorset and Wiltshire Fire and Rescue Service and incorporating recommendations of the National Fire Chiefs Council. The OBSMP ensures that risks associated with battery storage are appropriately mitigated. The OBSMP will be amended at Deadline 1 to fully accommodate the latest BESS safety requirements contained in NFPA 855 (2026) ensuring that any credible risks associated with battery storage are either prevented or fully mitigated if a BESS failure occurs. Section 2.4.2 of the **OBSMP [APP-286]** stipulates that: *"Final BESS design and site layout will have been validated through mandatory Large Scale Fire Testing (LSFT) and rigorous consequence modelling to minimise the requirement for any D&WFRS intervention in a thermal runaway incident. LSFT must establish minimum equipment spacing distances that demonstrate there is no fire propagation to adjacent BESS enclosures or ESS equipment. D&WFRS intervention in worst case scenarios would typically be limited to boundary cooling of adjacent BESS and Energy Storage System (ESS) units to prevent the fire from spreading. This*

	strategy will be finalised with D&WFRS and be clearly communicated in the Emergency Response Plan (ERP); • *To ensure that fire, smoke, and any release of toxic gases does not significantly impact site operatives, first responders, and the local community; and* • *To ensure that firewater run-off is contained and tested before release or, if necessary, removed by tanker and treated offsite."* Section 5 of the **OBSMP [APP-286]** covers all requisite firefighting requirements for the Scheme including fire service access, firefighting water supply, and emergency planning requirements. Section 6.1.1 of the **OBSMP [APP-286]** confirms that at the detailed design stage, the selected BESS will have undertaken Large Scale Fire Testing (LSFT) to fully inform inputs for risk assessment tools which will be utilised together with detailed consequence modelling to provide a comprehensive site operations and emergency response safety audit. LSFT is a mandatory requirement under NFPA 855 (2026) safety standards to demonstrate thermal insulation protection capabilities of the BESS enclosure design, validate minimum equipment spacing distances, and demonstrate that deflagrations do not occur and/or can be safely constrained. As set out in the **OBSMP [APP-286]**, the BESS Area will have a robust and validated Emergency Response Plan (ERP), developed in consultation with Dorset & Wiltshire Fire and Rescue Service at the detailed design stage. Section 5.4 of the OBSMP specifies the typical emergency response protocols, procedures and safety information that will be included in the ERP. The ERP will apply to all stages of the Scheme, including construction, operation and decommissioning. Potential effects of toxic gases arising from a BESS fire are assessed in **ES Volume 1, Chapter 15: Air Quality [APP-067]** and in **ES Volume 1, Chapter 20: Other Environmental Matters [APP-072]**, Section 20.7: Major Accidents and Disasters. An assessment of how these fumes could affect sensitive receptors within a 1 km radius of the BESS Area, including residential properties and ecological receptors, is provided in **ES Volume 1, Chapter 15: Air Quality [APP-067]**. This assessment concludes that no significant off-site impacts are predicted should a fire event occur.

	The **OBSMP [APP-286]** is secured through Requirement 6 (Battery safety management) in Schedule 2 of the **Draft DCO [APP-016]**, which provides that Work No. 2 must not commence until a Battery Safety Management Plan has been submitted to and approved by the relevant planning authority. The approved plan must be substantially in accordance with the Outline Battery Safety Management Plan. The Draft DCO also requires the relevant planning authority to consult with Dorset and Wiltshire Fire and Rescue Service and the Environment Agency before determining the application, and that the Battery Safety Management Plan must be implemented as approved.
Cumulative and In-Combination Effects	
Respondents expressed concern regarding the cumulative impact of solar parks within Wiltshire. Some respondents considered that Wiltshire already hosts sufficient or too many solar parks.	In terms of the Lime Down project, a comprehensive Cumulative and In-Combination Effects Assessment has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated Appendices **[APP-264].** Interaction with proposed or consented but not yet built developments has been fully explored within each of the technical assessments **[APP-059 - APP-072]** with a summary of each of these assessments provided within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073].** Existing schemes are captured within the baseline environment. The four-stage cumulative assessment methodology is described within **ES Chapter 6 EIA Methodology [APP-058].** 358 developments were included in the Long List **[APP-264].** 41 developments are included in the short list (and are therefore assessed) including a number of proposed solar and BESS developments. The list of developments included in the cumulative assessment was reviewed and developed in consultation with Wiltshire Council. Table 21-8 within **ES Volume 1, Chapter 21 Cumulative and In-Combination Effects [APP-073] identifies that,** taking a conservative worse case approach, significant cumulative effects with the short list of developments are identified at a limited and discrete number of receptors comprising tourism and recreation impacts during the construction phase on Corsham Park, PRoW WT|CORM|122, long path and Sustrans Cycle Route 403, and on skylark at a District level. Skylark-specific mitigation and habitat enhancement measures are incorporated into the Scheme design to reduce effects on skylark as far as practicable and are described in **ES Volume 1, Chapter 9: Ecology and Biodiversity [APP-061].** These include the provision of suitably large, open set-aside and grassland habitats designed to provide suitable skylark breeding and foraging conditions. These measures are illustrated in **ES Volume 2, Figure 3-4: Landscape and Ecological Mitigation Plan [APP-084]** and detailed in the **Outline Landscape and Ecological Management Plan (OLEMP) [APP-283]**. Such measures have

	been designed to reduce the anticipated residual effects resulting from the Scheme to a Local level of geographic importance.
Respondents expressed concern that the cumulative effects of the Scheme have not been adequately considered or assessed.	The Cumulative and In-Combination Effects Assessment as described above has been undertaken in accordance with Planning Inspectorate Advice Note 17 and the relevant NPS EN-1, NPS EN-3 and NPS EN-5 requirements which are set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]** and associated Appendices **[APP-264].** The assessment is comprehensive, taking into consideration 358 proposed or consented schemes within the identified Zones of Influence. The long-list and short-list has been developed and agreed in consultation with Wiltshire Council as set out within **ES Volume 1, Chapter 21: Cumulative and In-Combination Effects [APP-074]**.
Community Benefits	
Respondents expressed the view that the Scheme would provide no meaningful benefit to the local community, or that the proposed benefits would be insufficient. Some respondents also expressed scepticism as to whether any community benefits would in practice be delivered.	The Applicant acknowledges that any adverse effects from the Scheme are more likely to be felt locally than the largely wider-scale benefits of the Scheme. The Scheme is anticipated to help meet the UK's net zero requirements for energy production, which is considered a critical national priority and set out in National Policy Statements for Energy NPS EN-1 (section 4.2) and EN-3. This therefore will benefit the national population rather than just the local population. The benefits of the Scheme are set out in Section 5.3 of the **Planning Statement [APP-267]** and include the delivery of large amounts of cheap, secure, and low carbon electricity which will help the UK to achieve net zero by 2050, ecological and landscape enhancements, biodiversity net gain, permissive paths, employment generation, economic benefits and skills training. The Scheme is also anticipated to benefit the population within approximately 20km of the Scheme, through providing employment and income especially during construction and peak replacement activities, and providing skills and training opportunities. Where the Scheme is anticipated to benefit local people more specifically, this is done through providing onsite permissive paths to increase access to the countryside, providing improved landscape planting through reinforcing existing hedgerows and planting of new trees, providing

	biodiversity net gains through habitat improvements. That notwithstanding, the Applicant is committed to providing a Community Benefit Fund to allow for community-driven benefits that are not necessarily associated with the Scheme itself. The purpose is to establish a means to recognise local community needs that the Applicant wants to be able to contribute towards in recognition of the local impact of the Scheme.
Respondents expressed concern that insufficient information or detail has been provided in relation to community benefits and requested further clarification.	The Applicant reaffirms its commitment to the provision of a Community Benefit Fund should the Scheme be consented. The Applicant has explored ways in which the fund could be administered through discussions with appropriate bodies, such as established community benefit facilitators, and has sought opinions and suggestions throughout the consultation phases of the Scheme, noting additional expressions of suitable areas of support through the review of, and responses to, relevant representations. Information on the mechanics of the Community Benefit Fund and the areas to which it will contribute are being developed through ongoing consultation with Wiltshire Council, local parish councils, and any community groups that would like to be involved and have needs or services they would like to see benefit from the available funds. The Community Benefit Fund is separate from the DCO process, and so is not bound to the same timescales or information requirements as submitted information. Furthermore, community benefits are legally immaterial to planning decisions and cannot be considered when deciding whether to grant planning consent. The Applicant acknowledges this and so has sought to provide the Community Benefit Fund voluntarily even though it won't add favourable weight in the planning balance.
