Appendix 13-1: Transport Assessment

1.1 Introduction

1.1.1 This Transport Assessment (TA) has been prepared on behalf of Lime Down Solar Park Ltd (the 'Applicant') in relation to an application for a Development Consent Order (DCO) for Lime Down Solar Park (hereafter referred to as the 'Scheme').

1.1.2 The Scheme is situated within the jurisdiction of Wiltshire Council and South Gloucestershire Council, which act as the local planning authority and local highway authority.

The Scheme

1.1.3 The Scheme comprises a solar photovoltaic (PV) electricity generating station of over 50 megawatts (MW) and 'associated development' comprising up to 500 MW export capacity Battery Energy Storage System (BESS), grid connection infrastructure and other infrastructure integral to the construction, operation and maintenance, and decommissioning phases.

1.1.4 The main element of the Scheme comprises five Solar PV Sites that will accommodate the Solar PV Panels. These are referred to as:

- Lime Down A – 94 ha, located between the village of Sherston and the Ladywood Estate;
- Lime Down B – 70 ha, located to the west and north of Norton;
- Lime Down C – 241 ha, located either side of the Fosse Way, to the north of Grittleton;
- Lime Down D – 213 ha, located to the north of Hullavington; and
- Lime Down E – 131 ha, located to the south of Corston.

1.1.5 A BESS Area will be located within Lime Down D.

1.1.6 The electricity generated by the Scheme will be exported to the National Grid substation at Melksham via Grid Connection Cables sited within the defined Cable Route Corridor. These connections will also facilitate the import of electricity to be stored within the energy storage facilities at Lime Down D. The Cable Route Corridor will be approximately 22km in length, and is directed across open countryside. It will require crossings of railways, watercourses, various utilities, Public Rights of Way (PRoW) and roads.

1.1.7 The Order Limits are shown in **ES Volume 2, Figure 1-2: The Order Limits [EN010168/APP/6.2]**.

1.1.8 A full overview of the Order Limits and the Scheme can be found in **ES Volume 1, Chapter 2: The Order Limits [EN010168/APP/6.1]** and **ES Volume 1, Chapter 3: The Scheme [EN010168/APP/6.1]**, respectively. Additional information on the Cable Route Corridor can be found in the **ES Volume 3, Appendix 3-2: Cable Route Construction Method Statement [EN010168/APP/6.3**].

Transport Assessment

1.1.9 This TA provides an overview of the potential effects of the Scheme in transport terms and has been prepared in accordance with the National Planning Policy Framework (NPPF) (2024) (Ref 1). It should be read in conjunction with **ES Volume 1, Chapter 13: Transport and Access [EN010168/APP/6.1]**.

1.1.10 Once the Scheme is operational, it will generate very few traffic movements on a day-to-day basis. During the period of programmed replacements, expected to occur once during the 60-year operational phase, traffic will be increased in comparison to the normal operational traffic movements. However, the transport effects of the proposals will be greatest during the temporary construction phase. Therefore, the TA is supported by an **Outline Construction Traffic Management Plan (CTMP) [EN010168/APP/7.22]** and **Outline PRoW and Permissive Path Management Plan [EN010168/APP/7.17]**.

Consultation

1.1.11 The Applicant undertook a first stage of non-statutory public consultation from 14 March to 26 April 2024. Consultation activities included engaging with parish, district and county councillors; distributing Scheme information; hosting online and in person events; and collating consultation feedback.

1.1.12 A Scoping Report (Ref 2) was submitted to the Planning Inspectorate on 16 July 2024.

1.1.13 The Planning Inspectorate reviewed and consulted on the EIA Scoping Report and adopted (on behalf of the Secretary of State) a Scoping Opinion (Ref 3) on 22 August 2024.

1.1.14 A Preliminary Environmental Information Report (PEIR) was prepared and published in January 2025 to satisfy the requirement of the EIA Regulations (Ref 4).

1.1.15 The Applicant undertook statutory consultation on the Scheme with local communities in February 2025. Section 42 consultation responses from local stakeholders have also been received.

1.1.16 Separately, a Transport Scoping Note has been submitted to Wiltshire Council. A meeting was held with officers at Wiltshire Council to discuss the proposals on 5 March 2024 and 17 March 2025.

1.1.17 A further round of targeted consultation was undertaken between 3 June 2025 and 11 July 2025 following increases to the boundary of the Scheme presented in the PEIR and at Stage Two Statutory Consultation. The targeted consultation focused on fifteen small changes to the boundary of the Order Limits.

1.1.18 Six of the additional areas were included to enable the temporary highway and traffic works that would be required to safely accommodate the movement of Abnormal Indivisible Load (AIL) vehicles needed during the construction phase of the Scheme.

1.1.19 Key themes that have been raised through the consultation process in relation to Transport and Access are as follows:

- The use and management of Public Rights of Way, including bridleways, that operate through the Order Limits;
- The use of local roads for construction vehicle movements; and
- The management of construction vehicle movements on the local highway network.

1.1.20 Themes raised through the consultation process have been addressed through the DCO documentation, including in this TA the **Outline CTMP [EN010168/APP/7.22]** and **Outline PROW and Permissive Path Management Plan [EN010168/APP/7.17]**.

Report Structure

1.2 Existing Context of the Order Limits

1.2.1 This section summarises the existing context of the Order Limits and its surrounding area from a transport and access point of view.

Order Limit Location

1.2.2 A full overview of the Order Limits is provided in **ES Volume 1, Chapter 2: The Order Limits [EN010168/APP/6.1]**. The Scheme has five Solar PV Sites, known as Lime Down A, B, C, D and E. In addition, the Cable Route Corridor will run from the Solar PV Sites to the Melksham Substation, the grid connection point.

1.2.3 The five PV Solar PV Sites are situated to the north of the M4 between Junction 17 and Junction 18, within the vicinity of the villages and hamlets of Sherston, Luckington, Corston, Hullavington and Rodbourne. The town of Malmesbury is located approximately 5 km northeast of Lime Down B.

Lime Down A

1.2.4 Lime Down A is 94 ha in size and is made up of a number of fields located between the village of Sherston and the Ladywood Estate. The entirety of the Lime Down A is currently in agricultural use.

1.2.5 The Order Limits are broadly enclosed to the east by the Unnamed Road between the Fosse Way and Sherston and by Commonwood Lane to the west. The village of Sherston is located to the north.

Lime Down B

1.2.6 Lime Down B is 71 ha in size and is made up of a number of fields located to the west and north of Norton. The entirety of the Lime Down B is currently in agricultural use.

1.2.7 The Lime Down B is enclosed by the Fosse Way to the north, Honey Lane to the south and an unnamed road to the north of Norton.

1.2.8 Villages and Hamlets within close proximity of the Lime Down B are Norton, Foxley, Sherston and Hullavington.

Lime Down C

1.2.9 Lime Down C is 241 ha in size and is made up of a number of fields located either side of the Fosse Way and to the north of Grittleton. The entirety of the Lime Down C is currently in agricultural use.

1.2.10 The southern extent of the Lime Down C is bound by an unnamed road between the Fosse Way and Alderton. It is also bisected by the South West Main Line which route on an east-west axis through the centre of the of Lime Down C.

1.2.11 Villages and Hamlets within close proximity of the Lime Down C are Alderton, Grittleton, Luckington and Sherston and Hullavington.

Lime Down D

1.2.12 Lime Down D is 213 ha in size and is made up of a number of fields located to located to the north of Hullavington. The entirety of the Lime Down D is currently in agricultural use.

1.2.13 Lime Down D is located to the west of the A429, with the carriageway of Bradfield Cottages routing through the centre on a north/south axis. The South West Main Line routes to the south of Lime Down D.

Cable Route Corridor

1.2.18 The Cable Route Corridor runs for approximately 22 km from Lime Down D to the Existing National Grid Melksham Substation and connects the Solar PV Sites. It covers a total area of approximately 462 ha.

1.2.19 The land within the Cable Route Corridor is predominantly agricultural and, where practicable, cable routing would be to the edge of fields to minimise impacts. All Grid Connection Cables would be buried and there

is no requirement for overhead Grid Connection Cables to be used or constructed as part of the Scheme.

From the centre of the Solar PV Sites, Chippenham Railway Station is approximately 10 km south. Services from Chippenham Railway Station provide connections to Bristol, Bath, Swindon, Reading and London among other destinations.

Local Highway Network – Solar PV Sites

1.2.26 A summary of the local highway network that forms the construction vehicle route and Study Area is set out below.

A46 (Lime Down A, B, and C)

1.2.27 The A46 is a two-way, single carriageway road routing from Junction 18 of the M4 towards Nailsworth to the north.

1.2.28 Traffic surveys indicate that the A46 within the vicinity of the Study Area is already well used by HGVs. The road is subject to the national speed limit, which then reduces to 50 mph and then 40 mph as it approaches Old Sodbury.

1.2.29 There are no posted weight or height restrictions along the section of the A46 within the Study Area.

B4040 (Lime Down A, B, and C)

1.2.30 The B4040, is a two-way single carriageway road. It routes from the A46 to the B4039 near Acton Turville to the east. The road is subject to a 50 mph speed limit for a majority of its length within the Study Area, except where it reduces to 40 mph in the vicinity of Old Sodbury and Acton Turville.

1.2.31 Traffic surveys indicate that the B4040, within the Study Area, is already well used by HGVs. There are no posted weight or height restrictions along the section of the B4040 within the Study Area.

B4039 (Lime Down A, B, and C)

1.2.32 From its merger with the B4040 near Acton Turville, the section of the B4039 within the Study Area continues in a southeast direction towards the A420. It is a two-way single carriageway road subject to a 30 mph speed limit within the villages of Acton Turville and Burton, a 50 mph speed limit between the villages and the national speed limit to the east of Burton.

1.2.33 Traffic surveys indicate that the B4039 within the Study Area is already well used by HGVs. There are no posted weight or height restrictions along the section of the B4039 within the Study Area.

Unnamed Road (between The Gibb and Grittleton) (Lime Down A, B, and C)

1.2.34 From its junction with the B4039 to the west, an unnamed road routes between The Gibb and the Grittleton crossroads to the east. It is a two-way single carriageway road with no visible central markings. For the most part, the road is subject to the national speed limit, expect for on the approaches to The Gibb and Grittleton. Here, the speed limit is 30mph. The unnamed road routes beneath an M4 underbridge.

Alderton Road (Lime Down A, B, and C)

1.2.35 Alderton Road routes north towards the Fosse Way from Grittleton crossroads. It is a two-way single carriageway road, which is subject to the national speed limit upon exiting Grittleton. There are no posted weight or height restrictions along the section of Alderton Road within the Study Area.

Traffic Flows

1.2.63 Automatic Traffic Count (ATC) surveys have been undertaken for all roads forming the construction routes to the Solar PV Sites and Cable Route Corridor. Full traffic survey outputs are provided at **Annex A**.

1.2.64 For the Solar PV Sites, surveys were undertaken between 23 January 2024 and 1 February 2024 with additional surveys undertaken between the 13 and 20 September 2024. In addition, DfT data (Ref 5) has been reviewed for the strategic road network, including the M4 Junctions, A46 and A429. The count locations are shown in **ES Volume 2, Figure 13-9: Traffic Survey Locations: Solar PV Sites [EN010168/APP/6.2]**. The average weekday two-way traffic count for the main roads around the Solar PV Sites is shown in **Table 13-5**. The roads are grouped based on which Solar PV Site they serve.

Road Safety

1.2.69 Statistics showing Personal Injury Collisions (PIC) on the local road network within the Study Area have been obtained from Wiltshire Council for the most recent five-year period up to and including 19 November 2023.

1.2.70 At the request of National Highways, the M4 Junctions 17 and 18 have been included in the Study Area. The Crashmap (Ref 6) website has been used to obtain PIC data for these junctions.

1.2.72 **Table 13-7** indicates a total of 76 PICs within the Solar PV Sites Study Area over the five-year period. Of these collisions, 63 resulted in slight injuries, 10 were serious and three fatal.

1.2.73 Generally, collisions appear to be distributed throughout roads around the Solar PV Sites. A further review of the personal injury accident data is included within the 'Likely Effects: Accidents and Road Safety' section.

1.2.74 A breakdown of the recorded PICs for the Cable Route Corridor Study Area is shown in **Table 13-8**.

1.2.75 **Table 13-8** indicates a total of 49 PICs within the Cable Route Corridor area over the five-year period. Of these collisions, 35 resulted in slight injuries, 14 were serious and none were fatal.

1.2.76 Generally, collisions appear to be distributed throughout roads around the Cable Route Corridor. The majority of the incidents are a result of driver misjudgement, the weather or a faulty vehicle. The low level of construction traffic associated with the Cable Route Corridor is unlikely to materially affect road safety on the proposed construction routes.

Summary

1.2.77 The Order Limits is in a suitable location for the Scheme in terms of transport. Whilst there is not a significant level of walking, cycling or public

transport accessibility in the area, the operation of the Solar PV Sites generates very few trips.

1.2.78 The Order Limits are located near to the strategic road network, connected by a number of local roads. This will help facilitate the movement of construction vehicles to and from the Order Limits.

1.3 Transport Planning Legislation, Policy and Guidance

1.3.1 The proposals have been considered in the context of the following documents:

- National Policy Statement EN-1 (NPS EN-1) (designated January 2024) (Ref 7);
- National Policy Statement EN-3 (NPS EN-3) (designated January 2024) (Ref 8);
- National Policy Statement EN-5 (NPS EN-5) (designated January 2024) (Ref 9);
- National Planning Policy Framework (December 2024) (Ref 1);
- Wiltshire Core Strategy Development Plan (Adopted January 2015) (Ref 10);
- Wiltshire Local Plan Pre-Submission Draft 2020-2038 (Regulation 19) (Ref 11); and
- Wiltshire Local Transport Plan 2011-2026 (Ref 12).

Legislation

1.3.2 There is currently no specific legislation related to transport and access that should be referenced as part of the ES.

National Policy Statement EN-1

1.3.3 Section 5.14 of the NPS EN-1 relates to the traffic and transport effects of electricity network infrastructure. It states that:

> *"the transport of materials, goods and personnel to and from a development during all project phases can have a variety of impacts on the surrounding transport infrastructure and potentially on connecting transport networks, for example through increased congestion. Impacts may include economic, social and environmental effects.*

Environmental impacts may result particularly from trips generated on roads which may increase noise and air pollution as well as greenhouse gas emissions.

Disturbance caused by traffic and abnormal loads generated during the construction phase will depend on the scale and type of the proposal".

1.3.4 For assessment purposes, paragraph 5.14.5 of the NPS EN-1 states that:

"If a project is likely to have significant transport implications, the applicant's ES (see Section 4.3) should include a transport appraisal. The DfT's Transport Analysis Guidance (TAG) and Welsh Governments WelTAG provides guidance on modelling and assessing the impacts of transport schemes".

1.3.5 With regards to decision-making, paragraph 5.14.21 of the NPS EN-1 states that:

"The Secretary of State should only consider refusing development on highways grounds if there would be an unacceptable impact on highway safety, residual cumulative impacts on the road network would be severe, or it does not show how consideration has been given to the provision of adequate active public or shared transport access and provision".

National Policy Statement EN-3

1.3.6 Section 2.10.120 of the NPS EN-3 relates to construction traffic impacts from solar PV developments. It states that:

"Modern solar farms are large sites that are mainly comprised of small structures that can be transported separately and constructed on-site, with developers designating a compound on-site for the delivery and assemblage of the necessary components".

1.3.7 Paragraph 2.10.121 states:

"Many solar farms will be sited in areas served by a minor road network. Public perception of the construction phase of solar farm will derive mainly from the effects of traffic movements, which is likely to involve smaller vehicles than typical onshore energy infrastructure but may be more voluminous".

1.3.8 For assessment purposes, the NPS EN-3 states that:

"Applicants should assess the various potential routes to the site for delivery of materials and components where the source of the materials is known at the time of the application and select the route that is the most appropriate. (paragraph 2.10.123).

Applicants should ensure all sections of roads and bridges on the proposed delivery route can accommodate the weight and volume of the loads and width of vehicles. Although unlikely, where modifications to roads and/or bridges are required, these should be identified, and potential effects addressed in the ES. (paragraph 2.10.125)

Where a cumulative impact is likely because multiple energy infrastructure developments are proposing to use a common port and/or access route and pass through the same towns and villages, applicants should include a cumulative transport assessment as part of the ES. This should consider the impacts of abnormal traffic movements relating to the project in question in combination with those from any other relevant development. Consultation with the relevant local highways authorities is likely to be necessary'. (paragraph 2.10.126)".

1.3.9 In terms of mitigation, the NPS EN-3 sets out the following:

"In some cases, the local highway authority may request that the Secretary of State impose controls on the number of vehicle movements to and from the solar farm site in a specified period during its construction and, possibly, on the routeing of such movements particularly by heavy vehicles'; (paragraph 2.10.139)

'Where the Secretary of State agrees that this is necessary, requirements could be imposed on development consent'; (paragraph 2.10.140)

'Where cumulative effects on the local road network or residential amenity are predicted from multiple solar farm developments, it may be appropriate for applicants for various projects to work together to ensure that the number of abnormal loads and deliveries are minimised, and the timings of deliveries are managed and coordinated to ensure that disruption to residents and other highway users is reasonably minimised'; (paragraph 2.10.141)

'It may also be appropriate for the highway authority to set limits for and coordinate these deliveries through active management of the

delivery schedules through the abnormal load approval process'; (paragraph 2.10.142)

'Once consent for a scheme has been granted, applicants should liaise with the relevant local highway authority (or other coordinating body) regarding the start of construction and the broad timing of deliveries. Applicants may need to agree a planning obligation to secure appropriate measures, including restoration of roads and verges' (paragraph 2.10.143); and

'Further it may be appropriate for any non-permanent highway improvements carried out for the development (such as temporary road widening) to be made available for use by other subsequent solar farm developments'. (paragraph 2.10.144)".

1.3.10 With regards to operational impacts from solar PV developments, the NPS EN-3 states that:

'Once solar farms are in operation, traffic movements to and from the site are generally very light, in some instances as little as a few visits each month by a light commercial vehicle or car. Should there be a need to replace machine components, this may generate heavier commercial vehicle movements, but these are likely to be infrequent'; (paragraph 2.10.161)

'The Secretary of State is unlikely to give any more than limited weight to traffic and transport noise and vibration impacts from the operational phase of a project'. (paragraph 2.10.162)

1.3.11 In line with NPS-EN-3, this TA sets out the routes for construction vehicles, and how they will be managed through the **Outline CTMP [EN010168/APP/7.22].** The measures included will be applicable by means of a final CTMP for the construction phase and a final Operational Traffic Management Plan (OTMP) for replacement during the operational and maintenance phase**.** A cumulative assessment has also been provided.

National Planning Policy Framework (December 2024)

1.3.12 The National Planning Policy Framework (NPPF) came into force in March 2012 and was most recently updated in February 2025. It retains the core principle, set out within the preceding national policy guidance, for development to be located in order to help reduce car dependency by making walking and cycling trips easier, and by encouraging public transport trips between housing and jobs, shops and services. In transport

terms, the thrust of NPPF is a presumption in favour of sustainable development (paragraph 10).

1.3.13 Paragraph 110 of the NPPF states that *"… Significant development should be focused on locations which are or can be made sustainable, through limiting the need to travel and offering a genuine choice of transport modes. This can help to reduce congestion and emissions and improve air quality and public health. However, opportunities to maximise sustainable transport solutions will vary between urban and rural areas, and this should be considered in both plan-making and decision-making*."

1.3.14 Paragraph 115 states that *"In assessing sites that may be allocated for development in plans, or specific applications for development, it should be ensured that:*

i) Sustainable transport modes are prioritised taking into account of the vision for the site, the type of development and its location.

ii) safe and suitable access to the site can be achieved for all users; and

iii) any significant impacts from the development on the transport network (in terms of capacity and congestion), or on highway safety, can be cost effectively mitigated to an acceptable degree."

1.3.15 Furthermore, paragraph 116 of the NPPF states that:

"Development should only be prevented or refused on highways grounds if there would be an unacceptable impact on highway safety, or the residual cumulative impacts on the road network, following mitigation would be severe, taking into account all reasonable future scenarios."

Wiltshire Core Strategy Development Plan (Adopted January 2015)

1.3.16 The Wiltshire Core Strategy Development Plan Document was formally adopted on 20 January 2015. The Plan provides the overarching planning policy framework for Wiltshire for the period up to 2026 and includes the following polices relevant to the Scheme:

- **Core Policy 42: Standalone Renewable Energy Installations** – requires Applicants to demonstrate that impacts are satisfactorily assessed, including cumulative effects, on various factors including the local transport network.

- **Core Policy 60: Sustainable Transport –** where possible development should seek to reduce the use of private car, this should be done by ensuring developments are in accessible locations, promoting sustainable transport options and providing mitigation of developments on transport users, communities, and the environment;
- **Core Policy 61: Transport and Developments** – new developments should be designed to reduce the need to use private cars, as well to consider all road users in the design of the development; and
- **Core Policy 62: Development Impacts on the Transport Network** – developments should provide appropriate mitigation measures to offset adverse impacts on the transport network during construction and operation. Unless an over-riding need can be demonstrated, new development should not be accessed directly from the national primary route network.

Wiltshire Local Plan Pre-Submission Draft 2020-2038 (Regulation 19)

1.3.17 Wiltshire Council submitted the Wiltshire Local Plan to the Secretary of State for Housing Communities and Local Government for independent examination on 28 November 2024. The Local Plan Pre-Submission Draft includes the following policies relevant to the Scheme:

- **Policy 71: Transport and New Developments** – new development will be supported where users can access a choice of sustainable transport modes and opportunities are provided to make improvements;
- **Policy 72: Development Impacts on the Primary and Major Road Networks** – Proposals for new development should not be accessed directly from the national primary route network or major road network outside built-up areas in order to effectively manage traffic flow and reduce the risk to highway safety, unless an over-riding need can be demonstrated and the impacts can be safely mitigated; and
- **Policy 86: Renewable Energy** – proposals will need to demonstrate how impacts have been assessed, including any cumulative effects.

Wiltshire Local Transport Plan 4 2025-2038

1.3.18 The fourth Wiltshire Council Local Transport Plan (LTP4) covers the period from 2025 to 2038. It sets out Wiltshire Council's strategic transport objectives to align with the Wiltshire Local Plan and includes six strategic objectives:

- 1. Improving health, wellbeing and safety;

- 2. Economic growth;
- 3. Futureproofing transport;
- 4. Transport decarbonisation;
- 5. Protecting and enhancing our unique environment; and
- 6. Supporting rural communities.

1.3.19 The Wiltshire Council LTP4 includes a number of strategic objectives. Relevant to the Scheme is Strategic Objective 10, which seeks to encourage the efficient and sustainable distribution of freight in Wiltshire and Strategic Objective 12, which seeks to support planned growth in Wiltshire, and ensure that new developments mitigate their transport impacts

Other Guidance

1.3.20 Other guidance documents relevant to the assessment of the impacts of the Scheme on Transport and Access include:

- Department for Transport Circular 01/2022 – Strategic Road Network and the Delivery of Sustainable Development (Ref 13~~);~~).

1.3.21 The DfT Circular 01/2022 explains how National Highways will:

- Engage with the planning system; and
- Fulfil its remit to be a delivery partner for sustainable economic growth whilst maintaining, managing and operating a safe and efficient strategic road network.

Summary

1.3.22 This TA demonstrates that the Order Limits are situated in a suitable location for the Scheme. As set out in NPS EN-3, once solar farms are operational, they have very little effect on the local transport network. During the period of programmed replacements, expected to occur once during the 60-year operation, traffic will be increased in comparison to the normal operational traffic movements. However, the transport effects of the proposals will be greatest during the temporary construction phase. Through the documents submitted as part of the DCO application, in particular the **Outline CTMP [EN010168/APP/7.22]** and its proposed measures, the effects of the Scheme on the Local Transport Network and Strategic Road Network will be minimised during the construction phase and operational and maintenance phase. An **Outline Decommissioning Strategy [EN010168/APP/7.14]** sets out how the decommissioning phase will be managed.

1.4 The Scheme

1.4.1 The Scheme comprises a solar photovoltaic (PV) electricity generating station of over 50 megawatts (MW) and 'associated development' comprising up to 500 MW export capacity Battery Energy Storage System (BESS), grid connection infrastructure and other infrastructure integral to the construction, operation and maintenance, and decommissioning phases.

1.4.2 The PV electricity generating station and BESS would be contained within five land parcels referred to as Lime Down A, B, C, D and E (hereafter collectively referred to as the 'Solar PV Sites') (refer to **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [EN010168/APP/6.2]**).

1.4.3 The Cable Route Corridor is the area within which the export connection cables (hereafter referred to as the 'Grid Connection Cables') would be located to connect the Solar PV Sites to the National Grid at the existing Melksham Substation (hereafter referred to as the 'Existing National Grid Melksham Substation') and the area within which cables connecting the Solar PV Sites would be located (hereafter referred to as 'Interconnecting Cables') (refer to **ES Volume 2, Figure 3-1: Indicative Site Layout Plan [EN010168/APP/6.2]**).

Solar PV Sites

1.4.4 The Solar PV Sites comprise a total area of approximately 749 ha. The area and National Grid Reference (NGR) for each individual Solar PV Site is as follows:

- Lime Down A comprises an area of approximately 94 ha and is centred on NGR ST 86281 84700;
- Lime Down B comprises an area of approximately 70 ha and is centred on NGR ST 88571 85010;
- Lime Down C comprises an area of approximately 241 ha and is centred on NGR ST 86198 83092;
- Lime Down D comprises an area of approximately 213 ha and is centred on NGR ST 89705 83780; and
- Lime Down E comprises an area of approximately 131 ha and is centred on NGR ST 92698 81906.

1.4.5 The landscape within and surrounding the Solar PV Sites comprises predominantly agricultural fields and rural villages and hamlets, including Sherston (approximately 300 m north of Lime Down A), Luckington (approximately 830 m west of Lime Down C), Corston (approximately 480 m east of Lime Down D), Hullavington (approximately 700 m south of

Lime Down D), and Rodbourne (approximately 150 m southeast of Lime Down E). The town of Malmesbury is located approximately 3 km northeast of Lime Down B.

1.4.6 The key equipment within the Solar PV Sites are:

- **Solar PV Panels** – to convert sunlight into electrical current;
- **Mounting Structures –** Solar PV Panels will be mounted on a metal assembly of PV Mounting Structures. This includes metal rails to directly support the PV Panels, which themselves are supported by larger metal frames which are fixed on top of metal piles;
- **Conversion Units –** The Conversion Units incorporate inverters, transformers and switchgear and are required to manage the electricity generated by the PV Panels; and
- **Electric Cabling –** Electrical cabling will be required as part of the Generating Stations to connect PV Panels to the Conversion Units.

BESS Area

1.4.7 A BESS Area will be located within the western area of Lime Down D.

1.4.8 The BESS is designed to provide peak generation and grid balancing services to the electricity grid by allowing excess electricity generated either from the solar PV panels, or imported from the electricity grid, to be stored in batteries and dispatched when required.

Substations

1.4.9 Substations will be provided at Lime Down A, C, D and E Solar PV Sites. The substations will consist of electrical infrastructure such as the transformers, switchgear and metering equipment required to facilitate the export of electricity from each respective Solar PV Site.

Grid Connection

1.4.10 The electricity generated by the Scheme will be exported to the National Grid substation at Melksham via Grid Connection Cables within the Cable Route Corridor. These connections will also facilitate the import of electricity to be stored within the BESS Area at Lime Down D.

1.4.11 The Cable Route Corridor will be approximately 22km in length, and is directed across open countryside. It will require crossings of railways, watercourses, various utilities, PRoW and roads. The Cable Route Corridor as indicated by the Order Limits is at least 50m in width in order to accommodate working areas, construction laydown areas, haul roads,

open cut digging of trenches and horizontal directional drilling (HDD) where it may be required.

1.4.12 The final Cable Route Corridor is subject to an iterative design process and detail design. For assessment purposes, the placing of the cable anywhere within the Cable Route Corridor has been considered, including the avoidance of environmentally sensitive locations.

1.4.13 The construction of the Grid Connection Route includes the following elements:

- Construction of Haul Road and Laydown Areas;
- Open Cut Excavation;
- Construction of Joint Bays; and
- Cabling/Jointing.

1.4.14 The Cable Route Corridor will be built out in four sections over an 18 month period, with each section requiring a number of construction access points which will be in use simultaneously. It has been estimated that each section will be approximately 5.5km.

Permissive Paths

1.4.1 Permissive paths are incorporated into the Scheme design. The permissive paths will contribute to the wider network of footpaths and bridleways in the area and facilitate greater public access to the Countryside.

1.4.2 The design and implementation of the permissive paths is set out in **ES Volume 2, Figure 3-4: Landscape and Ecology Mitigation Plan [EN010168/APP/6.2]** and the **Outline Landscape and Ecological Management Plan (LEMP) [EN010168/APP/7.18].** They will be secured by a Requirement in the draft **DCO [EN010168/APP/3.1].**

1.4.3 The permissive paths are to remain open up to 364 days per year throughout the proposed 60-year operational lifetime of the Scheme.

Access Arrangements

Solar PV Sites

1.4.6 There will be a total of 21 access points, plus three crossings, for the Solar PV Sites. All access will be taken from the public highway. Where practicable, existing agricultural accesses will be utilised. These will be widened and formalised as appropriate. Visibility splays will be kept clear.

1.4.7 The access points will be retained for use by maintenance vehicles, once the Scheme is operational.

1.4.8 The access locations for the Solar PV Sites are shown in **ES Volume 2, Figure 13-11: Construction Access Locations: Solar PV Sites [EN010168/APP/6.2].**

1.4.9 The access arrangements are shown in **Drawings SK01** to **SK21**, contained in **Annex C**. The SK reference correlates with the figure reference (e.g. the location of SK01 is at point 1 in **ES Volume 2, Figure**

13-11: Construction Access Locations: Solar PV Sites [EN010168/APP/6.2]). The drawings show the achievable visibility splays, and the swept path analysis for the maximum sized vehicle that will use the specific access.

1.4.10 During the construction phase, banksmen will be deployed at each access whenever construction vehicles are accessing or egressing the Order Limits. This will ensure the safe movement of construction vehicles in and out of the Solar PV Sites and will overcome any instances where the achievable visibility is below guidance, which is a factor at a small number of access locations.

1.4.11 All construction vehicles will access and egress in a forward gear.

1.4.12 Temporary signage will be erected in the vicinity of the accesses during the construction phase. Diagram 7301 'WORKS TRAFFIC' in the Traffic Signs Regulations and General Directions (TSRGD) (2016) (Ref 14) will be used to indicate the access and will read 'WORKS TRAFFIC LARGE VEHICLE TURNING'. These signs will be white text and red background 1050 x 750 mm mounted in 'A' frames. The temporary signs will be in place for the duration of the construction phase.

1.4.13 The above measures are secured as part of the **Outline CTMP [EN010168/APP/7.22]**.

1.4.14 The proposed points of access are summarised in **Table 13-10**.

1.4.15 The proposed access arrangements are considered suitable for the following reasons:

- The majority of the accesses are currently regularly used by agricultural vehicles and are therefore considered appropriate for use by construction vehicles, with formalisation and widening as required;
- Banksmen will be deployed at each access whenever construction vehicles are accessing or egressing the Order Limits; and
- All construction vehicles will access and egress in a forward gear.

1.4.16 The proposed haul roads serving Lime Down B from Access 4 and Lime Down D from Access 10 will be temporary for construction, replacement and decommissioning phases only.

1.4.17 In addition, the access locations identified in Table 1-10, there will be occasional trips to the proposed habitat areas within the Solar PV Sites for operational and maintenance purposes. These would typically be made by light van or 4 x 4 type vehicles and will use the existing field access locations shown in **ES Volume 2, Figure 13-13: Operational Only Access Locations: Solar PV Sites [EN010168/APP/6.2]**. Vehicle trip generation associated with these access locations will be the same or lower than the existing agricultural use.

Cable Route Corridor

1.4.18 A total of 28 access points are required for the construction phase of the Cable Route Corridor. Approximately one access every kilometre. The locations of these accesses are shown in **ES Volume 2, Figure 13-12-1 to 13-12-5: Construction Access Locations: Cable Route Corridor [EN010168/APP/6.2].**

1.4.19 The access arrangements are shown in **Drawings SK101** to **SK128**, contained in **Annex D** and described in **Table 13-11**. The drawings show the achievable visibility splay, and the swept path analysis for the maximum sized vehicle that will use the specific access.

1.4.20 As with the Solar PV Sites, during the construction phase, banksmen will be deployed at each access whenever construction vehicles are accessing or egressing the Cable Route Corridor. This will ensure the safe movement of construction vehicles in and out of the access points and will overcome any instances where the achievable visibility is below guidance, which is a factor at a small number of access locations.

1.4.21 All construction vehicles will access and egress the Cable Route Corridor access points in a forward gear.

1.4.22 Temporary signage will be erected in the vicinity of the accesses during the construction phase. Diagram 7301 'WORKS TRAFFIC' in the Traffic Signs Regulations and General Directions (TSRGD) (2016) (Ref 14) will be used to indicate the access and will read 'WORKS TRAFFIC LARGE VEHICLE TURNING'. These signs will be white text and red background 1050 x 750 mm mounted in 'A' frames. The temporary signs will be in place for the duration of the construction phase.

1.4.23 The above measures will be secured as part of the Outline CTMP **[EN010168/APP/7.22]**.

1.4.24 The proposed points of access are summarised in **Table 13-11** below.

1.4.25 The proposed access arrangements are considered suitable for the following reasons:

- The majority of the accesses are currently regularly used by agricultural vehicles and are therefore considered appropriate for use by construction vehicles, with formalisation and widening as required;
- Banksmen will be deployed at each access whenever construction vehicles are accessing or egressing the Cable Route Corridor; and
- All construction vehicles will access and egress the Cable Route Corridor access points in a forward gear.

Construction Compounds

1.4.26 Construction compounds will be set up throughout the Solar PV Sites and the Cable Route Corridor. These will include space for the storage of equipment, construction worker parking and welfare facilities.

1.4.27 The construction compounds will include sufficient space for HGV turning. Full details of the Construction Compounds are set out in **ES Volume 1, Chapter 3: The Scheme [EN010168/APP/6.1]**.

Internal Access Tracks

1.4.28 The Scheme will include internal access tracks throughout the Solar PV Sites allowing for the movement of construction and maintenance vehicles. A haul road will also be constructed. Full details of the Construction Compounds are set out in **ES Volume 1, Chapter 3: The Scheme [EN010168/APP/6.1]**.

1.5 Trip Generation

1.5.1 This section sets out the trip generation associated with the construction and operation and maintenance phase of the Scheme.

Construction Phase: Solar PV Sites

HGV

1.5.2 The construction phase for the PV Solar Sites involves the preparation of the Order Limits including the provision of the construction compound, welfare facilities and fencing, installing the access tracks, the assembly and erection of the PV arrays, and the installation of the inverters/transformers.

1.5.3 To understand the number of HGV movements during the construction phase, trip generation has been calculated based on a first principles approach. This takes account of quantities of the following materials and activities required during the construction phase:

- Number of Solar PV modules;
- Number of Solar PV module mounting structures;
- Volumes of waste;
- Number of Skids and power stations;
- Cable lengths within the Solar PV Sites; and
- General activities, including fencing, landscaping, compounds etc.

1.5.4 A summary of the assumed components for construction of the Solar PV Sites is presented in **Annex E**.

1.5.5 The type and capacity of individual HGVs required to deliver the components and undertake the required construction activities has then been established following discussions with suppliers and contractors. A summary of the vehicle type and capacity assumptions is also presented in **Annex E**.

1.5.6 A breakdown of calculations for delivery of each of the identified component or activity for each Solar PV Site has then been undertaken and is presented in **Annex E.**

1.5.7 The anticipated trips for general construction activities include fencing and landscaping activities. While it is anticipated that most of the spoil from the construction of access tracks etc. will remain on site, the calculations allow a comfortable buffer for general construction activities, including the

removal of spoil, other construction waste and the installation and removal of construction compounds.

1.5.8 **Table 13-12** sets out a summary of the calculated HGV movements that will be associated with the construction phase of the Scheme. The movements for Lime Down D have been proportionally split between the western and eastern sections. The western area of Lime Down D will be accessed via access 7, 8, 9 and 20 with vehicles routing between the A429 and Bradfield Cottages. The eastern area of Lime Down D will be accessed via access 10, with vehicles routing via the A429 only.

*Figures are ~~provided~~ rounded to the nearest whole number

1.5.9 As shown in the calculations contained in **Annex E**. The vast majority, 83% of all HGV deliveries will be undertaken by HGV will be 10m rigid vehicles, with the remaining 17% of HGV deliveries made by 16.5m articulated vehicles or 8-10m rigid vehicles. However, .

1.5.31.5.10 There will also be a small number of abnormal load deliveries associated with the substations. Abnormal load movements are discussed separately in **Section 7**.

1.5.41.5.11 It is expected that there will be a relatively flat profile of deliveries throughout the construction phase. Therefore, an average number of deliveries per day has been calculated based on the length of the construction phase. for each Solar PV Site. Notwithstanding this, it is acknowledged that there will be small peaks throughout the construction phase of each Solar PV Site, especially during preparation of the Order Limits. To account for this, a 50% uplift has been applied for the purposes of assessment.

1.5.12 **Table 13-**A 50% uplift has been applied to reflect a peak day. This has been applied as an AADT flow within **ES Volume 1, Chapter 13: Transport and Access [APP-065]** and assumes a peak day occurs every day of the construction period. Whilst it is acknowledged this results in a significant overestimation of AADT flows, it provides a worst-case assessment for the ES assessment. The TA provides a more realistic breakdown of flows on links that will be experienced on a daily and hourly basis.

1.5.51.5.13 If all Solar PV Sites were to be constructed simultaneously, **Table 13-12** shows that there could be the following maximum daily HGV movements (across all sites):

- Average HGV Arrivals and Departures per Day – 48 Deliveries (96 Movements)
- Peak (50% uplift) HGV Arrivals and Departures per Day – 74 Deliveries (148 Movements)

1.5.6 However, as shown in the construction programme in **Table 13-9**, there is only one month where the not all construction of all Solar PV Sites overlapactivities will be undertaken simultaneously. Therefore, the number of HGV movements on the highway network is likely to be fewer than presented in **Table 13-12** on a typical day.

Figures are rounded to the nearest whole number

1.5.71.5.14 Each Solar PV Site is likely to have a peak period of construction during initial Order Limit set up where the number ofwill be much lower. To demonstrate this, link flow diagrams of daily HGV construction vehicles visiting the Solar PV Sites is higher than the daily average. However, these periods will not overlap. Therefore, it is considered that 74 HGV arrivals (148 movements) represent a reasonable worst-case assumption are provided in **Annex F.** Diagrams are provided both for the number of peak daily HGV movements associated with the construction phasea

scenario assuming a 50% uplift and a scenario assuming a typical average day. The typical average day represents the flows that a road user would experience on a day-to-day basis during the construction phase between 09:30 and 16:30 on a weekday. As shown, there are some months during the construction phase where certain links will experience no construction HGV movements.

1.5.15 To provide a further understanding of highway impacts, **Annex F** also presents a breakdown of hourly HGV movements on different links along the construction routes. This presents hourly flows for the months where the link would experience the most HGV construction movements in accordance with the construction programme provided in **Table 13-9.** Diagrams are provided both for a scenario assuming a 50% uplift and a scenario assuming a typical average day. The typical average day represents the hourly flows that a road user would experience on a day-to-day basis during the construction phase between 09:30 and 16:30 on a weekday.

1.5.16 As shown in **Annex F,** the hourly construction flows have then been compared against existing hourly HGV flows along each link for context. Existing minor road links on the construction route experience low numbers of existing hourly HGV traffic movements, a majority of which are smaller HGVs. This confirms the low probability of two HGVs meeting on the construction routes.

~~1.5.8~~1.5.17 Construction vehicles will avoid travel during the network peak hours ~~where practicable.~~. Therefore, deliveries will be scheduled for between 09:30 and 16:30~~, where practicable.~~ on weekdays and between 09:30 and 12:30 on Saturdays to avoid peak hours

1.5.18 The hourly link flows presented in **Annex F** have been split evenly across the scheduled daily delivery hours and will be managed by a booking system to be agreed as part of the Final CTMPs. This will also prevent HGV movements generated by the Scheme from passing on minor roads.

Cars/LGVs

~~1.5.9~~1.5.19 On a peak day, assuming the construction of all Solar PV Sites is undertaken concurrently, there is expected to be a peak of 622 workers spread across the Solar PV Sites. For assessment, construction workers have been spread across the Solar PV Sites on a proportional basis, based on the size of each area.

~~1.5.10~~1.5.20 Construction worker shifts will be scheduled so that workers are not traveling during the network peak hours of 08:00-09:00 and 17:00-18:00.

~~1.5.11~~1.5.21 An **Outline CTMP [EN010168/APP/7.22]** is submitted with the DCO application. This includes a measure for the provision of shuttle buses to

transport construction workers to and from the Order Limits. This is particularly important for non-local workers, who will stay in local accommodation and be transported to the Order Limits. It can also be utilised by other workers as appropriate. It is expected that a mixture of coaches and minibuses will be used. On average, it is expected that a shuttle bus will be able to accommodate 20 workers. In addition, workers who drive will be encouraged to car share where practicable.

~~1.5.12~~1.5.22 With this in mind, it is assumed that 50% of workers will be non-local to the Order Limits and will stay in local accommodation, arriving by shuttle bus. The remainder will arrive by car with an assumed 1.5 construction workers per car. This is a similar proportion to other DCO applications. For example:

- Longfield Solar Farm (PINS reference EN010118) - 55% non-local arriving by shuttle bus;
- West Burton Solar Farm (PINS reference EN010132) – 50% non-local arriving by shuttle bus; and
- Cottam Solar Farm (PINS reference EN010133) – 50% non-local arriving by shuttle bus.

~~1.5.13~~1.5.23 Based on 622 construction workers, the forecast number of cars/LGVs are set out in **Table 13-13**.

Table 13-13: Construction Workers

Construction Activity	Solar PV Sites

Shuttle Bus (20 Workers per Bus)	16
Car (1.5 Workers per Car)	208
Total (Arrivals)	224
Total Movements (Arrivals + Departures)	**448**

**Rounded to the nearest whole number*

~~1.5.14~~1.5.24 **Table 13-13** shows that there could be up to 208 construction worker arrivals by car and shuttle bus associated with the Solar PV Sites. These are likely to arrive in the morning, with the same amount of the departures in the afternoon/evening. As mentioned, shift patterns will be coordinated to avoid construction work travel during the traditional network peak hours of 08:00-09:00 and 17:00-18:00.

Typical Trip Profile

~~1.5.15~~1.5.25 Based on the trips set out within this chapter, a typical trip profile is set out in **Table 13-14.**

Construction Phase: Cable Route Corridor

~~1.5.16~~1.5.26 For the construction phase of the Cable Route Corridor, 28 temporary accesses are required, approximately one for every 1 km of the Cable Route Corridor. It is forecast that each access will generate up to eight arrivals and eight departures per day for the delivery of material and equipment. Around half of these will be HGV trips and half LGV trips. There will also be around 10 construction workers per access. Therefore, each access along the Cable Route Corridor will generate the following trips per day:

- Material and equipment:
  - HGV – 4 deliveries (8 movements) per access; and
  - LGV - 4 deliveries (8 movements) per access~~;~~.
- Construction worker arrivals (car/van) – 10 arrivals (20 movements). As a worst-case assessment, it is assumed that all workers will arrive via a private vehicle.

~~1.5.17~~1.5.27 HGV trips will largely consist of 10m tipper trucks, including those required to construct the haul road and laydown areas. There will be approximately 132 AIL movements associated with cable drum deliveries over the length of the route. Where practicable, a number of cable drums will be delivered in convoy to reduce disruption. This is discussed separately in **Section 7**.

~~1.5.18~~1.5.28 Each access ~~will only~~along the Cable Route Corridor is expected to be ~~required for~~in use for approximately 90 non-consecutive days~~. There could be~~ over the construction phase with up to four accesses (one per 5.5 km section of the Cable Route Corridor) in operation at one time. Based on this, the Cable Route Corridor will generate the following trips on an average day.

- Material and equipment:
  - HGV – 16 deliveries (32 movements); and
  - LGV - 16 deliveries (32 movements~~);~~).
- Construction worker arrivals (car/van) – 40 arrivals (80 movements). As a worst-case assessment, it is assumed that all workers will arrive via a private vehicle.

~~1.5.19~~1.5.29 These trips will be distributed around the local highway network, in relation to the location of each access. This is discussed further in **Section 6**.

Operation and Maintenance Phase

~~1.5.20~~1.5.30 During the operation and maintenance phase, there are anticipated to be around five visits to each Solar PV Site per month for maintenance purposes. These would typically be made by light van or 4 x 4 type vehicles. Whilst each construction compound will be removed at the end of the construction phase, space will remain within each Solar PV Site on the access tracks for such a vehicle to turn around to ensure that reversing will not occur onto the highway.

~~1.5.21~~1.5.31 There will be no transport operation effects associated with the installed Grid Connection Cables (within the Cable Route Corridor) as they will be located underground. Access may be required for maintenance, but this is only likely once or twice a year.

~~1.5.22~~1.5.32 During the operation and maintenance phase, there will be an ongoing replacement of defective panels and breakages etc. This is expected to be on an ad-hoc basis and will result in a non-material level of HGV trips on a day-to-day basis.

~~1.5.23~~1.5.33 The planned replacement of all Solar PV Panels transformers and BESS Containers will occur once during the Scheme's lifespan. The Solar PV Panels are anticipated to be replaced on a field by field basis. Just the Solar PV Panels, transformers and BESS Batteries will need replacing, with no activity relating to the mounting structures. There will also be no activity in relation to other elements of the Order Limits, including, fencing, access tracks and landscaping.

~~1.5.24~~1.5.34 **Table 13-15** sets out a summary of the HGV movements that will be associated with replacement during the operational phase of the Scheme. The trip generation calculations for replacement are provided in **Annex ~~F~~G**. The vast majority of deliveries by HGV will be by 16.5m articulated vehicles or 8-10m rigid vehicles. However, there will be a small number of abnormal load deliveries associated with the substations. Abnormal load movements are discussed separately in **Section 7**.

~~1.5.25~~1.5.35 It is expected that there will be a relatively flat profile of deliveries throughout the construction phase. Therefore, an average number of deliveries per day has been calculated based on the anticipated length of the replacement activities, which has been assumed to be 12 months in length. Notwithstanding this, it is acknowledged that there will be small peaks throughout the replacement activities. To account for this, a 50% uplift has been applied for the purposes of assessment.

~~1.5.26~~1.5.36 For the purposes of the assessment and to present a reasonable worst-case, it has been assumed that replacement activities associated with at Solar PV Sites, transformers and BESS Batteries are undertaken simultaneously.

~~1.5.27~~1.5.37 **Table 13-15** shows that there could be the following HGV movements (across all sites) as a result of replacement during the operational phase:

- Average HGV Arrivals and Departures per Day – ~~10 (20~~17 (34 Movements~~)~~); and
- Peak HGV Arrivals and Departures per Day – ~~16 (32~~29 (58 Movements~~)~~).

~~1.5.28~~1.5.38 The anticipated number of HGV trips for replacement shown in **Table 13-15**, demonstrate they are well below the number of HGV trips

associated with the construction phase shown in **Table 13-12**. During the period of programmed replacements, expected to occur once during the 60-year operation, traffic will be increased in comparison to the normal operational traffic movements. However, the transport effects of the proposals will be greatest during the temporary construction phase and therefore no further assessment of the operational phase has been undertaken.

~~1.5.29~~1.5.39 To further reduce the number of HGV trips, and where practicable, vehicles bringing new replacement Solar PV Panels and BESS Batteries to the Order Limits will also transport the replaced Solar PV Panels and BESS Batteries out of the Order Limits.

~~1.5.30~~1.5.40 The measures set out in the **Outline CTMP [EN010168/APP/7.22]** will be applied to the planned replacement operations by means of a final OTMP. This will include HGV routes and all management measures. During the planned replacement of Solar PV Panels and BESS Batteries, there will be significantly fewer HGV movements on the local highway network compared to the construction phase of the Scheme.

Decommissioning Phase

~~1.5.31~~1.5.41 The Scheme is anticipated to have a design life of approximately 60 years. At the end of the Scheme's operational life, it will be decommissioned. The number of vehicles associated with the decommissioning phase are not anticipated to exceed the number set out for the construction phase set out in **Table 5.1**. An **Outline Decommissioning Strategy [EN010168/APP/7.14]** has been submitted as part of the DCO application and a final version will be submitted to the local planning authority for approval prior to decommissioning. This is secured by a requirement in Schedule 2 of the DCO **[EN010168/APP/3.1]**.

Timings of Construction Vehicle Movements

~~1.5.32~~1.5.42 Deliveries by HGV will be coordinated through a booking system to avoid travel during the network peak hours where practicable. Therefore, deliveries will be scheduled for between 09:30 and 16:30 on weekdays and between 09:30 and 12:30 on Saturdays where practicable. Some deliveries may be required outside of these hours, if unavoidable.

~~1.5.33~~1.5.43 Construction worker shifts will be schedule so that workers are not traveling during the network peak hours of 08:00-09:00 and 17:00-18:00.

~~1.5.34~~1.5.44 Therefore, there should be limited or no construction vehicle movement between 08:00-09:00 and 17:00-18:00.

Summary

~~1.5.35~~1.5.45 On a peak average day during the construction phase, the following movements could be generated:

- Solar PV and BESS Sites:
  - HGV – 74 (148 total movements~~)~~); and
  - Car/Shuttle associated with construction workers – 224 (448 total movements~~)~~).
- Cable Route Corridor
  - HGV – 16 deliveries (32 movements);
  - LGV - 16 deliveries (32 movements); and
  - Construction worker arrivals (car/van) – 40 arrivals (80 movements). As a worst-case assessment, it is assumed that all workers will arrive via a private vehicle.

~~1.5.36~~1.5.46 During the Scheme's operation and maintenance phase, there is anticipated to be around five visits to each Solar PV Site per month for maintenance purposes. The planned replacement of all Solar PV Panels, transformers and BESS Batteries will occur once during the Scheme's lifespan. This will generate significantly less HGV movements on the local highway network compared to the construction phase of the Scheme.

~~1.5.37~~1.5.47 The number of vehicles associated with the decommissioning phase are not anticipated to exceed the number set out for the construction phase.

1.6 Construction Vehicle Trip Distribution

1.6.1 This section sets out the trip distribution associated with construction vehicles. Construction vehicle trips have been distributed on the local highway network surrounding the Order Limits. ~~This is based on the peak daily vehicle movements set out in the summary of **Section 5**.~~ The average daily trips presented below are taken from the maximum monthly trips for HGVs and workers, taking into account the construction programme.

Solar PV Sites (Lime Down A, B and C)

Construction Route

1.6.2 The construction route for Lime Down A, B and C is shown in **ES Volume 2, Figure 13-1: Study Area: Solar PV Sites [EN010168/APP/6.2]**.

~~1.6.9~~1.6.11 Based on the proposed daily delivery period an hourly breakdown of HGV movements on each link during the peak construction month is provided in **Annex F**. This shows a low level of trips will be experienced on a day-to-day basis. For example, the links past Hullavington to Bradfield cottages and at Alderton Road will experience approximately four HGV movements per hour ~~across~~during the ~~working period~~busiest months of ~~09:30-16:30).~~construction.

1.6.11 1.6.12 **Table 13-18** indicates that M4 Junction 17 and the A429 will be the busiest links on the network in relation to construction vehicles. During peak periods there could be up to 49 an average of 20 HGV arrivals and 49 20 HGV departures per day. This relates to around 7 arrivals/departures per hour during the construction working hours.

1.6.12 1.6.13 HGV movement movements will be managed via a booking system, with the aim of managing arrivals and departures to ensure that they do not cross each other on the local highway network. This is set out in more detail in the **Outline CTMP [EN010168/APP/7.22]**.

Cable Route Corridor

1.6.14 As discussed in **Section 5**, it is forecast that each access will generate up to eight arrivals and eight departures per day for the delivery of material and equipment. Around half of these will be HGV trips and half will be LGV trips. There will also be around 10 construction workers per access, arriving by private vehicle.

1.6.13 1.6.15 Each access will only along the Cable Route Corridor is expected to be used in use for approximately 90 non-consecutive days during over the

construction phase with up to four accesses (one per 5.5 km section of the Cable Route Corridor) in operation at one time.

~~1.6.14~~1.6.16 A summary of the construction route for each area is set out below and shown in **ES Volume 2, Figure 13-1: Study Area: Solar PV Sites [EN010168/APP/6.2~~]~~.]**.

~~1.6.15~~1.6.17 Along with 10m tipper trucks, there will be a number of AIL movements associated with cable drum deliveries. This is discussed further in **Section 7**.

1.7 Abnormal Load Routes

1.7.1 There will be a number of abnormal load movements associated with the construction of the Scheme.

1.7.2 The Department for Transport (DfT) define a movement to be abnormal if the load and vehicle meets any of the following criteria:

- A weight of more than 44,000kg;
- An axle load of more than 10,000kg for a single non-driving axle and 11,500kg for a single driving axle;
- A width of more than 2.9 metres; and
- A rigid length of more than 18.65 metres.

Trip Generation and Access

Solar PV Sites

1.7.3 As part of the Scheme, AIL vehicles will be required for the delivery of the transformers to the 132kV Substations located in Lime Down A, C, D and E and 400 kV Substation located in Lime Down D. There will be one AIL delivery per transformer. The number of transformers in each location will be as follows:

- Lime Down A: 2 x Transformers;
- Lime Down C: 2 x Transformers;
- Lime Down D: 7 x Transformers; and
- Lime Down E: 2 x Transformers.

1.7.4 This will result in the following number of AIL transformer deliveries on each identified AIL route:

- Lime Down A and C Substation Route: 4 x AIL deliveries;
- Lime Down D Substation Route: 5 x AIL deliveries; and
- Lime Down D and E Substation Route: 4 x AIL deliveries-.

1.7.5 It is also anticipated that they may be up to 10 AIL movements associated with cable delivery within the Solar PV Sites. However, the AIL vehicle is not anticipated to be as big as those required to deliver the transformers at approximately 26 m in length.

1.7.6 The AIL movements associated with the delivery of transformers to the Solar PV Sites and their access are summarised in **Table 13-19**.

Table 13-19: Lime Down Solar PV and BESS - Abnormal Load Movements

1.7.7 Transformers are assumed to have a design life of 30 years. Transformers may require replacement once during the lifetime of the Scheme, although replacement will only be carried out if required for performance or health and safety reasons.

Cable Route Corridor

1.7.8 Cable drums will be delivered on a Cable Reel Trailers. In comparison to the transformer deliveries, these will be delivered by smaller AIL vehicles or HGVs where practicable. It is estimated that the Cable Route may require around ~~130~~132 cable drum deliveries over the length of the Cable Route Corridor. This means each AIL access route serving the Cable Route Corridor~~,~~ could accommodate ~~between 15 to 20~~approximately 13 deliveries.

1.7.9 The Cable Reel Trailer and vehicle will get as close to the relevant access location as practicable. From here, the cable drum will be unloaded and towed along the haulage road to the appropriate location for installation. This will be managed through banksmen and/or traffic marshals.

1.7.10 To ensure minimal impact upon on the local road network, AIL vehicle movements will be undertaken during off-peak times and delivered in convoy to minimise incidents of disruption. This will be subject to the agreement and instructions of the Local Planning and Highway Authorities and the Police.

Construction Routes for Abnormal Load Movements

Solar PV Sites

1.7.11 It is assumed loads will be transported by boat to the Avonmouth Docks. From here they will use the M5 and M4 to reach the strategic motorway junctions. From the M4, the AIL routes to the relevant substations within each Solar PV Site are as follows:

- Lime Down A and C (Primary): M4 J18 → B4040 → B4039 → Unnamed rural road between Yatton Keynell and Grittleton → Alderton Road → Fosse Way → Solar PV Site access (5 and 19);
- Lime Down A and C (Alternative): M4 J17 → A350 → A420 → B4039 → Unnamed rural road between Yatton Keynell and Grittleton → Alderton Road → Fosse Way → Solar PV Site access (5 and 19);
- Lime Down D: M4 J17 → A429 → Road east of Hullavington → Bradfield Cottages → Solar PV Site access (20); and
- Lime Down DE: M4 J15 → A419 → A429 → Solar PV Site access (10, 12, 15 and 18).

1.7.12 These construction routes are shown in **ES Volume 2, Figure 13-5: Abnormal Indivisible Load (AIL) Routes: Solar PV Sites [EN010168/APP/6.2]**.

Cable Route Corridor

1.7.13 All accesses associated with the Cable Route Corridor are accessible by the Cable Reel Trailer. The AIL routes associated with the construction of the Grid Connection Cables are shown in **ES Volume 2, Figure 13-6: Abnormal Indivisible Load (AIL) Routes: Cable Route Corridor [EN010168/APP/6.2]**.

Highway Mitigation

1.7.14 To accommodate the AIL movements, temporary highway mitigation will be required at certain locations along the identified AIL routes. A description of which is provided below:

- A350/Corsham Road Junction, Lacock – Temporary removal of traffic signals, keep left bollards on traffic islands and 1no. street lighting

column to be temporarily removed (it is assumed that the traffic islands are overrunable and will remain in place). These works are required to allow the AIL vehicle to turn at the junction safely.

- A365 Devizes Road/B3109 Bradford Road, Box Fiveways Junction – Temporary removal of traffic signals, keep left bollards on traffic islands and 1no. signage board located on traffic island (it is assumed that the traffic islands are overrunable and will remain in place).
- A46 Bath Road/Acton Turville Road Junction, Tormarton – Minor temporary road widening at the junction and temporary removal of keep left bollards on traffic island (it is assumed that the traffic island is overrunable and will remain in place).
- A46 Bath Road/B4040 Junction, Old Sodbury – Temporary minor road widening at the junction, temporary removal of give-way and no-entry signage, and trimming of existing hedge/tree branches.
- B4039 At the Salutation Inn, Castle Coomb – Temporary minor road widening at the junction, and trimming of existing hedge/tree branches. These works are required to allow the abnormal load vehicle to turn at the junction safely.
- Alderton Road/The Street Junction, Grittleton – Temporary removal of stop sign due to vehicle oversail of verge.
- Fosse Way/Alderton Road, North of Grittleton – Temporary minor road widening at the bend, temporary removal of chevron signage, and trimming of existing hedge and other vegetation.
- Fosse Way Junction – Temporary minor road widening at the junction and trimming of existing tree branches.
- A429 Crudwell Road/B4014 Roundabout, Malmesbury – Temporary minor road widening, temporary removal of 2no. chevron/turn left sign assemblies.

1.7.15 Swept-paths of the required AIL vehicles at key points along the identified AIL routes for the Solar PV Sites and the Cable Route Corridor are provided at **Annex ~~G~~H**.

Management and Measures

1.7.16 All AIL movements will be co-ordinated by a haulage specialist. Traffic management will be in place to support the movement. The exact nature of the traffic management will be agreed with the local highway authority and police prior to the delivery being undertaken. However, it is likely to include the following procedures/measures:

- All appropriate notifications will be made to the local highway authority and local police force;
- The AIL route will be planned and agreed with the local highway authority local police force;
- Stakeholders along the AIL route will be notified of the date and time of the movement;
- Vehicles will be clearly marked with the appropriate plates and lighting;
- Vehicles will be escorted to the Order Limits; and
- Rolling road closures will be used where necessary.

1.8 Construction Phase Management and Mitigation

1.8.1 The section sets out the management and mitigation measures that will be put in place during the construction phase to reduce the effect of the Scheme on the local highway network.

Specific Highway Measures

1.8.2 The following highway measures will be implemented for the duration of the construction:

Banksmen

1.8.3 Throughout the construction phase, banksmen will be positioned at all construction access points, to assist vehicle movement in and out of the Solar PV Sites and Cable Route Corridor. Banksmen will also ensure the safe movement of all other users of the local highway network within the vicinity of the access, including any pedestrians and cyclists.

Junction Widening

1.8.4 As set out in **Section 4**, access to the Order Limits from the public highway will either utilise existing agricultural accesses or, in a small number of cases, involve the creation of a new temporary access into the land fields.

1.8.5 Where existing accesses are utilised, these will be widened and formalised as appropriate. Visibility splays will be kept clear throughout the construction phase.

~~**Pass-by-Bays**~~

Passing Points

1.8.6 On narrower sections on the highway, temporary ~~pass-by-bays~~passing points will be created within the Highway Improvement Areas. As HGV arrivals and departures will be managed through a booking system, it is unlikely that HGVs will cross each other on the local highway network. In addition, baseline traffic flows are very low on the narrower links within the network. Therefore, this is a precautionary measure to assist in the movement of construction vehicles.

~~1.8.6~~1.8.7 The extent of proposed road widening within the Highway Improvement areas is set out in drawing included in **Annex I**.

~~1.8.7~~1.8.8 The DCO includes powers to make adjustments within the highway verges, without having to identify every single location on the construction route at this stage.

~~1.8.8~~1.8.9 As presented in **Annex ~~H~~J**, swept-path analysis of the following roads on the construction routes has been undertaken to demonstrate adequate carriageway width or frequency of passing place opportunity to pass at least an HGV and a light vehicle in accordance with the requests of WC:

- Alderton Road;
- Fosse Way;
- Unnamed Road between Sherston and Fosse Way; and
- Unnamed Road between A429 and Bradfield Cottages.

1.8.10 The distances between passing points outside of the Order Limits are all within 150 m with forward visibility extending to the next passing point and beyond.

1.8.11 As presented in **Annex K**, a swept-path analysis of the same roads has been undertaken to demonstrate the frequency of passing place opportunity to pass two 16.5m articulated vehicles. The opportunities for passing shown on these drawings is considered appropriate for the following reasons:

- The frequency of passing place is adequate to accommodate for the existing and proposed level of hourly HGV movements along the constructions routes (See **Annex F**);
- Only 17% on HGV construction traffic will comprise of 16.5m articulated vehicles (See **Annex E**);

- Reduces the requirement for excessive widening of existing rural routes;
- A booking system in order to prevent HGV construction vehicles meeting on minor roads;
- Delivery times will be restricted to outside of peak hours; and
- Pre and Post-Construction highway condition surveys to repair any damage to verges that may be caused by construction vehicles.

Traffic Management

1.8.91.8.12 As set out in Section 7, traffic management will be a requirement for AIL movements. Traffic management will be agreed with the local highway authority and police prior to the abnormal load movements taking place.

Construction Traffic Management Plan

1.8.101.8.13 A Construction Traffic Management Plan (CTMP) will be implemented during the construction phase of the Scheme and will be in substantial accord with the **Outline CTMP [EN010168/APP/7.22]** provided as part of the DCO Application**.**

1.8.111.8.14 A CTMP provides a framework for the management of construction vehicle movements to and from the Order Limits, to ensure that the effect of the construction phase on the local highway network is minimised. It is an evolving document that will be updated prior to construction to reflect any considerations made during the DCO process, and to add detail that arises from the procurement of the Engineering Principal Contractor (EPC). The CTMP will be approved by the Local Highway Authorities prior to the construction phase commencing.

1.8.121.8.15 The **Outline CTMP [EN010168/APP/7.22]** contains further information on construction vehicle access, routing and trip generation. Most importantly, it sets out a package of mitigation measures aimed at minimising the effect of construction traffic on the surrounding transport network.

1.8.131.8.16 The measures set out in the **Outline CTMP [EN010168/APP/7.22]** are summarised below:

- Signage installed along the construction route to direct traffic to the Order Limits;
- The avoidance of travel during the network peak hours;
- The provision of a booking system with the aim of managing arrivals and departures to ensure that they do not cross each other on the local highway network;

- The provision of parking on-site, to ensure that vehicles are not parked on the local highway network;
- The provision of a wheel wash facility and access points, to ensure that vehicles do not distribute mud and debris on the local highway network;
- Noise reduction and air quality measures;
- A commitment to engage with the local community and set up a Community Liaison Group; and
- A commitment to undertake a pre and post-construction road condition survey. This will identify defects that can reasonably be attributable to construction activities within the Order Limits. Any identified highways defects resulting from construction activities associated with the Order Limits will be corrected to the satisfaction of the local highway authority, although the specification of such works will not exceed the pre-existing highway specification.

1.8.141.8.17 Through the CTMP, a construction worker travel plan will also be implemented. This will include the following measures aimed at reducing private vehicle use:

- **Shuttle Bus** - The location where staff will travel from is unknown at this stage as it will depend on the appointed contractor. However, it is envisaged that the majority of non-local workforce will stay at local accommodation and be transported to the Order Limits by shuttle bus to minimise the impact on the strategic and local highway network; and
- **Car sharing** – A car sharing scheme will be set up. This will match construction workers who live in a similar area, or who follow a similar route to the Order Limits and encourage them to car share to save costs and reduce their impact on the environment.

Public Rights of Way Management Plan

1.8.151.8.18 A PRoW and Permissive Path Management Plan will also be implemented during the construction phase of the Scheme and will be in substantial accord with the **Outline PROW and Permissive Path Management Plan [EN010168/APP/7.17]** prepared as part of the DCO Application.

1.8.161.8.19 A Public Right of Way Plan is provided in **ES Volume 2, Figure 13-3: Public Rights of Way Location Plan: Solar PV Sites [EN010168/APP/6.2]** and **ES Volume 2, Figure 13-4: Public Rights of Way Location Plan: Cable Route Corridor [EN010168/APP/6.2]**. The Public Right of Ways located within the Solar PV Sites and Cable Route Corridor are listed in **Table 13-1** and **Table 13-2**, respectively.

General Measures

~~1.8.17~~1.8.20 There are 21 PRoW that cross the Solar PV Sites. Where vehicles are required to cross one of these PRoW, the following measures will be implemented during the construction phase.

- The provision of banksmen to hold vehicles if a PRoW user is present and advise PRoW users of the potential for construction vehicles to be present;
- Speeds to be limited to 10mph;
- Drivers will stop and give-way to any PRoW user that they encounter;
- Appropriate signage will be installed along the PRoW to make PRoW users aware of the construction phase. This will include information on construction times and contact details for a public liaison officer;
- The PRoW will be kept clear of construction vehicles and apparatus outside of permitted construction hours so far as is practicable to do so; and
- Any damage to the surface of the footpath will be repaired as soon as practicable. The surface will be returned to its original condition following completion of the construction phase.

Cable Route Corridor

~~1.8.18~~1.8.21 The electricity generated by the Scheme will be exported to the National Grid substation at Melksham via Grid Connection Cables sited within the defined Cable Route Corridor. The Cable Route Corridor will be approximately 22km in length, and is directed across open countryside. It will require crossings of railways, watercourses, various utilities, PRoW and roads.

~~1.8.19~~1.8.22 The Cable Route Corridor will be built out in four sections over an 18-month period, with each section requiring a number of site access points. It has been estimated that each section will be approximately 5.5km long.

~~1.8.20~~1.8.23 The PRoW will be crossed by the proposed internal access tracks. As per the methodology for the Solar PV Sites, management measures will be put in place to ensure the safe movement of PRoW users. The measures to be employed where the PRoW is crossed by the haulage road are as follows:

- The provision of banksmen to hold vehicles if a PRoW user is present and advise PRoW users of the potential for construction vehicles to be present;
- Speeds to be limited to 10mph;

- Drivers will stop and give-way to any PRoW user that they encounter;
- Appropriate signage will be installed along the PRoW to make PRoW users aware of the construction activity. This will include information on construction times and contact details for a public liaison officer;;
- The PRoW will be kept clear of construction vehicles and apparatus outside of permitted construction hours so far as is practicable to do so; and
- Any damage to the surface of the footpath will be repaired as soon as practicable. The surface will be returned to its original condition following the construction phase.

1.8.211.8.24 When the Grid Connection Cables are installed, there will be some instances where the PRoW needs to be closed to users for a short period. This will not occur at all PRoW, as directional drilling will be used in some places. Where there is a requirement to temporarily close the PRoW, works will be undertaken overnight so far as is practicable to do so, when there are unlikely to be any PRoW users. It is anticipated that the installation of Grid Connection Cables over short sections where the PRoW is located can be undertaken in a single overnight period. The PRoW will remain open, and managed, during the daytime period so far as is practicable to do so.

1.8.221.8.25 Where a temporary stopping up/diversion of a PRoW is required, prior notices to the PRoW officers at the local highway authority will be provided so far as practicable.

1.8.231.8.26 All PRoW within the Cable Route Corridor will be reinstated once the Grid Connection Cables have been installed at each location.

1.8.241.8.27 Where Grid Connection Cables may be laid longitudinally in the highway, rolling traffic management will be implemented to allow for construction and agreed with Wiltshire Council in advance. This will potentially be required along Goodes Hill on the B3353 and along Westlands Lane in the vicinity of the Existing National Grid Substation.

Summary

1.8.251.8.28 A number of management and mitigation measures will be implemented throughout the construction phase. This includes:

- Localised access widening and pass-by bays;
- The use of banksmen and localised traffic management to ensure highway safety;

- The implementation of a CTMP with the aim of minimising the effect of construction vehicles on the local highway network; and
- The implementation of a Public Right of Way Management Plan.

1.9 Effect of the Development on the Local Highway Network

1.9.1 This section summarises the effect of the development on the local highway network.

Construction Phase: Solar PV Sites

1.9.2 The construction phase is expected to last approximately 24 months. The assessment of the effects of the construction phase is based on peak construction vehicle movements, as set out in **Section 5** and **Section 6**.

1.9.3 Baseline traffic flows for the local highway network are shown in **Table 13-5**.

1.9.4 At this stage, construction traffic is anticipated to peak in 2028. TEMPro growth factors, which have been adjusted in line with the National Traffic Model (NTM), have been applied to the observed traffic flows to generate baseline traffic flows for 2028. The TEMPro growth factor for the Wiltshire district the is shown in **Table 13-20**.

Table 13-20: TEMPro Growth Factors (2024-2028)

Year	Growth Factor
2024-2028	1.0403

1.9.5 The 2024 observed and 2028 future baseline traffic flows are shown in **Table 13-21**.

1.9.6 Daily construction traffic flows have been added onto 2028 base to show the change in vehicles. This is summarised in **Table 13-22**.

13	A429 South of Corston	12,083	12,197	0.9%	4.7%

1.9.7 **Table 13-22** indicates that there will not be a significant percentage change in the number of daily vehicles trips on the strategic network, namely the M4, A46 and A429 (less than 2.5%) as a result of construction traffic.

1.9.8 Smaller, rural roads will see a higher percentage increase in daily traffic flows. However, these typically have low baseline traffic flows and still have sufficient capacity to accommodate the anticipated trips.

1.9.9 The effect of these changes in traffic flows, which are spread out across local highway network surrounding the scheme, is not forecast to have

any significant effect over the course of the working day. The construction phase is 24 months so impacts will be temporary in nature.

Peak Hour Traffic Flows

1.9.10 Construction vehicles will avoid travel during the network peak hours where practicable. Deliveries will be scheduled for between 09:30 and 16:30~~.~~ on weekdays and between 09:30 and 12:30 on Saturdays. Construction worker shifts will be scheduled so that workers are not traveling during the network peak hours of 08:00-09:00 and 17:00-18:00.

1.9.11 As a result, there are unlikely to be any significant peak hour movements associated with the construction phase of the Scheme. Therefore, the construction phase of the Scheme will not result in any highway network capacity constraints during the network peak hours.

Cable Route Corridor

1.9.12 Each access along the Cable Route Corridor ~~will only generate traffic flows~~is expected to be in use for approximately 90 non-consecutive days~~.~~ over the construction phase with up to four accesses (one per 5.5 km section of the Cable Route Corridor) in operation at one time.

~~1.9.12~~1.9.13 Each access is only forecast to generate an average of eight arrivals and eight departures per day for the delivery of material and equipment (half by 10m tipper, half by LGV), and around 10 construction workers arriving by car and shuttle bus. These movements will again be spread throughout the day, and will avoid the network peak hours. Based on a seven-hour period of arrivals and departures (09:30-16:30), each access will generate approximately two to three movements per hour.

~~1.9.13~~1.9.14 Therefore, construction vehicles associated with the Cable Route Corridor are not expected to have any significant impact on the local highway network.

Operation and Maintenance Phase

~~1.9.14~~1.9.15 During the Scheme's operational phase, there is anticipated to be around five visits to each Solar PV Site per month for maintenance purposes. The planned replacement of all solar panels, transformers and BESS Batteries will occur once during the Scheme's lifespan.

~~1.9.15~~1.9.16 The principles of the **Outline CTMP [EN010168/APP/7.22]** will be applied to the Planned Replacement operations. This includes HGV routes and all management measures.

~~1.9.16~~1.9.17 Replacement will generate significantly fewer HGV movements on the local highway network compared to the construction phase of the

Scheme. This will not result any material impact on the local highway network.

Decommissioning Phase

~~1.9.17~~1.9.18 As set out in **Section 5**, the number of vehicles associated with the decommissioning phase are not anticipated to exceed the number set out for the construction phase. An **Outline Decommissioning Strategy [EN010168/APP/7.14]** has been submitted as part of the DCO application, and a final version will be submitted to the local planning authority for approval prior to decommissioning. This will be secured by a requirement of the DCO.

Summary

~~1.9.18~~1.9.19 The effect of the temporary changes in traffic flows on the local highway network associated with the construction phase of the scheme are not anticipated to be significant in nature. Trips are well spread out around the network, and will be spread across the working day, avoiding the network peak hours.

1.10 Cumulative Effects of the Scheme

1.10.1 A number of cumulative schemes are proposed in the local area. These are identified and presented in **ES Chapter 21 Cumulative and In-Combination Effects [EN010168/APP/6.1.3]**.

Construction Phase

1.10.2 The schemes presented in **Table 13-23** were considered to potentially have a transport and access effect on the construction routes associated with the Solar PV Sites.

1.10.3 The number of traffic flows on the links associated with the construction phase of the Scheme are low, and it is therefore unlikely that the cumulative effects will greatly affect the severity of effects from the Scheme. This is particularly the case given that the impacts of the construction phase are temporary in nature and that measures set out in the **Outline CTMP [EN010168/APP/7.22]** will ensure that construction traffic avoids the AM and PM highway peaks.

1.10.4 The TEMPro growth factor applied to establish the future baseline year presented within the analysis in **Section 9** also allows for increased future flows and, therefore, inherently takes into account those from permitted and allocated developments.

Table 13-23: Plans and Projects Relevant to Transport and Access Cumulative Assessment

(GIA) of research and development/office floorspace (Class B1 (a) and (b)) and 24,150 sqm. of ancillary development including test areas, an energy centre, a logistics/storage building, hangar building, staff and customer facilities, and gatehouse, and new access arrangements, comprising a re-aligned section of C1 road and new roundabouts at both the junction of the A429/C1 roads and on the C1 road (all matters reserved except for access).	0.8 km	TEMPro growth factor includes planned growth, so movements accounted for in Future Baseline. The proposed off-site highway works have been delivered. No significant cumulative effects have been identified.

Transport Assessment states that there could be eight HGV arrivals on an average day during the construction phase. These would use the A429. There could be some vehicle movements associated with up to 40 construction workers. Based on this low level of movement on a A-Road, no significant cumulative effects have been identified
PL/2023/04625	Proposed Battery Energy Storage Scheme on Land at Woolley Park Farm, Leigh Road, Trowbridge	5.8 km	Located south-west of Melksham sub-station. No significant cumulative effects have been identified within the Study Area.

1.10.5 There are additional cumulative schemes within the vicinity of the Cable Route Corridor. However, the addition of eight arrivals and departures associated with each Cable Route Corridor access~~, over a 90-day period,~~ is sufficiently low that it will not result in a significant cumulative impact at these locations.

Operation and Maintenance Phase

1.10.6 During the Scheme's operation and maintenance phase, there is anticipated to be around five visits to each Solar PV Site per month for maintenance purposes. The planned replacement of all solar panels, transformers and BESS Batteries will occur once during the Scheme's lifespan. This will generate significantly fewer HGV movements on the local highway network compared to the construction phase of the Scheme. This will not result in any material cumulative effect on the local highway network.

Decommissioning Phase

1.10.7 As set out in **Section 5**, the number of vehicles associated with the decommissioning phase are not anticipated to exceed the number set out for the construction phase. An **Outline Decommissioning Strategy [EN010168/APP/7.14]** has been submitted as part of the DCO application and a final version will be submitted to the local planning authority for approval prior to decommissioning. This will be secured by a requirement of the DCO. Therefore, the cumulative effects of the Decommissioning Phase will be similar to those set out for the construction phase.

1.11 Summary and Conclusions

1.11.1 This TA has provided an overview of the potential effects of the Scheme in transport terms. It should be read in conjunction with **ES Volume 1, Chapter 13: Transport and Access [EN010168/APP/6.1]**.

1.11.2 The Scheme will comprise the construction, operation and maintenance, and decommissioning phase of a solar photovoltaic (PV) array electricity generating station and Energy Storage System (BESS) with a total capacity exceeding 50 megawatts (MW), and export connection to the National Grid at Melksham Substation.

1.11.3 The grid connection point will be at the National Grid substation at Melksham substation. The Scheme is split into five Solar PV Sites, Lime Down A, B, C, D and E. In addition, a Cable Route Corridor is identified for the Grid Connection.

1.11.4 The electricity generated by the Scheme will be exported to the National Grid substation at Melksham via Grid Connection Cables sited within the defined Cable Route Corridor. These connections will also facilitate the

import of electricity to be stored within the energy storage facilities at Lime Down D. The Cable Route Corridor will be approximately 22km in length, and is directed across open countryside. It will require crossings of railways, watercourses, various utilities, PRoW and roads.

1.11.5 The Order Limits are in a suitable location for the Scheme in terms of transport. Whilst there is not a significant level of walking, cycling or public transport accessibility in the area, the operation and maintenance phase generates very few trips. The Order Limits are located near to the strategic road network, connected by a number of local roads. This will help facilitate the movement of construction vehicles to and from the Order Limits.

1.11.6 There will be a total of 21 points of access for the Solar PV Sites for the construction and operational and maintenance phases. In addition, there will be 28 points of access along the Cable Route Corridor. All have been assessed and designed for their appropriateness for the relevant vehicles that will use them. During the construction phase, banksmen will be provided at the access points to ensure the safe movement of construction vehicles when accessing and exiting the Order Limits.

1.11.7 Once operational, very few vehicle trips will be associated with the development (around five visits to each Solar PV Site per month for maintenance purposes). The planned replacement of all solar panels, transformers and BESS Batteries will occur once during the Scheme's lifespan. This will generate significantly fewer HGV movements on the local highway network compared to the construction phase of the Scheme.

1.11.8 On a peak day during the construction phase, the following movements could be generated:

- Solar PV and BESS Sites:
  - HGV – 74 (148 total movements~~)~~); and
  - Car/Shuttle associated with construction workers – 224 (448 total movements~~)~~).
- Cable Route Corridor:
  - HGV – 16 deliveries (32 movements);
  - LGV - 16 deliveries (32 movements); and
  - Construction worker arrivals (car/van) – 40 arrivals (80 movements). As a worst-case assessment, it is assumed that all workers will arrive via a private vehicle.

1.11.9 **Section 6** of this TA sets out how these trips will change traffic volumes on the local highway network. The effects of the temporary changes in traffic flows on the local highway network associated with the construction phase of the scheme are not anticipated to be significant in nature. Trips are well spread around the network, and will be spread across the working day, avoiding the network peak hours.

1.11.10 A number of management and mitigation measures will be implemented throughout the construction phase. This includes:

- Localised access widening and passby bays;
- The use of banksmen and localised traffic management to ensure highway safety;
- The implementation of an **Outline CTMP [EN010168/APP/7.22]** with the aim of minimising the effect of construction vehicles on the local highway network~~.~~; and
- The implementation of an **Outline PROW and Permissive Path Management Plan [EN010168/APP/7.17]**.

1.11.11 There will be a total of 13 abnormal ~~loads~~load movements across the construction phase, associated with the delivery of transformers. In addition, there will be a number of smaller abnormal load movements associated with Cable Route Corridor.

1.11.12 The number of vehicles associated with the decommissioning phase are not anticipated to exceed the number set out for the construction phase. An **Outline Decommissioning Strategy [EN010168/APP/7.14]** has been prepared and a final Decommissioning Plan will be submitted to the local planning authority for approval prior to decommissioning. This will be secured by a requirement of the DCO. Therefore, the effects of the Decommissioning Phase will be similar to those set out for the construction phase.

1.11.13 In light of the information contained within this report, it is concluded that the Scheme is acceptable from a transport perspective.

1.13 Glossary

Term	Acronym	Definition
Transport Assessment	TA	Transport Assessment is a document that is a way of assessing the potential transport impacts of developments (and they may propose mitigation measures to promote sustainable development. Where that mitigation relates to matters that can be addressed by management measures, the mitigation may inform the preparation of Travel Plans).
Outline Construction Traffic Management Plan	Outline CTMP	A framework document for the management of construction vehicle movements to and from the Scheme, to ensure that the effects of the temporary construction phase on the local highway network are minimised. The Outline CTMP sets out construction access arrangements, construction vehicle routing, construction vehicle trip generation, and the management/mitigation measures. It also summarises the requirements for vehicles transporting abnormal loads (for elements such as transformers).
Construction Traffic Management Plan	CTMP	A document for the management of construction vehicle movements to and from the Scheme, to ensure that the effects of the temporary construction phase on the local highway network are minimised building on the principles set out in the Outline CTMP. The CTMP sets out construction access arrangements, construction vehicle routing, construction vehicle trip generation, and the management/mitigation measures. It also summarises the requirements for vehicles transporting abnormal loads (for elements such as transformers).
Travel Plan	TP	Travel Plans are long-term management strategies for integrating proposals for sustainable travel into the planning process. They are based on evidence of the anticipated transport impacts of development and set measures to promote and encourage sustainable travel (such as promoting walking and cycling).
Public Right of Way	PRoW	A PRoW in the UK is a path or track that is open to the public to use at any time. They are protected by law and can be found in towns, villages, and the countryside.
Heavy Goods Vehicle	HGV	An HGV is any truck over 3.5 Tonnes gross combination mass (GCM).
Lights Goods Vehicle	LGV	An LGV is a commercial vehicle with a gross weight of 3,500 kg or less.
Abnormal Indivisible Load	AIL	An abnormal load is one where the vehicle exceeds 44 tonnes, the width is more than 2.9 m or the length is more than 18.65 m
10 m Tipper	n/a	A large truck for transporting heavy loads, with a back part that can be raised at one end so that its contents fall out.
10 m Rigid	n/a	A large, non-articulated truck where the cargo-carrying body is permanently attached to the chassis.
Receptor	n/a	A receptor is a component of the natural or human environment that can be affected by a project.

Term	Acronym	Definition

Visibility splays	n/a	A visibility splay is a designated area of land that allows drivers to see and be seen by other drivers at junctions and access points
Personal Injury Collisions	PIC	A road traffic incident that has involved an injury to one or more persons involved. They are categorised into 'slight', 'serious', and 'fatal' injuries.
Automatic Traffic Count Surveys	ATCs	Automatic Traffic Counts are undertaken by pneumatic tubes across the road that measure flow and traffic speed. These counters can classify vehicles into various groups, such as cars, buses and heavy commercial vehicles. They are usually installed for one week.
TEMPro	n/a	TEMPro is a software program that allows users to access and analyse the National Trip End Model (NTEM) dataset. The NTEM dataset is used to forecast the impact of transport projects and estimate traffic growth. TEMPro is the industry standard tool for this purpose.

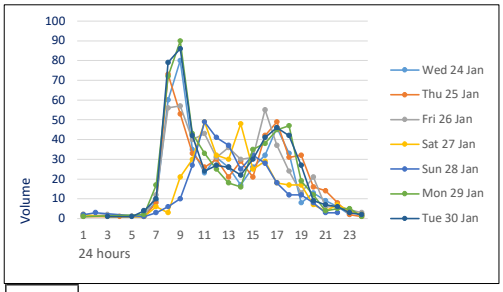
DAILY SPEEDS

NORTHBOUND ↑

SOUTHBOUND ↓



Average daily speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin is required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak average northbound daytime speed was 74mph at 18:30 on Wed 24 Jan, whilst the peak average southbound speed was 85.2mph at 07:45 on Sun 28 Jan (based on 15min averages between 0700 & 1900).

Average daily northbound and southbound volumes by class (condensed to the AQMA scheme), including 12hr totals for 0700-1900 and overall average percentages. Calculated from all available data over 7 days.

CYCLE PROVISION

The diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment will reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4:

Equipment damage & failure

Although checked intermittently the equipment remains unmanned for much of the duration of the survey, and can potentially be interfered with, vandalised, damaged or stolen and A-T-R cannot be held responsible for any periods where data has not been captured.

The equipment is located in accordance with the details provided by the client and A-T-R cannot be held responsible for the accuracy of the data or loss of equipment due to theft and vandalism.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, A-T-R cannot be held responsible for the forecast accuracy.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of ten classes based on axle spacing and pattern. This scheme is based on the AustRoad 94 algorithm and modified for UK traffic, referred to as ARX. The table on the left aligns the ARX classifications with the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, A-T-R may not be held liable for errors of fact or interpretation.

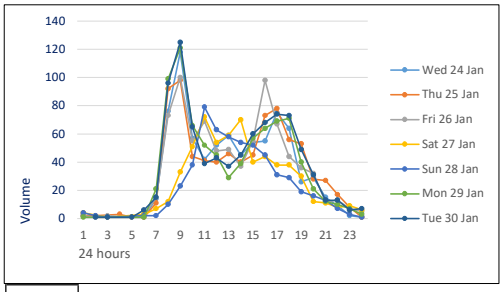
DAILY SPEEDS

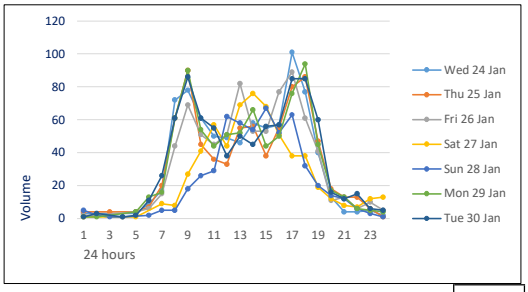
NORTHBOUND ↑

SOUTHBOUND ↓



Average daily speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin is required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak average northbound daytime speed was 45.3mph at 07:00 on Sun 28 Jan, whilst the peak average southbound speed was 50.7mph at 07:30 on Sun 28 Jan (based on 15min averages between 0700 & 1900).



HOURLY VOLUMES

Average daily northbound and southbound volumes by class (condensed to the AQMA scheme), including 12hr totals for 0700-1900 and overall average percentages. Calculated from all available data over 7 days.

CYCLE PROVISION

The diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment will reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4:

Equipment damage & failure

Although checked intermittently the equipment remains unmanned for much of the duration of the survey, and can potentially be interfered with, vandalised, damaged or stolen and A-T-R cannot be held responsible for any periods where data has not been captured.

The equipment is located in accordance with the details provided by the client and A-T-R cannot be held responsible for the accuracy of the data or loss of equipment due to theft and vandalism.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, A-T-R cannot be held responsible for the forecast accuracy.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of ten classes based on axle spacing and pattern. This scheme is based on the AustRoad 94 algorithm and modified for UK traffic, referred to as ARX. The table on the left aligns the ARX classifications with the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, A-T-R may not be held liable for errors of fact or interpretation.

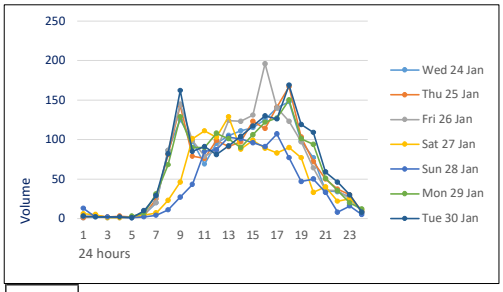
DAILY SPEEDS

NORTHBOUND ↑

SOUTHBOUND ↓



Average daily speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin is required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak average northbound daytime speed was 41.2mph at 07:00 on Sun 28 Jan, whilst the peak average southbound speed was 34.8mph at 08:00 on Sun 28 Jan (based on 15min averages between 0700 & 1900).

Average daily northbound and southbound volumes by class (condensed to the AQMA scheme), including 12hr totals for 0700-1900 and overall average percentages. Calculated from all available data over 7 days.

CYCLE PROVISION

The diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment will reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4:

Equipment damage & failure

Although checked intermittently the equipment remains unmanned for much of the duration of the survey, and can potentially be interfered with, vandalised, damaged or stolen and A-T-R cannot be held responsible for any periods where data has not been captured.

The equipment is located in accordance with the details provided by the client and A-T-R cannot be held responsible for the accuracy of the data or loss of equipment due to theft and vandalism.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, A-T-R cannot be held responsible for the forecast accuracy.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of ten classes based on axle spacing and pattern. This scheme is based on the AustRoad 94 algorithm and modified for UK traffic, referred to as ARX. The table on the left aligns the ARX classifications with the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, A-T-R may not be held liable for errors of fact or interpretation.

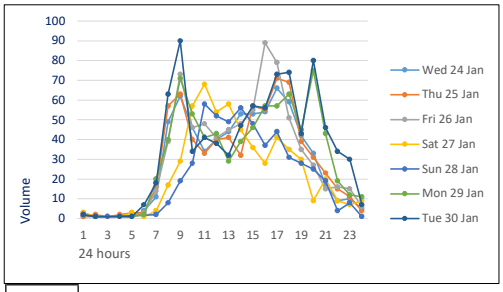
DAILY SPEEDS

NORTHBOUND ↑

SOUTHBOUND ↓



Average daily speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin is required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak average northbound daytime speed was 53.9mph at 07:00 on Sun 28 Jan, whilst the peak average southbound speed was 53.9mph at 07:30 on Sat 27 Jan (based on 15min averages between 0700 & 1900).

Average daily northbound and southbound volumes by class (condensed to the AQMA scheme), including 12hr totals for 0700-1900 and overall average percentages. Calculated from all available data over 7 days.

CYCLE PROVISION

The diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment will reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4:

Equipment damage & failure

Although checked intermittently the equipment remains unmanned for much of the duration of the survey, and can potentially be interfered with, vandalised, damaged or stolen and A-T-R cannot be held responsible for any periods where data has not been captured.

The equipment is located in accordance with the details provided by the client and A-T-R cannot be held responsible for the accuracy of the data or loss of equipment due to theft and vandalism.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, A-T-R cannot be held responsible for the forecast accuracy.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of ten classes based on axle spacing and pattern. This scheme is based on the AustRoad 94 algorithm and modified for UK traffic, referred to as ARX. The table on the left aligns the ARX classifications with the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, A-T-R may not be held liable for errors of fact or interpretation.

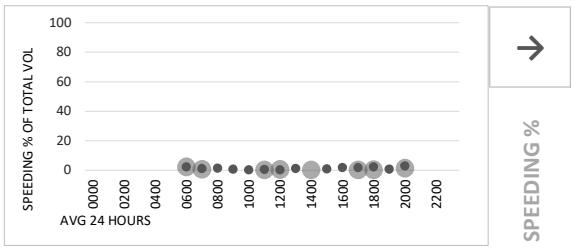
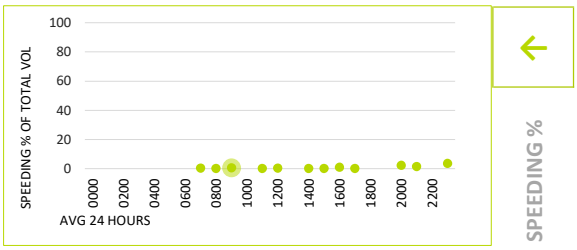
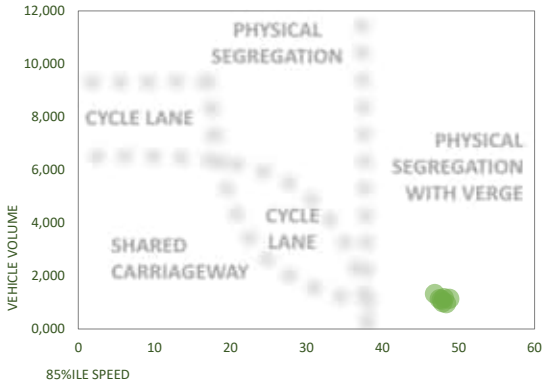
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak eastbound daytime speed was 51.2mph at 18:00 on Sun 16 Mar, whilst the peak westbound speed was 49.5mph at 12:45 on Wed 12 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday eastbound and westbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on Neeld Ct , commencing Tue 11 Mar 2025, recorded a total of 673 vehicles. The posted speed limit of 60mph was exceeded by 0.3% of vehicles, and the seasonally adjusted, combined AADT value is 100 (see 'Equipment & methodology' below).

SUMMARY

The combined summary on the left shows the total volumes, average speeds, AADT and 85%iles recorded in both directions from all the recorded data, plus the Mon-Fri peak periods. Speeding vehicles are defined as those travelling 61mph and above.

The summaries below provide directionalised details including speeding percentages and weekday daytime details.

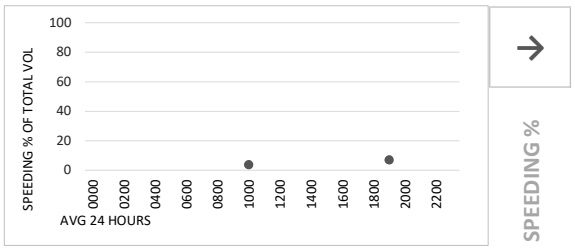
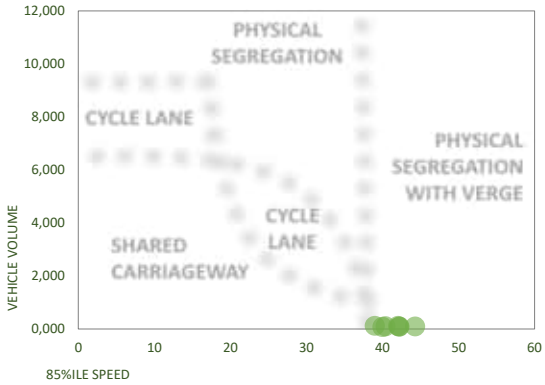
HOURLY SPEEDS



Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak eastbound daytime speed was 62.8mph at 10:00 on Fri 14 Mar, whilst the peak westbound speed was 51.5mph at 12:30 on Tue 11 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday eastbound and westbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on Unamed Rd, commencing Tue 11 Mar 2025, recorded a total of 11,902 vehicles. The posted speed limit of 60mph was exceeded by 1.1% of vehicles, and the seasonally adjusted, combined AADT value is 1,776 (see 'Equipment & methodology' below).

SUMMARY

The combined summary on the left shows the total volumes, average speeds, AADT and 85%iles recorded in both directions from all the recorded data, plus the Mon-Fri peak periods. Speeding vehicles are defined as those travelling 61mph and above.

The summaries below provide directionalised details including speeding percentages and weekday daytime details.

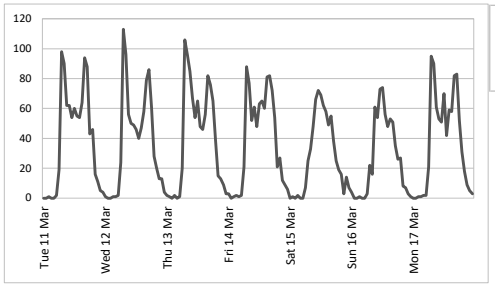
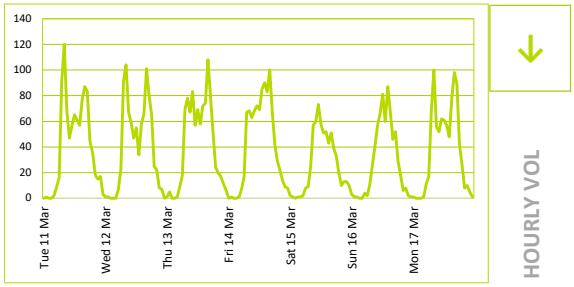
DAILY VOLUMES

NORTH- & SOUTHBOUND



Total 24hr northbound (solid, dark grey) and southbound (solid, dark green) traffic volumes, with light dashed grey and green representing 12hr volumes (0700-1900), over 7 consecutive days from all available data.



As can be expected, the lowest 24hr volumes were recorded on the Sunday, whilst the highest was on the Thursday.

HOURLY VOLUMES

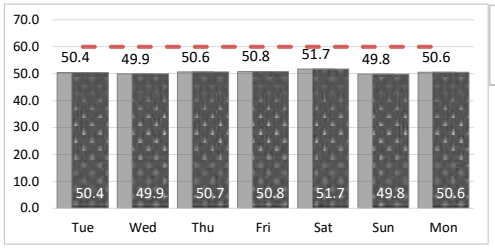
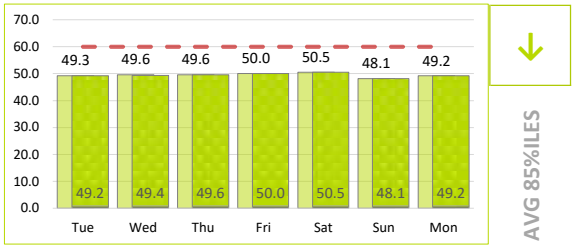
Hourly southbound traffic volumes over each 24hr period for 7 days from all available data

24hr & 12hr AVG SPEEDS

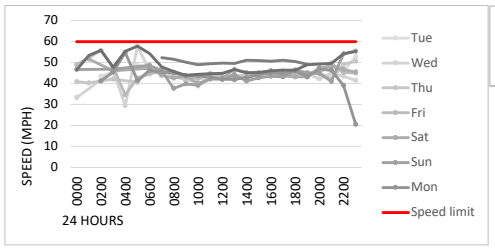


24hr (light) & 12hr daytime (dark grey, 0700-1900) average northbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)



24hr (light) & 12hr daytime (dark green) average southbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

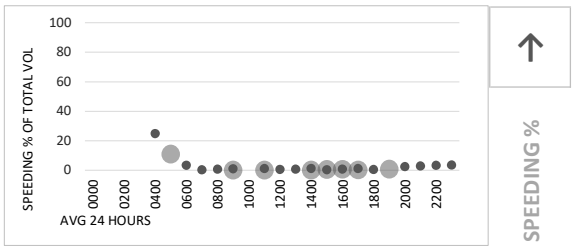
24hr & 12hr 85%ile SPEEDS

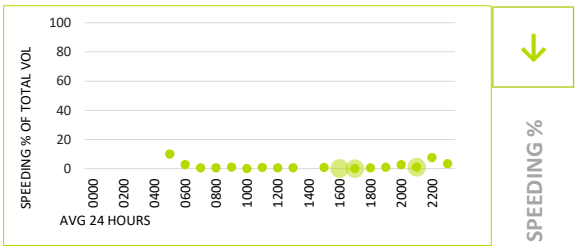


24hr (light) & 12hr daytime (dark grey, 0700-1900) average northbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr (light) & 12hr daytime (dark green, 0700-1900) average southbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

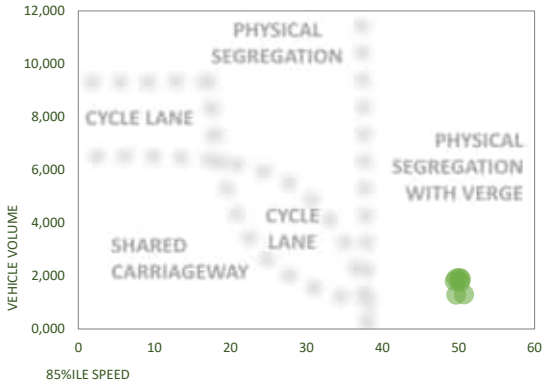
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak northbound daytime speed was 51.8mph at 17:30 on Sun 16 Mar, whilst the peak southbound speed was 51.4mph at 07:00 on Mon 17 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday northbound and southbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on Unamed Rd, commencing Tue 11 Mar 2025, recorded a total of 1,403 vehicles. The posted speed limit of 60mph was exceeded by 0.8% of vehicles, and the seasonally adjusted, combined AADT value is 209 (see 'Equipment & methodology' below).

SUMMARY

The combined summary on the left shows the total volumes, average speeds, AADT and 85%iles recorded in both directions from all the recorded data, plus the Mon-Fri peak periods. Speeding vehicles are defined as those travelling 61mph and above.

The summaries below provide directionalised details including speeding percentages and weekday daytime details.

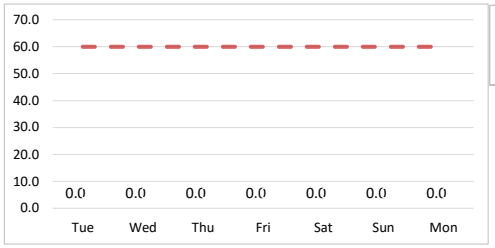
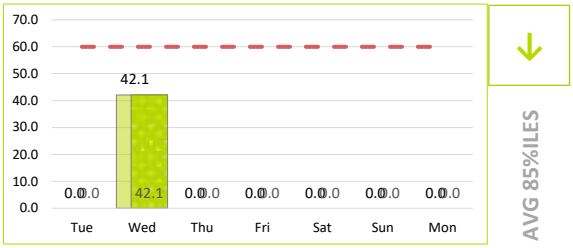
24hr & 12hr AVG SPEEDS

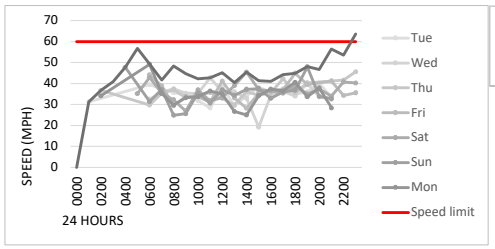


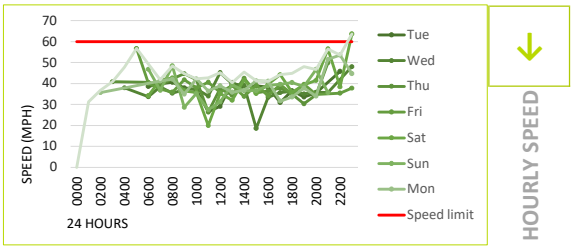
24hr (light) & 12hr daytime (dark grey, 0700-1900) average northbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)



24hr (light) & 12hr daytime (dark green) average southbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr & 12hr 85%ile SPEEDS

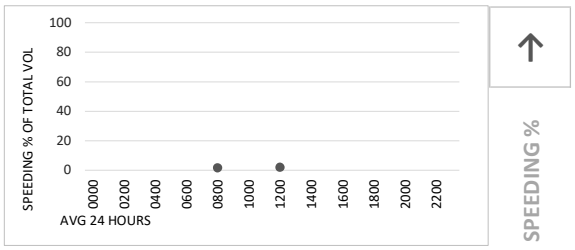


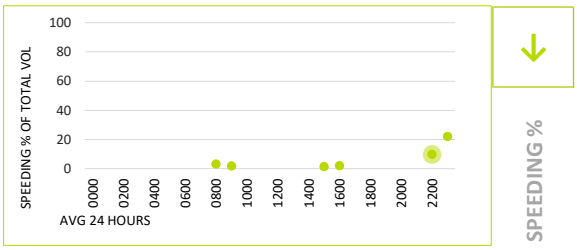


24hr (light) & 12hr daytime (dark grey, 0700-1900) average northbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr (light) & 12hr daytime (dark green, 0700-1900) average southbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

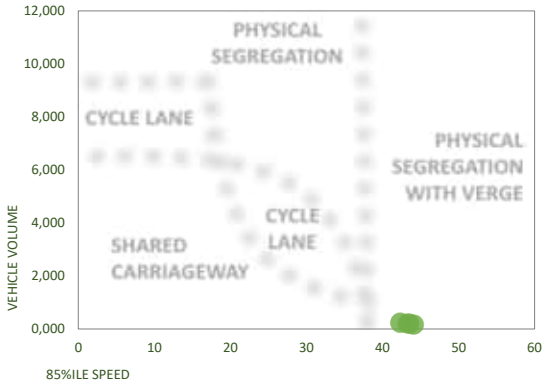
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak northbound daytime speed was 62.6mph at 08:30 on Sat 15 Mar, whilst the peak southbound speed was 62.9mph at 16:45 on Sun 16 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday northbound and southbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

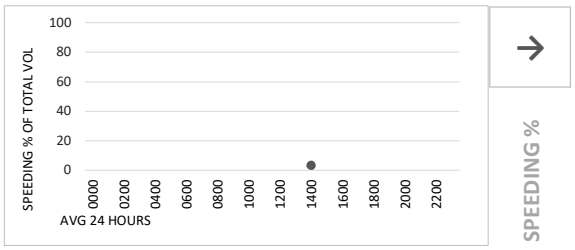
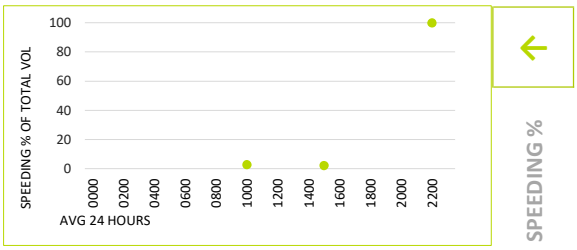
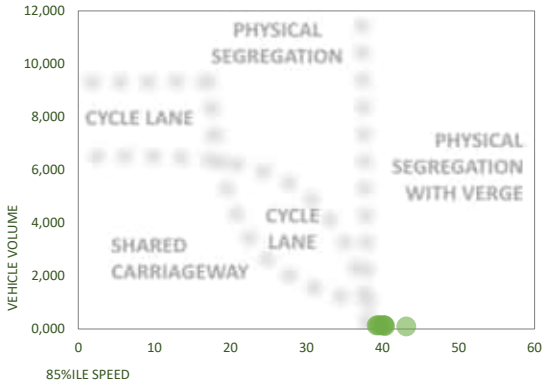
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak eastbound daytime speed was 63.6mph at 14:00 on Fri 14 Mar, whilst the peak westbound speed was 65.1mph at 15:45 on Wed 12 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday eastbound and westbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on Fowlswick Ln, commencing Tue 11 Mar 2025, recorded a total of 6,651 vehicles. The posted speed limit of 60mph was exceeded by 0.3% of vehicles, and the seasonally adjusted, combined AADT value is 998 (see 'Equipment & methodology' below).

SUMMARY

The combined summary on the left shows the total volumes, average speeds, AADT and 85%iles recorded in both directions from all the recorded data, plus the Mon-Fri peak periods. Speeding vehicles are defined as those travelling 61mph and above.

The summaries below provide directionalised details including speeding percentages and weekday daytime details.

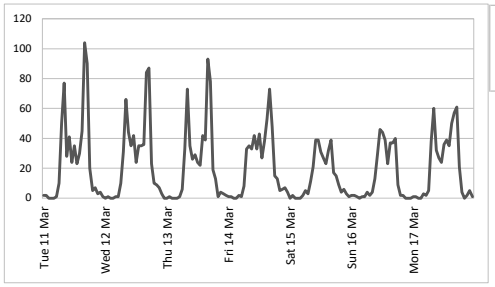
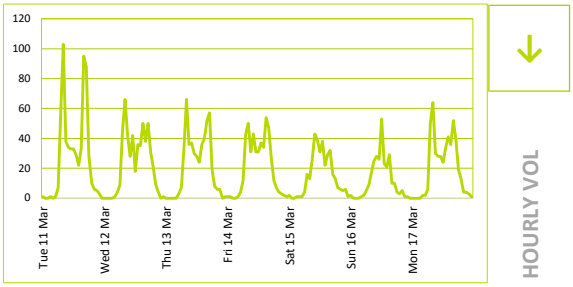
NORTH- & SOUTHBOUND



Total 24hr northbound (solid, dark grey) and southbound (solid, dark green) traffic volumes, with light dashed grey and green representing 12hr volumes (0700-1900), over 7 consecutive days from all available data.



As can be expected, the lowest 24hr volumes were recorded on the Sunday, whilst the highest was on the Tuesday.

HOURLY VOLUMES

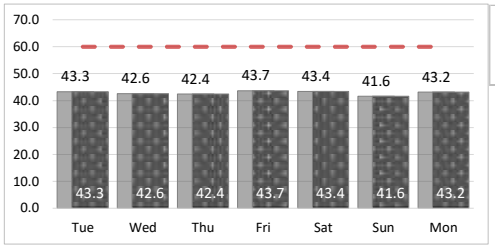
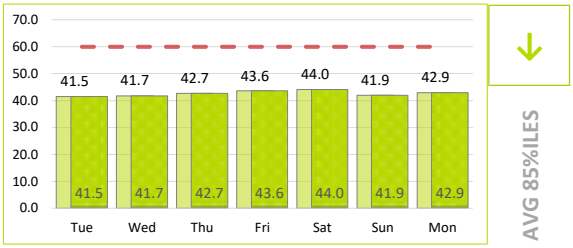
Hourly southbound traffic volumes over each 24hr period for 7 days from all available data

24hr & 12hr AVG SPEEDS

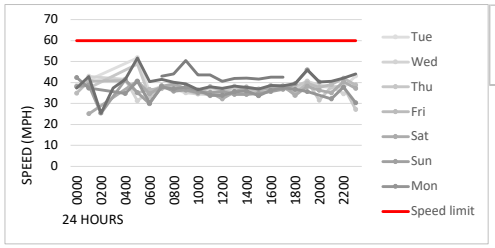


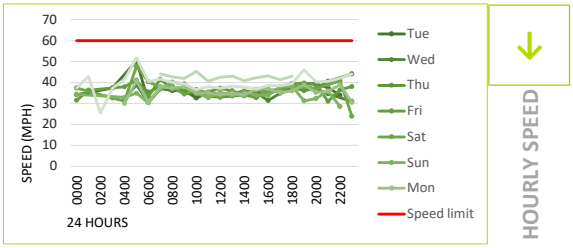
24hr (light) & 12hr daytime (dark grey, 0700-1900) average northbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)



24hr (light) & 12hr daytime (dark green) average southbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr & 12hr 85%ile SPEEDS

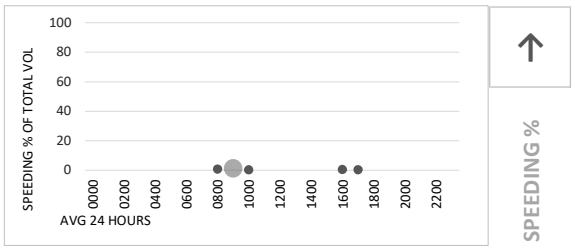


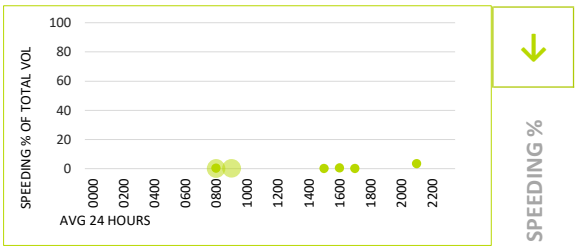


24hr (light) & 12hr daytime (dark grey, 0700-1900) average northbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr (light) & 12hr daytime (dark green, 0700-1900) average southbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

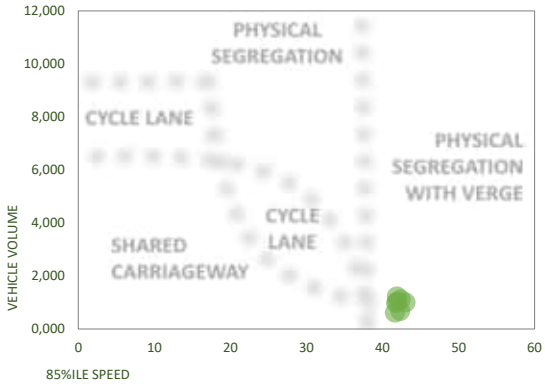
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak northbound daytime speed was 46.8mph at 07:00 on Wed 12 Mar, whilst the peak southbound speed was 48.6mph at 08:00 on Sun 16 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday northbound and southbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on B4039 , commencing Wed 19 Mar 2025, recorded a total of 35,922 vehicles. The posted speed limit of 50mph was exceeded by 20.7% of vehicles, and the seasonally adjusted, combined AADT value is 5,316 (see 'Equipment & methodology' below).

SUMMARY

The combined summary on the left shows the total volumes, average speeds, AADT and 85%iles recorded in both directions from all the recorded data, plus the Mon-Fri peak periods. Speeding vehicles are defined as those travelling 51mph and above.

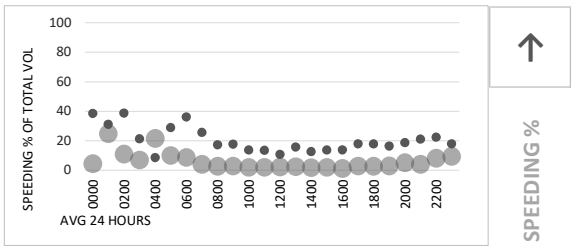
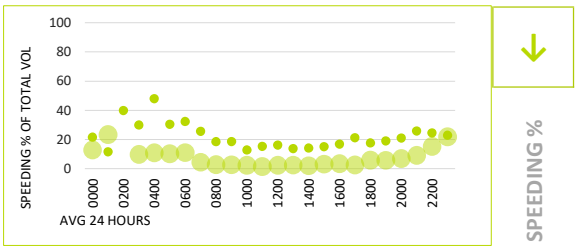
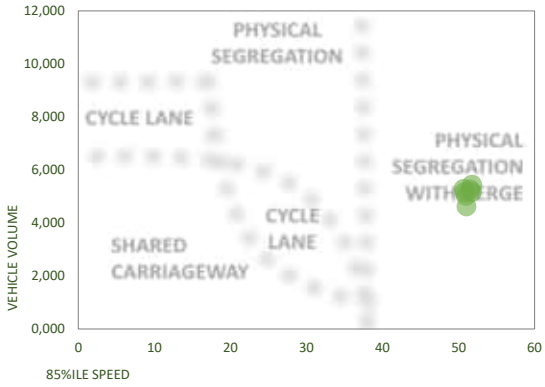
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 50mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak northbound daytime speed was 51.9mph at 07:45 on Sun 23 Mar, whilst the peak southbound speed was 54.4mph at 07:45 on Sun 23 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 50mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 50 and 55mph, whilst the larger markers represent those at 56mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday northbound and southbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on A420 , commencing Tue 11 Mar 2025, recorded a total of 51,801 vehicles. The posted speed limit of 60mph was exceeded by 17.2% of vehicles, and the seasonally adjusted, combined AADT value is 7,564 (see 'Equipment & methodology' below).

SUMMARY

The combined summary on the left shows the total volumes, average speeds, AADT and 85%iles recorded in both directions from all the recorded data, plus the Mon-Fri peak periods. Speeding vehicles are defined as those travelling 61mph and above.

The summaries below provide directionalised details including speeding percentages and weekday daytime details.

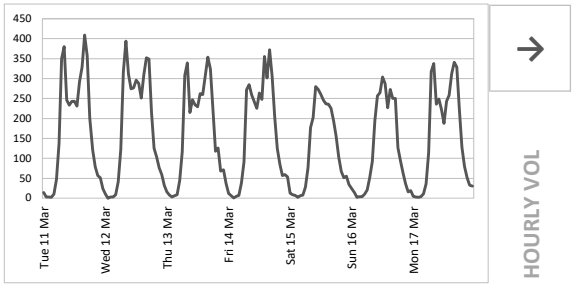
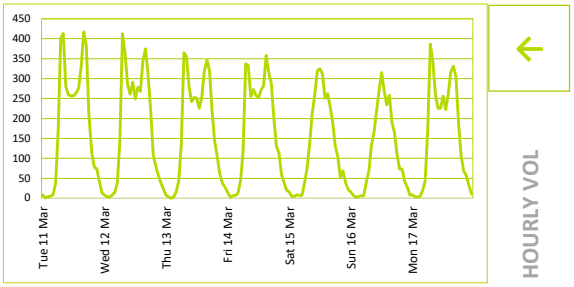
EAST- & WESTBOUND



Total 24hr eastbound (solid, dark grey) and westbound (solid, dark green) traffic volumes, with light dashed grey and green representing 12hr volumes (0700-1900), over 7 consecutive days from all available data.



As can be expected, the lowest 24hr volumes were recorded on the Sunday, whilst the highest was on the Wednesday.

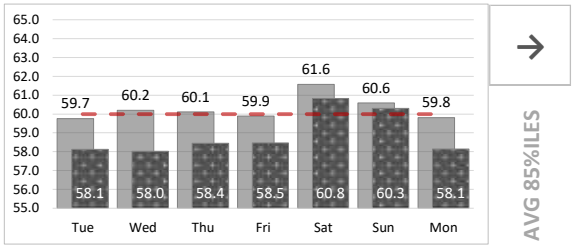
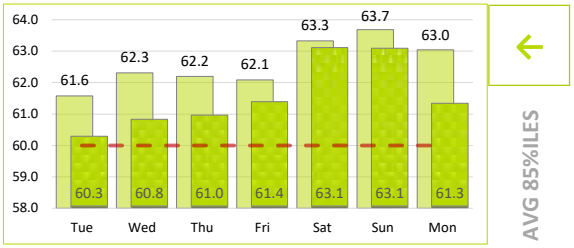
Hourly westbound traffic volumes over each 24hr period for 7 days from all available data

24hr & 12hr AVG SPEEDS

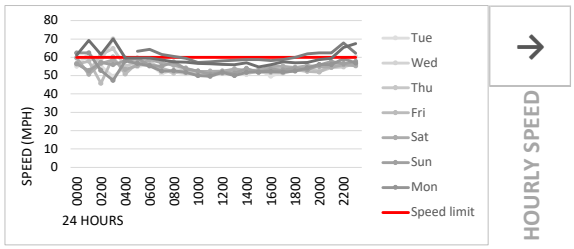


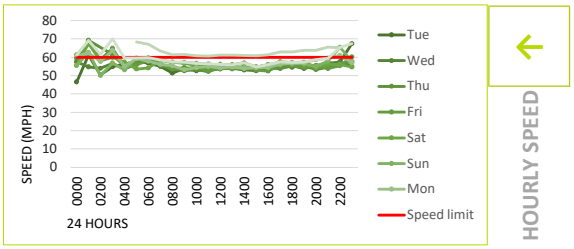
24hr (light) & 12hr daytime (dark grey, 0700-1900) average eastbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)



24hr (light) & 12hr daytime (dark green) average westbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr & 12hr 85%ile SPEEDS

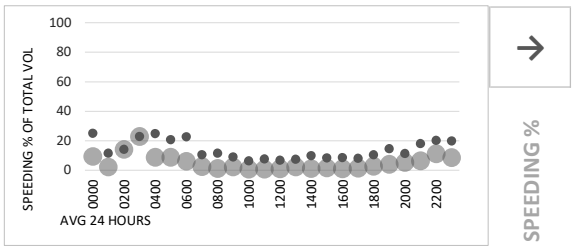


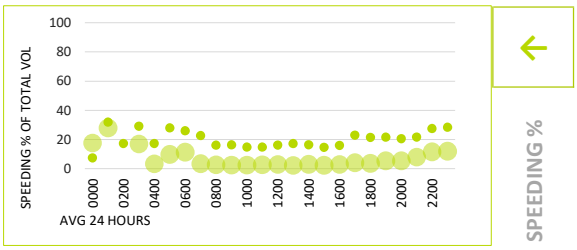


24hr (light) & 12hr daytime (dark grey, 0700-1900) average eastbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr (light) & 12hr daytime (dark green, 0700-1900) average westbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

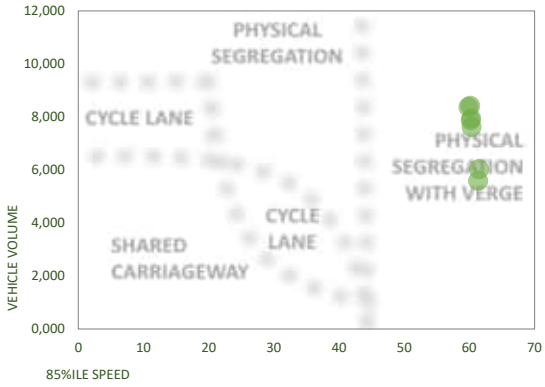
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak eastbound daytime speed was 60.4mph at 08:00 on Sun 16 Mar, whilst the peak westbound speed was 60.8mph at 07:45 on Sat 15 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday eastbound and westbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on Sheldon Cor, commencing Tue 11 Mar 2025, recorded a total of 7,614 vehicles. The posted speed limit of 60mph was exceeded by 2.4% of vehicles, and the seasonally adjusted, combined AADT value is 1,152 (see 'Equipment & methodology' below).

24hr (light) & 12hr daytime (dark green) average southbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr & 12hr 85%ile SPEEDS

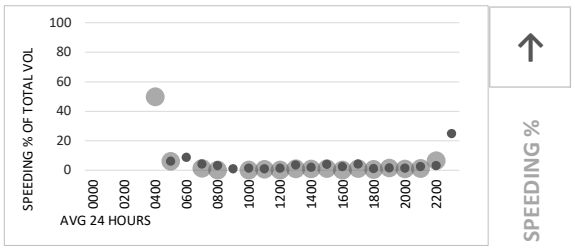
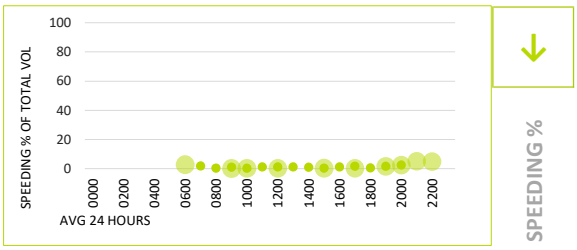
24hr (light) & 12hr daytime (dark green, 0700-1900) average southbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

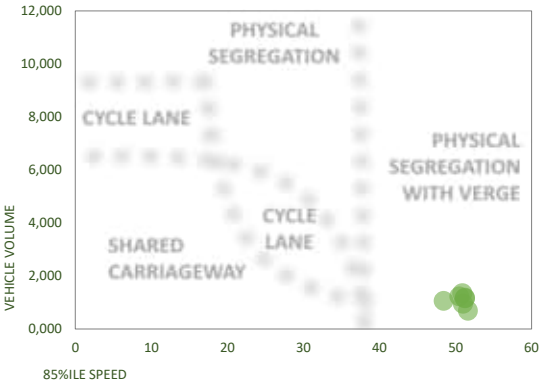
HOURLY SPEEDS





Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak northbound daytime speed was 57.8mph at 07:00 on Fri 14 Mar, whilst the peak southbound speed was 52.1mph at 07:30 on Sat 15 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday northbound and southbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.

ATC SUMMARY REPORT

7-DAY AUTOMATIC TRAFFIC COUNT

A 7-day automatic traffic count on Chippenham Ln, commencing Tue 11 Mar 2025, recorded a total of 954 vehicles. The posted speed limit of 60mph was exceeded by 0.0% of vehicles, and the seasonally adjusted, combined AADT value is 144 (see 'Equipment & methodology' below).

SUMMARY

The combined summary on the left shows the total volumes, average speeds, AADT and 85%iles recorded in both directions from all the recorded data, plus the Mon-Fri peak periods. Speeding vehicles are defined as those travelling 61mph and above.

The summaries below provide directionalised details including speeding percentages and weekday daytime details.

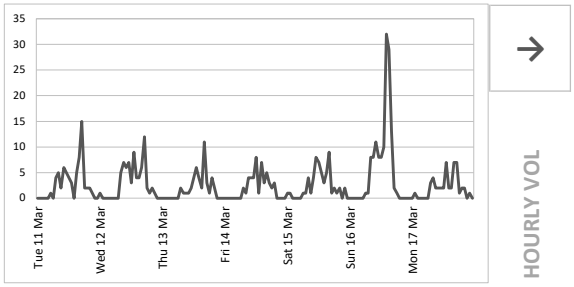
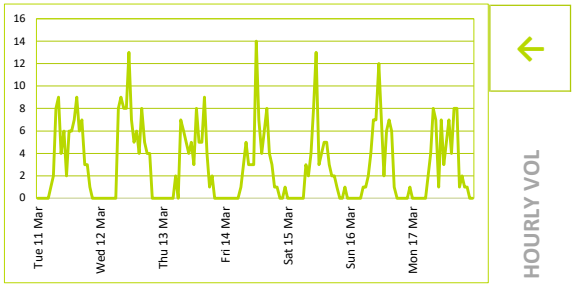
DAILY VOLUMES

EAST- & WESTBOUND



Total 24hr eastbound (solid, dark grey) and westbound (solid, dark green) traffic volumes, with light dashed grey and green representing 12hr volumes (0700-1900), over 7 consecutive days from all available data.



Unusually, the lowest volumes were NOT recorded on a Sunday but on the Thursday, whilst the highest was on the Sunday.

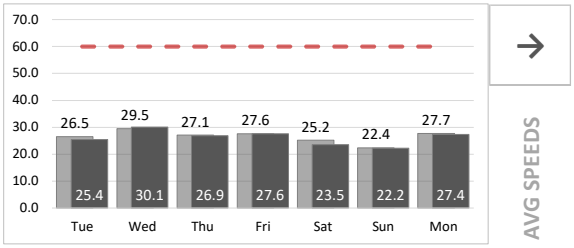
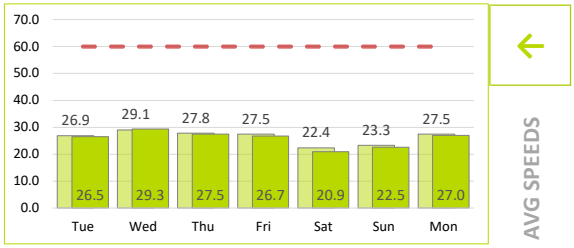
HOURLY VOLUMES

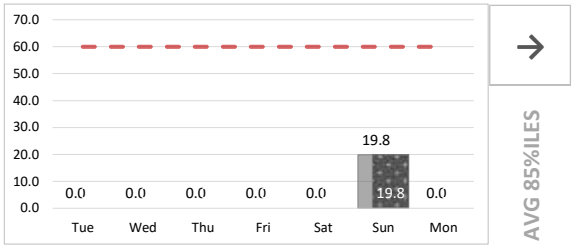


Hourly eastbound traffic volumes over each 24hr period for 7 days from all available data

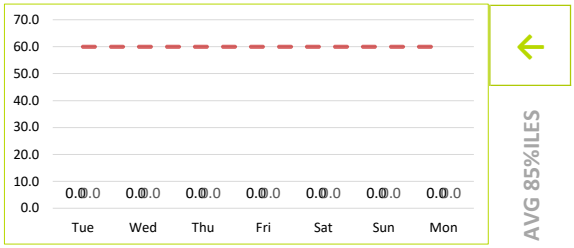


Hourly westbound traffic volumes over each 24hr period for 7 days from all available data

24hr & 12hr AVG SPEEDS

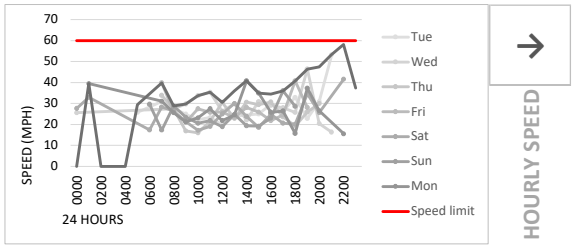


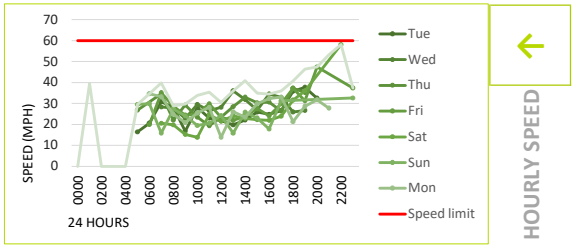
24hr (light) & 12hr daytime (dark grey, 0700-1900) average eastbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)



24hr (light) & 12hr daytime (dark green) average westbound speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

24hr & 12hr 85%ile SPEEDS

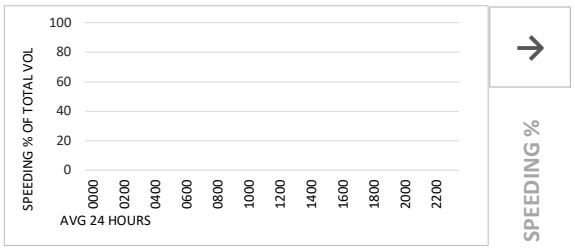




24hr (light) & 12hr daytime (dark grey, 0700-1900) average eastbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

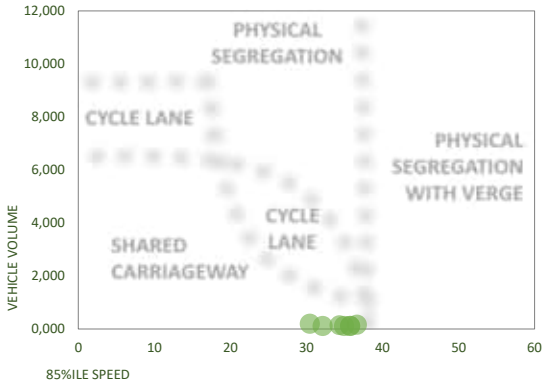
24hr (light) & 12hr daytime (dark green, 0700-1900) average westbound 85%ile speeds compared against the posted speed limit of Mon 17 Mar, 2025 (inc.)

HOURLY SPEEDS



Average hourly speeds (solid thin colours) and 85%ile (dashed black) compared against 60mph posted speed limit (dashed red). The 85%ile is the speed at which 85% of all vehicles are observed to travel under free flowing conditions. A minimum of ten vehicles per speed bin are required for this calculation, hence the overnight low-volume 85%ile values may be zero.

The peak eastbound daytime speed was 58.5mph at 11:15 on Wed 12 Mar, whilst the peak westbound speed was 50.4mph at 18:45 on Fri 14 Mar (based on 15min averages between 0700 & 1900).



SPEEDING % EXCEEDING 60mph

7-day average percentages of vehicles exceeding the posted speed limit each hour. The small, darker dots represent the percentage travelling between 60 and 65mph, whilst the larger markers represent those at 66mph and above. A high proportion of larger dots may indicate a potential speeding issue.

CYCLE PROVISION

The cycle provision diagram compares total daily traffic flow (vertical axis) against the average daily 85%ile speed (horizontal axis) to demonstrate cyclist and vulnerable user considerations.

The guidelines are based on the Sustrans Design Manual (Apr 2014); Understanding User Needs, part 2.

Valid 85%iles are required to plot the graph.

Average weekday eastbound and westbound volumes by class, including 12hr totals for 0700-1900 and overall average percentages. Figaures are calculated from all available data over 5 weekdays. See 'Equipment & Methodology' below for accuracy details.

METHODOLOGY

Equipment & methodology

Automatic traffic counts are undertaken using a pair of pneumatic tubes installed securely across the carriageway, one metre apart, recording air pulses to determine vehicle speed, class and volume. The ATC equipment generally remains in place for a consecutive seven day period, and the data analysed post-survey.

In queuing conditions, the accuracy of ATC recording equipment may reduce as follows;

- 20 – 30mph: potential reduction of 9% accuracy in volume values
- 10 – 20mph: potential reduction of 26% accuracy in volume values
- 00 – 10mph: potential reduction of 39% accuracy in volume values

These figures are based on multiple ATC results compared against accepted reference values from resilient manual counts.

Weather & environmental

Inclement conditions during winter months or outbreaks of unseasonable weather may affect survey data collection. This can result in distorted traffic flows or unusable data and should be considered prior to survey approval. Although forecast checks are made prior to the survey commencing, Advanced Transport Research cannot be held responsible for the forecast accuracy.

CLASS	ABBREV.	DESCRIPTION	AXLES	LENGTH
1	MC	Motorcycle	2	Up to 1.7m
2	Cars	Cars, taxis, 4WD	2	1.7 to 3.2m
3	LGV	Light goods vehicles	2 or 3	2.1 to 3.2m
4	OGV1	Other goods vehicles class 1	2 or 3	3.2m+
5	OGV2	Other goods vehicles class 2	4	3.2m+
6	PSV	Public service vehicles	2 or 3	3.2m+

Equipment damage, failure & calculations

Although checked intermittently the equipment remains unmanned for much of the duration of the survey. Therefore, equipment can potentially be interfered with, vandalised, damaged or stolen and Advanced Transport Research cannot be held responsible for any periods where data has not been captured.

16hr AADTs are calculated using the seasonal COBA methodology; DMRB Vol. 13, Pt 4: Traffic Flow Input To COBA.

Roadworks & events

Where possible, roadworks checks are made 7 days before the survey commences. Additionally, influencing major local events are also monitored, covering the immediate vicinity of the surveys and any routes likely to affect the outcome of the survey.

Vehicle classifications

Vehicles recorded by the ATC are placed into one of six classes (bins) based on axle spacing and pattern. This scheme is based on the COBA Chapter 8 (Vol 13, Sec 1) classifications.

Under adverse conditions the accuracy of ATC classifications will deteriorate and an appropriate link count should be used for validation.

Disclaimer

Although every attempt is made to achieve accuracy, Advanced Transport Research may not be held liable for errors of fact or interpretation.
