

The solar farm is using valuable farm land while there is plenty of brownfield sites available and roof tops on both industrial and domestic buildings to use instead. This arrangement is probably unacceptable to the company that is attempting to build this abhorrent site because they cannot profit from it.

Having visited Germany recently there are many thousands of solar panels alongside both sides of the road. They could be built there, not at the expense of prime farmland.

The size of the solar farm will surround some villages, which is unacceptable.

It also butts up to Dickleburgh Moor which is home to much rare wildlife.

There is an excess of solar power at the moment and this will add to that excess, large amounts of this power is just not required, at certain times.

This whole project is just an opportunistic attempt to profits from renewable energy at the cost of prime farmland.

We cannot eat electricity and recent developments around the World have shown that Worldwide food suppliers are not guaranteed and we need to be more self sufficient growing our own food and not destroying prime farmland for projects such as this.
