

This year is an obvious example of a bad harvest in Norfolk. Yields are down 30-50% What's that going to look like when acres and acres of prime arable land is covered in plastic and taken out of production altogether? Will we be reliant on produce from other countries and held to ransom on their prices? A hosepipe ban was introduced this summer. Is it true that these acres and acres of solar panels need frequent washing? If so how will we cope with this extra pressure on our water supply? How, on a global basis, will this ever attain 'Net Zero' unless there is a way to magically bypass the mining (eg Cobalt for which the machinery uses ridiculous amounts of diesel to extract), production, transportation and installation processes? My children are the 8th generation of my family to live in Saxlingham Nethergate and to hear that our Village could be destroyed just so that this solar factory can be built is beyond devastating. There has been a suggestion that our War Memorial will be 'moved' to let large lorries through. Is this true? It is so utterly disrespectful that I cannot even believe it could be considered.
