

Further to my comments written earlier this year I would like to add that for farmers, this summer has been hardest summer for generations with arable yields severely impacted by drought stress. Food security is a subject of national importance and with the weather due to get hotter farming will become more not less challenging. The UK will become increasingly reliant on other nations to feed themselves and/or face the prospect of ever increasing food costs.

-How can it make sense to build an industrial sized solar farm covering prime farming land in East Anglia?

-How can it be possible to give planning permission to build this foreign owned scheme in the middle of beautiful English countryside, the profits of which will go overseas?

-How can it be possible that this scheme is planned to be built in the middle of a populated area where the lives of the people living in the area will be destroyed by devastation of these industrial sized panels?

-How can it be possible that the value of peoples houses that they have worked their lives to pay for will be compromised and in some cases wiped out by this scheme?
