

This development seems to be justified on the grounds of reducing global warming. The UK makes too small an emissions contribution for this to be true and there is no justification for the UK suffering any disadvantage on this ground.

Global warming is already taking place and crop yields in the UK and foreign suppliers are suffering. The UK should be concentrating on projects that increase crop yields and protecting farming land from being used for other purposes. This project reduces farming land by using it for solar farms and associated infrastructure such as transmission lines.

Norfolk does not need to generate more electricity. If the South East does it should be generated there on brown field sites, roof tops, etc.

In summary this project and similar ones make no contribution to the well being or safety of the country and materially endanger the food security of the UK.
