

I run a small business in Saxlingham Nethergate- I am concerned that the sheer disruption in a small rural village will cause harm to my livelihood.

The house we live in was flooded in. 2020 and there is no mention of this in the flood risk assessment that I can see. This is an important environmental factor which seems to have been overlooked and shows that the developer's submission is incomplete and therefore flawed.

The pavement on The Street In Saxlingham Nethergate is often very narrow suitable for one person width at most. It is not an area suitable for huge transformer lorries and, if used as a route would mean people could not safely walk in the area. Several important species are found in the area including Skylark and bats which are protected. I would suggest that it would be hard if not impossible to mitigate the loss of habitat of these declining species.

Heritage- the area is culturally rich - a development of this scale is out of context and would cause more harm to people, wildlife and the environment than the benefit of renewable energy could justify
