

I am for renewable energy if it is done in correctly and the infrastructure is in place for it.

I live in [REDACTED]. It is one of the main roads through Hempnall. My property was built in the 1700s so has no foundations. It is not listed but both properties either side are. When a bus or anything heavy than a large van drives pass my home, the properties vibrates. Especially if the vehicle is driving faster than 20mph. I am worried that the volume of traffic going past and through Hempnall will have an effect on the house and well as neighbouring properties and the roads.

I am also concerned the volume of water needed for installing and cleaning. I am of the understanding that Anglian Water have declined EPS access to the water. So tankers will have to be brought in for the cleaning of the panels. But have we have not and still are in a hose pipe ban. How can we justify the amount of water needed to clean panels whilst we are short in water. Especially in East Anglia which is one the driest county in the UK.
