

When I first saw the 'nearby' Bloy's Grove Solar Farm near Swainsthorpe which covers 200 acres I felt physically sick of the impact on the countryside.

Has any consideration been made of the impact effecting our mental health due to the damage to our local communities and the farming landscape by a solar power station covering about 2,700 acres of productive farmland into a large industrial energy site?

I could accept a large power station producing reliable energy 24/7 but not a power station covering an area of 2,700 acres which will not produce reliable energy 24/7 and serve no benefit to the local community

Solar panels should not be installed on productive farmland around our communities!

This proposed solar power station is having an enormous damaging affect on our local communities!

This proposed solar power station is having an enormous damaging affect on our local communities!

The inspector needs to consider the impact on loss of productive agricultural land required for our future food security. The impact on local communities. The impact on the mental well being of all the residents. The impact of loss of the countryside and footpaths.

Other options need to be considered such as brown field sites, car parks, Large factory roofs. There must be an array of other opportunities to install solar panels on man made structures.

This East Pye proposal is too large and appears to be rushed through!

The impact of this project on our countryside and local population is not worth the gain in unreliable solar energy source. However Solar energy must be included in the future energy mix but by careful planning and in the right place such as brown field sites, car parks, Large factory roofs etc etc!

There is no benefit to local residences for this proposed solar installation!
