					development. There would also be total cumulative effects for a temporary and limited duration for LCA K3 (Aldringham and Freston Sandlands) as a result of the construction of Saxmundham South Green Neighbourhood and the Suffolk Onshore Scheme. Similarly, for SCT 03 Nearshore Waters there would be significant temporary cumulative effects experienced during construction as a result of the combined effects of the construction of the Suffolk Onshore Scheme, Sizewell C, East Anglia ONE & TWO Offshore Windfarms and LionLink Offshore Interconnector. Total cumulative effects on representative viewpoints have the potential to be significant as a result of the combined effects of East Anglia ONE and TWO Offshore Windfarms during construction for viewpoints 6, 7, 8 and 22 with only viewpoint 6 remaining significant during operation and maintenance stages, and with LionLink Offshore Interconnector development (viewpoints 1 – 7, 15-17, 19 – 21) at all project stages. Ecology and Biodiversity The potential for cumulative effects exists where multiple large schemes lie within 10 km of Minsmere-Walberswick SPA or 2 km of Alde-Ore Estuary SPA, through the potential for cumulative loss of functionally linked habitat associated with one or other SPAs. For those other developments located close to the Suffolk Onshore Scheme there is also potential for cumulative disturbance of nesting nightjar and woodlark at Sandlings SPA and cumulative disturbance or habitat loss relating to other locally important receptors such as breeding birds, bats and dormice. However, due to the embedded measures incorporated into the Suffolk Onshore Scheme (set out in **Application Document 7.5.7.1 Landscape and Ecological Management Plan – Suffolk**, and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**) no cumulative effects are predicted to arise. Historic Environment The assessment of total cumulative effects for cultural heritage has identified that there is the potential for four other projects to result in a cumulative impact on heritage receptors. These impacts include physical impacts on archaeological remains that potentially extend outside of the Proposed Project area, as well as impacts on the setting of heritage assets. However, the overall assessment of cumulative effects is currently assessed as 'not significant'. Water Environment Whilst each of the projects individually have the potential to have impacts on the watercourses and the land drainage regime within the study area, these impacts would expect to be reduced in magnitude by the adoption of embedded and control/management measures, secured against the individual consents, such that individually, and cumulatively, residual effects are not significant.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Agriculture and Soils There is a likely significant cumulative effect in relation to soils and best and most versatile (BMV) land as a result of the temporary disturbance and the temporary and permanent loss of BMV land associated with each of the other developments in isolation and when combined. However, there is no additional mitigation available in relation to the permanent loss of BMV land to that presented in **Application Document 7.5.10.1 Outline Soil Management Plan- Suffolk**, and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. Traffic and Transport In summary, based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. In terms of PRoW closures/ diversions, these will be coordinated with other committed developments where necessary (as identified above) to reduce the potential for significant cumulative effects. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. Air Quality There are a number of projects which overlap with the air quality ZOI and therefore there is potential for cumulative effects from construction dust and NRMM emissions at shared receptors. However, providing recommended mitigation is implemented as outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, this is unlikely to be significant. There are a few projects where associated construction / operation phase vehicle routes are the same as the construction vehicle routes for the Proposed Project. However, the overall assessment of cumulative effects has been assessed as ‘not significant’. Noise and Vibration There are a number of projects which overlap with the noise ZOI and therefore there is potential for cumulative effects from construction noise at shared receptors. However, providing recommended mitigation is implemented, as detailed in outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk, this is unlikely to be significant. The preliminary assessment of total cumulative effects for noise and vibration has not identified any significant cumulative effects. Socio-Economics, Recreation and Tourism The assessment of total cumulative effects for socio-economics, recreation and tourism has identified that there is the potential for six other developments to result in cumulative impacts upon shared socio-economic, recreation and tourism receptors. No significant cumulative effects on socio-economics, recreation and tourism are expected as a result of the Suffolk Onshore Scheme in combination with each of the other developments in isolation. In addition, no significant effects are expected when considering the impacts of the cumulative schemes in aggregation and in combination with the Proposed Project. Health and Wellbeing The health and wellbeing CEA draws upon the conclusions of other relevant environmental aspects, including landscape and visual, traffic and transport, air quality, noise and vibration, socio-economics, recreation, and tourism, whereby no significant effects were identified within the respective CEAs of these relevant environmental disciplines. Therefore, the health and wellbeing CEA includes no anticipated significant adverse effects on mental health due to community severance, reduced visual amenity, noise disturbance, or physical health outcomes such as levels of physical activity or respiratory health. This assessment also considers vulnerable groups, such as children, the elderly, and individuals with pre-existing health conditions. In conclusion, the overall inter-Project assessment of cumulative effects has been assessed as 'not significant'.
	DCO process, coordination with other projects, inter-project cumulative effects	**Coordinated Consenting Approach** 2.31 The principle of sub-sea interconnectors is an important aspect of an offshore centred approach. However, at this point, the outcomes of the Offshore Coordination Support Scheme (OCSS), and the review of connections in East Anglia, which are to be undertaken by National Grid Electricity System Operator, are unknown. Therefore, it is not possible to come to a reasonably informed preliminary conclusion about this project. 2.32 The County Council notes the OCSS funding announcement by Government on 5 December 2023 that a consortium of Sea Link and the offshore windfarm proposals of North Falls and Five Estuaries will receive funding to explore coordination between the projects, however, until there are some preliminary conclusions regarding this work, it does not affect the County Council's current stance.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			2.33 Given the spatial interdependencies of Sea Link and LionLink and the expectation of the amended National Policy Statements (NPS) for coordinated approaches, the County Council consider it essential for the National Grid Group to fully align the two projects both spatially and with their timing and development of their consenting in order to minimise the impacts of their projects on the communities and environment of the area. Such an approach would also be in accordance with both the amended National Policy Statements (NPS) and National Grid's own Responsible Business Chapter. However, the recent Non-Statutory Consultation put forward landfall and cable route options which would not allow coordination with the Sea Link proposals. 2.34 The alignment of project development and consenting by the National Grid Group would potentially allow the Planning Inspectorate (PINs) to consider both projects simultaneously, using a single panel of examiners to achieve coordinated consenting. This approach not only would reduce the impact of the consenting process on communities and statutory consultees, but it would also allow for a more efficient and effective examination of the issues relating to coordination and cumulative impacts and therefore could significantly improve public confidence regarding the consenting and delivery of these projects.		The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Please refer to the above summary of inter-project cumulative impacts.
		Inter-project cumulative effects, traffic and transport, consultation	Cumulative Impacts 2.35 Current timelines suggest that Sea Link will be under construction alongside several other NSIPs in the same area, including Sizewell C, LionLink and those promoted by Scottish Power Renewables (SPR). 2.36 Significant impacts are expected with regards to traffic on the routes leading to, and in proximity, to the Suffolk Coast, local housing, services, and labour supply. 2.37 The County Council encourages NGET to continue discussions with other developers scheduled to be undertaking construction at the same time, including Sizewell C, National Grid Ventures, and Scottish Power Renewables to minimise highways impacts on the host communities with regards to requirements for materials and associated HGV movements, workforce numbers and traffic management on the highways network.	N	Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The meetings have been run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. A complete cumulative assessment has been undertaken which identifies there is potential for significant inter-cumulative effects on landscape and visual receptors, soils (BMV) and PRoW closure and diversions. Further details of this assessment are contained in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Impacts relating to traffic are considered in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Inter-project cumulative effects, socio-	2.38 The accumulation of several NSIPs under construction at the same time is expected to impact tourism both in visitor perception and visitor numbers on the Suffolk Coast, and the	N	Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		economic, recreation and tourism, community benefits/enhancements	County Council considers it essential that the promotor engages with local businesses and the host communities to discuss potential impacts and community benefits.		local planning authorities in the Statutory consultation including consideration of impacts on visitors. The meetings have been run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. A complete cumulative assessment has be undertaken. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The assessment concludes no significant inter-project cumulative socio-economic effects.
		Traffic and transport, coordination with other projects, construction	**Highways** 2.39 Co-ordination of this project with LionLink would reduce the overall impacts in terms of transport. 2.40 The authority is not content with the suitability of a number of the routes proposed for construction access and further information is required to assess the positive and negative impacts of each of the three proposed new access routes including the permanence or otherwise of the three new access roads and potential legacy benefits for the area. 2.41 The methodology and findings of the environmental assessment require further detailed examination. To assist this more precise labelling and description or links and junctions is required. 2.42 Where assumptions are made, they should be evidenced. This includes the estimation of HGV, worker numbers and profiles, assumptions made for the sensitivity of receptors.	N	National Grid is maintaining dialogue with NGV regarding opportunities for coordination and optimising means of access to the Converter Station site. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes clearer labelling and descriptions of links and junctions (compared to the PEIR) where necessary. In addition, further details are provided to justify the sensitivity levels attributed to road junction and road link receptors.
		Traffic and transport, inter-project cumulative effects, construction	2.43 The cumulative impacts of this project with Sizewell C (SZC) have been underestimated, particularly on the A1094 corridor. 2.44 Repeated projects in the same area have a sequential impact on communities such as repeated disruption due to road closures. 2.45 The reliance on energy projects to use shift patterns to avoid worker trips during network peaks may in combination result in new peaks at the time workers arrive and depart. 2.46 If a local port is proposed for the offshore elements of this project a Port Traffic Management Plan may be applicable.	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes assessments of both the network peaks and the development peaks. No requirement for a Port Traffic Management Plan has been identified.
		Socio-economic, recreation and tourism, onshore environmental impact, construction	**Tourism** 2.47 As previously noted in the County Council's response to Sea Link's non-statutory consultation, Suffolk offers a rich and varied tourist offer and is known for its heritage assets and landscape designations, such as the Suffolk Coast and Heaths Area of Outstanding Natural Beauty (AONB) and Heritage Coast. 2.48 The Sea Link proposals need to fully assess its direct and indirect impacts on all known features and designations, in	N	**Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** identifies business premises within, and up to 500 m radius from the Suffolk Onshore Boundary (500 m is the distance threshold beyond which it is considered that people are likely to be deterred from making trips to an extent that they would change their habits, based on the Design Manuel for Roads and Bridges (DMRB) LA 112).

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			particularly the extent to which its physical infrastructure will impact and detract from the environmental quality of an area for recreational activity alongside quantifying the impact of construction on tourism assets and visitor numbers. 2.49 The County Council considers it imperative that the Sea Link also considers its part in the cumulative impact on the perception and propensity of people who visit the area during the onshore construction works. 2.50 The County Council is seeking to ensure the accommodation of construction workers and other workers who are not home based to be to the benefit of the visitor economy rather than disrupting it. For example depending on the scheduling of works, utilising accommodation that is available out of season that could compliment the tourist season. 2.51 The applicant should identify businesses, in particularly associated with recreation and tourism in close proximity to the red line boundary of the scheme, to assess potential impacts to these organisations of the construction works and access routes.		The assessment of effect on tourism and recreation assets is included within **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. It is concluded that there are no anticipated significant socio-economic effects. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** details the cumulative socio-economics impact of the Proposed Project in combination with other local projects. Again, it is concluded that there are no anticipated significant socio-economic effects. Further information on effects on the AONB and Suffolk Heritage Coast is detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1** Landscape and Visual. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. No significant effects on businesses were identified in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This includes consideration of impacts from construction works and access routes.
		Coordination with other projects, DCO process, construction	**Overview of the County Council's Position on the specific proposals** 2.52 The County Council considers it essential that the Sea Link project in Suffolk must fully coordinate consenting, construction, and operation, with the Lion Link project; and that it is the responsibility of National Grid Group to manage the operation of its subsidiaries to achieve this, to effectively minimise harm to the environment and communities of Suffolk. 2.53 While the County Council notes that the previous and unacceptable options, which were included in the non-statutory consultation, have been discarded, the option put forward still has significant challenges, which include: - - temporary and permanent access for construction and operations upon completion - the need for a masterplan for the converter station site - the requirement to coordinate construction operations with other projects in the area, to minimise impacts on the surrounding transport network. 2.54 Management plans in outline must be provided at DCO stage, to be discharged in detail once main contractors are appointed following any consent. The Council considers that it would not be acceptable for final management plans to be secured only as part of the initial DCO submission.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid will set out details of how it has coordinated with other projects as part of its DCO application (**Application Document 7.10 Coordination Document**). While efforts are being made to engage with other projects and identify appropriate ways of co-ordinating with different projects, covering several different geographical locations and on different timelines for delivery, it is not always possible to co-ordinate with all projects. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered within **Application Document 6.2.13 Part 2 Chapter 13 Inter-Project Cumulative Effects**. Whilst there are physical similarities between the infrastructure that would comprise the Proposed Project and the Lion Link and Nautilus interconnector projects, it differs from the interconnectors in terms of the type, purpose, need and geographical location outside of Suffolk. The Proposed Project will seek consent for its own works only. An illustrative coordinated masterplan showing one way in which converter stations for up to three projects could be accommodated on land near Saxmundham is provided in an appendix to **Application Document 7.10 Coordination Document**. This approach has been discussed with the Suffolk Host Authorities. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Development Report and Application Document 7.2 Strategic Options Back Check Report contain further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report (October 2023)**.
		Design	**Design Principles** 2.55 In the response to the non-statutory consultation held in 2022, the County Council included siting and design principles for the connection of offshore wind and interconnector infrastructure in Suffolk (Appendix B). In addition, the following design principles should also be considered: • **Engagement** with Parish Councils, local residents and relevant authorities. • **Design** should be sensitive to place, with visual impacts minimised as far as possible by the use of appropriate design, building materials, shape, layout, coloration, and finishes. • **Height** – Substation building, and ancillary equipment will be kept to a minimum and the slab level will be set at the lowest practical level. • **Landscaping** to minimise visual intrusion and respond to local landscape character and biodiversity, to be considered in the building design and layout of ancillary structures. • **Embedded ecological mitigation and enhancement** with particular attention to lighting, large areas of glass and the baffling of noise sources. • **Sustainable Urban Drainage (SUDs)** to be developed in accordance with DCO requirements. • **Engagement** – Through development of final design and landscaping proposals providing opportunity to engage with the local communities who will be directed impacted by the substation. • **Design Review** – The design should be subject to design review, in consultation with the relevant local authorities.	N	**Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** identifies the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Saxmundham Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. National Grid has developed design principles for the Suffolk project elements **Application Document 7.12.1 Design Principles – Suffolk**). The scope of the principles is not limited to any one design discipline and instead reflect a multi-disciplinary approach for coordinated design in the round. As such the design principles cover several design disciplines including architecture, landscape architecture, ecology, hydrology, civil engineering, wider engineering disciplines, town planning, archaeology and heritage. The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders including the County Council throughout the development of the Converter Station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.
		Consultation	**3 Site specific key Issues raised by the technical comments** 3.1 This section provides a brief summary of key issues raised by the technical departments of the County Council. These should	N	National Grid acknowledges the Council's comments.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			be read in conjunction with the full technical comments on the proposals and the PEIR which can be found in Appendix A		
		Converter station location, landscape and visual, agriculture and soils	**Proposed Converter Station Site – Saxmundham** 3.2 The converter station site is located on land to the north and east of Bloomfield's Covert on the eastern boundary of the small town of Saxmundham. 3.3 The site is open arable land, from which historical landscape features are absent. Before agricultural improvement works were undertaken after 1945, the site had a locally characteristic field pattern and included a substantial Ancient Woodland known as Great Wood, ponds, and a small plantation typical of the Ancient Estate Clavlands landscape type. Currently, the landscape is generally open and therefore a converter station would be prominent from the B1119 which enters Saxmundham from the southeast.	N	The location of the site is noted. The historic features of the Converter Station site, including the woodland and ponds, have been taken into consideration within the iterative design process and the indicative landscape strategy (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**). There would be localised significant effects for visual receptors, including those travelling along the B1119, as expected for the nature of this type of development. Mitigation design has been incorporated to reduce effect where possible, including hedgerow tree planting along the B1119 close to the receptor to maximise the screening capabilities.
		Converter station location, construction, traffic and transport	3.4 The site is constrained with regards to access due to the road network around the area, with the B1119 generally unsuitable for construction and subsequent operational traffic. It is acknowledged that new temporary and/or permanent routes which bypass Saxmundham are in development, subject to further discussions with District and County Councils.	N	National Grid acknowledges the Council's comments. Further engagement has taken place with Suffolk County Council Highways. The proposed construction traffic numbers and routing have been assessed as detailed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Construction traffic travelling through Saxmundham and to/ from the access on the B1119 will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than ten HGVs per day).
		Converter station location, cultural heritage, construction	Archaeology 3.5 The area has not been subject to systematic archaeological assessment, therefore the character, extent, and significance of any surviving above and below ground heritage assets have yet to defined. 3.6 Construction works have the potential to damage or destroy surviving archaeological remains so the area will require geophysics followed by trenched archaeological evaluation. Any reductions to this will need to be approved by the Suffolk County Council Archaeological Service (SCCAS).	N	Since submission of the PEIR, fieldwork and information gathering has continued to assist with defining the character and significance of heritage assets, as well as to assess the potential for impacts. This has included geophysical survey, a review of aerial photos and LiDAR data, walkover survey, setting assessment, and evaluation trenching. The information gathered was used to inform the baseline report (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**), as well as help define the significance of cultural heritage assets and assess impacts. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. The full assessment is detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. This identified that there is the potential for both physical and setting impacts resulting from the construction and operational phases of the Suffolk Onshore Scheme. However, in most cases the residual effect is 'not significant' with mitigation in place. All works have been undertaken in consultation with stakeholders including Suffolk County Council Archaeological Service (SCCAS), East Suffolk Council, and Historic England, with the Written Scheme of

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Investigations for geophysical survey and evaluation trenching approved by SCCAS.
		Traffic and transport, construction, consultation	Highways 3.7 The B1119 provides the only existing access to site. For access from the west, all traffic would need to pass via Saxmundham and from the east through Leiston, both of which have significant constraints besides the impact of the construction traffic on the communities. 3.8 The County Council requires further information to assess the positive and negative impacts of the three proposed access routes including the permanence or otherwise and potential legacy benefits for the area.	N	The western access south of Saxmundham is the preferred option being taken forward as a permanent access. The construction of this access will require the movement of construction vehicles through Saxmundham but these will be limited to less than 10 HGVs per day and will only be required during the period of construction of the access. This is to facilitate the construction of the bridge over the Fromus where access will be required both sides during construction. The permanent nature of this access will provide the opportunity for enhancement of the local PRoW network and liaison with the PRoW officer will continue to identify whether this would be beneficial and how it could be implemented. The proposed accesses and their associated routing have been assessed as detailed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Construction traffic travelling through Saxmundham and to/ from the access on the B1119 will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than ten HGVs per day).
		Converter station location, landscape and visual, coordination with other projects	Landscape and Visual Amenity 3.9 The County Council considers it essential for any landscape strategy for the converter station site to proactively plan for successful co-location with other projects on this site. 3.10 A landscape masterplan must be developed for the whole site with a focus to minimise harm to the landscape and visual amenity resulting from this, considering integration into the landscape using landform and landscape led cut and fill as well as mitigation in the form of screen planting.	N	The indicative landscape strategy for the Proposed Project only option (**Application Document 7.5.7.1 Outline Landscape and Ecological Masterplan - Suffolk**) has been developed in parallel to the co-location masterplan (**Application Document 7.10 Coordination Document**). The indicative landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation (**Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**) including screening in the form of proposed woodland, hedgerow and hedgerow tree planting, as well as responding to the local context in terms of the design of the landform. Regarding the landscape led cut and fill, as the design has developed, it is clear that there is limited material and limited availability to produce much cut that can be used in conjunction with the landscape proposals. The fill has been concentrated on the northern edge of the Saxmundham Converter Station as this is considered to be the most sensitive area. The landscape strategy aims to minimise landscape and visual effects and a range of likely significant and non-significant effects on both landscape character and visual amenity are detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. By year 15, generally for visual receptors, the landscape planting would have matured and part would be located on bunding which would provide some additional height and screening benefit. The planting would partially screen the lower parts of the permanent infrastructure and fencing; however, the upper extents and majority of the Saxmundham Converter Station would remain visible. By year 15, generally for landscape receptors, the landscape planting would have matured and would provide a degree of partial screening and landscape integration. The planting

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					would also increase biodiversity through native planting and integration into the wider, currently fragmented, green infrastructure network.
		Water environment, agriculture and soils, geology and hydrogeology	Local Lead Flood Authority 3.11 National mapping for the area suggests soils have poor properties for infiltration, therefore the County Council would encourage the application to explore opportunities for infiltration through compliant testing at the earliest opportunity.	N	The infiltration properties of the soils have been characterised by conducting compliant testing as part of the Proposed Project's ground investigations. The data has been used to inform the proposed surface water drainage designs of operational above ground infrastructure. Details of the drainage measures proposed are provided within **Application Document 6.8 Flood Risk Assessment**.
		Converter station location, walking, cycling and horse-riders	Public Rights of Way 3.12 The site crosses Saxmundham Footpaths 5 and 6 and would therefore require diversion.	N	**Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared which provides details of PRoW closures and diversions. Footpath 5 (E-491/005/0) is to be permanently diverted and will result in a temporary minor adverse impact. Footpath 6 (E-491/006/0) is temporarily diverted during construction but will be reinstated and results in a temporary minor adverse impact. Further details can be found in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.
		Landfall location, landscape and visual, cultural heritage	**Proposed Landfall Site** Landscape and Visual Amenity 3.13 The proposed landfall site is located between Aldeburgh and Thorpeness, within the Heritage Coast, Suffolk Coast and Heath Area of Outstanding Natural Beauty (AONB) and close to the Sandlings Special Protection Area (SPA) and the Leiston-Aldeburgh Site of Special Scientific Interest (SSSI). The site also has high archaeological potential.	N	The location of the landfall is noted. Information on effects on the Suffolk Heritage Coast and AONB is detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. No likely significant effects on the landscape character of the Suffolk Coast AONB or the Heritage Coast have been identified during construction or operation and maintenance phases. Impacts on the SPA and SSSI are assessed within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity.** No likely significant effects have been identified on these designated sites because of the Proposed Project. Impacts on archaeology are assessed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. No likely significant effects to archaeology have been identified as a result of the Proposed Project. The assessment of residual likely significant effects within the ES takes account of mitigation measures as set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Water environment, construction, onshore mitigation	Lead Local Flood Authority 3.14 As works at these locations are temporary in nature, focus is to ensure surface water is adequately managed during construction. Where possible, works should avoid areas of existing flood risk, with suitable mitigation in place where this is not possible.	N	A detailed process of routing and siting has been undertaken with the aim of avoiding works within areas at risk of flooding where practicable. Where this cannot be avoided, measures to manage surface water drainage at construction sites have been proposed to mitigate for any potential increase in flood risk from these sources. Further details are contained in **Application Document 6.8 Flood Risk Assessment**. Commitments for the appointed contractor to prepare more detailed construction drainage plans is described within the CEMP, and secured within Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Information on the alternatives considered and the reasonings for not pursuing that option (including flood risk) in the ES is

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Landfall location, traffic and transport	Highways 3.15 The landfall area can only be accessed via a narrow C road which passes through parts of Aldeburgh and Thorpeness. Access from the south through Aldeburgh is difficult for large vehicles, which was a matter explored in the examination for EA 1. 3.16 The site is constrained due to access as the surrounding roads are unsuitable for HGV and Abnormal Indivisible Loads (AILs).	N	Access to the foreshore (Thorpe Road) will only be for light vehicles for monitoring purposes only. Access to the trenchless drilling site east of Leiston Road will require limited access through Aldeburgh; this will be limited to less than 10 HGVs per day. The majority of construction traffic for the landfall will be routed via a new haul road constructed from B1069 Snape Road to the west. The proposed construction traffic numbers and routing are assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Details regarding construction traffic forecasts per access are also provided in **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent**.
		Onshore route location, cultural heritage	Proposed Cable Route Archaeology 3.17 The route is sited within a favourable location for archaeological activity. The majority of the area will require full archaeological assessment as has not previously been subject to systematic assessment.	N	The Limits of Deviation have been subject to archaeological assessment, with information gathered through desk-based methods as well as geophysical survey, a review of aerial photographs and LiDAR and targeted evaluation trenching. The information gathered was used to inform the baseline report (**Application Document 6.3.2.3.A ES Appendix 2.3.ACultural Heritage Baseline Report**), as well as to help define the significant of cultural heritage assets and assess impacts. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. It has been included in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and its associated appendices. All works have been undertaken in consultation with stakeholders including Suffolk County Council Archaeological Service (SCCAS), East Suffolk Council, and Historic England, with the Written Scheme of Investigations for geophysical survey and evaluation trenching approved by SCCAS.
		Onshore route location, cultural heritage, coordination with other projects	3.18 Given the interaction with the EA1N/2 scheme there is a need to include the results from these projects within assessments, especially for those areas where the schemes overlap or are in close proximity, given the results directly relate to the archaeological potential of this scheme. The EA1N/2 geophysical survey data and trial trenching results are publicly available as part of the relevant examinations and the SCCAS are also happy to advise on the findings where reports are not yet available.	N	The Cultural Heritage team have obtained information from the East Anglia ONE North and East Anglia TWO team including the result of geophysical surveys and evaluation trenching. This was used to inform the data gathering and assessment undertaken as part of the Proposed Project. The information gathered was used to inform the baseline report, as well as help define the significance of cultural heritage assets and assess impacts. In areas where the projects overlapped, the East Anglia ONE North and East Anglia TWO data was used by the Proposed Project. This has included data being used to inform evaluation trenching. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Data has been used and/or referenced in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and its associated appendices.
		Onshore route location, terrestrial ecology, ornithology, landscape and visual	Ecology 3.19 The promotor must be aware that the area is ecologically sensitive, including wetlands, shingle vegetation and lowland heath which support a variety of bird species, such as woodlark, nightjar and nightingale and the proposals are likely to impact local flora and fauna.	N	National Grid acknowledges this feedback. Meetings have been held with the Suffolk Councils' and surveys and impact assessments are taking account of the value of this environment. Further ecological surveys have been undertaken and assessment of impacts and proposed mitigation is contained within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Onshore route location, landscape and visual, walking, cycling and horse-riders	Landscape and Visual Amenity 3.20 The cable route from the landfall begins within the Heritage Coats, Suffolk Coast and Heaths AONB and is close to The Sandlings SPA. The construction of the cable route would affect the Sandlings Walk in several places, as well as other connected footpaths.	N	The route of the cable route is noted. Further information on the effects on the Suffolk Heritage Coast and AONB is detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any of the Proposed Project stages as a result of the Suffolk Onshore Scheme. The Suffolk Onshore Scheme would affect the Sandlings Walk and other PRoW in the Study Area, as detailed within **Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Such effects have been minimised where possible as set out within the embedded mitigation. The potential effects on the users of the Sandlings Walk is represented by representative viewpoint 8. The likely effects arising from the Proposed Project on this receptor are not expected to be significant during construction, operation or maintenance phases. Further details should be referred to within **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. Further information on the effects to footpaths is also detailed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.
		Water environment, construction, onshore mitigation	Local Lead Flood Authority 3.21 As works at these locations are temporary in nature, focus is to ensure surface water is adequately managed during construction. Where possible, works should avoid areas of existing flood risk, with suitable mitigation in place where this is not possible. 3.22 Where possible works should avoid areas of existing flood risk, with suitable mitigation in place where this is not possible.	N	A detailed process of routing and siting has been undertaken with the aim of avoiding works within areas at risk of flooding where practicable as well as information on the alternatives considered in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Where this cannot be avoided, measures to manage surface water drainage at construction sites have been proposed to mitigate for any potential increase in flood risk from these sources. Further details are contained in **Application Document 6.8 Flood Risk Assessment**. Commitments for the appointed contractor to prepare more detailed construction drainage plans is described within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). **Application Document 6.8 Flood Risk Assessment** concludes that as a consequence of the embedded design and control and management measures that would be adopted, the Proposed Project would not be at

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					significant risk of flooding from rivers and sea. It is not expected for there to be any increase in flood risk from rivers and sea during construction or operation from the Proposed Project activities. It has also concluded that as a consequence of the embedded design and control and management measures that would be adopted, the Proposed Project would not be at significant risk of flooding from surface water. Also, there would not be any increase in surface water flood risk to land outside of the Order Limits during construction or operation as a result of the Proposed Project. The Proposed Project is at low risk of groundwater flooding, and both operation of the Proposed Project and construction activities would have no increased impact on this source of flooding.
		Cultural heritage	**Friston Substation** Archaeology 3.23 The County Council notes much of the substation site has been subject to archaeological assessment as part of Scottish Power Renewables (SPR), East Anglia One North and Two (EA1N/2) scheme, however, further assessment will be required for any areas which fall outside works undertaken by SPR.	N	The Cultural Heritage team have obtained information from the East Anglia ONE North and East Anglia TWO team including the result of geophysical surveys and evaluation trenching. This was used to inform the data gathering and assessment undertaken as part of the Proposed Project. The information gathered was used to inform the baseline report, as well as help define the significance of cultural heritage assets and assess impacts. In areas where the projects overlapped, the East Anglia ONE North and East Anglia TWO data was used by the Proposed Project. This has included data being used to inform evaluation trenching. Archaeological mitigation for East Anglia ONE North and East Anglia TWO also commenced in Autumn 2024, and as such this mitigation has been taken into consideration in the assessment. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. Data has been used and/or referenced in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and its associated appendices, and the assessment has concluded that no residual significant effects are predicted.
		Traffic and transport, construction	Highways 3.24 The County Council is concerned regarding the lack of information on the amount of Abnormal Indivisible Loads (AIL) movements there will be during construction works. It is stated in the PEIR that construction vehicles will access the Friston site from the north of Friston, however for SPR projects, such vehicles are intending to use a haul road from the B1069 south of Knodishall. The scope of the PEIR does not show the highway network impacted by access to Friston substation, which is an area of concern to the County Council. 3.25 The EA 1N/2 project considered that the B1121 through Friston was inappropriate for use by construction vehicles and proposed access to the substation. The promotor of Sea Link does not appear to be following this approach which is of concern to the County Council. The County Council also argued in the examination that the B1119 between Saxmundham and Leiston is	N	AIL movements will be required for the Saxmundham Converter Station transformers and these will either be routed via the B1121 Main Road or from the Snape Road Access (via Leiston). No AIL movements are required for the Friston Substation element of the Proposed Project. The cable delivery drums may meet the AIL requirements depending on the detailed design and proposed section length to be used on the Proposed Project. The number of cable drum movements will be defined at the detailed design stage, but it is assumed that approximately 40 vehicles will be required (22 for the HVDC and 18 for the HVAC). Construction of Friston Substation would be undertaken via the haul road from Snape Road rather than through Friston. The B1121 through Friston is only being used to access the existing overhead line towers where minimal alteration works and scaffold works would be required along the existing overhead lines on the approach into Friston Substation. All Substation construction traffic would access it via the haul road. The use of the B1119 for construction is only to facilitate the construction of the new access (enabling bridging of the Fromus to be

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			also unsuitable for construction traffic, but NGET have identified this route for use for Sea Link. 3.26 Action is required to provide more detailed information regarding vehicular movements during construction, particularly AILs. NGET must also reassess their proposed construction routes around Friston, noting previous issues raised in the examination of EA1N/2.		constructed); this access is key in removing the majority of construction traffic from the B1119. Given the details of the AIL routing proposals, due regard to the constraints identified for the East Anglia ONE North and East Anglia TWO proposals have been considered within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent** for the relevant routes. Detailed information regarding vehicle movements during construction is contained within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. Construction vehicle movements will be controlled by gates at any crossing points, with the default position that construction routes would be gated off to provide priority to other users. Further details are contained within **Application Document 6.3.1.4.A ES Appendix 1.4.A Crossings Schedules**.
		Water environment, legislation and policy	Local Lead Flood Authority 3.27 Friston is a particularly sensitive area in terms of surface water flood risk, given the existing flood risk to downstream receptors and therefore must be adequately assessed. 3.28 It is noted that the Preliminary Environmental Impact Report (PEIR) chapter on existing flood risk and drainage fails to acknowledge historic surface water flooding downstream in Friston. This should include various s.19 Investigations by the County Council as LLFA under the Flood and Water Management Act 2010.	N	Since preparation of the PEIR, National Grid has liaised regularly with Suffolk County Council in its role as LLFA to gather information on flood risk sensitivities at Friston, including a review of all relevant S19 Reports and data from the Friston Surface Water Management Plan. This information has informed **Application Document 6.8 Flood Risk Assessment**, and has guided the measures embedded within the design of the Proposed Project to manage surface water runoff and land drainage. **Application Document 6.8 Flood Risk Assessment** concludes that as a consequence of the embedded design and control and management measures that would be adopted, the Proposed Project would not be at significant risk of flooding from surface water.
		Consultation	**4 Summary of Technical Feedback on General Proposals** 4.1 This section provides a brief summary of comments from the County Council technical departments. These should be read in conjunction with the full technical comments on the proposals and the PEIR which can be found in Appendix A.	N	National Grid acknowledges the Council's comment.
		Cultural heritage, inter-project cumulative effects, onshore mitigation	**Archaeology** 4.2 The archaeological implications of multiple schemes in this landscape are cumulatively increasing for every project and the County Council notes that options for coordination have been included for other projects, which would increase impacts as it reduces the flexibility to be able to avoid significant archaeology which has yet to be defined. 4.3 The County Council recommends that a full assessment is undertaken at the earliest opportunity as there is a high archaeological potential for all current areas being considered as part of the scheme, the majority of which have not being subject to systematic archaeological investigation.	N	The Cultural Heritage team have obtained information from the East Anglia ONE North and East Anglia TWO team including the result of geophysical surveys and evaluation trenching. This was used to inform the data gathering and assessment undertaken as part of the Proposed Project. The information gathered was used to inform the baseline report, as well as help define the significance of cultural heritage assets and assess impacts. Monitoring of ground investigation works was also undertaken. In areas where the projects overlapped, the East Anglia ONE North and East Anglia TWO data was used by the Proposed Project. This has included data being used to inform evaluation trenching. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			4.4 The results from other projects are showing that there is an enormous amount of important archaeology surviving within this landscape, which had previously not been known about, and some of the proposed areas for this scheme fall within busy geophysics areas which have been avoided by Scottish Power Renewables project East Anglia One North and Two (EA1N/2), but adjacent areas had discovered extensive archaeology. 4.5 All ground investigation/mitigation works must be covered by an Overarching Written Scheme of Investigation (OWSI). This would detail all types of ground investigation and mitigation with full detailed definitions and the need for further site specific WSIs. The OWSIs and all subsequent WSIs would need to be approved by SCCAS.		All works have been agreed with SCCAS who have approved the various WSI produced for intrusive and non-intrusive works. This has been followed by an overarching WSI for pre-construction works such as mitigation. Data has been used and/or referenced in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and its associated appendices. Additional topic and site-specific mitigation measures that have been applied to mitigate or offset any likely significant effects are included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation for cultural heritage includes but is not limited to: • Construction of the Proposed Project would employ the use of track matting for construction plant, where practicable, as opposed to topsoil stripping for the creation of haul roads. This measure would avoid permanent impacts to buried archaeological remains that may be present. • Locations of known archaeological interest/value to be preserved *in situ*, or areas where archaeological work is planned, would be signposted/fenced off to avoid unintentional damage. • Archaeological Watching Brief to be undertaken in pre-agreed areas of archaeological potential/features. Scope of works to be agreed with the Archaeology Advisor for SCC, and any other relevant heritage stakeholders prior to works commencing in the relevant area and detailed in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) Suffolk** or a site specific WSI. Other mitigation measures are detailed in **Application Document 6.2.2.3 ES Part 2 Suffolk Chapter 3 Cultural Heritage**. There are no significant residual effects to cultural heritage during construction, operation or maintenance for Suffolk.
		Community benefits/enhancements, onshore mitigation, consultation	**Community Benefits and Project Legacy** 4.6 The County Council encourages the promoter to consider community benefit options and would be happy to discuss how community benefits suitable for the locality could be incorporated. 4.7 Secondary mitigation should be in addition to any community benefits from the development, including any arising from emerging requirements in the expected guidance on Community Benefits foreshadowed in the British Energy Security Strategy and now proposed in the Government response to consultation (November 2023).	N	Community benefit is separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			4.8 The County Council also encourages project promoters to consider legacy opportunities of all elements of their development.		local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Terrestrial ecology, inter-project cumulative effects, onshore mitigation	**Ecology** 4.9 The County Council acknowledges that the Ecology and Biodiversity Chapter alongside the Phase 1 Habitat Survey has provided a good starting point in understanding the challenges of the development sites. 4.10However, in terms of Ecology and Biodiversity moving forward, the County Council would like to see the following: - • The full suite of survey data as a result of the on-going ecological survey work. • The establishment of an Ecology Working Group consisting of the Applicants' experts and key stakeholders (including from LPAs). • Consideration of the cumulative impacts of this proposal with other projects on the Suffolk coast. • A flexibility of approach to surveying and subsequent mitigation, compensation and enhancement measures which have been informed by comprehensive walkovers and other means of gathering biological data. • Consulting and working with key stakeholders to prepare a Construction and Ecology Management Plan (CEMP) showing how successful mitigation will be implemented and achieved.	N	A series of meetings are being held and have been held with key stakeholders including the Suffolk Councils. National Grid has been sharing survey reports and outcomes and discussing ecological mitigation and enhancement with Suffolk County Council and other statutory bodies in Suffolk, in addition to other organisations such as the RSPB. The assessment contained within the ES includes a cumulative assessment of the impact of the Proposed Project with other projects and this is contained within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The potential for cumulative effects exists where multiple large schemes lie within 10 km of Minsmere-Walberswick SPA or 2 km of Alde-Ore Estuary SPA, through the potential for cumulative loss of functionally linked habitat associated with one or other SPAs. For those other developments located close to the Suffolk Onshore Scheme there is also potential for cumulative disturbance of nesting nightjar and woodlark at Sandlings SPA and cumulative disturbance or habitat loss relating to other locally important receptors such as breeding birds, bats and dormice. However, due to the embedded measures incorporated into the Suffolk Onshore Scheme (set out in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**, and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**) no cumulative effects are predicted to arise. Survey reports have been shared with Natural England, the Kent Councils and the Suffolk Councils as they were finalised where possible. This began with the PEAs and the 2022-23 wintering bird surveys and 2023 breeding bird surveys. The Kent vantage point surveys and collision risk reports were shared. Other survey reports were not completed in time to be shared prior to DCO submission but summaries of findings were provided in thematic meetings (which effectively considered of a Working Group and which provided very useful feedback). Further information and ecological assessment is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and the associated appendices.
		Traffic and transport, construction, inter-project	**Highways** 4.11 The County Council is not content with the sustainability of the number of routes being proposed for construction access.	N	Further engagement has taken place with Suffolk County Council Highways across each item raised. Management and mitigation relating to the proposed construction traffic numbers, routing and Abnormal Indivisible Loads are set out within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** and

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		cumulative effects	4.12 The County Council is concerned that some of the routes proposed for construction traffic are not appropriate for significant volumes of construction traffic, including the geometry of the A1094/B1122 roundabout in Aldeburgh which was discussed in detail in the examination of EA1N/2. 4.13 Abnormal Indivisible Loads (AIL) routes must be surveyed to prove there is a viable route to the converter and substations. 4.14 Where assumptions are made regarding estimation of HGV movements, worker numbers and profiles, they must be evidenced. 4.15 Cumulative impacts of this project with Sizewell have been underestimated, particularly on the A1094 corridor. Repeated projects in the same area will have sequential impacts on the community such as disruption caused by road closures. 4.16 The reliance on energy projects to use shift patterns to avoid worker trips during network peaks may in combination result in new peaks at the time workers arrive and depart. 4.17 The County Council encourages discussions with the developer over weight restrictions on bridges along the proposed construction traffic routes.		these have also been assessed as detailed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. It is acknowledged that the Proposed Project will be under construction alongside other projects in the area which have been considered in the Inter-Project Cumulative Effects chapter of the ES for each discipline, including Traffic and Transport. Please refer to **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for the full assessment. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. In terms of PRoW closures/ diversions, these will be coordinated with other committed developments where necessary (as identified above) to reduce the potential for significant cumulative effects. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.
		Traffic and transport, socio-economic, recreation and tourism, onshore mitigation	4.18 The County Council notes that the sequential delivery of NSIPs on the east coast i.e. EA1, EA3, EA1(N), EA2, SZC and potentially Sealink and LionLink will impact communities on a recurring basis. This will create sequential impacts at the same locations and could be highly detrimental to, for example, tourism and PRoW users besides local residents. the County Council considers these Sequential Project Effects should also be considered or at least require enhanced mitigation or deliver legacy projects that offset this impact.	N	**Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** details the cumulative socio-economic impact of the Proposed Project in combination with other local projects. No significant cumulative socio-economic inter-project effects were identified. Further detail relating to these impacts are contained in this Chapter. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. In terms of PRoW closures/ diversions, these will be coordinated with other committed developments where necessary (as identified above) to reduce the potential for significant cumulative effects. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan -**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Suffolk and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.
		Landscape and visual, onshore mitigation	**Landscape and Visual Amenity** 4.19 The County Council considers that a clear vision for landscape for the whole project, and in particular the Converter Station site must be developed for the Environmental Impact Report. 4.20 While embedded mitigation will be essential to make the proposed scheme acceptable in landscape terms, the Mitigation Hierarchy will need to be applied in full, including compensation for impacts that result in adverse landscape and visual effects that cannot be avoided or mitigated through embedded measures.	N	The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in collaboration with various disciplines to maximise opportunities to minimise effects arising from the Proposed Project. Regarding landscape compensation, this has been discussed with stakeholders (including thematic meeting held with the County Council and District Council on 25 June 2024) and it is National Grid's position that NPS EN-1 does not support this position. There would not be any significantly adversely affected designated landscapes within the landscape and visual study area arising from the Suffolk Onshore Scheme. Detailed assessment information for landscape and visual receptors is provided within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. Under Friston Scenario 1 (scenarios are outlined within **Application Document 6.2.1.4 ES Part 1 Introduction Chapter 4 Description of the Proposed Project**), at construction, nine out of the 23 representative viewpoints within the landscape and visual study area would experience moderate or major (significant) adverse effects arising from construction of the Suffolk Onshore Scheme. Under Friston Scenario 2, at construction, an additional three representative viewpoints within the landscape and visual study area would experience significant adverse effects arising from the Suffolk Onshore Scheme. Under Friston Scenario 1, at year 1 of operation and maintenance, nine out of the 23 representative viewpoints within the landscape and visual study area would experience a moderate or major (significant) adverse effect arising from the Suffolk Onshore Scheme. Under Friston Scenario 2, at year 1 of operation and maintenance an additional two representative viewpoints within the landscape and visual study area would experience significant adverse effects arising from the Suffolk Onshore Scheme. Under Friston Scenario 1, at Year 15 of operation and maintenance, eight out of the 23 representative viewpoints within the landscape and visual study area would experience moderate (significant) adverse effects arising from the Suffolk Onshore Scheme. Under Friston Scenario 2, an additional two representative viewpoints within the landscape and visual study area would experience significant adverse effects arising from the Suffolk Onshore Scheme. Further details can be found in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Mitigation includes but is not limited to: • sensitive routeing and siting of infrastructure; • landscape design opportunities within the AONB: the temporary works within the AONB associated with the landfall and HVDC would be fully reinstated; and • the design of the Fromus bridge, in relation to its sensitive landscape and historic setting.
		Water environment, construction	**Local Lead Flood Authority** 4.21 The County Council, as Lead Local Flood Authority (LLFA), suggests that general consideration should be given to the return period to which construction drainage is designed, ensuring there is sufficient space within the Order Limits to accommodate such drainage provision.	N	National Grid has liaised regularly with Suffolk County Council in its role as LLFA and has agreed the return period to which construction stage surface water drainage measures are designed. This is documented within **Application Document 6.8 Flood Risk Assessment**. As illustrated on the drainage plans submitted with the DCO application there is sufficient space within the Order Limits to accommodate these requirements.
		Health and wellbeing, air quality, socio-economic, recreation and tourism	**Public Health** 4.22 With regards to Employment and Income, the section does not account for impacts to the existing local economy, but only additional jobs related to the scheme (Chapter 12 Health and Wellbeing: Appendix 1.4.A Outline Code of Construction Practice). 4.23 The County Council recommends more could be done with respect to the monitoring and mitigation of impacts on Air Quality as a result of construction operations and additional traffic, which will significantly increase. Of particular concern is of a Primary School being identified as being in close proximity of one of the sites, as children are more vulnerable to the effects of pollution. 4.24 The County Council recommends installation of live pollution sensors to accurately monitor levels of all pollutants not just NO2, particularly by the schools and residential developments identified.	N	With regard to Employment and Income, **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** outlines in depth the impacts of the Proposed Project on the existing local economy. There are no significant effects in relation to the local economy as stated in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism.** With regard to comment 4.23 and 4.24, measure AQ02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** recommends PM_{10} continuous monitoring prior to and during construction. National Grid has confirmed it will carry out real-time monitoring of NO_2, PM_{10} and $PM_{2.5}$ during the construction phase as detailed in the Air Quality Management Plan (**Application Document 7.5.6.1 Outline Air Quality Management Plan - Suffolk**).
		Walking, cycling and horse-riders, intra-project cumulative effects, onshore environmental impact	**Public Rights Of Way (PRoW)** 4.25 The County Council considers it essential that PRoW should be addressed as a separate topic in the PEIR and therefore disagrees with the approach taken by the developer where the consideration of effects on PRoW and their users is covered across several chapters of the PEIR. This has made it difficult for the relevant officer to comment on the effects of the proposals on PRoW. 4.26 The division of the effects of the development on PRoW across several chapters, each with their own set of criteria regarding harm, diminishes the level of cumulative effects and the level of importance of the local access network and the quality of the user experience and amenity value. As a result, an impact in isolation might be assessed as not being significant, whereas if	N	National Grid acknowledges the concern raised by the Council and has been in touch directly regarding this matter. It is proposed to continue to assess PRoW, following established practice in EIA. It is not conventional for an ES to have its own PRoW topic chapter. It is recognised that Sizewell C has a separate Amenity and Recreation chapter focusing on PRoW, but it is noted that most other local EIA schemes in Suffolk (EA1, EA TWO, EA1 N and BTNO) also adopt the same approach as the Proposed Project EIA. It is important for an EIA to remain proportional in approach and remain focused on assessing the likelihood of significant environmental effects, and by introducing a PRoW chapter it would risk double counting of effects already being reported somewhere else in the ES. It is National Grid's view that the structure of the ES as proposed allows for a full assessment of all potential impacts on PRoW where there is the potential for significant environmental effects. Across the Landscape and

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			impacts had been considered collectively for that receptor, then they could be significant. 4.27 The County Council would like to see a commitment to keeping PRoW open and available during the construction period through the use of management measures, such as controlled crossings, traffic marshals and signage. If temporary closures are required, then the number and duration should be kept to a minimum.		Visual, Traffic and Transport, Socio-Economics, Recreation and Tourism and Health and Wellbeing topic assessments the aspects mentioned will be covered. The concern that when considered individually an impact might be assessed as not significant, but if the impacts had been considered collectively for that receptor, they could be significant, is addressed within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**. This document considers the combined effects on PRoW and their users, that have been identified across the various topic chapters. Importantly, it is not felt that a separate PRoW topic would result in any difference in the outcome of the assessment of overall impacts on PRoW and the required mitigation. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared which provides details of PRoW closures and diversions, which will be kept to a minimum, and will include measures such as controlled crossings, marshals and signage. Continued liaison with the Council on this topic is ongoing.
		Socio-economic, recreation and tourism, inter-project cumulative effects	**Socioeconomic** 4.28 The construction period for Sea Link is predicted to coincide with Sizewell C Nuclear Power Station. It is anticipated there will be significant pressure on the available workforce, also considering other projects in the area such as LionLink. This could reduce opportunities to secure any skills and employment legacy from the construction workforces as the projects could be occurring in parallel. 4.29 The promoter expects that a large proportion of additional jobs, created by the Sea Link scheme, to be taken by those outside of the study area, with only 32 net additional jobs being expected to be taken up by residents, due to the jobs being specialised construction. The County Council finds this unacceptable, particularly with the number of infrastructure projects taking place in the area, including those proposed by the promoter. 4.30 A comprehensive Skills and Employment Plan and engagement with the Regional Skills Coordination Function at the County Council would support a strategic approach to this issue. 4.31 The County Council disagrees that Operational Employment was scoped out due to limited numbers, as this issue should have been considered alongside other projects in the region, which will amplify any effects caused.	N	Operational employment has been scoped out of the ES on the ground that the scale of operational employment is likely to be very limited. The Planning Inspectorate agrees with this approach on the basis that the description of the Proposed Project in the ES explains the level of employment generation in operation. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter Project Cumulative Effects**. National Grid has not committed to preparing and implementing a specific Employment, Skills and Education Strategy at a project level, as this is not considered to be an efficient or effective approach given the number of construction workers anticipated and that National Grid has not identified any likely significant effects in relation to construction employment.
		Consultation	**5 Appendix A – Detailed Technical Comments** **Introduction**	N	National Grid acknowledges the Council's comment.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			5.1 The County Council has gathered technical comments from its technical departments regarding the details contained within the Statutory Consultation. 5.2 The full list of technical comments are as follows: o Archaeology o Ecology o Landscape o Lead Local Flood Authority o Minerals and Waste o Public Health o Public Rights of Way o Socioeconomic		
		Cultural heritage, inter-project cumulative effects	**6 Archaeology** 6.1 As a general comment, there is high archaeological potential for all current areas being considered, the majority of which have not yet been subject to systematic archaeological investigation, therefore full assessment is required at the earliest opportunity. Geophysical survey and monitoring of GI works are underway with Written Schemes of Investigation submitted and approved by SCCAS, but no results have been seen. 6.2 The archaeological implications of multiple schemes in this landscape are cumulatively heightening for every project and we note that options for co- location of elements of this scheme with the LionLink project are included. These would increase impacts. Although we would generally see a benefit in this, this does have the potential to reduce the flexibility to be able to avoid significant archaeology which has yet to be defined. 6.3 The results from other projects are also showing that there is an enormous amount of important archaeology surviving in this landscape, which we previously knew nothing about (and some of the proposed areas for this scheme fall within busy geophysics areas which EA1N/2 had avoided, but adjacent to areas where the trenches identified extensive archaeology).	N	The Proposed Project Cultural Heritage team have obtained information from the East Anglia ONE North and East Anglia TWO teams including the result of geophysical surveys and evaluation trenching. This was used to inform the data gathering and assessment undertaken as part of the Proposed Project. The information gathered was used to inform the baseline report, as well as help define the significant of cultural heritage assets and assess impacts. In areas where the projects overlapped, the East Anglia ONE North and East Anglia TWO data was used by the Proposed Project. This has included data being used to inform evaluation trenching. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. Data has been used and/or referenced in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and the associated appendices. Additional topic and site-specific mitigation measures that have been applied to mitigate or offset any likely significant effects are included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation for cultural heritage includes but is not limited to: • Construction of the Proposed Project would employ the use of track matting for construction plant, where practicable, as opposed to topsoil stripping for the creation of haul roads. This measure would avoid permanent impacts to buried archaeological remains that may be present.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• Locations of known archaeological interest/value to be preserved *in situ*, or areas where archaeological work is planned, would be signposted/fenced off to avoid unintentional damage. • Archaeological Watching Brief to be undertaken in pre-agreed areas of archaeological potential/features. Scope of works to be agreed with the Archaeology Advisor for SCC, and any other relevant heritage stakeholders prior to works commencing in the relevant area and detailed in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) – Suffolk** or a site specific WSI. Other mitigation measures are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage.** There are no significant residual effects to cultural heritage during construction, operation or maintenance for Suffolk. A cumulative assessment has been carried out which includes the consideration of cultural heritage receptors. Further details are contained in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The assessment of total cumulative effects for cultural heritage has identified that there is the potential for four other projects to result in a cumulative impact on heritage receptors. These impacts include physical impacts on archaeological remains that potentially extend outside of the Proposed Project area, as well as impacts on the setting of heritage assets. However, the overall assessment of cumulative effects is currently assessed as 'not significant'.
	Cultural heritage, geology and hydrogeology, onshore mitigation	**Friston substation** 6.4 In the Friston substation area, the majority has been subject to geophysical survey and trial trenching as part of the EA1N/2 project and this assessment work has defined multi-period archaeological remains requiring mitigation. Further assessment work is necessary for any areas not previously included within the work undertaken as part of the EA1N/2 scheme.	N	The Proposed Project Cultural Heritage team have obtained information from the East Anglia ONE North and East Anglia TWO teams including the result of geophysical surveys and evaluation trenching. This was used to inform the data gathering and assessment undertaken as part of the Proposed Project. The information gathered was used to inform the baseline report, as well as help define the significant of cultural heritage assets and assess impacts. In areas where the projects overlapped, the East Anglia ONE North and East Anglia TWO data was used by the Proposed Project. This has included data being used to inform evaluation trenching. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. Data has been used and/or referenced in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and the associated appendices. Additional topic and site-specific mitigation measures that have been applied to mitigate or offset any likely significant effects are included in **Application Document 7.5.3.2 CEMP Appendix B Register of**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Environmental Actions and Commitments (REAC) which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation for cultural heritage includes but is not limited to: • Construction of the Proposed Project would employ the use of track matting for construction plant, where practicable, as opposed to topsoil stripping for the creation of haul roads. This measure would avoid permanent impacts to buried archaeological remains that may be present. • Locations of known archaeological interest/value to be preserved *in situ*, or areas where archaeological work is planned, would be signposted/fenced off to avoid unintentional damage. • Archaeological Watching Brief to be undertaken in pre-agreed areas of archaeological potential/features. Scope of works to be agreed with the Archaeology Advisor for SCC, and any other relevant heritage stakeholders prior to works commencing in the relevant area and detailed in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) – Suffolk** or a site specific WSI. Other mitigation measures are detailed in **Application Document 6.2.2.3 ES Part 2 Suffolk Chapter 3 Cultural Heritage.** There are no significant residual effects to cultural heritage during construction, operation or maintenance for Suffolk.
		Cultural heritage, geology and hydrogeology, onshore route location	**Cable Corridor** 6.5 The preferred cable route is situated within a favourable location for archaeological activity from all periods, on light, sandy soils and close to watercourses. The majority of all the cable corridor has, however, never been subject to any systematic archaeological investigation and so the full archaeological potential is currently unknown. The entire cable route (including all locations of permanent and temporary structures) therefore requires full, early archaeological assessment (desk-based assessment, geophysics, and trenching).	N	Since submission of the PEIR, fieldwork and information gathering has continued to assist with defining the character and significance of heritage assets, as well as to assess the potential for impacts. This has included geophysical survey, a review of aerial photos and LiDAR data, walkover survey, setting assessment, and evaluation trenching. The information gathered was used to inform the baseline report, as well as help define the significant of cultural heritage assets and assess impacts. It has been included in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and associated appendices. Archaeological remains fall within the Order Limits and the Suffolk Onshore Scheme has the potential to result in physical impacts from the underground cable installation and access track works. With mitigation in place, the impacts are reduced to not significant. There are no significant residual effects to cultural heritage during construction, operation or maintenance for Suffolk. All works have been undertaken in consultation with stakeholders including Suffolk County Council Archaeological Service (SCCAS), East Suffolk Council, and Historic England, with the Written Scheme of Investigations for geophysical survey and evaluation trenching approved

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					by SCCAS. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching.
		Cultural heritage, geology and hydrogeology, landfall location	**Landfall** 6.6 Whilst the landfall method is proposed to be a drilled system this site lies within 'The Mear' recorded from the 16th century (ADB 160), historically a turbary/natural harbour (Thorpe Haven, or Almouth). The potential for buried and organic (including wooden) remains is high in this area. Wetland archaeology is relevant here, albeit impacted by peat cutting and later WW2 anti-aircraft defences. Early assessment would therefore be necessary. SCCAS would need more details of the exact construction/drilling method (including depths) and how this would affect hydrology (using GI information) and therefore preservation any remains that may exist. This would inform any mitigation if necessary. It should not be assumed that drilling of cables is without impact without sufficient evidence.	N	Full details of trenchless construction techniques, including pipe jacking (auger bore), horizontal directional drilling, and micro boring (micro-tunnelling), have been included in **Application Document 6.2.1.4 ES Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment presented within **Application Document 6.2.2.3 ES Part 2 Suffolk Chapter 3 Cultural Heritage** has taken into account these parameters when assessing the potential for impacts in this area, as well as the potential for sensitive deposits to survive with works including a review of ground investigation works (i.e. boreholes), which suggests there are no extensive areas of organic material such as peat. This would correspond with descriptions of the area which suggest peat cutting/extraction took place in the past. Evaluation trenching was not undertaken in this area due to environmental and ecological constraints, but the potential for impacts was discussed with stakeholders. The assessment concluded that the residual effect on palaeo-environmental remains is not significant. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching.
		Cultural heritage, geology and hydrogeology, onshore route location	**Onshore Works** 6.7 The current onshore study areas have in most parts not been subject to systematic archaeological investigation and, therefore, the character, extent, and significance of surviving above and below ground heritage assets across this area has yet to be defined beyond the preliminary assessment in suitable detail. There is high potential for additional, and to date unknown, significant heritage assets to survive across much of this area. Some of these may be of national significance and worthy of preservation in situ. As such without further assessment to fully characterise the heritage resource, the impacts of the development upon above and below ground heritage assets cannot be fully understood.	N	Since submission of the PEIR, fieldwork and information gathering has continued to assist with defining the character and significance of heritage assets, as well as to assess the potential for impacts. This has included geophysical survey, a review of aerial photos and LiDAR data, walkover survey, setting assessment, and evaluation trenching. The information gathered was used to inform the baseline report, as well as help define the significant of cultural heritage assets and assess impacts. This has noted that no assets of national significance survive within the Order Limits. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. It has been included in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and associated appendices. Additional topic and site-specific mitigation measures that have been applied to mitigate or offset any likely significant effects are included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation for cultural heritage includes but is not limited to: • Construction of the Proposed Project would employ the use of track matting for construction plant, where practicable, as opposed to topsoil stripping for the creation of haul roads.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					This measure would avoid permanent impacts to buried archaeological remains that may be present. • Locations of known archaeological interest/value to be preserved *in situ*, or areas where archaeological work is planned, would be signposted/fenced off to avoid unintentional damage. • Archaeological Watching Brief to be undertaken in pre-agreed areas of archaeological potential/features. Scope of works to be agreed with the Archaeology Advisor for SCC, and any other relevant heritage stakeholders prior to works commencing in the relevant area and detailed in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) – Suffolk** or a site specific WSI. Other mitigation measures are detailed in **Application Document 6.2.2.3 ES Part 2 Suffolk Chapter 3 Cultural Heritage**. There are no significant residual effects to cultural heritage during construction, operation or maintenance for Suffolk. All works have been undertaken in consultation with stakeholders including Suffolk County Council Archaeological Service (SCCAS), East Suffolk Council, and Historic England, with the Written Scheme of Investigations for geophysical survey and evaluation trenching approved by SCCAS.
		Cultural heritage, geology and hydrogeology, programme	6.8 All onshore elements of the scheme (for example, landfall sites, converter station sites, grid connection substation site, underground cable corridors, jointing bays, link boxes, Horizontal Directional Drilling (HDD) pits and any other impacts associated with the scheme for example, haul roads, compounds, planting and ecological mitigation, offsite transport improvements etc.) have the potential to damage or destroy any surviving archaeological remains so all elements of the scheme should be scoped in for archaeological assessment. All areas of proposed works will require geophysics followed trenched archaeological evaluation. Any reductions to this will need to be agreed and approved by SCCAS. 6.9 Undertaking full archaeological evaluation early will enable the results of the surveys to be used to assist with project programming and to contribute to risk management. Upfront work will ensure all options can be properly considered and the scope of mitigation defined (including giving proper thought to preservation in situ and alternative solutions), avoiding unexpected costs and delays post-consent. Evaluation will test the suitability of sites for development, given the reduced flexibility for mitigation through design now that a location for landfall, converter station site, grid connection substation site, cable route, jointing bays, link boxes and HDD pits have been selected. Early work will also enable	N	Since submission of the PEIR, fieldwork and information gathering has continued to assist with defining the character and significance of heritage assets, as well as to assess the potential for impacts. This has included geophysical survey, a review of aerial photos and LiDAR data, walkover survey, setting assessment, and evaluation trenching. The information gathered was used to inform the baseline report, as well as help define the significant of cultural heritage assets and assess impacts. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. It has been included in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and associated appendices. Additional topic and site-specific mitigation measures that have been applied to mitigate or offset any likely significant effects are included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation for cultural heritage includes but is not limited to: • Construction of the Proposed Project would employ the use of track matting for construction plant, where practicable, as

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			archaeological work to be designed alongside other elements of the scheme, e.g. working in archaeological work with ecological work, or informing spoil and dust management.		opposed to topsoil stripping for the creation of haul roads. This measure would avoid permanent impacts to buried archaeological remains that may be present. • Locations of known archaeological interest/value to be preserved *in situ*, or areas where archaeological work is planned, would be signposted/fenced off to avoid unintentional damage. • Archaeological Watching Brief to be undertaken in pre-agreed areas of archaeological potential/features. Scope of works to be agreed with the Archaeology Advisor for SCC, and any other relevant heritage stakeholders prior to works commencing in the relevant area and detailed in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) – Suffolk** or a site specific WSI. Other mitigation measures are detailed in **Application Document 6.2.2.3 ES Part 2 Suffolk Chapter 3 Cultural Heritage**. There are no significant residual effects to cultural heritage during construction, operation or maintenance for Suffolk. All works have been undertaken in consultation with stakeholders including Suffolk County Council Archaeological Service (SCCAS), East Suffolk Council, and Historic England, with the Written Scheme of Investigations for geophysical survey and evaluation trenching approved by SCCAS.
		Cultural heritage, geology and hydrogeology, onshore mitigation	6.10 The combined results of the above assessments should then be used to develop a mitigation strategy Some areas (yet unidentified) may require localised preservation in situ where appropriate. For surviving below ground archaeological heritage assets, where (1) development impacts are proposed that will damage or destroy remains and (2) where mitigation through recording is considered acceptable, the resultant mitigation included should include proposals to record and advance understanding of the significance of heritage assets before they are damaged or destroyed. Appropriate mitigation techniques, such as excavation prior to development, will be based upon the results of the suite of evaluation and assessment work undertaken. Proposals for outreach and enhanced public understanding as part of this mitigation work must also be included. 6.11 All ground investigation/mitigation works should be covered by an Overarching Written Scheme of investigation (OWSI). This would be a process document, detailing all types of ground investigation and mitigation with full detailed definitions and the need for further site specific WSIs. It should be a flexible document include systems to adapt to changing plans and updated information. The OWSI and all subsequent WSIs need to be approved by SCCAS. All stages of the work will be monitored by	N	Archaeological monitoring of ground investigation works was undertaken in line with a WSI approved by Suffolk County Council. The archaeological data collected has been included in the ES, and also used to inform the Evaluation Trenching. Further details are contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. The results of the geophysical survey, as well as the evaluation trenching was used to inform design as well as develop the mitigation strategy. **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (WSI)) - Suffolk** has been produced and a full mitigation strategy and OWSI will be agreed with stakeholders post-DCO submission. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			SCCAS on behalf of the Local Planning Authority and Planning Inspectorate to ensure the written schemes are satisfactorily fulfilled.		
		Cultural heritage, construction, onshore mitigation	6.12 Any ongoing works during site operation must not take place within any areas where archaeological remains have been preserved in situ as part of archaeological mitigation strategies. If any areas of archaeology are to be preserved in situ, then a strategy for ongoing protection of these remains throughout construction, operation and in perpetuity must be agreed and included within the mitigation strategy for the development and provision must be made for a detailed management plan.	N	National Grid acknowledges this feedback. Suitable protection methods have been detailed in the mitigation section of **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**, and include monitoring by an Archaeological Clerk of Works. Outline mitigation is also included in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) - Suffolk**, and a full mitigation strategy (including protection methods) will be agreed with stakeholders.
		Cultural heritage, onshore mitigation, programme	6.13 As has been shown by other Nationally Significant Infrastructure Projects in the region time will be a critical factor. Archaeological and heritage assessments and mitigation phases should be programmed into the project at the earliest opportunity, with sufficient time allowed to enable evaluations to be undertaken (e.g. taking into account agricultural cycles and commencing landowner negotiations at the earliest opportunity) and also fieldwork to be completed prior to the start of construction works, so as to avoid any delays to the development schedule.	N	National Grid acknowledges this feedback. Evaluation trenching has already taken place to inform the assessment, and has been used to develop the mitigation strategy pre-construction. The results of Phase 1 are appended to the DCO submission, while the final results of Phase 2 will follow post-DCO submission. Please refer to **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** for further information.
		Cultural heritage, landscape and visual, geology and hydrogeology	**Setting** 6.14 SCCAS does not advise on setting, and we would defer to Historic England and Local Authority Heritage Advisors. Having said this landscape should be considered for assessment as an aspect of the historic environment. There will be interrelationships in assessment between archaeological and the built environment. The lack of a holistic approach to assessing the impact on landscape has given rise to omissions in other recent DCO applications. 6.15 A detailed settings impact assessment for above ground heritage assets should be undertaken and the impact of the proposals upon historic hedgerows, boundaries and other historic landscape elements should also be considered using historic mapping and Historic Landscape Characterisation data 6.16 Earthwork survey and building assessment should be undertaken of upstanding remains, particularly Second World War remains, to properly assess their significance and enhance our understanding in the context of the defensive coast.	N	The potential for impacts on setting have been discussed with Historic England and East Suffolk Council who have agreed viewpoints and the assets to be taken forwards to full assessment. This concluded that no significant residual effects are expected. Earthwork remains were not encountered as part of the site visits and desk-based assessment, with details of the mitigation currently assumed to be most appropriate detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** as well as an overview of the main mitigation types being suggested in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) - Suffolk**.
		Cultural heritage, geology and hydrogeology, onshore mitigation	**General Comments** 6.17 Several large projects in the area at a given time (which is likely given the timeframes of other schemes) may put pressure on available archaeological work forces.	N	National Grid acknowledges this feedback. Further details on the trenchless construction solution procedure and control measures can be found in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			6.18 Details about avoiding bentonite breakout should be included and procedures defined if it occurs (in areas defined for excavation or preservation in situ). Archaeological features can act as “weak points” allowing the bentonite a route to the surface or to infiltrate sub surface features. 6.19 Similarly, if there is bentonite breakout elsewhere controls would need to be in place to avoid disturbance of areas under archaeological preservation in situ. These cannot be disturbed by the movement of topsoil from sites to create bunds to stop the bentonite flooding elsewhere. 6.20 Where cables pass through watercourses there is potential for well-preserved stratified sites in and on the valley sides as well as palaeo-environmental remains, this may require borehole/coring/test pitting to characterise potential or more detailed survey as part of mitigation.		**Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan** contains mitigation against surface frac out or break out and is by: • ensuring sufficient ground investigations understand the ground strength to inform a suitable design; • design a profile sufficiently deep for the methodology and conditions, with hydrofracture modelling used to check that there is sufficient factor of safety; • use of a drilling fluids engineer to design and monitor the fluid properties; • ensure that the tunnel bore is sufficiently clean of cuttings during drilling; • monitoring fluid pressures in the bore, and returns to the entry pit during drilling; and • the use of “spotters”, personnel stationed above the drill line to look for any frac out or break out. **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Processes** notes that all drilling fluids used, such as bentonite, will be selected from the OSPAR List of Substances/Preparations Used and Discharged Offshore (2021) which are considered to ‘Pose Little or No Risk to the Environment’ (PLONOR). Additionally, where entry/exit points are in the intertidal area (i.e. at the southern landfall) drilling fluid will be captured where possible (control measure LVS05 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**). **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** sets out measures for control of break outs and frack outs. These are considered to be suitable to limit any potential impacts on heritage assets. A review of ground investigation data was undertaken as part of the desk-based assessment phase with information included in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and the associated appendices. This did not identify any well-preserved palaeo-environmental remains, although archaeological evaluation trenching did identify archaeological remains in a number of areas. Any areas of preservation in situ will not be disturbed through works such as stockpiling and bunding. If impacts are identified as a result of works such as stockpiling, etc., archaeological mitigation will be required. Any further requirement for geo-archaeological mitigation will be agreed with stakeholders as part of the preparation of the detailed Overarching Written Scheme of Investigation (**Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) - Suffolk**). which will include all mitigation.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage, coordination with other projects, geology and hydrogeology	6.21 Given the interaction with the EA1N/2 scheme there is a need to include the results from these projects within assessments, especially for those areas where the schemes overlap or are in close proximity, given the results directly relate to the archaeological potential of this scheme. The EA1N/2 geophysical survey data and trial trenching results are publicly available as part of the relevant examinations and the SCCAS are also happy to advise on the findings where reports are not yet available. These surveys illustrate how much information is added to HER data through systematic survey, realising archaeological potential, as a significant number of archaeological sites have been defined which were not previously recorded on the County HER, or associated with finds scatter or cropmark evidence. 6.22 There should not be an assumption that data within the Historic Environment Record (HER) is of local significance. The Historic Environment Record includes non-designated assets of national importance and regionally significant assets. Sites of archaeological potential which have not yet been subject to systematic assessment (and are therefore currently of unknown significance) should also be considered.	N	National Grid acknowledges this feedback. The Proposed Project Cultural Heritage team have obtained information from the East Anglia ONE North and East Anglia TWO teams including the result of geophysical survey and evaluation trenching. This was used to inform the data gathering and assessment undertaken as part of the Proposed Project. The information gathered was used to inform the baseline report, as well as help define the significant of cultural heritage assets and assess impacts. In areas where the projects overlapped, the East Anglia ONE North and East Anglia TWO data was used by the Proposed Project. This has included data being used to inform evaluation trenching. Surveys and investigations specific to the Proposed Project were undertaken in areas where the projects did not overlap. Significance has been assigned through consultation with stakeholders and through professional judgment. This has been based on data collected through the evaluation trenching, where possible, as well as comparing unexcavated assets to other examples in the local area where possible. No assets of national significance have been identified. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. Data has been used and/or referenced in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and associated appendices.
		Cultural heritage, geology and hydrogeology	**Comments on Preliminary Environmental Information Report Volume: 1 Part 2 Suffolk Onshore Scheme Chapter 4 Cultural Heritage** 6.23 The potential for extensive and yet unknown archaeological is not adequately recognised by the supplied documentation and current proposals for assessment are not sufficient to fully understand the archaeological impacts of proposals and to enable informed decisions to be made. 6.24 Having said this SCCAS welcomes that this document notes the need to do further assessment with the intention that: 6.25 “The ES will be further informed by results of other data gathering exercises that are currently being undertaken or are proposed before the submission of the ES. These include a review of aerial photographs and LiDAR data, geophysical survey, archaeological walkover survey, documentary research (including a map regression exercise), and archaeological monitoring of Ground Investigation works.” (2.4.4.9,) (essentially a full desk-based assessment enhancing on the PIER) 6.26 Paragraph 2.4.3.6 also notes that to inform the ES process geophysical survey and evaluation trenching will be undertaken. This is necessary and it must be completed at an early stage to define archaeological mitigation that may be required. If delayed, results from trial trenching (and other investigative methods) have	N	National Grid acknowledges this feedback. Further information obtained through non-intrusive and intrusive works have been used to input into design where possible. These surveys have included a review of aerial photos and LiDAR data, geophysical survey, and archaeological evaluation trenching. Full details of these surveys are included in the **Application Document 6.3.2.3.D ES Appendix 2.3.D Geophysical Survey Report; Application Document 6.3.2.3.E ES Appendix 2.3.E Aerial Photography and LiDAR Report; Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)**, with the information synthesised in **Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. Where assets cannot be avoided, full mitigation has been developed in consultation with stakeholders. See **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** for full assessment of impacts and mitigation. Additional topic and site-specific mitigation measures that have been applied to mitigate or offset any likely significant effects are included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			the potential to become a point of objection when we get to examination if not yet undertaken. 6.27 2.4.6.2, "The extent of the proposed study area is the standard for these types of projects," (The developer needs to reference the source regarding standards for 'this type of project'). SCCAS requires that HER (and other methods) searching should be at least 1000m in rural setting (for the DBA) and 3000m for designated monuments and please include Parish codes alongside MSF/MSX UIDs in future documents utilising HER data.		through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation for cultural heritage includes but is not limited to: • Construction of the Proposed Project would employ the use of track matting for construction plant, where practicable, as opposed to topsoil stripping for the creation of haul roads. This measure would avoid permanent impacts to buried archaeological remains that may be present. • Locations of known archaeological interest/value to be preserved *in situ*, or areas where archaeological work is planned, would be signposted/fenced off to avoid unintentional damage. • Archaeological Watching Brief to be undertaken in pre-agreed areas of archaeological potential/features. Scope of works to be agreed with the Archaeology Advisor for SCC, and any other relevant heritage stakeholders prior to works commencing in the relevant area and detailed in **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) - Suffolk** or a site specific WSI. Other mitigation measures are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage.** There are no significant residual effects to cultural heritage during construction, operation or maintenance for Suffolk. A revised HER data search was undertaken for Design Freeze 3 and Design Freeze 4 and the study area for this was agreed with stakeholders including SCCAS at the Scoping Stage, and was reaffirmed with SCCAS after the PEIR response. The HER data has been used to inform the baseline provided in **Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Repor.t**
		Cultural heritage, onshore mitigation	6.28 2.4.8.3 All of the archaeological mitigation options (H0-H6) will require extra specific detail when included in the OWSI. Strip map and excavate and watching brief will need to be defined and described further (i.e. controlled strip, continuous monitoring, frequency of visit etc) as will protection methods and regulations if H01 is appropriate.x 6.29 2.4.9.1 – preliminary assessment of NDHAs is generally fine as all mention mitigation, however there is potential in some circumstances for micro siting (i.e. measure H02) but this would only be based on new information from survey/trenching etc. 6.30 1.4.A.2.97 We would need more details of all "trenchless" construction methods in archaeological assessments (DBA) to better understand impact.	N	National Grid acknowledges this feedback. Further information obtained through non-intrusive and intrusive works have been used to input into design where possible. Where assets cannot be avoided, full mitigation has been developed in consultation with stakeholders. Further details regarding construction methods, such as trenchless methods, have also been included in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** provides details of the full assessment of impacts and proposed mitigation measures. This includes a detailed assessment for assets

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			6.31 Figure 2.4.1 is in error – it only shows event records on the HER not Monument records. 6.32 We support co-location, but regardless, DBAs need to highlight works done in advance of other schemes and areas where cable routes or others such permanent or temporary structures overlap. 6.33 The various assessments detailed from 2.4.12 to 2.4.26 are in general sound, although .13m (Gorse Hill), .17 (Hazelwood Aerodrome) .21 (Decoy Pond) need much more specific detail re: effects, investigation, and mitigation. 6.34 For all the= identified assets detailed from 2.4.12 to 2.4.26 further detail on management/mitigation Is necessary but this should be available when the various mitigation option H0-H6 are better defined and detailed in the OWSI.		where there is the potential for impacts including Gorse Hill, Hazelwood Aerodrome, and the Decoy Pond. All supporting figures have been updated to include all previously recorded assets on the Suffolk HER, as well as previously recorded assets identified through works such as geophysical survey and archaeological evaluation trenching. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. Please also refer to **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) - Suffolk** for an overview of the main mitigation types, which includes further details regarding how mitigation will be undertaken. Further detailed information about mitigation will be included in the individual WSIs that will be required for the various mitigation areas. These will be agreed post-consent.
		Cultural heritage, construction, onshore mitigation	6.35 Decommissioning work also has the potential to have an impact, but this is not currently recognised within documentation. This overlooks the potential for remains which are being preserved in situ and therefore need to be protected from disturbance throughout all phases (including during any maintenance works). Also, the compounds and access etc. associated with this work also have the potential to impact upon below ground remains if located in areas which have not already been subject to archaeological mitigation.	N	A full assessment of potential impacts are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**, and these include impacts resulting from associated infrastructure, etc. It is acknowledged that the decommissioning phase could result in impacts, as described in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The decommissioning phase will comprise temporary site compounds and other enabling works similar to that needed during construction. It is anticipated that the temporary site compounds required for decommissioning of the Friston Substation and Converter Station sites would be located in the same location as required during construction. Due to the anticipated reduced workforce required for decommissioning of the overhead line and underground cables, the locations of the temporary construction compounds should be reviewed at the time of decommissioning. The working hours for decommissioning activities would be similar to those for construction with a total estimated duration of decommissioning of two years. If decommissioning resulted in potential impacts on any areas where archaeological remains had been preserved in situ, or works outside of the Proposed Project Order Limits, further assessment would be required. Assets where mitigation consist of preservation in situ will remain protected during the operation phase to avoid accidental damage during works such as maintenance.
		Cultural heritage	6.36 SCCAS welcomes the preliminary assessment of impacts on the setting of various listed buildings, however it is possible that further unknown yet visible assets are identified (e.g. through Arial photography, earthwork survey or cartographic investigation) that may require inclusion into such reports.	N	No additional assets requiring an assessment of impacts on their setting were identified as part of the data collection and review process, or through fieldwork. These surveys have included a review of aerial photos and LiDAR data, geophysical survey, and archaeological evaluation trenching. Full details of these surveys are included in the **Application Document 6.3.2.3.D ES Appendix 2.3.D Geophysical Survey Report; Application Document 6.3.2.3.E ES Appendix 2.3.E Aerial**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Photography and LiDAR Report; Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft), with the information synthesised in **Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**.
		Terrestrial ecology, habitat screening regulations	**7 Ecology** **Sea Link Ecology Comments:** 7.1 These comments have made reviewed those made during the previous non- statutory consultation phase, the Ecology chapter of the current statutory consultation, the Phase 1 Habitat Survey and attended a Local Planning Authorities briefing presented by the Applicant. I have also had an opportunity to join a site visit hosted by the Applicants.	N	National Grid acknowledges the Council's comments.
		Terrestrial ecology, onshore mitigation	**Summary** 7.2 The Applicant has prepared helpful and useful documents that (with only one or two comments as set out below) have been prepared to a good standard. There is, however, the critical point that survey work is on-going, and it is only when the actual data – as a result of the survey work is compiled and presented – is available that we shall be able to make more constructive comments. 7.3 Critically, it is the Applicants' assurance that an Ecology Working Group will be set up in the near future which will enable the Local Planning Authorities and the other key natural environment stakeholders to make an informed contribution to this matter. 7.4 The County Council now await: • The survey information and data. • The setting up of the Ecology Working Group. • Appropriate mitigation, compensation, and enhancement to be set out in a Construction and Environment Management Plan (or similar document).	N	All survey work has now been completed. A series of meetings have been held bringing together key stakeholders including Suffolk County Council, Natural England and East Suffolk Council, constituting an ecology thematic meeting group. National Grid has shared survey outcomes, discussing impact assessments, ecological mitigation and enhancement with Suffolk County Council and other statutory bodies in Suffolk, in addition to other organisations such as RSPB. This began with the PEAs and the 2022-23 wintering bird surveys and 2023 breeding bird surveys. The Kent vantage point surveys and collision risk reports were shared. Other survey reports were not completed in time to be shared prior to DCO submission but summaries of findings were provided in thematic meetings (which effectively consisted of a Working Group and which provided very useful feedback). Mitigation, compensation and enhancement measures in relation to ecology are included within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**.
		Terrestrial ecology, inter-project cumulative effects	**Previous Comments:** 7.5 In response to the non-statutory consultation, our initial comment was that "The ecological information provided with this consultation is limited…." That still remains the case. 7.6 The County Council also expressed concern about how this proposal will impact upon biodiversity in combination with every other NSIP or other relevant proposal at this part of East Suffolk. The County Council is concerned that this does not appear to have been addressed in detail	N	A series of meetings were held with key stakeholders including Suffolk County Council Natural England and East Suffolk Council all discussing the Proposed Project together. National Grid has been sharing survey outcomes, discussing ecological mitigation and enhancement with Suffolk County Council and other statutory bodies in Suffolk, in addition to other organisations such as the RSPB. Full ecological surveys have been undertaken and their results and an impact assessment are set out in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. **Application Document 6.6 Habitat Regulations Assessment** includes a cumulative assessment of the impact of the Proposed Project with other

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					projects. **Application Document 6.6 Habitat Regulations Assessment Report** states that the Proposed Project will not result in an adverse effect on the integrity of any European sites either alone or in combination with other plans or projects. Data sharing began with the PEAs and the 2022-23 wintering bird surveys and 2023 breeding bird surveys. The Kent vantage point surveys and collision risk reports were shared. Other survey reports were not completed in time to be shared prior to DCO submission but summaries of findings were provided in thematic meetings (which effectively consisted of a Working Group and which provided very useful feedback).
		Terrestrial ecology, onshore environmental impact, consultation	**The Current Consultation:** 7.7 The statutory consultation has set out a lot of the "how" and "why" of the survey work required and the approach to obtaining the essential survey information seems satisfactory. It is only upon the reports and analysis being available to the environmental stakeholders that we can carry out a meaningful interrogation of the data. 7.8 One of the critical tools to allow the stakeholders to do this will be the establishment of an Ecology Working Group. This was touched upon at the recent engagement session by the Applicants for LPA Officers and, in the view of the County Council, this should be established at the earliest opportunity in order to ensure that the appropriate bodies are represented and agree terms of reference. 7.9 The current consultation has narrowed down the proposed areas for the cable corridor and converter station site(s) (e.g., land east of Saxmundham) and confirmed that there will not be any new overhead power lines. This is welcome as the land in question can be thoroughly surveyed for biodiversity interest and potential. 7.10 The County Council also welcomes the Applicants' policy to: • Minimise ecology and biodiversity effects. • To avoid significant adverse effects. • To deliver positive enhancement required (BNG). 7.11 The Applicants also state that, where the Environmental Impact Assessment (EIA) identifies opportunities to enhance biodiversity, this will be dealt with in the Planning Statement. Opportunities will be sought for "nature inclusive design" and there will be a "Biodiversity Management Strategy." All these points are most welcome, and the County Council looks forward to engaging with the Applicants vis the Ecology Working Group to gain an understanding of what this will mean on the ground.	N	A series of meetings were held bringing together the Suffolk Councils' and Natural England into ecology thematic meetings, effectively consisting of a working group. National Grid is in the process of sharing survey reports and outcomes and discussing ecological mitigation and enhancement with the Council and other statutory bodies in Suffolk, in addition to other organisations such as the RSPB. These meetings include discussions on Biodiversity Net Gain. A Biodiversity Management Strategy has not been produced but the requirements identified in 5.4.36 of NPS EN-1 are addressed in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk, Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan, Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice, or Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. The oLEMP effectively constitutes the Biodiversity Management Strategy for the DCO and among other provisions sets out biodiversity awareness training (using the standard term 'toolbox talks'). Nature inclusive design consists of including temporary features on hedgerow sections to enable continued bat usage at night; avoiding lighting of commuting features for bats and minimising permanent lighting; using a clear span bridge across the River Fromus; ensuring any culverts are passable by riparian mammals; maintaining a 40 m stand off from the identified badger setts; creation of 6 ha of acid grassland secured for 10 years, and securing favourable management for farmland birds of 12 ha of arable land secured for the lifetime of the Saxmundham Converter Station and Friston Substation. More details are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and mitigation measures are outlined in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Terrestrial ecology	**Scoping Out of Invertebrate Surveys:** 7.12 PINS has agreed with the Applicant that Notable Invertebrate Surveys should be scoped out of the data required.	N	As discussed with the Council in meetings, a decision has been taken to include terrestrial invertebrate and riparian mammal surveys in the scope of the assessment work, where suitable habitat exists (e.g. acid

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The County Council would like to see this reconsidered in the light of any encounters during the on-going walk over surveys that have taken place during the warmer months. The County Council does accept that the techniques being described to deliver the cable corridor may obviate the necessity for those surveys but would prefer to wait until the walkovers are complete before completely dismissing the necessity for these surveys. 7.13 **Scoping Out Riparian Mammals** Surveys:Similarly to the above, the County Council would like the up-to-date walkovers to inform this decision.		grassland for terrestrial invertebrates). Full ecological surveys have been undertaken and their results and an impact assessment are set out in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Terrestrial ecology, legislation and policy	**Rivers and Streams Generally:** 7.14 Should it appear necessary that any dam and pump work is required, The County Council would expect that it will be compliant with The Eels (England and Wales) Regulations 2009.	N	National Grid acknowledges the Council's comment. Full ecological surveys have been undertaken, including for fish, and their results and an impact assessment including consideration of the eel regulations are set out in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Terrestrial ecology	**Badgers:** 7.15 The County Council accepts the need to keep records confidential. The County Council would add that Badgers in East Suffolk are very successful and highly mobile. Alertness to Badger signs and constant monitoring of the entire development are essential.	N	National Grid acknowledges the Council's comment. Full ecological surveys have been undertaken, including for fish, and their results and an impact assessment including consideration of badgers are set out in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk** sets out requirements for monitoring of ecology during construction.
		Terrestrial ecology	**Survey Data:** 7.16 The County Council would be most grateful for confirmation that all biological data gained as a result of the surveys informing this proposal is sent to Suffolk Biodiversity Information Service (https://www.suffolkbis.org.uk/).	N	National Grid acknowledges the Council's comment. Data will be shared with Suffolk Biodiversity Information Service.
		Terrestrial ecology, legislation and policy	**Phase 1 Habitat Survey:** 7.17 This is a comprehensive document which has been thoughtfully and well prepared although the Applicants' surveyors acknowledge the incompleteness of the work through, e.g., lack of access. The County Council has the following queries: • Some trees that the Applicants' surveyors thought of as having low potential for bats should be climbed and inspected (by suitably licensed surveyors) if they are likely in any way to experience disturbance and in any event if they are to be cut back or removed. • Ponds that may or may not be suitable for Great Crested Newts could be eDNA tested? In any event, the County Council would anticipate HSI studies (as per: https://www.arguk.org/info-	N	Bat roost investigations were undertaken in line with the latest guidance. It has been agreed with Natural England that great crested newt surveys are not required as the Proposed Project will be making use of the district level licensing scheme for Suffolk. Access issues during 2023 were largely resolved during later survey seasons. If access was an issue in some areas this has been noted in the limitation's sections of survey reports and a precautionary approach taken to impact assessment.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			advice/advice-notes/9-great-crested-newt- habitat-suitability-index-arg-advice-note-5/file). • When will it be possible for those areas not yet accessed to be surveyed?		
		Terrestrial ecology, inter-project cumulative effects, onshore mitigation	**Conclusions:** The Applicants have provided a good starting point in both the Ecology and Biodiversity Chapter and the Phase 1 Habitat Survey of the Statutory Consultation. It has been helpful to see the options narrowed down. What will now be helpful (in terms of Ecology and Biodiversity) will be: • The full suite of survey data as a result of the on-going ecological survey work (and including the comments made above). • The establishment of an Ecology Working Group consisting of the Applicants' experts and key stakeholders (including from LPAs). • Consideration of the in-combination impacts of this proposal with others in the area. • Flexibility of approach to surveying (and then mitigation, compensation, and enhancement measures) informed by comprehensive walkovers and other means of obtaining biological data. • Consulting (and working with) the key stakeholders to prepare a Construction and Ecology Management Plan (CEMP) or similar document showing how successful mitigation will be implemented and achieved.	N	A series of ecology thematic meetings were jointly held with key stakeholders including Suffolk County Council, East Suffolk Council and Natural England, throughout preparation of the DCO, specifically to discuss ecology matters and results. National Grid has been sharing survey outcomes, discussing ecological mitigation and enhancement with Suffolk County Council and other statutory bodies in Suffolk, in addition to other organisations such as the RSPB. **Application Document 6.6 Habitat Regulations Assessment Report** includes a cumulative assessment of the impact of the Proposed Project with other projects. Data sharing began with the PEAs and the 2022-23 wintering bird surveys and 2023 breeding bird surveys. The Kent vantage point surveys and collision risk reports were shared. Other survey reports were not completed in time to be shared prior to DCO submission but summaries of findings were provided in thematic meetings (which effectively consisted of a Working Group and which provided very useful feedback).
		Traffic and transport, coordination with other projects, inter-project cumulative effects	**8 Highways** The County Council as Highway Authority makes the following high-level comments on the PEIR and supporting documents: - 8.1 Co-ordination of this project with LionLink would reduce the overall impacts in terms of transport. 8.2 The authority is not content with the suitability of a number of the routes proposed for construction access. 8.3 Further information is required to assess the positive and negative impacts of each of the three proposed new access routes including the permanence or otherwise of the three new access roads and potential legacy benefits for the area. 8.4 AIL routes need to be surveyed to prove that there is a viable route to the convertor and sub stations.	N	National Grid acknowledges these high level comments, and these comments have been responded to separately below within this table and subsequently addressed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport, Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** and **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** where appropriate. Assumptions and the reasoning for the assumptions made are included within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			8.5 The methodology and findings of the environmental assessment require further detailed examination. To assist this more precise labelling and description or links and junctions is required. 8.6 Where assumptions are made, they should be evidenced. This includes the estimation of HGV, worker numbers and profiles, assumptions made for the sensitivity of receptors. 8.7 Regrettably, the County Council has had insufficient resources available at this time to full examine the preliminary assessment of impacts. 8.8 Additional surveys and data collection is required to inform the Environmental Statement and Transport Assessment. 8.9 The cumulative impacts of this project with Sizewell C (SZC) have been underestimated, particularly on the A1094 corridor. 8.10 Repeated projects in the same area have a sequential impact on communities such as repeated disruption due to road closures. 8.11 The reliance on energy projects to use shift patterns to avoid worker trips during network peaks may in combination result in new peaks at the time workers arrive and depart. 8.12 Further assurance is required regarding the embedding of controls within management documents and the subsequent monitoring and enforcement of these. 8.13 If a local port is proposed for the offshore elements of this project a Port Traffic Management Plan may be applicable. 8.14 Whilst accepting that the operational and decommissioning phase is scoped out of the ES and TA the latter should be managed through a requirement.		
	Traffic and transport, consultation	**Highway Comments** Reference should also be made to the County Council's comments during the Non- Statutory Consultation in December 2022.	N	National Grid acknowledges this feedback. These have been picked up in the liaison trackers/ statements of common ground where necessary (i.e. where comments remain applicable or have not been superseded by more recent feedback or design changes).
	Traffic and transport, coordination with other projects	**PEIR Non-Technical Summary** 8.15 Table 3-1 estimates construction during 2026-2030. This will coincide with SZC Peak Year and may coincide with SPR EA1(N) and EA2 dependant on their start date (potentially late 2024, early 2025). 8.16 The County Council would strongly support co-location and co-ordination with LionLink (3.6.2) both during the DCO process and construction phase (if consented). This would hopefully reduce the overall transport impact on Suffolk.	N	It is acknowledged that the Proposed Project will be under construction alongside other projects in the area which has been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. Please refer to this Chapter for the full assessment. No additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			8.17 The County Council encourages the developer to engage with the authority as the Local Highway Authority and East Suffolk as the Local Planning Authority to discuss and where possible the methodology including scoping of surveys for the EIA (4.3).		While National Grid will not seek powers for the Proposed Project to consent and deliver elements of NGV projects, it is committed to maintaining dialogue with NGV with a view to co-locating new infrastructure and coordinating delivery. Transport thematic meetings have been held with Suffolk County Council and East Suffolk Council to review and agree the methodology for the ES including the scoping of traffic surveys. These traffic surveys were carried out in 2024 based on the agreed survey specification and form the basis for the assessment set out within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport, landscape and visual	8.18 It is unclear if consideration access tracks will include visual and landscape impacts of any permanent or temporary bridges and earthworks associated with these tracks (5.1.4).	N	The landscape and visual effects arising from the temporary and permanent access tracks have been assessed as part of the Landscape and Visual Impact Assessment at all Proposed Project stages. This includes their impacts on the landscape character and also visual amenity. Such effects have been considered as part of the Suffolk Onshore Scheme as a whole and not separately. Further information can be found within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. A range of likely significant and non-significant effects on both landscape character and visual amenity are detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.
		Traffic and transport, construction	8.19 The number of vehicles quoted in 5.7.1 appears to be for two-way journeys and thus there will be a maximum of 946 single direction trips of which 258 will be single direction HGV movements. It is unclear how many Abnormal Indivisible Loads (AIL) movements there will be. In 5.7.2 such vehicles will access the substation site north of Friston (Figure 2.9.3) although for SPR construction vehicles are intended to use a haul road from the B1069 south of Knodishall. The scope of the Pier as shown in Figure 2.93 does not show the highway network impacted by access to the Aldeburgh / Thorpeness Landfall nor the Friston Sub-Station, areas that are of concern to the authority.	N	Further details have been provided as part of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** based on the latest design, including in terms of study area, construction vehicle movements and AIL movements. The Proposed Project is not expected to result in any impacts on Thorpe Road at the point of landfall, as additional traffic movements are expected to be minimal.
		Traffic and transport, air quality	8.20 It is noted in 5.8 that no air quality baseline surveys are proposed for the B1121 through Benhall or Kelsale and just a single location in Saxmundham. the County Council would be interested to understand if these areas have been scoped out of the assessment.	N	The villages of Benhall and Kelsale screen out of the construction vehicle emissions assessment, as traffic flows associated with the Proposed Project along the B1121 do not screen in against the IAQM criteria. There is considered to be sufficient existing monitoring along the A12 and B1119 to inform the assessment such that no further monitoring was deemed necessary.
		Health and wellbeing, walking, cycling and horse-riders	8.21 In 5.10.2 it would appear that Public Rights of Way (PRoW) aspects are included in Social-Economic, Recreation and Tourism an also in Health and Wellbeing (5.11.2). the County Council has a strong preference that PRoW's are considered as their own unique topic.	N	National Grid acknowledges the concern raised by the Council and has been in touch directly regarding this matter. It is proposed to continue to assess PRoW following established practice in EIA. It is not conventional for an ES to have its own PRoW topic chapter. It is recognised that Sizewell C has a separate Amenity and Recreation chapter focusing on

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					PRoW, but it is noted that most other local EIA schemes in Suffolk (East Anglia ONE North, East Anglia TWO and BTNO) also adopt the same approach as the Proposed Project EIA. It is important for an EIA to remain proportional in approach and remain focused on assessing the likelihood of significant environmental effects, and by introducing a PRoW chapter it would risk double counting of effects already being reported somewhere else in the ES. It is National Grid's view that the structure of the ES as submitted allows for a full assessment of all potential impacts on PRoW where there is the potential for significant environmental effects. Across the Landscape and Visual, Traffic and Transport, Socio-Economics, Recreation and Tourism and Health and Wellbeing topic assessments the aspects mentioned by the Council will be covered. The concern that when considered individually, an impact might be assessed as not significant, but if the impacts had been considered collectively for that receptor, could be significant has been addressed within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**, which has considered the combined effects on PRoW and their users, that have been identified across the various topic chapters. Importantly, it is not felt that a separate PRoW topic would result in any difference in the outcome of the assessment of overall impacts on PRoW, and the required mitigation. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared which provides details of PRoW closures and diversions. The proposed methodology covers all of the specific assessment criteria that Suffolk County Council include on PRoW in their Public Rights of Way and Green Access Supplementary Guidance Document, albeit presented in a different way. Continued liaison with the Council on this topic is ongoing.
	Traffic and transport	8.22 The County Council would refer NG to the SZC DCO and Deed of Obligation to see the definitive list of highway schemes associated with this project https://infrastructure.planninginspectorate.gov.uk/projects/eastern/the-sizewell- c-project/ . Similarly, the Construction Traffic Management Plan and Access Management Plan gives details of highway mitigation schemes associated with the SPR EA1(N) and EA2 projects https://infrastructure.planninginspectorate.gov.uk/projects/eastern/east-anglia- one-north-offshore-windfarm/ . the County Council has recently secured funding for the A12 Major Road Network (MRN) Scheme between the A12/A14 Seven Hills Interchange and the A12/A1152 Woods Lane Roundabout north of Woodbridge https://www.suffolk.gov.uk/council-and-democracy/council-news/government-backs-a12-road-improvements-with-funding-	N	These schemes have been considered as part of the future baseline within the **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, as well as **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			commitment This is anticipated to be delivered between mid-2025 and mid-2027.		
		Inter-project cumulative effects, socio-economic, recreation and tourism, onshore mitigation	8.23 The County Council notes that the sequential delivery of NSIPs on the east coast i.e. EA1, EA3, EA1(N), EA2, SZC and potentially Sealink and LionLink will impact communities on a recurring basis. This will create sequential impacts at the same locations and could be highly detrimental to, for example, tourism and PRoW users besides local residents. the County Council considers these Sequential Project Effects should also be considered or at least require enhanced mitigation or deliver legacy projects that offset this impact.	N	National Grid is maintaining ongoing dialogue with the County Council, including thematic workshops covering socio-economic impacts which have been addressed in the ES. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Inter Project Cumulative Effects** details the cumulative socio-economics impact of the Proposed Project in combination with other local projects. It is concluded that there are no anticipated significant socio-economic effects. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
		Traffic and transport, DCO process	**Design Drawings** 8.24 Noted that Figure 2.9.3 does not show the order limits to the coast nor the Suffolk Road Network to be used to access this part of the scheme.	N	National Grid acknowledges the Council's comments and has addressed these issues in the ES. The order limits and access information is contained within the associated figures of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport, coordination with other projects, design	8.25 Drawings S42_S/TDD/SS/0013 and 14 clearly show one of the main advantages in terms of reduced impact of combined construction of the ducts in that only a single haul road is required for all three projects yet if delivered separately each project would need construction and removal of a haul road. It is noted that the drawing refers to future ducts. The County Council would prefer that the ducts are install in any case allowing later installation of the cable, the same as for EA1 and EA3.	N	National Grid acknowledges these comments and is maintaining ongoing dialogue with NGV to identify opportunities for project coordination, including colocation and construction requirements. Please refer to **Application Document 7.10 Coordination Document** for further details.
		Traffic and transport, design	**Bellmouth Drawing** 8.26 Existing highway presumed to be a wide two-lane road. This is not the case with most Suffolk roads which are generally not this wide nor straight. Drawings show the use of temporary traffic signals, a matter not yet discussed with The County Council. No visibility splays are provided for the accesses nor forward visibility to traffic signals noting that both are dependent on the speed of vehicles using the highway. In the County Council's opinion the design of a bell mouth is a specific operation as a generic design cannot account for the characteristics of each location.	N	Specific bellmouth designs have been shared with the Council on multiple occasions for feedback on location, visibility splay and proposed mitigation and these include site specific vehicle tracking. These designs are set out in **Application Document 2.13.1 Design and Layout Drawings – Suffolk** and described within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Traffic and transport, construction, onshore mitigation	**PEIR** 8.27 Table 2.8.4 states that the operational phase is scoped out from further assessment but would raise the matter of access to this and other adjacent energy sites in terms of HGVs and AILs if required during the operational phase. The County Council is	N	Whilst an assessment of the operational phase is scoped out of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** (as agreed with SCC), National Grid is maintaining ongoing dialogue with the County Council in its capacity as the Highways

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			concerned that the locations are not accessible by large vehiclParticularly if highway mitigation, for example haul roads, have been removed post construction.		Authority, including thematic workshops covering traffic and transport impacts which have been to be addressed in the ES. Details relating to permanent access points are also provided within the Transport Assessment Note which has been prepared for Suffolk (**Application Document 6.2.2.7.A ES Appendix 2.7.A Transport Assessment Note**).
		Traffic and transport	8.28 Whilst the study area for transport was agreed with SPR for the EA1(N) DCO this was revised when considering the in combination impacts of the SPR projects and SZC. This resulted in the scope being widened in Figure 2.2 in the EA1(N)& EA2 Sizewell C Cumulative Assessment Note https://infrastructure.planninginspectorate.gov.uk/wp-content/ipc/uploads/projects/EN010077/EN010077-004035-ExA.AS-6.D6.V2%20EA1N&EA2%20Sizewell%20C%20Cumulative%20Impact%20Assessment%20Note %20(Traffic%20and%20Transport).pdf.	N	National Grid acknowledges this feedback. The proposed study area for the traffic surveys and assessment within the ES has been agreed with the Council as part of the transport thematic meetings. The agreed study area and traffic surveys which were carried out in 2024 based on the agreed survey specification form the basis for the assessment set out in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport, inter-project cumulative effects	8.29 The County Council is concerned that the cumulative impact of this project with the consented EA1(N), EA2 and SZC when combined with this project and potentially LionLink may have significant impacts on the A12 as far south as the A12/A14 Seven Hills Roundabout. 8.30 As a minimum a sensitivity test should be undertaken to ensure that traffic from the three combined connector schemes do not exceed 30% (2.8.4.7), nor should this value of 30% be taken as definitive as uncertainties are built into the original base surveys and increase as assumptions are applied within the methodology. the County Council would expect the IMEA Rule 1 and 2 to form the starting point for assessment • Rule 1 Include highway links where traffic flows will increase by more than 30% (or the number of heavy goods vehicles will increase by more than 30%) • Rule 2 Include highway links of high sensitivity where traffic flows have increased by 10% or more	N	It is acknowledged that the Proposed Project will be under construction alongside projects schemes in the area which have been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. This Chapter is based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List** which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. The traffic and transport cumulative assessment includes the A12 to the north and south of the study area and the additional traffic to be generated on this part of the network by the Proposed Project and other cumulative schemes, based on the same Institute of Environmental Management and Assessment (IEMA) Guidelines for the Environmental Assessment of Traffic and Movement thresholds and assessment criteria, which have informed the assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport	8.31 It would be helpful to define the meanings of primary general traffic, LGVs and HGVs (2.8.4.9), for example is an HGV considered to be >3.5 tonnes or >7.5 tonnes?	N	Noted, this clarification has been provided within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport	8.32 When considering sensitivity (2.8.4.16) reliance should be placed on data rather than using professional judgment as the latter is open to challenge.	N	National Grid acknowledges this feedback. Sensitivity levels have been based on data where possible (such as queue lengths for driver delay and collision data for road safety), and supported by (rather than relying on) professional judgement where necessary. The sensitivity levels are

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					set out within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport, intra-project cumulative effects	8.33 The identified peak year of construction of 2029 (2.8.4.14) would mean that this project will be being constructed as Sizewell C reaches its peak construction year. Therefore, the County Council considers that the SZC peak year traffic data should be used in the cumulative impact assessment.	N	National Grid acknowledges this feedback. This has been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for traffic and transport, which has been informed by peak year traffic data for Sizewell C.
		Traffic and transport, walking, cycling and horse-riders	8.34 The County Council would welcome discussions regarding the sensitivities proposed in table 2.8.6 to table 2.8.10 with a view to agree these. For example, the County Council considers that the length and duration of diversion has an impact on delay and that the use for PRoWs (table 2.8.10) should be based on evidence rather than judgement.	N	As part of thematic meetings, the assessment approach to PRoW has been discussed and agreed with stakeholders. The thresholds for impacts on PRoW diversions and closures are set out within assessment criteria assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. This considers the additional journey lengths and durations associated with any proposed PRoW diversions. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared which provides further details of management and mitigation including PRoW closures and diversions.
		Traffic and transport, construction general	8.35 The road links referred to in 2.8.6.3 do not include that on the B1122 from Yoxford through Leiston to the B1353 at Aldrington, noting that this is shown going through the centre of Leiston. Grove Road north of Friston (2.8.7.4) is not considered by the County Council as suitable for any construction traffic. In addition to the junctions listed in 2.8.6.4 the County Council would consider that the A1094 /B1069 / C 247 Sternfield Road crossroads adjacent to Snape Church should be included as the SZC Transport Assessment noted that this was close to capacity in the peak year and concerns have been raised locally about road safety, particularly traffic exiting from the side roads into gaps in the traffic on the A1094. For clarity, the B1121 between the A12 at Sternfield and Friston (2.8.7.5) is subject to speed limits varying from 30mph to derestricted.	N	The construction vehicle routing has been designed to minimise impacts across the highway network (including the A1094, B1122 and B1069), as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. For example, the B1122 from Yoxford through Leiston to the B1353 at Aldringham will only be used by abnormal vehicles under careful management. Otherwise, this route will not be used by HGVs and the Proposed Project is not therefore expected to have any impacts on this route. This management plan has been informed by feedback received from Suffolk County Council, the design of the Proposed Project including and access and routing strategy as assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes the A1094/B1069/C247 Sternfield Road crossroads as requested, and does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the parts of the network identified (A1094, B1122 and B1069).
		Traffic and transport	8.36 The baseline traffic data listed in table 2.8.18 relies on DFT traffic counts are extrapolated for years between actual surveys and is dated (i.e. 2009). It is presumed the further surveys will be undertaken to show the current traffic flows and fill, in any gaps in coverage. Whilst using growth factors such as those in table 2.8.19 may be acceptable at this stage it would not be for the Transport Assessment / Environmental Statement.	N	The baseline traffic data within the **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** is based on recent traffic surveys which were carried out in accordance with the agreed survey methodology as reviewed and agreed with the Council.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Traffic and transport, safety	8.37 Further explanation is necessary regarding the data presented in Table 2.0.24 such as a more accurate description of the links (e.g. A12 (south of A104 junction), how far does this extend? The national averages in terms of collisions also require explanation particularly the selection of 'urban roads' and 'all roads other roads.' Both have high averages which appear to be related to roads within major built up areas as opposed to these roads which are part urban in minor settlements but predominately albeit sometimes with speed restrictions. the County Council would dispute the claims in 2.8.7.22 that the roads are less sensitive to changes in traffic. the County Council is concerned that the number of collisions on the B1119 between the B1121 at Saxmundham and the junction to Grove Road in Knodishall has been under-estimated. There appear to be 3 slight injury crashes in Saxmundham, three more at or near the Give Road junction and another two slight and one severe injury related collision between, a total of nine.	N	The collision review has been updated within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and is based on full Personal Injury Collision data obtained from the Council. Further clarification has also been provided where requested.
		Traffic and transport, socio-economic, recreation and tourism	8.38 In addition to bus routes referred to in 2.8.7.25 and 26 the applicant should be aware that there is a significant bus network for transporting school children in this rural area. Such routes are sensitive to road closures.	N	Noted, this has been acknowledged in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. No road closures are planned as part of the proposals other than to accommodate abnormal loads or the construction of bellmouths if required.
		Traffic and transport, onshore mitigation	8.39 It is unclear if the permanent access routes are considered as embedded mitigation (2.8.8.2) in Volume 2, Part 1, Appendix 1.4.B, Outline Construction Traffic Management Plan (Suffolk Onshore Scheme) or Volume 2, Part 1, Appendix 1.4.F, Outline Schedule of Environmental Commitment and Mitigation Measures. Although referred to in 1.4.B.6.5 in the former it is unclear if this is as mitigation or as a practical measure to gain access?	N	The proposed permanent access routes will provide a practical measure to gain access during the operational phase.
		Traffic and transport	**Appendix 2.8.B Receptor Sensitivity Levels** 8.40 Due to high levels of workload the County Council associated with examination and delivery of DCOs have been unable to review the information available to meet the deadline for response.	N	National Grid acknowledges this feedback. Transport thematic meetings have since be held with the Council to review/ discuss any related-matters as necessary.
		Traffic and transport	**Appendix 2.8.C Baseline Traffic Flows** 8.41 the County Council notes that the date of the historical data falls between 2009 and 2019 and is dated. Extrapolation from these dates to 2023 introduces uncertainty and additional surveys should be undertaken prior to the application.	N	The baseline traffic data in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** is based on recent traffic surveys which were carried out in accordance with the agreed survey methodology as reviewed and agreed with the Council.
		Traffic and transport	**Appendix 2.8.D Preliminary Highway Impact** 8.42 Due to high levels of workload the County Council associated with examination and delivery of DCOs have been unable to review the information available to meet the deadline for	N	National Grid acknowledges this feedback. Transport thematic meetings have since be held with the Council to review/discuss any related-matters as necessary.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			response. It is unclear how the development traffic flows have been derived. **Appendix 3.8.E Magnitude of Impact** 8.43 Due to high levels of workload the County Council associated with examination and delivery of DCOs have been unable to review the information available to meet the deadline for response. **Appendix 2.8.F Preliminary Assessment** 8.44 Due to high levels of workload the County Council associated with examination and delivery of DCOs have been unable to review the information available to meet the deadline for response.		
		Traffic and transport, inter-project cumulative effects	**Chapter 14 Suffolk Onshore Scheme Inter-Project Cumulative Effects** 8.45 With reference to Table 2.14.6 Seven Hills FMF. The FMF will still be operational in 2029, indeed approaching its peak use as the Sizewell C project reaches its peak in terms of HGV deliveries. Similarly, Table 2.14.8 Northern Park and Ride and table 2.14.9 Southern Park and Ride will both be operating close to or at their peak capacity as the SZC workforce reaches its maximum. 8.46 Tables 2.14.11 and 12 SPR EA1(N) and EA2 are expected to commence in the next few years but a date has not been confirmed. There remains a risk that some overlap in transport impacts may occur if the schemes are delivered sequentially over 5 years, particularly as transport peaks are expected at the end of the construction phase as the haul roads and site compounds are removed. 8.47 Table 2.14.17 Brightwell Lakes. The site access on the A12 is completed but the improvements at the Foxhall Roundabout are conditioned against a quantity of dwellings that can be occupied. There is uncertainty when this will be realised and hence when the highway improvements will be completed. Note that some of the other off site highway improvements will be incorporated in the A12 MRN scheme. 8.48 Table 2.14.45 the County Council does not recognise the traffic flows presented in this table as they appear to underrepresent the movements associated with the Sizewell C development. Table 8.7: 2028 peak construction – forecast daily (24-hour) AAWT traffic flows in https://infrastructure.planninginspectorate.gov.uk/wp-content/ipc/uploads/projects/EN010012/EN010012-005601-The%20Sizewell%20C%20Project%20-	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. In terms of PRoW closures/ diversions, these will be coordinated with other committed developments where necessary (as identified above) to reduce the potential for significant cumulative effects. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. This Chapter is based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**, which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, Nautilus, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. The traffic and transport cumulative assessment considers the additional traffic to be generated across the highway network (within the study area) by the Proposed Project and other cumulative schemes, based on the same assessment criteria assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			%20Consolidated%20Transport%20Assessment.pdf shows greater traffic movements associated with SZC peak year.		Robust assumptions have been made with respect to adopting peak construction traffic flows associated with Sizewell C and the SPR schemes. In terms of operation, the highway improvements identified would increase the capacity of the highway network to accommodate construction traffic associated with the Suffolk Onshore Scheme. Nonetheless, for the purposes of **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** it has been assumed that none of these improvements would be in place for robustness.
		Traffic and transport	**Structural Capacity of Bridges** 8.49 In its capacity as Local Highway Authority SCC regularly reviews weight restrictions on bridges it maintains. Following a review of structures in the Saxmundham area there have been a number of changes that are detailed below. SCC would encourage discussions with any developers with regard to these restrictions. [See Table and Figure page 35-36]	N	National Grid is aware of the weight restriction recently placed on the road over rail bridge on the B1121. This could impact on the use of the bridge for AIL movements. Further assessment of the bridge and or the installation of temporary works to facilitate the crossing of this structure will be undertaken at detailed design in consultation with the Council's structures team.
		Traffic and transport	**Appendix 1.4.B Outline Construction Traffic Management Plan (Suffolk Onshore Scheme)** 8.50 Little mention is made of the A12 which would form the main access road between the project and the SRN, noting that the A12 north of Seven Hills is maintained by the County Council and is not part of the SRN (1.4.B.2.6). Whilst the SZC highway improvements will aid congestion at those specific locations on the A12 (1.4.B.3.2) other locations remain of concern to the County Council. Funding has been secured to develop a scheme to improve the A12 between Seven Hills and the A12/A1152 junction north of Woodbridge but this itself will not resolve all areas where congestion or road safety may be of concern.	N	National Grid acknowledges this feedback. The study area for **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** has been agreed with the Council based on the parts of the highway network where impacts may arise as a result of the proposals (which includes localised sections of the A12). An assessment of Driver Delay and Road Safety is carried out in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** for the surrounding highway network, which includes the A12 within the agreed study area. The study area excludes areas where no impacts are expected as a result of the proposals (such as parts of the A12 further afield). Nonetheless, considerations relating to the Strategic Road Network (SRN) including the A12 corridor between the A14 and Lowestoft are set out in the Transport Assessment Note (TAN) which has been prepared for Suffolk (**Application Document 6.3.2.7.A ES Appendix 2.7.A Transport Assessment Note**) in support of the traffic and transport chapter. Details relating to the improvements to be implemented on the A12 as a result of other projects (such as Sizewell C), and potential localised improvements which may be required on the A12 to accommodate Abnormal Indivisible Loads (AILs) associated with the Proposed Project are included in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Traffic and transport, construction, inter-project	8.51 Table 1.4.B.1 indicates that workers will arrive between 0700-0800 and leave between 1800-1900, presumably to avoid the network peak. the County Council notes that all NSIPs are applying this approach and there is a significant risk that in combination this will result in the peak being displaced to the shift hours. In any	N	Noted, these shift patterns/ worker movements will be secured as part of **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Traffic and Transport** includes assessments of both the network peaks and the development

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		cumulative effects	case, the County Council notes that this shift pattern and hence workers movement is not secured in the CTMP.		peaks. There are no significant effects following implementation of the **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** and no additional mitigation measures are therefore required. It should be noted that overlapping worker shift patterns have also been considered as part of the Traffic and Transport cumulative assessment within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Inter-Project Cumulative Effects**.
		Traffic and transport	8.52 The length given in 1.4.B.5.27 for AILS but not weight. A feasible AIL route will need to be provided in terms of dimensions (width, length, height) and weight.	N	The exact dimensions and weights of the AILs will be provided at detailed design and coordinated through the AIL movement planning procedure set out by the Council. It is anticipated that the transformer AIL movements will be in the order of 350T whilst the cable drums would be approximate 80-100T.
		Traffic and transport	8.53 Some of the routes proposed in 1.4.B.6.3 are not considered appropriate by the County Council for significant volumes of construction traffic. Section 1 (Thorpe Road), Section 3 (B1353 Aldringham Lane, B1122 Aldeburgh Road), Section 8 (B1121 Aldeburgh Road), Section 9 (Grove Road), Section 9 (B1121 Church Hill, The Street), Section 12 (B1121 and B1119 from A12 through Saxmundham), Section 14 (B1119 and Mill Road Saxmundham) are all of concern due to their evolved nature, narrow width, and frequent bends. Details on many have been provided in the LIR for SPR EA1(N), EA2 and SZC. It is unclear which road Section 13 refers to as the B1110 is not a road in Suffolk.	N	In response to Council's review of individual routes, the following list sets out the intended use of each link made reference to as detailed within **Application Document 6.2.2.7 Part 2 Suffolk Traffic and Transport** and **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**: Thorpe Road - light vehicles only for monitoring purposes during the drilling process; Aldringham Lane - Cable drum movements under controlled conditions, no other construction access; B1121 Aldeburgh Road - access to existing overhead line infrastructure only, limited HGV movements less than 10 HGVs per day over a short period; Grove Road - monitoring access only for operational phase; no construction traffic; B1121 Church Hill/ The Street - monitoring and maintenance access only for operational phase; no construction traffic; B1121 and B1119 through Saxmundham - construction traffic HGVs limited to less than 10 per day to enable construction of the proposed western access only; B1119 and Mill Road - not proposed as an access for the works; and Section 13 was the B1119 between BM10 and BM08; this section is no longer required as the northern access has been removed from the Proposed Project. Please note, the reference to the B1110 within the PEI Report was a typo, and has been corrected to the B1119. As above, the proposals for each route are set out in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and reflected within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. The construction

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					vehicle routing has been designed to minimise impacts across the highway network and no significant impacts are expected as a result.
		Traffic and transport	8.54 The County Council notes there is an intention to use the B1122 Leiston Road to access the construction site north of Aldeburgh. The geometry at the A1094 / B1122 Roundabout was matter discussed in detail at the EA1(N) and EA2 examination where it was considered that use by articulated vehicles was a significant concern. The B1353 Aldringham Lane also has constrained geometry and is narrow for a B road.	N	Feedback received on both these points has led to a restriction on their use. By the nature of the works that will be undertaken using these routes, the flow of construction vehicles through Aldeburgh will be limited to less than 10 per day and the B1353 Aldringham Lane is only to be used by cable drum delivery vehicles following good practice in the Plan referenced below. Further details of construction vehicle routing and the limitations of construction traffic vehicle movements on these parts of the network are set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. Should any commitments be required to limit HGV movements on any specific parts of the highway network, then this will be reviewed with SCC Highways and set out within the Detailed CTMTP if necessary.
		Traffic and transport, construction	8.55 The SPR EA1(N) and EA2 projects judged that the B1121 through Friston was inappropriate for use by construction vehicles and proposed access to the substation and converter stations were to be accessed via a haul road from the B1069 south of Knodishall. The applicant does not appear to be following this approach (1.4.B.5.26) which is of concern to the County Council. Similarly, the County Council argued in the SPR that the B1119 between Saxmundham and Leiston is also unsuitable for construction traffic but is proposed for use by NG (1.4.B.5.32 and 33).	N	The B1121 through Friston is only being used to access the existing overhead line towers where minimal alteration works and scaffold works would be required along the existing overhead line on the approach into the proposed substation. All Substation construction traffic would access the Substation via the haul road. The use of the B1119 for construction is only to facilitate the construction of the new access (enabling bridging of the Fromus to be constructed); this access is key in removing the majority of construction traffic from the B1119.
		Traffic and transport, onshore mitigation, consultation	8.56 The County Council welcomes the proposal to provide permeant access roads to the substation and convertor stations as we consider this is an acknowledgement of the challenging access to the convertor and substation sites via the local road network. Prior to commenting further, the authority would need more information to consider the impact of such permanent access routes and any legacy or other positive impacts associated with a well-considered route. Where field accesses are considered as permanent (1.4.B.6.6) due attention must be made to provide suitable visibility at junctions with the local road network.	N	National Grid acknowledges the Council's comments. The proposed permanent routes which will be used during the operational and maintenance phase are shown in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Further details of the permanent access points including visibility splays are shown within **Application Document 2.13.1 Design and Layout Drawings – Suffolk**. The Proposed Project is not expected to have any traffic and transport impacts during the operational phase with respect to maintenance/ operational vehicles using permanent access points, as detailed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport	8.57 The County Council acknowledges the use of DMRB for determining visibility splays for access roads (1.4.B.6.23). Many of the proposed access are on derestricted roads and therefore a y distance of 215m appropriate although only 120m is shown on the drawings in Annex A. Even a visibility splay of 120m will require significant removal of vegetation and the impacts of this should be included within the ES. Of concern are comments within drawing SEAL-MMD- SEAL-ENG-DWG-0356 that it may be difficult to achieve the visibility required by DMRB. This echoes our concerns that without highway boundary and topographic data it is unclear if the necessary visibility can be delivered within the order limits.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** includes details on visibility splays and states that vegetation clearance will be carried out to achieve appropriate levels of visibility, subject to agreement with the local highway authority. This is secured by Requirement 6 of Schedule 3 to the draft DCO (**Application Document 3.1**). Where visibility splays to DMRB standard cannot be met, mitigation will be implemented as agreed with the local highways authority. This could include reduced speed limits for the duration of the use of the proposed accesses.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Habitat loss, such as vegetation removal from the creation of necessary visibility splays, is considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Traffic and transport	8.58 We would refer NG to Appendix F of Suffolk Design for the County Council's visibility guidance https://www.suffolk.gov.uk/asset-library/imported/5647-21- Suffolk-Design-Street-Guide-v26.pdf	N	National Grid acknowledges the Council's comments. This guidance, along with guidance within the Design Manual for Roads and Bridges, has been applied for the preparation of the access designs. These are set out in **Application Document 2.13.1 Design and Layout Drawings – Suffolk**. The visibility splays have been informed by 85th percentile speeds based on traffic survey data where available.
		Traffic and transport	8.59 Vehicle swept paths are dependent on the existing road layout not just a generic bell mouth design and need to be treated with caution if being proposed to show that access layouts are feasible.	N	Specific bellmouth designs have been shared with the Council on multiple occasions for feedback on location, visibility splay and proposed mitigation and these include site specific vehicle tracking. These designs are set out in **Application Document 2.13.1 Design and Layout Drawings – Suffolk** and described within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**.
		Traffic and transport, design	8.60 Trenchless crossings are preferred to trenched crossing of the public highway (1.4.B.6.27) to reduce disruption to road users and damage to the fabric of the highway. Where road widths are less than 7.4m is not usually feasible to trench across a road under two-way traffic control due to the required safety clearances.	N	Trenchless crossings will be utilised where viable e.g. the landfall will be completed via trenchless techniques so only light vehicle access is required for monitoring purposes. Where roads are narrower than 7.4 m it is proposed to have road closures and local diversions to undertake the works. These can be programmed to minimise impacts and will be discussed further with the local highways authority. The measures in respect of potential road closures and diversions are set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**.
		Traffic and transport	8.61 During the SPR examination all parties were advised that Network Rail had placed a 100-tonne weight limit on the rail bridge on the A104 at Farnham (Table 1.4.B.12).	N	National Grid is aware of the weight restriction on the A1094 Network Rail structure and was identified as a constraint by National Highways' website portal Electronic Service Delivery for Abnormal Loads (ESDAL) and is acknowledged in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. It is expected that the contractor will review all access constraints in more detail at a later stage and carry out additional assessments where necessary, alternative routes will be used if necessary.
		Traffic and transport, consultation	8.62 No details have been provided with regard to the extent of the highway improvements proposed at the A1094/B1121 junction at Friston (1.4.B.7.6), presumably these will be to allow turning from the A1094 eastbound to the B1121 northbound and vice versa. It is unclear what junction is referenced as the A1096/ Snape Road, but it may reflect the authorities concerns regarding the safety and capacity of the A1094/B1069 junction adjacent to Snape Church.	N	No improvements are now planned at the A1094/B1121 junction as only limited construction traffic is required to access existing overhead line assets. The A1094/ Snape Road junction is the A1094/B1069 junction where localised widening is proposed to enable the movement of HGVs and cable drums AILs through this junction. Information regarding the potential for localised widening is set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk.** The Detailed Plan will include the specifics of any carriageway widening, or improvement works if required.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Traffic and transport, construction	8.63 The County Council welcomes the draft management and control measures but notes that these measures will need to quantify and secure a number of key elements such as maximum HGV movements to ensure that the impacts assessed in the TA and ES are not exceeded. Regarding workers movements, if reliance is placed on shift patterns to avoid workers or visitors travelling in the network peak (1.4.B.7.38) this should be secured within the management plans.	N	Noted, these shift patterns/ worker movements will be secured as part of **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. This document contains details of measures, monitoring and compliance processes in respect of HGV movements. Should any additional commitments be required, such as to limit HGV movements on any specific parts of the highway network, then this will be reviewed with Suffolk County Council Highways and secured within the detailed Construction Traffic and Travel Management Plan if necessary.
		Traffic and transport	8.64 In terms of enforcement, it is unclear what actions will be taken to ensure compliance (1.4.B.8.5).	N	Section 8 of **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** outlines the details of the actions to be taken to ensure compliance.
		Traffic and transport	**Highways Non-Statutory Consultation Response** **Availability of Information** 8.65 NGET will be aware that a number of recent NSIPs have been submitted and given consent for the local area. Most notably: • The Sizewell C Project: https://infrastructure.planninginspectorate.gov.uk/projects/eastern/the-sizewell-c- project/ • East Anglia One North Offshore Windfarm https://infrastructure.planninginspectorate.gov.uk/projects/eastern/east-anglia-one- north-offshore-windfarm/ • East Anglia Two Offshore Windfarm https://infrastructure.planninginspectorate.gov.uk/projects/eastern/east-anglia-two- offshore-windfarm/ 8.66 A large amount of information and data is available from these projects, and this should be considered as part of the development of the NGET proposals. We would recommend that there is close collaboration between NGET, SPR, Sizewell C Co., East Suffolk Council and Suffolk County Council. The Sizewell C project in particular contains a significant amount of new or improved transport infrastructure that, if the project is completed, will provide more suitable access in the north parts of Suffolk being considered by Sea Link.	N	It is acknowledged that the Proposed Project will be under construction alongside other projects in the area which has been considered in the inter-project cumulative effects chapter of the ES for each discipline, including Traffic and Transport. The full assessment is available within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Inter Project Cumulative Effects**. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. In terms of PRoW closures/ diversions, these will be coordinated with other committed developments where necessary (as identified above) to reduce the potential for significant cumulative effects. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**.
		Traffic and transport,	8.67 As set out in the consultation documentation, NGET are also aware of proposals associated with the LionLink HVDC project and	N	National Grid acknowledges this feedback. National Grid will maintain ongoing dialogue on this matter.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		coordination with other projects	have considered options for a coordinated approach to the sites. NGET should continue discussions with these projects to minimise highway impacts on the local communities, such as requirements for materials and associated HGV movements, workforce numbers and traffic management on the highway network. All efforts should be made to reduce traffic impacts via a coordinated approach to site location.		
		Traffic and transport, construction	8.68 As no information is provided on vehicle or construction workforce forecasts, nor on exactly how traffic movements may be reduced through the use of haul roads, the ability for The County Council to comment is limited and so The County Council's position on impacts at locations may be subject to change.	N	National Grid acknowledges this feedback. Further clarity on construction vehicle and workforce forecasts have been provided within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. This ES chapter includes details of the proposed access strategy and use of haul roads as part of the delivery of the Proposed Project. For example, the accesses on Grove Road (S-BM05 and S-BM06) will be accessed via the internal haul road and used as a vehicle crossover only to prevent the requirement for construction vehicles to use and turn to/ from Grove Road to use these access points.
		Traffic and transport, inter-project cumulative effects	**General Comments** **Assessment Methodology** 8.69 As set out above, a considerable amount of work on traffic impacts has already been undertaken for the local area, and due regards should be paid to the impacts identified within any assessment NGET undertakes, including the potential for cumulative and contiguous impacts and appropriate assessment scenarios. Given the complexity of the impacts in the area (e.g. a number of different projects with different timings for mitigation) assessment scenarios should be agreed with the relevant authorities to ensure impacts are captured. The contiguous impacts we consider relevant are the repeated closure or diversion of public highways including public rights of way and the increased duration of the impacts that residents, businesses, and highway users will endure as each NSIP follows the previous one with a constrained geographical area.	N	It is acknowledged that the Proposed Project will be under construction alongside other projects in the area which has been considered in the inter-project cumulative effects chapter of the ES for each discipline, including Traffic and Transport. The full assessment is available within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. This Chapter is based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**, which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. The traffic and transport cumulative assessment considers the additional traffic to be generated across the highway network (within the study area) by the Proposed Project and other cumulative schemes, based on the same assessment methodology assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. This therefore applies a higher level of sensitivity to receptors where sensitive land uses are present nearby, such as schools, play areas, care/retirement homes, hospitals, places of worship, historic buildings and residential properties. Robust assumptions have been made with respect to adopting peak construction traffic flows associated with Sizewell C and the SPR schemes. Furthermore, cumulative considerations relating to PRoW diversions and closures have been included as a result of the Proposed project. Masterplanning is also being undertaken in order to ensure effective coordination takes place with regard to the impacts on PRoW, the co-location illustrative masterplan information can be found within **Application Document 7.10 Coordination Document**. For example, the Order Limits in the vicinity of Saxmundham Converter Station is crossed by two PRoW running north-south (PRoW E-491/005/0) and east-west

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					(PRoW E-491/006/0). Whilst PRoW diversions are required, these have been designed and co-ordinated with other projects in this area (e.g. LionLink) to minimise additional journey distances, re-join existing routes and improve route connectivity. The permanent diversions have been embedded into the master planning of the Proposed Project (including in consideration of temporary construction compounds), to fully consider the long-term future of the site and to avoid the need for subsequent diversions.
		Traffic and transport, inter-project cumulative effects, coordination with other projects	8.70 Consideration should be given to the assessment methodology for environmental effects, as set out in the Sizewell C Project 'Fourth Environmental Statement Addendum' [REP7-030] and [REP7-032], which was agreed between SZC Co. and The County Council, including categorisation of links and magnitude of impacts. Consideration should also be given to the scope of the assessed network as part of the East Anglia Projects.	N	National Grid acknowledges this feedback. Consideration has been given to the Sizewell C assessment methodology where necessary, i.e. where this does not contradict the Proposed Project EIA methodology. However, the assessment methodology for environmental effects (including the categorisation of links and magnitude of impacts) within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** primarily follows best practice guidance from the 2023 IEMA Guidelines for the Environmental Assessment of Traffic and Movement. The study area of the ES Traffic and Transport Chapter has been agreed during the transport thematic meetings with the Council and is detailed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport, onshore environmental impact	8.71 As part of any submission, a Transport Assessment and a separate Environmental Assessment of road traffic should be submitted. We consider that early consultation with the Local Highway Authority to determine the scope of such an assessment will be of benefit to the Applicant.	N	Transport thematic meetings have been held with the Council to review the scope of the Transport Assessment Note. An ES Traffic and Transport chapter has also been prepared and is contained within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport	8.72 Discussions will be needed over issues around traffic forecasting and the reliability of current traffic data due to Pandemic and Post Pandemic traffic volumes.	N	The baseline traffic data within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** is based on recent traffic surveys (2024) which were carried out in accordance with the agreed survey methodology as reviewed and agreed with the Council.
		Walking, cycling and horse riders, traffic and transport	8.73 Assessment of the impacts on Public Rights of Way should be treated as a specific topic area rather than encompassed within landscaping, social economic or transport sections. This enables a full appreciate of the impacts on the PRoW to be evaluated.	N	The approach to where PRoW are assessed follows EIA established best practice and the structure is considered typical of most EIAs. The proposed methodology covers all of the specific assessment criteria that Suffolk County Council include on PRoW in their Public Rights of Way and Green Access Supplementary Guidance Document, albeit presented in a different way. Thematic meetings held with Suffolk County Council have discussed this matter further and National Grid has provided a technical note setting out their robust approach to assessing PRoW in the EIA.
		Construction, inter-project cumulative effects, traffic and transport	**Work Force** 8.74 NGET should bear in mind that due to the number and scale of projects in the area, the availability of the workforce is likely to be limited, and any assumptions around workforce origins would affect the development's traffic impacts. It is important to agree the method for assessing these effects early in the project.	N	**Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** study area section sets out that employment generation during the construction phase will be assessed within a 60 minute travel area, based on research by the Chartered Institute of Personnel and Development. **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** also sets out the additional assumptions applied to the assessment which

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					have been informed by professional judgment and experience on comparable DCO schemes.
		Inter-project cumulative effects, programme, traffic and transport	8.75 The proposed timings of this project places delivery close to the peak of the Sizewell C construction work force (2028). Hence, there will be considerable pressure on securing workers for these energy projects. It is likely that the demand will require robust assumptions to be made in the workforce assessment model such as distances workers will travel. This, the relatively limited public transport in East Suffolk and location of project elements away from towns will provide a challenge to delivering a Travel Plan to facilitate sustainable travel patterns. Without some innovative measures it is likely that the result will be more, longer journeys by local workers on the local transport network.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** is based on the worst-case assumption that all staff will travel by vehicle as it is acknowledged that the potential to access the Site by other means such as public transport will be limited. Nonetheless, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** includes measures to encourage construction workers to travel by sustainable travel modes where possible, such as walking, cycling and using public transport. This also includes other measures to reduce vehicle trips on the surrounding highway network such as a Car Share Scheme and an internal minibus service to transport construction workers around the Site. The cumulative assessment, which takes account of the development of Sizewell C is available within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The cumulative assessment of the Sizewell C main development site includes construction traffic during the peak construction phase. The trip generation forecasts have been taken from the Consolidated Transport Assessment which informed the DCO submission for Sizewell C, including Tables 8.7 and 8.8 (of the Consolidated Transport Assessment) which identified forecast traffic flows across the network during the peak construction phase for the weekday peak hours and across the day. These vehicle trips also include other elements of Sizewell C during the construction phase, including the Northern park and ride and Southern park and ride. It is therefore considered that a robust assessment has been carried out for the Sizewell C main development site by considering additional vehicle trips associated with the peak construction phase of the development which include other elements of Sizewell C.
		Traffic and transport	8.76 The SPR and Sizewell Projects relied heavily on data from the 2011 census although it was recognised at the time that this data was dated and hence treated with caution. All data should be as recent as practical and where assumptions are made these are clearly explained and where possible evidenced.	N	Noted, it has not been necessary to use Census data to inform the staff vehicle trip distribution within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** as this has been determined based on a first principles approach. It has been assumed that all vehicles would travel to/ from the site via the A12 (north and south) and then via the most logical route to/ from each construction access.
		Traffic and transport, geology and hydrogeology, cultural heritage	**Pre-commencement** 8.77 Most NSIPs provide exemptions in the form of permitted works that can occur before commencement of the project. Typically, this includes site investigations, archaeology, and some elements of site clearance. As management plans typically only operate from commencement this has caused issues controlling transport impacts during these pre-commencement works with resultant complaints from local residents. The NGET should be mindful of this when considering the structure and implementation	N	National Grid has considered this comment in preparing **Application Document 3.1 draft Development Consent Order**, in particular Schedule 3, Requirements. A description of the enabling works are included within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid has considered the approach to and definition of 'commencement' and the controls applicable including via management plans. For example, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk** include management and mitigation measures relating to the construction

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			of plans, or for example if pre- commencement works should have separate management plans, as in EA1(N).		phase of the Proposed Project, including pre-commencement activities such as mobilisation works where these details are known. Should there be a requirement to prepare specific pre-commencement management plans, then this can be reviewed post-submission.
		Onshore route location, coordination with other projects, traffic and transport	**Reducing Disruption** 8.78 NGET will need to give strong consideration to how to minimise disruption on the local communities; their potential cable corridor might share its route with other projects and again how to minimise impacts on the local communities and the highway network needs to be fully considered, including where appropriate the use of a haul route along the corridor.	N	National Grid acknowledges this feedback. Haul roads along the route have been provided to minimise construction movements on the local network. This is described within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. For example, the accesses on Grove Road (S-BM05 and S-BM06) will be accessed via the internal haul road and used as a vehicle crossover only to prevent the requirement for construction vehicles to use and turn to/ from Grove Road to use these access points. Coordination amongst the several energy projects planned for Suffolk in the years ahead features as a significant theme of statutory consultation feedback. Coordination is a key consideration for the Proposed Project. The Proposed Project has therefore been designed to allow space for the future delivery of other projects. The Proposed Project is coordinating with other large scale infrastructure projects in Suffolk, noting that those other Projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other projects, inter-project cumulative effects, traffic and transport	8.79 Due regards should be paid to the Management Plans and Travel Plans submitted as part of the Sizewell C and East Anglia Projects above, as these will give an indication of the expected management measures, controls, and monitoring for managing freight and workforce traffic to be included within relevant management plans. Where NSIPs overlap this should include measures to coordinate theses with other developers so that cumulative impacts are minimised.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** includes complimentary management measures, controls and monitoring information to those set out within the management plans for Sizewell C and East Anglia Projects where applicable. National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The assessment of inter-cumulative effects with other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Construction, traffic and transport	**Traffic Impacts** 8.80 The County Council will need to understand impacts associated with all traffic during construction, operation, maintenance, and decommissioning, including freight and workforce movements, and the profile of traffic movements. In accordance with national planning guidance consideration must be given to achieving as sustainable a transport strategy as possible.	N	National Grid acknowledges this feedback. Details of forecast traffic movements associated with construction, operation, maintenance and decommissioning are set out within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. An assessment of the forecast impacts on the road network as a result of the Proposed Project during the construction and decommissioning phases is set out in Section 7.9 of this ES chapter. Traffic and transport effects associated with the operational and maintenance phase are scoped out of the assessment as this is likely to only include up to four daily car/Light Goods Vehicle (LGV) trips associated with two staff members who will be on-site or on-call at all times for the proposed Saxmundham Converter Station and monthly substation inspections and annual maintenance visits for Friston Substation and Saxmundham Converter Station. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** is supported by the **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** which includes measures to promote sustainable travel for construction workers where possible, such as walking, cycling and using public transport. This also includes other measures to reduce vehicle trips on the surrounding highway network such as a Car Share Scheme and an internal minibus service to transport construction workers around the Site.
		Construction, traffic and transport	8.81 Due regards should be paid to those areas where mitigation has been identified for the above projects, including the potential for complementary mitigation to these schemes.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** includes similar management measures, controls and monitoring information to those set out within the management plans for Sizewell C and East Anglia Projects where relevant, including for example in relation to HGV movements and

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					controlling their timings and routes to minimise impacts on the surrounding highway network.
		Inter-project cumulative effects, walking, cycling and horse-riders, traffic and transport	8.82 Particular key areas of concern that should be considered on the local highway network are: • Additional traffic through Leiston, Coldfair Green, Knodishall and Aldringham (B1069). • Additional traffic through Saxmundham (B1069, B1119, B1122). • Additional traffic on the A12 corridor e.g. Marlesford and Little Glemham (mitigation is proposed as part of both of the East Anglia projects and the Sizewell C project). • Additional traffic on the B1069 through Snape (mitigation is proposed as part of both of the East Anglia projects). • Additional traffic on the A12 through Farnham and Stratford St Andrew, either prior to or in the absence of the SZC Co. Two Village Bypass scheme depending on the progress of that project. • Additional traffic through Yoxford (A12/B1122/A1120) either prior to or in the absence of the SZC Co. Sizewell Link Road (and consideration of local improvements along the B1122 proposed as part of the East Anglia projects and the Sizewell C project). • A12 / A1094 junction either prior to or in the absence of the SZC Co. roundabout, which forms part of the Two Village Bypass scheme or in the absence of the A12 / A1094 traffic signal scheme, which forms a road safety measure for the junction, but would only be delivered due to delays to the delivery of the aforementioned roundabout scheme. • Additional traffic through Blythburgh (A12/B1125). • Additional traffic through Westleton and Middleton (B1125). • A1094 / B1069 western junction. • A1094 / B1069 eastern junction, which includes some minor road safety mitigation as part of both of the East Anglia projects and the Sizewell C project. • Increased use of the whole A12 corridor between the A14 Seven Hills Interchange and Lowestoft. • Impacts on local C and unclassified roads used for access to the cable corridor or landfalls • Impacts on the Rights of Way Network. • Potential interaction between delivery of mitigation and the Project's traffic (see the Sizewell C Implementation Plan).	N	The description of the route and the assessment as detailed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** sets out all of the road links, junctions and PRoW (including national walking and cycling routes) that may be subject to potential effects as a result of the Proposed Project. This includes reference to routes raised by Suffolk County Council as key areas of concern. For example, the southern access on the B1121 has been taken forward, which will minimise construction vehicles passing through Saxmundham. In addition the B1122 is proposed as an AIL access only; it has not been used as a construction access due to the potential impact of routing construction traffic through Leiston and Coldfair Green. A robust assessment has also been carried out for the A12 and associated junctions (the HGV trip distribution for the A12 has been informed by the HGV distribution adopted for Sizewell C). The construction vehicle routing has been designed to minimise impacts across the highway network (including the A1094, B1122, B1069 and B1119), as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the parts of the network identified (A1094, B1122, B1069 and B1119). The proposed management and mitigation relating to PRoW is set out within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Walking, cycling and horse-riders, traffic and transport	8.83 Location of the onshore elements within an area poorly served by public transport and limited pedestrian and cycle infrastructure. 8.84 The list above should not be treated as being a definitive list of the authority's concerns as these may change as more details of the project are made available. 8.85 National Highways opinion should be sought regarding potential impacts on the Strategic Road Network.	N	National Grid acknowledges this feedback. Further discussions have been held with the Council based on the final design to inform the assessment of the local highway network within the **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** based on the updated construction vehicle routing strategy. The cycle and public transport infrastructure is also addressed within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** which includes measures to promote sustainable travel for construction workers where possible, such as walking, cycling and using public transport. This also includes other measures to reduce vehicle trips on the surrounding highway network such as a Car Share Scheme and an internal minibus service to transport construction workers around the Site. National Highways has also been consulted following feedback received during Statutory consultation. Further to this, considerations relating to the SRN including the A12 corridor between the A14 and Lowestoft are set out in the TAN which has been prepared for Suffolk (**Application Document 6.3.2.7.A ES Appendix 2.7.A Transport Assessment Note**) in support of the traffic and transport chapter.
		Onshore route location, construction, traffic and transport	**Access Arrangements** 8.86 The highway authority will need to understand the proposed access arrangements for constructing the cable corridor. This includes understanding of required visibility and vehicle swept paths in order to provide safe turning movements in/out of each access. This may require relevant speed surveys to understand visibility requirements or potential temporary speed limit changes to reduce impacts on hedgerows etc. NGET should identify what highway powers they will be incorporating within the application so that it is clear how permanent and temporary restrictions on the highway (including rights of way) are to be implemented.	N	The design of the accesses has been informed by traffic and speed surveys (including 85th percentile speed data where available), and swept path analysis, as set out in **Application Document 2.13.1 Design and Layout Drawings – Suffolk**, and described within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. Details relating to these matters are provided within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** including in Section 7 which outlines that the site access layouts have been designed to accommodate HGVs as shown by the vehicle swept paths displayed in **Application Document 2.13.1 Design and Layout Drawings – Suffolk**. A hardstanding surface will be provided at the proposed accesses to ensure the weight of the HGVs can be accommodated. Also, Section 7 of **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** outlines localised traffic management measures, where Temporary Traffic Management measures will be required to accommodate the construction of each of the access points, which could entail temporary traffic lights or stop/go signage, lane closures and diversions, and restrictions to pedestrian access and car parking. A number of highways provisions are incorporated within the draft DCO and the draft DCO has been shared with Suffolk County Council and National Grid has had regard to the comments raised by the County Council (see Section 20 of **Application Document 5.1.7 Appendix F Targeted Consultation**.
		Safety, traffic and transport	8.87 Details of the connection of the access tracks or crossing points will need to be provided to show that they are safe to use,	N	These details are provided within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and as

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			with the need for an adequate length of access road that is of a suitable width to allow two vehicles to pass safely and that this is not obstructed by gates preventing vehicles leaving the public highway. The access roads will need to be designed to prevent trafficking of mud and debris or the flow of water onto the public highway.		part of the bellmouth drawings which have been supplied as part of the DCO. This Plan also includes measures that will need to be implemented by the construction contractors for wheel washing and site drainage. A Stage 1 Road Safety Audit will be carried out as part of the technical approval process for the preliminary design of the proposed site access points and crossovers for the Proposed Project.
		Construction, traffic and transport	**Abnormal Indivisible Loads (AIL)** 8.88 Further clarification will be needed over the potential for and number of Abnormal Indivisible Loads or abnormal loads that are expected to be generated by the proposed development. Including by relevant categorisation as follows: • STGO Category 1 • STGO Category 2 • STGO Category 3 • Special order movements.	N	AIL movements will be required for the Saxmundham Converter Station transformers these will either be routed via the B1121 Main Road or from the Snape Road Access (via Leiston). No AIL movements are required for the Friston Substation element of the project. The cable delivery drums may meet the AIL requirements depending on the detailed design and proposed section length to be used on the project, the number of cable drum movements will be defined at detailed design stage but it is assumed that approximately 40 vehicles will be required (22 for the HVDC and 18 for the HVAC). Details on the AIL are set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The exact dimensions and weights of the AILs will be provided at detailed design and coordinated through the AIL movement planning procedure set out by the council. It is anticipated that the transformer AIL movements will be in the order of 350T whilst the cable drums would be approximate 80-100T.
		Traffic and transport	8.89 As part of the East Anglia One (North) an assessment of the local AIL routes was undertaken, and this should be considered by NGET, along with the work required to understand any structural improvements that are necessary along the corridor.	N	National Grid acknowledges the Council's comments. Details on the likely routes to be used by abnormal loads and the constraints along these routes are contained within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. It is expected that the contractor will review all access constraints in more detail at a later stage and carry out any additional assessments (including structural assessments) where necessary. Alternative routes or temporary works will also be used if necessary.
		Coordination with other projects, construction, traffic and transport	8.90 In previous NSIPs, The County Council has highlighted the lack of coordination at all levels to provide and secure suitable permanent access for AILs. The current DfT preferred routes for high and heavy loads are out of date and in any case do not consider AILs that are not special-order movements. While some projects (e.g. EA1(N)) provide access to substation sites via haul roads during the construction phase these are not available for other projects nor in the operational phase. With the concentration of energy projects in East Suffolk The County Council consider it is not unreasonable for such infrastructure to be provided to support the industry.	N	National Grid acknowledges the Council's comments.
		Intra-project cumulative effects, onshore	8.91 The cumulative impacts of the energy proposals concentrating sub stations and convertor sites within the Saxmundham – Aldeburgh – Leiston triangle would, unless significant improvements are made to the highway infrastructure,	N	Principal accesses for the Proposed Project will be A12 via A1094 to B1069 and A12 to B1121; both are considered suitable for the proposed construction traffic requirements. All other accesses are limited to reflect the nature of the roads and their constraints.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		mitigation, traffic and transport	result in these facilities only being accessible by low standard minor rural roads.		**Permanent access routes:** Permanent access routes (taking access from the highway network) would be established to allow for the future maintenance of the Substation, the Converter Station, and the buried HVDC cable. To facilitate future replacement of the transformer, if needed, permanent access routes to the Substation and Converter Station would need to account for abnormal transformer and pick-up truck access. **Permanent field access routes:** Access to the cable routes would be needed and would be in the form of permanent field access routes, whereby an agreement with the relevant landowner is established to allow for access to the former construction swathe in each field that the cable passes through, following existing tracks and field entrances where possible. All field access routes have been designed to accommodate a 16.5 m articulated lorry, in the event that vehicles of this type are required for more significant repairs along the cable alignment during the operational period. Further information on access routes is provided in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. In terms of PRoW closures/ diversions, these will be coordinated with other committed developments where necessary (as identified above) to reduce the potential for significant cumulative effects. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.
	Traffic and transport, construction	**HGVs and LGVs** 8.92 The Applicant must provide clear definitions of the following: • HGV, LGV in terms of size. • Traffic movements i.e. a trip (single movement from an origin to a destination) or delivery (a movement from the origin to the destination and return to the origin). 8.93 Such terms should be used consistently in all documents and reflect relevant controls within the management plans.	N	National Grid acknowledges this feedback. Clear and consistent definitions have been provided within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and supporting documents such as the **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Walking, cycling and horse-riding, terrestrial ecology, onshore mitigation	**Net Gains on Public Rights of Way** 8.94 Significant discussions will be needed with the County Council PRoW team to minimise disruption and to identify relevant enhancements to the network. 8.95 Consideration should be given towards whether the linear nature of electricity networks infrastructure allows opportunities to connect people to the environment, for instance via footpaths and cycleways created in tandem with biodiversity enhancements.	N	Regular discussions have taken place prior to submission of the DCO application with the County Council PRoW team. Impacts on PRoW have been assessed, with appropriate mitigation set out where required within the design and as reported within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport, legislation and policy	**Maintenance** 8.96 The County Council will look to protect its role to enable it to discharge its legal duties and protect itself against future liabilities. This may be through legal agreement with the applicant, planning obligations, requirements, specific clauses of the management plans or by inclusion of protective provisions.	N	National Grid has considered this comment in preparing **Application Document 3.1 draft Development Consent Order**. National Grid has, as part of that drafting, reviewed the position in respect of maintenance provisions and controls. The draft DCO has an article dealing with maintenance of the authorised project, and requirement 6 of Schedule 3 of **Application Document 3.1 draft Development Consent Order** requires Host Authority approval of management plans dealing with highway matters.
		Legislation and policy, traffic and transport	8.97 It is expected that an agreement will be reached that will allow The County Council to recover reasonable costs including but not limited to: 8.98 Additional costs of routine, cyclic and emergency highway maintenance resulting from the Applicants' occupation or use of the highway. 8.99 Visual and structural condition surveys of the highway and contributions towards structural repairs. 8.100 Surveys and assessment of highway structures to facilitate AIL movements. 8.101 Damage to the Highway (in accordance with the provisions of Section 59 Highways Act 1980). 8.102 Creation of temporary traffic regulation orders (including The County Council consultation and issue of permits). 8.103 Relocating / removing street furniture and all other highway infrastructure to facilitate AIL movements. 8.104 Technical approval and inspection of highway accesses and cable crossings as detailed in the approved construction traffic management plan; and 8.105 Review of submitted materials for monitoring the final management plans.	N	National Grid has considered the position in respect of such costs and has and will continue to engage with the Council in its role as highway authority in respect of such matters.
		DCO process, legislation and	8.106 Agreements with Local Highway Authorities 8.107 The County Council considers it reasonable, and of benefit to the Applicant, to secure appropriate agreements to develop and	N	National Grid has considered this comment in preparing **Application Document 3.1 draft Development Consent Order**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		policy, traffic and transport	implement any highway works and recover its reasonable costs to do so. 8.108 Discharge of requirements relating to highways, including PRoW should be discharged by the LHA after consultation with the LPA.		107 - National Grid has considered the position in respect of such controls (and costs) and has and will continue to engage with the Council in its role as highway authority in respect of such matters. 108 - National Grid has considered the draft requirements and the wider order drafting, in light of this comment.
		Traffic and transport, intra-project cumulative effects	**Regional Access** 8.109 The main regional access route is the A12. The County Council are currently developing proposals to improve the A12 corridor between A14 'Seven Hills' and A1152 at Woodbridge; however, the proposal is subject to an application for Government funding. Separately, Sizewell C are proposing a bypass of Stratford St Andrew and Farnham; however, these improvements are subject to the project progressing. Despite these potential improvements on the A12 corridor there are a number of areas where transport impacts may occur. Examples would be between Woodbridge and Wickham Market Bypass (congestion / road safety), Marlesford and Little Glemham (traffic impacts on local communities, noise, air quality, vibration, and safety), between Yoxford and Lowestoft (single carriageway roads, road safety).	N	National Grid acknowledges this feedback. The study area for **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** has been agreed with the Council based on the parts of the highway network where impacts may arise as a result of the proposals (which includes localised sections of the A12). The study area excludes areas where no impacts are expected as a result of the proposals (such as parts of the A12 further afield). The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network (including the A12) during the construction phase with the proposed embedded mitigation and control and management measures in place including those identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. Considerations relating to the SRN including the A12 corridor between the A14 and Lowestoft are set out in the TAN which has been prepared for Suffolk (**Application Document 6.3.2.7.A ES Appendix 2.7.A Transport Assessment Note**) in support of the traffic and transport chapter. Information regarding the potential for localised highway improvements, including at the A12 junctions within the study area, is set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The detailed plan will include the specifics of any carriageway widening, or improvement works if required.
		Construction, traffic and transport	8.110 Limited road widths on the B1069 through Snape and the poor alignment of the junction of the B1069 and the B1078 at Tunstall make this route unsuitable for construction traffic. There are several aged structures at Snape that will need careful consideration regarding their load carrying capacity. Further south on the A1152 the level crossing and traffic signalised junction in Melton are both considered to be constraints on the local highway network in terms of capacity in peak periods. 8.111 There are several cross-country routes to the north of Ipswich that link to the A14 and / or A140. These are typically narrow winding minor A, B or C class roads (such as the A1120 or B1079) that pass through scattered communities. Some locations such as Coddenham have specific problems (very narrow road through buildings fronting the highway). These routes are unsuitable for construction traffic as has been recognised in recent NSIPs.	N	8.110 - It is not proposed to route construction traffic through Snape or Tunstall. The construction routing strategy is set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. 8.111 – National Grid acknowledges this feedback. These routes are excluded from the routing strategy for the Proposed Project. Details of the construction routing strategy are included in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Converter station location, construction, traffic and transport	**Converter Station** 8.112 The B1119 provides the only existing access to this convertor station. For access from the west all traffic would have to pass through Saxmundham and from the east through Leiston. Both have significant geometric constraints besides the impacts of construction traffic on the community. The B1119 between the towns has several sharp bends and occasional narrow pinch points making it unsuitable for construction traffic, again a matter discussed and agreed in recent DCOs.	N	National Grid acknowledges the Council's comments. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. For example, the access on the B1121 will minimise construction vehicles passing through Saxmundham. Construction traffic travelling through Saxmundham and to/ from the access on the B1119 will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than ten HGVs per day). In addition, the B1122 from Yoxford through Leiston to the B1353 at Aldringham will only be used by abnormal vehicles under careful management as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Otherwise, this route will not be used by HGVs and the Proposed Project is not therefore expected to have any impacts on this route.
		Converter station location, traffic and transport, safety	8.113 Whilst access via a haul road may be possible this can only realistically be from the A12 or B1122 (or Sizewell Link Road if constructed). The latter however would require significantly longer journeys to reach the site. The River Fromus Valley, East Suffolk Line (and potentially weight limits on the B1121 bridge over it) and Leiston Branch Line are constraints to the north, west and south. Access from the west would require a temporary bridge over the River Fromus. The use of the A12/B1121 junction at Benhall would be of concern to The County Council in terms of road safety with large vehicles turning across a dual carriageway, albeit one limited to 50mph speed limit.	N	The Proposed Project will use the B1121 / A12 junction as the access from the A12 for Converter Station traffic. National Grid would welcome further discussion on any concerns the Council has with the junction arrangement or use. The Proposed Project team currently deem this junction suitable for use. An assessment of road safety and hazardous/large loads is carried out within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** which includes the A12/B1121 junction and has been informed by personal injury accident data obtained from Suffolk County Council. The assessment does not identify any potential significant effects on this junction as a result of the Proposed Project. It is acknowledged that the weight limit on the road over rail bridge on the B1121 will need to be assessed further for AIL movements. Given the low number of movements required (7 transformer movements) it is proposed that temporary works to bridge the structure could be used to enable delivery of the transformers. This would require a road closure of the B1121 to facilitate the works and vehicle movements. The routing strategy, which includes a proposal for a bridge over the River Fromus, is set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Converter station location, traffic and transport, design	8.114 It is noted that when selecting sites, the Applicant has committed to considering the traffic and access opportunities, nature of adjacent roads and avoiding settlements, residential properties or	N	National Grid acknowledges the Council's comments.
		Coordination with other projects, traffic and transport, construction	**Co-ordination with other projects** 8.115 The County Council would strongly support co-location of landfalls, cable corridors and convertor station sites provided that suitable transport access can be provided during the construction and operational phases. Where possible this should also take	N	National Grid acknowledges the Council's support for its efforts to coordinate and co-locate infrastructure required for the Proposed Project with the infrastructure requirements of other projects. Coordination is a key consideration for the Proposed Project. Coordination amongst the several energy projects planned for Suffolk in the years ahead, features as a significant theme of Statutory consultation

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			advantage of transport improvements proposed for consented applications in the area.		feedback. While National Grid will not seek powers for the Proposed Project to consent and deliver elements of other projects, it is committed to maintaining dialogue with other developers, with a view to co-locating new infrastructure and coordinating delivery. Information on how National Grid is coordinating with other developers is contained in **Application Document 7.10 Coordination Document**.
		Coordination with other projects, traffic and transport, onshore mitigation	8.116 The proposed new access road from the B1122 / Eastbridge Road junction eastwards to Goose Hill could potentially form a corridor linking the S5 landfall to the converter site 3 alternative (option 2) although it is realised that there would be significant difficulties co-ordinating this proposal if delivered during construction of Sizewell C. It would however remove the cable corridor from the SSSI and environmental mitigation areas either side of Lovers Lane.	N	This cable route has been removed as an option for the Proposed Project. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** contain further information on this.
		Landfall location, traffic and transport, walking, cycling and horse-riders	**Landfall Specific Comments** 8.117 In the absence of a haul road, the landfall area can only be accessed from a narrow C road passing through parts of Aldeburgh or Thorpeness. This minor road although straight is narrow and used by significant numbers of cyclists.	N	The landfall will be completed via trenchless techniques so only light vehicle access will be required for monitoring purposes. The construction vehicle routing has been designed to minimise impacts across the highway network as set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Following receipt of feedback, traffic through Aldeburgh has been restricted to less than 10 HGVs daily, the majority of construction traffic will access the landfall location via the new haul road being constructed. Therefore, the Proposed Project is not expected to impact local routes to/ from the landfall area.
		Traffic and transport, walking, cycling and horse-riders	8.118 The B1353 from the B1121 at Aldringham to Thorpeness is relatively narrow, with some bends and crossed by a significant number of PRoW. A popular cycle route and the Suffolk Coastal Path traverse the area between the road and foreshore.	N	National Grid acknowledges this feedback. No construction vehicles are expected to travel along the B1353 as a result of the Proposed Project. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Traffic and transport, socio-economic, recreation and tourism, walking, cycling and horse-riders	8.119 Thorpeness is a tourist destination and in holidays there is significant on-street parking reducing the road to a single lane width. As footways are limited pedestrians frequently use the road.	N	National Grid acknowledges this feedback. No construction vehicles are expected to travel to/from Thorpeness as a result of the Proposed Project. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Traffic and transport	8.120 Access to the B1121 from the south through Aldeburgh is difficult for large vehicles, a matter explored in detail during the SPR EA1(N) examination. To access the B1121 from the north though Leiston has similar issues of narrow widths and restrictive junction layouts.	N	National Grid acknowledges this feedback. The construction vehicle routing has been designed to minimise impacts across the highway network as set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Following receipt of feedback, traffic through Aldeburgh has been restricted to less than 10 HGVs daily, the majority of construction traffic will access the landfall location via the new haul road being constructed. Therefore, the Proposed Project is not expected to impact local routes to/

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					from the landfall area. Furthermore, the B1122 from Yoxford through Leiston to the B1353 at Aldringham will only be used by abnormal vehicles under careful management as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Otherwise, this route will not be used by HGVs and the Proposed Project is not therefore expected to have any impacts on this route.
		Traffic and transport	8.121 It is envisaged that the traffic impacts on the A1094 through Aldeburgh would be reduced compared to S1; however, there would be increased impacts along B1121 Leiston Road, including turning movements at the A1094 / B1121 roundabout; which due to the roundabout geometries and on-street parking presented challenges during the development of EA1 North traffic management.	N	The S5 landfall has been removed from the Proposed Project. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** contain further information on this.
		Traffic and transport, design, onshore route location	**HVDC Cable Corridor Specific Comments** 8.122 Blue and Purple Corridor (S3 or S4 landfall - Thorpeness/ Sizewell –North of Leiston) 8.123 To the north of Leiston there is greater opportunity for use of the B1122 and/or Sizewell Link Road and Lovers Lane / Sizewell Gap. It is noted in fig 9-2 that the order limits for the Sizewell Link Road are not shown and therefore any potential links between cable corridors and conversion stations to the new road.	N	Northern corridors have been removed from the Proposed Project
		Construction, traffic and transport, walking, cycling and horse-riders	8.124 The highway network around Eastbridge, including Eastbridge Road consists of narrow, bendy roads which form important pedestrian and cycle connections. Thus, they are not suitable for construction traffic.	N	Northern corridors have been removed from the Proposed Project.
		Traffic and transport, inter-project cumulative effects, onshore route location	8.125 The corridor appears to interact with land that is proposed for the Sizewell C 'Green Rail Route and the protected sites of Aldhurst Farm and the SSSI east of Lovers Lane. Depending on the delivery of the corridor this is likely to cause significant disruption to the materials strategy for Sizewell C proposals and we would recommend discussions are had with Sizewell C Co. at as early a date as possible over this. The Council would oppose impacts that affect the materials strategy for Sizewell C, particularly those that result in large increases in HGV movements on the local highway network due to the absence of the rail route. Additional concerns would also occur for where the route crosses over the B1122, Lover's Lane and Sizewell Gap and the resulting impacts on other consented NSIPs.	N	Northern corridors have been removed from the Proposed Project.
		Traffic and transport, inter-project	**Summary** 8.126 The project documents do not consider the impacts on the A12 corridor between the A14 and Lowestoft. Whilst this route has, with mitigation, been accepted for other NSIPs the impact on this	N	The consideration of cumulative effects as a result of committed developments is set out within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. This is based on **Application Document 6.3.1.5.C**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		cumulative effects	corridor caused by this project partially when taken cumulatively with other consented or proposed schemes needs to be assessed.		**ES Appendix 1.5.C Inter-Projects Cumulative Effects Short List**, which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. The traffic and transport cumulative assessment includes the A12 to the south of the study area and the additional traffic to be generated on this part of the network by the Proposed Project and other cumulative schemes. In summary, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with other developments. Considerations relating to the SRN including the A12 corridor between the A14 and Lowestoft are set out in the TAN which has been prepared for Suffolk (**Application Document 6.3.2.7.A ES Appendix 2.7.A Transport Assessment Note**) in support of the traffic and transport chapter. This shows that there will be fewer construction vehicle trips on the SRN than the levels assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** for the local highway network within the study area. Therefore, based on the main assessment in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, which concludes that there are not expected to be any significant effects on the highway network as a result of the Proposed Project, the lower levels of forecast construction vehicle movements on the A14(T) are similarly not expected to have an impact on the SRN.
		Traffic and transport	8.127 Transport access to landfalls with the exception of S3 and S4 is poor.	N	Northern corridors have been removed from the project
		Construction, traffic and transport, design	8.128 The B1122 between Yoxford and Leiston is, with caveats regarding the impacts on Middleton Moor and Theberton, the only route suitable for significant volumes of construction traffic. This route would also be significantly improved if the Sizewell Link Road is constructed. The latter would benefit positioning of the converted site at location 4 and potentially site 3.	N	The B1122 is proposed as an AIL access only; it has not been used as a construction access due to the potential impact of routing construction traffic through Leiston and Coldfair Green. Further details have been provided as part of **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** based on the latest design, including in terms of study area, construction vehicle movements and AIL movements. In terms of the Sizewell Link Road, National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**.
		Construction, traffic and transport, onshore mitigation	8.129 The A1094 is the only realistic access route for the cable routes and convertor stations south of Leiston. Even so this route has significant issues if used for construction traffic that will need to be addressed. It is noted that even if mitigation is proposed there are limitations on delivering this within existing highway limits.	N	This is the route proposed, NGET would welcome feedback on potential limitations of this route as the Proposed Project team consider the A1094 to be a suitable access route. The construction vehicle routing has been designed to minimise impacts across the highway network (including the A1094), as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The traffic and transport

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network (including the A1094) during the construction phase with the proposed embedded mitigation and control and management measures in place. It should be noted that no improvements are now planned at the A1094/B1121 junction as only limited construction traffic is required to access existing OHL assets. Localised widening is proposed at the A1094/ B1069 Snape Road junction to enable the movement of HGVs and cable drums AILs through this junction. Further details are set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Construction, traffic and transport	8.130 Other routes south and west of Leiston such as the B1119, B1121 B1122, B1069/A1052 and the local minor roads are considered wholly unacceptable as routes for construction traffic.	N	In response to Council's review of individual routes, the following list sets out the intended use of each link made reference to as detailed within **Application Document 6.2.2.7 Part 2 Suffolk Traffic and Transport** and **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**: • B1121 Aldeburgh Road – access to existing overhead line infrastructure only, limited HGV movements less than 10 HGVs per day over a short period; • B1121 Church Hill/ The Street - monitoring and maintenance access only for operational phase; no construction traffic; • B1121 and B1119 through Saxmundham – construction traffic HGVs limited to less than 10 per day to enable construction of the proposed western access only; • B1119 and Mill Road – not proposed as an access for the works; • B1122 from Yoxford through Leiston to the B1353 at Aldringham – only to be used by abnormal vehicles under careful management, otherwise, this route will not be used by HGVs; and • B1069 Snape Road – construction vehicles will only use the section of the B1069 between the proposed site accesses and the A1094, to the southwest of Knodishall Common and Coldfair Green. Construction vehicles will travel to/ from the A1094 to avoid passing through the villages. As above, the proposals for each route are set out in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and reflected within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The construction vehicle routing has been designed to minimise impacts across the highway network and no significant impacts are expected as a result.
		Traffic and transport, inter-	8.131 The concentration of energy infrastructure in the Saxmundham – Leiston – Aldeburgh is not being supported by the	N	National Grid acknowledges the Council's comments.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		project cumulative effects	provision of permanent transport access, for example secure AIL routes.		
		Traffic and transport, design, walking, cycling and horse-riders	8.132 With the possible exception of Convertor Station 3 all the project options are poorly accessible by means of sustainable transport modes (walking, cycling and public transport) in the construction and operational phases.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** includes measures to encourage construction workers to travel by alternative means to the single occupancy vehicle where possible. A Car Share Scheme will be implemented and managed by the Transport Co-ordinator, to match potential car sharers and to help staff identify any colleagues who could potentially be collected along their route to/from the Site. The car share database will be available to staff that have signed up, to allow them to identify their own potential matches. Car sharing staff will be given preferential parking provision as an incentive to reduce single occupancy (and therefore overall) car travel to the construction compounds.
		Traffic and transport, design	8.133 As the emerging preferences for site 1 and 3 include corridor routes south of Leiston, The County Council would express significant concern regarding access from the local highway network based due to the issues discussed above.	N	National Grid acknowledges the Council's comments. Measures relevant to the control and management of impacts during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. No additional mitigation measures are necessary to avoid or reduce likely significant effects on traffic and transport receptors. No significant effects are anticipated on traffic and transport receptors for Suffolk.
		Traffic and transport, design	8.134 Of the alternate routes site 1 alternative and site 3 alternative (option 2) could gain access at their eastern extremities near Sizewell but again rely on the poor highway network to the south of Leiston. Site 3 alternative (option 1) is the proposal best served by the existing highway network and likely to benefit most from the Sizewell C improvements if these are delivered.	N	These options have been removed from the Proposed Project and are discussed within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023), Application Document 8.3 Strategic Options Report (October 2023) and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Needs case, coordination with other projects, climate change	**9 Landscape** 9.1 The County Council recognises the Climate Change Emergency and generally supports the provision of renewable energy infrastructure including, in principle, the use of Multi-Purpose Interconnectors, converter stations and other shared/combined infrastructure where suitable.	N	National Grid welcomes the Council's support for the drivers underlying the needs case for the Proposed Project and other projects generating and transmitting renewable energy.
		Coordination with other projects, inter-project cumulative effects	9.2 Project promoters connecting to National Grid onshore, in the same or similar locality, should seek to coordinate, co-locate, and consolidate infrastructure, both their own and other promoters' projects, wherever possible, to minimise the spatial extent of adverse effects on communities and the environment.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid will set out details of how it has coordinated with other projects as part of its DCO application (**Application Document 7.10 Coordination Report**). While efforts are being made to engage with other projects and identify appropriate ways of co-ordinating with different projects, covering several different geographical locations and on different timelines for delivery, it is not always possible to co-ordinate with all projects.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Onshore route location, design	9.3 Based on the information provided by the applicant and two site visits to the general area during the Non-Statutory Consultation process (on 17/06/2022 and 10/11/2022), I offer the following comments without prejudice to any further comments I or any other Suffolk County Council Officer may wish to make, as further detailed information with regards to the project becomes available. **Suffolk Onshore Scheme** 9.4 From the 5 landfall search areas and 7 converter station site search areas identified for Suffolk within the Non-statutory Consultation Documents, the Applicant has the developed the proposals presented in the Statutory Consultation as the Suffolk Onshore Scheme. These comprise: • Proposed Friston 400kV substation and associated overhead line modifications or a connection into and works within the proposed Friston substation. • A connection from the existing transmission network via the proposed Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If the proposed Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Proposed Project. • A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below). • A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham. • A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900m inshore from a landfall point where the cable transitions from onshore to offshore technology; and • A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).	N	National Grid acknowledges the Council's comments.
		Design, coordination with other projects,	**Context**	N	National Grid welcomes the Council's comments on this matter.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		onshore route location	9.5 The County Council welcomes the choices of the location for the landfall site, converter station site and for the cable corridor, as this combination does provide the opportunity to coordinate, co-locate and consolidate infrastructure, both the Applicant's own and other promoters' projects.		
		Landscape and visual, onshore mitigation, design	9.6 Notwithstanding this, the proposals are located in highly constrained landscapes and the application of Good Design principles (see Appendix 1 of this letter) as well as the full Mitigation Hierarchy (including compensation for adverse effects that cannot be mitigated) will be essential.	N	The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in collaboration with various disciplines to maximise opportunities to minimise effects arising from the Scheme and this has included the application of Good Design principles. This was communicated to stakeholders in a thematic meeting held on 27 February 2024 including that it should relate to the landscape within which the infrastructure sits within. Regarding landscape compensation and the mitigation hierarchy, this has been discussed with stakeholders (including thematic meeting held on 25 June 2024) and it is National Grid's position that NPS EN-1 does not support this position.
		Landfall location, onshore environmental impact, socio-economic, recreation and tourism	*Landfall option between Thorpeness & Aldeburgh* 9.7 This search area is highly constrained as it is located within the Heritage Coast and the Suffolk Coast & Heaths Area of Outstanding Natural Beauty. It is close to the Sandlings Special Protection Area and North Warren RSPB Reserve, and within the Leiston-Aldeburgh Site of Special Scientific Interest (SSSI). The site also has high archaeological potential. In terms of tourism, the site is located within a tourism hotspot, the flat stretch of coastline between Aldeburgh and Thorpeness being a popular route for walks between the two settlements. The site would require access along the B1122 via Aldeburgh.	Y	Environmental impacts were a key part of the consideration of the route and siting work that has been undertaken for the Proposed Project. Further detail can be found in **Application Document 8.2 Option Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report (October 2023)**. The approach to routeing and siting is also described in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 7.3 Design Development Report**. Since the selection of the landfall in this location and the design presented at Statutory consultation, the design has been amended taking into account the sensitive nature of the Sandlings SPA and North Warren RSPB Reserve, and the Leiston-Aldeburgh SSSI and other environmental constraints including the high archaeological potential of the site. The proposed construction compound in this location has been reduced in size and has been moved further away from the above mentioned designations. This has also helped to lessen the impact on relevant nearby environmental receptors and residential properties, and on the flood zone. This revised design was presented at the Targeted consultation. The EIA has considered the potential impacts of the Proposed Project on the Heritage Coast and AONB (in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**), on the SPA, RSPB Reserve and SSSI (in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**), on the archaeological potential of the location (in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**), and on tourism (in **Application Document 6.2.2.10**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism).
		Converter station location, cultural heritage, walking, cycling and horse-riders	*Converter Station Site at Saxmundham* 9.8 There are a number of listed buildings within the vicinity of this site. Wood Farmhouse and Hill Farmhouse, both Grade II listed, would potentially experience a detrimental impact to their setting. Saxmundham Footpaths 5 and 6 cross the site and would require diversion (see Figure 1.4.5).	N	An assessment of the potential for impacts on the setting of heritage assets has been undertaken as part of **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. This included assessing the impacts on the setting of a number of designated assets which were agreed through consultation with stakeholders including East Suffolk Council and Historic England, and included the Grade II listed Wood Farmhouse (LB1231179) and Hill Farmhouse (LB1231296), as well as Hurts Hall (LB1268178). The visual impact of Saxmundham Converter Station on Wood Farm Grade II listed building at year 15 operation (summer), when the planting has achieved its full height, is illustrated in **Application Document 6.4.2.1 Landscape and Visual** (6.4.2.3.8-A Representative Viewpoint Visualisations). This demonstrates that Saxmundham Converter Station would not be visible from the farmhouse and would not change or detract from its rural setting. Glimpses of the Converter Station may be possible during the winter periods when there would be less dense vegetation, but this would not constitute a significant change to the visual component of the farmhouse's setting. The residual effect at year 15 operation is therefore assessed to be minor adverse, which is not significant. The visual impact of Saxmundham Converter Station on Hurts Hall Grade II listed building and its associated parkland at year 15 operation (summer) is illustrated in **Application Document 6.4.2.1 Landscape and Visual** (6.4.2.1.10-B Representative Viewpoint 2). This visualisation shows the level of change as experienced from the B1121, which is identified as a view of historical importance in Saxmundham Neighbourhood Plan (East Suffolk Council, 2023) . The visualisation for year 15 operation demonstrates the effectiveness of the native hedgerow and tree planting around Saxmundham Converter Station and the new permanent bridge over the River Fromus. The Converter Station is visible but not prominent in the view from the B1121, and is blended into the edges of the mature vegetation of Bloomsfield's Covert. The permanent bridge is no longer visible in the view. The experience and historical relevance of the view of Hurts Hall within its associated parkland is maintained and still appreciable, and the presence of the Converter Station in the background of views does not sever the connectivity of the hall to its landscape. The residual effect at year 15 operation is therefore assessed to be minor adverse, which is not significant. As set out in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**, it is proposed to temporarily divert several PRoW, including Saxmundham Footpaths 6 and 5 (PRoW E-491/006/0 and E-491/005/0) which will be temporarily diverted and permanently diverted respectively. The permanent diversion will act in conjunction with the long-term temporary diversion route for E-491/006/0 which will feed east along the B1119 and rejoin the existing E-491/006/0 at the north east of the Converter Station location. The proposed PRoW closures and diversions are assessed within **Application Document**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport. No significant impacts are expected, following the mitigation set out within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. Further to the above, masterplanning is being undertaken in order to ensure effective coordination takes place with regard to the impacts on PRoW. These have been designed and co-ordinated with other projects in this area (e.g. Lion Link) to minimise additional journey distances, re-join existing routes and improve route connectivity. The permanent diversions have been embedded into the master planning of the Proposed Project (including in consideration of temporary construction compounds), to fully consider the long-term future of the site and to avoid the need for subsequent diversions.
		Landscape and visual, converter station location, terrestrial ecology	9.9 The land to the north and East of Bloomfield's covert is open arable land, from which all historic landscape features are absent. Prior to agricultural improvement works after 1945, this area had a locally characteristic field pattern and included a substantial Ancient Woodland known as Great Wood, as well as ponds and a small plantation typical of the Ancient Estate Claylands landscape type, of which this area is part. The current landscape is generally open, and a converter station would be prominent from the B1119. Whilst the provisional Agricultural land classification is slightly better than on alternative sites, the loss of landscape features would be minimal, and the potential for Green Infrastructure benefits and Biodiversity Net Gain would be greater.	N	The location of the site is noted. The historic features of the Converter Station site, including the woodland and ponds, have been taken into consideration within the iterative design process and the indicative landscape strategy (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**). The effects on visual receptors in the study area arising from the Proposed Project are detailed within **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. There would be localised significant effects for visual receptors, including those travelling along the B1119, as expected for the nature of this type of development. Mitigation design has been incorporated to reduce effects where possible, including hedgerow and tree planting along the B1119 close to the receptor to maximise the screening capabilities. The potential for Green Infrastructure benefits, Biodiversity Net Gain and details on mitigation planting have been considered within the indicative landscape strategy within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**.
		Onshore route location, onshore environmental impact, walking, cycling and horse-riders	*Cable corridor* 9.10 The emerging preference for a cable route begins within the Heritage Coast, Essex and Suffolk Coast & Heaths Area of Outstanding Natural Beauty and is close to the Sandlings Special Protection Area. The construction of the cable route would affect the Sandlings Walk in several places, as well as other connected footpaths.	N	Within the Order Limits, Sandlings Walk runs along a bridleway (PRoW E-354/002/0) which runs east-west along a rural (lightly trafficked) access track serving agricultural uses. Measures and mitigation regarding this PRoW which will therefore also be implemented for Sandlings Walk are set out in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. It should be noted that the Proposed Project is not expected to affect other connected footpaths/ bridleways to the Sandlings Walk in this area, as PRoW E-354/004/0 to the west and PRoW E-354/003/0 and PRoW E-354/020/0 to the east fall outside of the Order Limits. Nonetheless, all PRoW which are expected to be affected by the Proposed Project are included within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. Following the above, Sandlings Walk has been included in the assessment of national/ regional walking and cycling routes in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. This considers the potential impact of the Proposed Project during the construction phase as a result of temporary diversions and

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					haul road crossing points. The likely impact of the Proposed Project on Severance, Pedestrian Delay, Non-Motorised User Amenity and Fear and Intimidation for Sandlings Walk as a result of construction traffic or temporary diversions is considered to be not significant based on the assessment criteria and the management/ mitigation set out in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. Potential impacts of the Proposed Project on the Heritage Coast and on the Suffolk Coast & Heaths AONB are considered in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. No likely significant effects on either receptor are identified for construction (including decommissioning), or for operation and maintenance (including years 1 and 15). Potential impacts on the Sandlings SPA are considered in the **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Only one likely significant effect on the SPA is identified, relating to disturbance during construction. With the implementation of a seasonal restriction on compound set-up for the trenchless bore such that it occurs outside the February to August nesting season, the residual effect is deemed negligible (not significant).
		Landscape and visual, converter station location	**Landscape Strategy** 9.11 The County Council considers that a clear vision for landscape for the whole project, and in particular for the converter station site will need to be developed for the ES.	N	The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in collaboration with various disciplines to maximise opportunities to minimise effects arising from the Proposed Project. This includes minimising effects on landscape character and visual amenity, as detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.
		Terrestrial ecology, walking, cycling and horse-riders	9.12 The Saxmundham Converter Station Indicative Landscaping Strategy with Co- location (Figure1.4.6) and the design principles for the landscape strategy (PEIR Volume: 1 Part 2 Suffolk Onshore Scheme, Chapter 2 Landscape and Visual, pages 74 and 75) are welcome, but will need to be augmented to reflect the requirements for ecology (habitat connectivity, Biodiversity Net gain) and recreation and public amenity (PRoW), as well as reflecting potential archaeological constraints.	N	The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) and co-location master planning (**Application Document 7.10 Coordination Document**) have been developed in collaboration with various disciplines, including ecology, heritage and recreation and public amenity to maximise opportunities to minimise effects arising from the Proposed Project. This includes minimising effects on landscape character and visual amenity, as detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.
		Converter station location, coordination with other projects,	9.13 The County Council considers it essential for any landscape strategy for the converter station site at Saxmundham to not only allow for, but proactively plan for successful co-location with other infrastructure projects on this site. It would be important that the functionality and appearance of the site (in terms of landscape,	N	The indicative landscape strategy for the Proposed Project only option (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in parallel to **Application Document 7.10 Coordination Document**. This has been

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		landscape and visual	visual amenity, Biodiversity Net Gain, and recreation) works equally well, whether or not the other two converter stations materialise.		developed in collaboration with various disciplines to maximise opportunities to minimise effects arising from the Proposed Project.
		Converter station location, landscape and visual, onshore mitigation	9.14 The County Council considers that a landscape masterplan should be developed for the whole site with a focus to minimise the harm to landscape and visual amenity resulting from this project and potential further converter stations, by seeking integration into the landscape through embedded mitigation such as using landform and landscape-led cut and fill, as well through mitigation in form of screen planting at a landscape scale.	N	The indicative landscape strategy for the Proposed Project only option (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in parallel to **Application Document 7.10 Coordination Document**. The indicative landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation (**Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual Amenity**) including screening in the form of proposed woodland, hedgerow and hedgerow tree planting, as well as responding to the local context in terms of the design of the landform. Regarding the landscape led cut and fill, as the design has developed, it is clear that there is limited material and limited availability to produce much cut that can be used in conjunction with the landscape proposals. The fill has been concentrated on the northern edge of the Saxmundham Converter Station as this is considered to be the most sensitive area. By year 15, generally for visual receptors, the landscape planting would have matured and part would be located on bunding which would provide some additional height and screening benefit. The planting would partially screen the lower parts of the permanent infrastructure and fencing; however, the upper extents and majority of the Saxmundham Converter Station would remain visible. By year 15, generally for landscape receptors, the landscape planting would have matured and would provide a degree of partial screening and landscape integration. The planting would also increase biodiversity through native planting and integration into the wider, currently fragmented, green infrastructure network.
		Water environment, landscape and visual	9.15 The surface water drainage strategy and permanent access option should be an integral part within the landscape masterplan and enable a creative and landscape-led approach to the required water attenuation, management, and access.	N	The landscape team has worked closely with the drainage team to incorporate the drainage and permanent access option into the indicative landscape strategy (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**). This has also involved input from other key disciplines including ecology and Biodiversity Net Gain to incorporate riparian habitats around attenuation ponds and to design such features to maximise opportunities for recreation and habitats. Management is detailed within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan**.
		Walking, cycling and horse-riders, community benefits/enhancements	9.16 The opportunities for recreation should be further developed. The loss of footpath connections will need to be addressed and assessed in visual terms; additional opportunities for recreation should be developed through pro-active community engagement. It is noted that the existing footpath connecting from the centre of the	N	The opportunities for recreation have been developed in collaboration with other key disciplines including traffic and transport and socio-economics (further details within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**). This has included a permanent PRoW diversion on the Converter Station site which has been designed to have a variety of

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Converter station site southwards, appears to be missing from the Landscape Strategy.		experiences with some sections more open and others adjacent to woodland planting to aid screening of views towards the Suffolk Onshore Scheme. This has also included the provision of open access areas, as requested through stakeholder feedback. The existing footpath connecting southwards is shown on **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk**. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
		Walking, cycling and horse-riders, landscape and visual	**Landscape and Visual Assessment** *Methodology* 9.17 The assessment methodology could be more detailed, in particular regarding the derivation of visual sensitivity. It is, for example, not clear why some PRoW are considered to be of medium rather than high sensitivity.	N	The reasoning for the sensitivity judgement for each visual receptor is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual Amenity**. This includes an explanation of visual value and susceptibility for each receptor, which combines to result in the visual sensitivity. There are two representative viewpoints that are judged to have a medium sensitivity, which results from a medium value and susceptibility (viewpoints 7 and 15). Since the PEIR, further information has been added to the methodology to detail the different levels of sensitivity, as set out within **Application Document 6.3.2.1.A ES Appendix 2.1.A Landscape and Visual Impact Assessment and Photomontage Methodology**.
		Landscape and visual	9.18 While it is appreciated that the threshold for considering an effect as significant includes moderate effects, The County Council considers that the bar for falling into this bracket is set too high. Slight minor adverse effects should result in no more than a small part of characteristic features to be lost. Where characteristic features are partially lost moderate adverse landscape effects may already occur.	N	There is a distinct difference between the non-significant minor adverse effect which states that 'characteristic features' would be partially lost, whereas the significant moderate adverse effect and major adverse effects note that 'valued characteristic' features would either be largely or wholly lost as a result of the Scheme. There is a difference between characteristic features that are lost, such as a hedgerow which may be typical in that landscape, compared with a hedgerow that forms part of a historic landscape feature, which National Grid may consider is a 'valued characteristic' feature in such landscape. As such, it feels that this distinction for a non-significant effect and significant effect is sufficient. It is important to note that the assessment methodology descriptors are there as a guide and the assessment of effects within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** are supported by descriptive text to explain the effect attributed.
		Landscape and visual, onshore route location	9.19 Referring to paragraph 2.2.5.33, the County Council considers that the effects above the cable routes should also be assessed for year 15 and not be scoped out in the ES. Likewise, operational effects for the land fall should also be scoped in.	N	Significant operational effects are not expected to be permanent along the cable routes or at landfall. There will be full reinstatement of landscape elements along the cable route and landfall. It is acknowledged that acid grassland will take longer to reinstate as well as fully establishing hedgerows, as such there will be an acknowledgement of this in the Year 1 assessment. The operational assessment includes a sentence to confirm that by year 15 the cable corridor and landfall would

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					be fully reinstated as far as practicable and that effects would not be significant. Monitoring and management of the reinstatement is covered within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**.
		Landscape and visual	9.20 The Photomontage Methodology (Appendix 2.2.A) is broadly acceptable.	N	National Grid acknowledges the Council's comment.
		Landscape and visual, socio-economic, recreation and tourism	*Landscape and Visual Baseline* <u>District LCA Summary of description in published study relevant to the study area</u> • D4 Thorpeness to Aldeburgh (and other landscape character areas, such as J4 and K3); Although not strictly a landscape issue, but clearly linked, it may be worth mentioning that this area as a hotspot for tourism and recreation, rather than simply pointing out that there are opportunities for recreation.	N	Reference to tourism and recreation has been addressed for relevant LCAs D4, J4 and K3 within the landscape baseline, refer to **Application Document 6.3.2.1.B ES Appendix 2.1.B Landscape Baseline**.
		Landscape and visual	<u>Visual Baseline</u> *Viewpoints* 9.21 The proposals cover a considerable geographical area, and the County Council is concerned that 18 viewpoints may not be sufficient to convey the potential impacts and adverse effects on landscape and amenity. the County Council considers that an additional viewpoint should be provided from the PRoW passing Wardspring Farm to the north-east of the Converter Station site.	N	The representative viewpoints have been discussed within thematic meetings with the Council and other stakeholders as well as two specific meetings focusing on the topic. Since the production of the PEIR, five new viewpoints have been added, including one from the PRoW passing Wardspring Farm, which forms the basis for the visual assessment, as detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Landscape and visual, walking, cycling and horse-riders	9.22 Further, it is considered that the permanent access options must be fully assessed, as they will have their own landscape and visual impacts and effects. In due course visualisations will need to be provided for the diverted PRoW. • The OHL mentioned in the baseline description for value do not seem visible in the viewpoint photographs for VP3 nor in VP4. Neither are there annotations in this respect. • The descriptions for the multi-directional VP6 are not clear enough with regards to the direction of view that is being described. • the County Council queries the attachment of value to views 14, 15 and 16. In view 14 there few detracting features (except for the Water tower) and the only justification for not giving a very high values to this view, may be that it is outside the AONB. It is however from within a Park and Garden of Historic or Landscape interest. Similarly, Views 15 and 16 are largely intact views, the railway line being well integrated into the landscape and the OHL at a distance	N	The temporary and permanent access tracks have been assessed as part of the Landscape and Visual Impact Assessment, as documented in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**, at all Proposed Project stages. This includes their impacts on the landscape character and also visual amenity. A range of likely significant and non-significant effects on both landscape character and visual amenity are detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. This assessment takes into consideration mitigation embedded within the landscape mitigation planting, including woodland planting, as set out on **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**. The request for visualisations to be provided for the diverted PRoW has been discussed with stakeholders (including thematic meeting held on 27 February 2024). Difficulties with gaining winter photography was set out as the route diversion was not sufficiently developed during the winter 2023/24 season and subsequently difficulties with access due to the nature of the cropped field. A cross section has been prepared and is

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			that reduces their adverse effects. These views should be awarded a high value. • In View 17 the wood pole line referred to in the description is not visible in the photograph and the view of the OHL is filtered by a wooded landscape and at a distance that reduce its visual effects. View 17 should be awarded high value.		contained within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**. Relating to Viewpoints 3, 4 and 17, the representative viewpoint photography presented within the PEIR only covers a 90 degree horizontal field of view and is presented to assist the reader centred on the principal part of the Proposed Project. The representative viewpoints are not there to fully represent everything visible from each visual receptor. Labelling on viewpoint photographs against the visual baseline text has been revisited within the production of the ES chapter and is included at **Application Document 6.4.2.1 Landscape and Visual**. Similarly the angle of view annotation for each viewpoint including those with multi-directional views have been updated. Details regarding the landscape and visual assessment methodology, including descriptions into how value judgements are determined are included within **Application Document 6.3.2.1.A ES Appendix 2.1.A Landscape and Visual Impact Assessment and Photomontage Methodology** and summarised within **Application Document 6.2.2.1 ES Part 2 Suffolk Chapter 1 Landscape and Visual.** The difference in the value judgement between Viewpoint 14 (high value) and Viewpoints 15 (medium value) and 16 (medium value) is that Viewpoint 14 is located within a locally designated Park and Garden of Historic or Landscape Interest. The methodology (**Application Document 6.3.2.1.A ES Appendix 2.1.A Landscape and Visual Impact Assessment and Photomontage Methodology**) should be referred to regarding the comment around the value of Viewpoint 14, which does not merit a 'very high' value relating to scenic qualities and towards a designated landscape. This is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
	Landscape and visual	*Visualisations* 9.23 The Viewpoint photograph sheets contain useful technical details and are provide some annotations, which are, however, mostly generic. It would be helpful, if annotations would aid orientation, for example by naming landmarks and other built structures and indicating locations and names of roads, PRoWs, and woodlands/plantations.	N	The ES Chapter provides more annotations on the representative viewpoints to aid orientation, an enlarged viewpoint title and inclusion of a location map. These are included in **Application Document 6.4.2.1 Landscape and Visual**.
	Landscape and visual	9.24 The County Council would welcome it if the viewpoint title could be much more prominent on the page. There should also be a location map that references the viewpoint and the direction it is looking in at the bottom of the page.	N	The ES Chapter provides more annotations on the representative viewpoints to aid orientation, an enlarged viewpoint title and inclusion of a location map. These are included in **Application Document 6.4.2.1 Landscape and Visual**.
	Landscape and visual	9.25 There are currently no visualisations for year 15, which are expected to be provided in the ES.	N	The ES has provided year 15 visualisations, included in **Application Document 6.4.2.1 Landscape and Visual**.
	Landscape and visual, onshore mitigation	9.26 The visualisations provided are useful as a first indication as to where visual mitigation will be required.	N	National Grid acknowledges the Council's comment.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landscape and visual	9.27 The LVIA is both a technical and a public facing document and one of its purposes is to communicate the visual impacts and effects during construction and operation to the public. In absence of a viewpoint at the landfall site and in addition to viewpoint analysis and assessment around the converter station site, the County Council considers that supporting material, such as photographs of existing projects and explanatory text, should be provided for joint bays, transition bays and the construction of converter stations to illustrate anticipated and potential effects.	N	A viewpoint location is included at the landfall site, included at **Application Document 6.4.2.1 Landscape and Visual**. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** includes text explaining the construction of the various aspects of the Proposed Project such as the joint bays, transition bays and converter stations. This references appropriate design drawings submitted with the DCO application to aid understanding of the Proposed Project.
		Onshore mitigation, landscape and visual	*Mitigation* 9.28 While embedded mitigation will be essential to make the proposed scheme acceptable in landscape terms, the Mitigation Hierarchy will need to be applied in full, including compensation for impacts that result in adverse landscape and visual effects that cannot be avoided or mitigated through embedded measures.	N	Regarding landscape compensation and the mitigation hierarchy, this has been discussed with stakeholders (including thematic meeting held on 25 June 2024) and it is National Grid's position that NPS EN-1 does not support this position.
		Onshore mitigation, landscape and visual, combined effect of proposed project	9.29 Strategic landscape proposals which include on- and off-site mitigation planting are expected to be required. These should be brought together in an Environmental Masterplan around the Saxmundham site, integrating the requirements for of landscape and visual amenity with those of ecology, heritage (archaeology and settings of Listed Buildings) and recreation (PRoW).	N	The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in collaboration with various disciplines to maximise opportunities to minimise effects arising from the Proposed Project, including ecology, heritage and recreation. Offsite planting is not considered to be required to further reduce effects on landscape character and visual amenity.
		Landscape and visual, onshore mitigation	9.30 To aid mitigation of the proposals an Environmental Colour Assessment (ECA) should be considered, to inform the choice of colours used for the built structures of the scheme.	N	National Grid is pursuing a collaborative approach to the design of built structures. Having consulted on design approach, a set of Design Principles for the Proposed Project will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk)**. The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detailed proposals. National Grid will continue to engage with relevant stakeholders throughout the development of the Proposed Project design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Landscape and visual, onshore mitigation	9.31 For any mitigation planting proposals, it will be essential to apply realistic expectations to annual growth rates.	N	Growth rates have been discussed with stakeholders in various thematic meetings, including the February and April 2024 meetings. Arboricultural specialists have prepared a report to evidence the growth rates and information has been provided by East Suffolk Council, both of which have been used to inform the planting heights as shown within the year 15 visualisations, included in **Application Document 6.4.2.1 Landscape and Visual**. The indicative species mixes reflect a variety of species to increase their resilience and to be adaptive to climate change and pests. Information on planting heights, maintenance and aftercare are provided in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk and Application Document 6.3.2.1.A ES**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Appendix 2.1.A Landscape and Visual Impact Assessment and Photomontage Methodology.
		Landscape and visual, onshore mitigation	9.32 The aftercare and maintenance periods will need to be adaptive and will vary with the type of planting.	N	The monitoring and management of the planting proposals are detailed within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan** and are considered to be adaptive and vary with the type of planting proposed.
		Landscape and visual	**Arboricultural and Hedgerow surveys** 9.33 The PEIR states that Arboricultural Impact Assessments and Hedgerow Surveys will be provided in the ES. 9.34 Please find some guidance on hedgerow surveys and trees in Appendix 3.	N	National Grid acknowledges this feedback. Tree surveys have been undertaken in accordance with BS5837:2012 and further details are contained in **Application Document 6.10 Arboricultural Impact Assessment**. Important Hedgerow Surveys were undertaken in-line with the Hedgerow Survey Handbook (DEFRA, 2007) to assess hedgerows against the Hedgerow Regulations (HM Government, 1997). Details are contained in **Application Document 6.3.3.2.A ES Appendix 3.2.A Extended Phase 1 Habitat Survey Report**.
		Construction	**Control Documents** *Outline Code of Construction Practice* Working Hours 9.35 the County Council considers that further detail is required to clearly define and justify the exceptions to the standard working hours proposed. It should also be clarified whether the proposed working hours include the hour either side of the working day for setting out and winding down.	N	To give National Grid the flexibility to deliver the construction programme on time and incorporate standard industry working patterns, it has identified a need to include 7am to 5pm working on Sundays and bank holidays within the core working hours. The proposed construction core working hours (unless otherwise approved by the relevant Local Planning Authority) for all terrestrial works in Suffolk and Kent are: • Monday – Friday: 0700 to 1900; and • Saturday, Sunday and Bank Holidays: 0700 to 1700. These core hours exclude start up and close down activities up to 1 hour either side of the core hours. Requirement 7(4)(a) of Schedule 3 of the draft DCO (**Application Document 3.1**) states that the following operations may take place outside the core working hours referred to in paragraph (1): (a) trenchless crossing operations including at landfalls and beneath highways, railway lines, woodlands, nature reserves, Sites of Special Scientific Interest or watercourses; (b) the installation and removal of conductors, pilot wires and associated protective netting across highways, railway lines or watercourses; (c) the jointing of underground cables; (d) the continuation of any work activity commenced during the core working hours to a point where they can securely and or safely be paused; (e) delivery to the transmission works of abnormal loads and any highway works requested by the highway authority to be undertaken outside the core working hours; (f) the testing or commissioning of any electrical plant installed as part of the authorised development including undertaking of any identified corrective activities;

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					(g) the completion of works delayed or held up by severe weather conditions which disrupted or interrupted normal construction activities; (h) activity necessary in the instance of an emergency where there is a risk to persons or property; (i) marine works (all works below the mean high water springs line); (j) security monitoring; (k) intrusive and non-intrusive surveys; (l) mechanical and electrical installation works within buildings once erected and enclosed (m) any highway works requested by the highway authority to be undertaken on a Saturday or Sunday or outside the core working hours; and (n) activity necessary in the instance of an emergency where there is a risk to persons or property.
		Legislation and policy, consultation	<u>Community Engagement and Public Information</u> 9.36 A Government Policy Paper [Getting Great Britain building again: Speeding up infrastructure delivery - GOV.UK (www.gov.uk)] states that 'Developers are required to consult local communities before finalising their application, and we see instances of good practice in this area. But the desire to lower the likelihood of legal challenge may drive a tick box approach, rather than the effective engagement needed to get projects right.' And further, that 'Effective engagement and consultation allow developers and communities to work together to create development proposals that deliver benefits locally and for the country.'	N	National Grid acknowledges the Council's comment.
		Consultation, onshore mitigation, community benefits	9.37 The proposals for community engagement and public information are passive and reactive and do not provide any active engagement with the communities, such as regular updates via post and meetings or engagement with regards to community-led mitigation and landscape master planning, compensation, and wider community benefits. 9.38 The provisions of GG28 (notifications) should be reflected in the main text.	N	Community engagement for the Statutory consultation was undertaken in accordance with the SoCC, which was prepared in consultation with the County Council and other Host Authorities, having regard to the feedback they provided. National Grid has sought to keep the community informed of progress on the Proposed Project, publishing a further community newsletter in April 2024. National Grid has undertaken consultation in line with the standards required by statutory legislate and Planning Inspectorate guidance. Community relations activity includes engagement with key political stakeholders, residents and businesses. This may include further meetings with LPAs, parish, and ward councillors, and engaging with residents/businesses by letters/newsletters focusing on key topics of discussion such as master planning, community benefits, etc. The Proposed Project website will be kept up to date in order to publicise activities to the wider community and provide updates to stakeholders who have registered their interest, along with social media and other digital forms of engagement.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					As construction begins, community organisations and charities will have access to The Community Grant Programme in areas where National Grid's work is impacting on local people through its operations and site activities. During the construction phase, the community relations methodology and approach will focus on keeping people informed about the start of the work - what National Grid is doing, why, preparatory work; and provide information regarding traffic movements, key milestones, other construction activity and Proposed Project completion. It is unclear what the provisos of GG28 include. National Grid has undertaken the Statutory consultation in line with the published SoCC (see Section 5 of **Application Document 5.1.5 Appendix D SoCC**) and has continued to engage with relevant stakeholders as set out above.
		Landscape and visual, design	<u>Lighting and visual intrusion</u> 9.39 The information provided by the Applicant does require further clarification, for example whether the inside lighting of cable jointing bays will at all be visible on the outside. A detailed Lighting Design Strategy will need to be agreed with the relevant planning authorities in due course.	N	National Grid acknowledges this feedback. It is likely that lighting would be visible outside the joint bay housing, and the scale would be dependent on the type of housing used. Further details relating to lighting and design are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** sets out mitigation for lighting impacts, including the following: • GG22: Construction lighting will be of the lowest levels necessary to safely perform each task. It will be designed, positioned and directed to reduce the intrusion into adjacent properties, protected species and habitats. It is assumed that associated construction lighting is expected to be localised and limited to temporary task lighting. Associated operational lighting for Saxmundham Converter Station (and Friston Substation (under Friston Scenario 2)) is expected to be limited to external column and building mounted lighting. It would be controlled manually as required during low periods of light or darkness and has been designed to minimise light spill. Further information is contained within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The likely effects of the proposed lighting on landscape character and visual amenity during construction, operation or maintenance phases are set out within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation** and **Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.
		Landscape and visual, onshore mitigation	<u>Clearance of Site on Completion</u> 9.40 1.4.A.2.68 Removal of trees, tree groups and hedges should be minimised and avoided for temporary structures such as compounds. A five-year aftercare plan will not be sufficient for all types of planting. While this may be sufficient for hedgerow	N	Minimising the removal of trees, tree groups and hedgerows has been a key part of the iterative design process. A post-construction monitoring programme and reporting procedure will be formalised, agreed with the relevant planning authority and included within a detailed Landscape and Ecological Management Plan, prior to construction works commencing. In addition to this, post-construction

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			reinstatement, it will not be sufficient for trees, tree groups and woodland planting.		monitoring and reporting programmes will be established for some habitats and species following completion of construction works, where agreed with the relevant planning authority. The monitoring and management of the planting proposals are detailed within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** and are considered to be appropriate for the type of planting proposed. Additional details of monitoring during the construction phase are set out within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**.
		Landscape and visual, DCO process	<u>Landscape and Ecological Management Plan (LEMP)</u> 9.41 It is highly likely that the level of detail known at submission and examination stage will not be sufficient to produce a final Landscape and Ecological Management Plan (LEMP). the County Council considers that it would be more useful to produce an Outline LEMP, with detailed LEMPs being produced and discharged as requirements post consent.	N	Details are contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan**. As set out in the draft DCO (**Application Document 3.1**), a requirement will necessitate the submission and approval of a detailed Landscape and Ecological Management Plan, which must be in substantial accordance with the provisions set out in the Outline Landscape and Ecological Management Plan.
		Construction, noise and vibration. design	<u>Landfall Installation</u> 9.42 It should be clarified, for what period of time the 24-hour working will be required, and whether, together with associated noise, contingencies may be required to provide alternative accommodation for residents of the most affected receptors. It should be confirmed as early as possible that trenchless technology will be used, as this is considered to be essential to make the project acceptable.	N	Example criteria for noise levels and associated works durations for the provision of temporary rehousing is provided in BS 5228-1:2009+A1:2014 'Code of practice for noise and vibration control on construction and open sites – Part 1: Noise'. An assessment of likely construction noise impacts has been conducted as part of the ES (**Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**) which did not identify any locations where noise level criteria for temporary rehousing are likely to be met during the works, including during night-time. A further detailed assessment will be conducted by the contractor based on their specific construction methodologies and mitigation and the potential requirement for temporary rehousing will be reviewed at that stage. As stated in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**, the construction of the marine cable would be a 24 hour operation. It is estimated that at the Suffolk and Kent landfall, construction would be required for 24 hours / 7 days for 120 days.
		Landscape and visual	<u>Control and Management Measures</u> 9.43 Many of control and management measures contain vague language, which means that the measures are not secure. the County Council considers that ambiguities need to be clarified for the ES.	N	The ES includes **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan, Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.3.2 Appendix B Register of Environmental Actions and Commitments (REAC)**. There is also a separate **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**. These documents have been developed further and now contain more detail than the version submitted as part of Statutory consultation and are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landscape and visual, construction, traffic and transport	GG03 An Outline Construction and Environmental Management Plan (CEMP), an Outline Landscape and Ecological Management Plan (OLEMP) and an Outline Construction Traffic Management Plan (OCTMP) should be produced for the ES.	N	The request for these three documents has been noted and all are included within the DCO application submission. The ES includes the following: • **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan;** • **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan;** • **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk;** • **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent;** • **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk; and** • **Application Document 7.5.1.2 Construction Traffic Management and Travel Plan - Kent.**
		Landscape and visual	GG05 The abbreviation for the Environmental Clerk of Works should be EnvCoW to avoid confusion with an Ecological Clerk of Works (ECoW).	N	National Grid acknowledges this feedback. All final abbreviations have been made clear in the ES.
		Landscape and visual	GG07 It should be clarified where aerial photographs would be considered sufficient. To support hedgerow survey and tree record, photographs need to be taken in the field.	N	Publicly available aerial imagery has been utilised to inform indicative tree and hedgerow positional information. This has been used to inform **Application Document 6.10 Arboricultural Impact Assessment**. Where notable trees or tree features have been recorded photographs have been taken.
		Landscape and visual	GG08 Reinstatement will need to be agreed with relevant planning authorities.	N	National Grid acknowledges the Council's comment. Reinstatement is discussed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). This will be agreed with relevant planning authorities. Further details on reinstatement should be referred to within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**.
		Landscape and visual	GG09 Sensitive features: it should be stated, how the appropriate protective area will be established, i.e. which standards and recommendations will be used.	N	National Grid acknowledges this feedback. Where sensitive features will be retained within or immediately adjacent to the Order Limits, an appropriate protective area will be established using appropriate fencing and signage and will be inspected, repaired and replaced as necessary as outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. Further details regarding the protected areas are contained in the Retention and Reinstatement Plans within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landscape and visual	GG15-GG17 Root protection zones should be protected within these measures.	N	Root protection areas are fully considered within **Application Document 6.10 Arboricultural Impact Assessment**. They are also captured within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** submitted as part of the DCO application. This will be development into a detailed Construction Environmental Management Plan in advance of construction commencing.
		Landscape and visual	GG22 Lighting should be designed, positioned, and directed to minimise intrusion.	N	National Grid acknowledges this feedback. Please refer to the control and management measures GG11 and GG22 within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. GG11: Any activity carried out or equipment located within a construction compound that may produce a noticeable nuisance, including but not limited to dust, noise, vibration and lighting, will be located away from sensitive receptors such as residential properties or ecological sites where practicable. GG22: Construction lighting will be of the lowest levels necessary to safely perform each task. It will be designed, positioned and directed to reduce the intrusion into adjacent properties, protected species and habitats. Further details on lighting are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** states that associated lighting during construction and operation is expected to be localised and it is not expected that lighting would affect the Suffolk Coast and Heaths AONB due to distance and intervening vegetation. The lighting associated with the Proposed Project would not be permanent. Associated lighting during construction and operation is expected to be localised to small parts of the LCAs and would only be on for short periods so would not noticeably affect the perceptual quality of the LCAs with some screened by intervening vegetation. Associated lighting during construction is expected to be localised and would have limited perceptual effects on the Seascape Character Type 3 due to intervening vegetation and landform. **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment** contains the assessment of viewpoints and lighting is considered amongst the impacts during construction and operation and mitigation is noted.
		Landscape and visual, agriculture and soils	GG26 Decompaction of subsoil may still need to be required.	N	**Application Document 6.10 Arboricultural Impact Assessment** details how retained trees will be protected to avoid direct or indirect damage. This includes information on the location of tree protection fencing to prevent the compaction of soil within root protection areas. Any requirement for decompaction works will be determined as required. This commitment is noted in **Application Document 7.5.10.1 Outline Soil**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Management Plan – Suffolk which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Landscape and visual, onshore mitigation	LV01 All reinstatement planting and mitigation planting must be agreed with the relevant Planning Authority.	N	The reinstatement planting and mitigation planting has been communicated with the relevant Planning Authority and is detailed within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**.
		Landscape and visual	LV02 The language is unacceptably vague. In particular, the wording 'where such [tree protection] measures do not hinder or prevent the use of the relevant working width for construction,' is unacceptable. In addition to works to 'high grade' trees, all works within Root Protection areas will require details of special methods of construction to be submitted and agreed with the relevant planning authority and supervision by a suitably qualified Arboriculturist.	N	**Application Document 6.10 Arboricultural Impact Assessment** details how trees located within and immediately adjacent to the Order Limits will be protected, which includes the use of tree protection fencing. Where construction activities are required within root protection areas, the construction methodologies are detailed within the Arboricultural Method Statement within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**.
		Landscape and visual, onshore mitigation, DCO process	LV03 A five-year aftercare period will not be sufficient for all types of planting. Other Control Documents are due to be provided in the ES, such as OCEMP and OLEMP and a Draft DCO.	N	This comment has been acknowledged and a longer aftercare period has been provided where relevant. This is detailed within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**, **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk** and **Application Document 3.1 draft Development Consent Order** will be submitted with the draft DCO.
		Landscape and visual, intra-project cumulative effects, inter-project cumulative effects	**Intra- and Inter-cumulative effects** 9.44 Any assessment of intra- and inter-cumulative effects with regards to landscape and visual sensitivity must consider that the receptors can move through the landscape (PRoW), that therefore sequential effects need to be assessed and that a series of non-significant effects can become significant in accumulation. The effects on the receptors are also not restricted to visual effects. Even, when the infrastructure is not seen, is the knowledge that the infrastructure is there (for example, behind screen planting) likely to affect how the landscape is perceived and valued.	N	The cumulative assessment for visual receptors considers sequential effects and is included within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The routes included have been discussed with stakeholders, including the thematic meeting held on 23 April 2024. The landscape cumulative assessment covers indirect and direct effects on perceptual qualities so it is considered that landscape sequential effects have been covered, which was communicated to stakeholders within the thematic meeting held on 27 February 2024.
		Intra-project cumulative effects, landscape and visual	*Intra- cumulative effects* 9.45 The preliminary assessment of intra-cumulative effects is broadly acceptable. the County Council will provide more detailed comments at a later stage when more detailed assessments are available.	N	National Grid acknowledges the Council's comment and further details are contained in **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**.
		Inter-project cumulative effects,	*Inter-cumulative effects* 9.46 The preliminary assessment of inter-cumulative effects shows that there is some considerable potential for these types of	N	Inter-project cumulative effects resulting from the Proposed Development have been assessed within the ES and are reported within **Application**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		landscape and visual	effects. These will have to be examined in greater detail when further information of this and other proposals will be available. the County Council will provide more detailed comments then.		**Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Landscape and Visual In summary, based on the inter-project cumulative effects indicative screening matrix, significant cumulative effects on landscape and visual receptors are expected from the combined effects of the Suffolk Onshore Scheme with East Anglia ONE North and East Anglia TWO Offshore Windfarms and LionLink Offshore Interconnector at all project stages on landscape character and visual amenity. During the construction and decommissioning stages only, there is the potential for significant cumulative effects as a result of the combined effects of the Suffolk Onshore Scheme and the Saxmundham South Green Neighbourhood. When considering the total potential cumulative effect of all the other developments combined with the Suffolk Onshore Scheme, there is the potential for significant cumulative effects for a temporary period on the Suffolk Coast and Heaths AONB as a result of the potential simultaneous or sequential construction of the Suffolk Onshore Scheme, East Anglia ONE North and East Anglia TWO Offshore Windfarms and LionLink Offshore Interconnector. The concentration of construction activity associated with the landfalls and HVDC cable corridors within part of the Suffolk Coast and Heaths AONB has the potential to alter the perception of the AONB with construction of major energy projects becoming a temporary characteristic feature of the landscape. These total cumulative effects are unlikely to remain once all projects are operational, particularly once the cable corridors are reinstated and mitigation plantings become established over time. Total cumulative effects on LCAs only have the potential to be significant for LCA L1 [Heveningham and Knodishall Estate Claylands] as a result of the construction of additional converter stations and the connection at Friston associated with the LionLink Offshore Interconnector development. There would also be total cumulative effects for a temporary and limited duration for LCA K3 (Aldringham and Freston Sandlands) as a result of the construction of Saxmundham South Green Neighbourhood and the Suffolk Onshore Scheme. Similarly, for SCT 03 Nearshore Waters there would be significant temporary cumulative effects experienced during construction as a result of the combined effects of the construction of the Suffolk Onshore Scheme, Sizewell C, East Anglia ONE North and East Anglia TWO Offshore Windfarms and LionLink Offshore Interconnector. Total cumulative effects on representative viewpoints have the potential to be significant as a result of the combined effects of East Anglia ONE North and East Anglia TWO Offshore Windfarms during construction for viewpoints 6, 7, 8 and 22 with only viewpoint 6 remaining significant during operation and maintenance stages, and with LionLink Offshore Interconnector development (viewpoints 1 – 7, 15-17, 19 – 21) at all project stages.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Ecology and Biodiversity The potential for cumulative effects exists where multiple large schemes lie within 10 km of Minsmere-Walberswick SPA or 2 km of Alde-Ore Estuary SPA, through the potential for cumulative loss of functionally linked habitat associated with one or other SPAs. For those other developments located close to the Suffolk Onshore Scheme there is also potential for cumulative disturbance of nesting nightjar and woodlark at Sandlings SPA and cumulative disturbance or habitat loss relating to other locally important receptors such as breeding birds, bats and dormice. However, due to the embedded measures incorporated into the Suffolk Onshore Scheme (set out in **Application Document 7.5.7.1 Landscape and Ecological Management Plan – Suffolk** and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**) no cumulative effects are predicted to arise. Historic Environment The assessment of total cumulative effects for cultural heritage has identified that there is the potential for four other projects to result in a cumulative impact on heritage receptors. These impacts include physical impacts on archaeological remains that potentially extend outside of the Proposed Project area, as well as impacts on the setting of heritage assets. However, the overall assessment of cumulative effects is currently assessed as 'not significant'. Water Environment Whilst each of the projects individually have the potential to have impacts on the watercourses and the land drainage regime within the study area, these impacts would expect to be reduced in magnitude by the adoption of embedded and control/management measures, secured against the individual consents, such that individually, and cumulatively, residual effects are not significant. Agriculture and Soils There is a likely significant cumulative effect in relation to soils and best and most versatile (BMV) land as a result of the temporary disturbance and the temporary and permanent loss of BMV land associated with each of the other developments in isolation and when combined. However, there is no additional mitigation available in relation to the permanent loss of BMV land to that presented in **Application Document 7.5.10.1 Outline Soil Management Plan- Suffolk**, and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. Traffic and Transport In summary, based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. In terms of PRoW closures/ diversions, these will be coordinated with other committed developments where necessary (as identified above) to reduce the potential for significant cumulative effects. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. Air Quality There are a number of projects which overlap with the air quality ZOI and therefore there is potential for cumulative effects from construction dust and NRMM emissions at shared receptors. However, providing recommended mitigation is implemented as outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, this is unlikely to be significant. There are a few projects where associated construction / operation phase vehicle routes are the same as the construction vehicle routes for the Proposed Project. However, the overall assessment of cumulative effects has been assessed as 'not significant'. Noise and Vibration There are a number of projects which overlap with the noise ZOI and therefore there is potential for cumulative effects from construction noise at shared receptors. However, providing recommended mitigation is implemented, as outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and **Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk**, this is unlikely to be significant. The preliminary assessment of total cumulative effects for noise and vibration has not identified any significant cumulative effects. Socio-Economics, Recreation and Tourism The assessment of total cumulative effects for socio-economics, recreation and tourism has identified that there is the potential for six other developments to result in cumulative impacts upon shared socio-economic, recreation and tourism receptors. No significant cumulative effects on socio-economics, recreation and tourism are expected as a result of the Suffolk Onshore Scheme in combination with each of the other developments in isolation. In addition, no significant effects are expected when considering the impacts of the

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					cumulative schemes in aggregation and in combination with the Proposed Project. Health and Wellbeing The health and wellbeing CEA draws upon the conclusions of other relevant environmental aspects, including landscape and visual, traffic and transport, air quality, noise and vibration, socio-economics, recreation, and tourism, whereby no significant effects were identified within the respective CEAs of these relevant environmental disciplines. Therefore, the health and wellbeing CEA includes no anticipated significant adverse effects on mental health due to community severance, reduced visual amenity, noise disturbance, or physical health outcomes such as levels of physical activity or respiratory health. This assessment also considers vulnerable groups, such as children, the elderly, and individuals with pre-existing health conditions. In conclusion, the overall inter-project assessment of cumulative effects has been assessed as 'not significant'.
		Legislation and policy, landscape and visual	**Landscape Response Appendices** **Appendix 1 The importance of Good Design** The County Council notes that 4.6.5 of the emerging Draft Overarching National Policy Statement for Energy, EN-1 (March 2023), suggests that both the developer and the Secretary of State should consider taking independent professional advice on the design aspects of schemes.	N	National Grid is cognisant of the requirements of national policy and has given careful consideration to how it will approach infrastructure design at a project and strategic level across all Great Grid Upgrade projects. National Grid has developed design principles for the Suffolk project elements (**Application Document 7.12.1 Design Principles – Suffolk**). The scope of the principles is not limited to any one design discipline and instead reflect a multi-disciplinary approach for coordinated design in the round. As such the design principles cover several design disciplines including architecture, landscape architecture, ecology, hydrology, civil engineering, wider engineering disciplines, town planning, archaeology and heritage. The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles. National Grid will continue to engage with relevant stakeholders including the County Council throughout the development of the Converter Station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process. National Grid welcomes the County Council's views and concur that through a collaborative approach to design, involving other projects and local stakeholders, a coherent architectural and landscape design is achievable. Acknowledging that each project has its own independent consenting programme, there is a need to consider the cumulative impacts of co-locating infrastructure. This remains a matter of ongoing discussion amongst the relevant developers, with the respective design and landscaping teams from each project working together to achieve
		Legislation and policy, landscape and visual	Furthermore, the Council notes that in the National Infrastructure Strategy (November 2020) the government states its commitment to embedding good design in all infrastructure projects through: "Requiring all infrastructure projects to have a board level Design Champion in place by the end of 2021 at either the project, programme or organisational level, supported … by design panels"	N	
		Coordination with other projects, landscape and visual, design	the County Council considers there is the opportunity to achieve a coherent architectural and landscape design approach between all projects at a consolidated converter station site, and that this can be achieved at the proposed site near Saxmundham. Furthermore, this approach could be used to support the necessary modifications to the design and layout of the Friston site.	N	
		Coordination with other projects, landscape and visual, design	The Council would support the principle of a Design Champion being engaged sufficiently early in the development of the project, and the other projects that are anticipated to use any coordinated site, to oversee the design process. In practice, because this work will need to straddle both architectural and landscape disciplines, two key leads may be required to work in close collaboration.	N	
		Coordination with other	A Design Champion would have the potential to contribute to the consideration of sustainable design issues and to the integration of	N	

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		projects, landscape and visual, design	the proposals into the landscape at the detailed design, construction, and operational stages of the project. The Councils would also support the use of a design review panel, design code/design approach document, and an outline of the design process, setting out key stakeholders, consultees, and the community engagement processes.		design approaches that are tailored to address the impacts of the Proposed Projects and seeking to establish design principles that can be used consistently. The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in collaboration with various disciplines to maximise opportunities to minimise effects arising from the Proposed Project and this has included the application of Good Design principles. This was communicated to stakeholders in a thematic meeting held on 27 February 2024 including that it should relate to the landscape within which the infrastructure sits within. National Grid has taken on board this feedback and has worked with the local design panel following good practice guidance from the National Infrastructure Commission. A project level Design Champion has been appointed as noted in **Application Document 7.12.1 Design Principles – Suffolk**.
		Landscape and visual	The skillset required of a Design Champion has not been clearly defined within the National Infrastructure Strategy. The Institution of Civil Engineers (ICE) and the National Infrastructure Commission Design Group (NICDG) have produced a useful working paper 'Defining and developing the design champion role', (August 2022), in this respect.	N	
		Landscape and visual	**Appendix 2 Comments of specific viewpoints** Comments on specific viewpoints Viewpoint the County Council (Landscape) comment 1 -- 2 The effects of the potential access route are currently not reflected. 3 Please clarify the location of the isolated residential property shown in the view. 4 -- 5 -- 6 -- 7 -- 8 Please check that the viewing angle is correct on the viewpoint map (looking at the photo it would appear that the view is towards north- west rather than west) 9 Viewing angle and location of viewpoint does not seem to fully align with photomontage. Please check. 10 -- 11 -- 12 -- 13 Here at least a wire frame of the landfall site should be considered.	N	The viewing angle, annotations on specific viewpoints and location of the viewpoints have been reviewed for all viewpoints in the preparation of material for the ES chapter following stakeholder comments. These are included in **Application Document 6.4.2.1 Landscape and Visual**. There is no wireframe provided for Viewpoint 13 as there would be no above ground infrastructure visible.

			18 It appears that the viewing angle does need adjustment to align with the photopage.		
		Legislation and policy, landscape and visual	**Appendix 3 Guidance on Hedgerows and Trees** *Hedgerows and Important Hedgerows* It should be anchored in the ES and in the definitions of the DCO that “hedgerow” and “important hedgerow” have the meaning given in the Hedgerow Regulations 1997. Any important hedgerows that are to be removed should be listed in a Schedule (Removal of Important Hedgerows) and identified on an appropriate plan.	N	The DCO application includes **Application Document 2.12.1 Trees and Important Hedgerows to be Removed or Managed Plans – Suffolk and Application Document 2.12.2 Trees and Important Hedgerows to be Removed or Managed Plans - Kent**. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.3.2.2.A ES Appendix 2.2.A Extended Phase 1 Habitat Survey Report** contain an assessment of Important Hedgerows. It is noted in **Application Document 6.3.2.2.A ES Appendix 3.2.A Extended Phase 1 Habitat Survey Report** that the hedgerows within and immediately adjacent to the Suffolk Onshore Scheme Order Limits typically acted as the margins for the arable fields present. Using the criteria set out in the Hedgerow Regulations 1997 the protected status of these hedgerows as well as their significance to the landscape were determined. Note that in addition to these criteria, Suffolk County Council also regard hedgerows with over 200 bat passes as “important hedgerows” where the main criteria of being older than 30 years is also met[1].
		Landscape and visual, terrestrial ecology, construction	No work should be allowed to commence until full and complete hedgerow surveys have been carried out. This is necessary to inform the baseline against which Biodiversity Net Gain and the success of the LEMP would be assessed and to agree replacements as part of the landscaping scheme.	N	A hedgerow survey assessment against the Hedgerow Regulations has been undertaken and the outputs can be found in **Application Document 6.3.2.2.A ES Appendix 2.2.A Extended Phase 1 Habitat Survey Report**.
		Legislation and policy, landscape and visual, terrestrial ecology	The County Council considers that important hedgerows for the purposes of this scheme should include: • Those meeting the Hedgerow Regulations, including the criteria for Archaeology, History, Wildlife and Landscape as listed in Schedule 1 of the Regulations. • If bat surveys identify 20 or more passes by bats the hedgerow should be considered important as a bat corridor. • All the hedgerows where one or more passes of a barbastelle have been recorded - due to the rarity of the species and margin for error in recording.	N	It has since been clarified with Suffolk County Council that 20 or more should say 200 or more, and one or more passes should be five or more passes. The important hedgerow criteria have been taken into account in all relevant assessments. The landscape team has discussed the fourth point at landscape and visual thematic meetings; however, no further information has been provided. Nonetheless, the assessment carried out is considered full and robust, with further detail provided in **Application Document 6.2.2.1 Part 2 Chapter 1 Landscape and Visual**. The Important Hedgerows under the Regulations have been considered within the landscape and visual impact assessment, refer to **Application**

[1] Suffolk Council personal correspondence / statutory consultee response.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• Those that perform an important visual function.		**Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. They have also been considered within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and are depicted in **Application Document 6.4.2.2.A Phase 1 Habitat Survey Report (including Badgers and Important Hedgerows**.
		Legislation and policy, landscape and visual, terrestrial ecology	Any required hedgerow removal will need to be compliant with the Wildlife and Countryside Act 1981 which restricts the timings of this in relation to nesting birds. Also, as hedges are an invaluable habitat resource the removal of hedges, if required, must have a degree of control, suitable assessment, and adequate mitigation, including that hedges can only be removed in accordance with any approved plans.	N	National Grid acknowledges the Council's comment. Restrictions around hedgerow removal (including Important Hedgerows) are set out in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Landscape and visual, design, construction	To enable full understanding and assessment of locations of important hedges, and areas, where either Horizontal Directional Drilling (HDD) needs to be undertaken, or offsetting of residual impacts needs to be agreed the County Council would ask the applicant to: • Append a column which identifies, by reference to the hedgerow regulations, why hedgerows are considered important. • Display the above hedges on a colour – coded map of an appropriate scale, distinguishing between the different criteria and include the additional hedgerows covered by points 2 (bat passes) and 3 (visual importance) above. • Confirm that the hedgerows in the cable corridor have been assessed against all the criteria in the hedgerow regulations, regarding, for example the presence of other protected species (Part II 6 (3)) and proximity to rights of way (Part II 8). • Provide photos of each of the hedgerows which fall within the definition of 1, 2 and 3 above as and in accordance with point C. This will provide a reference for the baseline. • Confirm which hedgerows the applicant is proposing to HDD. • Confirm how adverse impacts on hedgerows are minimised, for example by defining a minimum width for the cable corridor, when crossing hedges. This should be individual for each hedgerow (as circumstances may differ).	N	A hedgerow survey assessment against the Hedgerow Regulations has been undertaken and the outputs can be found in **Application Document 6.3.2.2.A ES Appendix 2.2.A Extended Phase 1 Habitat Survey Report** including the requested table. The table and associated figure deal with all the points requested. While colour coding the map against particular criteria was not possible due to the complexity, the table clearly identifies which criteria have been used to deem a hedgerow important and the map does discriminate by colour coding between ecologically and historically important hedgerows. The minimum width for the cable corridor is dictated by the minimum spacing that must existing between buried electricity cables. Where HVDC only traverses a hedgerow this minimum distance is 20 m, where HVDC and HVAC must traverse a hedgerow it is 39 m. No hedgerows will be crossed using trenchless solutions. The reasons for this, and an impact assessment regarding important hedgerows, is presented in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Legislation and policy, landscape and visual	*Trees* The Arboricultural Impact Assessment, which should be included in the ES, should provide full Tree Surveys in accordance with BS 5837:2012 Trees in relation to design, demolition, and construction. These Tree Surveys should then be used to inform the detailed	N	Tree survey information in accordance with BS5837:2012 is included within the **Application Document 6.10 Arboricultural Impact Assessment**. The Tree Constraints Plans were shared with the National Grid Design team and a meeting was held on 12 January 2024 to discuss

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			design stage and micro-siting of all works and required tree protection measures, such as protective fencing.		the tree related constraints within the order limits to inform the design for Design Freeze 3.
		Landscape and visual	Ancient and veteran trees and ancient woodlands are considered irreplaceable habitats and landscape features and any impacts on these should be avoided.	N	The locations of all recorded veteran and ancient trees and the locations of ancient woodland are shown within **Application Document 6.10 Arboricultural Impact Assessment**. Where identified buffer zones in accordance with standing advice have been implemented. No veteran and ancient trees or ancient woodland will be removed to facilitate the Proposed Project.
		Legislation and policy, landscape and visual	Post Consent, no works should be allowed to commence until a full Arboricultural Impact Assessment (including Tree Survey and Tree Protection Plan) and an Arboricultural Method Statement, (including location specific special construction method statements, where works are to be carried out within rootzones of trees that are to be retained) in accordance with BS 5837:2012 are submitted to and agreed with the relevant LPAs in writing.	N	The Arboricultural Method Statement will be secured via Requirement 8 of Schedule 3 of the draft DCO and will detail how sensitive operations are to be achieved in proximity to retained trees and detail the final protection measures for the Proposed Project.
		Landscape and visual, onshore mitigation, DCO process	No article in the DCO should automatically authorise any works to any tree subject to a tree preservation order. Such works, if demonstrated to be unavoidable, should be agreed with the relevant LPA on a case-to-case basis so that appropriate compensation can be agreed and secured.	N	The draft Order contains an article dealing with TPO trees, enabling works to TPO trees as listed in a schedule to the draft Order. This power will be discussed with relevant stakeholders and examined during the DCO examination.
		Water environment, construction	**10 Lead Local Flood Authority** **Landfall & cable corridor** 10.1 Given works at these locations are of a temporary nature, the County Council's focus is to ensure that surface water is adequately managed during the construction phase.	N	**Application Document 6.8 Flood Risk Assessment** has been undertaken which sets out measures to manage surface water drainage at construction sites and mitigate for any potential increase in flood risk from these sources. Commitments for the appointed contractor to prepare more detailed construction drainage plans are described within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**, and secured within Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Water environment, onshore mitigation, construction	10.2 Where possible, works should avoid areas of existing pluvial flood risk, with suitable mitigation in place where this is not possible.	N	A detailed process of routing and siting (documented in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 7.3 Design Development Report**) has been undertaken with the aim of avoiding works within areas at risk of flooding where practicable. Where this cannot be avoided, **Application Document 6.8 Flood Risk Assessment** has been undertaken which sets out construction stage surface water drainage principles to mitigate for any potential increase in flood risk from these sources. Commitments for the appointed contractor to prepare more detailed construction drainage plans are described within the CEMP, and secured within Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Water environment, onshore	10.3 Consideration should be given to the return period to which construction drainage is designed, ensuring that there is sufficient space available within the Order Limits to accommodate such drainage provision.	N	National Grid has liaised regularly with Suffolk County Council in its role as LLFA and has agreed the return period to which construction stage surface water drainage measures are designed. This is documented within **Application Document 6.8 Flood Risk Assessment**. There is

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		mitigation, construction			sufficient space within the Order Limits to accommodate these requirements.
		Water environment, onshore mitigation, construction	10.4 Where works intercept overland flow paths, consideration must be given to how these flows will be managed, to ensure there is no increase in flood risk, ensuring there is adequate space available for any necessary mitigation within the Order Limits.	N	This aspect has been assessed within **Application Document 6.8 Flood Risk Assessment** that has been prepared for the Proposed Project. The assessment describes interactions with existing surface water flow paths and how these will be managed to prevent increases in baseline flood risk.
		Water environment, geology and hydrogeology	10.5 Design Drawings, Version A, S42_S/TDD/SS/0010, 0013, 0014 & 0018 and others – Indicative sections do not show any methods for surface water drainage and would present a barrier to overland surface water flows, which could increase offsite flood risk.	N	Overland flow cut off drains will be provided to divert surface runoff from the construction area, these will be connected to local water courses or allow for infiltration where ground conditions allow. Additional 'dirty' water drainage will collect runoff from compounds and haul roads, this will be attenuated through the use of attenuation ponds before being infiltrated or discharged to local water courses at attenuated green field run off rates.
		Water environment, onshore mitigation, construction	**Converter station** 10.6 Consideration should be given to the return period to which construction drainage is designed, ensuring that there is sufficient space available within the Order Limits to accommodate such drainage provision.	N	National Grid has liaised regularly with Suffolk County Council in its role as LLFA and has agreed the return period to which construction stage surface water drainage measures are designed. This is documented within **Application Document 6.8 Flood Risk Assessment**. There is sufficient space within the Order Limits to accommodate these requirements.
		Water environment, agriculture and soils, geology and hydrogeology	10.7 National mapping suggests that soils in this general area are Lowestoft Formation – Diamicton, this soil generally has poor properties for infiltration. We would encourage the applicant to explore opportunities for infiltration through compliant testing at their earliest opportunity. If infiltration is not possible, locations to discharge surface water (at greenfield runoff rate) should be identified. These systems should be part of a wider watercourse network.	N	The infiltration properties of the soils have been characterised by conducting compliant testing as part of the Proposed Project's ground investigations. The data has been used to inform the proposed surface water drainage designs of operational above ground infrastructure. Details of the drainage measures proposed are provided within **Application Document 6.8 Flood Risk Assessment**.
		Water environment, geology and hydrogeology	10.8 The County Council LLFA encourage the principle of water re-use and would welcome further discussions with the project promoter on this topic. However, it is noted that General Arrangement Plan Version A, Section 2, Drawing number S42_S/IGA/PS/0002 shows the proposed converter station discharging to a 'permanent attenuation pond', which in turn is shown to discharge within the Order Limits. The discharge location would appear to be a farm irrigation pond. This would not be a suitable location to discharge surface water as it cannot be guaranteed that it has capacity to receive flow when required. Whilst the option for some surface water to discharge to the farm irrigation pond could be retained, this should not be a primary outfall location.	N	Since preparation of the PEIR, through regular engagement with the LLFA, drainage designs have been modified to avoid discharges into farm irrigation ponds. Opportunities for water re-use have also been discussed, however, these are limited within the constraints of the Proposed Project.
		Water environment,	10.9 General Arrangement Plan Version A, Section 2, Drawing number S42_S/IGA/PS/0005 – Drawing denotes 'drainage connections works', but it is not clear what this is referring to.	N	'Drainage connections works' refers to overland flow cut off drains which will be provided to divert surface runoff from the construction area and will be connected to local water courses or allow for infiltration where

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		geology and hydrogeology			ground conditions allow. ‘Drainage connections works’ additionally refers to 'dirty' water drainage which will collect runoff from compounds and haul roads and will be attenuated through the use of attenuation ponds before being infiltrated or discharged to local water courses at attenuated green field run off rates.
		Water environment, geology and hydrogeology	10.10 General Arrangement Plan Version A, Section 3, Drawing number S42_S/IGA/SS/0008 – What confidence can be assigned to each of the proposed outfall locations? How have these been determined as suitable?	N	Site topography has been used to identify the location of attenuation ponds, ground investigation surveys have been undertaken to define where attenuation and outfall is required and where infiltration can occur. Outfall locations are predominately driven by the topography of the land and proximity of water courses for outfall. Attenuation has been applied in all cases to reduce discharge to green field runoff rates.
		Water environment, geology and hydrogeology, construction	**Friston sub-station** 10.11 Consideration should be given to the return period to which construction drainage is designed, ensuring that there is sufficient space available within the Order Limits to accommodate such drainage provision.	N	National Grid has liaised regularly with Suffolk County Council in its role as LLFA and has agreed the return period to which construction stage surface water drainage measures are designed. This is documented within Application Document 6.8 Flood Risk Assessment. There is sufficient space within the Order Limits to accommodate these requirements.
		Legislation and policy, water environment, geology and hydrogeology	10.12 General Arrangement Plan Version A, Section 2, Drawing number S42_S/IGA/PS/0003 10.13 Proposed substation located over existing ordinary watercourse. Land Drainage Consent will be required for such works, and we would not accept the piping of this watercourse for such a long distance. Therefore, whilst not part of the DCO (unless the DCO seeks to disapply the Land Drainage Act 1991), the project promoter will need to give due thought to how this ordinary watercourse will be diverted as an open channel.	N	The requirement to secure land drainage consent for works to ordinary watercourses is noted. The contractor would prepare these applications, informed by detailed method statements and design information and secure all relevant permits following grant of the DCO, as set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Water environment, geology and hydrogeology	10.14 Proposed ‘permanent infiltration pond’ shown. Justification must be provided that such a feature can function as a standalone infiltration feature.	N	Drainage calculations following ground investigation results have been completed to identify where infiltration is acceptable in isolation. **Application Document 6.2.1.4 Description of the Proposed Project** contains details of drainage systems associated with the Proposed Project.
		Water environment, geology and hydrogeology	10.15 Proposed ‘permanent infiltration pond’ is also shown with a positive outfall to a nearby watercourse. However, this watercourse does not have onward connectivity and instead conveys water overland, down a farm track, until it enters the Main River in Friston. The Order Limits do not extend far enough south to provide a direct connection to the Main River in Friston.	N	The Order Limits have been amended in this area at the Statutory consultation stage having had regard to the feedback received. See **Application Document 2.14.1 Indicative General Arrangement Plans - Suffolk**, drawing number DCO/S/IGA/PS/1502. As such this matter should be regarded as having been resolved.
		Water environment, geology and hydrogeology, coordination with other projects	10.16 It is unclear what arrangement the proposed infrastructure would take if it were installed in addition to proposals as part of the Scottish Power Renewables (SPR) DCO. For example, would the National Grid sub-station consented through SPR need to increase in size? If so, in what direction? Would this impact SPR proposed attenuation basins? Where would Sea Link SuDS be located?	N	The substation proposed by SPR would not need to be expanded for the Proposed Project which could complete the required connections within the compound area proposed by SPR.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Water environment, geology and hydrogeology, legislation and policy	**PEIR Volume 1, Part 2, Chapter 5** 10.17 Existing flood risk and Land Drainage – fails to acknowledge historic surface water flooding downstream in Friston. This should include reference to multiple Section 19 investigations by Suffolk County Council as Lead Local Flood Authority under the Flood & Water Management Act 2010. The County Council LLFA have also produced a Surface Water Management Plan (SWMP) for the Friston catchment, which is available to the project promoter (should they not already have it), to enable them to assess existing surface water flood risk in the Friston catchment.	N	Since preparation of the PEIR, National Grid has liaised regularly with Suffolk County Council in its role as LLFA to gather information on flood risk sensitivities at Friston, including review of all relevant S19 Reports and data from the Friston Surface Water Management Plan. This information has informed **Application Document 6.8 Flood Risk Assessment** that has been prepared for the Proposed Project and has guided the measures embedded within the design to manage surface water runoff and land drainage.
		Water environment, geology and hydrogeology	10.18 2.5.8.2 – States that work is located in areas to avoid risk of flooding, but the proposed sub-station is located directly over an ordinary watercourse. A surface water flow path adjacent this watercourse has been identified as part of the SWMP developed by The County Council LLFA, which would directly impact the chosen site location.	N	The proposed substation designs have been progressed since the PEIR and the Proposed Project's interactions with watercourses and surface water flow paths in this location have been rationalised to avoid or reduce effects. Where effects have not been avoided, mitigation measures to reduce effects on flood risk and the land drainage regime are detailed in **Application Document 6.8 Flood Risk Assessment** that has been prepared.
		Water environment, geology and hydrogeology	**PEIR Volume 3, Part 2, Chapter 5 Figures – Figure 2.5.2** 10.19 Only high-risk surface water areas are shown in the legend. I assume this relates to the national mapping definition of high risk i.e. locations with >3.33% AEP. Why has only this risk level been used? The County Council LLFA recommend the use of the national mapping 'low risk' scenario as this is the most appropriate national scenario for the 1% + CC event. It is also worth noting that the 1% + CC event is included in the Friston SWMP.	N	**Application Document 6.8 Flood Risk Assessment** has been informed by the Friston SWMP dataset that defines 1% AEP plus climate change surface water flood extents, as well as having considered the national surface water mapping dataset, in terms of high, medium and low risk areas within the draft Order Limits.
		Construction, water environment, geology and hydrogeology	**Construction compounds** 10.20 Adequate surface water drainage must be provided for construction compounds. At present no surface water drainage infrastructure, such as attenuation ponds, are shown for construction compounds, in the same way that they are shown for permanent infrastructure. The return period for construction compound drainage should also be stated.	N	Proposed drainage principles for construction compounds are described in **Application Document 6.8 Flood Risk Assessment** prepared for the Proposed Project and design standards for construction drainage infrastructure have been agreed with the LLFA. This includes compound drainage design to accommodate runoff generated from the 1 in 100-year return period storm event in Suffolk. In Kent, the construction compound drainage systems would be designed to accommodate a 1 in 30-year return period storm event. This is in line with guidance nationally and from the relevant local planning authorities for enabling works. Commitments for the appointed contractor to prepare more detailed construction drainage plans are described within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Geology and hydrogeology, agriculture and soils	**11 Minerals and Waste** 11.1 The County Council as minerals and waste planning authority has responsibility for the safeguarding of planned and operational minerals and waste facilities as well as underlying minerals resources.	N	National Grid acknowledges the Council's comments.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Geology and hydrogeology, agriculture and soils	11.2 Reference to the Safeguarding plans attached to the Suffolk Minerals & Waste Local Plan indicate that there would be no conflicts with existing minerals and waste facilities. In general, there would potentially be a positive impact upon minerals and waste facilities arising from the demand for sand and gravel and waste disposal.	N	National Grid acknowledges the Council's comments.
		Geology and hydrogeology, agriculture and soils	11.3 In terms of the underlying sand and gravel resources the majority of the proposed development is not irreversible and although during the operational lifetime of the proposal, which would likely extend beyond the lifetime of anybody alive today, extraction within parts the area occupied by the underground cables would not be possible. Where minerals are excavated on site during the course of construction then they should be used in the construction of the proposed development where possible. Removal of the development following cessation of use should be required to restore access to mineral resources.	N	Mineral extraction would be unlikely given the limited amount of excavated material. However, National Grid will be looking to reuse the excavated material as far as reasonably practicable, as backfill where thermally suitable or in levelling the Converter Station and Substation sites, or within landscaping.
		Geology and hydrogeology, agriculture and soils	11.4 Waste created during construction, operation and decommissioning should be treated in accordance with the waste hierarchy of: - a) Prevention b) Preparing for re-use c) Recycling d) Other recovery e) Disposal	N	The waste hierarchy will be followed with a Material and Waste Management Plan to be developed and submitted to and approved by the local planning authority prior to construction. The ES includes references to applicable control and management measures for waste. Further detail can be found in **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**, **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.3.2 Appendix B Register of Environmental Actions and Commitments (REAC)**. There is also a separate **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**.
		Design, converter station location, intra-project cumulative effects	**12 Public Heath** **Convertor Station Design** 12.1 2.4.2, 2.4.3 and 2.4.4, page 6: The County Council welcomes the prospect of a green roof that has potential to boost local ecology. Though noting the technical challenges presented in construction, it will be important for the developer to evidence the overall benefits to ecology and carbon reduction outweigh the impacts brought about by complex construction methods including sourcing of materials.	N	National Grid welcomes the support for the Converter Station design to incorporate a green roof and acknowledges the importance of balancing the perceived benefits of such an approach with the complexity of integrating this within the design and ensuring it is sustainable from construction and supply chain, through to maintenance when in operation. As part of the DCO submission, National Grid has prepared **Application Document 7.12.2 Design Principles – Suffolk**. These will be developed during the detailed design process and any ecological benefits will be determined at this stage.
		Health and wellbeing	**Part 2 Suffolk Onshore Scheme Chapter 12 Health and Wellbeing** 12.2 2.12.7.45-47, Future baseline, page 45 – The applicant may wish to consider referencing the Suffolk in 20 years resource	N	National Grid acknowledges the Council's comments. The assessment of effects on health and wellbeing is primarily informed by best practice guidance from the Institute of Environmental Management and Assessment. Additional guidance from the World Health Organisation, the Dahlgreen and Whitehead's model of the main

			https://www.suffolk.gov.uk/asset- library/suffolk-in-20-years-2023.pdf		determinants of health, and the NHS Healthy Urban Development Unit (HUDU) Rapid Health Impact Assessment HIA Assessment Tool (2019) is also used to supplement a thorough assessment. It, therefore, should be noted that HUDU is only used as supplementary guidance to further substantiate a thorough assessment.
		Health and wellbeing	12.3 2.12.4.2, Guidance specific to the health and wellbeing assessment, Page 12 – The County Council note use of NHS Healthy Urban Development Unit (HUDU) Rapid Health Impact Assessment HIA Assessment Tool (2019) and question whether HUDU is the most appropriate HIA tool given Suffolk is a predominantly rural County (https://www.healthysuffolk.org.uk/asset-library/APHRs/core20plus5-aphr-2022.pdf, https://www.healthysuffolk.org.uk/asset-library/APHRs/core20- evidence-base.pdf)	N	
		Health and wellbeing, onshore mitigation	12.4 2.12.9.6, Preliminary magnitude, Page 52 quotes 'On the basis of the above, and with the mitigation measures listed above in place, the magnitude of impact is assessed to be low.' Mitigation measures are not listed in 2.12.9.6.	N	**Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**, Section 12: Sensitivity Testing, outlines that the mitigation measures relevant to the technical chapters and that are drawn upon for the health and wellbeing assessment are detailed in the relevant chapters. Furthermore, to date no additional measures for health and wellbeing have been identified and hence are not listed. The mitigation measures referred to on Page 52 are detailed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Health and wellbeing, socio-economic, recreation and tourism	12.5 2.12.9.12, Employment and income, Page 66. The section does not account for impacts to the existing local economy, but only additional jobs relating to the scheme.	N	**Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** outlines in depth the impacts of the Proposed Project on the existing local economy.
		Construction, consultation	**Appendix 1.4.A Outline Code of Construction Practice** 12.6 1.4.A.2.14A, Page 6, Community Engagement and Public Information: 12.7 With respect to communications and signage, The County Council recommend neurodiverse friendly methods are used wherever possible.	N	These comments are noted. Neurodiverse communication and signage will be considered as appropriate and National Grid will seek further steer from the Council on this matter in the course of ongoing engagement.
		Construction	12.8 1.4.A.2.49, Page 11, Welfare: 'Welfare facilities will be kept clean and tidy.' How will this be monitored? i.e. will the Contractor undertake daily inspections and complete monitoring forms to ensure welfare facilities are kept clean and tidy? Perhaps this could be included in 1.4.A.2.69	N	Both **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** set out the good practice measures to reduce effects on people and local communities during construction and also include a commitment to communicate information about the Proposed Project to local communities. Commitment GG11 within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** refers to a list of good housekeeping measures. However, this is not an extensive list and the full suite of measures will be outlined within the detailed CEMP which will be developed in advance of construction using

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan as a basis.
		Legislation and policy, air quality	**Part 2 Suffolk Onshore Scheme Chapter 9 Air Quality** 12.9 Page 3 states 'It should be noted that the PM2.5 objective is a target value and is not in the 2010 regulations as a legal requirement to be achieved by local authorities. Please note the Environment Act 2021 established a legally binding duty on government to bring forward at least two new air quality targets in secondary legislation. This duty sits within the environmental target's framework outlined in the Environment Act (Part 1).	N	National grid acknowledges this feedback. With regard to the targets, it appears that based on the Regulations, compliance with the target will only be measured and assessed at $PM_{2.5}$ monitoring stations. There is as yet limited advice from Defra on how compliance with the $PM_{2.5}$ targets will be determined, and how the targets should be considered in the planning system. For the purpose of the assessment in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**, the Limit Value for annual mean $PM_{2.5}$ ($20\mu g/m^3$) has been used.
		Legislation and policy, air quality	12.10 The air quality targets set under the Act are: • Annual Mean Concentration Target ('concentration target') - a maximum concentration of 10µg/m 3 to be met across England by 2040 • Population Exposure Reduction Target ('exposure target') - a 35% reduction in population exposure by 2040 (compared to a base year of 2018). See Development of the Environment Act Targets - Defra, UK for more information.	N	National Grid acknowledges this feedback. This has been referenced in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**. The targets set under the Environment Act have been considered in the assessment following the interim Defra guidance. The assessment has identified key sources of $PM_{2.5}$ and taken appropriate action to minimise emissions as far as is reasonably practicable.
		Air quality	12.11 The County Council also recommend taking account of the World Health Organisations guidelines on Air Quality available at https://www.who.int/publications/i/item/9789240034228	N	The Air Quality Strategy (AQS) objectives are the national air quality objective levels which the local authorities need to meet in England. The World Health Organisation guidelines are not legally binding in the UK and are not the standards to which local authorities are held to. Therefore, for the assessment detailed in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**, AQS Objectives have been used.
		Air quality, onshore mitigation, intra-project cumulative effects	12.12 The County Council recommend more could be done to monitor and mitigate against PM2.5 implications deriving from the project. The data referred to in Part 2 Suffolk Onshore Scheme Chapter 9 Air Quality is from diffusion tubes which do not measure PM2.5 and both the construction traffic and dust from site will significantly increase levels. This is of particular concern as one of the 'receptors' mentioned in the document is a Primary School in 'close proximity' to one of the sites – children are more vulnerable to the effects of pollution and exposure in childhood can lead to life-long health conditions. The County Council recommend installation of live pollution sensors to accurately monitor levels of all pollutants not just NO2, particularly by the schools and residential developments identified.	N	Measure AQ02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** recommends PM_{10} continuous monitoring prior to and during construction. National Grid has confirmed real-time monitoring of NO_2, PM_{10} and $PM_{2.5}$ during the construction phase will be undertaken at the locations agreed with the local authorities as detailed in the Air Quality Management Plan (**Application Document 7.5.6.1 Outline Air Quality Management Plan - Suffolk**).
		Walking, cycling and horse-riders	**13 Public Rights of Way (PRoW)** **Summary** **Assessment of Effects**	N	A separate PRoW ES chapter has not been prepared, given that PRoW are considered across multiple chapters and details relating to management and mitigation are set out in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk**. As part of the socio-economics thematic meetings, the assessment

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			13.1 The County Council disagrees with the current approach of dividing the consideration of the effects on PRoW and their users across several chapters, none of which consider the actual experience of the PRoW users. It also makes it unnecessarily difficult for consultees to engage with the process. The County Council requires PRoW to be considered as a separate theme considering the effect on the physical resource, the amenity value, and the quality of the user experience.		approach to PRoW has been discussed with stakeholders and includes consideration of the quality of user experience. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. Further details are contained in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. Amenity effects arising from changes in noise, air quality, transport and visual have been considered in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. Impacts to PRoW as a physical resource, i.e. diversions and closures, have been considered in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, while visual amenity effects have been considered in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Walking, cycling and horse-riders	**Labelling of PRoW** 13.2 Is inconsistent, confusing, contradictory, and unacceptable. the County Council is very disappointed that the labelling has not followed the standard expected by the County Council as owner of this digital data.	N	This is acknowledged and **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** have been updated to retain the use of the correct PRoW labelling throughout. The correct PRoW labelling has also be used within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk**.
		Walking, cycling and horse-riders, intra-project cumulative effects	**Robustness of information** 13.3 the County Council is concerned that the desk-based approach and the many assumptions being made in the various chapters that consider PRoW and their receptors, are not sufficiently robust or accurate and are therefore leading to inaccurate assessments of sensitivity, magnitude and ultimately underestimating the significance of the effect of the development.	N	Noted, these comments have been considered within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** provides details of measures and mitigation to avoid any significant PRoW impacts. From a socio-economics perspective, as part of Thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes.
		Walking, cycling and horse-riders, intra-project cumulative effects	**Assessment of effects** 13.4 the County Council is disappointed that Public Rights of Way & Recreation have not been considered as a separate topic in the PEIR. Dividing the effect of the development on PRoW and their users across several chapters, each with its own set of criteria for sensitivity and magnitude, results in individual assessments which do not reflect the importance of the local access network and the quality of the user experience and amenity value. The combined effects of all the aspects of the development, such as the severance and loss of the physical resource, construction traffic, noise, visual intrusion, and loss of tranquillity, all contribute to the quality of the user experience inherent in a recreational walk or ride.	N	National Grid acknowledges the concern raised by the Council and has been in touch directly regarding this matter. It is proposed to continue to assess PRoW, following established practice in EIA. It is not conventional for an ES to have its own PRoW topic chapter. It is recognised that Sizewell C has a separate Amenity and Recreation chapter focusing on PRoW, but it is noted that most other local EIA schemes in Suffolk (East Anglia ONE North, East Anglia TWO and BTNO) also adopt the same approach as the Proposed Project EIA. It is important for an EIA to remain proportional in approach and remain focused on assessing the likelihood of significant environmental effects, and by introducing a PRoW chapter it would risk double counting of effects already being reported somewhere else in the ES. It is National Grid's view that the structure of the ES as proposed allows for a full assessment of all potential impacts on PRoW where there is the potential for significant environmental effects. Across the Landscape and Visual, Traffic and Transport, Socio-Economics, Recreation and Tourism

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					and Health and Wellbeing topic assessments the aspects mentioned by the Council will be covered. The concern that when considered individually, an impact might be assessed as not significant, but if the impacts had been considered collectively for that receptor, could be significant has been addressed within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**, which has considered the combined effects on PRoW and their users, that have been identified across the various topic chapters. Importantly, it is not felt that a separate PRoW topic would result in any difference in the outcome of the assessment of overall impacts on PRoW, and the required mitigation. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared which provides details of PRoW closures and diversions. Continued liaison with the Council on this topic is ongoing.
		Walking, cycling and horse-riders, intra-project cumulative effects, legislation and policy	13.5 This fragmented approach gives rise to a weakness in the EIA process, as recognised in PINS advice note 9, that when considered individually, an impact might be assessed as not significant, but if the impacts had been considered collectively for that receptor, they could be significant. A walker, cyclist or horse rider using a public right of way or on open access land experiences the countryside, and hence any impacts, holistically; namely the quality and diversity of the views, wildlife and natural features, the sense of wildness, peace and quiet, the presence (and absence) of traffic, noise, lighting and air quality, and the connectivity of the network.	N	National Grid acknowledges the concern raised by the Council and has been in touch directly regarding this matter. It is proposed to continue to assess PRoW, following established practice in EIA. It is not conventional for an ES to have its own PRoW topic chapter. It is recognised that Sizewell C has a separate Amenity and Recreation chapter focusing on PRoW, but it is noted that most other local EIA schemes in Suffolk (East Anglia ONE North, East Anglia TWO, and BTNO) also adopt the same approach as the Proposed Project EIA. It is important for an EIA to remain proportional in approach and remain focused on assessing the likelihood of significant environmental effects, and by introducing a PRoW chapter it would risk double counting of effects already being reported somewhere else in the ES. PINS advice note 9 addresses the use of a ‘Rochdale Envelope’ approach to EIA. It states that applicants who follow a parameters-led assessment should clearly set out the parameters assessed in order to ensure that interactions between individually assessed impacts are taken into account relevant to the established worst case scenario. **Application Document 6.2.1.5 Part 1 Introduction EIA Approach and Methodology** describes the Proposed Project EIA’s use of the Rochdale Envelope approach, which National Grid considers to be in accordance with PINS advice note 9. It is National Grid’s view that the structure of the ES as proposed allows for a full assessment of all potential impacts on PRoW where there is the potential for significant environmental effects. Across the Landscape and Visual, Traffic and Transport, Socio-Economics, Recreation and Tourism and Health and Wellbeing topic assessments the aspects mentioned by the Council will be covered. The concern that when considered individually, an impact might be assessed as not significant, but if the impacts had been considered collectively for that receptor, could be significant has been addressed within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Suffolk Onshore Scheme Intra-Project Cumulative Effects, which has considered the combined effects on PRoW and their users, that have been identified across the various topic chapters. Importantly, it is not felt that a separate PRoW topic would result in any difference in the outcome of the assessment of overall impacts on PRoW, and the required mitigation. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared which provides details of PRoW closures and diversions. Continued liaison with the Council on this topic is ongoing.
		Walking, cycling and horse-riders, intra-project cumulative effects	13.6 Therefore, the County Council's position remains that the impact on both the physical resource and the amenity value of the public rights of way and access network should be addressed as a separate theme within an Environmental Assessment. This should include both the effect on the physical resource from temporary or permanent closures and diversions, as well as the quality of user experience and amenity value.	N	National Grid acknowledges the concern raised by the Council and has been in touch directly regarding this matter. It is proposed to continue to assess PRoW, following established practice in EIA. It is not conventional for an ES to have its own PRoW topic chapter. It is recognised that Sizewell C has a separate Amenity and Recreation chapter focusing on PRoW, but it is noted that most other local EIA schemes in Suffolk (East Anglia ONE North, East Anglia TWO, and BTNO) also adopt the same approach as the Proposed Project EIA. It is important for an EIA to remain proportional in approach and remain focused on assessing the likelihood of significant environmental effects, and by introducing a PRoW chapter it would risk double counting of effects already being reported somewhere else in the ES. It is National Grid's view that the structure of the ES as proposed allows for a full assessment of all potential impacts on PRoW where there is the potential for significant environmental effects. Across the Landscape and Visual, Traffic and Transport, Socio-Economics, Recreation and Tourism and Health and Wellbeing topic assessments the aspects mentioned by the Council will be covered. Impacts to PRoW as a physical resource, i.e. diversions and closures, have been considered in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, while changes to user experience have been assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and visual amenity effects have been considered in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Amenity effects arising from changes in noise, air quality, transport and visual have been considered in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. The concern that when considered individually, an impact might be assessed as not significant, but if the impacts had been considered collectively for that receptor, could be significant has been addressed within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**, which has considered the combined effects on PRoW and their users, that have been identified across the various topic chapters. Importantly, it is not felt that a separate PRoW topic would result in any difference in the outcome of the assessment of overall impacts on PRoW, and the required mitigation. **Application Document 7.5.9.1 Outline Public Rights of**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Way Management Plan - Suffolk has been prepared which provides details of PRoW closures and diversions. Continued liaison with the Council on this topic is ongoing.
		Walking, cycling and horse-riders, intra-project cumulative effects	13.7 the County Council welcomes that PRoW have been taken forward to the stage 3 -Intra-project effects assessment but this should focus on more than just visual intrusion.	N	National Grid acknowledges the Council's comment. With regard to PRoW, **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects** reports the consideration of changes to user experience and local travel patterns, and traffic and transport effects, alongside visual amenity effects.
		Walking, cycling and horse-riders	**Labelling of PRoW** 13.8 This is completely unsatisfactory and contradictory throughout all the PEIR documents and infuriating for consultees to attempt to know which PRoW is being referred to. For example, Chapter 8, Traffic and Transport has listed each PRoW in 2.8.66 with the correct label E-460/001/0 together with a shorter 4 number label (8622) and a third reference label (S-P25), but then proceeds to use the latter two in most other sections, before resorting solely to the third reference label in the preliminary assessment section. The PRoW Figure 2.8.4 (plan of all PRoW) only uses the 4 number reference. This point was raised in the County Council response to the Non-Statutory Consultation, and it is frustrating that it has been ignored.	N	This is acknowledged and **Application Document 6.2.2.7 Part 2 Suffolk Chapter 2 Traffic and Transport and Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** have been updated to retain the use of the correct PRoW labelling throughout. The correct PRoW labelling has also be used within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk**.
		Walking, cycling and horse-riders	13.9 Labelling of PRoW should be consistent and standard across all documents and follow the same convention as depicted on the Definitive Map, the legal record for PRoW. The applicant was advised of this correct convention when acquiring the digital data from the County Council. PRoW are identified by the parish (which has a code) and the path number, for example E – 354/007/A is East/parish code (Knodishall=354)/path number =7A, i.e. Knodishall 7A. Currently a variety of labels are used in different chapters of the PEIR, some correct, some not, and it is confusing and impenetrable making consultation much more difficult for statutory bodies and the public. It is unacceptable to use any other label in the consultation documents without at least being accompanied by the correct Definitive Map label.	N	
		Legislation and policy, onshore mitigation, intra-project cumulative effects	**Local Planning Policy** 13.10 Suffolk County Council Green Access Strategy 2020-2030 (Rights of Way Improvement Plan) should be included as relevant local planning guidance. The plan sets out the council's commitment to ensuring and promoting sustainable travel options for all. The strategy focuses on walking and cycling for commuting, accessing services and facilities, and for leisure reasons. Specifically, 2.1 "Seeks opportunities to enhance public rights of way, including new linkages and upgrading routes where there is a need, to improve access for all and support healthy and	N	Suffolk County Council's Supplementary Guidance Document on Public Rights of Way and Green Access has been considered as part of the management and mitigation proposed within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. No new 'green' routes are proposed as part of the Proposed Project, as this is not required mitigation based on the assessment of PRoW diversions and closures within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Any enhancements such as this fall outside of the DCO. Nonetheless, National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			sustainable access between communities and services. Funding to be sought through development and transport funding, external grants, other councils, and partnership working." The council will expect enhancements to the network in addition to mitigation, compensation, and management strategies that will ensure that the public; residents and tourists alike, retain the quantity and quality of access provision.		those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**.
		Walking, cycling and horse-riders, DCO process	**Volume 2 Part 1 Appendix 1.4.A Outline Code of Construction Practice** 13.11 the County Council welcomes the commitment to produce a PRoW Strategy as part of the CoCP and looks forward to working with the applicant on the development of the outline PRoW Strategy prior to the DCO application.	N	The PRoW strategy for the Proposed Project has been the subject of discussion at multiple thematic meetings with Suffolk County Council. The DCO application includes **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk and Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent**.
		Walking, cycling and horse-riders, design, traffic and transport	**Control and management measures** **GG07** 13.12 The general project commitment regarding pre-condition surveys (Table 1.4.A.2 Ref GG07) should explicitly include all PRoW within the working areas, crossing points, haul routes and used as access roads and include any pre- construction/pre-commencement activities. Note that the County Council is the landowner as regards the surface of the public highway.	N	As documented in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**, secured by Requirement 6 of Schedule 3 of the draft DCO, National Grid will undertake pre-commencement condition surveys of all directly affected PRoW prior to the commencement of construction. At this stage this is expected to be limited to any PRoW to be crossed by the temporary haul road or directly affected by installation of works, as summarised within the document.
		Walking, cycling and horse-riders, construction, traffic and transport	**TT03** 13.13 The County Council would like to see a commitment to keeping PRoW open and available during the construction period through the use of management measures such as controlled crossing points, traffic marshals and signage. If temporary closures are required, then the County Council expects the number and duration to be kept to a minimum with alternative routes provided and has included the principles it would expect to be followed in the Addendum: PRoW Guidance.	N	National Grid acknowledges this feedback. Diversion routes have been identified where any temporary PRoW closures will be required. These details are set out in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk**. It is proposed to temporarily divert several PRoW during the construction phase. The proposed diversion routes will be designed to be of equivalent nature and connectivity to the existing sections of the routes to be closed, whilst minimising the additional journey length as far as practical. Short term temporary diversions will last four weeks, and long term temporary diversions will be the full construction phase.
		Walking, cycling and horse-riders, traffic and transport, construction	**Terrestrial enabling works, access, and site preparation.** 13.14 An onshore preparation works /pre commencement management plan and accompanying figure should be produced that outlines any PRoW affected by site preparation and early works, together with the management measures necessary to protect the PRoW and public users. Note that Figure 1.4.19 describes traffic routes during construction and operation but no information provided for pre-construction activities.	N	**Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk** covers the construction (decommissioning) and operational phases. Pre-commencement/ mobilisation works are expected to be similar to construction both in terms of methodology and diversion routes, albeit over a shorter duration. The mitigation and management measures identified for the construction phase will be applied during preparation/ mobilisation works where there are any interactions with any PRoW. This commitment is made within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, which is secured

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Walking, cycling and horse-riders, construction	13.15 the County Council notes that the proposed access tracks and working areas would be fenced with 1.2m high stock fencing with gates to maintain access to PRoW. However, the County Council oppose the gating of PRoW as an unnecessary barrier to some users of the network, particularly those with limited mobility and equestrians on bridleway. There should be a presumption against installing gates unless this could be justified to the County Council for a specific site. Any gate would need to comply with current BS 5709-2018.	N	As stated in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**, gates would be provided on the haul road with the priority access provided to the PRoW user. Construction traffic using the crossing would open the gates (closing off the PRoW temporarily for safety) move through the crossing point and then close the gate to return priority to the PRoW.
		Walking, cycling and horse-riders, traffic and transport	**Volume 2 Part 1 Appendix 1.4.B Outline Construction Traffic Management Plan** 13.16 The PRoW which are impacted by this scheme have been identified and described through a high-level desktop review considering surfacing, signage, width, potential obstructions when referring to route quality. (Appendix 1.4B Outline CTMP 1.4.B.2.16). the County Council are very concerned that this is introducing false assumptions and significant errors at this early stage. For example, describing a public footpath as an alternative route for a public bridleway shows a lack of understanding of the different classes of user, namely equestrians and cyclists, which are legally entitled to use the bridleway compared to a footpath. Route E-460/001/0 (8622) is described as expected to be lightly used with limited alternative routes available, whereas in fact, this is the only public footpath from the northeast side of Saxmundham linking to the quiet lanes and public footpath network in Kelsale, is locally well used and there are no alternative routes available.	N	National Grid acknowledges this feedback. These comments have been considered as part of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, which includes an assessment of PRoW diversions and closures. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** sets out measures to manage PRoW through the construction and operational phases of the Proposed Project.
		Walking, cycling and horse-riders, traffic and transport	13.17 the County Council welcome the commitment to retaining access to all existing PRoW with a limited number of temporary diversions to be used. (Appendix 1.4B Outline CTMP 1.4.B.7.10)	N	National Grid acknowledges the Council's comment.
		Walking, cycling and horse-riders, onshore mitigation, landscape and visual	**Mitigation Measures** 13.18 the County Council welcomes the opportunity to discuss the additional mitigation required for any of the permanent diversions of PRoW at the substation and converter sites. (E-354/006/0 (7975), E-491/005/0 (8903) and E- 491/006/0 (8904). (Appendix 1.4B Outline CTMP 1.4.B.7.13) 13.19 the County Council welcomes working with the applicant regarding the outline PRoW Management Plan to identify the management and mitigation measures to be implemented to avoid any significant effect on PRoW during all phases of the project. the County Council asks that this should also include any onshore preparation/early works. (Appendix 1.4B Outline CTMP 1.4.B.7.14) and those PRoW used as construction accesses where additional	N	Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The meetings have run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. For example, in July 2024, a meeting was held with the Council and East Suffolk Council to review the proposed design changes to the Suffolk Onshore Scheme as part of the Targeted consultation period between 08 July and 11 August 2024, including potential implications to the traffic and transport assessment. The meeting was also used to cover the proposed scope of **Application Document 7.5.9.1 Outline Public Rights of Way**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			highway related works are required such the construction of bell mouths. (S-BM 08, S-BM 013) 13.20 the County Council would welcome the opportunity to discuss the appropriate mitigation at the converter site to ensure the continuity of access from Saxmundham to Sternfield and Friston, on PRoW designed and integrated into the proposed landscaping strategy.		**Management Plan – Suffolk** and the feedback previously received on PRoW as part of the Statutory consultation. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been developed in consultation with Suffolk County Council and East Suffolk Council. The document sets out measures to maintain continuity of access, and manage PRoW through the construction, operation and decommissioning phases of the Proposed Project. The proposed management measures seek to retain access to PRoW during all phases of the Proposed Project, with temporary diversions only being proposed where these are required to bypass any temporary closures during the construction phase where necessary. Two PRoW are proposed to be permanently stopped up (with permanent diversions) as a result of the Suffolk Onshore Scheme which comprise PRoW E-354/006/0 due to the location of the Friston Substation and PRoW E-491/005/0 due to the location of the Saxmundham Converter Station. These permanent closures/ diversions have been considered and assessed as part of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. All locations where a PRoW would be impacted by the Proposed Project would have appropriate signage to advise the dates and hours affected. National Grid would develop, through consultation with Suffolk County Council PRoW officers, a standard form of signage relating to temporary PRoW closures and diversions which would be used across the Proposed Project. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk** will be developed further into a finalised document (Detailed PRoWMP) by the appointed Contractor, ahead of the commencement of any construction activities. National Grid will maintain a regular dialogue with the PRoW officers at Suffolk County Council throughout the construction period of the Proposed Project in order to ensure the objectives of the Detailed PRoWMP are achieved.
	Walking, cycling and horse-riders, landscape and visual, onshore mitigation	**Volume 1 Part 2 Chapter 2 Landscape and Visual** 13.21 the County Council welcomes the recognition that the effect on the visual amenity for users on the public footpath at viewpoint 1 is significant. PRoW at the converter station site are proposed to be permanently diverted (E-491/005 and E-491/006/0), and so this new route should be included as a representative viewpoint location. 13.22 The principle of connecting people to the environment via footpaths constructed in tandem with environmental enhancement is described in the draft NPS for Electricity Networks Infrastructure (EN-5). This principle should be applied to the design of the landscaping and the PRoW network at the converter station and substation sites. 13.23 Therefore the County Council expects the Indicative Landscaping Strategy (Doc Ref Fig 1.4.3) to integrate PRoW into the design with futureproofing for the possibility of co-location and not as currently indicated on the indicative landscape plan for the	N	Five new viewpoints have been included following the production of the PEIR, which include a range of different receptors and distances from the Proposed Project (refer to **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**). Another viewpoint on the permanent PRoW diversion is not considered to be appropriate as the existing Viewpoint 1 is representative of users of the local PRoW in close proximity to the proposed Converter Station location. The opportunities for recreation have been developed in collaboration with other key disciplines including traffic and transport and socio-economics (further details within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**). This has included a permanent PRoW diversion on the Converter Station site which has been designed to have a variety of experiences with some sections more open and others adjacent to woodland planting to aid screening of views towards the Suffolk Onshore Scheme. This has also included the provision of open access areas, as requested through stakeholder feedback. The indicative landscape

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			converter site. This shows the indicative recreational access route including the diverted PRoW, located to the north of the new native woodland planting which would leave it exposed to the possible permanent access road to the north and also within the footprint of the co located converter station (Doc Ref Fig 1.4.6). 13.24 The public footpath E-491/005/0 is omitted from both these plans but is within the footprint of the proposed converter station and co-located station and the County Council will expect the mitigation, including the alternative route for the footpath, to be integrated into the landscaping.		strategy is shown in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** which details the permanent PRoW diversion across the site and the potential visual amenity effects on users of PRoW in the study area is detailed within **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.
		Walking, cycling and horse-riders, traffic and transport, onshore mitigation	**Vol 1 Part 2 Chapter 8 Traffic & Transport** 13.25 the County Council is concerned that the desk-based approach and the many assumptions being made regarding the quality, level of use, availability of alternative routes for PRoW users and non-motorised amenity are not robust or sufficiently accurate and are leading to the inaccurate assessment of the sensitivity of receptors and ultimately, the significance of the effect of the development. For example, E-491/005/0 (S-P21/8903) lies directly under the footprint of the Saxmundham converter station and is the only direct off-road link from the village of Sternfield to Saxmundham yet is deemed to have low sensitivity as it is expected to be lightly used and alternative routes available. This leads to an overall conclusion of 'not significant.' However, it does not seem appropriate to assess the permanent closure of the footpaths at the Saxmundham site as 'not significant,' on the basis of having identified the need for further consultation to identify mitigation and the production of a management plan. Until those measures are identified and agreed, then the significance of effect of the development should remain as significant. 13.26 We do however welcome the recognition in 2.8.9.50 that there are potentially significant effects which will be reviewed as part of the ES, and we look forward to working with the applicant on identifying the appropriate mitigation as described in S-TTAMO1 and S-TTAM02.	N	National Grid acknowledges this feedback. These comments have been considered as part of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, which includes an assessment of PRoW diversions and closures. **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** sets out measures to manage PRoW through the construction and operational phases of the Proposed Project.
		Walking, cycling and horse-riders, traffic and transport, socio-economic, recreation and tourism	**Vol 1 Part 2 Chapter 11 Socioeconomics, Recreation and Tourism** 13.27 the County Council is disappointed that the effects considered under the heading of recreation focus solely on changed in journey length, local travel patterns and severance. It was expected that the assessment would consider the qualitative sensitivity of receptors and there was hope that this would ensure that the impact on the amenity value of the PRoW network would be adequately recognised. However, this does not seem to be the case, which is both disappointing and concerning that quality of	N	As part of thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. The approach to assessing impacts on PRoW includes considering of impact on quality of user experience. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			user experience is not recognised as being inherent in a recreational context. 13.28 The assessment methodology has not in the County Council's opinion recognised the local importance of PRoW, some of which are the only off-road access for a community or are the main recreational space. the County Council are concerned about the robustness and accuracy of the assumptions being made, for example about the availability of alternative PRoW when allocating the level of sensitivity; it is wrong to suggest that there are alternative routes available when these alternative routes are also subject to the construction impacts or closure and diversion. 13.29 This particularly applies to the PRoW affected by the Saxmundham substation area E-491/005/0, E-491/006/0 and the Friston substation site, E-260/017/0 and E354/006/0. The converter station is proposed to be built over E-491/005/0 and if co -location occurs, also on E-491/006/0. There are no alternative off road routes linking Sternfield to Saxmundham and Saxmundham to Friston and until reasonable alternatives are confirmed, then the County Council consider that it is premature to suggest that the effect of the project is not significant.		
		Walking, cycling and horse-riders, inter-project cumulative effects, socio-economic, recreation and tourism	**Vol1 Part 2 Chapter 13 Intra- Project Cumulative effects** 13.30 the County Council welcomes that PRoW have been taken forward to stage 3 -Intra-project effects assessment. However, the County Council considers that because of the assumptions made and the inaccuracies in describing the effects on PRoW as detailed above, the impact on the amenity and quality of the user experience should also be considered significant at this stage and not just the visual intrusion.	N	Following completion of the environmental assessments, including the assessment of impacts to PRoW, a full intra-project cumulative assessment has been undertaken and is presented within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**. This Chapter considers the combined effects on PRoW and their users, that have been identified across the various ES topic chapters. Details of the assessment of amenity and quality of user experience on PRoW are contained in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism and Application Document Part 2 Suffolk Chapter 11 Health and Wellbeing**. Please note that the approach taken for the assessment of PRoW has been informed by Standard for Highway's Design Manual for Roads and Bridges, the Institute of Environmental Management and Assessment, and best practice methodology from assessments undertaken on other major infrastructure schemes. It also aligns with the Public Rights of Way and Green Access Supplementary Planning Guidance released by Suffolk County Council (July 2024).
		Walking, cycling and horse-riders, inter-project cumulative effects, design	**Vol 1 part 2 Chapter 14 Inter-Project Cumulative effects** 13.31 The cumulative impact of this proposal with the other existing energy projects consented and proposed in this area is concerning. the County Council believe that there are inter-project effects that will impact on the PRoW network and its users from more than just visual intrusion, but the lack of the single	N	The consideration of cumulative effects as a result of committed developments is set out within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**, which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, East Anglia ONE North Offshore Windfarm and East

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			assessment approach for public rights of way, access and amenity has resulted in this effect not being recognised. In particular, the onshore works of the East Anglia 1N and East Anglia 2 windfarms will impact on the PRoW network to the north of Friston where there will be repeated temporary closures of PRoW that could overlap with temporary closures on the same PRoW required for the Sealink project. 13.32 It is unacceptable for the public to lose their amenity by the effective sterilisation of an area due to closures and disruptions from parallel or concurrent projects. The impact of temporary closures of PRoW should not be underestimated, as their value for local amenity could be severely reduced or removed during works. 13.33 the County Council expects the inter project cumulative effect assessment to specifically consider the impact on PRoW and the amenity value of the PRoW network in the vicinity of the proposed Friston substation and to provide mitigation, compensation, and management strategies to ensure that the quantity and quality of access provision is retained. 13.34 In addition, it should be noted that as part of the consented EA1N and EA2 windfarm, PRoW E -354/006/0 will be permanently closed with a new PRoW created to the east and north of the proposed substation site as shown on the approved DCO ROW Plans. This new PRoW will cross the cable corridor and haul road to the east of crossing point S/PR/0044 and will need to be included for consideration by Sealink.		Anglia TWO Offshore Windfarm. Cumulative considerations relating to PRoW diversions and closures have been included as a result of the Proposed Project, Sizewell C, East Anglia ONE North, East Anglia TWO, Nautilus and LionLink. Masterplanning is being undertaken in order to ensure effective coordination takes place with regard to the impacts on PRoW. For example, the Order Limits in the vicinity of Saxmundham Converter Station is crossed by two PRoW running north-south (PRoW E-491/005/0) and east-west (PRoW E-491/006/0). Whilst PRoW diversions are required, these have been designed and co-ordinated with other projects in this area (e.g. LionLink) to minimise additional journey distances, re-join existing routes and improve route connectivity. The permanent diversions have been embedded into the master planning of the Proposed Project (including in consideration of temporary construction compounds), to fully consider the long-term future of the site and to avoid the need for subsequent diversions. Land has also been safeguarded so that new PRoW routes can be provided by other projects when these come forward to enhance the network/open access across the countryside, which is an approach welcomed by Suffolk County Council. Therefore, the Proposed Project is designed to minimise adverse or repeated impacts on the PRoW network and to provide benefits to the public.
		Walking, cycling and horse-riders, onshore mitigation, design	**Addendum: PRoW Guidance** <u>Guidance for matters to be included a PRoW Strategy or Management Plan</u> • Early engagement with the County Council PRoW & Access Team to discuss the impact on and management of the PRoW & access network. Suffolk County Council is the Highway Authority for public rights of way and the Access Authority for Open Access land and the National Trail. • The Applicant must obtain the Definitive Map and Statement from the PRoW & Access Team at Suffolk County Council. This is the only source of the up-to-date record of the PRoW (supplied digitally). • Public rights of way should be marked on plans using the County Council digital data and labelled as per the Definitive Map and Suffolk County Council convention (Area -parish number - path number) • Identifies where and how (i.e. physical disruption and impact on amenity) the project affects PRoW in the pre commencement stages, construction, and operational phase.	N	**Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk** has been prepared in consultation with the Council and in accordance with this guidance in terms of identifying PRoW, any impacts and management/ mitigation.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• Identifies the wider access network and ensures continuity of the access network including links to U roads, quiet lanes and promoted routes by avoiding severance or sterilisation of an area through closures. • Sets out the management measures for minimising disruption to the public and ensuring public safety during all stages of the project. •The hierarchy for managing affected PRoW should lead with the principle of keeping PRoW open though use of signage and traffic management measures, followed by temporary closures with alternative routes provided for as short a duration as possible. • Identifies the PRoW proposed to be temporarily closed and/or management measures. • Includes management measures for any shared construction access. • Identifies any PRoW to be permanently closed and the alternative route/s including the specification for new routes. • Includes plans for restoration of all affected PRoW – e.g. on access routes and crossing points. • Includes a pre and post condition survey to be undertaken including identification and assessment of surface condition and with a scope of coverage and methodology to be agreed with Suffolk County Council (the County Council) as Highway Authority. This should include pre-construction work where PRoW might be used to gain access to the corridor and reinforcement required prior to use by vehicles. • Where impacted by the works, commitment to restoring any PROW to original condition or to a condition agreed with the County Council - where there are existing defects, the applicant should agree restoration measures with the County Council. • Identifies any decommissioning work that will affect the access network and provides proposals for mitigation and restoration. • Includes details and specifications for any improvement works or other mitigation measures that may be required as a result of the EIA.		
		Walking, cycling and horse-riders, onshore mitigation, design	**Principles for the practical management of affected Public Rights of Way** The Council expects the following principles to be followed: - • Early engagement with the County Council PRoW & Access Team to discuss the impact on and management of the PRoW & access network. Suffolk County Council is the Highway Authority	N	**Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared in consultation with the Council and in accordance with this guidance in terms of identifying PRoW, any impacts and management/ mitigation.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			for public rights of way and the Access Authority for Open Access land and the National Trail. • Where PRoW cross the cable corridor, haul road, access tracks and other sites, the surface must be always kept in a safe and fit condition for all users to the satisfaction of the County Council. • Pre-construction works must not obstruct or disturb any public rights of way (e.g., newt fencing, archaeology surveys etc) unless otherwise agreed with the County Council. Management measures or temporary closures not covered in the DCO must be by application to the County Council. • Public rights of way that are used for any stage of construction access should remain open, safe, and fit for the public to always use with management measures put place with the agreement of the County Council. • Any temporary closure of a PRoW must be agreed with the County Council and the duration kept to the minimum necessary. • An alternative route must be provided for any public right of way that is to be temporarily closed prior to closure to a standard agreed with the County Council. • The location of alternative routes to be agreed with the Council. • Any alternative route must be safe and fit for the public to always use – suitable surface, gradient, and distance with no additional road walking between the natural destination points. • Any temporary closure and alternative route will be advertised in advance on site and in the local media, and to the local parish councils including a map showing the extent of the closure and alternative route – process and cost to be agreed between applicant and the County Council. • There will be no new gates or stiles erected on any public rights of way that are impacted by the cable corridor and any other associated site.		
		Socio-economic, recreation and tourism, inter-project cumulative effects, coordination with other projects	**14 Socioeconomic** 14.1 It is expected that a large portion of additional jobs expected to be taken by those outside of the study area and a predicted leakage rate of 70%. Only 32 net additional jobs expected to be taken up residents, with reasoning given that jobs will be specialised construction. This leakage rate is unacceptable, particularly with the number of infrastructure projects in the local area, including those by the Applicant. The Council would expect that the Applicant works as a meta-project in order to reduce the leakage rate and maximise the number of jobs taken up by residents through investment in skills locally. A comprehensive Skills and Employment Plan and engagement with the Regional	N	14.1 &14.2 - **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** sets out that employment generation during the construction phase will be assessed within a 60 minute travel area, based on research by the Chartered Institute of Personnel and Development (CIPD). Section 10 Approach and Methodology of **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** sets out the additionality assumptions applied to the assessment which have been informed by professional judgment and experience on comparable DCO schemes. The CIPD research is not specific to the construction industry, however this research has been used to inform comparable DCO applications.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Skills Coordination Function at the County Council would support a strategic approach to this. 14.2 We are pleased to see that the economic impacts on the Suffolk Onshore Scheme is considered relative to a 60-minute travel time from the Proposed Project boundary, utilising CIPD employee data. We would welcome clarification whether this is specific to the construction industry. 14.3 The 60-minute travel time area includes the main roads running through Bury St Edmunds, to the furthest point west. However, this excludes the majority of the settlement, including large sections of the eastern area, situated closer to the project. The Council would welcome revision of the study area to encompass the whole of Bury St Edmunds. 14.4 The local labour force has been assessed to be of low sensitivity due to its adequate capacity to experience impacts without incurring a change on the economic well-being of residents and local businesses. The Council disagrees with this due to existing skills shortages in the region, which will be exacerbated by the cumulative impacts of other infrastructure projects in the local area with overlapping construction periods. 14.5 Operational employment has been scoped out due to limited numbers. However, we believe that this should have been considered cumulatively alongside other projects in the region, as this will amplify any effects caused.		14.3 - Section 11.6 Study Area of **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** includes Bury St Edmunds. 14.4 - Section 10.4 Approach and Methodology of **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** sets out the sensitivity criteria for economic impacts. 14.5 Operational employment has been scoped out of the ES on the ground that the scale of operational employment is likely to be very limited. The Planning Inspectorate agrees with this approach. Please refer to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** which outlines the level of employment generation during the operational phase of the Proposed Project.
		Cultural heritage	**15 Other Issues** 15.1 Although a District responsibility, it is important to note there are several Listed Buildings located in the vicinity of the site including the Grade II Listed Wood Farmhouse and Hill Farmhouse. The development would potentially cause a detrimental impact to their setting. 15.2 Wood Farmhouse, which is adjacent to the proposed converter station site, was severely damaged by fire in April 2023, with its future uncertain. The County Council still considers it appropriate to consider the impact of the project on its setting, while its restoration is still a possibility.	N	An assessment of the potential for impacts on the setting of heritage assets has been undertaken as part of the Cultural Heritage Assessment. This included assessing the impacts on the setting of a number of designated assets which were agreed through consultation with stakeholders including East Suffolk Council and Historic England, and included the Grade II listed Wood Farmhouse (LB1231179) and Hill Farmhouse (LB1231296), as well as Hurts Hall (LB1268178). The results of this assessment are covered in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and its associated appendices.
		Design, alternative solutions, coordination with other projects	**Appendix B - Siting and design principles, for the connection of offshore wind and interconnector infrastructure in Suffolk** The purpose of this document is to set out at a high level, siting and design principles for offshore wind and interconnector infrastructure. Sections A, B and C, reflect the hierarchy of priorities that is, strategic principles, operational infrastructure, and its associated harm, and finally, temporary infrastructure related to construction and its associated harm. Within each of these sections the numbered principles included are prioritised.	N	National Grid acknowledges the Council's comments.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			It should be noted that this document recognises the national importance of strategic energy infrastructure and therefore, in section B, sets out limited and specific circumstances where it may be appropriate to consider sites both adjacent to, or within, Nationally Designated Landscapes, particularly if these are brownfield or previously developed sites. This would need to satisfy the national planning tests for development within or adjacent to a Nationally Designated Landscape, or within its setting. Furthermore, these principles are predicated on the idea that coordination is desirable and appropriate in all cases, and at all scales. The intention of such coordination is to effectively minimise harm to Suffolk's communities and environment, that is, in terms of, strategic offshore connections, co-location and consolidation of onshore infrastructure, and coordination of construction activity.		
		Landfall location, design, intra-project cumulative effects	**Strategic principles** 1. Where it is necessary to connect offshore wind to a landing point in Suffolk, this should wherever possible, be connected to a multipurpose interconnector to minimise the extent and adverse impacts of onshore infrastructure	N	National Grid acknowledges the Council's concerns on this matter. However, at present, the needs case for the Proposed Project is driven by the requirement to alleviate identified network capacity constraints in the region and to facilitate the delivery of existing contracted electricity generation connections in this area. National Grid uses the concept of network boundaries to understand network capacity. Where power flows will be higher than the capability of the network there are two options to manage this: 1. pay electricity generators on one side of the boundary to reduce the energy they produce and compensate them for the shortfall, or 2. increase the capability of the network to allow more electricity to flow. Under option 2 above, the Proposed Project has been developed in response to the identification of limitations at the EC6 and SC2 boundaries, this means that the Proposed Project must connect within the Sizewell area in Suffolk and east of Kemsey in Kent. Landfall remote from these locations would require additional onshore infrastructure to connect into these areas to alleviate the boundary constraints.
		Offshore route location, alternative solutions	2. Offshore transmission infrastructure should, wherever possible, be directed to the principal point of electricity use. In the south-east of England this is currently anticipated to be in the region of the Thames Estuary.	N	The needs case for the Proposed Project is driven by the requirement to alleviate identified network capacity constraints in this region and to facilitate the delivery of contracted electricity generation connections coming online as part of the Government's aspiration to connect 50GW of offshore wind to the network by 2030. National Grid acknowledges the Council's views on connections and demand, yet is obliged to fulfil existing connection requirements where they are already agreed.
		Coordination with other projects, health and wellbeing, onshore	3. Project promoters connecting to National Grid onshore, in the same or similar locality, should seek to coordinate, co-locate, and consolidate infrastructure, both their own and those of other promoters' projects, wherever possible, to minimise the spatial extent of adverse effects on communities and the environment.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		environmental impact			Further details are contained in **Application Document 7.10 Coordination Document**.
		Coordination with other projects, health and wellbeing	4. Project promoters connecting to National Grid onshore, in the same or similar locality, should seek to coordinate the construction of projects, both their own and those of other promoters, wherever possible, to minimise the extent and duration of adverse effects on communities and the environment.	N	The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Alternative solutions, design	**Converter/substation station siting and operation** These principles also apply to grid connection infrastructure, including NGET substations, sealing end compounds, and related transmission equipment 5. The first preference for siting should be brownfield sites/previously developed sites that meet the required planning tests.	N	In developing the Proposed Project, National Grid has assessed a variety of other options, including other potential areas for new infrastructure. The reasoning behind the location of the proposed new infrastructure is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. National Grid has been unable to find brownfield sites within the converter station option areas in Suffolk that are suitable for the required infrastructure. All existing National Grid substations in the area are already at capacity or do not have the space around them to allow the connection required by the Proposed Project. Therefore, the identification of converter station site options was based on avoidance of designated sites as far as possible, opportunities for natural screening and minimising visual impacts on settlements.
		Alternative solutions, design	6. In the absence of appropriate brownfield sites/previously developed sites, consideration should be given to new sites adjacent to existing built development, specifically, industrial, or commercial development.	N	In developing the Proposed Project, National Grid has assessed a variety of other options, including other potential areas for new infrastructure. The reasoning behind the location of the proposed new infrastructure is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Design, alternative solutions, onshore mitigation	7. Sites adjacent to, or within the setting of, an AONB or National Park should not usually be considered at all, unless exceptionally, and in recognition of the need to deliver strategic net Zero energy infrastructure, AND to the satisfaction of the decision maker, there are no alternative sites available outside the setting of the AONB or National Park. OR the site meets criteria 5 and/or 6 AND The development is capable of being effectively mitigated, such that during its operation, it will have only, to a minimal extent, non-significant direct, or indirect, impacts on the designation. (The accumulation of multiple non-significant impacts, such that together they become significant, is to be avoided)	N	In developing the Proposed Project, National Grid has assessed a variety of other options, including other potential areas for new infrastructure. The reasoning behind the location of the proposed new infrastructure is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Further details relating to the assessment of impacts to the setting of AONB's (National Landscapes) and National Parks are provided within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Consideration of National Landscapes are also documented within **Application Document 7.11.1 Design Approach Document - Suffolk, Application Document 7.3 Design Development Report and Application Document 7.1 Planning Statement**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design, alternative solutions, onshore mitigation	8. Sites within an AONB or National Park should not usually be considered at all, unless exceptionally, and in recognition of the need to deliver strategic Net Zero energy infrastructure, they meet criteria 5 and/or 6, AND alternative sites outside the AONB or National Park are, to the satisfaction of the decision maker, deemed not to be available AND the development can be effectively mitigated such that during its operation, it will only have, to a minimal extent, non-significant impacts on the designation. (The accumulation of multiple non-significant impacts such that together they become significant, is to be avoided)	N	In developing the Proposed Project, National Grid has assessed a variety of other options, including other potential areas for new infrastructure. The reasoning behind the location of the proposed new infrastructure is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 7.3 Design Development Report**. Further details relating to the assessment of impacts to the setting of AONB's (National Landscapes) and National Parks are provided within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Consideration of National Landscapes are also documented within **Application Document 7.11.1 Design Approach Document - Suffolk, Application Document 7.3 Design Development Report and Application Document 7.1 Planning Statement**.
		Design, alternative solutions	9. Other sites within AONBs and National Parks that do not meet criteria 5 and 6, should only be considered, if it is conclusively demonstrated to the satisfaction of the decision maker, that there are no alternatives.	N	In developing the Proposed Project, National Grid has assessed a variety of other options, including other potential areas for new infrastructure. The reasoning behind the location of the proposed new infrastructure is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Further details relating to the assessment of impacts to the setting of AONB's (National Landscapes) and National Parks are provided within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Consideration of National Landscapes are also documented within **Application Document 7.11.1 Design Approach Document - Suffolk, Application Document 7.3 Design Development Report and Application Document 7.1 Planning Statement**.
		Design, intra-project cumulative effects	10. Following the application of 1-9 above, preference should be given to sites that meet the following criteria: · The site and cable corridors should minimise or eliminate permanent adverse impacts on the fabric of the landscape, historic features and character, or ecological features such as trees, hedges, woodlands wetlands etc · Harm to built heritage assets and their setting should be minimised, substantial harm should be avoided. Minimise adverse impacts of noise on public and residential amenity	N	In developing the Proposed Project, National Grid has assessed a variety of other options, including other potential areas for new infrastructure. The reasoning behind the location of the proposed new infrastructure is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Further details relating to the assessment of impacts on the fabric of the landscape, historic features and character, ecological features, built heritage assets and their setting and noise on public and residential amenity are included within the relevant ES chapters. Specific reference should be made to following chapters where this assessment is presented: **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual, Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity, Application Document 6.2.2.3**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration. These chapters also detail required mitigation to reduce and minimise adverse environmental effects. Consideration of National Landscapes is also documented within **Application Document 7.11.1 Design Approach Document - Suffolk, Application Document 7.3 Design Development Report and Application Document 7.1 Planning Statement**.
		Cultural heritage, onshore route location	Cable corridors an associated haul and construction access routes should avoid or minimise permanent loss of buried archaeological features.	N	National Grid acknowledges this feedback. Further information obtained through non-intrusive and intrusive works has been used to input into design where possible. Where assets cannot be avoided, full mitigation is being developed with Stakeholders. See **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** for full impact assessment and mitigation.
		Landscape and visual, onshore mitigation	Minimise adverse impacts on landscape and visual amenity, and existing public access through the inherent characteristics of the site, or because the site can be adapted to successfully mitigate such adverse effects.	N	The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed in collaboration with various disciplines to maximise opportunities to minimise effects arising from the Proposed Project. The embedded mitigation for the Scheme is detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Water environment, geology and hydrogeology	Does not add to local surface water or fluvial flood risk OR provides an opportunity to eliminate such additional risks as may be created.	N	The Proposed Project's drainage design is such that there would be no additional burden of runoff into the receiving water environment compared to pre-development conditions, such that there would be no increase in surface water or fluvial flood risk.
		Construction, traffic and transport	Can achieve acceptable operational site access, and where required temporary construction access, which can be reasonably remediated following commencement of site operation.	N	The proposed site access arrangements during the construction and operational phases have been developed in consultation with Suffolk County Council and a Stage 1 Road Safety Audit has been undertaken so that any potential safety problems can be addressed as part of the detailed design.
		Landscape and visual, terrestrial ecology, cultural heritage	**C) Cable Corridors, temporary haul routes, and construction access and laydown** 12. Cable corridors, associated haul routes and construction access, should avoid, or minimise temporary loss of trees, hedgerows, woodland, and other landscape features, historic landscape character and wildlife.	N	Minimising the removal of trees, tree groups and hedgerows as well as historic landscape features associated with temporary construction features has been a key part of the iterative design process. Please refer to **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Construction, noise and vibration, air quality	14. Cable corridors, associated haul routes and construction access should avoid or minimise temporary adverse impacts on public and private amenity in respect of noise, dust and other disturbance.	N	Mitigation is to be put in place to minimise adverse impacts on public and private amenity in respect of noise, dust and other disturbance. Applicable control and management measures for these are set out in **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan, Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.3.2 Appendix B Register of Environmental**

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Actions and Commitments (REAC). There is also a separate **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**. The assets are also assessed within the following ES chapters relevant to Suffolk: • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual; and** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism.**
		Construction	15. Cable corridors, haul routes and construction access should be located and designed in such a way that they are capable	N	Text appears to be missing from the response provided by Suffolk County Council. Further detail on the cable corridors, haul routes and construction accesses are located within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

24 October 2023	18 December 2023	Consultation	Thank you for consulting Surrey County Council on the proposed Sea Link Project. Please note that we have no comments to raise.	N	National Grid acknowledges this feedback.

Table 1.18 Thanet District Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, Needs case, Intra-project cumulative effects	Thanet District Council adopted the following motion at a full Council on the 8th December 2023: “Council acknowledges the considerable public concern over the impacts of National Grid’s Sealink project, which is currently the subject of a statutory consultation process. We share this concern, and wish to reassure residents that their views are heard and understood. We recognise the need to adapt the electricity transmission network in order to respond to rising demand and the move to sustainable generation methods in new locations. We welcome the extensive engagement by National Grid with both elected members and the communities in Thanet most affected. Council agrees that it does have major concerns regarding the proposed location on Minster Marshes; the scale of the converter building, as well as the effects of the associated infrastructure; the significant impact on protected wildlife and species habitat both during construction and afterwards; and the potential change to the character of the landscape.” The full debate of the motion and additional concerns can be viewed here: https://youtu.be/c9TpT0wW7kQ?t=3588. We will outline our specific comments on the information provided at this pre-application consultation stage of the process.	N	National Grid acknowledges this feedback. Specific concerns raised are responded to below.
		Design, Consultation	The approach taken in the Preliminary Environmental Information Report (PEIR) appears to assume that the adverse impacts of the Project can be successfully mitigated. The Council notes that there are a significant number of outstanding surveys and reports for which the outcomes are unknown at this stage, spanning a number of topics. As such, it is essential for the Council to be kept informed and given the opportunity for active engagement as the surveys and outstanding data becomes available and prior to the final selection of options including, but not limited to, the scale, orientation and finish of the converter and substation, pylon design, access routes, mitigation methods, management plans and security measures. It is difficult to assess and understand the exact impacts of the Project given the unknowns and limited details at this point. The Council’s comments are therefore based on the information that is known at this stage, contained within the consultation documentation.	N	The PEIR was a preliminary assessment of the potential effects. Engagement with Thanet District Council continued following Statutory consultation via the thematic meetings where updates were provided in relation to design details and information from further surveys as these became available. Final details of the design are available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Please also note that the complete environmental assessments which include the full suite of environmental surveys carried out to date are included within the relevant technical chapters of the ES.
		Legislation and policy inc. permits	**Principle and Policy Context** The proposed converter site is located within the open countryside as defined by Policy SP24 of the Thanet Local Plan which permits development on non-allocated sites in the countryside subject to a number of restrictions: "Development on non-allocated sites in the countryside will be permitted for either: 1) the growth and	N	National Grid has taken account of local planning policy in its development of the Proposed Project and an appraisal of important and relevant planning policy is presented within the **Application Document 7.1 Planning Statement**. Under Section 104 of the Planning Act 2008, the Secretary of State is required to decide the application in accordance with any relevant national

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			expansion of an existing rural business; 2) the development and diversification of agricultural and other land based rural businesses; 3) rural tourism and leisure development; 4) the retention and/or development of accessible local services and community facilities; or 5) the redevelopment of a brownfield site for a use that is compatible with its countryside setting and its surroundings. All development proposals to which this policy applies should be of a form, scale and size which is compatible with, and respects the character of, the local area and the surrounding countryside and its defining characteristics. Any environmental impact should be avoided or appropriately mitigated ." Policy SP37 of the Thanet Local Plan relates to Climate Change and states "New development must take account of the need to respond to climate change: 1) by minimising vulnerability and providing resilience to the impacts of climate change through the use of up to date technologies, efficient design and appropriate siting and positioning of buildings; 2) mitigating against climate change by reducing emissions and energy demands through the use of up to date technologies; 3) realise and make best use of available opportunities to reduce the impact of climate change on biodiversity and the natural environment by providing space for habitats and species to move through the landscape and for the operation of natural processes, particularly at the coast". The February 2022 review of the National Policy Statement for Energy welcomes the government's commitment to deliver net zero by 2050 and states that; ""Meeting our net zero target will require a significant scale and pace of change in delivering new energy infrastructure.		policy statement. National Grid notes that paragraph 4.1.15 of NPS EN-1 sets out that where there is a conflict between local policy documents and a NPS, the NPS prevails for the purpose of Secretary of State decision making given the national significance of the infrastructure. NPS EN-1 acknowledges at paragraph 5.10.5 that "Virtually all nationally significant energy infrastructure projects will have adverse effects on the landscape" and at paragraph 5.10.6 states that: "Projects need to be designed carefully, taking account of the potential impact on the landscape. Having regard to siting, operational and other relevant constraints the aim should be to minimise harm to the landscape, providing reasonable mitigation where possible and appropriate." The converter station and substation site is adjacent to Richborough Energy Park, in which other energy infrastructure is located. National Grid will develop the design and landscaping proposals of the converter station and substation to be sensitive to its location. The ES includes a lifecycle greenhouse gas assessment and a climate change risk assessment. Further details are contained in **Application Document 6.2.5.1 Part 5 Chapter 1 Climate Change Document**. Design measures which mitigate greenhouse gas emissions and contribute towards adaptation to climate change risks are considered in the ES which has been conducted in accordance with relevant policies. For information, National Grid also notes that the Council has referred to a superseded draft version of NPS EN-1.
		Legislation and policy inc. permits, Landscape and visual	**Landscape and Visual Impact** This site is located within the Stour Marshes Landscape Character Area (Policy SP26 of the Thanet Local Plan). This policy states that development should be directed away from this area as it is largely undeveloped and key to retaining the island character of Thanet. Policy SP26 specifically states that the Stour Marshes area "is characterised by a vast, flat, open landscape defined by the presence of an ancient field system, defined by an extensive ditch and dyke system, the sea walls and isolated groups of trees. The former grazing land has been improved and managed as arable farmland, however, it still retains its network of ditches which provide biodiversity interest. It is important to conserve the long distance views to the Thames Estuary to the north and Pegwell Bay to the south". The consideration of any visual impact on the Landscape Character Area from the converter station, substation and pylons is a key concern of the Council.	N	NPS EN-1 (paragraph 5.10.12) requires that outside of nationally designated areas "particular attention" should be paid to local planning policies that are "based on landscape or waterscape character assessment". Thanet Local Plan Policy SP26 is one such local policy. This states that "Development should generally be directed away from the Stour Marshes (E1), Wade Marshes (E2) and Pegwell Bay (F1) character areas (as detailed in the LCA), as these are largely undeveloped and key to retaining the island character of Thanet". However, NPS EN-1 paragraph 5.10.12 goes on to note that "locally valued landscapes should not be used in themselves to refuse consent, as this may unduly restrict acceptable development" and paragraph 4.1.15 of NPS EN-1 states that in the event of a conflict between a local Development Plan and the NPS, the NPS will prevail for the SoS' decision making, given the national significance of infrastructure. National Grid has paid particular attention to the location of the Converter Station within the Stour Marshes LCA and to Thanet Local Plan policy SP26. The characteristics of the Stour Marshes LCA are noted and the effects on the LCA and visual receptors have been further assessed within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** with consideration of Policy SP26. The key characteristics have been taken into

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					account through the design process including minimising the effects on the ancient field system. The permanent infrastructure has been sited near to the Richborough Energy Park, which also falls within the LCA, and mature vegetation to minimise encroachment into the open marshland. The indicative landscape strategy for the Kent Onshore Scheme (**Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**) has been developed to provide belts of native woodland planting on the northern edge of the converter station and substation to provide landscape integration and partial screening. Opportunities to enhance the riparian vegetation along the River Stour and some of the drainage ditches is also incorporated into the design and will provide local landscape benefit.
		Design, Landscape and visual, Onshore mitigation	Design The design of the converter station and substation, in terms of the building form and external materials remains under development and a Design Code for the buildings is stated to be provided with the application for development consent. There are also three options with regards to pylon type and the final selection will be determined through further environmental considerations, stakeholder engagement and consultation. In terms of the landscape mitigation proposals identified within the Indicative Landscape Strategy (Figure 1.4.13) and the proposed native woodland planting, strengthened boundary planting, transition to marshland landscape, enhanced riparian vegetation and the maintenance and enhancement of drainage ditches, a detailed andscaping plan is yet to be determined. There is a lack of clarity at this stage in terms of the design and material of the proposed converter station and substation (with various options in the document 'Converter station design – background to potential architectural approaches'), to the pylon type (and associated arrangement) and landscaping plans. The details of the proposed lighting infrastructure and security fencing arrangements are also unclear at this time. The final pylon type and details including the external treatment and orientation of the proposed buildings has the potential to impact on the different viewpoints and the effectiveness of any planting will be determined by the design parameters. The Council would like to be actively engaged and directly consulted in terms of the detailed design of the proposed buildings and landscape mitigation, prior to the submission of the NSIP.	N	The indicative landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** which includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting. This is shown on **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent** and has been designed in collaboration with stakeholders as communicated through various thematic meetings (first introduced on 16 April 2024). The ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station and Substation. The design of this structure, in terms of the building form and the external materials, has been developed alongside consultation and stakeholder feedback. Design Principles for the building have been provided within the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. National Grid is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles.
		Landscape and visual	Significance of landscape visual impact on Landscape Character Area The Council considers that the impact the Project has on the landscape is a key consideration and as such the layout of the site and orientation of the converter station and substation needs to be	N	The siting of the Kent Onshore Scheme has been influenced by a range of disciplines including landscape and visual, as set out within **Application Document 6.2.1.4 Part 1 Chapter 4 Description of the Proposed Development**. The Thanet District Council Landscape Character Assessment forms part of the landscape baseline, as set out within **Application Document 6.3.3.1.B ES Appendix 3.1.B Landscape Baseline**, and the key characteristics of the LCAs in which the Kent Onshore Scheme lies within are noted and influence the iterative design process and ultimately the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			dictated by their impact on the landscape and not by operational requirements. Thanet District Council published the Thanet District Council Landscape Character Assessment in 2017. The key characteristics of the Stour Marshes is the flat typography with little structural vegetation resulting in long open views with big skies. This is a largely undeveloped landscape with few roads or buildings and limited tree cover with occasional small wooded copses and absence of enclosure. The irregular arable fields are defined by straight and meandering drainage ditches representing an ancient enclosure pattern and the area contains some of Kent's most extensive water and wetland habitats. In terms of a vision for this area, the Landscape Character Assessment considers this to be an area celebrated for its openness, sense of remoteness and lack of development that can be experienced from the recreational access network. The guidelines seek to conserve the intact undeveloped rural character of the marshes as a breathing space between adjacent districts and as a setting to Thanet and conserve the panoramic views across the open landscape including those to and from the adjacent district (Canterbury) restricting new detracting/vertical features that would interrupt views. The Project will fall within the following Landscape Character Areas: B1 - Wantsum North Slopes, E1 - Stour Marshes, F1 - Pegwell Bay and G1 - Ramsgate and Broadstairs Cliffs. At this stage the Landscape Character Areas have been given a value judgement within the PEIR with the Landscape Character Areas of F1 and G1 assigned a 'high' and Landscape Character Areas B1 and E1 assigned a 'medium'. Landscape Character Areas B1, E1, F1 and G1 have been scoped into the preliminary assessment of effects on landscape character for construction, maintenance and decommissioning whilst Landscape Character Areas B1 and E1 have been scoped in for operation.		assessment of effects. The assessment of effects on the landscape character arising from the Kent Onshore Scheme are set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Landscape and visual, Intra-Project cumulative effects	There are 14 representative viewpoints that have been provided using winter baseline photography with summer baseline photography expected post PEIR. The value of each view has been appraised with viewpoints 2, 7 and 8 considered to have a high value, viewpoints 4, 5, 6, 9, 10, 11, 12, 13 and 14 considered to have a medium value, viewpoint 3 a low value and viewpoint 1 a negligible value. Having regard to the preliminary assessments presented within Volume 1, Part 3, Chapter 2 Landscape and Visual, the Council considers that the likely significance of effect for the affected Landscape Character Areas and viewpoints provided would be greater than indicated. The assessment identifies only one Landscape Character Area (B1) and one viewpoint (4) as having a preliminary likely significance of effect as 'significant' at construction, maintenance and decommissioning stage and one	N	The comment is acknowledged that the Council consider that the effects on landscape character and visual amenity would be greater than that presented within the PEIR. It should be noted that this was a preliminary assessment undertaken before further detail was provided. The assessment of effects arising from the Kent Onshore Scheme on landscape character and visual amenity are set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. NPS EN-1 (paragraph 5.10.12) requires that outside of nationally designated areas "particular attention" should be paid to local planning policies that are "based on landscape or waterscape character assessment". Thanet Local Plan Policy SP26 is one such local policy. This states that "Development should generally be directed away from the Stour Marshes (E1), Wade Marshes (E2) and Pegwell Bay (F1) character areas (as detailed in the LCA), as these are largely undeveloped and key to retaining the island character of Thanet". However, NPS EN-1 paragraph 5.10.12 goes on to note that "locally

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Landscape Character Area (E1) and one viewpoint (4) as having a preliminary likely significance of effect as 'significant' during the operational phase of the project. It is the view of the Council that the proposed converter station and associated structures would result in significant harm to the intrinsic character of the immediate and surrounding landscape to the detriment of visual amenity for a variety of users. It is also considered that the cumulative effect of elements of the project such as the buildings, associated infrastructure, roads and parking areas would result in a significant visual impact particularly from viewpoints to the north looking south (viewpoints 4 & 5). Specifically this would affect the key characteristic in the Stour Marshes Landscape Character Area as a "vast, open landscape with huge skies, extensive views and a strong rural, even remote, character" providing "Long uninterrupted views across the marshes and Pegwell Bay and into marshes of neighbouring districts (Dover and Canterbury)". The development would therefore be in direct conflict with the principles of Policy SP26 of the Local Plan, meaning that development should only be permitted if it can be demonstrated that the development is essential for the economic or social well-being of the area. From the assessment of the information provided, this has not been demonstrated.		valued landscapes should not be used in themselves to refuse consent, as this may unduly restrict acceptable development" and paragraph 4.1.15 of NPS EN-1 states that in the event of a conflict between a local Development Plan and the NPS, the NPS will prevail for the SoS' decision making, given the national significance of infrastructure. As per the requirements of NPS EN-1, National Grid has paid particular attention to the location of the within the Stour Marshes LCA and to Thanet Local Plan policy SP26.
		Walking, cycling and horse-riders, Landscape and visual	Public Rights of Way There are seven Public Rights of Way (PRoW) and recreational routes which pass through the Kent Onshore Scheme draft order limits including the King Charles III England Coastal Path and eight PRoW and recreational routes located within 500m of the onshore scheme boundary (Volume 1, Part 3, Chapter 11). Having regard to the consultation documents and whilst the final overhead pylon design (and arrangement) has not yet been determined, the options indicate that there would be new pylons erected in close proximity to PRoW routes (with the potential for permanent PRoW diversions) and as such these are likely to have a significant visual impact for users of these routes.	N	The assessment of effects arising from the Kent Onshore Scheme on visual amenity is set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. This includes reference to effects on the visual amenity of users of the PRoW within the Study Area and reference to any PRoW diversions.
		Walking, cycling and horse-riders, Construction – general, Onshore mitigation	It is noted that within the consultation documents Control and Management Measures in relation to the PRoWs state that all designated PRoWs crossing the working area will be managed with access only closed for short periods whilst vehicle construction activities occur. Any required temporary diversions will be clearly marked at both ends with signage explaining the diversion, the duration of the diversion and a contact number (Measure TT03). The Council considers that the visual impact along these routes, taking into consideration the scale and footprint of the proposed converter station and substation together with the traffic and noise associated with the construction phase,	N	The assessment of effects arising from the Kent Onshore Scheme on visual amenity including PRoW diversions is set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Following recommendations during the period of thematic landscape and visual meetings, the National Trails Officer at Kent County Council was involved in these thematic meetings. The Traffic and Transport team held a thematic meeting with Kent County Council highways and Thanet District Council in order to provide a progress update on the transport aspects of the Proposed Project. The matter of the Outline PROW Management Plan was discussed with officers in order to seek agreement regarding scope.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			in particular, is likely to result in a significant adverse impact for users. In terms of the PRoW Network, the Council notes that an outline PRoW Management Plan will be prepared in support of the Environmental Statement (ES). We would encourage National Grid to develop and formulate this plan and sufficient mitigation, as necessary, alongside the Kent County Council (KCC) PRoW Team prior to the submission of the application to the Planning Inspectorate.		**Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been developed in consultation with Kent County Council.
		Agriculture and soils	**Agriculture and Soils** The likely impacts on Best and Most Versatile (BMV) land will be fully assessed as part of the Agriculture and Soils Chapter of the ES and mitigation measures will include the submission of an outline Soil Management Plan (SMP) in line with published guidance. Provisional Agricultural Land Classification (ALC) mapping shows that the study area comprises Grade 2 land and a desk based study together with information from other survey visits, has shown that the land appears to be principally arable, with small areas of pasture. It is noted that the preliminary assessment has been undertaken based on preliminary design information for the Proposed Project and will be updated for the ES as the design evolves. The full assessment presented in the ES will be reliant on land access to enable focused soil and ALC surveys. At the ES stage it should be made clear the exact locations where the surveys have been carried out and, if applicable, how any changes to the overhead line alignment impacts on different soil types or grades. In terms of embedded measures, the PEIR Volume 1, Part 3, Chapter 7 Agriculture and Soils states that the temporary nature of many construction activities and the subsequent restoration of the land and its return to the preconstruction use is likely to result in the avoidance of long-term impacts on agricultural and soil receptors. The PEIR assessment in terms of likely significant effect of the temporary loss of BMV land is likely not significant whilst the assessment of the permanent loss of BMV land is likely significant with the preliminary sensitivity assessed as very high (Grades 1 and 2) to high (Grade 3a) and preliminary magnitude as medium/large. It is highlighted within the assessment that based on the description of the proposed project, it is likely that the extent of BMV land permanently lost will exceed the thresholds for a medium or large magnitude impact. Whilst the implementation of good practice soil handling, storage and re-use approaches as set out in the Soil Management Plan would maximise the re-use of the soil from these areas and thus ensure the continuation of a range of soil functions, it is not possible to mitigate for the permanent loss of BMV land. The magnitude of impact will be confirmed through ALC surveys.	N	Due to an elevated UXO risk across the project, detailed Agricultural Land Classification site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report** presents the results of the Agricultural Land Classification predictive modelling, which will include plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred the implications for soil type and land grade have been assessed. Preconstruction surveys are committed to, and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice (**Application Document 7.5.10.2 Outline Soil Management Plan – Kent**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Agriculture and soils, Intra-project cumulative effects, Traffic and transport	The Council raises concerns with regards to the scale of loss of BMV land in this sensitive area and it is considered that the cumulative impact of buildings (converter station and substation), areas for parking and access roads would result in larger scale BMV losses. The proposed highways works for access would involve the loss of a larger proportion of greenfield land and this infrastructure will remain in situ beyond the construction phase, into the operational phase of the Project. There is an additional concern that the land required for the proposed highway access during the construction period (and in turn a permanent access for the operational period of the project) has the potential to impact on agricultural holdings as a result of land separation.	N	National Grid acknowledges this feedback The impact of the entire project on BMV land is set out in **Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils**. Potential impacts on agricultural operations have been assessed based on the final design presented within **Application Document 6.2.4.1 Part 1 Introduction Chapter 4 Description of the Proposed Project** and issues such as fragmentation of land parcels identified, where applicable, and mitigation set out.
		Legislation and policy inc. permits, Terrestrial ecology, Onshore route location	**Ecology and Biodiversity** Under Policy SP30 of the Local Plan, development will "be required to make a positive contribution to the conservation, enhancement and management of biodiversity and geodiversity assets resulting in a net gain for biodiversity assets through the following measures: 1) the restoration / enhancement of existing habitats, 2) the creation of wildlife habitats where appropriate, by including opportunities for increasing biodiversity in the design of new development 3) the creation of linkages between sites to create local and regional ecological networks, 4) the enhancement of significant features of nature conservation value on development sites, 5) protect and enhance valued soils, 6) mitigating against the loss of farmland bird habitats. Sites should be assessed for the potential presence of biodiversity assets and protected species. For sites where important biodiversity assets, including protected species and habitats including SPA functional land, or other notable species, may be affected, an ecological assessment will be required to assess the impact of the proposed development on the relevant species or habitats. Planning permission will not be granted for development if it results in significant harm to biodiversity and geodiversity assets, which cannot be adequately mitigated or as a last resort compensated for, to the satisfaction of the appropriate authority. " The route of the cable proposed is likely to go through International and European designated sites. Policy SP28 of the Thanet Local Plan states that "proposals likely to have a significant effect on an SPA, SAC or Ramsar site, either alone or in-combination, will be required to undergo appropriate assessment as per the Conservation of Habitats and Species Regulations 2017 (as may be amended). Where possible applicants should incorporate measures to avoid or mitigate any adverse impacts. Where, despite all possible avoidance and mitigation measures being put in place, a proposal is still shown to have an adverse effect on the integrity of an International site,	N	National Grid acknowledges this feedback. A Biodiversity Net Gain assessment has been undertaken and is presented within **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. The Proposed Project is also being supported by a Landscaping Strategy which considers these points. **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** also includes an assessment of the points raised in this comment. With specific regard to impacts on internationally important wildlife sites, an appropriate assessment has been produced and impacts have been discussed in meetings with Thanet District Council and Natural England. Proposals for avoidance of direct land take from European sites, avoidance of disturbance and mitigation for loss of functionally linked land have been shared. Further details are contained in **Application Document 6.6 Habitat Regulations Assessment Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			planning permission will only be granted in exceptional circumstances, where there are no less ecologically damaging alternatives, there are imperative reasons of overriding public interest and damage can be fully compensated. Where proposals are considered likely to have a significant effect on an International site, early consultation with Natural England, the Council and any other appropriate statutory consultees is recommended." Kent County Council, Natural England and the Environment Agency will comment as key consultees on the impact from the proposal on biodiversity and their expertise should be relied upon.		
		Design, Intra-Project cumulative effects, Terrestrial ecology	Thanet District Council's Thanet Coast Project Officer has reviewed the consultation documents and makes the following comments: The underground cable needs to completely avoid Kent's largest National Nature Reserve and come out in the sub-tidal zone to avoid any impact on the numerous intertidal features and habitats of the international and national nature conservation designations found here: SPA and Wetland of International Importance, SAC, SSSI, NNR. https://www.thanetcoast.org.uk/about-us/nature-designations/ Only a 1km underground cable is proposed to avoid the main impact on the most sensitive coast to land interface and still appears to be surfacing within the Pegwell Bay mudflats. It is imperative that there is no repeat of the NEMO cable trenching which has affected the intertidal saltmarsh, lagoon and associated wild and birdlife ever since. The type of any proposed trenching still appears to be unsure and will need clarification. If the proposed cable is to surface within the intertidal zone, then it could easily create a major disturbance for the typography, hydrology, bird life and macro-fauna habitats. There appears to be a lack of intertidal wildlife surveys and assessments (eg Lugworm not even mentioned) and needs more surveys to assess its impact and mitigate for this. If it does go ahead in this area it should completely avoid the internationally important wintering bird months (1 October to 31 March), but avoid the nationally important bird breeding within the landfall area. Offshore cabling needs to avoid and reduce its impact in line with any sensitive marine communities such as Sabellaria reefs and offshore nature designations such as the Goodwin Sands MCZ and Margate Long Sand SAC. A detailed assessment needs to cover the land site wildlife losses due to the site's extreme close proximity to the Sandwich & Richborough SSSI and Local Wildlife Sites. The assessment needs more ecological surveys to show the known birds and wildlife in the area that are currently not included. The work	Y	As discussed in the thematic meeting 05 March 2024, the Proposed Project does not include any open cut in the SPA saltmarsh and the tunnelling exit point is approximately 105-140 m seawards of the saltmarsh boundary and is also not in the vicinity of the lagoon. This placement will ensure the avoidance of any of the issues caused to sensitive habitats by the Nemo Link. Whilst the cable will emerge in the intertidal environment the bore will be driven from west of the golf course, such that disturbance impacts would mainly originate from that location which is too far from the SPA to cause significant disturbance. The works in the intertidal zone will result in disturbance to mudflat habitats but they are temporary and short term since all cables and ducts in Pegwell Bay will be fully buried. The works associated with the exit in the intertidal area are also very short-term and any activities that have the potential to result in sound propagation causing disturbance to marine receptors, particularly birds and seals, have been addressed via noise modelling. The cable pull, taking place the year after, is of a minimal duration, taking only two days for each of the four ducts, each approximately 30 days apart. The cable pull will involve the use of a static jack-up barge or similar and up to four excavators may be required to assist due to the extent of the intertidal area at Pegwell Bay. All cables will be buried and all disturbance to intertidal habitats in Pegwell will be temporary and recover to baseline rapidly from regular tidal and wind driven water movement. Intertidal ornithology surveys and an intertidal benthic survey have been undertaken and used to inform impact pathways. Details of the species present are included in the survey report (**Application Document 6.3.4.2.C ES Appendix 4.2.C Intertidal Surveys 2023**). For example, lugworm were observed in the presence of scattered lugworm casts. The Proposed Project route has already been designed to avoid Margate and Long Sands SAC. Further survey work was undertaken to support routing and siting of the offshore cable and the cable corridor is now fully outside Goodwin Sands. The offshore route has been assessed within the marine ecology chapters in the ES. Impacts on landside habitats including Sandwich Bay to Hacklinge Marshes SSSI are discussed at length in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The full suite of ecology surveys has been discussed with Thanet District Council and results have been shared, along with mitigation proposals, in

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			acknowledges that the cumulative impacts could potentially be significant and needs to be made clearer - with why other sites in North Kent were not more suitable during the options. The future sustainability of the land based site needs to be considered with likely sea level rise and flooding due to future isostatic rebound changes.		thematic meetings. The full suite of survey reports covers birds and other sensitive wildlife.
		Ornithology, Terrestrial ecology, Design	The Bird Wise East Kent Project Manager makes the following comments: With the construction of any large facility on the marshes surrounding Pegwell Bay there is concerns that both breeding birds and roosting wading birds will be impacted on as Pegwell Bay NNR and the wetlands/marshes surrounding it provide a vital habitat mosaic that cannot be artificially replicated. It is therefore imperative that any planned works are given due consideration for the long term impacts on not only the birds but the multitude of species that solely live around wetland habitats. Wetland habitats, and in particular marshes are very rare and dwindling.	N	Meetings have been held with Natural England where the approach to addressing loss of habitat, in particular the loss of functionally-linked land for golden plover, has been discussed at length. Various strategies have been discussed with Natural England. The possibility of creating new wetland south of the River Stour was explored prior to Statutory consultation but technical challenges were identified in discussion with hydrologists and Natural England with keeping it sufficiently wet. Therefore, an alternative approach has been pursued (discussed and agreed in principle with Natural England) to instead enhance an area of arable land close to the coast and adjacent to the A256. This was consulted on at Targeted consultation. Further details can be found in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Ornithology, Agriculture and soils, Onshore mitigation	With regard to Pegwell Bay itself and the laying of another cable through the site there are concerns around how this will impact the saltmarsh, which was greatly impacted on when the NEMO link was laid. Again, saltmarsh is not easily replicable and also a very rare habitat. Also, the level of disturbance this is going to cause over the period of the cable being laid will cause untold damage to the already decreasing number of birds and seals on the NNR. In addition to the above, within PEIR Volume 1, Part 3, Chapter 3 Ecology and Biodiversity it is stated that two periodically flooded arable fields of potential significance for non-breeding Golden Plover (totalling 13.6 ha) will be permanently lost and are likely to constitute functionally linked habitat for the Thanet Coast and Sandwich Bay SPA/Ramsar site. The loss of these fields to the proposed converter station and substation will require offsetting. It is suggested that this could be done through converting arable land along the river corridor to new areas of seasonally flooded grassland, or scrapes, thus also enhancing the Lower Stour Wetlands Biodiversity Opportunity Area. Enhancements to this Opportunity Area are also being considered to comply with Biodiversity Net Gain requirements, which will be reported for the ES to be submitted with the application for development consent. Whilst the Council acknowledges that the Project is stated to comply with Biodiversity Net Gain requirements, it is considered that the loss of valuable arable fields providing established foraging habitat cannot be adequately offset and mitigated.	N	National Grid acknowledges this feedback. As discussed in the thematic meeting on the 05 March 2024, the Proposed Project will not be open cut in the saltmarsh of the SPA which would avoid the issues caused by the Nemo Link. The commitment to the use of a trenchless construction solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Please see the response above in relation to the golden plover.
		Terrestrial ecology,	Therefore, whilst it is acknowledged that the survey work is ongoing (and has yet to commence for most receptors), there is	N	Arable land is not the preferred habitat of golden plover. Rather they use it opportunistically when it floods. Historically it would have been marshy

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Intra-Project cumulative effects, Onshore environmental impact	significant concern about the impact the project will have on the habitat of protected and notable species which, it appears, will result in significant harm to ecology at the local level.		grassland and this will support a greater number of golden plover than arable fields. Therefore, it is considered that it is possible to offset the loss of a suboptimal habitat by creating a sufficient area of optimal habitat. This is commonly done to offset losses of functionally linked land as part of DCOs. The principle of this has been discussed with Natural England and captured in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Air quality, Noise and vibration	**Air Quality and Noise** Thanet District Council's Senior Environmental Health Officer has reviewed the documents and has the following comments to make: I have read chapters 9 Air Quality & 10 Noise for the Kent onshore scheme - cabling, overhead transformer pylons and substation/convertor station and considered the PEIR for both construction and operational impacts. Baseline data used for the PEIR included Thanet diffusion tubes and on site noise monitoring to obtain existing levels to be able to scope out any negligible impacts and the assessment and mitigation of others. I appreciate there are separate sections for biodiversity but it is worth mentioning that the air quality and noise chapters relate only to impact on human health, not the natural environment.	N	The air quality and noise impacts on ecology receptors are assessed within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The air quality assessment within **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality** has considered ecological receptors.
		Air quality, Legislation and policy inc. permits, Traffic and transport	Air Quality assessment of construction and operation of the convertor was initially scoped out of the ES but has now been scoped back in, in relation to cumulative traffic generated during construction. A detailed assessment of air quality will now be carried out of construction traffic generated emissions. Operational impacts remain scoped out. This approach is accepted and in accordance with relevant IAQM and TG22 guidance The subsequent detailed assessment should have regard to the recently updated Institute of Air Quality Management Guidance on the Assessment of Dust from Demolition and Construction Version 2.1 (August 2023) as well as the revocation of Thanet's urban wide AQMA and the declaration of a smaller defined Ramsgate AQMA (June 2023). Air quality assessments are only as reliable as the traffic data used in the assessment procedure so it is important that KCC Highways review this element of the PEIR.	N	The Institute of Air Quality Management Assessment of Dust from Demolition and Construction (2024) V2.2 is used within the ES. Further details regarding the Thanet Urban AQMA and Ramsgate AQMA have been included in **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality**.
		Air quality, Onshore mitigation, Traffic and transport	Embedded mitigation measures to minimise AQ air quality effects include: 'Sensitive routing and siting of infrastructure and temporary works;' and 'Commitments made within Volume 2, Part 1, Appendix 1.4.F, Outline Schedule of Environmental Commitment and Mitigation Measures'. There are two possible construction traffic routes currently under consideration; if the one	N	As outlined in **Application Document 7.5.6.2 Outline Air Quality Management Plan - Kent**, monitoring is proposed on Jutes Lane. It should be noted that the main access will predominantly be taken K-BM02 (A256), K-BM01 (Ebbsfleet Lane), K-BM06 (Ebbsfleet Lane North) and K-BM07 (Sandwich Road). Only a very low proportion of construction vehicles is expected to access the site via K-BM03 (Jutes Lane).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			nearest the school and dwelling on Jutes lane is selected, EH would request that real time air quality sensors are installed to ensure action is taken to avoid episodes of significant dust and included within the dust management plan and CEMP.		
		Noise and vibration	In terms of noise, the baseline levels indicate very low existing background noise: 35dB,L90 day and 29dB, L90 night. Therefore construction noise has been assessed against BS5228 category A threshold given the relatively quiet baseline levels at Great Oaks Small SEN school, EH would therefore recommend the following noise limits (i.e. BS5228 mins 5dB for SEN sensitivity to noise) are used as the basis for the assessment with the following target levels. Weekdays 7:00am to 7:00pm, and Saturdays 7:00am to 1:00pm: 60 dB LAeq,T Saturdays 1:00pm to 7:00pm 55 dB LAeq,T Please ensure that these recommendations are taken into consideration in the production of the ES. Natural England will comment as a key consultee in relation to environmentally sensitive receptors.	N	Agreed and special consideration has been given to Great Oaks Small School as a high sensitivity receptor. Further details are contained in **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**.
		Geology and hydrogeology, Design, Onshore route location	**Water Environment, Geology and Hydrology** Thanet District Council's Regulatory Services Manager has reviewed the consultation documents in relation to contaminated land, hydrogeology and protection of the SSSI and makes the following comments: Volume: 1, Part 3 Kent Onshore Scheme, Chapter 6 Geology and Hydrogeology of the PEIR and Volume: 2, Part 3 Kent Onshore Scheme, Appendix 3.6.A Preliminary Contamination Risk Assessment, identify a number receptors along sections of the route as Medium-Severe risk and this department is satisfied with the assessment proposed. Regarding the cable landfall location tranche at Pegwell Bay (Pages 64-65 of the Design Drawings, Version A, October 2023) in proximity to the landfill site and the Jet Garage in particular, we would invite further information regarding the trenchless methodologies being employed in this section as part of the ES (this element cannot be scoped out) and additional consultation with the Environment Agency to confirm that potential historic fuel / oil contamination from the garage or leachate from the landfill site are not mobilised during this work via a potential new pathway into the SSSI / Pegwell Bay. The Design Drawings, Version A, October 2023, Pages 56-57, highlight that additional boreholes will be placed along the cable route. Clarification of the testing undertaken at these locations to ensure there are no accidental releases of historic contaminants is required, alongside the trenchless methodology being employed	N	The Preliminary Contamination Risk Assessment has been discussed with Thanet District Council during thematic meetings. They have stated they were generally happy with the assessment undertaken and proposed. The Jet Garage is now included within the updated Preliminary Contamination Risk Assessment and additional information is included within the ES. Further details are contained in **Application Document 6.3.3.5.A ES Appendix 3.5.A Preliminary Contamination Risk Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			(and Risk Assessments), once known, in accordance with the Control and Management Measures (GH02).		
		Water environment, Onshore mitigation, Agriculture and soils	In regard to the water environment, the PEIR confirms a flood risk assessment will be produced to identify the future flood risk and identified mitigation measures when required. It is noted that increased surface water flooding from the converter site and increased flood risk has been scoped out by the Planning Inspectorate. It is vital that existing drainage channels across the full scope of the development site are not impacted during construction. Measures should be implemented to ensure surrounding landowners and farmland are not affected by the development of the site, particularly given the timeframe (length) for construction. The mitigation measures W11 and AS05 are noted and the Council would like further information on the temporary alternative drainage routes, the proposed scheme of pre-construction land drainage and the surface water runoff measures, prior to submission, in collaboration with KCC as the Local Lead Flood Authority (LLFA). Kent County Council, Natural England and the Environment Agency have been consulted on these proposals, and their expertise should be relied upon.	N	**Application Document 6.8 Flood Risk Assessment** has assessed flood risk from a range of sources including surface water, considering both flood risk to and arising from the Proposed Projects construction and operation phase. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime). In addition, where the Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a Project commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. In preparing the Flood Risk Assessment and surface water drainage strategies, National Grid has engaged regularly with Kent County Council, Natural England and the Environment Agency to agree key design principles and mitigation strategies.
		Onshore route location, Construction – general, Design	**Coast** Thanet District Council's Deputy Technical Services Manager has reviewed the consultation documents and makes the following comments: Having visited the consultation event in Sandwich I understand that the cable will tunnel under Pegwell Bay, emerging from the ground at an unconfirmed distance above the mean low water level. More information on specifically how a trench will be dug from where the cable emerges from the ground to the point where the cable is laid on the surface is required to be able to understand the potential impact of this activity. It has been advised that any plant vehicles will be brought to the site near the low water line by sea which will be much less damaging than tracking across the mud flats. Please ensure that these comments are taken into account when finalising the Project.	N	The cables and bellmouths (exit point of ducts) will be buried into the mudflats to a minimum of 1.5 m below ground level. The exact depth will be defined after specialist studies are concluded for the landfalls, which are currently underway. The final technique to be employed to bury the individual cables from the bellmouth to the bundling point, and then the bundled cable, has yet to be confirmed, as it forms part of the Main Works Contract, which is currently out to market. Burial across the mudflats can take place from a vessel with excavators onboard (anchored barge), or from an amphibious trenching system which can operate 24/7, irrespective of the state of the tide. Nominally the depth where the nearshore trenching operations end is c. 10 m water depth, depending on solution. Construction activities are planned to be undertaken from the marine environment.
		Land rights and CPO	**Estates** The Council's Estates Team is in dialogue with National Grid's appointed agents and will separately correspond in regard to access, licensing and rights over land under the Council's ownership.	N	National Grid acknowledges this comment and will continue to engage with the Council Officers as necessary.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage, Construction – general, Onshore mitigation	**Heritage and Archaeology** Thanet is rich in archaeology and the site lies in an area that is generally rich in archaeology with buried landscapes from prehistoric, Roman, Saxon and mediaeval times known to lie in the fields and open ground on the southern slopes of Thanet around Minster. The route and development site is in close proximity to/within the former Wantsum Sea Channel that once was a significant major sea route in prehistoric and Roman times, with ancient settlement and other activities along its edge. Kent County Council and Historic England have been consulted on these proposals. These bodies are key consultees and their expertise should be relied upon. Potential impacts from construction work through HDD installation works and the erection of the converter station and pylons on heritage assets is identified within the Cultural Heritage section of the PEIR. This identifies the Roman site north of Ebbsfleet Farm as “High Sensitivity” as likely to be affected by the cable route and associated haul road. The Council will await feedback from colleagues at KCC regarding the identification of assets and quantification of their significance. We also await the completion of the geophysical survey and subsequent trial trenching prior to forming a view on the significance of the impact on archaeology in the area and whether sufficient mitigation can be undertaken through and post construction work.	N	Since submission of the PEIR fieldwork, information gathering has continued to assist with defining the character and significance of heritage assets, as well as to assess the potential for impacts. This has included geophysical survey, a review of aerial photos and LiDAR data, walkover survey, setting assessment and evaluation trenching. The information gathered was used to inform the baseline report, as well as help define the significant of cultural heritage assets and assess impacts. It has been included within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and associated appendices. All works have been undertaken in consultation with stakeholders including Kent County Council Archaeological Adviser (KCCAA), and Historic England, with the Written Scheme of Investigations (WSI) for geophysical survey and evaluation trenching approved by KCCAA.
		Socio-economic. recreation and tourism, Walking, cycling and horse-riders	**Socio-economics, Recreation and Tourism** The socio-economics, Recreation and Tourism Chapter highlights that there is currently no statutory guidance on the methodology for undertaking assessments of socio-economic, recreation and tourism effects. As such, the assessment follows professional judgement and best practice methodology from other assessments undertaken on comparable energy infrastructure schemes. Kent County Council will provide detailed comments in relation to any impacts on PRoW.	N	National Grid acknowledges this feedback.
		Construction – general, Socio-economic. recreation and tourism, Intra-Project cumulative effects	The Council has concerns that the construction period of the Project which would result in disruption, noise and visual impacts to the PRoW network and coastal paths is likely to impact on tourism and the enjoyment of this area. There is also a concern that due to the length of the construction period opportunities for exercise and use of these routes for leisure would be affected leading to avoidance which has the potential to negatively impact use of these routes in the longer term. The preliminary likely significance of effect for PRoW Footpath TE26 is assessed as not significant with a magnitude of small adverse. This footpath lies within the area of all three overhead	N	Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The meetings have been run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. As part of thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-economics, Recreation and Tourism** concludes

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			line options subject to temporary closures with the potential for a permanent diversion, dependent on the final pylon arrangement selected. The Council considers that there is the potential for a significant effect and notes that the magnitude of impact will be confirmed at the ES stage when additional design information is available. It is noted that additional mitigation measures and provisions made by the applicant will be defined further at the ES stage (PEIR Volume 1, Part 3, Chapter 11 Table 3.11.2).		that there are no anticipated significant effects on PRoW/Recreational routes as a result of the Proposed Project. Additionally, a complete cumulative assessment has be undertaken. This is set out in **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Inter Project Cumulative Effects**.
		Socio-economic. recreation and tourism, Walking, cycling and horse-riders, Onshore mitigation	The Inspectorate has commented that the study area for local communities identified as being impacted only accounts for those connected by recreational routes and PRoW; however, the Inspectorate considers this should also include routes connected via the road network and the study area for landscape and visual impacts and traffic and transport. The study area identified in the ES should include the extent of potential impacts on receptors from changes in the road network from the proposed development. Effort should be made to agree the study area with relevant consultation bodies. The Council notes that National Grid intends to assess these effects at ES stage, as there is currently insufficient information to assess the impacts on walkers, cyclists and horse riders along routes connected via the road network (PEIR Volume 1, Part 3, Chapter 11 Table 3.11.7). It is the Council's view that there is an opportunity for the project to provide educational benefits. We would welcome a program involving local schools and colleges during survey works and the construction phase (as appropriate) similar to those that have been employed for other energy projects in the District. In terms of tourism, information boards (sensitively designed and located) providing detail on the project would be welcomed.	N	As part of thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. The assessment includes consideration of routes connected via the road network and the study area for landscape and visual impacts and traffic and transport. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Health and wellbeing	**Health and well-being** Kent County Council will comment on the impact from the development on health and well-being, and their expertise should be relied upon.	N	National Grid acknowledges this feedback.
		Traffic and transport, Timescales / programme, Walking, cycling and horse-riders	**Traffic and Transportation** Kent County Council will comment on the impact from the development on the highway network, and their expertise should be relied upon. The main construction phase for the proposed project is currently predicted to be 5 years between 2026 and 2031, with the construction peak in terms of activity and vehicle movements expected to take place in 2029. The Kent onshore scheme will be accessed via three access points during the construction phase, namely the A256 Northbound Carriageway (main access during	N	In terms of potential PRoW impacts, this is assessed within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** following finalisation of the Proposed Project Design and mitigation identified. As above, **Application Document7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been developed in consultation with Kent County Council to mitigate PRoW impacts. In terms of potential highways impacts, this is assessed within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** was updated to mitigate any impacts.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			construction and operation), Ebbsfleet Lane (access during construction and operation) and Jutes Lane (secondary access, alternative to the main A256 access for construction and operation). Permanent access to Minster converter station and substation will either be via the A256 or via Jutes Lane. There are also a number of secondary access routes for construction vehicles which include Tothill Street, High Street, Marsh Farm Road, Ebbsfleet Lane North and Cottington Road. There are two options for providing permanent access to the Minster converter station and substation. The first option involves access to the converter station from Jutes Lane, following the HVDC cable route and then existing field boundaries before passing along the south side of the Minster converter station and Minster substation. The second option would utilise a new access point off the A256, North of Jutes Lane. The Council considers that given the number and type of vehicle movements and hours of use, traffic associated with construction is likely to have a significant impact on the local highway network. In particular concern is raised with any construction access via Tothill Street or Ebbsfleet Lane North, even as a secondary means of access. Direct access from the A256 as shown at BM02 would appear inadequate as a means of connection to a national speed limit highway, with limited filter lanes for slow moving traffic joining the northbound carriage. It is noted that National Grid will undertake a Road Safety Audit (RSA) for each proposed access and take advice from Kent County Council Highways to determine the approach. This advice must be given the utmost importance in determining an appropriate point of access onto the network, in advance of any formal NSIP submission. Please can you inform Thanet District Council once the audit has taken place and the outline Construction Transport Management Plan (CTMP) has been updated accordingly. If an access point is created at BM02, there should be no ability for vehicles to access Ebbsfleet Lane North from the access. Please note our comment with regards to the impact on the PRoW network, with the submission of an outline PRoW Management Plan required to be provided within the application submission documents in consultation with KCC, rather than post decision.		In terms of the A256 access, the Stage 1 RSA has been shared with Thanet District Council. The proposed design/ layout of the A256 access was revised to consider any recommendations where necessary. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** was updated accordingly. In terms of consultation, Thanet District Council was invited to transport thematic meetings since these commenced April 2024. In terms of the comment 'there should be no ability for vehicles to access Ebbsfleet Lane North from K-BM02 (A256 access)', the new access shall have fencing and gates to prevent unauthorised access. There will be no connection to Ebbsfleet Lane North from the proposed access road other than the cycle/pedestrian crossing point. It is considered that the proposed design shall provide greater security than the existing arrangement in this area. In terms of the comment 'K-BM02 (A256 access) to be inadequate due to the national speed limit and limited filter lanes for slow traffic to join', the junction has been designed to be fully compliant with DMRB and a designer's response to the RSA Stage 1 has been produced outlining the changes made in response to the RSA's comments.
		Climate change, Inter-Project cumulative effects, Onshore mitigation	**Other Matters** The submission states that the level of significance of project-related emissions will be determined at the ES stage using IEMA's (2022) five distinct levels of significance which are not solely based on whether a development emits Greenhouse Gas (GHG) emissions alone, but how it makes a relative contribution towards achieving a science based 1.5°C aligned transition towards net zero. Embedded measures are stated to include the use of materials with a low embodied carbon and low carbon	N	A lifecycle greenhouse gas assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment goes into more detail than the greenhouse gas assessment previously submitted in the Preliminary Environmental Information Report. This assessment has been conducted in accordance with the Institute of Environmental Management and Assessment good practice guidance for greenhouse gas assessments in EIAs. The greenhouse gas assessment considers the mitigation measures embedded in the project to reduce greenhouse gas emissions, as well as puts

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			construction techniques with additional mitigation measures to include an intention to reduce construction emissions associated with energy consumption (e.g. source energy from renewable sources, use low carbon fuels), use energy efficient machinery and vehicles and where possible, source materials locally to reduce emissions associated with transport. Further details on the effectiveness of the mitigation will be required to be included within the ES and register of environmental commitments to accompany the NSIP submission. The submission also states that the GHG impacts of the project will be quantified in more detail in the ES as more data becomes available, but that the majority of GHG emissions are likely to be embodied carbon in construction materials. The GHG emissions associated with the construction phase of the project are estimated in the submission to be approximately 151,000 tCO2e whilst the GHG emissions during the operational phase are estimated to be approximately 110,000 tCO2e (40 year lifespan assumed). It is noted that the potential GHG emissions of the Proposed Project are estimated to contribute less than 0.1% of any respective UK carbon budget and the Proposed Project is part of UK policy to decarbonise the electricity grid and transition to net zero by 2050. However, significant concerns are raised about the levels of embodied carbon associated with the construction of the Project. The Council has committed to work towards carbon neutrality by 2030 within our published Net Zero Strategy, with the aim of net-zero on Thanet wide emissions by 2050. The Proposed Project would have the potential to affect the Council's ability to meet this target and the implications of the construction project on district-wide targets should be fully appraised within the ES. In addition, concerns are raised regarding the cumulative impact of energy projects in this location and the potential need for further expansion within and potentially beyond the Draft Order Limits to satisfy future energy infrastructure demands. Further information on these matters should be provided in the ES in due course.		forward additional mitigation measures where applicable. More detail on the mitigation measures is provided in the greenhouse gas assessment. The Proposed Project has been designed to increase the capability of the network to carry low carbon and renewable energy from where it is generated to homes and businesses across the country. The Proposed Project will play an important part in allowing the UK to decarbonise its energy system in a meaningful way that will not only support net zero energy targets, but also deliver a more secure and resilient energy system. The implications of the Proposed Project on net zero targets is considered and discussed in more detail in the greenhouse gas assessment. **Application Document 7.5.13 Greenhouse Gas Reduction Strategy** has been developed alongside the climate change chapter. This document sets out how greenhouse gas emissions will be managed across the project lifecycle. More detail on cumulative effects with other projects is discussed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects, Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects** for the marine aspect of the Proposed Project.
		Needs case, Intra-Project cumulative effects, Climate change	**Conclusion** It is acknowledged and understood that the project will reinforce the existing transmission network and build new electricity infrastructure to support new sources of renewable and low-carbon energy, providing a national benefit to energy security and net zero targets in the long term. However, the Council has specific concerns as outlined above about the impact on the environment from the project at the local and regional level, namely: the visual impact from the convertor station, substation and pylons on the character of the area, and how the impacts	N	National Grid acknowledges this feedback. The specific issues raised have been responded to where raised above within the main response. For reference, the ES assesses the impacts that have been raised in the relevant ES chapters as follows: The visual impact from the convertor station, substation and pylons on the character of the area, and how the impacts have been quantified within the submission (the significance of impact/effect) within **Application Document Part 3 Kent Chapter 1 Landscape and Visual**. The permanent loss of Best and Most Versatile agricultural land is assessed in **Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			have been quantified within the submission (the significance of impact/effect); the permanent loss of Best and Most Versatile agricultural land; the impact on biodiversity and loss of important habitats, specifically Golden Plover; construction impact on recreation and tourism, disturbance to flora and fauna and impact on net zero targets for the district; the impact on local infrastructure including the highway network during construction and operation.		The impact on biodiversity and loss of important habitats, specifically golden plover within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Construction impact on recreation and tourism, disturbance to flora and fauna and impact on net zero targets for the district within **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The impact on local infrastructure including the highway network during construction and operation within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.
		Onshore mitigation, Design, Consultation	The Council requests continued discussions during and following further planned survey work and to be directly involved with providing feedback on all proposed mitigation/environmental commitments, prior to the submission of the NSIP application. In addition, further clarity in the proposal in terms of the scale, layout and design of the converter station and substation and the pylon layout and scale should be formulated prior to submission and provided to the Council for comment. The above comments are made without prejudice to the Council's written representation submission, adequacy of consultation and Local Impact Report on the Development Consent Order application.	N	National Grid acknowledges this feedback. The PEIR was a preliminary assessment of the potential effects. Engagement with Thanet District Council continued following Statutory consultation via the thematic meetings where updates were provided in relation to design details and information from further surveys as these became available. Final details of the design are available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Please also note that the complete environmental assessments which include the full suite of environmental surveys carried out to date are included within the relevant technical chapters of the ES.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Alternative solutions, Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Further comment**: Instead of bringing all power to a small area of protected Suffolk why not deliver the power from the windfarm to Richborough* directly? (*the Thames estuary). The whole idea of bringing all power into Sizewell and then out again essentially defies logic. The power is required in the Thames Valley - this should be the main hub, not Sizewell/East Suffolk. Use brownfield sites for converter station and sub-station."	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
	Alternative solutions, Needs case	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** [Transcription note: Respondent has crossed out 'positive' in tick box list and written 'slightly better']. **Further comment:** A logical proposal: [Transcription note: Respondent has drawn diagram pointing from offshore wind power directly to south east of England] Result - Sealink not required, much money saved... Where wind power located, build hydrogen production and power station, NOT nuclear.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Onshore route location, Alternative solutions	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Further comment:** The substation should be in the Thames Valley on brownfield sites where the power is required.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location, Needs case	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk?	N	Please see comments above regarding the need for the Proposed Project. National Grid will use trenchless construction methods for cabling under sensitive sites such as the RSPB North Warren and the Leiston-Aldeburgh

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Further comment: Sealink is effectively evidence of the power being brought to the wrong location - rural Suffolk. In these circumstances it is difficult to approve the concept. As regards the cable route itself the important criteria is horizontal direct drilling not surface trench.		SSSI. The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The commitment to the use of trenchless solutions is contained in Requirement 6 of Schedule 3 of the draft DCO (Application Document 3.1). The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**.
		Onshore route location, Onshore Environmental Impact	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Further comment:** [Transcription note: Respondent has drawn an arrow on the eastern side of the map and written 'AONB'] No open trenching in SSI/AONB or any other protected area.	N	The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. In Suffolk, National Grid will use trenchless construction methods for cabling under the Aldeburgh – Leiston SSSI and part of the Suffolk Coast and Heaths AONB. For the section of the AONB that will be crossed with open trenching, National Grid will reinstate the disturbed areas. The challenges relating to reinstatement following construction are set out within the assessment of effects on the AONB, landscape character and visual amenity within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes consideration that heathland and acid grassland will take longer to be reinstated than other habitat types and this has been acknowledged within the assessment. Details around reinstatement are set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**. The commitment to trenchless solutions is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Landfall location, Onshore environmental impact	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Further comment:** [Transcription note: Respondent has drawn an arrow across map and written 'AONB'] The first 3km of cable run from landfall is through the SSSI (as you note) and the AONB (which is not noted). Horizontal	N	National Grid will use trenchless construction methods for cabling under sensitive sites such as the RSPB North Warren, the Leiston-Aldeburgh SSSI and part of the Suffolk Coast and Heaths AONB. The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**. The commitment to trenchless solutions is secured

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Directional Drilling should be used at least to the AONB boundary.		through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore route location, Design	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Onshore route location, Design	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I support co-location	N	National Grid acknowledges this feedback.
		Design, Construction - general	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** I support co-location with the proviso that there will be no open-cut trenching in AONB/SSSI areas.	N	In Suffolk, National Grid will use trenchless construction methods for cabling under the Aldeburgh – Leiston SSSI and part of the Suffolk Coast and Heaths AONB. For the section of the AONB that will be crossed with open trenching, National Grid will reinstate the disturbed areas. The challenges relating to reinstatement following construction are set out within the assessment of effects on the AONB, landscape character and visual amenity within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes consideration that heathland and acid grassland will take longer to be reinstated than other habitat types and this has been acknowledged within the assessment. Details around reinstatement are set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**. The commitment to trenchless solutions is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Construction – general, Onshore mitigation	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:**	N	Please see the response above regarding the use of a trenchless construction solution. National Grid has reviewed the feedback received from SEAS. The comment regarding what are perceived to be gratuitous images is noted.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Any cable routing should be using Horizontal Directional Drilling for all areas listed as SSSI, AONB and other protected classifications. It would not be acceptable to use open-cut trenching techniques in these protected areas. When producing information about the project please avoid gratuitous images of 'very happy people'. This can be irritating for those whose environment is being substantially damaged. Please take note of all recommendations made by SEAS (Suffolk Energy Action).		

Table 1.2 SL-PIL-0800, SL-PIL-0044

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Yes.	N	National Grid acknowledges this feedback.
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are positive.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I think this is the best location for connecting into the existing network.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I think this is the best cable route.	N	National Grid acknowledges this feedback.
		Converter station location, Design	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I think the converter station is in the right location. **Further comment:** Well located, flat land, well screened from town.	N	National Grid acknowledges this feedback.
		Design, Converter	**Feedback form question 6:**	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		station location	We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Colour, Green roof **Further comment:** Green roof - most discrete especially if clad in colour.		application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I think this is the best cable route.	N	National Grid acknowledges this feedback.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I think this is the best location for the landfall.	N	National Grid acknowledges this feedback.
		Onshore route location, Design	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Converter station location, Design	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I support co-location.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? Response: I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Construction - general	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation.	N	National Grid acknowledges this feedback. The Proposed Project Environmental Statement is contained in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport; and** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore mitigation, Offshore mitigation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** I am sure all issues will be considered sensitively.	N	National Grid acknowledges this feedback. National Grid is committed to developing a project that takes account of the sensitivities of the local people and the environment to avoid or minimise impacts as far as possible and to mitigate the significant effects of the construction and operation phases. Potential impacts are detailed in the ES in Volume 6 of the DCO application. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Very good. **Further comment:** Well communicated easy to follow.	N	National Grid acknowledges this feedback.

Table 1.3 SL-PIL-0647, SL-PIL-0380

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Yes.	N	National Grid acknowledges this feedback.
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are positive.	N	National Grid acknowledges this feedback.
		Onshore Route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:**	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Green roof, Colour and curve.		into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location, Design	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location, Design	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I think this is the best location for the landfall.	N	National Grid acknowledges this feedback. National Grid is committed to developing a project that takes account of the sensitivities of the local people and the environment to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. This includes careful siting of Proposed Project infrastructure. Information on the selection of the proposed landfall site in Kent is contained in **Application Document**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Further comment: Comments: away from most residential housing.		**8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Onshore route location, Agriculture and soils	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I think this is the best cable route. **Further comment:** Will the land marked with an X still be farmed as it currently is?	N	National Grid acknowledges this feedback. Once the HVDC cable has been installed, land will be reinstated to its current condition.
		Converter station location, traffic and transport	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I think the substation and the converter station are in the right location. **Further comment:** How will construction traffic get to the location?	N	Access to the Converter Station site will be via the A256 from the east. For details, please see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The impacts of the additional traffic that will be generated by the Proposed Project have been assessed in **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.
		Design	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof, Colour and curve. **Further comment:** This is most important. I would like to see a minimal impact to the visual landscape (as much as possible).	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. Landscape and visual impacts are contained in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Landscape planting required for screening will be undertaken in advance of construction wherever possible. However, it should be acknowledged that such measures take time to establish, meaning that there will be some residual effects will remain.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line?	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I agree with the plans to use an overhead line connection.		
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Landscape and visual impact, Ecology and biodiversity, Noise, Archaeology, Disruption to land use.	N	National Grid acknowledges this feedback. The Proposed Project Environmental Statement is contained in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage; and** • **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation, Onshore mitigation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** I would be keen to see more plans surrounding this. I would also like more information about any wildlife groups involved.	N	Mitigation measures are set out in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation includes establishment of protective areas for sensitive ecological and archaeological features to be retained, control of run-off across the construction site(s), landscape planting, retention of topsoil, avoidance of certain breeding seasons and implementation of construction traffic management and travel plan, among others. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council, Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					For biodiversity, further information is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Very good.	N	National Grid acknowledges this feedback.

Table 1.4 SL-PIL-0107

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** Needs brownfield sites.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative	N	National Grid acknowledges this feedback. In developing the Proposed Project, National Grid has assessed a variety of options, including other potential areas for new infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and**

					• **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location, Alternative solutions	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** Needs brownfield sites.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023) and Application Document 6.2.1.3 Part 1 Introduction**.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location.	N	National Grid acknowledges this feedback. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.** Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas.
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof, Agricultural barns.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I agree with some elements of the proposed cable route but disagree with others.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** Habitat destruction.	N	National Grid acknowledges this feedback. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) Application Document 8.3 Strategic Options Report (October 2023) and Application Document 7.2 Strategic Options Back Check Report**. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routing and siting of infrastructure and temporary works. The impacts on habitats are considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. Response: I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. 					these coordination benefits and to also explore further opportunities for coordination where they arise.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? Response: I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Design	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof, Colour and curve	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Construction – general, Combined effect of the	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link?	N	National Grid acknowledges this feedback. The Proposed Project Environmental Statement is contained in Volume 6 of the DCO application. Further information is contained in:

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		proposed Project	**Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Impact on tourism, Impact on recreational activities.		• **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average.	N	National Grid acknowledges this feedback.

Table 1.5 SL-PIL-0168, SL-PIL-0172

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Onshore mitigation	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Unsure. **Further comment:** Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent? Response: While I do understand the case for improving grid links from where power is generated to where it's required, I think the residents of the locations in Suffolk that are going to be disrupted for a decade with multiple projects need the companies looking to build these links to give more back - either directly to affected residents or through community improvements. For example, one of the proposed construction access roads around the Saxmundham site could be extended to provide relief to the significantly congested junction in Saxmundham. While this is a specific example rather than on the principle, the same should be considered for all the locations - people need more electricity, and local residents and businesses who have to put up with either electricity generation or transmission infrastructure should be in some way compensated (not necessarily monetarily, although that would be probably the simplest) for both the disruption associated with construction and the loss of amenity of the green areas being turned into industrial sites. At the moment the proposal basically barely waves a hand at inwards investment into the local area, and so while I support the concept of needing to transmit power in the manner and between the locations proposed, I cannot support this specific proposal as it stands, as the community only loses.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the project progresses, it will work with stakeholders and local communities to further inform this.
		Design, Needs case, Community benefits / enhancements	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:**	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The proposal doesn't adequately explain why disrupting more landscape to build further inland is a good idea. No consideration for any obvious community improvements.		coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The potential effects on landscape and visual receptors is included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location, Coordination with other Projects	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** If this absolutely has to be built this far inland, on this greenbelt land, propose that the most easterly identified suitable location would be chosen (the 'co-located converter stations' option). There should absolutely not be 3 of these giant monstrosities in this location and I do not support that at all.	N	National Grid acknowledges this feedback. While the site at Saxmundham is in planning terms a ‘greenfield’ site, there is no green belt in this area. The benefits of co-location with other projects are recognised because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the co-location of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. With regard to the converter stations at Saxmundham, the process of site identification is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints. The proposed approach for co-locating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. **Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** also provide details about assessment criteria and the rationale underlying decision-making for the Proposed Project.
		Design, Consultation	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof, Agricultural barns, Colour and curve. **Further comment:** I've selected these three as the others are not at all clear what they mean (and look awful in this 2D representation). Your proposal should have done a much better job - a paragraph or two on what terms like 'Kinetic' means in design terminology. A green roof and surrounds that entirely obscures the converter station and makes it look like it's part of the landscape would be optimal.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. While it is accepted that the architectural terminology may be unfamiliar to consultees, the terms and context are explained in the Statutory consultation document ‘Converter station design – background to potential architectural approaches’ which can be found in the document library of the Proposed Project website, under archived statutory consultation documents (October 2023).
		Landfall location, Alternative solutions	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** Your route drawn seems to come directly through a nature reserve. It's also an extremely pretty part of the coastline that I don't think should be disrupted - can this come in at Sizewell for example since there's likely to be a load of disruption for Sizewell C, it'd just be adding to the melee.	N	The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the route of the HVDC cable and the location of the joint bays and the high importance of the RSPB reserve and the AONB is noted. This is a major reason why the reserve will be traversed through trenchless methods. The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB and Suffolk Heritage Coast are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. This acknowledges the sensitivity of the landscape, including the open scale of the coastline, and details potential effects arising from the Suffolk Onshore Scheme.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Traffic and transport	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Preference for access route to the Saxmundham converter station (if built here) - this should be option 1 if at all possible, as it avoids the town of Saxmundham and the problems with the junction there, additionally route 2 crossing the main road (B1119) doesn't make much sense to me, although this is one option for turning this access / construction road into a possible bypass route for the town for traffic from the north at least (including access to estates on the east of Saxmundham). If this is done, providing an actual community benefit, then access road option 2 becomes a good choice, but only in that instance.	N	National Grid has identified a modified version of the western access route for the Saxmundham Converter Station (Option 3). On further assessment, the southern route (Option 1) was deemed to be not suitable for the construction traffic required. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? Response: I have no preference either way.	N	National Grid acknowledges this feedback.
		Construction – general, Combined effect of the	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link?	N	National Grid acknowledges this feedback. The Proposed Project Environmental Statement is contained in Volume 6 of the DCO application. Further information is contained in:

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		proposed Project	**Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Impact on recreational activities.		• **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Construction – general, Walking, Cycling and Horse Riding	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** The proposal does not make clear how maintenance of access to footpaths (that I currently use regularly across the field east of Saxmundham) will be managed both during construction and after, as this passes through the final plot of land. It is therefore not clear to me how that is handled (although this information may be buried in one of your badly signposted extra documents).	N	Impacts on footpaths and opportunities for recreation have been assessed and developed in collaboration with key disciplines including traffic and transport and socio-economics (further details are within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. National Grid acknowledges that there will be a temporary disruption to footpaths during the construction phase. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. Where a permanent impact is expected, a suitable diversion will be provided. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average. **Further comment:** I've commented earlier on this - the proposal does not make a number of areas clear (like the impact of design choices 'Kinetic' vs. 'Colour and curve').	N	National Grid acknowledges this feedback. See response above regarding the Converter Station design.
		Consultation	**Feedback form question 26:** Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation? **Response:** Very limited number of evening options for a number of the proposed sessions, and relatively short notice for things like the webinar briefing, letter dated 9/11/23 for a webinar held 2pm on the 14th of the same month - a time when many people will be working, and even if they're not that's not much notice. Things like the construction roads being used and construction areas - yes it's on your detailed maps on your website but not mentioned anywhere in the main body of the proposal. Nor any construction traffic mitigation strategies - again all hidden away in further documentation on the website. At least signpost it from the main proposal.	N	National Grid acknowledges this feedback regarding consultation. The Statutory consultation programme offered meetings in a range of formats that gave individuals and community groups the opportunity to explore and develop their understanding of matters of concern. National Grid acknowledges the criticisms of the timing of the webinars. The information presented in consultation materials provides as much detail as is available at the time of writing. As the Proposed Project is developed further, more detailed information will become available. This will be submitted with the DCO application. Traffic and transport details will be included in **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, which will outline mitigation measures. These are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Table 1.6 SL-PIL-0146

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No.	N	National Grid acknowledges this feedback. The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative.	N	
		Onshore route Location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network.	N	National Grid acknowledges this feedback. Information on the connection points for the Proposed Project and its need is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023) and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Onshore route Location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023) and Application Document 6.2.1.3 Part 1 Introduction**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location.	N	National Grid acknowledges this feedback. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas.
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof, Agricultural barns.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall.	N	National Grid acknowledges this feedback. Information on the selection of the landfall location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location.	N	National Grid acknowledges this feedback. The identification of converter site option areas was based on the potential to site adjacent to similar infrastructure, avoidance of designated sites as far as possible, landform, opportunities for natural screening and to minimise visual impacts on settlements. When considering all receptors, constraints and opportunities, the preferred converter site option area for the Richborough Substation connection point is converter site option A. Further details are contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**.
		Design	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			I have no preference either way.		
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Impact on tourism, Impact on recreational activities.	N	National Grid acknowledges this feedback. The Proposed Project Environmental Statement is contained in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average.	N	National Grid acknowledges this feedback.

Table 1.7 SL-PIL-123, SL-PIL-0128

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** I think you need to consider an offshore hub with converter station, with cable to Kent. The network needs reinforcing, but WHY spoil a beautiful bit of coast with construction, putting Converter stations at Friston and Saxmundham when you could re-think and use the offshore model which the Netherlands, along with other countries, have used?	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Combined effect of the	**Feedback form question 2:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		proposed Project	What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative.		
		Onshore route location, Combined effect of the proposed Project, Alternative solutions, water environment	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** THIS IS NOT THE BEST LOCATION. I understand there are still judicial reviews to be decided about Friston, but it CANNOT be the best location. The proposal to gather energy here, although the substation, with roads etc is an ancient rural setting, very popular with tourists and retirees. It also gets flooded (see for example November 2023. You would need to build your infrastructure, roads etc on a greenfield land which includes SSSIs and AONBs. PLEASE CONSIDER ALTERNATIVES WHICH ARE LESS DAMAGING.	N	National Grid acknowledges this feedback Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Onshore route location, Alternative solutions	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** I do not agree because the proposed HVAC between Friston and Saxmundham would not be necessary if you did not bring the cable ashore from windfarms, but took it by a sea route.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land.
		Converter Station location, Alternative solutions	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:**	N	

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			It is not the right location. The converter station would not be needed if alternative solutions are developed. The location is not suitable for this scale of industrialisation and the road network would not sustain the construction. It is of concern that you suggest that up to three converter stations could be built at the same location! Madness in such a rural location close to residential properties.		Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** IT should not be built to any design. It should not be constructed.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Onshore route location, Needs case, Combined effect of the proposed Project	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** You are proposing approximately 10 kms between Saxmundhan and a transition joint bay just under 1 km inshore. You WOULD OT need this if you considered offshore solutions. The disruptions of temporary roads, workers' buildings, parking areas and lots of heavy digging and other equipment will negatively affect, wildlife, environment, tourism, the beautiful countryside which residents and visitors love, and which is the source of fa great deal of our local income- without it jobs will be lost. They will often be the opportunities for the poorest local people without alternatives sources of income.	N	Please see above for National Grid's comments on offshore solutions. National Grid acknowledges this feedback. The Proposed Project Environmental Statement is contained in Volume 6 of the DCO application. With regard to the impacts mentioned, please see **Application Document 6.2.2.2 Part 2 Suffolk Chater 2 Ecology and Biodiversity, Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual; and Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The proposed mitigation in relation to the potential impacts is contained in these chapters. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023) and Application Document 6.2.1.3 Part 1 Introduction**.
		Coordination with other Projects, Alternative solutions	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects **Response:** I do not support co-location. Are there any other ways that you would like us to explore coordination with other projects? **Further comment:**	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			This "co-location" means lumping projects together causing further damage and distress. Please consider, since there are several things NG wants to do, using brownfield site/s.		proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**.
		Consultation	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Please present a full description of all the proposals you have for this area of Suffolk,. It is tricky and looks duplicitous to present each in isolation.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia One North, East Anglia Two, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. Additionally, the cumulative effects of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Impact on tourism, Impact on recreational activities.	N	National Grid acknowledges this feedback. The Proposed Project Environmental Statement is contained in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Alternative solutions, Consultation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** It would be better to read all the feedback and to respond constructively with an alternative proposal or proposals. You do not seem to be taking note of alternative suggestions but stick to making the feedback about choosing only from your chosen alternatives! The number of things you are lumping together also has massive impact (see my response to q 18).	N	National Grid has listened extensively to the views of stakeholders and the wider public throughout the development of its proposals. This Consultation Report provides an account of how National Grid has responded to feedback throughout the development of its proposals, including where this feedback has resulted in a change in the plans for the Proposed Project. National Grid has also demonstrated how it has had regard to feedback throughout the pre-application process. As part of the Statutory consultation in 2023, it set out how it had responded to the key themes from Non-statutory consultation feedback. It also published a detailed Non-Statutory Consultation Report as part of this consultation. As part of the subsequent Targeted consultation, the Project Update Document set out some of the key themes of Statutory consultation feedback and again set out how National Grid was responding to these comments.
		Inter-Project cumulative effects, Consultation	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** You have, rather, carefully not described these proposals (with your alternatives suggesting a done deal) along with the many other proposals, which include a nuclear power station among others, The blight on our lives, the economic impact, the possible long term decline in local tourism and local quality of life for	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia One North, East Anglia Two, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			residents and retirees means this already fragile economy is at risk alongside the ecosystem. This is short sighted and feels a bit like your consultation is being 'done by numbers"" because you must, not with genuine thinking about how to do this better for everyone. So many project have been presented separately one might begin to think that this was the only co-ordination- to blindside the local population. Please do not bamboozle us.		Additionally, the cumulative effects of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Table 1.8 SL-PIL-0012, SL-PIL-0015

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Yes.	N	National Grid acknowledges this feedback.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I think this is the best location for the landfall.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I think this is the best cable route. **Further comment:** This depends on where the ending is. I can see that his probably the least invasive route to get to the proposed destination.	N	National Grid acknowledges this feedback. Historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter station location, Alternative solutions	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location. **Further comment:** Why not have this closer to the existing energy park? This is going to be a huge angular box built on flat land, with few trees to the south to mask it. Hence it will be very visible in a non-built up area. it must be less intrusive to have it sited closer to the existing developments in Richborough.	N	There is insufficient space at the Richborough Power Station site for a converter station. A robust alternatives assessment has been undertaken for the Proposed Project. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023) and Application Document 8.3 Strategic Options Report (October 2023)**. The assessment on potential landscape and visual impacts is set out in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. The proposed mitigation in relation to the potential impacts is contained in this chapter. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders (see **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**). National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Design, Landscape and visual, Water environment	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Enhanced elevations, Colour, Green roof, Agricultural barns, Colour and curve. **Further comment:** Viewed from the south, which i will do, this is going to look dreadful in the landscape. South means from Ash, specifically from the junction of the cop Street Road & A257. From here the land slopes gently north to the the flat marshes of the ash level before rising again towards the Manston ridge. Richborough power station, as was, had large rectangular buildings that were demolished, along with the rest of the site. What replaced it is not so bad bearing in mind it has replaced something similar. This new build in the proposed site, must be made to blend in with the landscape. It must be coloured and preferably it would have a rounded form to bear up the box like structure. I understand that due to possible flooding it cannot be sunk in the ground a bit. this is a red herring. The land that side of the river rarely, if ever, floods. The flooding all occurs, by design, on the south side. Hiding it somehow in the flat landscape be an option. You will have noticed there are not many trees on either side of the river so tree planting to aid it is not an option.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. The assessment on potential landscape and visual impacts is set out in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. In summary the significant landscape effects are as follows: During construction, two out of the 11 landscape and seascape receptors within the landscape and visual study area would experience significant adverse effects arising from the Kent Onshore Scheme. These are TDLCA LCA E1 and DDLCA LCA A2 within which the Minster Converter Station, Minster Substation, and HVAC OHL works would be constructed. At Year 1 of operation and maintenance, one out of the 11 landscape and seascape receptors within the landscape and visual study area would experience significant adverse effects arising from the Kent Onshore Scheme. This is TDLCA LCA E1 within which the Minster Converter Station and Minster Substation would be permanently located. At Year 15 of operation and maintenance, none of the landscape and seascape receptors within the landscape and visual study area would experience significant adverse effects arising from the Kent Onshore Scheme. In summary the significant visual effects are as follows:

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					During construction, five out of the 14 representative viewpoints within the landscape and visual study area would experience significant adverse effects arising from the Kent Onshore Scheme. These comprise receptors from representative viewpoints 3, 4, 5, 6, and 11 which are all located in the local landscape around the Minster Converter Station and Minster Substation and also the HVAC OHL works. At Year 1 of operation and maintenance, four out of the 14 representative viewpoints within the landscape and visual study area would experience significant adverse effects arising from the Kent Onshore Scheme. These comprise receptors from representative viewpoints 4, 5, 6, and 11 which are all located in the local landscape to the north of the Minster Converter Station and Minster Substation and also the HVAC OHL works. At Year 15 of operation and maintenance, four out of the 14 representative viewpoints within the landscape and visual study area would still experience significant adverse effects arising from the Kent Onshore Scheme. These comprises receptors from representative viewpoints 4, 5, 6 and 11 which are located in close proximity to the north and north west of Minster Converter Station and Minster Substation. The proposed mitigation in relation to the potential impacts is contained in this chapter. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders (**Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent**).
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I have no preference either way. **Further comment:** There are already pylons - a few more is irrelevant. If you have to bridge the river, make sure it is secure. Last time we were invaded on the south side with undesirables riding motorcycles through the marshes and on two occasions people hare coursing. My company owns land in front of minster sewerage works on the south side of the river.	N	National Grid seeks to conduct its business without putting members of the public at risk. Any installations or bridges will be designed safely for both intended authorised use and for protecting the public. It will manage access across its boundaries and take steps to exclude unauthorised persons. In addition, National Grid will ensure that its contractors provide the appropriate levels of security and where gates are installed these will be locked out of hours and mobile and static security patrols or CCTV will be installed where it is deemed to be required.
		Design	**Feedback form question 17:** Anything else, comments?	N	National Grid acknowledges this feedback and proposed a series feasible, deliverable options, set out in the Statutory consultation document 'Converter station design – background to potential architectural approaches' which can

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: be imaginative in designing the buildings. Pylons are pylons, but buildings can be made to blend in with their surroundings.		be found in the document library of the Proposed Project website, under archived statutory consultation documents (October 2023).
		Construction – general, Landscape and visual	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Landscape and visual impact, Other. **Further comment:** it will have impact on people but that will die away with time. Equally ecology will recover once work has finished. Air quality is unaffected except maybe for dust during construction, noise and traffic more or less eases once the work is done. Don't know about archeology, st Augustine might a comment! The biggest thing is its impact on the landscape visually if construction in the proposed site.	N	National Grid acknowledges this feedback and refers you to the comments on its landscape strategy above. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk;** • **7.5.7.2 Outline Landscape and Ecological Management Plan – Kent; and** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? Response: Good.	N	National Grid acknowledges this feedback.

Table 1.9 SL-PIL-0103, SL-PIL-0109

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Community benefits / enhancements	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Unsure. **Further comment:** The purpose of Sealink is to enable surplus power to be exported from Suffolk to Kent. It is not clear how this benefits Suffolk residents. Their environment is being destroyed to benefit power supply in Kent. Where is the mutuality in this?	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Land rights and CPO	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** You have firmed up in proposals: To put cables through my fields. To use my fields for a construction compound and access roads. To leave Joint Boxes in my fields.	N	National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding privately owned assets where interfaces are identified. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Your Consultation Paper rightly sets out the detrimental impact on Gorse Hill and its surroundings.		
		Onshore route location, Alternative solutions	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** I favour the offshore routes suggested by Suffolk Energy Action Solutions (SEAS).	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas.
		Onshore route location, Alternative solutions	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** I prefer the offshore solutions suggested by SEAS.	N	
		Converter station location, Alternative solutions	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** I prefer the offshore solutions suggested by SEAS.	N	

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Details of the appraisal process are set out in **Application Document 8.2 Option Selection and Design Evolution Report (October 2023).**
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None **Further comment:** I have no preference.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location, Alternative solutions	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** This should all be offshore.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project (affecting the proposed HVDC cable route), the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landfall location, Onshore environmental impact, Cultural heritage	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** This is a nationally important bird sanctuary and a rare haven for wildlife. There are also possibly important Roman remains etc. Trashing nature in order to save it is not the right thing to do.	N	The potential impacts of the Proposed Project on terrestrial ecology and ornithology are acknowledged. The assessment of effects on wildlife is within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report** and the impacts on heritage assets is considered in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. The mitigation hierarchy has been applied to lessen effects where possible. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham. **I support co-location** **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness. **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Coordination with other Projects, Timescales / Programme	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:**	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			If you are going to do this, then co-location is the most sensible strategy. It is vital that projects are coordinated and are executed in a timely manner. Disturb the landscape not more than once (and preferably not at all).		This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Onshore mitigation, Land rights and CPO	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? Response: You need to compensate property owners and residents: For the permanent loss of value to property (including loss of development potential). For the massive disruption during the planning and building phase. For planning blight incurred whilst all the projects are being considered.	N	All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Design	**Feedback form question 15:**	N	The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** I have no preference.		A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Archaeology, Impact on recreational activities.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**)..
		Timescales / programme	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** I am concerned about how long all these projects will take. I reckon it will take at least 10 years from now, which is just too long.	N	An indicative construction programme is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The cumulative impact assessment for the Proposed Project was based on the most up-to-date information for other projects in the area. Information can be found in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Very good. **Further comment:** Pretty easy to understand the proposals.	N	National Grid acknowledges this feedback.

Table 1.10 SL-PIL-0002, SL-PIL-0003

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Inter-Project cumulative effects, Alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** This area of fragile and important coast is the wrong place especially with other HVDC cables proposing the same Heritage Coast area and Sizewell C being constructed during the same period. The effect on wildlife, tourism and residents will be cumulative and unsustainable. There are alternative options of offshore solutions and brownfield sites nearer to where the energy is needed.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**
		Design, Onshore environmental impact, Alternative solutions	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** Offshore and brownfield options have not been included and the Aldeburgh/Thorpeness landfall site is the worst possible considering the effect on the wildlife and natural environment.	N	
		Onshore route location, Needs case, Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** Wrong place. The energy is needed in other parts of the country so why bring it onshore where it isn't needed? Friston is a small village in an AONB and SSSI. It's the wrong place and is driving the location of the HVAC cables causing more disruption of this fragile and important area.	N	

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The potential impacts of the Proposed Project on terrestrial ecology and the landscape are acknowledged. The assessment of effects on wildlife is within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and the assessment on landscape receptors is considered in **Application document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Onshore Route location, Needs case	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** This route would not be needed if the transmission was offshore or to a site nearer to where the energy is needed.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at
		Converter station location, Needs case	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** This converter station would not be needed if the transmission was offshore or to a site nearer to where the energy is needed. It's further industrialisation of an important natural area.	N	

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** None of the designs is acceptable. No converter station should be built.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. Please see the response above with regard to the need for the Proposed Project.
		Onshore route location, Inter-Project cumulative effects and onshore route Location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** Wrong place for all of this. The cumulative effect of the proposed projects for many years on the environment, travel, residents and tourists is totally unacceptable.	N	The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Landfall location, Onshore environmental impact	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** This is a fragile and important area for wildlife and tourism. Heritage Coast, SSSI, RSPB, AONB! You are deranged choosing this site. Other HVACs have discounted it, but Sealink forges ahead on the basis that co-location with other HVACs can happen. However, there is no guarantee they will want to co-locate and worse that if they do, they may have to do the same	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken, informed by consultation with key stakeholders, and a rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Details of the appraisal process are set out in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the route of the HVDC cable and the location

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			boring and tunnelling again in the future. Absolute madness. You need to try harder and work out a better way so that Net Zero doesn't ruin the environment for our children and grandchildren.		of the joint bays and the high importance of the RSPB reserve and the AONB is noted. This is a major reason why the reserve will be traversed through trenchless methods. The other projects that may collocate in this area are being delivered at different timescales to the Proposed Project. As such, National Grid is maintaining ongoing dialogue with other developers to ensure coordination of project development, consenting and delivery - including shared use of accesses, compounds. Nonetheless, individual project must ensure that they are deliverable as standalone projects. The level of detail around these elements of the Proposed Project will develop as these discussion progress and as the design develops further.
		Coordination with other Projects, Alternative Solutions	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** Wrong place. How often do I have to repeat this? Offshore best. If it has to happen onshore Sizewell would be the best worst option even though no co-location would be possible.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. The Sizewell site is not big enough to accommodate the infrastructure needed for the Proposed Project.
		Coordination with other Projects	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** There is no overall co-ordination of the HVAC projects and Sizewell C. Everyone we have spoken to keeps repeating that "they are a different company so we have no sway on their decisions". As nationally important projects the overall impact should be.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					these coordination benefits and to also explore further opportunities for coordination where they arise.
		Offshore route location, Geology and hydrogeology	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** The Coraline Crag has meant this areas has been discounted by others. Another reason that Sealink is sited in the wrong place.	N	The Coralline Crag formation is considered within **Application Document 6.2.4.1 Part 4 Chapter 1 Physical Environment**. The cable corridor route passes over a small section of the Crag, therefore, the potential impacts associated with suspended sediment deposition onto the Crag, cable installation burial and rock armouring are assessed in this Chapter. Furthermore, the potential for permanent damage to the Crag occurring and having a knock-on impact on sediment transport in the region and potentially altering coastal geomorphology is also assessed.
		Construction – general, Inter-Project cumulative effects	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Other. **Further comment:** Concerns in all of the above. Plus the cumulative effect over many years of all the proposed projects.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects; and** • **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of schedule 3 of the draft DCO (**Application Document 3.1**).
		Alternative solutions	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** The best mitigation would be an offshore solution.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.
		Inter-Project cumulative effects, Consultation	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** There have been no assessments of the total impact of all the proposed projects. There may be even more projects in the future. The Government needs to take control of these projects of national importance as National Grid seems unable to do so. Each time a new project is proposed there are consultations, meetings, exhibitions and feedback is required. This piecemeal strategy of unco-ordinated projects is inefficient. It's exhausting	N	National Grid is not an electricity generator in its own right – its role is to ensure that power can be transported from where it is generated to where it is needed. Whilst National Grid Ventures, a legally-separate part of the National Grid Group, is responsible for two energy projects planned in East Anglia (the LionLink and Nautilus interconnectors), the range of other energy projects being planned in East Anglia are being developed by different private developers. National Grid considered the cumulative effect of these other projects when developing its plans for the Proposed Project, with more information available in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			for residents and I suspect it is deliberate to wear us all down and give up objecting. However, the natural environment needs protecting for future generations and we will continue to fight to protect it. You need to do better as what is proposed is needlessly destructive when there other better options are available.		**Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. They have additionally considered the potential for coordination of their proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham converter station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures projects. That said, it is not possible to bring all these different projects forward at the same time as they are at varying different stages of development. For example, projects such as Sizewell C, East Anglia ONE North and East Anglia TWO have all had their applications for development consent approved. The Proposed Project has now submitted its DCO application, whilst National Grid Ventures' LionLink and Nautilus interconnectors are at a much earlier stage of development. Delaying the more advanced projects in this area to allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets.
		Consultation, Land rights and CPO	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Very poor. **Further comment:** Building a house in Aldeburgh but as we are currently in Hertfordshire, we didn't receive anything until a letter from Terraquest recently so didn't know about the non statutory consultation last year. I would have thought you would have ensured all local residents were mailed. No information about offshore options. No information about why Friston ie the driver for the cable locations. We were promised at our online meeting that we would be emailed further information, but nothing has arrived.	N	National Grid's approach to Non-statutory consultation is set out in Section 5 of **Application Document 5.1 Consultation Report**. Prior to the Non-statutory consultation, National Grid developed a Primary Consultation Zone (PCZ) and a Secondary Consultation Zone (SCZ). These zones were geographical areas that sat within a certain distance from the Proposed Project footprint. The PCZ included properties that lay within a 1 km radius of the proposed underground cables and overhead line and 2 km around the proposed converter station sites. Where appropriate, the PCZ was extended to whole streets rather than dissecting hamlets or neighbourhoods. The SCZ included properties that lay within a 4 km radius of the swathes that were proposed to be constructed on and, as with the PCZ, where appropriate, the SCZ was extended to whole streets rather than dissecting hamlets or neighbourhoods. At Non-statutory consultation stage, a desktop referencing exercise was undertaken for all route options; however, contact referencing to confirm the records was not undertaken at this stage. Once the options were refined, contact referencing commenced. During Non-statutory consultation, in addition to the main stakeholder engagement events described above, there were two landowner-focused events. For these events, written invitations were sent to all contacts identified via the desktop referencing exercise. National Grid is engaging with affected landowners on an ongoing basis in order to understand the potential impacts of the Proposed Project and seeking to identify the most appropriate means of addressing these where necessary.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Consultation	**Feedback form question 26:** Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation?	N	National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: Ensure all landowners are kept informed at all stages. No information about offshore options. No information about why Friston ie the driver for the cable locations. We were promised that we would be emailed further information, but nothing has arrived.		It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Table 1.11 SL-PIL-0219, SL-PIL-0229

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** This is the wrong solution in that an offshore hub would make much more sense. It is also the wrong place as it will impact on an environmentally sensitive area and lead to further impact on the area as future projects come along. Why not use brownfield sites closer to where the energy is required? If it has to come ashore in this part of the Suffolk Coast why not at Sizewell?	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Sizewell. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The potential impacts of the Proposed Project have been assessed in the ES which is Volume 6 of the DCO application.
		Design, Onshore environmental impact, Alternative solutions	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** The feedback to consider the sue of an offshore solution and brownfield sites appear too have been totally ignored. The options proposed do not fully address the seriousness of the potential impact on an internationally important natural environment, local tourism and resident's quality of life.	N	Please see the response to question 1 above.
		Onshore route location, Coordination with other Projects, Alternative solutions	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** It is a small rural village that will be decimated. The associated infrastructure will abuse Greenfield areas, AONB and SSSI. If it has to be in the area why not Sizewell which has already been decimated and is likely to be more so with Sizewell C. Why not co-ordinate things? It would make more economic sense, cause less local disruption and make use of local transport routes.	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a project that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases.
		Onshore route location, Alternative solutions	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I agree with some elements of the proposed cable route but disagree with others. **Further comment:**	N	Please see the response on offshore solutions in question 1 above.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			An offshore hub would make so much more sense. Is it really impossible to do? is it financial or technical? Or is it lazy thinking? Come on, you must be able to come up with an offshore solution. If not, be clear, you will have failed local residents, the environment and future generations. Its on you!		
		Converter Station location, Alternative solutions	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** This would not be needed if you could come up with an offshore solution. Must try harder!	N	Please see the response on offshore solutions in question 1 above. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas.
		Design, Alternative solutions	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** The energy needs to come ashore closer to a brownfield site where it is required (London). The look and feel is irrelevant. How about pink in the shape of an elephant?	N	Please see the response on offshore solutions and the use of a brownfield site in question 1 above.
		Onshore route location, Combined effect of the proposed Project	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** The route will detrimentally impact on local residents, local tourism and internationally important wildlife habitats. How can you even think of using routes through RSPB reserves, AONB, SSSIs? Do you really care so little about the environment and its importance to our (and future generations) physical and mental health, that you won't try harder to make other options happen?	N	The potential impacts of the Proposed Project on the AONB, North Warren Nature Reserve and the SSSI are acknowledged. The assessment of effects on the AONB is set out within **Application Document Part 2 Suffolk Chapter 1 Landscape and Visual**, and the effects on the North Warren site and SSSI in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The mitigation hierarchy has been applied to lessen effects where possible. In Suffolk, National Grid will use trenchless construction methods for cabling under the Aldeburgh – Leiston SSSI and part of the Suffolk Coast and Heaths AONB. For the section of the AONB that will be crossed with open trenching, National Grid will reinstate the disturbed areas. The challenges relating to reinstatement following construction are set out within the assessment of effects on the AONB, landscape character and visual amenity within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes consideration that heathland and acid grassland will take longer to be reinstated than other habitat types and this has been acknowledged within the assessment. Details around reinstatement are set out within **Application Document 7.5.7.1 Outline Landscape and**
		Landfall location, Onshore	**Feedback form question 8:**	N	

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		environmental impact, Health and wellbeing	What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** I repeat: Do you really care so little about the environment and its importance to our (and future generations) physical and mental health, that you won't try harder to make other options happen?		**Ecological Management Plan - Suffolk**. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**. The commitment to their use is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects, Alternative solutions	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** Co-location offshore would be best but if it has to happen on the Suffolk Heritage Coast then co-location at Sizewell would seem the least undesirable solution.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Sizewell. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**.
		Coordination with other projects, Inter-Project cumulative effects	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Please try as hard as you can to come up with a workable offshore solution. If it has to happen on the Suffolk Heritage coast you need to: Co-ordinate with the other cables so the onshore work is not repeated multiple times. Give us an impact assessment based on all the local energy projects including Sizewell C.	N	Please see the response above with regard to an offshore solution. National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. National Grid considered the cumulative effect of these other projects when developing its plans for the Proposed Project, with more information available in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Geology and hydrogeology, Offshore physical environment	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** I understand that the Coraline Crag protects against coastal erosion. Please investigate this thoroughly so that you don't cause an Aldeburgh flood disaster in future years. If it does happen it is not an 'oversight' I would want to have to live with in my old age.	N	The Coralline Crag formation is considered within **Application Document 6.2.4.1 Part 4 Chapter 1 Physical Environment**. The cable corridor route passes over a small section of the Crag, therefore, the potential impacts associated with suspended sediment deposition onto the Crag, cable installation burial and rock armouring are assessed in this Chapter. Furthermore, the potential for permanent damage to the Crag occurring and having a knock-on impact on sediment transport in the region and potentially altering coastal geomorphology, with associated flooding, is also assessed.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Impact on recreational activities, Other.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Alternative solutions, Onshore mitigation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? Response: I am sure that you will consult experts on this and so you should. Such 'mitigation' would not be needed if you tried harder to make other options happen. National Grid (you) needs to step up and provide an acceptable offshore grid coupled to brownfield on-shoring closer to where the energy is required.	N	National Grid acknowledges this feedback. Please refer to its regard on alternative solutions above.
		Inter-Project cumulative effects, Consultation	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** There have been no assessments of the total impact of all the proposed projects and these projects are likely to lead to further energy infrastructure development in the area (think Sizewell A, then B, now C). The Government needs to take control of these projects of national importance as National Grid seems unable to do so. What is proposed is needlessly destructive when better options are available. The natural environment needs protecting. Please take personal responsibility to do all you can to influence decisions so that future generations are able to still enjoy what is left of this sensitive, uniquely beautiful, part of the country.	N	National Grid is not an electricity generator in its own right – its role is to ensure that power can be transported from where it is generated to where it is needed. Whilst National Grid Ventures, a legally-separate part of the National Grid Group, is responsible for two energy projects planned in East Anglia (the LionLink and Nautilus interconnectors), the range of other energy projects being planned in East Anglia are being developed by different private developers. National Grid considered the cumulative effect of these other projects when developing its plans for the Proposed Project, with more information available in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. National Grid has additionally considered the potential for coordination of their proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham Converter Station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures projects. That said, it is not possible to bring all these different projects forward at the same time as they are at varying different stages of development. For example, projects such as Sizewell C, East Anglia ONE North and East Anglia TWO have all had their applications for development consent approved. The Proposed Project has now submitted its DCO application, whilst National Grid Ventures' LionLink and Nautilus interconnectors are at a

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					much earlier stage of development. Delaying the more advanced projects in this area to allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets.
		Consultation, Alternative solutions	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Poor. **Further comment:** I don't think that there is sufficient information on why an offshore hub(s) and brownfield on-shoring sites have been discounted when they are the obvious, least impactful, solutions.	N	National Grid acknowledges this feedback. Please refer to its regard on alternative solutions above.
		Consultation, Land rights and CPO	**Feedback form question 26:** Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation? **Response:** Please ensure that the local landowners are kept informed. We are building close to Aldeburgh but don't yet live there. We only found out about the project when the TerraQuest letter arrived a few months ago. This is poor.	N	National Grid acknowledges this feedback. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding privately owned assets where interfaces are identified.

Table 1.12 SL-PIL-0298, SL-PIL-0307

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** I accept the need for re-inforcing the National Grid network for re-routing power generate by off-shore windfarms. However I object strongly to the Suffolk onshore scheme - it is not necessary and should be replaced by an off-shore grid approach and support for the offshore coordination support scheme. The Onshore scheme is environmentally destructive, will damage the local economy and is unnecessary as well as blighting the lives of residents. This should explain my responses to Q.3-1. In addition, I consider there is potential to create space at Sizewell for all National Grid + other wind farm activity. Government should cancel Sizewell C and replace with small modular reactors. The space then created outside the existing nuclear boundary but within the new permitted area could be used for those additional projects.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Sizewell. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The potential impacts of the Proposed Project have been assessed in the ES which is Volume 6 of the DCO application. National Grid cannot comment on matters relating to Government Policy.
		Onshore route location, Alternative solutions	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** See Q1.	N	National Grid acknowledges this feedback. Information on the connection points for the Proposed Project and its need is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. Please see the answer to question 1.
		Onshore route location, Alternative solutions	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** See Q1.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. Please refer to the answer to question 1.
		Converter station location, Alternative solutions	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** See Q1.	N	National Grid acknowledges this feedback. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)** Please refer to the answer to question 1. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas.
		Onshore route location, Alternative solutions	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk?	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I disagree with the proposed cable route. **Further comment:** See Q1.		**Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. Please refer to the answer to question 1.
		Landfall location, Onshore route location, Alternative solutions	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** See Q1.	N	National Grid acknowledges this feedback. Information on the selection of the site for the landfall and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. Please refer to the answer to question 1.
		Coordination with other Projects, Alternative solutions	**Feedback form question 8:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** See Q1. Offshore via offshore co-ordination support scheme.	N	National Grid acknowledges this feedback and refers the respondent to the answer to question 1.
		Alternative solutions	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** See Q1.	N	National Grid acknowledges this feedback and refers the respondent to the answer to question 1.
		Offshore Route Location, Alternative Solutions	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** I fully support the use of offshore grid approach and so believe this cable should be routed only from an off-shore station.	N	National Grid acknowledges this feedback and refers the respondent to the answer to question 1.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:**	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Impact on tourism, Impact on recreational activities.		• **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore mitigation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** Given the damage that would be caused to nationally-recognised conservation areas in Suffolk, it would not be possible to develop other areas to mitigate this damage.	N	The sensitivity of the nature conservation areas inn Suffolk is acknowledged. Potential impacts on terrestrial ecology can be found within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Mitigation measures have been outlined within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Table 1.13 SL-PIL-0005, SL-PIL-0006

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Landscape and visual, Construction - general	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Unsure. **Further comment:** The principle seems superficially plausible but we do not have enough information to know whether the case is fully justified. Aside from the significant disruption to our peaceful enjoyment of our home during the construction phase there will be a considerable amount of long term infrastructure damaging the East Suffolk landscape.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid has an established and effective code of construction practice which has been used on many projects, refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**.
		Design, Construction – compound areas, Converter station location	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** The impact on us personally has been greatly increased by the need for boring the conduits for the marine cable and the proposal to site the construction compound on our boundary.	N	NGV and NGET have agreed to collocate converter stations and associated infrastructure in order to minimise the risk of more widespread visual impacts within this area. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken, informed by consultation with key stakeholders, and a rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The impact on the area as a whole has been greatly increased by the siting of the converter stations on farmland on the edge of Saxmundham.		
		Onshore route location, Alternative solutions, Design	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way. **Further comment:** On the one hand, the site is in open countryside. On the other hand, the site is juxtaposed to the existing overhead cable route. If the infrastructure cannot be located next to the Sizewell power stations, the optimal location for all the infrastructure would appear to be X as marked on the map on page 11. [Transcription note - X on page 11 is on map to the north west of Stone House near Aldringham]	Y	The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. With regard to the converter stations at Saxmundham, the process of site identification is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints. The proposed approach for co-locating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area.
		Onshore route location, Converter station location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** Given that we disagree with the location of the converter station, the route from it should also change.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter station location, Landscape and visual	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** There is at least one and potentially three very large permanent structures in the middle of a field without any screening on the edge of a town and some distance beyond the overhead cable line to which it would ultimately connect. Would it not make more sense to co-locate the converter station(s) with the substation as is proposed in Kent?	N	With regard to the converter stations at Saxmundham, the process of site identification is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints. The proposed approach for co-locating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area. The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design, Landscape and visual	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof. **Further comment:** These are massive structures and anything which would make them less obviously visible wherever they are to be located should be strongly advocated.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location, Converter station location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I agree with some elements of the proposed cable route but disagree with others. **Further comment:** Given that I don't think the converter stations should be where they are proposed, it is impossible to agree with the proposed cable route. All I would say is the route in many places looks relatively sensible insofar as it avoids as many houses as possible (sadly ours is not one of those it avoids).	N	National Grid acknowledges this feedback.
		Landfall location, Alternative solutions	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** Surely, the best location for the landfall would be at Sizewell where there is already substantial infrastructure and there is bound to be a great deal more. This would also avoid landfall in an SSSI and nature reserve.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects **Response:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			I support co-location.		
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Converter	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:**	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		station location	In principle, co-location seems a good idea to lessen the amount of disruption causes across the AONB. However, the choice of location then becomes even more critical. Per Q5, the proposed location is not ideal for 1 converter station, 3 would aggravate the long-term effect/damage considerably. Per Q8, the proposed location is not ideal for 1 landfall, as above 3 would be worse.		As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. Please see above for responses to questions 5 and 8.
		Timescales / programme	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Whatever happens to this project there is already a considerable amount of blight and distress for those who lives are potentially affected. Whatever the outcome the sooner the matter is resolved and the project completed the better.	N	National Grid acknowledges this feedback. The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts.
		Construction – general, Combined effect of the proposed Project, Inter-Project cumulative effects	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Archaeology, Public access to rights of way (such as bridleways), Impact on tourism, Impact on recreational activities, Other. **Further comment:** The construction stage of such a large project is bound to have a wide-range of negative externalities. The particular features of the location chosen entail that these effects will be more significant and cover a wide range of factors than many other locations and this is compounded by the significant energy infrastructure projects proposed for the area.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects; and** • **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Furthermore, National Grid has an established and effective code of construction practice which has been used on many projects. Further details are contained in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**.
		Consultation, Combined effect of the proposed Project	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average. **Further comment:** The information published does not begin to explain the likely level of disruption. Even after meeting the project Chief Engineer (with all the extra information they provided) we can still only imagine the effect on our lives.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application.

Table 1.14 SL-PIL-0686, SL-PIL-0384

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions, Coordination with other Projects	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** It is my strong view that onshore connections should be placed on brownfield land much further down the coast, especially as East Suffolk will already be hosting the new Sizewell C nuclear power station. Therefore, I oppose the principle of reinforcing the network in this location.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The potential impacts of the Proposed Project have been assessed in the ES which is Volume 6 of the DCO application.
		Design, Onshore mitigation	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** I think there should be an upfront payment to all houses in manor gardens of circa 20% of their respective property	N	National Grid will continue to liaise with affected landowners on an ongoing basis. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			values for any potential loss in value as a result of their proposals.		
		Onshore route location, Alternative solutions, coordination with other projects	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** The onshore connections for offshore wind should be placed on brownfield land! It is now likely that the Nautilus, North Falls and Five Estuaries will have a combined connection via the Isle of Grain. This is good and the same should be done for LionLink and Sea Link and EA1N and EA2. I beseech National Grid ventures to better explore the other options available.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid as part of their submission has produced a report on coordination which covers how they approached coordination with other projects with the aim to reducing the impact on the environment and local communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. National Grid is committed to developing a project that takes account of the feedback received during the course of consultation to avoid or

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter station location, Landscape and visual, Health and wellbeing	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** it will have a devastating impact on our previous local landscape and a profound impact on the quality of locals lives.	N	The potential effects of the Proposed Project on landscape and visual receptors is included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. The proposed mitigation in relation to the potential impacts is contained in these chapters. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The impact of the Proposed Project on the quality of life for local residents is assessed in the following relevant ES chapters: • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**; • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and wellbeing.** Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof, Agricultural barns. **Further comment:** At very least the building should be so beautiful that people are drawn to it as an area of outstanding beauty.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location, Inter-Project cumulative effects, Alternative solutions	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** I believe more can be done to find a solution outside of ruining the lives of people in East Suffolk! We already host Sizewell A, B and the new C and that is enough.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landfall location, Onshore environmental impact, Socio-economic. recreation and tourism	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall.	N	The special nature of the landscape is acknowledged by National Grid. The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. This Chapter includes proposed mitigation measures that have been embedded in the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Further comment: This is very inconsiderate of the beautiful local nature reserves, areas of outstanding beauty and conservation areas. The disruption will damage the coastline in such a way that will also destroy the essential tourist trade in the area.		design to minimise the effects. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. Furthermore, the potential impacts on terrestrial ecology are considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. The mitigation hierarchy has been applied to lessen effects where possible.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Alternative solutions	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** I don't oppose co-locating but just not in East Suffolk. This must not be here. It's my strong view this should happen on brownfield sites or somewhere where it won't disrupt East Suffolk**.**	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Construction - general	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Traffic and transportation, Disruption to land use.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further details are contained in: • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport; and** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Good.	N	National Grid acknowledges this feedback.

Table 1.16 SL-PIL-0058, SL-PIL-0066

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are neither positive or negative.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network.	N	National Grid acknowledges this feedback. Information on the connection points for the Proposed Project and its need is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter Station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location.	N	National Grid acknowledges this feedback. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects, the selection of the converter station and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas.
		Design, Converter station location	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** NONE OF THE ABOVE. WHATEVER IS DONE ALL DEVELOPMENT MUST BE GROUNDED IN THE REALITY OF SUSTAINABILITY SO THAT THE BUILDING HAS MINIMAL ECOLOGICAL AND ENVIRONMENTAL IMPACT.	N	National Grid is committed to developing a project that takes account of the sensitivities of the local people and the environment to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. Potential impacts are detailed in the ES in Volume 6 of the DCO application. Where land perceived to be of value is lost as a result of new permanent infrastructure this needs to be balanced with the Proposed Project needs case, which will help the UK with British Energy Security Strategy 'Security of Supply' and with helping the UK to meet its Net Zero target to reduce carbon emissions. National Grid has a duty to balance the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. As such, National Grid is rigorously assessing the Proposed Project's impact on

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring and offsetting impacts.
		Onshore route location, Traffic and transport	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** NO INFORMATION IS SUPPLIED ABOUT HOW THE ROUTE BE SERVICED. ROADS FOR SERVICE VEHICLES ETC.	N	The information presented in consultation materials provides as much detail as is available at the time of writing. More detailed information is available with the DCO application. Traffic and transport details are included in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**, which outlines mitigation measures. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Additional details on permanent access routes have been publicised in documentation associated with further consultation on the Proposed Project and shown in **Application Document 2.14.1 General Arrangements Plans - Suffolk**.
		Landfall location, Terrestrial Ecology	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. Further comment: THE MAP ABOVE CLEARLY DEMONSTRATES WHY THE LOCATION IS WRONG. STRAIGHT THROUGH SSSI!	N	National Grid recognises the statutory designation mentioned in the feedback. A detailed impact assessment is provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. While this chapter addresses impacts on terrestrial birds, further information is provided in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. The map referred to is shown on page 12 of the Proposed Project Feedback Form. It shows the draft Order Limits and the HVDC cable route superimposed on the footprints of the North Warren Nature Reserve, the Sandlings and Thames Estuary SPA and the Leiston-Aldeburgh SSSI. National Grid is committed to a trenchless solution beneath these designated sites and they have not included the option of a trenched installation. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects **Response:** I support co-location.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Design	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** CO LOCATION AS A PRINCIPAL IS OF COURSE SENSIBLE THE PLAN PRESENTED IS NOT.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Consultation, Design, traffic and transport, landscape and visual	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** YOU HAVE PROVIDED NO DETAIL ON THE FOLLOWING: 1. SERVICE ROADS ETC (FUTURE NEEDS OF SITES) 2. HEIGHTS AND SCALES OF BUILDINGS (THESE STRUCTURES COVER AREAS AND WILL BE SEEN FROM SPACE). 3. WHAT THE WORKS WILL LOOK LIKE ENTAIL, SPOIL HEADS, JUNCTION STRUCTURES ETC. THE LEVEL OF DETAIL IS VERY POOR AND NOT SATISFACTORY WHEN ASSEMBLING A DEVELOPMENT PROPOSAL OF SUCH SCALE.	N	A complete project description is contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. As part of the DCO submission, National Grid has included a complete set of drawings which provide detail of the Proposed Project. A guide to the drawings is provided in **Application Document 2.1 Guide to the Plans**. Design drawings are from **Application Document 2.13.1 to 2.13.4** and general arrangement plans are from **Application Document 2.14.1 to 2.14.3**. Further information on the detailed design will be forthcoming as the Proposed Project progresses into the more detailed design stage. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process. The information presented in consultation materials provides as much detail as is available at the time of writing. More detailed information is available with the DCO application. Traffic and transport details are included in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**, which outlines mitigation measures. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Additional details on permanent access routes have been publicised in documentation associated with further consultation on the Proposed Project and shown in **Application Document 2.14.1 General Arrangements Plans - Suffolk**.
		Consultation	**Feedback form question 22:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average. Further comment: POOR LEVEL OF DETAIL.		

Table 1.17 SL-PIL-0147, SL-PIL-0150

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023		**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** There may be a need to reinforce the network but the chosen location and in particular the location in Suffolk I do not support.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
	Design		**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are neither positive or negative. **Further comment:** I think the changes are negligible.	N	National Grid acknowledges this feedback. Please see the response above on the need for the Proposed Project.
	Onshore route location, Socio-economic. recreation and tourism,		**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:**	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Alternative solutions	I do not think this is the best location for connecting into the existing network. **Further comment:** The impact to this rural area will be huge, this is a thriving tourist area and an environmentally important area. I feel there are other options which should be explored.		coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location, Alternative solutions	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** I think offshore options would be a better solution.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Converter station location, Landscape and visual	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** The size of the converter station in Suffolk will make a huge detrimental impact in this rural area - However, you try to disguise it or reduce its impact it is an industrial scale building in a rural area.	N	The sensitivity of the area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Furthermore, the ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. National Grid has developed design principles for the building in **Application Document 7.11.1 Design Approach Document – Suffolk and Application Document 7.12.1 Design Principles - Suffolk**. These Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.
		Design, Alternative solutions	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** The design approaches for the converter station are all ways to disguise an eyesore in a rural area - if it were placed either offshore or in a more industrial or brownfield site there would be no need to disguise it.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location, socio-economics, recreation and tourism,	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:**	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. There are no significant impacts predicted. Both **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan and Application Document 7.5.3.1**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		terrestrial ecology, noise	I disagree with the proposed cable route. **Further comment:** The impact of this rural area cannot be underestimated, it is a thriving tourist area and ecologically important area. There would be noise pollution and general disruption over many years with no long term gain to the area.		**CEMP Appendix A Outline Code of Construction Practice** set out the good practice measures to reduce effects on people and local communities during construction and also include a commitment to communicate information about the Proposed Project to local communities. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
		Landfall location, Onshore environmental impact	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** The map says it all - landfall is through a SSSI.	N	National Grid recognises the statutory designation mentioned in the feedback. A detailed impact assessment is provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. While this chapter addresses impacts on terrestrial birds, further information is provided in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. The map referred to is shown on page 12 of the Proposed Project Feedback Form. It shows the draft Order Limits and the HVDC cable route superimposed on the footprints of the North Warren Nature Reserve, the Sandlings and Thames Estuary SPA and the Leiston-Aldeburgh SSSI. National Grid is committed to a trenchless solution beneath the SSSI and it has not included the option of a trenched installation. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.
		Landfall location	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Further investigation into offshore options should be considered. Most continental countries have found offshore solutions. The area chosen in Suffolk is not the right place it will be totally changed if these proposal go ahead.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2GW are not available yet. As such, in Belgium, the 3.5GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					least 13 individual 2GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.
		Onshore route location, Design	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I disagree with the plans to use an overhead line connection.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Archaeology, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Impact on recreational activities.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;**

		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average.	N	National Grid acknowledges this feedback.

Table 1.18 SL-PIL-0938

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No **Further comment:** I am totally against it. It has nothing to do with Suffolk, take the energy from it's source direct to where it is needed. Please consider off shore alternative.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Combined effect of the proposed Project, Intra-project	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:**	N	National Grid is committed to developing a project that takes account of the sensitivities of the local people and the environment to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. Potential impacts are detailed in the ES in Volume 6 of the DCO application.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		cumulative effects	I think the changes are negative. **Further comment:** The changes you have made do not change my mind. Destroying more land, disrupting wildlife, reducing property value, constriction lasting for longer are all TERRIBLE IDEAS.		
		Onshore Route Location, Design	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** Why do you need to bring the cable so far in land? What a waste of time, money and wildlife. Go direct!	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location, Walking, cycling and horse riding	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** They will destroy land that I walk on every day. Why come even further inland away from where the power is needed?!	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The potential impacts of the Proposed Project on PRoW are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.
		Converter station location, Combined effect of the proposed Project	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** Too close to resident's houses, Light, sound and environmental pollution. Our children are DEVASTATED at the proposals - it's showing next generation wildlife etc doesn't matter. Devaluing of property prices. Construction traffic on Church Hill - pedestrian crossing near Manor Gardens needed. LOTS of wildlife inc deer, pheasants, birds of prey will be displaced. How would be compensated for noise/light pollution, reduction in our quality (important as I have asthma triggered by dust and house value dropping?	N	National Grid is committed to developing a project that takes account of the sensitivities of the local people and the environment to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. Potential impacts are detailed in the ES in Volume 6 of the DCO application and mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas. Details of the appraisal process are set out in **Application Document 8.2 Option Selection and Design Evolution Report (October 2023)** Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration; and** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
		Design, Landscape and visual	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof. **Further comment:** [Interested party has draw an arrow from the 'Colour' box stating "In addition to sinking/building and trees”]. This is the least worse option. Would prefer building sunk in ground if it is built. Trees in pictures nowhere near their actual height - they'd be much shorter in comparison. [Interested party had drawn arrows from 'Green roof' and Colour and curve' to here stating “if bunking came higher up sides from all sides, so buildings less visible”].	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. Due to the ground conditions, it is not possible for the Converter Station to be sunk into the ground.
		Onshore route location,	**Feedback form question 7:**	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid’s publicly documented needs case explains the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Alternative solutions	What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** Or you could go from source of power DIRECT to where it is needed in Kent. Underground cables = destroyed wildlife. Overground = destroyed sight lines.		requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landfall Location, Combined effect of the proposed Project	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** None. **Further comment:** You'll destroy a nature reserve, actually more than one! Sizewell C already ruining just down the coast. It's also far too close to properties, disrupting residents and devaluing property. It's also right across Suffolk Coastal Path [Transcription note Q8: interested party circled the nature reserves on map provided].	N	National Grid recognises the statutory designation mentioned in the feedback. A detailed impact assessment is provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. While this chapter considers impacts on terrestrial birds, further information can be found in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. National Grid is committed to a trenchless solution beneath the SSSI and it has not included the option of a trenched installation. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Combined effect of the proposed Project	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** Co-locating means even larger areas of land are destroyed. THREE converter stations net to residential properties is a TERRIBLE idea. Why on earth come so far in land to just take power back out to sea and to Kent?! The rest of Europe go direct - learn from them, don't be ridiculous come in land destroying so much unnecessarily!	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore environmental impact, Walking, cycling and horse riding	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Why are you considering building so close to residential property? Our children are devastated at the proposals. They love the countryside and want to protect it, they enjoy walking where you're proposing the converter stations will be built. What are you teaching the next generation about environmental concern? Why are you even considering Suffolk in the first place? Take the power direct to where it is needed.	N	Please see the answer to question 9 on the need for the Proposed Project.
		Offshore route location, Alternative Solutions	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** Why bring it to Suffolk first? Direct is best.	N	Please see the answer to question 9 on the need for the Proposed Project.
		Landfall location, Terrestrial ecology, Cultural heritage	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I do not think this is the best location for the landfall. **Further comment:** It's an SSS1 and a major historical site	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. While this Chapter provides some information on terrestrial birds, further assessment can be found in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. In Kent, National Grid will use trenchless construction methods for cabling under the sensitive saltmarsh habitat from the transitional joint bay eastwards. The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. It is of note that Minster Marshes is not designated as a SSSI and is not a protected site. Further information on the reasoning behind the landfall location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Onshore Route location, Cultural heritage	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I disagree with the proposed cable route. **Further comment:** [Transcription note: respondent circled Ebbsfleet Traditional site of the Landings of the Saxons and of St Augustine on the map and stated too close to here".]	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. The proposed mitigation in relation to the potential impacts is contained in this chapter. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Design, Landscape and visual	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Colour, Green roof. **Further comment:** Trees would not be that tall don't lie. Bury the building as much as possible and colour fades and trees.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. Due to the ground conditions, it is not possible to bury the Kent Converter Station.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I disagree with the plans to use an overhead line connection.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause issues for the railway line. National Grid looked further up towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions. Once under the river, it would then need to build further electrical infrastructure (a smaller substation) in the flood plain. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Alternative solutions	**Feedback form question 17:**	N	National Grid acknowledges this feedback and directs you to its response to question 9 relating to the need for the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Anything else comments? **Response:** Go direct to Kent!		
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Impact on recreational activities, Other.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore mitigation, Project finance / cost of scheme	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** Financial compensation to those who own property near construction area. Properties will decrease in value. Sink/bury proposed substations as much as possible to alleviate noise and visual pollution. Rewild area. Plant more woodland. Create a better public footpath to replace the one destroyed by converter stations near Saxmundham (which stations can't be seen from). Give funding to local schools for Forest school and outdoor learning activities. e.g. Sax primary schools. Put in reservoirs. Fund outdoor, community gym in Fromus Park (providing alternative outdoor recreation). Swift boxes. Bat boxes. Introduce deer colony.	N	National Grid greatly appreciate the insights of the local communities in how it can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual; Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity; Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration; and Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
		Consultation, Landscape and visual	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average. **Further comment:** You lie about height of trees. Transcription note interested party drew an arrow to the 'Ask the Experts' options and wrote 'but they had no answers to any of my questions. My daughters cried when they saw models of converter station buildings next to our house'.	N	The 3D model available at the public information exhibitions was one of several tools utilised by National Grid to help explain its proposals. Information about the proposed planting around the converter station can be found in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk and Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent**. A range of technical disciplines were represented at each public information exhibition. All members of the team were able to talk about the broad plans for the Proposed Project, whilst representatives from each discipline were able to talk about their specialism in further detail. Where a person attending the public information exhibitions expressed a desire to talk about a specific subject, the Proposed Project team tried to ensure that they were able to talk to the relevant discipline wherever possible, but this may have not always been possible. In the event that a member of the team was unable to answer a question posed by an attendee, they first tried to find the relevant discipline

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					representative to provide an answer during the event. In any rare instances that this was not possible, Proposed Project team representatives will have offered to follow-up by phone/email with a response.
		Consultation	**Feedback form question 26:** Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation? **Response:** Draw to scale. Have people there that can actually answer questions, not just dodge them!! It was so unhelpful/ sad to see models providing how disruptive proposed plans will be.	N	Please see the response above.

Table 1.19 SL-PIL-0234, SL-PIL-0243

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative Solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** I do not agree with the principle of destroying the countryside when other options are available, and I do not understand why you have not considered the option of a offshore grid linking into existing brownfield sites that have already destroyed the countryside. This option has been adopted by the Dutch and Belgians and I cannot see why we cannot do this on this side of the North Sea.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Sizewell. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2GW are not available yet. As such, in Belgium, the 3.5GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Needs case, Alternative solutions	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** Your latest proposals do not address the principle issue outlined in by response to item 1.	N	Please see the response to question 1 above.
		Onshore route location, Agriculture and soils, Onshore environmental impact	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** This is a very large development on productive agricultural land and out of keeping with that environment.	N	National Grid acknowledges this feedback. Information on the connection points for the Proposed Project and its need is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. The proposed mitigation in relation to the potential impacts is contained in this chapter. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore route location, Needs case	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** As we do not agree with your proposal I cannot agree with this route.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter station location, Needs case	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:**	N	National Grid acknowledges this feedback. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			I do not think the converter station is in the right location. **Further comment:** See previous comments.		
		Landfall location, Onshore environmental impact	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** This is destroying an area that has been designated as an area of Outstanding Natural Beauty and is on an eroding coastline. THINK AGAIN.	N	The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. A detailed assessment of the impact on the coastline and beaches (Including coastal erosion) is provided in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The sensitivity of landfall sites to erosion has been fully assessed taking into consideration that erosion and beach lowering is already taking place in some areas. The assessment concludes at both landfalls that the magnitude of the impact is likely to be small. This will result in a minor effect that is not significant. In addition, Mitigation measure MPE06 states that over the operational lifetime of the Proposed Project, monitoring of the beach profile and erosion rates is carried out at the Suffolk landfall site where protection are planned to be placed at the HDD exit pits. This assessment concludes no significant effects associated with the Proposed Project.
		Coordination with other Projects, Inter-Project cumulative effects	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** If Sizewell C is given the go ahead then this will have a massive impact on this area, and any of your proposals must take this into account with regard to co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document.** This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Offshore route location,	**Feedback form question 11:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Alternative solutions	Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** Offshore marine cables are acceptable when they have landfall to existing coastal broad field sites not when they are destroying protected environments and productive agricultural land.		
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Archaeology, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Impact on recreational activities.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.3.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore mitigation, alternative solutions	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** Do not destroy it in the first place, THINK AGAIN and reuse the land you have already destroyed in the first place.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Sizewell. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average.	N	National Grid acknowledges this feedback.
		Consultation	**Feedback form question 26:**	N	National Grid hosted nine public information exhibitions across Suffolk and Kent both at the weekend and in the week. It is acknowledged that not

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation? **Response:** Would attend public information exhibitions if timing were more convenient.		everybody would be able to attend an exhibition and to counter this, National Grid published a range of materials on the Proposed Project Website, sent newsletters to the PCZ and SCZ and placed all project information at information points throughout both counties.

Table 1.20 SL-PIL-0042, SL-PIL-0050

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No **Further comment:** This location option tears up the countryside over a period of years and will be very intrusive. Other options would be much less intrusive e.g. an offshore option or alternative brownfield sites.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Sizewell. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative.	N	National Grid acknowledges this feedback. Please see the response above on the need for the Proposed Project.
		Onshore route location, Agriculture and soils, Onshore environmental impact	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** This proposed development (very large) is on agricultural land and is totally out of keeping with the local environment.	N	National Grid acknowledges this feedback. Information on the connection points for the Proposed Project and its need is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. The proposed mitigation in relation to the potential impacts is contained in this chapter. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore route location, Needs case	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** Totally unsuitable - as I do not agree with the whole proposal - obviously it should not be necessary to tear up this area.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** Totally unsuitable development in a rural area.	N	National Grid acknowledges this feedback. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design, Landscape and visual	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** None of the above- this proposal is much too big and intrusive and dominant in a rural area.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. National Grid is taking a comprehensive masterplanning approach towards the development of the converter station site, seeking to utilise the site's topography and natural features within the design as much as possible, to lessen the visual impact. Landscape planting required for screening will be undertaken in advance of construction wherever possible. However, it should be acknowledged that such measures take time to establish, meaning that there will be some residual effects will remain.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** Previous comments as regards a rural area apply to this proposal also.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Landfall location, Onshore environmental impact	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall. **Further comment:** Definitely not the best location. Destroying an area that has been designated an Area of Outstanding Natural beauty. Also this is an eroding coastline.	N	The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. A detailed assessment of the impact on the coastline and beaches (Including coastal erosion) is provided in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The sensitivity of landfall sites to erosion has been fully assessed taking into consideration that erosion and beach lowering is already taking place in some areas. The assessment concludes at both landfalls that the magnitude of the impact is likely to be small. This will result in a minor effect that is not significant. In addition Mitigation measure MPE06 states that over the operational lifetime of the Proposed Project, monitoring of the beach profile and erosion rates is carried out at the Suffolk landfall site where protection are planned to be placed at the HDD exit pits.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					This assessment concludes no significant effects associated with the Proposed Project.
		Coordination with other projects, Needs case	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** As I do not agree with the whole proposal in this particular area this question does not apply.	N	National Grid acknowledges this feedback. Please see the response to question 1 regarding the need for the Proposed Project.
		Alternative solutions	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Again I would ask you to consider alternative options.	N	Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Offshore route location, Landfall location	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** Offshore proposals seem acceptable but not to proposed landfall sites on the map.	N	National Grid acknowledges this feedback. Information on the selection of the landfall site and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation,	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Archaeology, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Impact on recreational activities.		• **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.3.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
	Onshore mitigation, Alternative solutions	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals?	N	Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in:

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: It would be better not to tear up the landscape in the first place when alternative options are available.		• **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average.	N	National Grid acknowledges this feedback.
		Consultation	**Feedback form question 26:** Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation? **Response:** Timings of public information exhibitions - often difficult to get to.	N	National Grid hosted four public information exhibitions across Suffolk both at the weekend and in the week. It is acknowledged that not everybody would be able to attend an exhibition and to counter this, National Grid published a range of materials on the Proposed Project Website, sent newsletters to the PCZ and SCZ and placed all Project information at information points throughout the county.

Table 1.21 SL-PIL-0608, SL-PIL-0903, SL-PIL-0354, SL-PIL-0365

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. Further comment: Not in this area but in an area where the infrastructure is already present e.g. Kingsnorth.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Kingsnorth. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, alternative solutions	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are neither positive nor negative. **Further comment:** It is good that the cables are going underground but it is still in the wrong location.	N	Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Onshore route location, Onshore environmental impact	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** You are ruining a really important natural environment site.	N	National Grid acknowledges this feedback. Information on the connection points for the Proposed Project and its need is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. The respondent's concerns are noted. National Grid is committed to developing a project that takes account of the sensitivities of the local people and the environment to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. Potential impacts are detailed in the ES in Volume 6 of the DCO application.
		Onshore route location, Onshore environmental impact	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** The environmental impact will be v negative.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**. Potential impacts are detailed in the ES in Volume 6 of the DCO application.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location.	N	National Grid acknowledges this feedback. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Enhanced elevations, Colour, Green roof, Colour and curve.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk?	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I disagree with the proposed cable route.		**Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall.	N	National Grid acknowledges this feedback. Information on the selection of the landfall site route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Coordination with other projects, Alternative solutions	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** Electricity needs to be brought in through brown field sites where colocation could be used.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim to reducing the impact on the environment and local communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Alternative solutions, Design	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Is there anywhere else this can be located not near an RSSP reserve?	N	National Grid undertook an extensive search of available sites. This is detailed in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

					• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Landfall location, Alternative solutions	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I do not think this is the best location for the landfall. **Further comment:** It should come into an industrialised area not over fields and onto a green field site.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Kingsnorth. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. In Kent, National Grid will use trenchless construction methods for cabling under the sensitive saltmarsh habitat from the transitional joint bay eastwards. The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Onshore route location, Alternative solutions	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I disagree with the proposed cable route. **Further comment:** It should come into an industrialised area not over fields and onto a green field site.	N	Please see response above.
		Converter station location, Alternative solutions	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location. **Further comment:** It should be sited at Kingsnorth on the old power station site. Or sited behind the old power station in the cross hatched section - this would reduce the overhead line connection considerably as the cable is already there.	N	Please see response above.
		Design	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Enhanced elevations, Colour, Green roof, Colour and curve.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location, Ornithology	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line?	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I disagree with the plans to use an overhead line connection. **Further comment:** You will be putting in 10 new pylons whilst removing two this will adversely affect migratory and local birds.		The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause issues for the railway line. National Grid looked further up towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions. Once under the river, it would then need to build further electrical infrastructure (a smaller substation) in the flood plain. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway. Although the assessment concludes no significant impact even in the absence of mitigation, mitigation has been included in the form of bird diverters on the new section of overhead line. Further details can be found in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**.
		Construction – general, Combined effect of the proposed project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Archaeology, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Impact on recreational activities, Other.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.3.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Poor. **Further comment:**	N	In accordance with the requirements of the Planning Act 2008, National Grid has made diligent inquiries to identify Persons with an Interest in Land, in order to notify them of consultation on the Proposed Project. This comprised initial desktop referencing using information obtained from the Land Registry and other online resources (such as Experian, Royal Mail address verification and Companies House checks). The land referencing methodology is provided in **Application Document 5.1.8 Appendix G Land Referencing Methodology** and **Application Document 8.3 Strategic Options Report (October 2023)**. Following this initial desktop exercise, National Grid issued letters and forms by post (First Class) requesting further information (see section 5 of **Application Document 5.1.6 Appendix E Statutory**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Businesses have not been informed.		**Consultation)** from the parties identified to confirm the interests in the land held by those parties and requesting information on any other persons with interests in the land. Further inquiries were made by way of further written correspondence, site visits, telephone calls, emails and landowner engagement meetings. Furthermore, National Grid undertook consultation with the local community and key stakeholders in accordance with the published **Statement of Community Consultation Application Document 5.1.5**.

Table 1.22 SL-PIL-0331

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions, ecology and biodiversity, socio-economic, traffic and transport	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Unsure. **Further comment:** We are unsure as we don't know what the alternative sites may have been. This site will surely have an impact on the marshland ecosystem currently home to many different animal species and construction and access for the site may directly affect our business.	N	National Grid undertook an extensive search of available sites. This is detailed in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project. The respondent's concerns are noted. National Grid is committed to developing a project that takes account of the sensitivities of the local people and the environment to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. Potential impacts are detailed in the ES in Volume 6 of the DCO application. Impacts on the marshland are considered in **Application Document 6.2.2.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and Traffic and transport details are included in **Application Documents 7.5.1.2 Outline Construction Traffic Management and Travel Plan and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, which will outline mitigation measures. These are controlled through **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Commitments (REAC) which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are neither positive or negative.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Design	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness. **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Landfall location, Terrestrial ecology	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I do not think this is the best location for the landfall. **Further comment:** It will undoubtedly cause disturbance to the wildlife and ecosystem of the SSSI and nature reserve, as evidenced by the nemo cable installed a few years ago.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. The Nemo Link interconnector is a joint venture between National Grid Interconnector Holdings Limited, a subsidiary company of the UK's National Grid Plc, and the Belgian Elia group which is a separate entity to National Grid Electricity Transmission. While the Proposed Project does make landfall

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					in Pegwell Bay, National Grid has committed to a trenchless technique to go beneath the sensitive saltmarsh habitat.
		Onshore route location, Terrestrial ecology	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I disagree with the proposed cable route. **Further comment:** Again the digging etc required will disrupt wildlife habitat and I worry that habitat will not be properly reinstated after the works as seen at Pegwell with a huge long chalk mound left bare.	N	The effects arising from the cable routes will be temporary. Reinstatement of the cable corridors will occur following the construction period as far as practically possible. Details regarding the reinstatement of the cable corridors including monitoring and management measures are contained in **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent**. National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.** Please refer to the above response regarding the Nemo Link.
		Converter station location, Agriculture and soils, Terrestrial ecology	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location. **Further comment:** It will cover agricultural land adding to the reduction of national and local food sustainability and security: Greatly affect the local ecosystem and reduce biodiversity. It leaves no room for the sewage works to expand to deal with the extra flow created by many new housing developments in Minster.	N	A complete assessment of the impacts on agriculture in Kent has been undertaken. This is set out in **Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils**. Please see comments above relating to ecology and biodiversity in National Grid's answer to question 12. National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the wastewater treatment works. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Design, Terrestrial ecology	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof. **Further comment:** This may at least replace some of lost wildlife habitat.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I disagree with the plans to use an overhead line connection.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause issues for the railway line. National Grid looked further up towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions. Once under the river, it would then need to build further electrical infrastructure (a smaller substation) in the flood plain. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Document 8.2 Options Selection and Design Evolution Report (October 2023). The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Alternative solutions	**Feedback form question 17:** Anything else, comments? **Response:** I would like to see possible alternative options for siting the station and cabling.	N	National Grid undertook an extensive search of available sites and routes. This is detailed in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Construction – general, Traffic and transport, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Other. **Further comment:** Our business is sited directly next to the converter station and the roads which will be used for access during construction. In January surveyors and their equipment often blocked access to our business on the one track road to our workshop. After talking to your engineering and lands representatives it is clear that traffic on jutes lane will be disrupted and access made difficult/impossible at times. There is already a problem with traffic queueing for the school morning and afternoon reducing access to one lane. There are also often queues of sewages lorries waiting for access to the sewage works which reduces flow to one lane. We require access for large lorries during working hours.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** More detailed information is submitted with the DCO application. Traffic and transport details will be included in **Application Documents 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent and Application Document 7.5.3.1 CEMP Appendix A Outline**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Code of Construction Practice, which will outline mitigation measures. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore mitigation, Consultation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** As we are not experts in this field I would advise you consult a number of independent bodies including the RSPB and Kent Wildlife Trust along with local custodians of the land and those who use the area recreationally and have observed the local environment and wildlife. I would hope many surveys of the ecosystem are made before construction goes ahead as mitigation and compensation often cannot repair irrepairably affected or destroyed habitats.	N	An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.
		Socio-economic. recreation and tourism, Traffic and transport	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** If construction goes ahead we would expect a potentially affected business to be taken into account within the plans for access to the site. We are one of many small businesses on Jutes Lane and access can already be challenging at times as I have mentioned in Part 18. We would expect that any blocking of access be done outside of our business hours of 8-6 Mon-Sat. We often need to come and go during these houses to and from sites in and around Thanet as part of our work. We also need to receive deliveries of materials during these times often on large trucks/lorries.	N	More detailed information is submitted with the DCO application. Traffic and transport details will be included in **Application Documents 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, which will outline mitigation measures. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:**	N	National Grid acknowledges this feedback.

			Average.		

Table 1.23 SL-PIL-0144, SL-PIL-0148

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** Principle of development. We object in principle to the proposals, under section 42 and 49 Planning Act (2008), Regulation 3 of the Infrastructure Planning Regulations 2009, and Regulation 11 of the Infrastructure Planning Regulations 20217. The detrimental environmental impact of the proposals on the Suffolk Coast and Heath area of outstanding beauty (AONB) and affected site of special scientific interest (SSSI) will be profound and permanent. The proposals should be fundamentally reconsidered to minimise these impacts, potentially by considering a fully offshore route.	N	A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council, Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The potential impacts of the Proposed Project on the AONB and SSSI are acknowledged. The assessment of effects on the AONB is set out within **Application Document Part 2 Suffolk Chapter 1 Landscape and Visual,** and the effects on the SSSI in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. The mitigation hierarchy has been applied to lessen effects where possible. National Grid undertook an extensive search of available sites and routes. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.
		Design, Onshore route location	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** Changes since earlier consultation. As an affected landowner (Sea Link_ s.44_0144), the latest proposals have fundamentally worsened the impact the proposals will have on our property. The route of the HVDC cable corridor has been altered in the latest proposals to include two right angle bends within the Aldeburgh Golf Club's northern field so that the original straight route across the field (adjoining our property), now diverts to a position directly adjacent to us. The proposed route is now less than 40m from High Warren, closer than any other dwelling along the entire Suffolk to Kent corridor. Apart from the worsened proximity to High Warren, (and similarly Tall Pines and Pinehurst) the new bends will lengthen the cable by approximately 50m, increasing costs and project duration.	Y	Having had regard to this feedback and through further discussions with relevant stakeholders, National Grid has realigned the cable route and haul road in this location to address these comments. (**Application Document 2.1.4.1 General Arrangement Plans**, drawing DCO/S/IGA/PS/1505).
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			I have no preference either way.		
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Design, Converter station location	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Kinetic.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore Route location, Combined effect of the proposed Project	**Feedback form question 7:** **What do you think about our proposed HVDC cable route in Suffolk?** **Response:** I disagree with the proposed cable route. **Further comment:** The route of the HVDC cable corridor has been altered in the latest proposals to include two right angle bends within the Aldeburgh Golf Club's northern field so that the original straight route across the field (adjoining our property), now diverts to a position directly adjacent to us. The proposed route is now less than 40m from High Warren, closer than any other dwelling along the entire Suffolk to Kent corridor. Apart from the worsened proximity to High Warren, (and similarly Tall Pines and Pinehurst) the new bends will lengthen the cable by approximately 50m, increasing costs and project duration.	N	Having had regard to this feedback and through further discussions with relevant stakeholders, National Grid has realigned the cable route and haul road in this location to address these comments. (**Application Document 2.1.4.1 General Arrangement Plans**, drawing DCO/S/IGA/PS/1505).
		Onshore Route location, Combined effect of the proposed Project	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I do not think this is the best location for the landfall.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Further comment: See earlier comments.		
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham. **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Combined effect of the proposed Project,	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** While co-location with other infrastructure projects may be positive in principle, we are concerned that co-location will	N	There are benefits to co-location with other projects because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Timescales / programme	increase both the scope and duration of the construction works and therefore worsen the impact on High Warren and other directly affected landowners. Furthermore, the lack of agreement in this regard risks missing the opportunity for simultaneous works in favour of a sequential strategy that would inevitably extend the period of disruption.		and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken, informed by consultation with key stakeholders, and a rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. However, these are separate projects being promoted by different developers and working to different timescales for delivery. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the co-location of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Construction – general, Alternative solutions, Combined effect of the proposed Project	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Construction There remains a high degree of uncertainty in relation to construction methodology, sequencing, access strategy, etc, and the stated intention that these will be decided by the appointed contractor is likely to result in a construction strategy that prioritises cost and convenience to the contractor rather than minimising construction duration and detrimental impacts on local residents. Suggestions If the HVDC cable corridor is to proceed, the current proposals should be revised at the Aldeburgh Golf Club's northern field to avoid unnecessary impact on High Warren, Tall Pines, and Pinehurst. The layout should revert to the original, diagonal route across the field, shortening the route by approx. 50m and	Y	Having had regard to this feedback and through further discussions with relevant stakeholders, National Grid has realigned the cable route and haul road in this location to address these comments. (**Application Document 2.1.4.1 General Arrangement Plans**, drawing DCO/S/IGA/PS/1505). The programme is designed to allow the cable to be installed in sections, therefore, the impact can be reduced in this area. The construction methodology for the Proposed Project is contained in **Application Document 6.2.1.4 Part 1 Introduction Description of the Proposed Project** and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. The detailed construction methodology is contained in the detailed Code of Construction Practice, submission of which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The construction working hours for the Proposed Project will be secured through Requirement 7 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			therefore reducing the programme and minimising the period of impact on adjoining properties. The implementation of the works should be carried sequentially (i.e., commencing and completing the works on a phased basis) This would allow works at the AGC field to be completed as quickly as possible and reinstated before the entirety of the works are completed, lessening the period of disruption to the adjoining owners. The access and construction strategy and methodology should avoid unnecessary detrimental impacts on adjoining properties including noise, dust, staging, lighting, hours of operation, etc.		
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I disagree with the plans to use an overhead line connection.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause issues for the railway line. National Grid looked further up towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions. Once under the river, it would then need to build further electrical infrastructure (a smaller substation) in the flood plain. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Application Document 8.2 Options Selection and Design Evolution Report (October 2023). The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Archaeology, Public access to rights of way (such as bridleways), Disruption to land use, Drainage.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.3.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Very good.	N	National Grid acknowledges this feedback.

Table 1.24 SL-PIL-0837, SL-PIL-0184

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Unsure.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
	Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are neither positive nor negative.	N	National Grid acknowledges this feedback.
	Landfall location, Onshore route location, Socio-economic. recreation and tourism	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I do not think this is the best location for the landfall. **Further comment:**	N	National Grid acknowledges this feedback. National Grid has been and will continue to work with this landowner to help mitigate any impact the cable would have on their land which would allow them to explore raising the land levels. This will be confirmed following the detailed design of the Proposed Project. National Grid is negotiating voluntary easements with landowners for the cable and that easement does include certain restrictions to protect the cable.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			This has a direct impact on my client. We are concerned about the route of the cable, subsidence and the potential hazard of Bentonite if it comes to the surface of the golf club. My client is concerned that this line could impact the future plans of the golf club, such as raising levels and if they can build on top of the cable.		Bentonite is chosen as a filling material as it is an inert substance, therefore poses no risk. After construction, all land will be reinstated to its previous use, with no change in land levels. Settlement is unlikely because the drilling infrastructure is in competent ground over its length. In the unlikely event that discernible settlement occurs, it would be near the entry or exit point. For guidance on settlement limits, major roads (motorways and A roads) typically require settlement to be less than 10 mm and based on National Grid's calculations, any settlement will be less than this.
		Construction – General, Socio-economic. recreation and tourism	**Feedback form question 17:** Anything else, comments? **Response:** My client is concerned about continued access from contractors for this project onto their land, it is a working business and therefore any interruption has a detrimental effect.	N	National Grid acknowledges this feedback. Land agents will work with landowners to mitigate disturbance where possible. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. These plans will help the control and management of potential impacts on landowners. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Construction – General, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Disruption to land use, Drainage, Impact on recreational activities.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average. Further comment:	N	National Grid has engaged with the respondent throughout the consultation periods held since 2022 and representatives from National Grid's land agents and its engineering team, have held meetings with the respondent and their agent. Details are contained in Appendix B of **Application Document 8.3 Strategic Options Report (October 2023)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			It has taken a while to receive any meaningful information regarding the scheme.		

Table 1.25 SL-PIL-0631, SL-PIL-0370

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** I do not support you reinforcing the network in this particular location, its impact will be greater myself and the local population than progressing this project in a different location.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Noise and vibration, Landscape and visual	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** Your proposal will impact on fields that are in close to my property, and therefore may cause noise and light pollution to myself.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The potential effects of lighting proposals on landscape and visual receptors is included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Onshore route location,	**Feedback form question 3:**	N	National Grid acknowledges this feedback. Information on the connection points for the Proposed Project and its need is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Alternative solutions	What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** I think you could connect in a more remote location.		**Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Onshore route location, Land rights and CPO	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** Your proposed cable route impacts on local properties.	N	National Grid acknowledges this feedback. It took a staged approach to identify corridors and potential preliminary routeing and siting options for the Proposed Project. This approach considered the potential effects on the environment, the local community, relevant spatial planning policy and planning applications, other existing and proposed developments as we ll as technical and engineering design considerations. Details are contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation siting Study (October 2022)**. The impact on properties is contained in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.
		Converter station location, Noise and vibration, Landscape and visual	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** Your proposal to build at this location places the converter station in a place where noise and light pollution may affect my property and impact on my enjoyment of spending time living here.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The potential effects of lighting proposals on landscape and visual receptors is included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Design, Landscape and visual	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** I do not support any of these disguises to you converter station, all will be a big change to the current views.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The special nature of the landscape is acknowledged by National Grid. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This Chapter includes proposed mitigation measures that have been embedded in the design to minimise the effects.
		Onshore route location, Alternative solutions	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** I do not agree with your proposed cable route and believe you should create an offshore structure to house the converter stations.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landfall location, Alternative solutions	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness?	N	Please see National Grid's response to question 7 above.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I do not think this is the best location for the landfall. **Further comment:** I do not agree with the landfall proposal and believe you should carry out the construction of offshore converter stations and substations.		
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham? **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness? **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Alternative solutions	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** I do not support your proposal to build 3 converter stations in the field close to my property. I think you should work with Lion Link and other projects and undertake to complete all of these projects offshore.	N	National Grid has engaged with other project developers, including LionLink, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Combined effect of the proposed Project, Landscape and visual, Traffic and transport	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Your proposals will impact on my property and the enjoyment I have living here. Your proposal will change the views on the local area and cause noise and light pollution. Your proposal will cause traffic and parking problems for myself and local residents.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. The special nature of the landscape is acknowledged by National Grid. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This Chapter includes proposed mitigation measures that have been embedded in the design to minimise the effects. The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Impacts associated with the operational and maintenance phase were scoped out of the assessment on the basis that the vehicle movements associated with this phase will be infrequent and low. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase.
		Offshore Route location, Alternative solutions	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** Your marine proposal would be better accomplished by offshore connections removing the need to do any construction on land.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landfall location,	**Feedback form question 12:**	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Alternative solutions	What do you think about our proposed landfall at Pegwell Bay? **Response:** I do not think this is the best location for the landfall. **Further comment:** Landfall at Bradwell in Essex would allow construction on buildings close to Bradwell power station and connection to the grid by building a new substation there and re-stringing or renewing the pylon line to Rayleigh.		brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Bradwell. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location, Alternative solutions	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I disagree with the proposed cable route. **Further comment:** A landfall at Bradwell would remove the need for this cable route.	N	Please see the response to question 12 above.
		Converter station location, Alternative solutions	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location. **Further comment:** A landfall at Bradwell would remove the need for this converter station.	N	Please see the response to question 12 above.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line?	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I have no preference either way.		
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Impact on recreational activities.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Good.	N	National Grid acknowledges this feedback.

Table 1.26 SL-PIL-0630, SL-PIL-0369

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No. **Further comment:** I do not support you reinforcing the network in this particular location, its impact will be greater myself and the local population than progressing this project in a different location.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Design, Noise and vibration, Landscape and visual, Construction - general	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. Further comment: Your proposal will impact on fields that are in close to my property During construction you will cause noise and light pollution to myself and affect the enjoyment I have living here.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The potential effects of lighting proposals on landscape and visual receptors is included within the Proposed Project ES in **Application Document 6.2.2.1**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual.
		Onshore route location, Alternative solutions	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I do not think this is the best location for connecting into the existing network. **Further comment:** I think you should build offshore structures for connection.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I disagree with the proposed cable route.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Further comment: Your proposed cable route impacts on local properties.		Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Compensation offered for voluntary land rights is benchmarked against other similar utility providers. If a voluntary agreement cannot be reached, then the Compulsory Purchase Compensation Code allows for a claim of compensation for the loss that property owners may have suffered as a direct result of the retained part of their property ownership being worth less as a direct result of the works. Compensation for compulsory acquired rights is governed by statute.
		Converter station location, Landscape and visual, Noise and vibration	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I do not think the converter station is in the right location. **Further comment:** Your proposal to build at this location places the converter station in a place where noise and light pollution will affect my property and impact on my enjoyment of spending time living here. You also suggest you may build further converter stations which will cause even more disruption.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise**. National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The potential effects of lighting proposals on landscape and visual receptors is included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. Whilst National Grid is not considering a further converter station as part of the Proposed Project, other developers may construct one as part of a different project. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**.
		Design, Converter station	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** I do not support any of these buildings which is imply a way of you disguising your converter station.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. The special nature of the landscape is acknowledged by National Grid. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This Chapter includes proposed mitigation measures that have been embedded in the design to minimise the effects.
		Onshore route location, Alternative solutions	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I disagree with the proposed cable route. **Further comment:** I do not agree with your proposed cable route and believe you should create an offshore structure to house the converter stations which would better serve myself and the local community.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.

Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in:

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham? **Response:** I do not support co-location	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness? **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Alternative solutions	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** I do not support your proposal to build 3 converter stations in the field close to my property. I think you should work with Lion Link and other projects and undertake to complete all of these projects offshore where it will not cause light and noise pollution. Working with other projects would allow the sharing of costs.	N	National Grid has engaged with other project developers, including LionLink, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landscape and visual, Noise and vibration, Traffic and transport	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** Your proposals will impact on my property and the enjoyment I have living here. Your proposal will change the views on the local area and cause noise and light pollution. Your proposal will cause traffic and parking problems for myself and local residents.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. The special nature of the landscape is acknowledged by National Grid. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This Chapter includes proposed

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					mitigation measures that have been embedded in the design to minimise the effects. The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. Impacts associated with the operational and maintenance phase were scoped out of the assessment on the basis that the vehicle movements associated with this phase will be infrequent and low. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase.
		Alternative solutions, Coordination with other Projects	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** Your marine proposal would be better accomplished by offshore connections removing the need to do any construction on land. Working with other projects would allow the sharing of costs.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid is coordinating with other developers of large-scale infrastructure in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landfall location, Alternative solutions	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** None. **Further comment:** Landfall at Bradwell in Essex would allow construction on buildings close to Bradwell power station and connection to the grid by building a new substation there and re-stringing or renewing the pylon line to Rayleigh.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes land at Bradwell. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Onshore route location, Landfall location, Alternative solutions	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I disagree with the proposed cable route. **Further comment:** A landfall at Bradwell would remove the need for this cable route.	N	Please see the response to question 12 above.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Converter station location, Alternative solutions	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location. **Further comment:** A landfall at Bradwell would remove the need for this converter station.	N	Please see the response to question 12 above.
		Design, Alternative solutions	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** None. **Further comment:** A landfall at Bradwell would remove the need for this converter station.	N	Please see the response to question 12 above.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Impact on people, Landscape and visual impact, Noise, Traffic and transportation, Public access to rights of way (such as bridleways), Disruption to land use, Impact on recreational activities.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. With regard to the issues raised in the feedback, further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)

		Land rights and CPO, Intra-Project cumulative effects, noise, landscape and visual, traffic and transport	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** Your proposals will impact on my property and the enjoyment I have living here. Your proposal will change the views on the local area and cause noise and light pollution. Your proposal will cause traffic and parking problems for myself, while you were conducting investigations into the fields close to our property we had problems with vehicles and noise. The building of converter station will cause problems during construction and leave an ongoing intrusion into our enjoyment of living here.	N	National Grid acknowledges this feedback. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;**

					• **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appen x B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This will help to minimise any disruption caused.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Very good.	N	National Grid acknowledges this feedback.

Table 1.27 SL-PIL-0276, SL-PIL-0291

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** No.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
	Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are broadly positive but still need some refinement.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Landfall location, Terrestrial ecology	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I do not think this is the best location for the landfall. **Further comment:** The effect it will have on the wildlife.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. While this Chapter provides some information on terrestrial birds, further assessment can be found in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. In Kent, National Grid will use trenchless construction methods for cabling under the sensitive saltmarsh habitat from the transitional joint bay eastwards. The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The drawing showing the extent of use of a trenchless construction solution is within **Application Document 2.1 Guide to the Plans – Plan DCO/S/DE/SS/1211**. The commitment is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. It is of note that Minster Marshes is not designated as a SSSI and is not a protected site. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I disagree with the proposed cable route.	N	National Grid acknowledges this feedback. Information on the selection of the cable route and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter station location, Terrestrial ecology, Ornithology, landscape and visual	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location. **Further comment:** Loss of views, wildlife and their habitats. The proposed pylons and over head cables will pose an aerial threat to migratory birds.	N	National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Alternative options have been carefully considered. Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 ES Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 ES Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. An extensive programme of environmental surveys has been undertaken to help inform understanding of the sensitive receptors in this area, including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. During the design of the Proposed Project these surveys have fed into design amendments and extensive discussions with Natural England, the Environment Agency, Thanet Council, Dover Council, Kent Council, the RSPB and Kent Wildlife Trust among others. Detailed assessment and mitigation measures has been developed and is presented within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Ecology and Biodiversity.**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The key characteristics of this landscape have been taken into account through the design process. The permanent infrastructure has been sited near to the Richborough Energy Park and mature vegetation to minimise encroachment into the open marshland. The indicative landscape strategy for the Kent Onshore Scheme (**Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**) has been developed to provide belts of native woodland planting on the northern edge of the converter station and substation to provide landscape integration and partial screening. Opportunities to enhance the riparian vegetation along the River Stour and some of the drainage ditches is also incorporated into the design and will provide local landscape benefit. The ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. The design of this structure, in terms of the building form and the external materials, has been developed alongside consultation and stakeholder feedback. **Application Document 7.12.2 Design Principles – Kent** outlines the Design Principles – providing guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles. As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
	Design, Landscape and visual	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages?	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: None. **Further comment:** Any of these buildings will spoil the landscape and views of the area.		**Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. The assessment of landscape impacts is contained within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Landscape planting required for screening will be undertaken in advance of construction wherever possible. However, it should be acknowledged that such measures take time to establish, meaning that there will be some residual effects will remain.
		Onshore Route location, Alternative Solutions, Terrestrial ecology, Landscape and visual	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I disagree with the plans to use an overhead line connection. **Further comment:** Why cant the cables go underground to the existing pylons this will have less impact on the wild life, vistas, open skies and landscape.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause issues for the railway line. National Grid looked further up towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions. Once under the river, it would then need to build further electrical infrastructure (a smaller substation) in the flood plain. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Alternative solutions, Construction - general, traffic and transport	**Feedback form question 17:** **Anything else, comments:** **Response:** What consideration has been given to using alternative sites of existing N.G sites. I live at Marsh Farm Road, Minster, so I am in very close proximity of where the proposed work is to be carried out and I am the one who suffered the most when work was carried out by N.G putting up the new pylons. I had to endure the constant daily noise of machinery, reversing vehicle, concrete breakers, diggers. The construction and deconstruction	N	Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			of an iron bridge and laying of a temporary road. Unable to access certain footpaths when construction was being carried out Vehicles using Marsh Farm Road even though it was prohibited and on occasions blocking my access. On this proposed Sealink construction the plans show that there will be vehicle access from Marsh Farm Road and the track that runs along side by property. So once again the impact of this proposed construction will be detrimental to my quality of life.		• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** Several alternative options were considered when developing plans for the Proposed Project, with details of these alternatives shared as part of the pre-application public consultations. For example, as part of the Strategic Options Report, National Grid set out how it considered connections to the Sellindge, Richborough and Canterbury areas. These areas were considered because the existing electricity transmission network is between Kemsley and Lovedean, meaning that any reinforcement must connect between these two locations. A connection in the Isle of Grain or Kingsnorth, two of the alternative locations suggested by stakeholders, would therefore not reinforce the network in the right place. A connection close to Richborough was found to offer environmental and socio-economic benefits over connecting in the Canterbury area, whilst a northern Kent landfall was found to be significantly constrained. At Richborough, National Grid also found opportunities to locate the converter station and substation close to the existing network and similar infrastructure. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**. **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** demonstrate that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation measures identified. This indicates that a very low proportion of construction vehicles (circa 1% in total, and less than 1% HGVs) is expected across the access points at Jutes Lane, Marsh Farm Road and Whitehouse Drove. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Marsh Farm Road is to be managed as a shared access route with up to ten HGV movements per day for circa six months of the programme. Movements to be guided by banksman to prevent any interactions with PRoW users.
		Construction – general, Combined effect	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link?	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in:

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		of the proposed Project	**Response:** Impact on people, Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Traffic and transportation, Archaeology, Public access to rights of way (such as bridleways), Disruption to land use, Drainage, Impact on tourism, Impact on recreational activities.		• **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.3.3 Part 2 Suffolk Chapter 3 Cultural Heritage;** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Alternative solutions,	**Feedback form question 20:**	N	National Grid acknowledges this feedback. Please see the response to question 17.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Construction - general	Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** Please see question 17.		
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Poor. **Further comment:** Colour coding for routes and pylons very similar which makes it difficult to distinguish which route is which.	N	National Grid acknowledges this feedback and notes the confusion caused by the colour coding.

Table 1.28 SL-PIL-0642, SL-PIL-0376, SL-PIL-0459

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Yes. **Further comment:** Would prefer offshore as many countries have already proven to be safe and secure.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Design, Consultation	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?	N	A range of measures were employed to help promote the Statutory consultation. These promotional measures included sending a newsletter to every property in the Primary Consultation Zone that gave details of the consultation, including details of every public information exhibition. The Statutory consultation and public information exhibitions were also advertised

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: None. **Further comment:** I couldn't answer. I have not been made aware of this project but 2 days before the consultation in Saxmundham.		in local newspapers and on social media. The locations referenced by the respondent are all within the Primary Consultation Zone, and were therefore due to receive this newsletter, which was sent via Royal Mail. The approach to Statutory consultation is set out in Section 7 and Appendix D of this Report (**Application Document 5.1 Consultation Report**).
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location, Design	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I think this is the best cable route. **Further comment:** As long as it is underground and not pillons above ground.	N	The HVAC cable route in Suffolk will be underground.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Design, Landscape and Visual	**Feedback form question 6:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green Roof. **Further comment:** Blend into surrounding area more.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore route location, Design	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I agree with some elements of the proposed cable route, but disagree with others. **Further comment:** As long as it is underground.	N	The HVDC cable route in Suffolk will be underground.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I have no preference either way. **Further comment:** I haven't studied it enough to judge it.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I do not support co-location.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham? **Response:**	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			I do not support co-location.		As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness **Response:** I have no preference either way.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Coordination with other Projects, Noise and vibration	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** All three on one site is too much noise pollution.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other project with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. Inter-project cumulative effects are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					An indicative assessment of operational noise from the proposed Saxmundham Converter Station, based on current design information, is presented in **Application Document 6.3.2.9.D Part 2 Appendix 9.D Suffolk Preliminary Operational Noise Assessment**. With standard embedded mitigation measures, the impact of operational noise from the proposed Saxmundham Converter Station on all nearby Noise Sensitive Receptors, has been assessed as having a small magnitude impact, during both daytime and night-time periods, taking account of context. This would result in a minor adverse effect at all nearby Noise Sensitive Receptors, which is considered to be not significant. The assessment is indicative for the purpose of demonstrating that significant adverse effects can be avoided. The assessment is based on early design information and standard noise mitigation measures. Further detailed design would be undertaken by the developers, including consideration of specific noise mitigation measures.
		Traffic and transport, Noise and vibration	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** The access road to it runs next to my property. After consultation my developer he assured me that the road to it lays too close to my property and the noise of the road will have a bearing on future development of my land. I therefore strongly object to this. Unless you buy me out or make a huge sound barrier.	N	National Grid is endeavouring to engage with the respondent regarding the issues raised. Traffic and transport details are included in **Application Documents 7.5.1.2 Outline Construction Traffic Management** and **Travel Plan and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, which will outline mitigation measures. These are controlled through **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore route location, Landscape and visual	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I disagree with the plans to use an overhead line connection. **Further comment:** Never overhead in this day and age there is never a need for such thing. They are an eyesore no matter where you are in the country.	N	National Grid acknowledges this feedback and can confirm that it fully investigated alternatives to the provision of new pylons. Following the investigation, it was concluded that the potential for significant environmental impacts was greater with the option of going under the railway line and under the river than for the installation of overhead lines. For more information, please see the response to question 17 immediately below.
		Onshore route location, Design	**Feedback form question 17:** Anything else, comments? **Response:** Under cable NO overhead.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details are set out in **Application Document 8.2 Historical Report 2 (Option Selection and Design Evolution Report)**.
		Construction – General, Landscape and visual, Traffic and transport, noise	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Landscape and visual impact, Noise, Traffic and transportation, Other. **Further comment:** Overhead cabling a no-no Noise pollution of the site plus the noise relentless zooming of the access roads to the sites	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport; and** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Please see the above comment from National Grid in relation to overhead lines.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Good.	N	National Grid acknowledges this feedback.
		Consultation	**Feedback form question 26:** Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation? **Response:** Experts where vague when answering questions in particular about noise their answer was 'It should be'.	N	An indicative assessment of operational noise from the proposed Saxmundham Converter Station, based on current design information, is presented in **Application Document 6.3.2.9.D ES Appendix 9.D Suffolk Operational Noise Assessment**. With standard embedded mitigation measures, the impact of operational noise from the proposed Saxmundham Converter Station on all nearby Noise Sensitive Receptors, has been assessed as having a small magnitude impact, during both daytime and night-time periods, taking account of context. This would result in a minor adverse effect at all nearby Noise Sensitive Receptors, which is considered to be not significant. The assessment is indicative for the purpose of demonstrating that significant adverse effects can be avoided. The assessment is based on early design information and standard noise mitigation measures. Further detailed design would be undertaken by the developers, including consideration of specific noise mitigation measures.

Table 1.29 SL-PIL-0851, SL-PIL-0256

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Yes. **Further comment:** The importance of upgrading and reinforcing the electricity transmission network (Sea Link Project) as soon as practically possible cannot be overstated in our opinion. It is vital to the UK's need for energy independence, the green energy sectors, the environment and overall economic prosperity. As a major landowner and developer of Solar and BESS projects in Richborough we have seen how the existing capacity limitations to the grid have contributed to significant delays to connection dates. This has resulted in significant delays to numerous renewable energy projects totalling hundreds of MW's of green renewable energy.	N	National Grid acknowledges this feedback and welcomes your support for the Proposed Project.
		Design, Alternative solutions	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are negative. **Further comment:** It is essential from a delivery perspective as well as an environmental and sustainability perspective that the proposals requiring the erection of large numbers of new pylons and or new converter station(s) and or substation(s) are located on 'brownfield land' and as close as possible to National Grid's existing (high-voltage) assets and existing corridors. There are significant amounts of available brownfield land in the required scale that could be utilised throughout the area of interest. In some instances, similar utility infrastructure uses are already present. In our opinion sites/land with these characteristics and adjacencies should be utilised in the first instance. Brownfield land is available in sufficient scales to accommodate the required converter and substation land take plus the additional land inevitably required during the construction phase.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			This approach safeguards the areas invaluable agricultural land, the areas of Special Scientific Interest and is surely likely to safeguard the planning approval both in terms of outcome and timescales. At the same time, leaving such areas untouched greatly limits the potential for 'blight' given the volume of proposed pylons required plus the significant size and scale of the proposed converter and substation which we understand could be at least 26-meters high. We recognise the above may require more challenging technical or potentially expensive solutions due to the River (high-voltage) Richborough substation		
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way. **Further comment:** We have no direct or first hand knowledge of the area concerned therefore cannot make an informed decision either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I have no preference either way. **Further comment:** We have no direct or first hand knowledge of the area concerned therefore cannot make an informed decision either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I have no preference either way. **Further comment:** We have no direct or first hand knowledge of the area concerned therefore cannot make an informed decision either way.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design, Landscape and visual	**Feedback form question 6:** We have identified several design approaches for the proposed converter station. **Response:** Green roof, Colour and curve, Colour. **Further comment:** External design considerations, given the sheer scale of the converter stations, is essential to minimise the visual impact on the area. This is for the sake of local ecology, wildlife and any surrounding business such as golf courses and hospitality sectors relying on natural beauty.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. The special nature of the landscape is acknowledged by National Grid. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This Chapter includes proposed mitigation measures that have been embedded in the design to minimise the effects. Impacts on ecology are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I have no preference either way. **Further comment:** We have no direct or first hand knowledge of the area concerned therefore cannot make an informed decision either way.	N	National Grid acknowledges this feedback.
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I have no preference either way. **Further comment:** We have no direct or first hand knowledge of the area concerned therefore cannot make an informed decision either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I support co-location.		
		Coordination with other Projects	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham? **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness? **Response:** I support co-location.	N	National Grid acknowledges this feedback.
		Coordination with other Projects	**Feedback form question 9:** Are there any other ways that you would like us to explore coordination with other projects? **Response:** We imagine the Co-location of infrastructure is preferable for a wide range of reasons but in simple terms we support this approach on the basis that it will minimise the potential for future additional projects that would put further pressure on developing on or disrupting the countries precious greenfield and agricultural areas. Any route that protects our ecology, wildlife and agriculture areas is preferable. We are not aware of other ways you could explore coordination with other projects.	N	National Grid acknowledges this feedback and welcomes your support for co-location.
		Design	**Feedback form question 10:** Is there anything further you would like us to take into consideration when developing our proposals in Suffolk? **Response:** No.	N	National Grid acknowledges this feedback.
		Offshore route location	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** No.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landfall location, Alternative solutions	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I do not think this is the best location for the landfall. **Further comment:** We would like to see landfall to a point further towards Ebbsfleet House which will limit the disruption to St Augustine's and Stonelees Golf Club's and Hacklinge Marshes Site of Special Scientific Interest. Utilisation of running underground cables along existing highway routes (Sandwich Road & A256) is surely a 'win-win' from cost and planning perspectives.	N	National Grid has minimised the impact on the mentioned locations by using trenchless technology for construction of the landfall and cabling up to the transitional joint bay. The commitment to the use of this technology is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further details on the selection of the landfall location are contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Putting cables under existing highways is always considered; however, the Sandwich Road already contains the Thanet Windfarm cables. Therefore, there is no suitable route for the Proposed Project.
		Onshore route location, Design, Agriculture and soils	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I disagree with the proposed cable route. **Further comment:** We believe the route should follow the A256 wherever possible in order to limit the disruption to 'greenfield' and agricultural land which will inevitably be caused during the construction phase.	N	National Grid acknowledges this feedback. **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** provides information reasoning behind the selection of the cable route.
		Converter station location, Alternative solutions	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I do not think the substation and the converter station are in the right location. **Further comment:** The Converter Station and Substation should be located closer to National Grid's existing assets on Richborough Energy Park. Given their sheer scale they should be located on 'brownfield' land and adjacent to similar types of uses as opposed to being located on 'greenfield' land and or land currently being used for agricultural use. We believe from a planning approval process and a construction delivery phase perspective the above approach is far more sustainable in terms of planning approval and associated timescales.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. This includes an explanation as to why it was not possible to accommodate a site within Richborough Energy Park. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Statement of Reasons (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			UGE (Kent) Limited is in possession of an 88-acre brownfield site and immediately adjacent to National Grid's existing assets at Richborough Energy Park. Land of sufficient size to accommodate the Converter and substation is in single ownership which is also beneficial.		• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Alternative solutions, Combined effect of the proposed Project, landscape and visual, terrestrial ecology	**Feedback form question 15:** We have identified several design approaches for the proposed converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green Roof, Colour & Curve, Colour **Further comment:** Unless the location of the converter Station and Substation are located on 'brownfield' land and in close proximity to similar uses and building sizes then the above crossed options will greatly reduce their visual impact. Regardless of the above design approaches and or however expensive they maybe it does not address the significant negative impact the building will have (if delivered in the currently proposed agricultural / greenfield land) on the ecology and wildlife.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. The impact of the Kent Converter Station on the landscape is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding biodiversity net gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Onshore route location, Alternative solutions, Landscape and visual	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I disagree with the plans to use an overhead line connection. **Further comment:** The above approach of delivering the Converter and Substation closer to Richborough Energy Park will significantly reduce the number of new pylons required. In turn this will further remove the development on greenfield land and the inevitable disruption to the ecology and wildlife around the SSSI. We estimate this will remove the need to deliver up to eight new pylons which are a blight on the landscape.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause issues for the railway line. National Grid looked further up towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions. Once under the river, it would then need to build further electrical infrastructure (a smaller substation) in the flood plain. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Impacts on biodiversity are considered in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The Richborough site is not big enough for use by the Proposed Project. Acknowledging the concerns about the potential impacts upon the SSSI, the Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken, informed by consultation with key stakeholders, and a rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Details of the appraisal process are set out in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023), Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the route of the HVDC cable and the location of the joint bays and the high importance of the RSPB reserve and the AONB is noted. This is a major reason why the reserve will be traversed through trenchless methods. The other projects that may collocate in this area are being delivered at different timescales to the Proposed Project. As such, National Grid is maintaining ongoing dialogue with other developers to ensure coordination of project development, consenting and delivery - including shared use of accesses, compounds. Nonetheless, individual project must ensure that they are deliverable as standalone projects. The level of detail around these elements of the Proposed Project will develop as these discussion progress and as the design develops further.
		Land rights and CPO, Alternative solutions	**Feedback form question 17:** Is there anything further you would like us to take into consideration when developing our proposals in Kent? **Response:** More consideration and focus should have been given to existing landowners in the areas and priorities to those parties in the ownership Brownfield land of sufficient scale to accommodate the new buildings proposed. We believe this approach would greatly improve the projects deliverability in planning preparation, consultation and approval terms and as such reduce the planning approval difficulties the current proposals are likely to encounter.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Construction – general, Combined effect of the proposed Project	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Landscape and visual impact, Ecology and biodiversity, Air quality, Noise, Disruption to land use, Impact on tourism, Impact on recreational activities, Other. **Further comment:** The explanations provided in the above responses have already outlined the basis for the concerns we have from a environmental perspective of the proposed plans for the completed Sea Link project and these concerns are only magnified and increased further when considering the actual delivery and constructions phase. The fact that virtually all of the chosen routes and or locations for above ground development are on high-value green land (ecology, tourism, agriculture) then it also means that access roads and site compounds will also need to be formed. This could quite easily double if not triple the land that will be effected and we would like to understand the proposed access routes and location of the site construction compounds sufficient to receive, store and build building which will no doubt contain numerous items of plant weighing over 50-tones per item. Should Brownfield land have been chosen then in many cases existing access or indeed temporary access routes would be far easier to deliver and have a significantly reduced impact on the surrounding area.	N	National Grid acknowledges this feedback. Potential impacts of the Proposed Project are considered in the ES in Volume 6 of the DCO application. Further information is contained in: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Details of the proposed access routes are contained in **Application Document 6.2.1.4 Part 1 Introduction Description of the Proposed Project**. How National Grid will manage traffic during construction is set out in

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or collocated. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.
		Alternative solutions, Onshore mitigation, Consultation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** Meaningful engagement by the Sea Link project with local wildlife and ecological groups to understand their short, medium and long term funding requirements to enhance and protect the SSSI and other areas is one compensation type measure that should be introduced. This is in addition to the statutory consultation process that will be undertaken as part of the planning application process which as we have highlighted would be far more acceptable if delivery on Brownfield land had been made more of a priority.	N	Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Consultation, Land rights and CPO	**Feedback form question 20:** Do you have any other comments about Sea Link to give that you have not previously mentioned? **Response:** As a major landowner in the area we have established relationships with many of the adjoining land owners which can greatly assist with the delivery of the Sea Link project. Stakeholder engagement by the Sea Link team does not seem to have gone far enough in our opinion.	N	National Grid is engaging with affected landowners on an ongoing basis through meetings in order to understand the potential impacts of the Proposed Project and seeking to identify the most appropriate means of addressing these where necessary.
		Consultation, Alternative solutions	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Average. **Further comment:** It is unclear what other proposal have been considered before arriving at the current proposals and what were the technical reasons for choosing not to develop plans utilising Brownfield land or in closer proximity to existing Nation Grid assets such as NGET etc.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project.

Table 1.30 SL-PIL-0155, SL-PIL-0159

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, Combined effect of the proposed Project, Alternative solutions	I live at Friston House, which shares curtilage with the proposed site at Friston, in addition sections of our land are within the red line of your draft order limits. This is now the third time we have been exposed to the insensitivity of a consultation process whose application directly impacts our property. This is taking a heavy toll on our mental health, as well as the value of our home. Your consultation process is disingenuous and clearly your team has made no effort to reference the findings of the Scottish Power examination and subsequent DCO's before forging ahead with your own proposal. Had your team done so they would be acutely aware of the concerns voiced by the local community regarding: Construction impacts; Working hours; Cumulative construction impacts; Flood risk; Noise; Traffic; Impact on local economy and used this information as a template. This carelessness makes National Grid look unprofessional and incompetent which in turn does not instil any kind of confidence in your 'consultation' process truly taking any interest in the concerns and wellbeing of the local community. This is just another insincere box ticking exercise for the local community to endure. I will not be filling out your feedback form as I am of the belief that you have skewered the questions to best suite the answers you wish to achieve. It is hard to believe that there were no other connection sites available in Suffolk using brownfield sites or near to pylons, with direct access to/from an 'A' road and a decent distance from a village or town. The fact that National Grid ever suggested (and offered up) a grid connection point so close to a village with such restricted site access is beyond any logical comprehension. Alternately this could all be avoided by using an offshore solution.	N	National Grid acknowledges these concerns. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. The health and safety of the public, local communities and employees is National Grid's highest priority. National Grid has consulted on the Proposed Project, seeking feedback from local residents so it can identify means of mitigating impacts from construction and operational phases. The proposals will be scrutinised by the Planning Inspectorate's independent Examination Panel and determined by the Secretary of State. The consultation process is designed to gather a wide range of feedback and ensure that all voices are heard before any decisions are finalised. While initial assessments are necessary to identify feasible options, these are not definitive. National Grid is committed to engaging with the community at every stage, ensuring that feedback informs and shapes the project moving forward. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.

24 October 2023	18 December 2023	Needs case, Consultation	Thank you for your notification of 19 October 2023 seeking the views of the Coal Authority on the above. I have checked the site location plan against our coal mining information and can confirm that, whilst the proposed development site falls within the coalfield, it is located outside the Development High Risk Area as defined by the Coal Authority. On this basis, the Planning team at the Coal Authority have no comments to make. Please do not hesitate to contact us if you would like to discuss this matter further.	N	National Grid acknowledges this feedback.

Table 1.32 SL-PIL-0828, SL-PIL-0136, SL-PIL-0425

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	We act on behalf of Blackheath Farms Ltd, being the landowner of land and property known as the Blackheath Estate (the "Estate"). We are instructed to submit the following representation in response to the National Grid statutory consultation. The Estate is affected by the proposed National Grid Sea Link project (the "scheme"), which sees cables being brought onshore and laid underground up to the necessary substation. We have been instructed to submit the following concerns:	N	National Grid acknowledges this feedback and refers to the answers given below.
		Converter station location, Design	**Substation Location** On review of the statutory consultation documents, we note that the proposed location of the Converter Station is to be the site formally known as "Site 3". This is welcomed and supported by the Estate.	N	National Grid acknowledges your support for Site 3.
		Water environment, Consultation, Design	**Hazlewood Reservoir** The scheme's proposed red line boundary encompasses the Estate's main reservoir, known as Hazlewood reservoir. One of National Grids General Arrangement Plan's (plan ref: S42_S/IGA/PS/0005) identifies the reservoir for "Drainage Connection Works". Hazlewood reservoir is an integral part of the Estate, not least as it acts as the 'central hub' for the Estates irrigation, with the ability to store and move water from Hazlewood, across to the Estates other reservoir at Friston Hall. The capacity of Hazlewood reservoir is 250,000m³. To put this into perspective, this equates to 2,450 acre inches, providing enough water to irrigate approximately 400 acres of root crops. Our concerns are that should the reservoir continue to be incorporated into the red line boundary, and used for "drainage" purposes, we may, firstly, lose outright control of the reservoir and secondly, be at risk of the reservoir water becoming contaminated. Root crops are incredibly sensitive to water. Water must be applied regularly and at the right quantities to ensure the crop receives the water it requires in order to yield and survive to harvest. Should we not have outright control of the reservoir, the Estate is at risk of not being able to apply the water as and when required. The financial risk to the estate would be significant (see point 3 below).	Y	National Grid acknowledges the concerns raised regarding Hazlewood Reservoir and the sensitivity of the farming activity in this area and the perceived risk of contamination. Following review of feedback and recognition of the potential risks to the water supply on the estate, the reservoir has been removed from the Order Limits. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding privately owned assets where interfaces are identified.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			As to any potential contamination, we would lose the ability to irrigate a substantial area of cropping. Whilst the capacity of the reservoir is 250,000m³, any contamination would in fact affect a much larger volume of water, as the Estate benefits from a winter and summer abstraction licence, thus as soon as the Estate is able to do so, it starts to top-up the reservoir levels in the summer months. As a result, the reservoir is very rarely emptied, meaning any contamination would remain in the water and would contaminate at least 250,000m³ of water. It was most frustrating at a recent National Grid public event when it was made clear that the National Grid representatives were unaware that the Hazlewood Reservoir was predominately an above ground structure. Thus, there had clearly been no consideration or attention to detail in drafting the proposals, as all water runoff from the nearby compound would have to be bunded and pumped up and over the reservoir banks. In light of the clear lack of knowledge on what the reservoir comprises and the importance of the reservoir to the Estate, we request that the reservoir is excluded from the red line boundary immediately, thus limited the potential impact on the Estates growing crops during the period of construction. In order to demonstrate cooperation, the Estate would be happy for water to be drained into a nearby pond (which is at ground level) and which eventually drains into a nearby watercourse. This provides a much cheaper and less risky water drainage solution, and had there been engagement on this matter, this would no doubt have been the chosen option.		
		Geology and hydrogeology, Water environment	**Irrigation** As eluded to above, the Estate is reliant on irrigation, predominantly because of the light soil type which makes up most of the Estate soil. The irrigation system at Blackheath has seen significant investment since 2017, with a new reservoir, new pumps, control boards and underground mains installed. The extent of the irrigation infrastructure is identified on the enclosed plan, which shows all underground infrastructure and hydrant locations. As you will note, the there are two mains out of the Hazlewood reservoir, the “200mm Transfer Main” and the “Original Hazlewood Irrigation main”. Should at any point the Hazlewood Irrigation Main become severed, broken, or unusable as a result of the scheme, the whole of Halewood side of the Estate will be without water. The same applies to the 200mm Transfer Main – should this become unusable, the Estate will lose all ability to transfer any water to the Friston side of the Estate.	N	National Grid acknowledges the significance and importance of land drainage and irrigation to the estate and its range of functions and the land produce. With regard to Hazlewood Reservoir, following review of feedback and recognition of the potential risks to the water supply on the estate, the reservoir has been removed from the Order Limits, therefore addressing these concerns. National Grid will work with landowners on an ongoing basis to understand the nuances of site drainage. However, assurances can be given insofar as the converter station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems. All of the potential effects on the water environment identified in the PEIR have been subject to detailed assessment, presented in **Application Document 6.8 Flood Risk Assessment** and **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. Measures to avoid or mitigate the effects identified by these detailed assessments are described in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Both scenarios will have a detrimental impact on the Estates cropping, turnover and ultimately profitability. To provide a guide as to the area of cropping, which is reliant on water being continuously available, I provide a brief summary of this year's cropping rotation below: Crop / Hectares / Acres Potatoes / 78.37 / 193.65 Onions (sets and drill) / 52.04 / 128.73 Carrots / 25.03 / 61.86 Turf / 14.55 / 35.95 Dairy / 108.75 / 268.73 Sugar Beet / 70.15 / 173.34 Maize / 94.30 / 233.02 Wheat / 57.85 / 142.94 Pigs / 46.56 / 115.06 In order to further emphasise the importance of the water, the turnover generated by the Estate's cropping and let livestock enterprises, which are all reliant on water, is in excess of £1.5m. Should at any point the water become contaminated, or an irrigation main is interrupted or damaged, this turnover figure is significantly affected, which National Grid would be liable to compensate. The estate operates 14 irrigators, which during the summer, will all be running at any one time.		via Requirement 6 of Schedule 3 in the draft DCO, and the assessments conclude that there would be no significant effects on the water environment. National Grid will review the impact of the scheme on the irrigation mains and irrigation systems. Working with the landowners National Grid will look to ensure that the land is not left without irrigation where its works effect the landowner's ability to irrigate the land through its normal means. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
		Terrestrial ecology, Land rights and CPO	**Shoot** The Estate is subject to a shoot syndicate. The syndicate is an important part of the farm for two reasons: Firstly, biodiversity. The estate does not establish commercial game covers but utilises the wild bird seed mixes available under the Countryside Stewardship Scheme. The shoot syndicate can	N	National Grid acknowledges the diverse range of activities that the Estate caters for and the role that these may play in maintaining biodiversity and contributing to pest control. National Grid is maintaining ongoing dialogue with affected landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding identified interests.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			therefore be deemed a 'warden' to the countryside stewardship covers, ensuring they flourish and provide the biodiversity benefits they are set out to do. Secondly, pest control. The shoot syndicate undertake all the Estates pest control all year round at no cost to the Estate. With the significant disruption caused by the scheme, it is unlikely the shoot syndicate will be able to continue to operate, thus the Estate would lose the benefit of pest control. This will have an immediate impact on the Estates cropping, adversely affecting yields and farm profitability. The only recourse would be to employ a pest control team/contractor, which will bring to a compensation claim due to the costs incurred.		All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
		Design, Coordination with other Projects, Inter-Project cumulative effects	**Collaborative Working** This scheme, and National Grids additional projects (Lion Link and Nautilus) are all proposing to bring underground cables onshore and to connect into each project's respective converter stations, all of which will feed into the new Scottish Power Renewables substation at Friston. At this stage, we do not know whether each project will follow the same cable corridor or not and co-locate its respective convertor stations (albeit the chosen Sea Link converter station site implies opportunities for co-location). At this stage, there seems to be little collaboration between each National Grid project. Given the significant impact these schemes will have on the Estate and the environment, it seems insensitive that there cannot be more commitment to working together. We request that all schemes take place at one time, to avoid the possibility of three projects being constructed at three different times, which would bring rise to many years of disruption.	N	Each of the projects referenced by the respondent are separate, being promoted by different developers and working to different timescales for delivery. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the colocation of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. There are benefits to co-location with other projects because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors, etc. National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Consultation	**Landowner Engagement** Throughout this process, there has been a lack of meaningful engagement, as demonstrated within point 2, above. We request that going forward, National Grids representatives engage fully and with empathy.	N	The consultation process is designed to gather a wide range of feedback and ensure that all voices are heard before any decisions are finalised. While initial assessments are necessary to identify feasible options, these are not definitive. National Grid will maintain ongoing engagement with landowners and the wider community at every stage, ensuring that feedback informs and shapes the project moving forward.
		Construction – general, Consultation,	**Code of Construction Practice** We note there is an Outline Code of Construction Practice in the documents supplied. This is very pertinent to the Estate, and we would like to be consulted on elements that should be included in this document as it is developed to ensure it addresses, where reasonable, items of concern to landowners. This code should apply to not just the main works but also the pre-construction investigations and mitigation works including archaeology. We are aware that there are specific requirements for archaeology that result in soil movement being carried out to preserve the archaeology to be investigated. The Estate and Brooks Leney need to be consulted to ensure the working methods are done in such a way as to minimise the impact on soils whilst also recognising the need to ensure archaeology is not destroyed before it is investigated.	N	National Grid is maintaining ongoing dialogue with affected landowners in order to better understand issues arising from the Proposed Project. Since submission of the PEIR, further works were undertaken including a geophysical survey, a review of aerial photographs and LiDAR data and evaluation trenching. National Grid has maintained ongoing dialogue with Historic England through regular thematic group meetings. A full detailed assessment is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the final project design as detailed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Archaeological survey work is progressing as part of the DCO application and ES preparation process. Affected landowners will be engaged throughout this process. As part of the Proposed Project EIA, baseline archaeological data has been collated and a Written Scheme of Investigation has been prepared. Please see **Application Document 7.5.4.1 Outline Overarching Written Scheme of Investigation – Suffolk (OWSI)**. **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, outlines mitigation measures embedded within the Proposed Project. These are controlled through Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC) which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Agriculture and soils, Landscape and visual	**Soil** We request that an obligation is placed on National Grid and/or its appointed contractors to undertake a detailed soil analysis pre and post construction along the route of the cable. This will enable the Estate to properly assess the impact the scheme will have had on its soil quality in order to then assess remedial works required to put the land back in the same order as it was preconstruction. This survey needs to be carried out by a suitably qualified soil scientist with experience of analysing soils for agriculture and preferably experience of linear construction projects. Furthermore, we request that National Grid, under the Soil Management Plan, are obligated to establish a cover crop (such as a clover mix) on the soil bunds to prevent soil run off during wet weather, or wind erosion during adverse weather. Due to the	N	A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site-specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. The oSMP includes a requirement for stockpiles to be seeded if they will be in place for over 6 months and other measures to be used, as appropriate, to limit dust generation or erosion.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			nature of the soil types, blowing sand is common and thus this must be managed when the soil is in bunds. We also request the soil bunds are kept clear of all weeds, to minimise weed pressure when the land is reinstated.		
		Water environment, Construction - general	**Drainage** **We have not** had any engagement on land drainage, specifically pre and post construction drainage. We request the Estate, where required, has the ability to appoint their own drainage contactor to advise on the drainage schemes, the costs of which will be payable by National Grid. We cannot stress the importance of fully functioning land drainage for the purpose of land husbandry. Without this, some land will be rendered unproductive, and the proposed scheme will have a severe impact of the productivity of the land. The scheme will therefore require pre and post construction schemes to be put in place by National Grid.	N	National Grid will work with landowners on an ongoing basis to understand the nuances of site drainage. However, assurances can be given insofar as the converter station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems, as proposed by **Application Document 6.8 Flood Risk Assessment**. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Discussions around the appointment of a drainage contractor will feature as part of ongoing discussions with landowners and related compensation claims.
		Water environment, Onshore route location, Construction - general	**Private Water Supplies** This scheme will impact private water supplies running underground across the Estate. In the interest of highlighting these now, a plan is enclosed identifying the indicative location of these. We request National Grid, and its contractors ensure careful management of these, so not to disrupt supply to Estate and third-party properties.	N	Information on private water supplies within the study area has been obtained and an assessment on the potential impacts on groundwater receptors including the abstractions is included within **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology for Suffolk** and **Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding privately owned assets where interfaces are identified.
		Construction – general, Water environment	Cable Depth The minimum soil cover to the top of the tile over the ducts should be 1.2m in order to provide sufficient clearance for the land drainage and irrigations infrastructure, allowing the Estate to manage their land as they were pre-construction.	Y	Based on feedback received during the consultation process, the typical depth of the cable trenches will be 1.5 m, see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** for further information. The minimum depth of burial of the cable to the top of the protective tile will be 0.9 mm. In some instances, subject to discussion and agreement with the landowner this may be deeper but this will depend on cable design. Any disturbance to or modifications required to the current land drainage system will be incorporated into the construction scope to ensure the land is properly reinstated and drains are left in no worse condition than prior to construction. The cable routes will be reinstated post construction to allow the previous farming operations to continue.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Air quality, Onshore mitigation	**Carbon** Will there be scope to review the requirements of the scheme to offset either carbon/biodiversity footprints and will there be opportunities for fields that are left too small or awkwardly shaped to be used for offsetting during the scheme? Such proposals could be of mutual benefit to National Grid and the Estate.	N	A lifecycle greenhouse gas assessment is included in **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This is an assessment of the greenhouse gas emissions (also known as 'carbon' for shorthand) associated with the Proposed Project over its whole life, including operational emissions and embodied carbon. This assessment considers the mitigation measures embedded in the Proposed Project to reduce greenhouse gas emissions, as well as puts forward additional mitigation measures where applicable. This assessment has been conducted in accordance with the Institute of Environmental Management and Assessment good practice guidance for greenhouse gas assessments in EIA. National Grid has a corporate commitment to at least 10% environmental net gain, which includes Biodiversity Net Gain. There is currently no statutory requirement for Biodiversity Net Gain on NSIPs, but this is anticipated to come into effect from November 2025. It is not expected that the Proposed Project will be caught by this statutory requirement. However, there is policy requirement for NSIPs to provide BNG and environmental net gain as set out in National Policy Statements EN-1 and EN-5. Where possible, the Proposed Project will deliver BNG offsite at scale through partnerships and seek to provide value-added BNG with wider benefits to ensure best value for money from consumer-funded BNG. Other options are by the purchase of BNG commercial units or statutory credits but as a last resort. National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture & Soils and Application Document and 6.2.3.6 Part 3 Kent Chapter 6 Agriculture & Soils** make reference to access to and from residential, commercial, community and agricultural land uses will be maintained throughout the construction period or as agreed through the landowner discussions. This may require signed diversions or temporary restrictions to access. The means of access to affected properties, facilities and land parcels will be communicated to affected parties at the start of the project, with any changes communicated in advance of the change being implemented. Where field-to-field access points require alteration as a result of construction, alternative suitable field access will be provided in consultation with the landowner/occupier. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Agriculture and soils, Water environment, Onshore	**Cropping** As referred to above, the majority of the Estate's cropping is reliant on irrigation. How a field is irrigated is stipulated by the	N	All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		mitigation, CPO	location of the mains, the hydrants, and the shape of the field. As a result of the scheme proposals, there will be part fields severed, or left with an awkward boundary, resulting in areas that may not be suitable for farming, or not be available to irrigate. In such circumstances, we would expect National Grid to compensate the Estate on whole field basis and not just on an area taken basis. We would also expect National Grid to compensate the Estate in establishing and maintain the cover crop in the severed areas, to prevent weed and pest build up. In addition, considering the damage a scheme such as Sea Link has on soil structure and quality, we request the Estate, if required at the time, has the right to establish and maintain a cover crop over the affected fields for a period of up to two years, in order to remediate the damage caused by the scheme and before establishing a commercial crop. Should this be a necessity at the time, National Gird will compensate the Estate for the loss of income and costs in establishing and maintaining the cover crops.		Compensation claims for other disturbance, such as loss of ability to irrigate a part of a field during the construction phase, are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. All soil handling (stripping, stockpiling and reinstatement) will be undertaken in accordance with good practice. **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site-specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. This includes a requirement for an Aftercare Management Plan to be produced; this will include all measures required post-restoration to ensure the recovery of the soils to pre-construction condition. Fragmentation of land was scoped out of the ES and **Application Document 7.12.1 Design Principles – Suffolk** outlines how National Grid will minimise land take, make efficient use of land in consideration of potential seasonal disruption, and avoid where reasonably practical dividing land to be returned into farming use into inaccessible and unsuitable parcels. However, this principle should be considered in the context of awareness of the need to consider and facilitate delivery of future projects to the extent that they are known about and likely to proceed. has sought to make effective use of space that minimises fragmentation of agricultural land.
		Agriculture and soils, Onshore mitigation, CPO	**Farm Management** The proposed scheme will dissect fields and the associated construction will involve track closures. This will have a significant impact on the day to day running of the Estate, especially during harvest and lifting of root crops. We assume the Estate will be appropriately compensated in time and running costs associated with additional travel required.	N	National Grid will continue to liaise with affected landowners on an ongoing basis. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
		Agriculture and soils, Design	**Link Boxes** We are naturally concerned with the potential number of link boxes along the cable route. We understand there will be a requirement for link boxes every 500 – 1,000m, which in some cases may well be in the middle of arable fields. This will cause inefficiencies to farming and thus we request all link boxes are in field hedges, abutting hedgerows/roadsides and where they can't be, the link boxes are buried to a cover of 1.2m to allow for uninterpreted farming going forward.	Y	National Grid acknowledges these concerns and will seek to place link box kiosks at the edges of fields wherever possible, in order to minimise impacts on agricultural land. National Grid has allowed sufficient space within the Limits of Deviation to accommodate adjustments in the position of link boxes. Link boxes are only present above ground on the HVAC cables and, as mentioned, these will be placed at the edges of fields where possible to allow the uninterrupted farming of land.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Agriculture and soils, Consultation	**Heat** Due to the size of the cables, there are concerns that heat generated from the cables will have an adverse impact on the above soil, possibly affecting yields achieved. Landowners will need some explanation/undertaking that this will not be a significant problem for their ongoing use of their land.		Electric current passing through the cables generates heat that must eventually be dissipated to the atmosphere. The heat dissipation is limited in part through the temperature limit at which the cables can operate. The cable is designed to limit the maximum temperature that occurs at the 'worst case' location along the entire route. This 'worst case' is generally the location where the cable is at the greatest depth, this is generally associated with a trenchless installation or another crossing point where the cable passes under a watercourse or embankment, etc. Therefore, if the peak temperature is reached at this 'worst case' location then the temperature at shallower depths along the route, such as through agricultural fields, will always be lower than this peak value as the cable is the same throughout. The cable system design is developed in accordance with the relevant National Grid Technical Specifications. These consider the seasonal variations of ground temperature and the system is designed based on the most onerous seasonal ground temperature considered, summer. Note the ground temperature is taken at 1 m depth. Further mitigation is provided through the separation of the cables and the provision of a thermally suitable surround material that helps to dissipate the heat uniformly away from the cables before it is conducted into the surrounding ground. The issue of heat dissipation was not considered in the ES as it was scoped out during the scoping phase. Information on the scoping exercise undertaken is contained in **Application Document 6.14 Environmental Scoping Report 2022**.

Table 1.33 SL-PIL-0876, SL-PIL-0313

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	Aldeburgh Golf Club (AGC) is one of the leading golf courses in the UK (ranked number 1 in Suffolk and 80 in Golf Monthly's UK's Top 100 Courses in 2023). As such it makes a significant contribution to the local economy, attracting visitors to the area and supporting the employment of over 20 full time equivalent staff; and makes a significant contribution to the health and wellbeing of the community. It is a local business that relies on the health of the local economy for its success and will consequently suffer from the wider Economic Impact of these proposals on East Suffolk. AGC is a significant landowner located at the western edge of Aldeburgh with Golf Courses on either side, north and south of Saxmundham Road (A1094), the road linking Friston to the Coast. On AGC's behalf we made representations to the non-statutory public consultation in December 2022 on the Sea Link proposals. Representatives of the Club have also met with members of the Sea Link team to explain their concerns. AGC objects to the Sea Link proposals in the strongest possible terms. Their objections fall into three categories: That the fundamental need for the Sea Link Project has not been established; notwithstanding which That the selection of the proposed landfall site and route is flawed; notwithstanding which That the selection of the proposed Route across AGC land is flawed. These are detailed in turn below.	N	National Grid notes your objection to the Proposed Project. Please see the comments below.
	Traffic and transport, Landscape and visual, Terrestrial ecology	**<u>The Fundamental Need for the Sea Link Project</u>** AGC have raised strong objections to this major infrastructure energy project either in isolation or in combination with other local Nationally Significant Infrastructure Projects - East Anglia One North, East Anglia Two which were granted a consent Order on 31 March 2022; Nautilus Interconnector (non-statutory consultation 2022); and Lion Link (public consultation 2023) on the basis of: The serious impact of their construction, maintenance and operation on the sensitive and valued local landscape and wildlife habitat.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Traffic impacts, with projected increases in traffic movement and particularly of HGVs leading to congestion and safety concerns for members and visitors accessing the Club's courses.		• **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** considers traffic impacts in Suffolk in relation to existing traffic and pedestrian route severance, pedestrian delay, non-motorised user amenity, fear and intimidation, driver delay, road safety and PRoW closures and diversion. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts. Potential impacts of the Proposed Project on landscape and visual receptors is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Potential impacts of the Proposed Project on ecology is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Socio-economic. recreation and tourism, Coordination with other Projects, Alternative solutions	Economic impacts with the effects of the development highlighted above having a severe negative impact on the attractiveness of the area with consequent decline in visitor numbers to the area and a serious detrimental economic impact on the Club and its operations. What remains absent in this latest round of public consultation is a coordinated strategic approach to these projects which seeks to co-locate and limit their significant environmental effects. It is unacceptable for such major, environmentally impactful projects to be brought forward on a piecemeal basis. It is inappropriate to seek to justify this approach on the basis that they are being progressed by different companies at different design stages. These are nationally important infrastructure projects with far reaching environmental, social and economic impacts which should be coordinated as such to limit impacts and disruption to the communities affected. Our representations to the non-statutory consultation made the point that consideration of the Sea Link proposals in isolation	N	Potential impacts on the tourism economy are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (**see Application Document 7.13 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			were premature and the case for the need for Sea Link is fundamentally incomplete in the absence of: **An ENERGY INFRASTRUCTURE STRATEGIC PLAN encompassing:** Existing & future Offshore Wind Projects (including EA1N & EA2); Sizewell B and the proposed Sizewell C nuclear plants; Future onshore renewable projects (e.g. solar); Grid Reinforcement (like Sea Link); 'Multipurpose' Interconnectors (like Nautilus & Euro, now Lion Link); Complementary (and necessary) Technology to large-scale intermittent renewable generation such as Battery Energy Storage Solutions (BESS) and Power-to-X (like Green Hydrogen); Associated Landfall, Cable Route, Converter Station and Sub-Station requirements and associated BESS and Power-to-X infrastructure; **A COMPARATIVE STUDY of all GRID OPTIONS and LANDFALL SITES including:** Offshore grids and/or more extensive use of multipurpose interconnectors such as Lion Link to integrate Landfall, Cable Routes, Converter Locations and Connections; Brownfield Sites for Landfall and Infrastructure; and		reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Inter-Project cumulative effects	**A TRANSPARENT ASSESSMENT of the CUMULATIVE IMPACT:** of the potential energy infrastructure in East Suffolk, where we have particular concerns over the permanent cumulative and growing impact on the Environment and Local Economy of creating an 'Energy Hub' at Friston and its future role as the logical host for future BESS and Power-to-X Technology and infrastructure, as well as the connection point for future Offshore Wind, Onshore Renewable and Interconnector Projects.	N	National Grid acknowledges these concerns. However, the development of other projects is outside of National Grid Electricity Transmission's control. National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia One North, East Anglia Two, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. While there are clear benefits associated with coordination of project delivery and colocation of infrastructure with other projects, proposals coming forward in close proximity must show consideration of the cumulative effects. In the case of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Landfall location, Onshore route Location, Onshore environmental impact	**Sea Link Proposed Landfall & Route** Notwithstanding the above, it is particularly concerning that the proposed route impacts directly on Golf Club land. AGC objects to the proposals in the strongest possible terms. The proposed route would have significant impacts on the Heritage Coast, AONB, Special Protection Area, Important Bird Area and RSPB reserves. These would be greater than the 'Suffolk Site 1 – Alternative' illustrated in the Sea Link Options and Design Evolution Report which is already impacted by Sizewell and its associated infrastructure and pylons etc. Furthermore, the route from Sizewell, as illustrated in the plans contained in the same report would avoid more protected environments than the proposed route.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. The need case for the Proposed Project has identified that connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide (**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**). The reasoning behind the selection of the location and the alternatives considered is set out in • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023); and**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.2 Strategic Options Back Check Report.** National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the route of the HVDC cable and the location of the joint bays and the high importance of the RSPB reserve and the AONB is noted. This is a major reason why the reserve will be traversed through trenchless methods. The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**
		Coordination with other Projects	The current consultation advises that the proposals are being brought forward as a stand-alone project with 'opportunities to co-locate' infrastructure. It is understood that of those other projects Nautilus Interconnector is focussing on a potential location away from Suffolk on the Isle of Grain in Kent. The Lion Link project is well behind Sea Link in its progress towards an application being made, with a range of options still under consideration. This undermines the reason given for discounting a connection and route from Sizewell (Suffolk Site 1 – Alternative), i.e. that the benefits of co-location outweigh the technical difficulties of delivering the Alternative route from Sizewell. The explanation given in the Project Overview Document indicates that technical difficulties of this option are being afforded priority over environmental impacts. Furthermore, in the absence of any clear evidence to the contrary the claimed benefits of co-location which it appears may never happen should be afforded little or no weight at this stage of the process.	N	A staged approach was adopted to identify corridors and preliminary routeing and siting options for the Proposed Project, considering environmental and socioeconomic factors as well as technical and engineering design considerations, and cost. The approach was used to identify 'on-balance' preferences for landfalls, converter station sites and potential route corridors within which preliminary alignments could be developed. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site Areas. Details of the appraisal process are set out in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. National Grid has provided the details of what the co-ordination and co-location of the three projects might look like, but have no control over the timescales of the NGV Projects. All three projects need to submit planning applications through the DCO process and gain consent for their individual assets, without this they cannot be installed. The Proposed Project is an NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it. National Grid is working closely with NGV and other developers to minimise the disruption caused by the Proposed Project and, where possible, will look to provide a co-ordinated programme of works where possible. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (**see Application Document 7.10 Coordination Document**).
		Legislation and policy inc. permits, Landscape and visual	The National Planning Policy Framework (NPPF) leaves no doubt as to the importance which should be afforded conserving landscape and scenic beauty in Areas of Outstanding Natural Beauty (AONB) which have the highest status of protection in relation to these issues, as should the conservation and enhancement of wildlife and cultural heritage in these areas.1	N	The Planning Act 2008 states that the National Policy Statements for Energy (NPS) provide the primary basis for decisions taken by the SoS on applications for development consent he or she receives for electricity network infrastructure, and in turn, the Proposed Project. Paragraph 5 of the NPPF makes it clear that the NPPF does not contain specific policies for developments requiring development consent and that applications in relation

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Paragraph 177 of the NPPF makes it clear that major development as defined by footnote 60 of the NPPF, for which these proposals would certainly qualify, should be refused other than in exceptional circumstances, including an assessment of: The need for the development, including in terms of any national considerations, and the impact of permitting it or refusing it, upon the local economy; The cost of, and scope for developing outside the designated area, or meeting the need for it in some other way; and Any detrimental effect on the environment, the landscape and recreational opportunities, and the extent to which that could be moderated. We maintain that a full and proper assessment of the proposals against criteria b) and c) has not been conducted including the scope to progress less damaging alternatives. Accordingly, the proposals do not satisfy this test and if progressed to application unaltered should be refused. This important national policy is not somehow disengaged by the nature of these proposals with the National Planning Practice Guidance (NPPG) advising that a need for renewable energy does not override environmental protections nor indeed the planning concern of local communities.		to developments requiring development consent are to be determined in accordance with the decision-making framework set out in the Planning Act 2008. Appendix A, NPS Accordance Table of **Application Document 7.3 Planning Statement** sets out an analysis of compliance with the policies within the NPS. Section 7.3 of the **Application Document 7.1 Planning Statement** confirms compliance with the policy tests set out in NPS EN-1 paragraphs 4.2.17, 5.10.32, 5.10.33 and 5.10.34 and NPS EN-5 paragraph 2.2.11.
		Coordination with other Projects	Furthermore, the concept of 'Project Coordination' is worthless in the absence of a Strategic Plan, and meaningless when National Grid cannot guarantee coordination across NGESO and NGV Projects, let alone integration with other projects (like Sizewell B & C, EA1N & EA2).	N	National Grid has provided the details of what the co-ordination and co-location of the three projects might look like; but have no control over the timescales of the NGV Projects. All three projects need to submit planning applications through the DCO process and gain consent for their individual assets, without this they cannot be installed. National Grid is working closely with NGV and other developers to minimise the disruption caused by the Proposed Project and, where possible, will look to provide a co-ordinated programme of works; however, this will depend on the programme of the other projects. The Proposed Project is an NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it. National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Onshore route location, Onshore environmental impact, Socio-economic. recreation and tourism	The proposed route will directly impact on communities, settlements and countryside areas which unlike Sizewell have not thus far been impacted. In so doing these proposals do not meet any of the claimed intentions to: Limit environmental damage and disruption; Avoid landscape designations; Limit visual impacts; Limit ecologically designated and sensitive sites; Avoid recreational areas; and As far as possible co-locate infrastructure and cable routes to maximise opportunities for joint working and limit environmental impacts Sea Link Proposed AGC Route Notwithstanding the above, AGC contends that the selection of the proposed route in the region of the Golf Club is fundamentally flawed as it did not take into account the full environmental impact. The proposed route impacts on Aldeburgh Golf Club land within the AONB. Indeed it directly impacts on costly proposals to extend the course in an area of their land where the route is proposed. The plans to deliver new championship standard golf holes designed by international leading golf architects and granted planning permission by East Suffolk Council (Planning application reference DC/22/2697/FUL) in March 2023 are being brought forward now. Representatives of the Golf Club have met with Sea Link to discuss their respective proposals and it is understood that should the Sea Link proposals get permission and go ahead as currently proposed they will inevitably negatively impact on: The appearance and attractiveness of the course; Noise and disturbance impacting on enjoyment of the course by fee paying members, visitors, neighbours of the course and those utilising the public footpath network etc;	N	In developing the Proposed Project, National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. The concerns of Aldeburgh Golf Course are acknowledged, including those relating to the potential environmental impacts of the Proposed Project. The route selection process is explained in detail in the following documents: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** The landscape and visual team have been a key discipline when determining the route of the required cables. This has been developed to minimise effects on the landscape character, including avoiding landscape features where possible and visual amenity, including limiting the infrastructure in views from sensitive receptors including residential and recreational receptors. It should also be noted that the effects arising from the cable routes will be temporary and that reinstatement of the cable corridors will occur following the construction period as far as practically possible. Acknowledging the important role that the Golf Course plays as a visitor attraction in this area, a complete assessment of socio-economics effects has

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Landscape and ecological enhancements which are being delivered upfront by the Club as part of the course extension works to comply with a pre-commencement planning condition of the planning permission for the new holes; The enjoyment of playing the new holes; Greenkeeping staff's ability to maintain those parts of the Club's land impacted by the construction works; Disturbance to the turf nursery which the Club intends to bring forward alongside the delivery of the new holes in part of the site impacted by the Sea Link construction works. AGC does not believe that the full environmental impact of the proposed cable corridor across its land was fully understood by National Grid at the time of their assessment and that, as a result, the selection of their proposed route across AGC land is fundamentally flawed. The proposed route of Sea Link would clearly negatively impact on the attractiveness of the course as a destination for golf and its existing and future operations with substantive adverse economic consequences for the Club and the Local Economy. For the reasons explained AGC remain strongly opposed to the proposals.		been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Alternative solutions, Onshore mitigation, Consultation	Without prejudice to that position if the preferred route is maintained the direct impacts on the course could be mitigated by moving the proposed route parallel to the new 7th hole a short distance north to avoid the land used for golf purposes. This is explained by the enclosed overlay plan (enclosure 1) which shows the proposed route of Sea Link on the part of Golf Club Land where the new holes are proposed. I would be grateful if this representation could be recorded and we are included as an interested party to be notified of future stages as plans progress. In the meantime, should you have any queries on the information submitted or require anything further please do not hesitate to contact either myself or my colleague Roger Welchman.	Y	National Grid has held ongoing engagement with Aldeburgh Golf Club regarding the route of the cable and the route that will be put forward as part of the draft DCO (**Application Document 3.1**) is a reflection of this ongoing engagement. National Grid has undertaken an extensive environmental impact assessment, which together with the development of its engineering solution, has enabled it to establish measures to mitigate potential impacts. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Table 1.34 SL-PIL-0608, SL-PIL-0903, SL-PIL-0354, SL-PIL-0365

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Alternative solutions	Sealink The Great Grid Upgrade: I asked why not put this project at the Kingsnorth Power station? This was your answer: Because the power is needed in the Canterbury region, so Kingsnorth is not suitable – is this really true? Kingsnorth advantages: has plenty of space brownfield site on the coast less environmental impact less housing impact as there aren't any in the area direct links as National Grid infrastructure already in place	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes the Kingsnorth Power Station site. Information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description of the location for the Proposed Project infrastructure provided in Chapter 4 is the preferred location. Several alternative options were considered when developing plans for the Proposed Project, with details of these alternatives shared as part of the pre-application public consultations. For example, as part of the Strategic Options Report, National Grid set out how it considered connections to the Sellindge, Richborough and Canterbury areas. These areas were considered because the existing electricity transmission network is between Kemsley and Lovedean, meaning that any reinforcement must connect between these two locations. A connection in the Isle of Grain or Kingsnorth, two of the alternative locations suggested by stakeholders, would therefore not reinforce the network in the right place. A connection close to Richborough was found to offer environmental and socio-economic benefits over connecting in the Canterbury area, whilst a northern Kent landfall was found to be significantly constrained. At Richborough, National Grid also found opportunities to locate the converter station and substation close to the existing network and similar infrastructure.
		Safety, Construction - general	Security: Having a large project such as this in the area makes it a magnet for anyone wishing to steal equipment etc. What security are you	N	As an operator of national infrastructure, National Grid commit significant resources and investment into maintaining the security of their sites and assets.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			going to have in place? All access roads must be gated/lockable and located, preferably adjacent to a ditch so that would be thieves can't go round them. At all times during the construction phase the area must be kept locked, secure and have security patrols to dissuade would be thieves. This did not happen during the Richborough Connection Project and local farms were broken into using the projects haul roads as easy access.		National Grid is engaging with the local authorities on an ongoing basis and will seek to discuss and identify security measures that may be necessary at each stage of development and operation. National Grid will ensure that its contractors provide the relevant levels of security and where gates are installed these shall be locked out of hours and mobile and static security patrols or CCTV will be installed where it is deemed required.
		Consultation	Communication with Landowners, Tenants, and their Agents: Your information packs state that you are having meetings with local landowners and tenants. This is untrue as you have not had the curtesy to contact many of them or their local agents with relevant information at this point in time.	N	National Grid has a landowner engagement strategy that commits it to engaging with landowners as circumstances require. Where a specific interface is identified National Grid will seek individual engagement, however, this may not be necessary for all landowners. Where individuals feel that further engagement is warranted, National Grid welcomes contact and opportunities for appointments are also made available during formal periods of consultation. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding privately owned assets where interfaces are identified.
		Converter station location, Water environment	Minster Marsh Site: In the PEIR you say that you could cause pollution, physical disturbance, increased runoff rates and volume, loss of flood plain storage, be detrimental to flood plain flows and deterioration of water quality. This is not acceptable, all the above must be mitigated at the planning stage for this upgrade. Drainage: Recommend before anything is done that you clean out the ditch and drainage system including outfalls which are already in place but haven't been maintained for over 40 years. This is why the site suffers from pluvial flooding at the moment. The plans don't show any evidence of SuDS / balancing ponds / bio beds which must be included on the site with the capacity to contain all ground water runoff from the site. The expected increase in ground water because of this building cannot be put into the main drainage channel (the Minster stream). The Minster Stream drains the whole of the Marsh system from Gore Street to Richborough including the Marshes at Monkton, Minster and Ebbsfleet. If extra pressure is put on the Minster stream it will cause flooding of land and houses at Monkton, Minster and Gore Street. This system is already at over capacity due to it being partial emptied by gravity via the Kingsfisher sluice and because the Minster pumphouse does not have fish friendly infrastructure so cannot be operated to capacity during eel	N	All of the potential effects on the water environment identified in the PEIR have been subject to detailed assessment, presented in **Application Document 6.8 Flood Risk Assessment** and **Application Document 6.2.3.5 ES Part 3, Chapter 5: Water Environment**. Measures to avoid or mitigate the effects identified by these detailed assessments are described in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO, and the assessments conclude that there would be no significant effects on the water environment. Drainage solutions for the Minster substation and other elements of the Kent Onshore Scheme have been developed in consultation with the Stour (Kent) Internal Drainage Board and integrated into the design. These measures include sufficient capacity to capture, store, attenuate and treat rainfall runoff from the 1% chance (1 in 100 year) storm, inclusive of climate change allowance in line with the latest Environment Agency guidance, with discharge rates in line with pre-development (greenfield) rates. Measures to control water runoff from temporary roads and construction sites would also be put in place to prevent pollution and surface water flooding. The measures are described in **Application Document 6.8 Flood Risk Assessment** and are secured through commitments within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			migration from October – end February. The above means that the site will have to have a large storage capacity including balancing ponds and attenuating tanks or discharge directly into the Stour. The balancing ponds and bio beds will help prevent pollution to the environment including bird life and endangered species including water voles, eels etc. This stream is the main migration route for eels from the whole of the Marsh system via the Kingfisher sluice which is a gravity feed into the estuary of the Stour. Eels are protected under EU law. The runoff rate must be kept at the greenfield rate of 4ltrs/sec via a metered system. Water runoff from temporary roads and construction sites during the construction phase must be contained in bunded SuDS and not allowed into the local ditch system. Bunding must be put along the edges of all the water courses to prevent pollution ingress. The SuDS / balancing ponds / bio beds / metering infrastructure must be maintained on an ongoing basis once the building is completed and for perpetuity. The SuDS must have enough capacity to hold the 100 year storm plus 30% for climate change.		
		Onshore route location, Ornithology	Environment Post Build: The buildings and new pylons will have a massive detrimental effect on the wildlife, locally and internationally migrating birds as they are passing to and from the RPSB site at Pegwell Bay and the neighbouring triple SSSI site at Weatherlees Hill to the local area and further across England.	N	National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. National Grid acknowledges the ecological sensitivity of Pegwell Bay and the surrounding area. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.
		Landscape and visual, Onshore mitigation	The report mentions planting trees for screening, but this will have little impact on hiding the view of the site as the buildings are 26 m high. No screening of the site has been allowed for the nearby hamlet of Sevenscore to the Northeast. You need to raise the ground on the adjacent fields and then plants trees on the raised ground to create a knoll effect. This would mirror image the Weatherlees Hill SSSI site. This would hide / screen the local communities from the sight/noise and light pollution of the proposed site. There also needs to be a tree line planted on the upland near to the railway line. This being on a higher gradient of land would	N	The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. These concerns are acknowledged and it is recognised that there will be some residual impacts arising from the development of the Proposed Project. The landscape and visual team have been a key discipline when determining the route of the required cables. This has been developed to minimise effects on the landscape character, including avoiding landscape features where

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			provide more effective screening and as birds use natural features to navigate it would hopefully help keep them away from the substation. Otherwise, this project will have a significant impact on the visual viewpoint of Minster, Sevenscore, Laundry Hill and Cliffsend. Trees planted for this project need to include a large number of mature trees so that they have an instant impact rather than planting whips.		possible and visual amenity, including limiting the infrastructure in views from sensitive receptors including residential and recreational receptors. It should also be noted that the effects arising from the cable routes will be temporary and that reinstatement of the cable corridors will occur following the construction period as far as practically possible.
		Ornithology	It states in the PEIR that you are going to remove habitat for some of the rare birds in the area outside their nesting season. This is disgraceful and is showing a poor attitude to environment by the National Grid. Removing the habitat to prevent them nesting is not the answer to the issue. You need to provide alternative nesting sites for these species.	N	Habitat for nesting birds is best removed outside the nesting season because this minimises the harm to nesting birds compared to removing the habitat while they are nesting. This is discussed further in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Habitat that is removed will be restored where possible and there will be a net increase in suitable nesting habitat as a result of the Kent Onshore Scheme due to extensive planting around the converter station and substation.
		Water environment, Terrestrial ecology	Hydrology: The PEIR states that there is no problem with hydrology as there is no ground water Source Protection Zones (SPZ's) however: The Minster Stream is not only important for wildlife, but it is the main irrigation channel for the whole of the marsh system. Three farms have a pump house within 400 meters of the proposed site which is2 used to irrigate the marshes and the Thanet upland up to Manston and Cliffsend. It supplies irrigation for farms back towards Minster, Monkton and Gore Street and is used to irrigate Potatoes and salad crops. Another reason why there can be no pollution into the drainage channel. The workings and roadways are going to cross the pipework infrastructure for these irrigation systems.	N	The Proposed Project has secured through commitments within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** that where there are interactions with existing land drainage and irrigation systems, National Grid will ensure the integrity of these systems, providing for temporary alternatives during construction, as necessary. In addition, there are a range of commitments to safeguard the quality of the water environment and to control and manage the risks of pollution during the construction phase. All Proposed Project infrastructure will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems. Further information is contained in **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment**.
		Geology and hydrogeology, Agriculture and soils, Onshore mitigation	At the site the PEIR discusses storing chemicals and fuel which will need to be in a secure 110% bunded site. Taken by N Dyas: Machinery during the Richborough Connection Project did not have drip trays During construction all equipment and machinery needs to be kept in secure sites with drip trays to prevent any pollution (as this did not happen during the construction of the Richborough Connection Project) Taken by N Dyas: Drip trays not used on the Richborough Connection Project Soils: Any soils that are moved during construction needs to be stored in a suitable condition i.e. topsoil stored separately from the sub soil and must be kept covered to prevent erosion and weeds.	N	All soil handling (stripping, stockpiling and reinstatement) will be undertaken in accordance with good practice. **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site-specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. This includes the requirement for the suitable storage of topsoil and subsoil and erosion/weed growth prevention. National Grid will ensure that its contractors provide appropriate levels of security and where gates are installed these shall be locked out of hours and mobile and static security patrols or CCTV will be installed where it is deemed required

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Any compaction will have to be lifted and damaged to sub strata repaired by subsoiling when the soil is dry. Taken by N Dyas: Soil piles not covered and top & Subsoil mixed as unfortunately happened in the Richborough Connection Project. Depth of Cables: Where the cables cross the Southern Water waste pipes they must go deep enough as the SW pipes keep collapsing due to degradation of the pipes. This has already caused a number of sink holes and has the potential to do so in the future. It is recommended that any trench work done on the marsh is done in the summer due to the high-water table in the area during the winter (all work on the marsh should be done in the Summer).		National Grid's Contractors are required to install drip trays / plant nappies on all machinery when left standing or stored. This will be part of their site management plans and will be enforced by National Grid. The depths of the cables installed will be discussed with the landowners and any crossings of utilities will be installed with guidance from the Utility owner. Trenching for the scheme will be carried out following an extensive review of all elements - seasonal requirements, archaeology, soil types, ecology and hydrology. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Traffic and transport, Construction – general, Onshore environmental impact	Traffic: In the PEIR report you say that daily there will be 122 heavy goods vehicles HIV's 98 LGV's and 292 construction worker vehicles. As Ebbsfleet lane North is too narrow and Jutes Lane is already being used by the Weatherlees water treatment works an exit off the Dual carriageway needs to be constructed before any work is carried out to the site. Access Roads: On the plans it shows 2 permanent access roads – this is excessive and there should only be one. It should be kept as close to Ebbsfleet Hill as possible so that it is less visible to residents. This is a more direct route and crosses less marshland. Trees and shrubs should be planted along its line to screen it from residents. The permanent road and any temporary roads used during construction need to be a raised structure with membrane base so that the stone can be removed. Floating roads should not be used for construction as these were a disaster when used in the Richborough Connection Project on the Marshes. See the photos below. Taken by N Dyas: Floating road showing severe signs of flooding and pollution during the Richborough Connection Project. The permanent access on the Marsh needs to be a raised road. Taken by N Dyas: Chaos and huge environmental impact caused across the Marsh area by National Grid during the Richborough Connection Project.	Y	These construction numbers represented peak daily levels of traffic during the busiest day of the construction programme (rather than average levels of construction traffic expected on a typical day) and have been reviewed further within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**. This shows that the majority of construction vehicles will use the proposed main site access on the A256 northbound carriageway. Ebbsfleet Lane North will only be used as a secondary access for approximately six months during construction to carry out vegetation clearance works, utility diversion works for the overhead lines, survey works, and limited mobilisation movements associated with the construction of the A256 access. There will also no longer be a requirement for Jutes Lane to be used, other than for the construction of required utility crossings in the area. The new permanent access point for Minster Converter Station and Minster Substation will be via the main site access (K-BM02) off the A256. Further details of this access point are provided within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**. The proposed location and layout of this permanent access point is also shown within **Application Document 2.13.2 Design and Layout Drawings – Kent**. Other existing access routes will also be used by light vehicles to access the Order Limits for the full lifespan of the Proposed Project, including for monitoring purposes and to access parcels of land for ecological mitigation and enhancement. These will utilise existing routes including the A256, the Pegwell Road access track towards landfall (via Sandwich Road), Cottington Lane to the east of the A256 and Ebbsfleet Lane North to the west of the A256, as well as Marsh Farm Road and Whitehouse Drove. Agreements will be established with the relevant landowners to access permanent works (e.g. cables passing through fields), using existing tracks and field entrances where possible. The effects arising from the Kent Onshore Scheme on landscape character and visual amenity are summarised within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual and detailed in Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment. The impacts of access routes and water environment receptors, land drainage and flood risk are assessed in **Application Document 6.8 Flood Risk Assessment**, which sets out a range of design and control measures to reduce and manage the effects of the access routes.
		Noise and vibration, Air quality, Construction - general	Air Quality/Noise and Vibrations: Concerns during construction of the dust in the air and dirt on the road network. How are you going to clean the works traffic before it gets onto the local road infrastructure. Dust on vegetation and local crops will block out photosynthesis and affect quality Effects on asthmatics and others sensitive to air quality Noise and vibrations will impact nearby residents – Minster, Sevenscore and Ebbsfleet etc. The PEIR says that construction noise will be heard for 300 meters, vibrations will only effect to the distance of 100 m and when it is operating noise will only be for 1 km. These predictions are wildly inaccurate and underestimate aspects both during construction and operation as evidenced by the amount ofnoise and vibration caused during previous construction at the Richborough site. Noise and vibration pollution will be horrendous during construction and will still have a major impact on local residents once construction has finished and the site is operational. It will be detrimental to the quality of life to local residents.	N	National Grid has an established and effective code of construction practice which has been used on many projects and covers the matters of concern raised in these comments (refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**). This includes matters such as dust and wider air quality impacts. The potential for noise impacts as a result of the Proposed Project are assessed in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. Potential impacts of the proposed lighting on landscape and visual receptors is included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Onshore route location, Design	Pylons: The height of the pylons needs to be future proofed so that modern and future machinery will be able to safely work/travel underneath them. This was not done on the Richborough Connection Project where land was lost to farming due to the low height of the cables. As you are aware the cables sag/sink over time, due to increased electrical load and temperature this must all be factored into the pylon height. If National Grid are proposing to upgrade the existing power line from Richborough to Canterbury, then details of this requirement should be made to the farmers and their representatives. What is proposed? Just putting in one new conductor line, are you just changing the cables? Are they going to be using private access (paid for)? Are you planning to put in new haul roads?	N	The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. The proposed overhead lines have been designed to ensure they are fully compliant with guidelines and policies. This ensures that health concerns are properly and adequately addressed. Where possible the required cabling has been placed underground. The new pylons will be designed and installed to maintain the required clearances to the ground. Where the conductors are replaced on the existing line these will be done so to maintain the statutory clearance required within the Spans. **Application Document 7.3 Design Development Report** explains that a decision on the proposed pylon type for the HVAC connection was not made prior to Statutory consultation as it was felt further environmental considerations, and stakeholder engagement and consultation feedback, was

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			At today's date there has been no information relating to the upgrading of the existing line?		required to inform the decision. Making the connection via both full height steel lattice and low height steel lattice was included within the statutory consultation materials. The impacts of the pylons have been considered in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual and Application Document 6.2.3.2 Part 3 Kent Onshore Scheme Chapter 2 Ecology and Biodiversity** with mitigation measures relating to impacts on breeding birds set out **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The refurbishment of the overhead line will involve the replacement of the existing conductor with new conductor and possible replacement of some of the other parts of the equipment that hold the conductor. Access to the towers will be agreed with the landowners and tenants prior to access being required. The upgrading project is not being carried out as part of the Proposed Project and National Grid will be contacting the landowners at the appropriate time to carry out these works.
		Converter station location, Alternative solutions	Suggested new location for the proposal sealink substation: Land adjacent to the old power station site but on the opposite side of the river. See map below (grided area is the proposed site) with three options for the underground connection cables highlighted in red. No 1 ideally go up the river, No 2 across the SSSI straight in, No 3 follow the originally recommended route turning parallel with the road on an unused strip of land. This land is on the same flood plain as the proposed site and the level of the land can be raised as you are already proposing to do. This site is further away from local communities and will be partly screened by the SSSI of Weatherlees Hill. It already has nearby road connections to it, so the access is much shorter than the proposed site. This site is located just behind an industrially developed area and would have much less impact on the environment and local communities.	N	While National Grid welcomes the suggested alternative locations for new infrastructure, the current proposals are the product of extensive assessments to identify locations that provide for the operational requirements of the Proposed Project. National Grid assessed a variety of potential areas for new infrastructure. This process is explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation siting Study (October 2022)**, including the area of search, the criteria used to identify the location of the current design and the constraints affecting other locations. The location suggested opposite the existing site has been considered and for reasons set out tin the Document mentioned above is not suitable. National Grid is unable to install the cables in the river due to it being a dredged river and the size of vessel that would be needed to install the cables will not fit down the river. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore route location, Alternative solutions	Priority: The substation must be connected to Pegwell Bay with an underground cable to reduce the detrimental impact of this project on the area. The Substation must have SuDS, balancing ponds and bio beds to prevent increased water runoff and pollution. Relocation of the proposed site to behind the old Richborough power station.	N	The details of connection from the landfall to the converter station and substation are set out in the Project Overview Document that formed part of this consultation exercise and within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The converter station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems. Measures to control water runoff from temporary roads and construction sites would also be put in place to prevent pollution and surface water flooding. The measures are described in **Application Document 6.8 Flood Risk Assessment** and are secured through commitments within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1)**. National Grid assessed a variety of potential areas for new infrastructure. This process is explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation siting Study (October 2022)**, including the area of search, the criteria used to identify the location of the current design and the constraints affecting other locations. **Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** are also add further context.

Table 1.35 SL-PIL-0218, SL-PIL-0228, SL-PIL-0692, SL-PIL-0021, SL-PIL-0023, SL-PIL-0067

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions	**Question 1** **Do you support the principle of reinforcing the network in this location?** Answer – 'No'. **Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?** In my opinion, justification for the need to reinforce the network between Suffolk and Kent has not, to date, been provided by National Grid. At a recent private meeting with Dr Therese Coffey, she advised that reinforce of the network at this time was not required, i.e. there was already sufficient capacity and that, 'if' greater capacity was required in London, then this would be better facilitated by providing a connection between Kent and Bradwell-on-Sea in Essex.	N	The Proposed Project's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including the Bradwell Power station. However, this site was considered too small to accommodate the required infrastructure. Further details are contained in **Application Document 8.2 Historic Report 2 (Options Selection and Design Evolution)**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**
		Consultation, Combined effect of the proposed Project, Socio-economic. recreation and tourism, alternative solutions, water environment	**Question 2** **What do you think about how our proposals have evolved? Do you think that this is an improvement on what we presented previously?** Answer – I think the changes are negative. **Tell us more about why you selected this option and anything else you would like use to take into consideration.** As detailed in the answers provided to the questions raised in the Statutory Consultation regarding both the route for the Sealink Project in Suffolk and the location of the converter and sub-stations, I would preface my responses with the overarching comment that, had National Grid adopted a more inclusive approach from the outset and engaged with local landowners	N	National Grid has carefully considered all feedback submitted in response to its pre-application public consultations when developing its plans. Throughout the development of the proposals, it has sought to show how feedback has informed the development of the plans. For example, the Project Overview Document published as part of the Statutory consultation specifically addresses how feedback had informed changes to its plans, whilst the Non-Statutory Consultation Report published at this consultation considers in further detail feedback received to the Non-statutory consultation. This Consultation Report provides a detailed analysis of feedback received to National Grid's pre-application public consultations on the Proposed Project, along with how this feedback informed the development of its plans. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			regarding their requirements, then it is possible that the current designs could have been modified to minimise their impact on the natural environment, landscape and farming businesses. Notwithstanding my answer to Question 1, the refinement of the proposed route for the cables and the associated proposed location of the converter station fail to reflect the impact of the proposed development on both the wider landscape and farmers in the locality. The site for the proposed converter station lies within a strategic landscape identified within the Saxmundham Neighbourhood Plan, adopted in July 2023, being a 'wide-open plateau' and providing a clear division between the town and the surrounding countryside along the wooded ridge line. The development of converter station would irreversibly destroy this landscape feature. In respect of the proposed development, I consider that the proposal fails to reflect; the overall cost to develop the cable route corridors and converter site at the location shown, as opposed to alternative sites, notably the proposed Transformer site at Friston (see below); the accessibility of the converter site for both its' construction and long term maintenance consideration of the proposed transformer site at Friston to be developed by Scottish Power Renewables as an alternative option; the impact of the cable routes and development of the converter site on the respective farming businesses affected by the Project land drainage issues arising from the laying of the cables land drainage and discharge of water issues arising the development of the converter station on the site identified; the impact on planning and diversification opportunities arising form the proposed development of the converter station; the impact on road infrastructure; the impact on adjoining residential properties; the impact on geophysical features; the impact on the proposed bio-diversity and ecological mitigation being implemented by Scottish Power Renewables as part of the EA1 (North) and EA2 Projects; the impact on local ecology, notably badger setts, house martin colony's, bats and hares; and		**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Concerns about land drainage are recognised, however, once the HVDC cable has been laid, land will be reinstated to its previous condition and the converter station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems (commitment W06 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**). Further details are contained in **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and Substation siting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. It is acknowledged that there will be some residual localised impacts arising from the Proposed Project, however, National Grid has considered the important viewpoints identified within the Neighbourhood Plan and these have informed the assessment of the ES, alongside engagement with the Town Council and the local planning authority. This has also informed the proposed mitigation plans, including proposed woodland on the western edge of the converter station site. Mitigation planting along the permanent access route has also been developed in collaboration with the cultural heritage team. Further details are contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1)**. Analysis of the site within the context of the surrounding area indicates that historically there is evidence of blocks of woodland on this site. The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. National Grid will continue to liaise with affected landowners on an ongoing basis. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			the social economic impact of the development on the locality and farming business in particular.		National Grid is working closely with East Anglia ONE North and East Anglia TWO to ensure that it coordinates development efforts effectively where it is feasible to do so and seeking to avoid harm to mitigation measures approved through those projects' respective DCOs. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken, informed by consultation with key stakeholders, and a rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Similarly, with regard to impacts on the surrounding area, Management Plans have been prepared for both Suffolk and Kent as part of the DCO application. These have been developed in consultation with the relevant local planning authorities and provide details on PRoW or road diversions, closures and management during the construction, operation and decommissioning phases. With regard to some of the feedback made, information can be found in the following documents: • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.6 Part 2 Suffolk Agriculture and Soils; and** • **Application Document 6.2.2.5 Part 2 Suffolk Geology and Hydrogeology.** Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Onshore route location	**Question 3** **What do you think about our proposal to connect into the existing network via the proposed Friston substation?** Answer – I think that this is the best location for connecting into the existing network. **Tell us more about why you selected this option and anything else you would like us to take into consideration.** As set out in answers to the other questions raised, my view is that 'if' justification for the development of the Sealink Project is ultimately determined, then it naturally follows that to minimise its' impact on the natural environment, landscape and farming businesses, associated connection to the existing network should be colocated on a single site; i.e. that proposed to be built at Friston.	N	National Grid acknowledges this feedback. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Onshore route location, Alternative solutions	**Question 4** **What do you think about our proposed HVAC cable route in Suffolk** Answer – I agree with some elements of the proposed cable route, but disagree with others. **Tell us more about why you selected this option and anything else you would like us to take into consideration.** As a result of the proposed location of the converter station on Wood Farm, Saxmundham, to minimise the overall length of the cable, the ensuing proposed HVAC cable route passes directly through the Christmas tree plantations established on the land owned by my neighbour, Ian Rix. To minimise the impact of the Project on the Christmas tree enterprise situate at Redhouse Farm, I believe that Sealink should consider the re-alignment of the route to the north of that currently proposed, such that it runs to the north and parallel with the B1119 Leiston Road before then crossing back across the road and heading directly to the sub-station site at Friston. I attach below a schematic plan showing indicatively a potential route. It should be noted that the route passes through my own land which, subject to agreement of terms, I would be prepared to support although I remain of the view that the converter station would be better co-located with the sub-station at Friston.	Y	A staged approach was adopted to identify corridors and preliminary routeing and siting options for the Proposed Project, considering environmental and socioeconomic factors as well as technical and engineering design considerations, and cost. The approach was used to identify 'on-balance' preferences for landfalls, converter station sites and potential route corridors within which preliminary alignments could be developed. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site Areas. Details of the appraisal process are set out in **Application Document 8.2 Option Selection and Design Evolution Report (October 2023) and Application Document 8.1 Corridor and Preliminary Routeing and Siting Study (October 2022)**. Information on the selection of the cable route is contained in **Application Document 8.3 Strategic Options Report (October 2023)**. National Grid acknowledges that there will be some temporary impacts on the landscape as a result of the proposed HVDC cable route. Efforts have been made to ensure that the design of the Proposed Project is compliant with the purpose of National Landscapes, which is to 'to conserve and enhance the beauty of the area'. As such, no above ground infrastructure will be constructed within the National Landscape, while careful consideration has been given to the ways in which development outside of the designation may

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					affect its setting. Following construction, the HVDC cable route, including farmland, will be fully reinstated. Alternative routes to avoid the Christmas Tree plantation have been reviewed and assessed and on balance the route through the plantation still represents the best route. The corridor has however been minimised to ensure that there is as smaller impact on the Christmas Trees as possible by the Proposed Project – see **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.** Once installed there will be limitations of what can be planted above the cables and within the easement however this doesn't preclude all planting.
		Converter station location, Alternative solutions, combined effect of the proposed Project, water environment, soil, landscape and visual	**Question 5** **What do you think about our proposed converter station, including its proposed location?** Answer – I do not think the converter station is in the right location. **Tell us more about why you selected this option and anything else you would like us to take into consideration.** The site for the proposed converter station lies within a strategic landscape identified within the Saxmundham Neighbourhood Plan, adopted in July 2023, being a 'wide-open plateau' and providing a clear division between the town and the surrounding countryside along the wooded ridge line. The development of converter station would irreversibly destroy this landscape feature. There will be considerable water run-off from the proposed converter station site and, although an 'attenuation pond' is proposed, I am concerned that the existing watercourses and drains will be overwhelmed by the additional water generated from the site. I remain of the view that the location of the converter station should, to minimise both its' and the associated cable routes' impact on the natural environment, landscape and farming activities, be co-located on the Scottish Power Renewables site at Friston or, should this not be an option, further consideration be given to its location to the site identified in the recent Eurolink Consultation off the Aldeburgh Road on the Blackheath Estate. In my opinion, only the development of converter station on the proposed substation site at Friston will minimise disturbing land with a heavier soil type and thus obviating associated reinstatement issues and, to date, no explanation of why the converter station could not be located on the proposed substation site at Friston have been provided, as this would reduce the	N	Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.** Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site areas It is acknowledged that there will be some residual localised impacts arising from the Proposed Project, however, National Grid has considered the important viewpoints identified within the Neighbourhood Plan and these have informed the assessment of the ES, alongside engagement with the Town Council and the local planning authority. This has also informed the proposed mitigation plans, including proposed woodland on the western edge of the converter station site. Mitigation planting along the permanent access route has also been developed in collaboration with the cultural heritage team. Analysis of the site within the context of the surrounding area indicates that historically there is evidence of blocks of woodland on this site. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime). In addition, where the project interacts with existing land drainage, there is a Project commitment, secured through the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. See commitment W06 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. Further details

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			overall project costs by reducing the length of the cabling to be installed and create a single 'energy hub', that could then be landscaped.		are contained in **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document Corridor Preliminary Routeing and Substation Siting Study (October 2022)**, sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. Since the LionLink (formally known as Eurolink) consultation, NGV and National Grid have agreed to collocate converter stations and associated infrastructure in order to minimise the risk of more widespread visual impacts within this area.
		Design, Landscape and visual	**Question 6** **Which approach(es) would you like to see explored at later design stages?** Answer – Green roof. **Tell us more about why you selected the above option(s) and anything else you would like us to take into consideration.** I have opted for the 'Green Roof' option, as I consider that this will potentially enable the visual impact of the development to be minimised when viewed from the Public Highway against the surrounding landscape and skyline.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location, Landfall location, ecology and biodiversity, landscape and visual	**Question 7** **What do you think about our proposed HVDC cable route in Suffolk?** Answer – I agree with some elements of the proposed cable route but disagree with others. **Tell us more about why you selected this option and anything else you would like us to take into consideration.** To minimise the impact of the proposed development on both the natural environment (ecology and bio-diversity) and landscape, my view is that the shortest route for the cable corridor should be adopted between the landfall site and the converter station, having regard to existing farming enterprises and natural features along its' proposed route. The objective of the Project should be to minimise the impact of the route of the cable corridor through the through the Suffolk Heritage Coast and the Suffolk Coast and Heath AONB.	N	A staged approach was adopted to identify corridors and preliminary routeing and siting options for the Proposed Project, considering environmental and socioeconomic factors as well as technical and engineering design considerations, and cost. The approach was used to identify 'on-balance' preferences for landfalls, converter station sites and potential route corridors within which preliminary alignments could be developed. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site Areas. Details of the appraisal process and selection of the cable route are set out in **Application Document 8.2 Option Selection and Design Evolution Report (2023) and Application Document 8.1 Corridor and Preliminary Routeing and Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023)**. National Grid acknowledges that there will be some temporary impacts on the landscape as a result of the proposed HVDC cable route. Efforts have been made to ensure that the design of the Proposed Project is compliant with the purpose of National Landscapes, which is to 'to conserve and enhance the beauty of the area'. As such, no above ground infrastructure will be

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					constructed within the National Landscape, while careful consideration has been given to the ways in which development outside of the designation may affect its setting. Following construction, the HVDC cable route, including farmland, will be fully reinstated.
		Onshore route location, Agriculture and soils	I consider that the proposed route: between the landfall site and Grove Road, Friston, will achieve the objectives described above and will minimise disruption to farming businesses due to the prevailing soil type (light sandy soils). from Grove Road, Friston to the proposed converter station there will be significant damage to the soil structure and the drainage on heavier land, i.e. clay soils. It should be noted that where the route for the cable corridor crosses heavier land, it is likely that the soil structure will take up to 20 years to recover once it has been stripped and subsequently reinstated.	N	National Grid acknowledges these comments based on knowledge of the local area. All soil handling (stripping, stockpiling and reinstatement) will be undertaken in accordance with good practice. **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site-specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. This includes the requirement for the suitable storage of topsoil and subsoil and erosion/weed growth prevention. Please see response above for details of the appraisal process and selection of the cable route.
		Onshore route location, Alternative solutions, Land rights and CPO	As previously highlighted, the proposed route passes though established Christmas tree plantations at Redhouse Farm. To obviate the impact of the proposed route, I attach below a schematic plan showing indicatively an alternative proposition. It should be noted that the route passes through my own land which, subject to agreement of terms, I would be prepared to support, although I remain of the view that the converter station would be better co-located with the sub-station at Friston.	Y	Alternative routes to avoid the Christmas Tree plantation have been reviewed and assessed and on balance the route through the plantation still represents the best route. The corridor has, however, been minimised to ensure that there is as smaller impact on the Christmas Trees as possible by the Proposed Project. Once installed there will be limitations of what can be planted above the cables and within the easement; however, this doesn't preclude all planting.
		Landfall location	**Question 8** **What do you think about our proposed landfall between Aldeburgh and Thorpeness?** Answer – I think this is the best location for the landfall. **Tell us more about why you selected this option and anything else you would like us to take into consideration.** I consider this the best location for the landfall, as it minimises disruption to both the natural environment (ecology and bio-diversity) and landscape, whilst at the same time providing an opportunity to re-locate the converter station on the transformer site at Friston, as previously described, to create an energy hub.	N	National Grid acknowledges the respondent's support of the proposed landfall site.
		Coordination with other Projects,	**Question 9** **Our proposals include the option of co-locating infrastructure with that of up to two other projects, if they**	N	The benefits to co-location with other projects are recognised because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Alternative solutions	**are required. Do you support this approach? Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects** Answer – I support co-location, so long as the converter site is re-located to the Friston sub-station site. **Co-locating up to three converter stations at a single location near Saxmundham:** Answer – I support co-location, but not at the proposed site near Saxmundham, but rather on the Friston sub-station site. **Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness:** Answer – I support co-location, if this helps enable the re-location of the converter site to the Friston sub-station site. **Are there other ways you would like us to explore coordination with other projects?** To minimise the impact of the proposed developments in East Suffolk, great coordination and planning between the projects must be an imperative, given the delivery timescales being proposed and the uncompensated professional and legal costs being incurred by landowners as a result of the consultations and the requests for access and information (landownership and occupation). Where practical, cable corridor routes should be shared to minimise impact on the natural environment, landscape and farming businesses but I would ask that a further review of the planned location of the converter station be implemented, as; only the development of converter station on the proposed substation site at Friston will minimise disturbing land with a heavier soil type and thus obviating associated reinstatement issues; and no explanation of why the converter station could not be located on the proposed substation site at Friston have been provided, as surely this would reduce the overall project costs by reducing the length of the cabling to be installed and create a single 'energy hub', that could then be landscaped?		surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors, etc. National Grid is maintaining ongoing dialogue with NGV regarding the possibility of co-locating new infrastructure. However, these are separate projects being promoted by different developers and working to different timescales for delivery. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the co-location of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. With regard to the converter stations at Saxmundham, the process of site identification is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints. The proposed approach for co-locating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area. Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.** The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and substation Siting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. Choice of cable corridors for each project is determined by the landfall location, which is in turn determined by factors affecting the marine route of sub-sea cables. National Grid acknowledges that development may cause concern to landowners. Diminution in property value known as 'injurious affection' and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					any other appropriate heads of claim will be considered on an individual basis in accordance with current legislation. The Compulsory Purchase Compensation Code allows for a claim of compensation for the loss that property owners may have suffered as a direct result of the retained part of their property ownership being worth less as a direct result of the works.
		Converter station location, Alternative solutions	**Question 10** **Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?** I am the owner of the land shown coloured green on the plans below, know as Fristonmoor Barn, Saxmundham. As stated in answer to Questions 4 and 7 above, should it not be possible for the converter station to be re-located from the current site at Wood Farm, Saxmundham, to the sub-station site at Friston then, subject to agreement of terms, I would be supportive of the re-alignment of both the HCDC and HVAC cable routes through the arable field forming part of Land Registry Title No. [REDACT SK290870].	Y	National Grid acknowledges this request which has been considered in the design change review process. Alternative routes to avoid the Christmas Tree plantation have been reviewed and assessed and on balance the route through the plantation still represents the best route – see **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.** The corridor has however been minimised to ensure that there is as smaller impact on the Christmas Trees as possible by the Proposed Project. Once installed there will be limitations of what can be planted above the cables and within the easement; however, this doesn't preclude all planting.
		Converter station location, Terrestrial ecology	**I would like to further highlight:** that the impact on the ecology and biodiversity of Wood Farm, Redhouse Farm that will result from the construction of the converter station (or co-location of up to three stations) on the land identified at Wood Farm has not been properly assessed or considered.	N	The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. Details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. All land within the Order Limits has been assessed.
		Design, Water environment	I have been advised by my drainage consultant that any cables should be laid ‘below’ a depth of 1500mm, as the bottom of the land drainage pipes and surrounding shingle will, in places, be at 1500mm to allow for falls across the field. The proposal to therefore lay at a nominal cover of 900mm is deficient.	Y	Based on feedback received during the consultation process, the typical depth of the cable trenches will be 1.5 m, see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** for further information. The minimum depth of burial of the cable to the top of the protective tile will be 0.9 mm. In some instances, subject to discussion and agreement with the landowner this may be deeper, but this will depend on cable design.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Any disturbance to or modifications required to the current land drainage system will be incorporated into the construction scope to ensure the land is properly reinstated and drains are left in no worse condition than prior to construction. The cable routes will be reinstated post construction to allow the previous farming operations to continue.
		Coordination with other Projects, Alternative solutions, Consultation	**Question 11** **Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?** Although I am not qualified to comment specifically on the offshore study area, a detailed explanation of why the proposed development could not form part of a strategic energy grid forming a ring main around the East Anglian coast (and beyond) should be published. Given both the offshore wind projects proposed to be built around the East Anglian coast by Scottish Power Renewables and others and the inter connector projects proposed by National Grid, surely the time has come for a co-ordinated approach to the delivery of energy security overseen by Central Government.	N	National Grid supports coordinated approaches to consenting and delivery with other projects where opportunities are available. However, the projects listed are being promoted by different developers and working to different timescales for delivery. It is therefore not possible to bring all these different projects forward at the same time as they are at varying different stages of development. Delaying the more advanced projects in this area to allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets.

Table 1.36 SL-PIL-0021, SL-PIL-0023, SL-PIL-0067

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Design, Combined effect of the proposed Project, traffic and transport, socio-economics, water environment, geophysical, ecology and biodiversity	**Question 1** **Do you support the principle of reinforcing the network in this location?** Answer – 'No'. **Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?** In my opinion, justification for the need to reinforce the network between Suffolk and Kent has not, to date, been provided by National Grid. At a recent private meeting with Dr Therese Coffey at Redhouse Farm, she advised that reinforce of the network at this time was not required, i.e. there was already sufficient capacity and that, 'if' greater capacity was required in London, then this would be better facilitated by providing a connection between Kent and Bradwell-on-Sea in Essex. **Question 2** What do you think about how our proposals have evolved? Do you think that this is an improvement on what we presented previously? Answer – I think the changes are negative. Tell us more about why you selected this option and anything else you would like use to take into consideration. Notwithstanding my answer to Question 1, the refinement of the proposed route for the cables and the associated proposed location of the converter station fail to reflect the impact of the proposed development on both the landscape and farmers in the locality. The site for the proposed converter station lies within a strategic landscape identified within the Saxmundham Neighbourhood Plan, adopted in July 2023, being a 'wide-open plateau' and providing a clear division between the town and the surrounding countryside along the wooded ridge line. The development of converter station would irreversibly destroy this landscape feature. In respect of the proposed development, I consider that the proposal fails to reflect; the overall cost to develop the cable route corridors and converter site at the location shown, as opposed to alternative	N	National Grid has carefully considered all feedback submitted in response to its pre-application public consultations when developing its plans. Throughout the development of the proposals, it has sought to show how feedback has informed the development of the plans. For example, the Project Overview Document published as part of the Statutory consultation specifically addresses how feedback had informed changes to its plans, whilst the Non-Statutory Consultation Report published at this consultation considers in further detail feedback received to the Non-statutory consultation. This Consultation Report provides a detailed analysis of feedback received to National Grid's pre-application public consultations on the Proposed Project, along with how this feedback informed the development of its plans. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Concerns about land drainage are recognised, however, once the HVDC cable has been laid, land will be reinstated to its previous condition and the converter station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems (commitment W06 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**). Further information is contained in **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. It is acknowledged that there will be some residual localised impacts arising from the Proposed Project, however, National Grid has considered the important viewpoints identified within the Neighbourhood Plan and these have informed the assessment of the ES, alongside engagement with the Town Council and the local planning authority. This has also informed the proposed mitigation plans, including proposed woodland on the western edge of the converter station site. Mitigation planting along the permanent access route has also been developed in collaboration with the cultural heritage team. Proposed planting is detailed in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**. Analysis of the site within the context of the surrounding area indicates that historically there is evidence of blocks of woodland on this site.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			sites, notably the proposed Transformer site at Friston (see below); the accessibility of the converter site for both its' construction and long-term maintenance consideration of the proposed transformer site at Friston to be developed by Scottish Power Renewables as an alternative option; the impact of the cable routes and development of the converter site on the respective farming businesses affected by the Project land drainage issues arising from the laying of the cables land drainage and discharge of water issues arising the development of the converter station on the site identified; the impact on planning and diversification opportunities arising from the proposed development of the converter station; the impact on road infrastructure; the impact on adjoining residential properties; the impact on geophysical features; the impact on the proposed biodiversity and ecological mitigation being implemented by Scottish Power Renewables as part of the EA1 (North) and EA2 Projects; the impact on local ecology, notably badger setts, house martin colony's, bats and hares; and the social economic impact of the development on the locality and farming business in particular.		The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. National Grid will continue to liaise with affected landowners on an ongoing basis. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. National Grid is working closely with East Anglia ONE North and East Anglia TWO to ensure that it coordinates development efforts effectively where it is feasible to do so and seeking to avoid harm to mitigation measures approved through those projects' respective DCOs. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken, informed by consultation with key stakeholders, and a rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Similarly, with regard to impacts on the surrounding area, Management Plans have been prepared for both Suffolk and Kent as part of the DCO application. These have been developed in consultation with the relevant local planning authorities and provide details on PRoW or road diversions, closures and management during the construction, operation and decommissioning phases. A complete assessment of socio-economics effects has also been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. With regard to some of the feedback made, information can be found in the following documents: • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.2.6 Part 2 Suffolk Agriculture and Soils; and** • **Application Document 6.2.2.5 Part 2 Suffolk Geology and Hydrogeology.** Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
	Onshore route location	**Question 3** **What do you think about our proposal to connect into the existing network via the proposed Friston substation?** Answer – I think that this is the best location for connecting into the existing network. **Tell us more about why you selected this option and anything else you would like us to take into consideration.** As set out in answers to the other questions raised, my view is that 'if' justification for the development of the Sealink Project is ultimately determined, then it naturally follows that to minimise its' impact on the natural environment, landscape and farming businesses, associated connection to the existing network should be co-located on a single site; i.e. that proposed to be built at Friston.	N	National Grid welcome these comments supporting colocation of infrastructure. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**. National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in A**pplication Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
	Onshore route location, Agriculture and soils, Socio-economic.	**Question 4** **What do you think about our proposed HVAC cable route in Suffolk**	Y	All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		recreation and tourism, traffic and transport	Answer – I disagree with the proposed cable route. Tell us more about why you selected this option and anything else you would like us to take into consideration. The proposed HVAC cable route passes directly through Redhouse Farm. A detailed explanation of the impact of the cable route is provided in answer to Question 10 but, in summary, the key enterprises to be impacted by the development of the Project will be; the established Christmas tree plantations (long term / permanent impact due to loss of trees within the working strip and sterilisation of the easement strip); Redhouse Christmas Barn (short and medium term impact during the construction period and long-term impact post completion due to loss of client base and associated losses resulting from the sterilisation of the planting areas; Weddings at Redhouse Barn (medium term impact before, during and post completion of the construction work to enable the enterprise to be re-established), and long-term impact on the general 'setting' of the venue once the converter station(s) have been built; Poultry Sheds (short term impact during the construction period due to potential bio-security risks associated with construction workers on site and impact on ability to spread manure from the buildings on land, reducing reliance on inorganic fertiliser and improvement of soil structure. Industrial Units (short term impact during the construction period due to potential disruption to deliveries, dust (noting one tenant resprays classic cars); and Holiday Lets (three cottages) medium term impact, before, during and post construction due to clients being put off staying at the properties due to the general disruption associated with the construction of the converter station and laying of the cables. It should be noted that ultimately whatever route is taken for the cable corridor, save for the fields within which the Christmas trees plantations are established, it will cross heavier land where there will be significant damage to both soil structure and land drainage, with the former taking at least 20 years to recover. If the converter station is developed at the site shown within the consultation documentation, then I would ask that the associated HVAC cables be laid along a route avoiding direct impact on the Christmas tree plantations at Redhouse Farm. The annotated		Compensation claims for other disturbance, such as loss of ability to irrigate a part of a field during the construction phase, are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. All soil handling (stripping, stockpiling and reinstatement) will be undertaken in accordance with good practice. **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site-specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. This includes a requirement for an Aftercare Management Plan to be produced; this will include all measures required post-restoration to ensure the recovery of the soils to pre-construction condition. In addition, National Grid acknowledges the concerns regarding the cable route which have been considered in the design change review process. Alternative routes to avoid the Christmas Tree plantation have been reviewed and assessed and on balance the route through the plantation still represents the best route. The corridor has however been minimised to ensure that there is as smaller impact on the Christmas Trees as possible by the Sea Link project. Once installed there will be limitations of what can be planted above the cables and within the easement; however, this doesn't preclude all planting. Acknowledging the well-established commercial activities that are located in this area, a complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. A staged approach was adopted to identify corridors and preliminary routeing and siting options for the Proposed Project, considering environmental and socioeconomic factors as well as technical and engineering design considerations, and cost. The approach was used to identify 'on-balance' preferences for landfalls, converter station sites and potential route corridors within which preliminary alignments could be developed. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			aerial image below, shows my preferred route for the cables marked in red.		Information on the selection of the cable route and appraisal process is contained in **Application Document 8.2 Option Selection and Design Evolution Report (October 2023) and Application Document 8.1 Corridor and Preliminary Routeing and Siting Study (October 2022) and Application Document 8.3 Strategic Options Report (October 2023)**.
		Converter station location, Water environment, Alternative solutions, soil	**Question 5** **What do you think about our proposed converter station, including its proposed location?** Answer – I do not think the converter station is in the right location. Tell us more about why you selected this option and anything else you would like us to take into consideration. The site for the proposed converter station lies within a strategic landscape identified within the Saxmundham Neighbourhood Plan, adopted in July 2023, being a 'wide-open plateau' and providing a clear division between the town and the surrounding countryside along the wooded ridge line. The development of converter station would irreversibly destroy this landscape feature. There will be considerable water run-off from the proposed converter station site and, although an `attenuation pond' is proposed, I am concerned that the existing watercourses and drains will be overwhelmed by the additional water generated from the site. I remain of the view that the location of the converter station should, to minimise both its' and the associated cable routes' impact on the natural environment, landscape and farming activities, be co-located on the Scottish Power Renewables site at Friston or, should this not be an option, further consideration be given to its location to the site identified in the recent Eurolink Consultation off the Aldeburgh Road on the Blackheath Estate. In my opinion, only the development of converter station on the proposed substation site at Friston will minimise disturbing land with a heavier soil type and thus obviating associated reinstatement issues and, to date, no explanation of why the converter station could not be located on the proposed substation site at Friston have been provided, as this would reduce the overall project costs by reducing the length of the cabling to be installed and create a single 'energy hub', that could then be landscaped.	Y	Information on the selection of the converter station location and the need for the Proposed Project is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.3 Strategic Options Report (October 2023), Application Document 7.2 Strategic Options Back Check Report and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered.** The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime). In addition, where the project interacts with existing land drainage, there is a Project commitment, secured through the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. See commitment W06 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. Further details are contained in **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. The landscape and visual team have been a key discipline when determining the route of the required cables. This has been developed to minimise effects on the landscape character, including avoiding landscape features where possible and visual amenity, including limiting the infrastructure in views from sensitive receptors including residential and recreational receptors. It should also be noted that the effects arising from the cable routes will be temporary and that reinstatement of the cable corridors will occur following the construction period as far as practically possible. The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** sets out the site requirement criteria. Furthermore, additional development at Friston would undermine the landscape mitigation scheme that has been agreed under the DCO's for East Anglia ONE North and East Anglia TWO.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design, Landscape and visual	**Question 6** **Which approach(es) would you like to see explored at later design stages?** Answer – Green roof. **Tell us more about why you selected the above option(s) and anything else you would like us to take into consideration.** I have opted for the 'Green Roof' option, as I consider that this will potentially enable the visual impact of the development to be minimised when viewed from Redhouse Farm against the surrounding landscape and skyline.	N	National Grid acknowledges this feedback and the interest in the Proposed Project. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A set of Design Principles for the building will be provided with the application for development consent (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process.
		Onshore route location, Landfall location, ecology and biodiversity, landscape and visual	**Question 7** **What do you think about our proposed HVDC cable route in Suffolk?** Answer – I agree with some elements of the proposed cable route, but disagree with others. Tell us more about why you selected this option and anything else you would like us to take into consideration. To minimise the impact of the proposed development on both the natural environment (ecology and bio-diversity) and landscape, my view is that the shortest route for the cable corridor should be adopted between the landfall site and the converter station, having regard to existing farming enterprises and natural features along its' proposed route. The objective of the Project should be to minimise the impact of the route of the cable corridor through the through the Suffolk Heritage Coast and the Suffolk Coast and Heath AONB. I consider that the proposed route; between the landfall site and Grove Road, Friston, will achieve the objectives described above and will minimise disruption to farming businesses due to the prevailing soil type (light sandy soils). from Grove Road, Friston to the proposed converter station there will be significant damage to the soil structure and the drainage on heavier land, i.e. clay soils. It should be noted that where the route for the cable corridor crosses heavier land, it is likely that the soil structure will take up to 20 years to recover once it has been stripped and subsequently reinstated. The proposed route passes though established Christmas tree plantations at Redhouse Farm, which will have a significant long-term impact on both this enterprise and those associated	N	All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance, such as loss of ability to irrigate a part of a field during the construction phase, are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. All soil handling (stripping, stockpiling and reinstatement) will be undertaken in accordance with good practice. **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site-specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. This includes a requirement for an Aftercare Management Plan to be produced; this will include all measures required post-restoration to ensure the recovery of the soils to pre-construction condition. A staged approach was adopted to identify corridors and preliminary routeing and siting options for the Proposed Project, considering environmental and socioeconomic factors as well as technical and engineering design considerations, and cost. The approach was used to identify 'on-balance' preferences for landfalls, converter station sites and potential route corridors within which preliminary alignments could be developed. Each of the options identified for the converter site areas and cable route corridors were appraised in accordance with National Grid's approach to options appraisal. In addition, in the absence of guidance for specific siting of converter stations, the Horlock Rules were applied. Although these were developed for the siting of substations, they were considered appropriate to use when identifying and appraising converter site Areas.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			therewith. Please refer to Question 10 for further information and commentary. If the converter station is developed at the site shown within the consultation documentation, then I would ask that the associated HVDC cables be laid along a route avoiding direct impact on the Christmas tree plantations at Redhouse Farm. The annotated aerial image below, shows my preferred route for the cables marked in red.		Details of the appraisal process and site selection are set out in **Application Document 8.2 Option Selection and Design Evolution Report (October 2023) and Application Document 8.1 Corridor and Preliminary Routeing and Siting Study (October 2022)** and **Document 8.3 Strategic Options Report (October 2023)**. National Grid acknowledges that there will be some temporary impacts on the landscape as a result of the proposed HVDC cable route. Efforts have been made to ensure that the design of the Proposed Project is compliant with the purpose of National Landscapes, which is to 'to conserve and enhance the beauty of the area'. As such, no above ground infrastructure will be constructed within the National Landscape, while careful consideration has been given to the ways in which development outside of the designation may affect its setting. Following construction, the HVDC cable route, including farmland, will be fully reinstated. In addition, National Grid acknowledges the concerns regarding the cable route which have been considered in the design change review process. Alternative routes to avoid the Christmas Tree plantation have been reviewed and assessed and on balance the route through the plantation still represents the best route. The corridor has however been minimised to ensure that there is as smaller impact on the Christmas Trees as possible by the Sea Link project. Once installed there will be limitations of what can be planted above the cables and within the easement; however, this doesn't preclude all planting. Acknowledging the well-established commercial activities that are located in this area, a complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.
		Landfall location	**Question 8** **What do you think about our proposed landfall between Aldeburgh and Thorpeness?** Answer – I think this is the best location for the landfall. **Tell us more about why you selected this option and anything else you would like us to take into consideration.** I consider this the best location for the landfall, as it minimises disruption to both the natural environment (ecology and bio-diversity) and landscape, whilst at the same time providing an opportunity to re-locate the converter station on the transformer site at Friston, as previously described, to create an energy hub.	N	National Grid acknowledges the respondent's support of the proposed landfall site.
		Coordination with Other Projects, Alternative Solutions,	**Question 9** **Our proposals include the option of co-locating infrastructure with that of up to two other projects, if they are required. Do you support this approach?**	N	The benefits to co-location with other projects are recognised because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors, etc. National Grid is maintaining ongoing dialogue with

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects: Answer – I support co-location, so long as the converter site is re-located to the Friston sub-station site. **Co-locating up to three converter stations at a single location near Saxmundham:** Answer – I support co-location, but not at the proposed site near Saxmundham, but rather on the Friston sub-station site. **Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness:** Answer – I support co-location, if this helps enable the re-location of the converter site to the Friston sub-station site. **Are there other ways you would like us to explore coordination with other projects?** To minimise the impact of the proposed developments in East Suffolk, great coordination and planning between the projects must be an imperative, given the delivery timescales being proposed and the uncompensated professional and legal costs being incurred by landowners as a result of the consultations and the requests for access and information (landownership and occupation). Where practical, cable corridor routes should be shared to minimise impact on the natural environment, landscape and farming businesses but I would ask that a further review of the planned location of the converter station be implemented, as; only the development of converter station on the proposed substation site at Friston will minimise disturbing land with a heavier soil type and thus obviating associated reinstatement issues; and no explanation of why the converter station could not be located on the proposed substation site at Friston have been provided, as surely this would reduce the overall project costs by reducing the length of the cabling to be installed and create a single 'energy hub', that could then be landscaped?		NGV regarding the possibility of co-locating new infrastructure. However, these are separate projects being promoted by different developers and working to different timescales for delivery. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the co-location of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. With regard to the converter stations at Saxmundham, the process of site identification is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints. The proposed approach for co-locating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area. The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. Choice of cable corridors for each project is determined by the landfall location, which is in turn determined by factors affecting the marine route of sub-sea cables. National Grid acknowledges that development may cause concern to landowners. Diminution in property value known as 'injurious affection' and any other appropriate heads of claim will be considered on an individual basis in accordance with current legislation. The Compulsory Purchase Compensation Code allows for a claim of compensation for the loss that property owners may have suffered as a direct result of the retained part of their property ownership being worth less as a direct result of the works.
		Land rights and CPO, Needs case, Design	**Question 10** **Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?** I am the owner and occupier of the property, known as Redhouse Farm, Sternfield, Saxmundham, comprising Land Registry Title Nos. SK258213, SK363555 and SK312683.	N	The consultation undertaken in October 2023 was the Statutory consultation, undertaken in accordance with the Planning Act 2008. Following this, the timescales for submission of the DCO application have changed. Details of the programme are however maintained on the Proposed Project website and National Grid will maintain dialogue with affected landowners. The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			On 21st August 2023, a meeting was convened at Redhouse Farm, to discuss the potential implications of the National Grid Sealink Project developing 'Site 3' (now the identified site) as a converter station, with the resulting need to lay cables across Redhouse Farm to link the site to the sub-station site at Friston. The following is an extract from subsequent correspondence circulated to the agents acting for both the Sealink Project by my agents' Brown & Co, outlining the implications of the proposed route for the cable corridors and suggesting potential alternative routes. The key objective of the meeting was to facilitate dialogue directly between National Grid and our client, to ensure that should a decision ultimately be taken to locate the Sealink Transformer at Site 3 (Saxmunham) and its' associated infrastructure (i.e. the cable corridors) across Redhouse Farm as currently proposed, your client is aware of the impact (financially, physically and mentally) that this will have on my client, his family and the diversified enterprises on the holding. One point that was not touched upon at the meeting, given the cost per kilometre of the cabling, was 'why the Transformer site could not be co-located with those of SPR on the land that is being acquired from our client beside Grove Wood'? I would appreciate James Buckley providing a 'Janet and John' explanation for the rationale that led to this option being discounted in the first instance. More generally, I noted that; following the initial consultation exercise in October 2022, a second round of 'non-statutory' public consultation is planned to be undertaken this autumn (24th October); assuming that there are no significant issues arising from the consultation, a DCO application will be submitted in September / October 2024; with work then aimed to start on site in 2026. it is proposed that 'non-intrusive' surveys will commence on 4th September 2023, with 'intrusive' surveys following thereafter; although no definitive route has yet been agreed, the second round of consultation in 2023 will show preferred options; a final decision on the location of the Transformer Site and the associated cable corridors will ultimately be subject to review against the following key criteria; – ecological impact; – socio economic impact; – traffic movement impact;		**Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** sets out the site requirement criteria. Furthermore, additional development at Friston would undermine the landscape mitigation scheme that has been agreed under the DCO's for East Anglia ONE North and East Anglia TWO. While Proposed Project timeline has changed since the target dates presented at non-statutory consultation, key milestones, including periods of statutory consultation and the targeted DCO submission, have been kept up to date on the project website throughout the pre-application period. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project. National Grid acknowledges the diverse range of activities that are present on the land at Redhouse Farm and a complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			– archaeological impact; – engineering requirements. due to the Planning Inspectors comments in relation to the infrastructure connected with the Scottish Power Renewables' Projects, it is anticipated that the Transformer requirements for Sealink, Lionlink and Nautilus (if not built on the Isle of Grain) will all be 'co-located'; i.e. where one goes the others will follow. the DC cable route will comprise two cables set within a 2300mm wide trench and requiring a 30 to 40m wide working width and a permanent easement of 15 to 20m; the AC cable route will comprise six cables set within two 2300mm wide trenches, with a 7000mm gap between. The overall working width was not discussed, but it is assumed that a 25 to 30m easement would be required. temporary and permanent access routes and compound areas required for the Project are not yet finalised as remain 'fluid' and up for discussion. that the approximate cost for the cabling is £10m per kilometre. From my clients' perspective, he highlighted; the continuing problems with land drainage resulting from the 'intrusive' surveys undertaken by SPR; his concerns that the surveys and subsequent development of the scheme will have on his cropping in general and the associated farm enterprises (see specific comments below); the location of the existing and proposed Christmas tree planting (as shown marked in red on the attached plan); the impact on his farming business of losing a minimum of 38.25 hectares of land for the SPR Transformer and Sub-Station site; the location for a proposed new reservoir to provide irrigation for the Christmas trees (as shown marked in blue on the attached plan, to the rear of the duck sheds) the 'improved' condition of the farm access leading to the cottages, wedding barn, units and farm buildings at Redhouse Farm; and the presence of the bridleway and footpaths through Redhouse Farm. As our client explained, he purchased Redhouse Farm in 2003, with subsequent land acquisitions made as adjoining land became available. The farm currently extends to 193 hectares and is 'owner / occupied'.		

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			As a result of the Scottish Power Renewable EA1 (North) and EA2 Projects, our client will lose a minimum of 38.25 hectares of Grade 2 arable land (with the potential to lose up to a further 17 hectares, if required by the Projects), with no likelihood of being able to replace this locally within the foreseeable future, which in turn will place a greater reliance upon the diversified business that our client has, through substantial capital investment, developed and which includes; oRedhouse Farm Christmas TreesoRedhouse Christmas Barn - https://www.redhousechristmas.com/oRedhouse Farm Holiday Accommodation - https://www.suffolk-secrets.co.uk/aldeburgh-surrounding-villages/sternfield-cottages/sfrhb-red-house-barns-sternfieldoRedhouse Farm Commercial UnitsoSpecialist Duck / Poultry Buildings capable of holding 50,000 DucksoRedhouse Wedding Barn - https://www.redhouseweddings.com/oWhilst, for many landowners and farmers, the laying of cables or other similar infrastructure beneath their land would be potentially viewed as an 'irritation' for one or possibly two growing seasons, for which the disturbance compensation can be easily quantified, as our client explained, the proposed route for the cable corridors will have a permanent impact on the Christmas tree enterprise which is centred around the production of high quality Nordmann Firs for the retail, wholesale and commercial markets. oSince the first trees were planted in 1995, on land belonging to our client at Benhall, he has continued; to plant additional trees on available land on an annual basis to ensure good crop rotation; to harvest the existing growing trees; to invest additional capital in machinery and technology to maximise the productive output and therefore returns from the enterprise; and to expand and build upon the Redhouse Christmas Barn 'brand'. As our client explained, the trees are planted along the 'valley' that runs through the farm, as shown on the attached plan (submitted separately to Dalcour MacLaren 01.11.23). Whilst the soil type on the farm is generally a 'clay loam', through the valley the land reverts to a light sandy soil, ideal for the growing of Christmas trees hence, notwithstanding the rotational issues caused by any disturbance to the trees (see below), it is not practical nor possible to simply relocate the trees from the current location; i.e. on the route of the proposed cable corridor. As the presence of any cables will effectively sterilise a 20m to 30m swathe through the existing planting and with no alternative planting options, this will inevitability lead to a contraction of the enterprise and ensuing losses. Nordmann Firs grow on average approximately 10% in height each year; i.e. they are very slow growing to start with. There are		

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			two periods during their 'life cycle' when the trees are generally harvested; when they are between 6' to 12' in height (for domestic purposes) and then at 20' to 25' (for commercial uses; i.e. city centres, shopping malls, etc.). The growing period from planting to maximum maturity is approximately 20 years. It should be noted that the tap root of the tree will generally be 6' to 10' in depth, therefore directional drilling below the trees would not be an option. The 'Redhouse Christmas Barn' enterprise was started in 1995 and the intervening years have been spent accumulating customers and building an established brand based on home-grown, fresh Christmas trees, such that these customers can arrive, walk through the plantation and specify the Christmas tree of their choice, which is then felled and wrapped whilst they continue to a barn stocked with retail Christmas decorations, as well as a Father Christmas experience for children and fairground-type food and rides. It is the Unique Selling Point of 'home-grown' Christmas trees, which, by its' very nature, cannot be replaced by brought-in trees that clients return for on an annual basis and the loss of this would significantly impact the central tenet of the business and lead to inevitable and significant losses. It should be noted that our client was awarded the 'Grower of the Year Award' in 2010, with the resulting privilege of supplying the Christmas tree for No.10 Downing Street that year, demonstrating that this is not simply a 'side enterprise' to the agricultural business, but a key component thereof.		
		Socio-economic. recreation and tourism, Agriculture and soils, land rights and CPO, needs cse, alternatives, ecology and biodiversity	As described above, Christmas tree production and the Redhouse Christmas Barn are only two of the enterprises on the farm that would be affected by a decision to lay the cables along the route shown. For the duration of the works, there would be significant impact on: both the holiday accommodation and wedding venue, due to the noise disturbance, dust and the general impact on the appearance and approach to the farm resulting from the works; and on the duck / poultry enterprise located on the farm through the bio-security risks associated with vehicle and machinery movements along the cable corridor and the potential to transfer the H5N1 avian flu virus between sites. It should be noted that our clients' three children have now all returned to Redhouse Farm to oversee and manage the diversified enterprises and therefore the project threatens the livelihood of not simply our client but the next generation as well. As discussed with James Buckley, our client accepts that if Site 3 (Saxmundham) is ultimately chosen as the location for the	Y	In developing the Proposed Project, National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality National Grid has carefully considered all feedback submitted in response to its pre-application public consultations when developing its plans. Throughout the development of the proposals, it has sought to show how feedback has informed the development of the plans. For example, the Project Overview Document published as part of the Statutory consultation specifically addresses how feedback had informed changes to its plans, whilst the Non-Statutory Consultation Report published at this consultation considers in further detail feedback received to the Non-statutory consultation. This Consultation Report provides a detailed analysis of feedback received to National Grid's pre-application public consultations on the Proposed Project, along with how this feedback informed the development of its plans. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Sealink Transformer, then the associated cabling will inevitably have to cross his farm at some point to get to the Sub-Station site located on his land at Friston. Having taken on board James' general comments regarding costs, constraints and National Grids' discussions with other landowners, I attach three annotated plans (to be submitted separately to Dalcour MacLaren 01.11.23) showing potential alternative routes which our client would ask National Grid to consider to obviate the impact of the scheme on Christmas tree and associated enterprises located at Redhouse Farm, which will otherwise be decimated. I apologise for the use of such an 'emotive' word, but the reality is that the scheme will cut through our clients' areas of Christmas tree production, shortly no doubt to be followed by Lionlink, effectively ending 30 years of Christmas tree production and undermining the Redhouse Christmas Barn brand. My client remains keen to engage with National Grid both during the formal consultation process and outside of it to minimise the impact to his farming business. Notwithstanding answers provided in response to the previous questions raised in the Feedback Form, I would also like to highlight; my general concerns and previous comments expressed to National Grid and their agents' regarding the proposed location of the converter station and the associated cable corridors, do not appear to have been acknowledged or reflected in the current consultation process; that the development of the land for the converter station (or co-location of up to three stations) will, depending upon the cable routes therefrom connecting the site to the proposed Friston sub-station site, have a significant impact on my diversified farming business, in particular on the production of Christmas trees, as detailed in the correspondence above. that the impact on the ecology and biodiversity of Redhouse Farm and surrounding farm and woodland that will result from the construction of the converter station (or co-location of up to three stations) and the resulting cable routes have not been properly assessed or considered. that when National Grid make their formal application for a Development Consent Order, they will be required to provide evidence to the Inspector at the Public Inquiry of their engagement with landowners and that they acted reasonably in their negotiations therewith. Coupled to that, they will also need to demonstrate that they have not contravened Mr Rix or other landowners Human Rights. Article 1 of the First Protocol (A1P1) to the European Convention on Human Rights states that:		**Application Document 8.1 Corridor Preliminary Routeing and Substation Sting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			"Every natural or legal person is entitled to the peaceful enjoyment of his possessions. No one shall be deprived of his possessions except in the public interest and subject to the conditions provided for by the law and by the general principles of international law. The preceding provisions shall not, however, in any way impair the right of a State to enforce such laws as it deemed necessary to control the use of property in accordance with the general interest or to secure the payment of taxes or other contributions or penalties." Whilst I accept that A1P1 is a qualified right, in that no one shall be deprived of his possessions "except in the public interest and subject to the conditions provided for by law', the rationale for; (a) the construction of the converter station (or co-location of up to three stations), as opposed to its' location on the other sites previously identified or, more practically, for the development of an 'energy hub' at the proposed transformer sub-station site at Friston and (b) the resulting associated routes for the cable corridors across Redhouse Farm will be contested, unless a clear rationale for the requirement and routes has been established.		
		Socio-economic, recreation and tourism, Agriculture and soils, Alternative solutions	In addition to the above, as discussed with National Grid and their agents, the proposed permanent right of way over the main drive and farmland at Redhouse Farm, as shown highlighted in yellow on the annotated plan below. The proposed route shown is opposed on the basis that: the route will destroy the existing Christmas tree plantations within the two fields as indicated on the plan; I have recently spent over £70,000 improving the access leading to the holiday cottages, industrial units and Redhouse Barn and would not wish for this to be damaged as a result of either temporary access or permanent rights being secured over the drive; as described above, the drive is the principal access for all of the alternative (non-farming) enterprises established at Redhouse Farm and its use by third parties has the potential to impact on these enterprises and detract from the 'on farm experience'; the route is beside a deep watercourse into which vehicles have previously driven into, which I can foresee being a potential problem going forward; the route is a Public Right of Way (Bridlepath / Footpath). I attach below and alternative route plan for access to the converter station site, if required from the farm entrance. It is accepted that the land over which the routes are marked does	Y	The compounds and access roads have been altered taking into consideration the feedback provided to minimise the impact on the land holdings of Redhouse Farm.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			not belong to me, but it does provide a more direct route over predominantly existing established agricultural tracks which already take heavy vehicles. With reference to the plan below, the area highlighted in green is shown as a temporary compound for use during the construction phase of the works. This is opposed on the basis that this area forms part of the existing Christmas tree plantation and its' use for this purpose will result in both short and long term financial impact resulting from the loss of the trees and its' impact on the overall viability of the enterprise. From the consultation plans, I note that a small attenuation pond is proposed beside Bldrys Cottages. Not only will this 'again' impact on an area planted up with Christmas trees, but the surrounding land already has been known to flood, despite it being light free draining soil. As previously advised, my drainage consultant has expressed concern that any cables should be laid 'below' a depth of 1500mm, as the bottom of the land drainage pipes and surrounding shingle will, in places, be at 1500mm to allow for falls across the field. The proposal to therefore lay at a nominal cover of 900mm is deficient.		
		Coordination with other Projects, Alternative solutions	**Question 11** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? Although I am not qualified to comment specifically on the offshore study area, a detailed explanation of why the proposed development could not form part of a strategic energy grid forming a ring main around the East Anglian coast (and beyond) should be published. Given both the offshore wind projects proposed to be built around the East Anglian coast by Scottish Power Renewables and others and the inter connector projects proposed by National Grid, surely the time has come for a co-ordinated approach to the delivery of energy security overseen by Central Government.	N	National Grid supports coordinated approaches to consenting and delivery with other projects where opportunities are available. However, the projects listed are being promoted by different developers and working to different timescales for delivery. It is therefore not possible to bring all these different projects forward at the same time as they are at varying different stages of development. Delaying the more advanced projects in this area to allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;**

24 October 2023	18 December 2023	Needs Case	1. Introduction This representation is prepared on behalf of Justin and Emma Dowley, whom are directly affected by the proposed Sea Link Option 2 Access Road for the converter station east of Saxmundham which crosses arable farmland in their ownership. This representation is a formal objection to the proposals submitted as part of the statutory consultation. Extensive research into the proposals has been undertaken on a desk top basis and we are familiar with the physical location of the potentially affected areas. An inspection of the land to be affected was undertaken in November 2023 and photographs are shown at Appendix II.	N	National Grid acknowledges your objection to the Proposed Project.
		Converter station location, Onshore route location	2. Background The proposed Option 2 Access Road to the Converter Station site south-east of Saxmundham crosses the Dowley's land, shown edged red on the enclosed plan at Appendix I. The land extending to approximately 165 acres is in arable production, farmed as part of the farms wider crop rotation scheme, and is also the subject of an option agreement for residential development which is to be signed shortly, after several months of negotiation. The Option 2 Access Road proposes to pass through 3 out of the 4 fields, dividing them in two to create a total of 7 small, irregular shaped and partially inaccessible fields.	N	National Grid acknowledges this feedback.
		Needs case, Timescales / programme, Alternative solutions	3. Principle As a general point, reports on the East Anglia Green scheme, comprising a route of predominantly overhead pylons from Norwich to Tilbury, have raised concerns about the validity of National Grid's arguments and methodology therefore further information is required to ensure the same potential mistakes have not been made in their Sea Link proposals. We also understand that the proposed timelines for a number of the offshore windfarms and other schemes that are proposing to connect into the grid in this area which have contributed to the need to improve the infrastructure in this area have been delayed beyond their original targets and this therefore is understood to have altered the capacity requirements and timelines. On top of this, the government has announced funding to investigate the feasibility of offshore	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The Proposed Project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			schemes. Proposals for offshore schemes include the creation of a series of modular grids to which the various offshore wind farms, and interconnectors are connected in to, requiring only a single set of subsea cables to be brought to the shore and connected at a Brownfield site such as Bradwell Power Station, West Grain or Tilbury. With offshore schemes potentially still a possibility, it seems wholly inappropriate to be finalising any onshore proposals and submitting a DCO until such time as this study is complete and the outcome understood. Given all this uncertainty, it is not felt that the need case for the project has been truly justified within the provided documentation. Without a well-qualified, need case, against which affected parties are expected to consider their concerns, it is difficult to make an accurate judgement towards the proposals.		coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** National Grid (the Proposed Project), North Falls (Offshore Wind Farm) and Five Estuaries (Offshore Wind Farm) have been working together to explore the potential for offshore coordination as part of the Offshore Transmission Network Review (OTNR) “Early Opportunities” workstream. The projects, acting together in a consortium led by North Falls, were awarded funding by the Department of Energy Security and Net Zero (DESNZ) through the Offshore Coordination Support Scheme (OCSS) in December 2023. On 28 March 2024, the consortium submitted a high-level feasibility study that formed the first step of the grant funding agreement. The study assessed the feasibility of a coordinated offshore connection specifically: the capital costs; building blocks; construction and commissioning methodologies and overall programme associated with a coordinated solution. The Secretary of State for Energy Security and Net Zero has reviewed this study, amongst other information and has decided not to grant further funding to the consortium. The feasibility study identified that coordination is technically feasible however, it also identified an increase in capital costs of up to £890 million; constraint costs associated with an outage on the Proposed Project of over £500 million; and a programme delay for North Falls and Five Estuaries of up to five years. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's electricity system by 2030, the consortium supports the Secretary of State’s decision and will not be further pursuing a coordinated offshore connection.
		Water environment, Agriculture and soils, Design	4. Consequences 4.1. Farming Drainage & Soil Structure	N	National Grid acknowledges the concerns raised with regard to the interfaces of new and existing infrastructure. It will therefore maintain ongoing dialogue with landowners in order to understand and identify potential constraints and appropriate mitigation measures including those regarding access arrangements during construction of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Construction of the access road may sever existing drainage and service systems and damage the natural soil structures across a large swathe of the land. The soil structure is essential for the productive farming of the land. Poor soil reinstatement and substantial compaction along the edges of the road, could at worst result in areas of land being entirely unproductive and at best will result in more expensive inputs with cultivations, subsoiling/ploughing in the following years being more difficult with increased machinery/metal wear and fuel consumption as well as reduced crop yields. Efficiencies The proposed route divides a number of the existing fields creating small, triangular and irregular shaped fields which will be difficult to access and to farm using modern machinery. Modern farming businesses rely on maximising efficiencies in order to be profitable, these small fields will be substantially less efficient to farm than the current larger fields. Access Access would also need to be maintained, in a form suitable for modern farm machinery, over the access road in order to reach the various severed fields. 4.2. Development Potential The proposed route cuts across land which is considered to have future development potential which is the subject of an option agreement for a proposed residential scheme. We enclose at Appendix 3 a plan indicating the proposed development land and its phases. Not only is the land therefore more valuable than if it was agricultural land without development potential, which National Grid nor their agents have engaged with the landowners on in order to understand, the positioning of the road is likely to affect the developable area of the proposed site and this will ultimately reduce the viability of any scheme.		Potential impacts on agricultural operations have been assessed based on the final design presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** issues such as fragmentation of land parcels identified, where applicable and mitigation set out. The assessment is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been developed to ensure the effective management, protection, and reinstatement of soil resources during the proposed development of the Suffolk Onshore Scheme as part of the Proposed Project. The plan outlines the necessary measures to minimise soil degradation and promote sustainable land use in accordance with best practice and regulatory requirements. The cable route will be reinstated to its previous use and therefore farming operations are able to continue post construction. Compensation claims for disturbance are considered on an evidence basis and landowners and farmers will therefore be encouraged to keep records to support their claims. Where productive land is lost as a result of the permanent infrastructure this needs to be balanced with the Proposed Project needs case, which will help the UK with British Energy Security Strategy ‘Security of Supply’ and with helping the UK to meet its Net Zero target to reduce carbon emissions.
		Traffic and transport, Design, socio-economic, tourism	5. Concerns 5.1. Permanence Although the plan indicates that a permanent access is required, defined as “surfaced roads for day to-day use through during operation”, we understand there is some uncertainty and a lack of clarity whether the infrastructure for this proposed route will indeed be permanent and to what specification it would be built and maintained. Assuming the access is permanent, no comment has been on made on whether this road will be publicly accessible or if there will be any form of barriers to prevent it being used as a bypass for the town. No discussion or attempt to communicate has been	N	Additional details on permanent access routes are provided in **Application Document 2.7.1 Access, Rights of Way and Public Rights of Navigation Plans - Suffolk** which has been submitted with the DCO application. National Grid will as a matter of course engage with all other relevant infrastructure providers in order to identify asset interfaces and appropriate design responses. However, with regard to the preferred access route, the option now chosen by the Proposed Project is the route to the south of Saxmundham crossing the River Fromus, therefore the concerns raised here are no longer relevant. The access road and associated infrastructure will not be publicly accessible and will have locked gates. Where the road crosses farmland, agreements will be put in place with the landowner to allow access as required to keep up with Farming Practice.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			forthcoming by National Grid or their agents to discuss how the severed land will be accessed or if it will be possible to continue to farm any of the affected land at all. 5.2. Distance The distance required for Option 2 seems unjustifiable when there are two shorter options available. Option 2 is the longest of the proposed routes, approximately twice as long as the alternatives and requiring a junction/crossing point with the B1119 as well as a bridge over the railway line. The additional distance will come at significantly greater expense both in materials and time to construct, and the large machinery / lorries using the crossing point will create an additional hazard for road users on the B1119 into and out of the town. The proposed junction for the Option 2 route with the B1121 north of Saxmundham, meets at a point with a number of other junctions close to the Tennis Club and Camping entrance, as well as the industrial estate entrance making this a more dangerous place to introduce further traffic, particularly large lorries and machinery. The alternative proposed access roads also offer shorter distances to the main A12 trunk road and will result in vehicles using the junction south of Saxmundham near Benhall Green, keeping traffic further away from the historic settlement of Saxmundham. 5.3. Rail Crossing The requirement for a bridge over the railway line to the north of Saxmundham will create substantial construction issues, both in additional cost but also in timing and organisation of the works due to the need to liaise with Network Rail ahead of construction commencing as well as throughout the process. It is likely to also create delays within the rail services on the East Suffolk line due to the inherent complexities of construction of the crossing. This could cause significant disruption and inconvenience to commuters and residents who rely on public transport to access work / education and to tourists who use the line for day trips and visits. Any disruption to accessibility for tourists will also have consequences for those businesses who rely on their trade which comprises a significant percentage of the East Suffolk economy. The creation of a new hazard in the form of the bridge / crossing on the railway line will also introduce additional safety concerns both during construction and in the longer term assuming the new infrastructure is to remain in place. The construction of this substantive physical structure and its associated works, including project management with Network		

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Rail, potential delays / service disruptions and required health and safety measures are all additional costs that will make this significantly more expensive than the alternatives access road options that do not require a rail crossing.		
		Walking, cycling and horse riding, traffic and transport	5.4. Public Rights of Way In addition to the train line, there is a public right of way in the form a footpath which follows the route of the trainline, crosses it and emerges on Clayhills Road. The initial part of the proposed access road between the convertor station and the B1119 Leiston Road also crosses a public footpath.	N	Management Plans have been prepared for both Suffolk and Kent as part of the DCO application. These have been developed in consultation with the relevant local planning authorities and provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk**.
		Cultural heritage	5.5. Archaeology As part of the allocation of the housing land now constructed off Beech Road/Oak Close, Suffolk County Council Archaeology indicated the area has high archaeological potential overlooking the River Fromus. Later Neotholic / Early Bronze Age layers have already been identified as being possibly present. Construction of a road in this location may be made more difficult by potential archaeological finds, may require substantial investigation, and could result in greater expense and / or time delays.		The area within the Order Limits have been subject to assessment, which has been informed by the baseline study (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**). Works undertaken around the Fromus include geophysical survey (**Application Document 6.3.2.3.D ES Appendix 2.3.D Geophysical Survey Report)** and evaluation trenching (**Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report**) which have identified archaeological remains. Mitigation, where impacts cannot be avoided, will be agreed with stakeholders, in line with **Application Document 7.5.4.1 Suffolk Outline Onshore Overarching Written Scheme of Investigation (OWSI)**.
		Coordination with other Projects, Traffic and transport, Construction - general	5.6. Additional Projects / Co-Location The plans indicate potential locations for two further convertor stations in the locality of the proposed converter station for this project, whilst the concept of co-locating in order to minimise the impacts across a wider area, is understood there appears to be little real co-operation between projects. Furthermore, it is not clear whether the wider access routes etc. will therefore need to accommodate all projects. If future construction traffic is to share the access roads, there are concerns around the frequency of vehicle movements on the access road, how wide the road will need to be to accommodate i.e. single track v two lanes, any traffic control at the crossing points and therefore how dangerous the crossing point may be or how difficult it will be to access the fields with slow moving agricultural vehicles whilst trying to navigate large construction vehicles. 5.7. Planning Policy: East Suffolk Local Plan (Adopted September 2020) and Saxmundham Neighbourhood Plan 2022-2036 (adopted July 2023)	N	Details on the assessment and proposed use of access routes are contained in **Application Document 7.5.1.1 Construction Traffic Management Travel Plan Suffolk.** The other projects that may co-locate in this area are being delivered at different timescales to the Proposed Project. As such, National Grid is maintaining ongoing dialogue with other developers to ensure coordination of project development, consenting and delivery - including shared use of accesses, compounds. Nonetheless, individual project must ensure that they are deliverable as standalone projects. The level of detail around these elements of the Proposed Project will develop as these discussion progress and as the design develops further. National Grid is only seeking consent for works relating to the Proposed Project. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** assesses the effects of traffic generated in conjunction with the Proposed Project. Should other projects opt to make use of these access points, they will need to assess the potential cumulative effects and the dynamics of interactions with the volume of traffic in the consented scheme(s). As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**
		Landscape and visual, Design	The open characteristic of the land adjacent to the B1119 approaching Saxmundham from the east, is noted as being an important visual characteristic of the area in the Neighbourhood plan. The introduction of an access road sharply crossing this	N	The effects arising from the Suffolk Onshore Scheme on visual amenity are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and detailed within Application Document 6.3.2.1.D Appendix 2.1.D Visual Amenity Baseline and Assessment**. The

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			land, not to mention the view of the converter station itself, will result in a substantially different visual aspect to the town from this approach. There are limited existing features or changes in topography, which the design/construction could be designed around in order to minimise the visual impact in this area east of Saxmundham as opposed to the other options which would be less visually intrusive.		representative viewpoints assessed include Important Views identified within the Saxmundham Neighbourhood Plan. The open characteristic of the land adjacent to the B1119 and the alteration to the existing views are noted. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** identifies the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Saxmundham Converter Station. The design of this structure, in terms of the building form and the external materials, has been developed alongside consultation and stakeholder feedback including engagement with a Design Review Panel as explained in **Application Document 7.11.1 Design Approach Document - Suffolk**.
		Design, Alternative solutions, Needs case	6. Conclusion We have highlighted a number of issues with the proposed Option 2 access road for the converter station east of Saxmundham, which contribute to our view that is not an appropriate or viable proposal. With the regard to the wider project, we are of the opinion that the alternative offshore options and alternative routes have not been sufficiently explored, particularly given that the government has only earlier this month announced funding to investigate the viability of the alternative offshore solutions which could negate all of the consequences of disruption to businesses, residents, tourists, habitats, ecology and the historic environment which will occur as a result of the multitude of projects in the area. Until such time as these alternatives have been truly investigated with the combined cooperation of all the stakeholders in the individual projects, we consider it entirely inappropriate or justified to be making any decisions with regard to the individual onshore projects. We therefore urge you to consider our objection accordingly.	N	National Grid has discounted Option 2 as a proposed access to the Saxmundham Converter Station. National Grid acknowledges the concerns raised in these comments. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Please see above response to Q3 (Principle) for information on the assessed feasibility of a coordinated offshore connection specifically. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);**

					• Application Document 8.3 Strategic Options Report (October 2023); • Application Document 7.2 Strategic Options Back Check Report; • Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered; • Application Document 7.10 Coordination Document; and • Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.

Table 1.38 SL-PIL-0051, SL-PIL-0060

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, Design, Land rights and CPO	As you are aware I am the owner of land over which you wish to secure certain rights. The land concerned is a field on which under the EA1N and EA2 DCOs you wish to carry out pylon realignment works and the erection of a new pylon. These works also encroach on my residential property. The documents which you published for the Sealink statutory consultation showed different works with no explanation of why the works are different. I spoke to James Buckley at a consultation event at Saxmundham who was helpful. However it is unhelpful that such substantial changes to works are proposed with no explanation of why the changes are necessary, whether National Grid no longer intends to carry out the pylon realignment works proposed under the EA1N and EA2 DCOs and what further work what might be necessary for the Lionlink and Nautilus projects, and any other projects which National Grid may choose to connect at Friston. If you want my cooperation going forward, you need to be a lot more open and transparent about what your plans are and I look forward to receiving full details in writing. I have been assisting Friston Parish Council in its response to the statutory consultation and I adopt its response as my own.	N	The Proposed Project will continue to evolve as it progresses towards the submission of the DCO application. As part of its submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project.

Table 1.39 SL-PIL-0231, SL-PIL-0232, SL-PIL-0233, SL-PIL-0890, SL-PIL-0242, SL-PIL-0638, SL-PIL-0734

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Converter station location, Cultural heritage, Landscape and visual	I am the owner and occupier of Hurts Hall house and park, and I OBJECT in the strongest terms to the proposal to build a massive electricity converter station within 750m of my house and to the associated infrastructure, including the proposed permanent access. The proposal will significantly adversely affect the setting of my listed house and the character of the deeply rural surrounding landscape. My more detailed reasons for objecting are as follows:	N	An assessment of impacts on the setting of Hurts Hall has been included in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. This has been informed by the baseline study (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**), as well as visualisations (**Application Document 6.4.2.1 Landscape and Visual**). This includes visualisations from Hurts Hall towards the Converter Station as well as the Permanent Access. A Heritage Statement of Harm is presented in **Application Document 7.1 Planning Statement**.
		Needs case, Onshore environmental impact, Construction – general, alternative solutions	SITE SELECTION PROCESS AND EIA. Little regard has been given to the dreadful impact which the development will have on the countryside and the community. The site appears to have been chosen for the express and sole reason that there is an intention to co-locate three converter stations each of a size and scale similar to the one currently proposed. It was only after this proposal came forward that this site was identified as being supposedly suitable for the purpose. This suggests to me that it was not considered to be one of the most suitable sites for a single converter and that it now represents no more than a compromise. There can be no doubt, taking into account the evolution of the scheme, that the intention is ultimately to build all three converter stations and therefore it is imperative that before the scheme progresses any further, an EIA is undertaken in respect of all three, which realistically form a single project. If they are treated separately, it is inevitable that the later projects will at EIA, be treated as having little impact on the landscape because the first converter station is already present or permitted. This is a clear case of salami slicing and can be seen already in the landscape and visual impact already performed where at table 2.2.B.4., Friston substation is referred to as bringing “large scale uncharacteristic energy infrastructure into the arable landscape”. This substation is part of the same scheme as is now being assessed and it is wholly unreasonable to use the harm caused by one part of the scheme to justify the harm caused by another. The Impact of the construction phase also needs to be assessed on the assumption that all three stations will be built. Failure to do so will mean that the impact of construction will be seriously underestimated. The scheme should not proceed until an EIA of the full proposal has been carried out. Without it, the potential of the site for co-location (and so for the currently proposed converter station) has not been properly assessed. The site now chosen was not a site which was identified when nine possible sites were originally put	N	A robust alternatives assessment has been undertaken for the Proposed Project. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023) and Application Document 8.3 Strategic Options Report (October 2023)**. National Grid is coordinating with other developers of large-scale infrastructure projects where possible, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. The assessment of inter-cumulative effects with other proposed developments is considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. The effects arising from the Suffolk Onshore Scheme on landscape character and visual amenity are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and** detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			forward and it is not clear why this site has ultimately been chosen as the preferred site. There is lack of transparency in decision making in relation to this, so it is impossible to properly assess the process, which was undertaken, without this information the consultation is inadequate, and the scheme should not be allowed to progress while that remains the case.		
		Converter station location, Cultural heritage, Combined effect of the proposed Project	IMPACT ON HERITAGE ASSETS. Hurts Hall is a grade II listed house which my wife and I have spent eleven years renovating. It is essential to the setting of Hurts Hall that it is located in a deeply rural area. The list description describes it as a “Country House”. It was built in 1893 and replaces an earlier house which was burnt down in 1889. In March 1943, Hurts Hall was the headquarters of the 79th Armoured Division under the command of Major General Sir Percy Hobart. His mission was to develop special vehicles and equipment for use in the D-Day Landings, so the house played a pivotal role in WWII. It was also the venue chosen by Churchill, Eisenhower and Montgomery to sign important D-Day papers. The proposed converter station and access will have a permanent and significant urbanising and industrialising effect on the setting of the house. During the construction phase the development will introduce a long period of significant disturbance and total loss of the tranquillity of the area, with no chance that the tranquillity and rural character will be restored on completion of the work. The enormous size of the proposed converter building means that it has no realistic chance of being accommodated within the landscape and so, as a plain modern structure only about 750m from the house (and closer to the park boundary) it will inevitably have a severe adverse impact on the setting of the building. We will be able to see the immediately proposed converter and at least one of the other converters from our home, particularly from the first and second floors. This will represent a substantial change to the setting and be harmful to the character and heritage value of the house. It will also be visible from the boundary of our parkland. There are many other listed building buildings and heritage assets in the immediate area. There are 18 listed buildings in Sternfield, including the Church of St Mary Magdalene which is a grade II* Listed Building and Sternfield House a magnificent Queen Anne home. Together, all these heritage assets and the historical structure of the landscape create a rural agricultural landscape of great heritage significance and beauty. The proposed converter station is completely at odds with that because of its massive scale, its appearance and its essentially industrial function. It would ruin the rural environment and reduce	N	An assessment of impacts on the setting of Hurts Hall have been included in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. This has been informed by the baseline study (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**), as well as visualisations (**Application Document 6.4.2.1 Landscape and Visual**). This includes visualisations from Hurts Hall towards the Converter Station as well as the Permanent Access. A Heritage Statement of Harm is presented in **Application Document 7.1 Planning Statement**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			the important sense of separation between the surrounding rural villages. Access Option 2 would be very harmful to the setting of our house as it would intrude into the landscape in a place which is very visible and where there is “no development within the landscape except for Hurts Hall within a rural valley context”. (Settlement Sensitivity Assessment Volume 2: Suffolk Coastal Page 26) It is very clear that this forms part of the setting within which the heritage value of Hurts Hall is enjoyed. Access Option 3 would be even worse because it would intrude into an area where there is currently no development and destroy both the setting and the tranquility of the Hall.		
		Landscape and visual, Construction - general	IMPACT ON LANDSCAPE. As mentioned above, the landscape in this area is a deeply rural and tranquil one of considerable beauty. The Settlement Sensitivity Assessment Volume 2 Suffolk Coastal says of the local landscape “The 20th century built edge of Saxmundham to the west of the B1121 is not visible as it sits behind the vegetated railway line and field hedgerows/trees. There is no development within this landscape except for the mansion house of Hurts Park within a rural valley context”. Of the land to the east it says” The parkland landscape is open, affording memorable views to the rebuilt manor house (Hurts Hall) and church beyond”. The proposed converter station and access roads would be a prominent alien feature in this landscape, which otherwise has very little modern development. The landscape impact assessment undertaken for this development does not give proper recognition to the quality of the landscape and it is nothing short of astonishing to suggest that the “large scale field pattern is considered to have the ability to accommodate this type of development”. This development is so enormous and will be so incongruous that no rural landscape could possibly “accommodate” it. The fact that this suggestion has been made is indicative of an evaluation exercise aimed at reaching a particular conclusion and not an arm’s length objective evaluation. Such an evaluation would inevitably conclude that this development will have a wholly unacceptable landscape impact. To suggest that local plantations will form a “back cloth to the development” (chapter 2 LVIA page 84) is to ignore the fact that the proposed building will be equivalent in height to an 8 storey building (on the basis that Grenfell Tower was 67.3m and 24 storeys). It is not possible to realistically pretend that the converter buildings will be other than intrusive, incongruous and unattractive. DISTURBANCE DURING CONSTRUCTION. The construction phase of all three converters is likely to take TEN YEARS OR MORE, during which time there will be	N	The effects arising from the Suffolk Onshore Scheme on landscape character and visual amenity are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. This acknowledges the landscape baseline with reference to published Landscape Character Areas within the landscape and visual study area, which notes the rural nature of the landscape. Potential effects on the Suffolk Coast and Heaths AONB are also detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The visual assessment also refers to Important Views which are identified within the Saxmundham Neighbourhood Plan and include reference to the approach to Saxmundham. The landscape and visual assessment follows best practice and the methodology is set out within **Application Document 6.3.2.1.A ES Appendix 2.1.A Landscape and Visual Impact Assessment and Photomontage Methodology**. This refers to landscape susceptibility and statements are made about how the scale of the landscape influences its ability to accommodate development, of which larger scale has a higher ability than smaller scale. The assessment also takes into account the scale of the development and acknowledges where this cannot be mitigated by proposed landscape mitigation planting. The potential for impacts on the setting of heritage assets was discussed with key stakeholders including Suffolk County Council and Historic England and, as part of this procedure, a list of assets to fully assessed was agreed. The assessment of impacts on cultural heritage can be found in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. National Grid acknowledges that the Proposed Project has the potential to cause disturbance during construction. From a nuisance viewpoint, the assessment of impacts is considered in the following document:

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			significant noise, vibration, dust, light pollution and general disturbance in an otherwise extremely quiet area. The techniques proposed in the EIR to mitigate these effects will have very limited benefit and there can be no doubt that the impact will be significant over a wide area. This will harm the amenity of the residents as well as the setting of the listed buildings. The general ambience of the area is part of the heritage setting and that will be completely changed during the construction period. The peace and rural feel of the environment will never be returned because it is highly likely that the building will be accessed by vehicles, potentially at any time of the day or night and also that the development would be lit for security and to facilitate working. This will impact not only on the landscape and amenity but also on the biodiversity of the area.		• **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration; and** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This will help control potential nuisance impacts. This Plan is secured through Requirement 6 of Schedule 3 of **Application Document 3.1 draft Development Consent Order**.
		Walking, cycling and horse riding, onshore mitigation, design, landscape and visual	IMPACT ON RIGHTS OF WAY. The proposed site of the converter station is on the junction of footpaths 5 and 6 so it would have a significant adverse impact on the network of public rights of way in the area. It is not enough to say that the routes may have to be diverted. The presence of the building will permanently harm the enjoyment of users of footpaths which currently enjoy a tranquil rural environment and attractive views. The buildings will dominate the environment of the users of the rights of way for a significant part of both paths. Any diversion around it would need to be very significant due to the scale of the interruption and the potential for the public to use and enjoy the routes will be reduced to a very low level. PROMISES OF ENHANCEMENT TO THE AREA. This is plainly a sham. There is no realistic possibility that development on such a scale, causing such a high level of adverse impact will provide any genuine enhancement to the area. It is certainly clear that the area around Hurts Hall will be irreparably damaged in a way which no amount of landscaping or biodiversity net gain could possibly adequately mitigate. PHYSICAL APPEARANCE. I note that various options for physical appearance are put forward. None of them are desirable but the least damaging (though still very harmful) is the option with bunding and a green roof. Unfortunately, I believe this obviously expensive option has been included to suggest a willingness to make every effort to mitigate landscape harm, but with no intention that it will be pursued. I trust that if this dreadful scheme is pursued to the next stage, I will be proved wrong in this and it will be the proposed design. Frankly, I doubt it because the Landscape Assessment	N	As set out in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**, Saxmundham Footpaths 6 and 5 (PRoW E-491/006/0 and E-491/005/0) will be temporarily diverted and permanently diverted respectively. The permanent diversion will act in conjunction with the long-term temporary diversion route for E-491/006/0 which will feed east along the B1119 and rejoin the existing E-491/006/0 at the north east of the Converter Station location. The proposed PRoW closures and diversions are assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. No significant impacts are expected following the mitigation set out within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk** which has been developed in consultation with Suffolk County Council and East Suffolk Council. The proposed diversion routes will be designed to be of equivalent nature and connectivity to the existing sections of the routes to be closed, whilst minimising the additional journey length as far as practical. The proposed diversion routes are subject to agreement with Suffolk County Council. The opportunities for recreation have been developed in collaboration with other key disciplines including traffic and transport and socio-economics (further details within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This has included a permanent PRoW diversion on the Converter Station site which has been designed to have a variety of experiences with some sections more open and others adjacent to woodland planting to aid screening of views towards the Suffolk Onshore Scheme. This has also included the provision of open access areas, as requested through stakeholder feedback. The existing footpath connecting southwards is shown on **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			takes a completely unrealistic view on the degree of harm that will be caused.		National Grid is pursuing a coordinated masterplan for the development of the site, including landscaping. While there will be some residual impacts, **Application Document 6.3.2.1.A ES Appendix 2.1.A Landscape and Visual Impact Assessment and Photomontage Methodology** refers to landscape susceptibility. Statements are made about how the scale of the landscape influences its ability to accommodate development, of which larger scale has a higher ability than smaller scale. The assessment also takes into account the scale of the development and acknowledges where this cannot be mitigated by proposed landscape mitigation planting. National Grid have developed design principles for the Suffolk project elements. Details are contained in **Application Document 7.12.1 Design Principles – Suffolk**.
		Socio-economic. recreation and tourism, Alternative solutions	TO SUM UP Given the number of alternative sites that are available, I find it hard to believe that National Grid have the gall to tell us this is their preferred site. Anyone with a modicum of common sense can see that this proposed development will decimate our beautiful Heritage Coast and drive away the tourists that the local economy depends on. I gather that our local MP has suggested Bradwell as an alternative site but every time I have raised this with National Grid staff at various meetings, I have been given a different answer as to why this is not possible. I do not believe the truth is being told. Rather than take the people of Suffolk for being fools, it might be better to tell them the real reason for sighting it here is money. Roughly translated, this is the most profitable place for National Grid to site the converters, which of course is very beneficial for their American shareholders, but detrimental to the people of this beautiful county of Suffolk.	N	The Proposed Project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. In addition, the publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including the Bradwell Power station. However, this site was considered too small to accommodate the required infrastructure. Further details are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**.

Table 1.40 SL-PIL-0289

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore route location, Terrestrial ecology, Landscape and visual	We have been residents of Aldeburgh for over twenty years and are living within a few hundred yards of the proposed cable route which will cross under the Leiston Road. We have attended all of the various meetings put on by National Grid for the SeaLink proposals And strongly object to the proposals you have put forward for the area. Our reasons for objecting are based on the following. The landfall and cable corridor not only goes through the protected AONB and SSSI sites which have been nurtured and protected for the past 75 years but also will permanently destroy wildlife habitat and one of the reasons why so many people come to the area to enjoy the beauty of the countryside. The location of the converter stations (is it 1,2 or 3) is situated on one of the highest and flautist parts of the local countryside. No amount of trying to hide a 23 M high structure will hide them from view. The concrete structures will dominate the skyline around the area changing it from countryside to an industrial wasteland.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. The need case for the Proposed Project has identified that connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the route of the HVDC cable and the location of the joint bays and the high importance of the RSPB reserve and the AONB is noted. This is a major reason why the reserve will be traversed through trenchless methods. The commitment to trenchless methods is secured in Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid acknowledges the comments regarding the design of the converter station to fit in with its surrounding. The assessment on potential landscape and visual impacts is set out in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. National Grid have developed design principles for both the Suffolk and Kent project elements. The scope of the principles is not limited to any one design discipline and instead reflect a multi-disciplinary approach for coordinated design in the round. As such the design principles cover several design disciplines including architecture, landscape architecture, ecology, hydrology, civil engineering, wider engineering disciplines, town planning, archaeology and heritage. Climate change is an important consideration as is developing the design to minimise light and noise intrusion, maximising the use of trenchless techniques in sensitive areas, and the use of sustainable construction techniques and efficient use of responsibly sourced materials (see **Application Document 7.12.1 Design Principles – Suffolk**). National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.
		Water environment, Traffic and	The area surrounding the proposed site is also prone to flooding from water runoff from the fields this will be compounded by the	N	Where the project temporarily or permanently adds hardstand land cover (and in areas of topsoil strip), rainfall runoff will be collected by a range of drainage features. These features will encourage infiltration to ground where ground

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		transport, Socio-economic. recreation and tourism	large area of hard surfaces creating even more flooding more quickly. The present main roads serving Friston and Saxmundham area already have problems with heavy vehicle traffic and would be unable to cope with the combined traffic of this project, Sizewell C and LionLink let alone Scottish Power scheme. This extra traffic will only endanger the local road traffic users and the minor road junction works that have been indicated on your proposals will do nothing to solve the problem of the narrow widths to the existing main roads off of the A12. This area is dependent on tourism which will be decimated for years to come if the works proceed and the local population in particular the youngsters will have little opportunity for jobs .As no provision has been made to house the necessary workforce we can only assume that you are hopeful of renting local property thereby preventing letting to holidaymakers who are the lifeline to the area.		conditions will be suitable to collect and convey runoff to storage areas for slow release back to the water environment at rates not exceeding predevelopment rates. This will prevent increases in surface water flooding. Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). Commitment W14 of **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** states that the appointed contractor shall develop a Drainage Management Plan which must be submitted to the Local Planning Authority for approval prior to construction. The Plan will demonstrate how surface water runoff will be managed during construction and how surface water would be managed during operation including maintenance of the drainage infrastructure over the lifetime of the Proposed Project. The requirement is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. Potential impacts on tourism are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This Chapter estimates around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes, thereby providing local people with job opportunities. The Chapter also demonstrates that at peak workforce employment and typical seasonal occupancy levels, all of Suffolk Onshore Scheme's construction workers could be accommodated within a 60-minute drive time of the Order Limits. Given this, it is assessed that there would be negligible magnitude of impact on the hotel, bed and breakfast, and inns

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					accommodation sector arising from the Suffolk Onshore Scheme. It is anticipated that accommodation providers would be able to accommodate employees working at the Suffolk Onshore Scheme without any adverse effects on the sector.
		Alternative solutions	The obvious answer is to have an offshore transmission network coming onshore at brownfield sites and nearer to London which is the area we are being told requires all of this additional power. Offshore assume the was looked at a few years ago but reverted however technology has improved and this form of transmission is now being used by Belgium, Norway and now Scotland in the latest scheme being piloted by Seimans on the new wind farm of the Scottish coast. You have a brownfield site at Bradwell together with a transmission route, this must be the most sensible, least destructive to the countryside and long turn cheapest of all proposals. You have not listened to the public at previous consultations you should do so now.	Y	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.

Table 1.41 SL-PIL-0059, SL-PIL-0067

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Landfall location, Combined effect of the proposed Project, landscape and visual, cultural heritage	As a prescribed consultee I write to object to the proposed Sea Link project. 1) The Suffolk landing site for the Sea Link project should not be between Aldeburgh and Thorpeness. This section of the coast is an exceptionally sensitive area within the Area_ of Outstanding Natural Beauty (AONB) and forms a part of the Heritage Coast which is undeveloped. The coastline between Aldeburgh and Thorpeness is characterised by its long open vista that extends through the bird sanctuary into the interior and Aldeburgh is set within this landscape. Both the landscape and the sensitive setting of the town is of great importance and should be protected. 2) National Grid have not provided sufficient detail with regard to the nature and scale of any proposed Transition Joint Bay as well as any development related to it (such as ongoing maintenance, repair and security). 3) Imposing the Sea Link project into this landscape is particularly harmful and will have significant adverse impacts and potentially result in irreversible harm. Such development between the seashore and the inland fringes would result not only in significant harm to the landscape but threaten the setting of Aldeburgh, a town of considerable cultural significance.	N	The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB are outlined summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment takes into account the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. The effects on the Suffolk Heritage Coast are also detailed within **Application Document 6.3.2.1.C Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. Details of the site and route selection process are contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in A**pplication Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The transition joint bay is an underground structure with a ground level access manhole which will be locked. Maintenance is required on a monthly basis to check the structure and at a five-yearly basis to check the condition of the joints. This will not be visible from the surface apart from the manhole.
	Alternative solutions, Onshore environmental impact, Landscape and visual	4) The Sea Link development in this coastal location would be contrary to national and local planning policies including those which recognise and seek to protect this environment and the sensitive setting of Aldeburgh. 5) The adverse impacts on the landscape of the proposed landing site between Aldeburgh and Thorpeness cannot be properly mitigated. The principal mitigation measure should be to avoid landfall in this especially sensitive part of the AONB and Heritage Coast. There is no need for the landing site to be between Aldeburgh and Thorpeness. A more appropriate landing site or alternative option should be considered that accords better with policy and takes proper account of the sensitivity of places and communities. 6) The Sea Link project would also have a significant adverse effect on the North Warren RSPB / SSSI site which supports a range of protected and/or UK priority species associated with the habitat types present.	N	Efforts have been made to ensure that the design of the Proposed Project is compliant with the purpose of National Landscapes, which is to 'to conserve and enhance the beauty of the area'. As such, no above ground infrastructure will be constructed within the National Landscape, while careful consideration has been given to the ways in which development outside of the designation may affect its setting. Following construction, the HVDC cable route, including farmland, will be fully reinstated. The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB and Suffolk Heritage Coast are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. This notes that the construction activity affecting the AONB and its setting would be localised and the main activity of the laying of the HVDC cable is not considered to be dissimilar to typical agricultural machinery on arable fields and the seasonal disturbance of soils which is characteristic of arable land. There would be highly localised temporary adverse effects on scenic quality, natural heritage, tranquillity and wildness, both directly and indirectly, due to construction activity including limited vegetation loss. At operation year 1, the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					operational activity affecting the AONB and its setting would be highly localised. The re-instatement of localised areas of acid grassland would be in the early period of re-establishment at Year 1 of operation and there would be highly localised permanent tree loss however this is considered to be a slight alteration on the overall landscape character. **Application Document 7.3 The Planning Statement** and Appendix A, NPS Accordance Table of this document sets out an analysis of compliance with the policies within the NPS.
		Water environment, Onshore EMF, Alternative solutions	7) The development between Aldeburgh and Thorpeness is substantially within flood risk zones 2 to 3 and should therefore be avoided. 8) National Grid has given scant detail regarding high voltage lines and the detrimental impact of electro-magnetic fields on people residing nearby. 9) National Grid have not provided sufficient detail to allow proper and intelligent consideration of the proposal or the outlined alternative options and this is a glaring omission given the far-reaching impact of the current proposal. For instance, there is insufficient detail about any marine constraints relating to potential landing sites, especially 53, 54 and 55 and how these constraints might be overcome or avoided. There is also insufficient detail about perceived constraints pertaining to converter locations and land corridors to these landing sites, particularly 53. 10) While I object to the project being situated in the Aldeburgh-Sizewell area, any new Sea Link infrastructure would be better kept closer to Sizewell, an area which is already blighted visually and environmentally by the nuclear power stations and associated electrical pylons. That would facilitate connection to the existing overhead power line (ie converter site B or C) and proximity to potential landing sites north of Thorpeness.	N	No operational infrastructure is proposed within Flood Zones 2 or 3. At the landfall locations, whilst there would be a small footprint of temporary construction activity, this largely involves cable installation using trenchless drilling techniques, thereby avoid change to landform with these flood zone extents. Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Commitment W14 of **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** states that the appointed contractor shall develop a Drainage Management Plan which must be submitted to the Local Planning Authority for approval prior to construction. The Plan will demonstrate how surface water runoff will be managed during construction and how surface water would be managed during operation including maintenance of the drainage infrastructure over the lifetime of the Proposed Project. The requirement is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. These conclude that there are no anticipated significant effects as a result of the Proposed Project. With regard to electromagnetic fields (EMFs), the UK has a carefully thought-out set of policies for protecting the general public against EMFs, the main component of which is exposure guidelines. These exposure guidelines are set by independent scientific bodies and are based on decades-long studies into the effects if EMFs and ill health. After those decades of research, the weight of evidence is against there being any health risks of EMFs below the guideline limits. It is National Grid's policy to ensure that all of its equipment comply fully with these exposure limits. Further information can be found in **Application Document 6.5 Electric and Magnetic Field Compliance Report**. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**. National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area, including impacts upon the AONB, is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Needs Case, Alternative Solutions	In summary, I strongly object to the proposed route and scheme. National Grid has provided insufficient reasoning on why Sea Link is needed and it has not sufficiently addressed alternative options, including the merits of a modular offshore grid system which can better protect communities and people from the environmental impacts of multiple cable corridors coming onshore.	N	National Grid acknowledges the respondent's objection. The publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			It is apparent that the research and assessment leading to this proposed route has been piecemeal and driven by costs, to the detriment of the environment. The proposal lacks vision with regard to the future technological innovation in the renewable energy industry. As such, bringing the application forward is premature. I reserve the right to reconsider the comments in light of future updates.		National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** With regard to the claims about the Proposed Project being driven by cost, in developing the design, National Grid has a duty to balance the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. As such, National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring and offsetting impacts.

Table 1.42 SL-PIL-0809, SL-PIL-0078

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Consultation	We are writing in response to reviewing Sea Link's Statutory Consultation Preliminary Environmental Information Report (PEIR). The National Trust have made previous comments in relation to this project, and these are appended to this response. The National Trust does not object to the principle of the proposed offshore high voltage line, but we have reviewed the more detailed information submitted at the statutory consultation stage and we have made some comments and observations on which we hope National grid will find useful and constructive as this NSIP proposal moves forward. The National Trust once more welcomes the opportunity to respond to the National Grid Sea Link Corridor consultation for a proposed offshore high voltage direct current link between Suffolk and Kent, with onshore converter stations and connections back to the national electricity transmission system. This response relates solely to the proposals in Kent as we have previously indicated that the Suffolk end of the Sea Link proposal does not have any impact on national Trust interest in this location.	N	National Grid welcomes the National Trust's constructive approach to engaging with the Proposed Project.
		Land rights and CPO	The National Trust is a charity and Europe's largest conservation organisation, with a current membership of over 5 million people. With the support of our Parliamentary Act, we are legally responsible for the protection of some of the most beautiful, historically important and environmentally sensitive places in England, Wales and Northern Ireland. Within the South East, this includes a wide range of publicly accessible properties. The National Trust owns land at Pegwell Bay, which forms part of a wider landholding within the Sandwich and Pegwell Bay area. Pegwell Bay is located to the south of Ramsgate and is included within the proposed marine route corridor within this development. The National Trust's landholdings at Pegwell Bay span more than 130 hectares of coastline, saltmarsh and mudflats and our land ownership is shown in the map below. Kent Wildlife Trust manage this landholding under a lease from the National Trust, as a part of their management of the larger National Nature Reserve.	N	National Grid acknowledges the sensitivity of the assets under The National Trust's stewardship and the role it plays in conserving and sustaining the landscape and habitats they support. In developing the Proposed Project National Grid has a duty to balance the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. As such, National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring and offsetting impacts.
		Intra-project cumulative effects, Needs case	We have set out some detailed comments on matters which affect National Trust Interests below: **Nature Conservation Designations** The National Trust are concerned about the potential direct and cumulative impacts on nationally and internationally designated sites at this location. The proposed marine route corridor at Pegwell Bay would cross a highly designated and sensitive part	N	National Grid acknowledges the sensitivity of these assets and the role The National Trust plays in conserving and sustaining the landscape and habitats it support and reiterates its duty to balance the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			of the Kent Coast, much of which is owned and managed by conservation organisations like the National Trust and Kent Wildlife Trust. The designations at Pegwell Bay are set out below: Sandwich and Pegwell Bay National Nature Reserve Thanet Coast and Sandwich Bay Ramsar Site Sandwich Bay to Hacklinge Marshes Site of Special Scientific Interest Sandwich Bay Special Area of Conservation Thanet Coast and Sandwich Bay Special Protection Area As indicated in our introductory paragraph the National Trust does not object to the principle of the proposed offshore high voltage direct current link between Suffolk and Kent with onshore converter stations and connections back to the national electricity transmission system.		
		Intra-project cumulative effects, Design, Ornithology, ecology and biodiversity	However, we are concerned that the direct and cumulative impacts of this proposal alongside the other cabling that has already crossed this highly sensitive site would potentially have a detrimental impact on the integrity of the aforementioned ecological designations. At the Kent landfall, we would support the developer's preferred method as being a trenchless technique that will drill beneath the ground surface to avoid the need to trench the cables through the saltmarsh and would expect to see a firm commitment to undertake this form of engineering. However, if open-cut trenching were to be used the Trust would have concerns due to the cumulative impacts on the Nature Reserve, particularly on the bird population, specifically ringed plover, turnstone and red throated diver arising due to the proliferation of cables installed previously for the Nemo link. Consequently, the Trust would want assurances that there will be nothing above ground on our land.	N	National Grid can confirm that geotechnical investigation has established that trenchless methods are possible and appropriate for traversing Pegwell Bay, and these confirm the depth of the of bore (see Appendix A of **Application Document 7.3 Design Development Report**). The DCO will therefore not include an option for surface trenching in this area. Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The impact of multiple projects in the area is assessed in **Application Document 6.2.2.13 Part 3 Kent Chapter 13 Inter Project Cumulative Effects**.
		Converter station location, Landscape and visual, Onshore mitigation	**Landscape and Visual Impact** Having reviewed the PEIR we note that the proposal includes a Converter Station that measures 200m x 300m and 26m in height. However, because of the low lying and relatively flat landscape coupled with a scrub covered bund situated on slightly higher ground and located between the site and Pegwell Bay, the	N	The effects arising from the Kent Onshore Scheme on visual amenity are summarised within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** and detailed in **Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**. This includes details around potential views towards the Minster Converter Station from the east, including a representative viewpoint at Pegwell Bay.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Converter will not be perceptible. Despite this there remains some concern regarding the potential future impact caused by: The scrub vegetation which is responsible for screening the structure from the Bay located beyond the ownership control of the applicant and its presence in perpetuity is therefore not assured. The Converter Station will be seen in views from Ramsgate to the northeast from where it will be seen in relation to the Trust's property at Pegwell Bay. The raised bund is potentially at risk of being eroded away. As such and to protect the Trust's property at Pegwell Bay it is recommended that the developer gives assurances to mitigate the impact of the Converter Station when viewed from the east by establishing a belt of woodland planting within the area highlighted orange in the figure below. This will assist the long-term screening of the more visible northern half of the building.		An iterative design process has informed the siting and routeing of the Kent Onshore Scheme. Mitigation measures including those which are embedded in the design of the Kent Onshore Scheme are presented in the Proposed Project Design and Embedded Mitigation section of **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. The mitigation proposals are set out on **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent** and includes native woodland planting on the eastern edge of the Minster Converter Station.
		Design, Converter station location, Landscape and visual	**Design of the Converter Station** We note that the developer has offered several design solutions for the proposed Converter Station to enhance and assimilate its position in the landscape. Rather than commenting on these design solutions in turn, the Trust feels it would be constructive to identify what are considered to be necessary design considerations required to deliver a building of good design that respond to the context, its function and as part of the national electricity infrastructure network in a positive way.nArchitectural design solutions that aim to, either camouflage the building into the context, or alternatively contrast with the context in a stimulating way, have equal merit. That said, should the building be designed to be conspicuous, high-quality design and detailing are of great necessity. Attributes that would be regarded as positive include:nbeing simple, beautiful, scaleless, having a simple silhouette against the sky, quiet and understated;nimproves with age;nhaving reference to the forms and details seen in the design language of electrical components such as junction boxes, fuses switch gear etc. n**Building Detailing**nThe corners of the building (arises) should be detailed in a way that gives the building a sense of being of high quality. Consider making the arises rounded, in two or three dimensions.nThe surface finish/patina of the building should reflect these ns of high quality. Consideration being given to the colour, texture and reflective or non-reflective finish.nCould solar panels be incorporated into the large structure? **Roof Line**	N	**Design of the Converter Station** National Grid welcomes The National Trust's views and carefully considered observations on design approaches for the Kent Converter Station within the surrounding landscape setting. It is recognised that there will be some residual impacts arising from the development of the Proposed Project. The assessment of landscape impacts is contained within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid will seek to minimise the visual effects as far as possible through consultation on design principles and landscape masterplanning. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Furthermore, the ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. National Grid have developed design principles for both the Suffolk and Kent project elements. The scope of the principles is not limited to any one design discipline and instead reflect a multi-disciplinary approach for coordinated design in the round. As such the design principles cover several design disciplines including architecture, landscape architecture, ecology, hydrology, civil engineering, wider engineering disciplines, town planning, archaeology and heritage. Climate change is an important consideration as is developing the design to minimise light and noise intrusion, maximising the use of trenchless techniques in sensitive areas, and the use of

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The Converter Station will be visible in views from Pegwell Bay from the east and the form and appearance of the roofline will be a major factor in determining whether the building will be perceptible and whether it assimilates well/responds positively to the context. Recognition that the site's landscape context is large in scale, relatively flat, with a low horizon, large sky and that the form of the roofline should have regard to this. Whether this means having a flat roof, as shown on the current visualisations or a gently undulating roof form in contrast to the setting. A solution that adopts a roof line and flat is considered most desirable. Having said that, an approach that aims to contrast with the context also has its merits. **Scale and Detail** The building should be scaleless. It is recommended that details that giveaway the scale of the building, such as doorways, balustrade that conform to handbook standards are concealed. Also, for this reason, avoid the options that apply a pitched roof to the building. Scale could be further be camouflaged by including pattern/ texture that large in scale. Clutter on the roof of the structure should be avoided. Concern that reference is made to balustrading on the roof too. Openings/pattern/decoration needs to be large in scale and to avoid domestic scale proportions. Tree planting that results in trees reading as individual elements that provide a sense of scale, should be avoided. **Bold Screening** The lower parts of the building (often where clutter is found) should be screened. Planting should be in the form of simple bold belts of planting, such as hedges, woodland, rather than planting that results in the reading of individual trees. Camouflage Strategies Camouflage needs to take into consideration that the landscape context reads as a series of narrow horizontal bands or stripes. Horizontal stripes – darker or stronger colour at the base, and lighter in colour and more washed out in the upper parts of the elevation would be positive, however vertical stripes that camouflage the form of roofline would also be considered positive, Anchorage/relation to the ground		sustainable construction techniques and efficient use of responsibly sourced materials (see **Application Document 7.12.2 Design Principles – Kent**). This Document sets out Project Level Design Principles common to both the Suffolk and Kent ends of the project. The Site-Specific Design Principles (SSDPs) within this document cover the Kent Converter Station, and its relationship to the site access and landscape mitigation proposals. The Design Principles respond to National Policy Statements EN-1, EN-3 and EN-5; local policy including the Thanet District Council Local Plan, Dover District Local Plan, and the Kent Design Guide; the NIC Design Group – Design Principles for National Infrastructure; the National Design Guide alongside the National Model Design Code; and the Planning Inspectorate's Nationally Significant Infrastructure Projects: Advice on Good Design. **Building Detailing** Comments on approaches to converter station design detailing are welcomed. Views were sought over the architectural design approaches for the Kent converter station and National Grid is considering feedback, alongside ongoing discussions with local authorities to inform the detailed design approach within its DCO application in **Application Document 7.12.2 Design Principles – Kent**. The design contractor(s) will be required to follow the specific principles within this document. The emerging Design Principles indicate that there is a likelihood that some solar PV could be accommodated, although how much PV is appropriate and on which roofs would be determined in the technical design stage. In addition to the details contained within **Application Document 7.12.2 Design Principles – Kent**, National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Either rooted to the ground or floating above it with equal merits. Plan Form Reconsider the need for the projecting bay, as the bay corrupts the simple form and erodes the scaleless qualities. **Lighting** The architecture needs to work to contain light spill, possibly with an upper elevation of the building overhanging with concealed down lighters that throw light around the buildings perimeter to prevent it spreading upwards.		
		Land rights and CPO, Legislation and policy inc. Permits, DCO process	**The National Trust and Compulsory Purchase** The National Trust Acts enable our Trustees to declare that land "inalienable". This means that the land is so important to the nation that it cannot be sold or mortgaged, rather it must remain in the care of the Trust, in perpetuity. Once declared inalienable this designation cannot be reversed. Most of the property at Sandwich and Pegwell Bay is held inalienably. There is additional protection when a potential compulsory acquisition of inalienable land or rights over inalienable land is in prospect. In the face of an objection to a compulsory purchase order ("CPO") by the National Trust which has not been withdrawn by the time the confirming authority (the Minister) comes to deciding about whether to confirm the CPO, the CPO becomes subject to 'special parliamentary procedure' (SPP). To avoid possible future delay in progressing land ownership matters, we strongly urge that future engagement takes place between the Trust and the developers at the earliest opportunity. To protect the National Trust's position around inalienable land and SPP, we may have to lodge an objection on submission of the DCO. Again, we would welcome early engagement with National Grid to overcome any matters in relation to National trust inalienable land prior to submission.	N	National Grid will continue to engage with the National Trust to seek voluntary agreements for construction and any required easement or ancillary rights. The National Trust land has been identified as special category land within the DCO application and will therefore be treated accordingly.
		Consultation, Construction – general, Onshore mitigation	**Construction Period** Given the potential impact this proposal could have on the significant nature designations at Pegwell Bay, the National Trust request more in-depth details on the construction and design methods than would usually be available during the Development Consent Order (DCO) process, so that we can be reassured that the works proposed will provide the highest level of mitigation possible. We would wish to see further details as set out in the Outline Construction Traffic Management Plan to further reduce route and journey mileage to and from site as well as around site as set out in the PEIR review. The National Trust would encourage the developer to consider additional mitigation in the form of funding to support the ongoing management and future	N	National Grid acknowledges your concerns and is seeking to minimise potential impacts through careful consideration of construction methods and design, while the EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area. This then determines the mitigation that must be put in place and is then discussed with the relevant statutory advisory services. National Grid can confirm that geotechnical investigation has established that trenchless methods are possible and appropriate for traversing Pegwell Bay, and these confirm the depth of the of bore (see Appendix A of **Application Document 7.3 Design Development Report**). The DCO will therefore not include an option for surface trenching in this area.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			conservation of Pegwell Bay and would welcome discussion on this topic with both the National Trust as landowner and the Kent Wildlife Trust as site manager.		Further information on the construction methodologies is available within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Further work will be required once the contractor is appointed, confirming the construction methodology. However, outline management plans for different aspects of the construction programme have been submitted with the DCO application as follows: • **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan;** • **7.5.3 Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan;** • **7.5.3.1 Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice; and** • **7.5.3.2 Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC).**

Table 1.43 SL-PIL-0128, SL-PIL-0132

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, Alternative solutions Inter-Project cumulative effects,	I have lived in this area for many years and was very disappointed by the recent SeaLink consultation. It did not take into account the suggestions from last year's non-statutory consultation regarding offshore options and brownfield landfalls. I am not in favour of the current misguided plans for the associated onshore infrastructure. The cumulative impact of these plans will devastate Nationally protected environmental areas, bring roads to a standstill and destroy the local tourism economy with the loss of jobs for many years. A better solution for consumers involves an offshore grid approach, taking wind energy offshore, closer to where it is needed in London and the South East, going onshore at Brownfield sites, e.g. Bradwell-on-Sea, Isle of Grain, Tilbury etc. There would be no need for SeaLink if pilot tests were considered taking power directly closer to where it is needed, e.g. East Anglia One North and East Anglia Two pooling their energy with LionLink taking the power to Bradwell-on-Sea. I support a pause to allow for a review of all proposed East Anglian transmission infrastructure and a fully costed cost-benefit analysis for an integrated offshore grid.	Y	National Grid has carefully considered all feedback submitted in response to its pre-application public consultations when developing its plans. Throughout the development of the proposals, it has sought to show how feedback has informed the development of the plans. For example, the Project Overview Document published as part of the Statutory consultation specifically addresses how feedback had informed changes to its plans, whilst the Non-Statutory Consultation Report published at this consultation considers in further detail feedback received to the Non-statutory consultation. This Consultation Report provides a detailed analysis of feedback received to National Grid's pre-application public consultations on the Proposed Project, along with how this feedback informed the development of its plans. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The Proposed Project's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. An assessment was undertaken of the Bradwell Power station site. However, this site was considered too small to accommodate the required infrastructure. Further details are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.
		Consultation, Coordination with other Projects, Inter-project cumulative effects	In addition to the above and from a personal point of view. Friston has endured five years of this process, it looks as though there will be many more similar years to come. Although the planning process has granted permission to a Scottish Power Renewables project it appears that NG choose to be oblivious to it's findings regarding the fact that this single application is likely to cause severe harm to East Suffolk and Friston in particular. It identifies that significant care will be required in instigating that project for the well-being of the environment and the communities in its path. Rather than pay heed to that clear warning of harm, Sealink and at least two other projects are likely to progress according to your consultation. It cannot be possible that you are unaware of the significant opposition to all of these projects, yet you approach these communities as if for the first time. You are sparing with the information you share with the public as if they are ill informed. You avoid laying out the cumulative impact of these projects by showing only a single project in Friston when SPR already has a significant footprint on the village including a cable route to the coast which Sealink will have to traverse.	N	National Grid acknowledges the concerns of residents affected by different projects. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. **Application Document 7.10 Coordination Document** sets out how National Grid has engaged and co-ordinated with other developers to minimise the disruption caused by the Proposed Project and, where possible, will look to provide a co-ordinated programme of works to support this, along with site-wide a masterplan. This approach aims to reduce the impact on the environment and local communities. While SPR's projects have consent, the NGV projects proposed in this area are not as well-advanced. All three projects need to submit planning applications through the DCO process and gain consent for their individual assets, without this they cannot be installed. The Proposed Project is an NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it.
		Traffic and transport, Construction – general, Health and wellbeing	You do not show or even allude to the reality of the transport links required. A suggested red line does not indicate the scale of change proposed. Choosing Saxmundham as an appropriate site for three more projects is frankly, extraordinary. Saxmundham provides the main food shopping opportunities for miles around. It is the most important rail link between Lowestoft and Woodbridge. The reality of Sizewell C will be very significant to this market town but under these proposals it will also be a giant building site for many years with access roads and cable routes radiating across the countryside. I hardly need to remind anyone that this process started off in the Leiston/Sizewell area. Had that been allowed to progress at least the damage to East Suffolk would not have been quite so severe	N	National Grid has sought to provide as much information for consultation as is available at the time of publication. The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. These concerns are acknowledged, including those relating to the potential environmental impacts of the Proposed Project. However, the route and site selection process is explained in detail in the **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			whether from transport routes to not tearing up miles and miles of countryside for cable routes. Everyone will have their own story of how these projects will impact them but when push comes to shove it is not hard to identify those who will have a great deal to lose. I am not referring to fiscal loss, I refer to lives ruined by anxiety and fear for their well-being. In Friston there are homes that lie a fair distance from the actual site but there are also those who will have these projects front and centre for most of their remaining lives. In the last five years there has not been a single instance of an approach regarding well-being or mitigation from any party, whether that be SPR or NG or SCC or ESC. So far Friston House has been forced to grant licenses to three interested parties (SPR Sealink Lionlink) re “non intrusive” surveys. That entails unwelcome visits from strangers with access to all parts of the curtilage of Friston House.		With regard to the converter stations at Saxmundham, the process of site identification is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints. The proposed approach for co-locating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area. Further details are contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022) and Application Document 7.1 Coordination Report**. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. The impact of the Proposed Project on the quality of life for local residents is assessed in the following relevant ES chapters: • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**; • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and wellbeing.**
		Onshore mitigation, Cultural heritage	We have been left to fend for ourselves in our opposition to these projects all the while financing our own efforts of mitigation re tree planting and boundary protection. In theory at least, one of the future applications may take this land from us anyway and dig up the trees we have planted so far! As you already know, Frsiton House is grade 11 listed which is a liability and a burden given that the future is very bleak indeed. As a footnote, we have been approached by BSR energy to partner in a project for battery installations. 2-3 acres as a preliminary enquiry. No doubt a lot of land in the Friston area will be of interest to subsidiary projects not discussed in public consultations.	N	National Grid has engaged extensively with local representatives, including Parish Councils, East Suffolk Council and Suffolk County Council, all of whom have responded to consultations and highlighted issues of concern. Many of the issues identified on behalf of the wider community have been addressed either through the design change control process or through identification of appropriate means of mitigation. Similarly, National Grid is maintaining ongoing dialogue with affected landowners in order to understand the potential impacts of the Proposed Project and seeking to identify the most appropriate means of addressing these where necessary. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					basis if there is evidence of negative impacts as a result of the Proposed Project. A full detailed assessment of impacts on designated heritage assets is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.2 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the final Proposed Project design as detailed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment includes Friston House.

Table 1.44 SL-PIL-0217, SL-PIL-0226

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore route location, Construction – general, Health and wellbeing	**Proposed route for inspection of joint bay and Plan of Bulls Hall** My interest in the Sea Link proposals and consultation relates to both the potential impact on me personally, as my home and also the wider affect on the area in which I live, love and greatly value. I am a local resident/landowner occupying a small mixed farm for 23 years to the east of the B1069 between Knodishall and Friston, officially within the parish of Friston, the site of the proposed sub station. Together with my late husband, until very recently we were running a construction company, Fielden Ltd, a small company heavily invested in providing residential property development in the area, predominately, Aldeburgh, Friston and Saxmundham. Whilst it appears with the exception of the bridle path, (and I will refer to this point later) the cables will not be accessing my land, but will run adjacent to my land, in particular my field known as Dog Leg. My personal concern is that both cables, access road and a compound will be adjacent to my farmland on the south and west side. This is in addition to Scottish Power to the north of my property which will already be in occupation with a 2 lane haul road, cables, and another compound. To the east, the B1069 will become a major route for all construction traffic. If you refer to the attached map you will see that Bulls Hall, my farm and home will be sandwiched on all sides by construction of what can only be described as severely damaging to my home, lifestyle and impacting my health. Bulls Hall has been described as an oasis of beauty, a biodiverse area attracting wildlife to include 13 acres of home paddocks and gardens which are organically managed and landscaped. The gardens are regularly open for Charity and I have recently been asked to open for the National Garden Scheme, a request purely based on merit. The disruption on the scale proposed is unlikely to encourage visitors. The farmland is predominately root crops, potatoes and onions and has previously been used to graze our herd of Red Poll cattle and a small flock of Herdwick sheep still remain on the home paddocks. I cannot underestimate the concern and worry this additional consultation has caused me having recently been bereaved and now potentially faced with years of disruption at a time of my life when I should be looking forward to retirement in a property chosen for its peaceful location.	Y	National Grid acknowledges these concerns. The health, safety and wellbeing of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases. The impact of the Proposed Project on the quality of life for local residents is assessed in the following relevant ES chapters: • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**; • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism; and** • **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and wellbeing.** All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. The effects arising from the cable routes will be temporary. Reinstatement of the cable corridors will occur following the construction period as far as practically possible. Details regarding the reinstatement of the cable corridors including monitoring and management measures are contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**. Following consultation with the landowner and their agent, some amendments have been made to the cable route, the compound location and haul road alignment and a commitment has been made to ensure the orientation of the compound layout has been done in such a way as to minimise noise and light pollution to the property.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Due to my personal situation and location, selling and relocating, is a consideration now inflicted upon me and I will certainly be seeking advice on injurious affection and compensation if my property is devalued as a result of the impact of this and other similar schemes.		
		Alternative solutions, Design	From the General Arrangement Plan, it is noted that it is proposed that National Grid acquire a permanent right of way over the track, highlighted in yellow on the attached plan, to provide, post construction access for inspection of the joint bay indicated. Given that the joint bay is located on land belonging to the owner of Church Farm, I would ask that the proposed right of way be re-located so that it is taken along the track, highlighted in green on the attached plan, which forms part of this property; i.e. that any matters pertaining to the cables and joint bay be contained within a single land ownership.	Y	This has now been amended as part of this feedback and the track is no longer used for access to the joint bay for maintenance or at any time in the project.
		Combined effect of the proposed Project	Also, in relation to my property, may I draw your attention to the following points, some of which I consider will not only be detrimental to me personally, but will also impact the surrounding area: Use of bridle path (see attached/as already mentioned) Disruption and loss of income from barn conversion/music studio used for recording by musicians Loss of income from potential ‘wild camping' scheme run off from the field causing flooding in Wills Wood and overfill of ditches and flooding the impact of recent rainfall which was recently caused rain water flowing to my house Access road noise, dust and pollution Compound noise and light pollution Close to nesting sites of hen harriers, buzzards, herons, and migrating patterns of large nesting population of house martins Home to deer, badgers, hares and crested newts Increased traffic use of B1069 and other roads in the area Restricted access to my driveway Damage to road, hedges and banks, caused by heavy construction traffic and inevitable widening of the road Restricted access to local footpaths pollution/chemical/diesel leakage on farmland	Y	This has now been amended as part of this feedback and the track in this location is no longer used for access to the joint bay for maintenance or at any time in the Proposed Project. All drainage for the compounds will be designed to limit the outfall to the same discharge rate as that of a greenfield site, meaning that there will be no increase in the volume or rate of water discharged into the local drainage systems. A complete assessment of socio-economic effects has been undertaken including the impact on public rights of way. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Tourism and Recreation** and concludes that there are no anticipated significant effects as a result of the Proposed Project. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project’s lifetime). In addition, where the project interacts with existing land drainage, there is a Project commitment, secured through the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. See commitment W06 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. Further details are contained in **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. Following consultation with the landowner and their agent, some amendments have been made to the cable route, compound and haul road alignment and a commitment has been made to ensure the orientation of the compound layout has been done in such a way as to minimise noise and light pollution to the property. The impact of the Proposed Project in relation to increased noise is

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					considered in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. All ecological surveys will be carried out prior to the setup of site, any works to areas of potential nesting birds will be carried out outside of nesting season and where required alternative nesting site will be created. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** identify mitigation for any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. Traffic will be managed in a way as not to restrict the locals from the use of any private driveways. Condition assessments of the highways will be carried out and any damage will be repaired as required. Footpaths locally will be managed in accordance with **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk.** All fluids that will be used on site will be managed and used in accordance with the legal requirements to prevent spills, if spills do occur then these will be managed in the required way and notifications will be provided to the relevant authorities and remedial action will be taken as appropriate. The During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This will help control nuisance impacts to within acceptable levels. Compensation claims for disturbance are considered on an evidenced basis and landowners and farmers will therefore be encouraged to keep records to support their claims.
		Construction – general, Inter-project cumulative effects,	With regard to the overall proposal, I have many concerns relating to the construction of Sea Link. I have attended many meetings, in person and virtually and I cannot comprehend why this project is not presented alongside all the other energy projects intended for the Suffolk Heritage Coast. The cumulative impact of half a dozen projects similar to Sea Link in this area at the same time as Sizewell C construction is inconceivable. Not only will this blight the lives of residents for many years, but it will seriously damage the visitor-based economy resulting in significant job losses, in which this area is reliant on.	N	Different projects referenced by the respondent are separate from the Proposed Project, being promoted by different developers and working to different timescales for delivery. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the colocation of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. Potential impacts on the tourism economy are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					basis if there is evidence of negative impacts as a result of the Proposed Project. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**.
		Combined effect of the proposed Project, Alternative solutions, coordination with other projects	Choosing Friston for the substation means that all future associated onshore infrastructure projects will be located in this area, devastating farms, homes, wildlife and have a huge detrimental effect on areas of AONB and SSSI. A better solutions should be considered with the use of brownfield alternatives and an offshore grid solution. The most sensible option would be for Sealink and potentially Lionlink and EA1N & EA2 (although I know they are subject to a judicial review) to connect to an onshore site at Bradwell or similar, closer to the larger scale populations where the energy is needed.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. National Grid assessed the Bradwell Power station site. However, this site was considered too small to accommodate the required infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Consultation, Inter-project cumulative effects	The sheer scale of all the proposed onshore infrastructure, together with all it entails is a horrifying prospect for all those who live and enjoy this part beautiful area of Suffolk. The consultations provide piecemeal presentation of individual projects, putting an onerous responsibility of time, energy and	N	National Grid acknowledges the concerns of residents affected by different project proposals in this area. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Each stage of consultation on the Proposed Project has

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			commitment to remain informed, attend events and engage by providing feedback repeatedly over the last 5 years ...and likely to continue for many more years. Not only is it unfair and unjust, but it is inefficient and ineffective as the total picture is extremely difficult to understand and make clear judgements specially in my situation when it may have such a huge direct and personal effect.		presented the design and environmental information that is available at that time. The evolution of the design is captured in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia One North, East Anglia Two, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand.
		Consultation, Land rights and CPO	I would appreciate a response and a meeting on site to discuss the impact on my land and property to assess and offset exactly the effects the Sealink proposal will have on me personally.	Y	National Grid's land agents arranged a meeting on the 24 July 2024 to discuss project updates with landowner.

Table 1.45 SL-PIL-0421

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore route location, Design, Landscape and visual	I am writing to provide feedback following the first statutory consultation meeting with Dalcour Maclaren and James Buckley of National Grid on 12th December 2023. I was personally representing Chandler & Dunn Ltd. The feedback is as follows: **Alignment** It was confirmed that the cabling to the south of the River Stour would be overhead which is more disagreeable than an underground solution. It will also add up to 9 additional pylons and whilst these will not be situated directly on the land owned by C&D they will be visually present.	N	Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places, however, such as south of the River Stour, it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. Further information is contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. The assessment of landscape impacts is contained within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid will seek to minimise the visual effects as far as possible through consultation on design principles and landscape masterplanning.
		Construction - general, Socio-economic. recreation and tourism, Consultation	**Construction** It was confirmed that a large area of land to the south of the river would be fenced off to allow for construction and whilst this doesn't directly affect the freehold land it does affect land which is farmed by the business. Early discussions should be had to limit the amount of grazing land affected, as grass is often short especially in the summer months. Availability of water and movement of livestock also need to be considered. Some works will be undertaken to the current towers, which will involve the placing of sleds and anchor points within the land, which is accepted on the basis that livestock can continue to graze the land.	N	National Grid is maintaining ongoing dialogue with affected landowners in order to understand the potential impacts of the Proposed Project and seeking to identify the most appropriate means of addressing these where necessary. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. National Grid has an established and effective code of construction practice which has been used on many projects and covers the matters of concern raised in these comments (refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**).
		Construction - general, Water environment	Access is not to be via the freehold land, but along the Kings End Drove and over a bridge to be constructed to the east of the waterworks. Said access points need to be secure or regularly patrolled to avoid trespass. The land is extremely wet during the winter months so works need to be planned for the summer months when ground conditions allow If fencing is required then this needs to be suitable and fit for purpose, Land Rights Strategy (LRS) The LRS doesn't cover a right for access and it is to be confirmed if this is required. I hope this feedback is helpful in progressing to the next design stage of the project and we look forward to receiving further detail in due course.	N	National Grid has an established and effective code of construction practice which has been used on many projects and covers the matters of concern raised in these comments (refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**). Access during the construction phase will be in accordance with the terms of agreements secured through ongoing discussion with landowners. National Grid will, through negotiations seek to secure voluntary access rights where required. Our land agents will be in contact shortly with Heads of Terms documents and will be able to discuss scheme in detail with you and log any specific requests you have to mitigate any disturbance.

Table 1.46 SL-PIL-0210, SL-PIL-0219

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore route location, Design	**Alignment** At present the cable is due to be directionally drilled beneath the golf course at a depth which will not impact upon the operation or long-term use of the course. It is however noted that there cannot be any onerous restrictions placed on the land due to the presence of the cable which would affect any works such as changing levels which are commonplace.	N	Based on feedback received during the consultation process, the typical depth of the cable trenches will be 1.5 m, see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** for further information. The minimum depth of burial of the cable to the top of the protective tile will be 0.9mm. In some instances, subject to discussion and agreement with the landowner this may be deeper, but this will depend on cable design. The cable routes will be reinstated post construction to allow existing operations to continue.
		Construction – general, Onshore route location, Water environment	**Construction** Any further survey works are to be undertaken in the drier months to avoid any further damage, ideally there will be no more intrusive surveys located on the golf course. Access for any further survey works or during construction is to be via the access used for the borehole works. The land is crossed by drainage and irrigation systems and it is imperative that these are not impacted during construction. Plans will be provided where available. Any seepage of bentonite is to be controlled and cleared immediately to avoid long term impact to the golf course.	N	Further survey works will be agreed on the basis of ongoing discussions with landowners. Based on feedback received during the consultation process, the typical depth of the cable trenches will be 1.5 m, see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** for further information. The minimum depth of burial of the cable to the top of the protective tile will be 0.9mm. In some instances, subject to discussion and agreement with the landowner this may be deeper, but this will depend on cable design. Any disturbance to or modifications required to the current land drainage system will be incorporated into the construction scope to ensure the land is properly reinstated and drains are left in no worse condition than prior to construction. National Grid has an established and effective code of construction practice which has been used on many projects and covers the matters of concern raised in these comments (refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**).
		Land rights and CPO, Socio-economic. recreation and tourism, Design	**Land Rights Strategy (LRS)** The new LRS is due to be published next year and for now it is considered that the current LRS is appropriate for underground assets, subject to a reasonable land value being agreed. This also assumes that there are no onerous restrictions to be implied under the Development Consent Order or the voluntary agreement. Mr Chapman is keen to note that some golf courses namely Herne Bay have been developed residentially and that he would not want the presence of the cable to prejudice any long-term alternate uses for the land.		National Grid's new LRS has now been published and is available on the National Grid website. The Lands agent - Dalcour Maclaren - will be contacting landowners in due course to discuss voluntary agreements, which will be in line with the compensation code.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			A permanent right of access is to be confirmed, albeit based on the current design and construction methodology it is not intended or necessary. We hope this feedback is helpful in progressing to the next design stage of the project and we look forward to receiving further detail in due course.		

Table 1.47 SL-PIL-0041, SL-PIL-0818, SL-PIL-0110, SL-PIL-0049

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore route location, Design	**Alignment** As discussed, the land is earmarked for the expansion of the existing St Augustine's Golf Course and designs have been provided to National Grid and Dalcour Maclaren in both PDF and CAD formats. The alignment needs to be such that material can be deposited over the new cable(s) in accordance with the design or similar designs provided. The levels and quantum of fill have been specified. Any joint boxes that need to be inspected on a regular basis must be located in an area where the levels are not due to change. Ideally the cable would be installed around the boundary of the land to limit disturbance in the long term, however this is not such an issue if the cable is buried as a suitable depth to allow 'build over'. It is the intention that the new golf course design will include some planting and this shouldn't be prejudiced by the presence of the cable. It would be preferable if the cable were to be directionally drilled underneath both parcels of land with the reception pit being located within the parcel of land where the converter station is due to be constructed.	Y	The feedback received at the meeting has been taken into account and the proposed methods of installation have now been altered to take into account the information provided by the Landowners. The alignment of the cable has been moved to the boundary of the property to minimise disturbance. Any increase in ground level over the cable, once installed, would need to be agreed with National Grid.
		Construction – compound, Construction - general Areas, Agriculture and soils,	**Construction** During the meetings it was confirmed that a large area would be occupied as a site compound to facilitate the directional drill and said compound needs to be located in a position that causes least severance and land take from a farming perspective. Any severed areas still need to be managed to preserve soil quality/PH etc. Access is suggested via the existing field entrance adjacent to St Augustine's for construction and ongoing maintenance.	N	The construction compounds shown on the drawings are indicative. These are for the contractors to house offices, storage and parking for their plant and vehicles. National Grid will continue to engage with landowners on the Proposed Project and their feedback and comments taken into account in the revised design. National Grid acknowledges the comments and concerns regarding impacts on agricultural land. **Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils** explains National Grid's assessment of potential impacts on agricultural operations have been based on the final design presented within A**pplication Document Part 1 Introduction Chapter 4 Description of the Proposed Project** issues such as fragmentation of land parcels identified, where applicable, and mitigation set out.
		Water environment, Agriculture and soils, construction	The land is extensively drained and both pre and post construction drainage works will be required to ensure that the existing land drainage continues to function during the construction phase and once the project has been completed. Plans will be provided where available. An appropriate surfacing material will need to be installed in order to protect the soil during the construction phase of the project and it is suggested that this is stone sourced locally, as opposed to the soil stabilisation or track matting that has been used on other projects. The land in this particular location can become very wet	N	The Proposed Project has secured through commitments within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** that where there are interactions with existing land drainage and irrigation systems, the project will ensure the integrity of these systems, providing for temporary alternatives during construction, as necessary. Based on feedback received during the consultation process, the typical depth of the cable trenches will be 1.5 m, see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** for further information. The minimum depth of burial of the cable to the top of the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			during the winter months and the alternative methodologies such as soil stabilisation do not function properly.		protective tile will be 0.9 m. In some instances, subject to discussion and agreement with the landowner this may be deeper but this will depend on cable design. Any disturbance to or modifications required to the current land drainage system will be incorporated into the construction scope to ensure the land is properly reinstated and drains are left in no worse condition than prior to construction. National Grid has an established and effective code of construction practice which has been used on many projects and covers the matters of concern raised in these comments (refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**).
		Construction – General, Consultation, Onshore mitigation	It is noted that some of the existing high voltage overhead electricity lines may need to be diverted or placed underground to facilitate construction, which is acceptable, but needs to be discussed in advance. Demarcation fencing will need to be installed during the construction phase to prevent the contractor from deviating outside of the order limits. Topsoil is to be carefully stripped and stored during the construction phase and is to be managed appropriately to include regular spraying to prevent injurious weeds.	N	National Grid is maintaining ongoing dialogue with affected landowners in order to understand the potential impacts of the Proposed Project and seeking to identify the most appropriate means of addressing these where necessary. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. Following construction, the cable routes, including farmland, will be fully reinstated. Commitment GG26 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** relates to the provision of fencing during construction and states where working areas are fenced, the type of fencing installed will depend on the area to be fenced and will take into consideration the level of security required in relation to the surrounding land and public access, rural or urban environment and arable or stock farming. For some locations the fence used may also serve to provide acoustic and visual screening of the work sites and reduce the potential for disturbance of users in the surrounding areas. Fencing will be regularly inspected and maintained and removed as part of the demobilisation unless otherwise specified. During construction topsoil (and where necessary subsoil) would be removed from the affected area and stored appropriately for later use in reinstatement. All trenches will be reinstated to the level of the base of topsoil and the topsoil replaced. All soil handling will be undertaken in accordance with good practice as set out in an outline Soil Management Plan (**Application Document 7.5.10.2 Outline Soil Management Plan - Kent**).
		Land rights and CPO	**Land Rights Strategy (LRS)** The new LRS is due to be published next year and for now it is considered that the current LRS is appropriate for underground assets, subject to a reasonable land value being agreed.	N	National Grid's new LRS has now been published and is available on the National Grid website. The Lands agent - Dalcour Maclaren - will be contacting landowners in due course to discuss voluntary agreements, which will be in line with the compensation code.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			This also assumes that there are no onerous restrictions to be implied under the Development Consent Order or the voluntary agreement. We hope this feedback is helpful in progressing to the next design stage of the project and we look forward to receiving further detail in due course.		

Table 1.48 SL-PIL-0161, SL-PIL-0162, SL-PIL-0165

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Converter station location, Alternative solutions	**General discussion:** What is proposed on GA plans across land owned by Peter Mann and Blackheath Farms. PM owned land has HVDC cable route, haul road and 1 joint bay. Blackheath has HVDC cable route, haul road, various access points, joint bays, construction compounds and drainage connections. SG questioned why the converter station(s) can't all be located at Friston with the SS with appropriate landscaping to minimise impact.	?	The site of the substation at Friston does not have capacity to accommodate converter stations - either singularly or through colocation. **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** sets out the site requirement criteria and explains the rationale underlying decision-making about the route and location of the infrastructure required for the Proposed Project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** It is acknowledged that there will be some residual localised impacts arising from the Proposed Project, however, National Grid has considered the important viewpoints identified within the Neighbourhood Plan and these have informed the assessment of the ES, alongside engagement with the Town Council and the local planning authority. This has also informed the proposed mitigation plans, including proposed woodland on the western edge of the converter station site. Mitigation planting along the permanent access route has also been developed in collaboration with the cultural heritage team. Analysis of the site within the context of the surrounding area indicates that historically there is evidence of blocks of woodland on this site. The sensitivity of this area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore route location, Safety, Design	Reviewed designed drawings for working width and buried HVDC cables. PM + SG raised concerns regarding the depth of cables – they grow predominantly root crops and worry that with wet areas over time there will be a reduced depth of cover to the cables. PM has confirmed that, for clarity, this is a significant health and safety issue as there is considerable concern that catching the cables with farm implements could result in death or serious injury to the operator of the tractor.	N	The health, safety and wellbeing of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases. National Grid installs protection tiles above all cable installations. The standard cover to the protection tile is a minimum of 0.9 m when in agricultural land. National Grid will liaise with landowners about their specific working methods to identify whether any increase in this depth is required and this will be implemented where possible.
		Water Environment, Socio-economic. recreation and tourism, Onshore mitigation	PM raised concerns over the inclusion of the reservoir at Blackheath, this holds 250,000m3. This is used as irrigation across the area by Manor Farm, Knodishall and Mann Potatoes. For clarity, PM has confirmed that Hazelwood reservoir does not irrigate Manor Farm, Knodishall, but is used by Mann Potatoes in connection with the contract irrigating undertaken on the Blackheath Estate. There is an additional reservoir to the south of the road which has a pipe into the Blackheath reservoir which holds 100,000m3. The reservoir is vital to the farming businesses and any contamination from construction or any connection into it would mean they cannot use the water to irrigate without it being decontaminated. There are some ponds on Blackheath land next to the reservoir which would provide an alternative drainage outfall. For clarity, PM has confirmed that if contaminated it could cause Mann Potatoes not to be able to supply produce for contracts undertaken in advance this would need to be compensated on top of any loss of income from irrigating and crop loss. JL to understand further what is proposed here and pick up with Gwyn. The land across Blackheath and Manns is mostly light/sandy land with some areas heavier/wetter. Peter Mann does not have drainage plans of his land to provide – JL to follow up if they have irrigation plans.	Y	National Grid acknowledges the concerns raised regarding Hazlewood Reservoir and the sensitivity of the farming activity in this area and the perceived risk of contamination. Following review of feedback and recognition of the potential risks to the water supply on the estate, the reservoir has been removed from the Order Limits. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding privately owned assets where interfaces are identified. On a wider scale, National Grid acknowledges the significance and importance of drainage and irrigation land-based enterprises. National Grid will work with landowners on an ongoing basis to understand the nuances of site drainage. **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** set out good practice measures relating to drainage, irrigation, groundwater and protection of private water supplies. These actions are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Socio-economic. recreation and tourism, and rights and CPO	**Businesses:** Peter Mann owns plot 28 in his name, he operates under Manor Farm Partnership, Knodishall which includes additional family members. Manor Farm Partnership rent land to various growers, including turf and Christmas tree companies. They also provide irrigation and cultivation work for the companies they rent land to.	N	National Grid recognises the well-established farming and diversified activities that are reliant upon the land in this area. Acknowledging the important role that these enterprises play in this area, a complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Manor Farm includes PMs house, storage units which are rented out with 24/7 access, 5x residential dwellings all let on 1 year AST (tenants have all been there number of years, they are reluctant to provide details of the tenants due to GDPR), glamping business, stables which have conversion potential, agricultural yard used by Mann Potatoes, access track though to fields beyond. Concerns here over the impact of construction on the ability to keep/get new residential tenants and if they have to reduce rents. Also impact on glamping business during construction. This is a separate business operated by PMs wife. Manor Farm Knodishall – Suffolk Farm Glamping. For clarity, PM has confirmed that this is a separate business operated by his wife, Samantha Mann, called Turner Mann Enterprises. Previously run B&B from farmhouse which was voted best in Norfolk and Suffolk – have taken a break due to family commitments but will likely want to start up again in future. Storage units currently have 24/7 access – will this be disrupted by construction corridor going across their new track – JL to ask what whether construction period will allow crossing points to keep access available PM also runs Mann Potatoes with Richard Mann, they do not own land as this business. They rent land across Suffolk to grow each year approx. 750 acres potatoes, 500 acres onions + 100 acres carrots. Mann Potatoes have 1 year FBTs on land owned by Peter Mann. They have a cropping rotation which is planned years ahead across the land they rent and they purchase seed, fert etc. up to 1.5 years in advanced depending on cost. PM has highlighted that Mann Potatoes have a highly trained team with most staff working for the business between 5-33 years. If they drop area due to Sealink Project then they will potentially have to let people go as the business won't be able to sustain that wage bill. Mann Potatoes are due to sign a Contract Farming Agreement for the entirety of Blackheath Farms. PM did not seem as concerned over Red Tractor here as Blackheath do their own accreditation. Asked us to liaise with Gwyn as PM does not want to tread on his toes. PM has highlighted that, notwithstanding the comments of Messrs Brooks Leney on behalf of the Blackheath Estate, he has a Contract Farm Agreement in the name of Mann Potatoes for all land that is not used in connection with the dairy and outdoor pigs and is concerned as to how the works may affect Mann Potatoes Red Tractor Accreditation and Certification.		Potential impacts on agricultural operations have been assessed based on the final design presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** issues such as fragmentation of land parcels identified, where applicable and mitigation set out. The cable route will be reinstated to its previous use and therefore farming operations are able to continue post construction. Compensation claims for disturbance are considered on an evidence basis and landowners and farmers will therefore be encouraged to keep records to support their claims. Where productive land is lost as a result of the permanent infrastructure this needs to be balanced with the Proposed Project needs case, which will help the UK with British Energy Security Strategy 'Security of Supply' and with helping the UK to meet its Net Zero target to reduce carbon emissions.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design, Socio-economic. recreation and tourism	**Development:** Manor Farm Partnership have a grant for a new farm track from School Road into the yard, through field called 'Monks'. This will be used by agricultural traffic with the aim being residential traffic to use the existing track. They will apply for PP in next 6 months with it being built under grant funding. This track will be severed by the construction corridor. They will retain the existing access track to the house/farm which will be able to be used in the case the new track is severed. For the avoidance of doubt, no construction traffic nor post construction access should be taken over the existing farm drive, as this will significantly impact on the existing glamping and bed and breakfast businesses. Fields known as 'School' and 'Commons' – currently in turf but they have long term plans for battery storage. They are soon to sign an exclusivity agreement with the developer with the option yet to be agreed. They are expecting a 10 year option term with the developer expecting to wait for Sea Link to be constructed before they exercise the option. This area is included in draft order limits only for works to existing OHL + Towers.	N	National Grid acknowledges your concerns on this matter and will seek to maintain ongoing dialogue with landowners to understand and satisfactorily resolve any issues arising on land that is affected by the Proposed Project. Where relevant, the Compulsory Purchase process requires applicants to justify any land included in a CPO application, keep it to the minimum required to deliver the proposed project and to seek voluntary agreement on reasonable terms ahead of the application being heard. National Grid is committed to seeking to acquire the necessary land rights on voluntary terms and undertake construction under those terms. While this area remains within the Proposed Project Order Limits, National Grid will not use the track for construction traffic and will instead be using a haul road which is also within the Order Limits **(Application Document 2.14.1 Indicative General Arrangement Plans – Suffolk**). While this area remains within the Proposed Project Order Limits, National Grid will maintain ongoing discussions with the landowner. Compensation claims for disturbance are considered on an evidence basis and landowners and farmers will therefore be encouraged to keep records to support their claims.
		Consultation, Design, Onshore mitigation	**Surveys:** PM happy for NI surveys to take place in fields which are not cropped by Mann Potatoes. JL to collate survey programme and issue to SG for review. The land in turf will need consideration as to harvest timing. For clarity, PM has confirmed that Non-intrusive surveys can be done on land in crop which Red Tractor is not affected. Intrusive surveys the same as long as compensation is paid. No non-intrusive or intrusive surveys can be carried out on land that has a root crop on or is under Mann Potatoes. Discussion of archaeology trenching programme – JL to consider impacts and mitigation for these fields. 'Tennis' field has been trenched by SPR. 'Grainstore' field is currently in turf, turf is grown on 18 month FBTs, being harvested between now and Jan and they plan to plant potatoes in March, with cultivations to start in Feb which will need Red Tractor sign off. 'Monks' field is on an 8 year lease to Christmas tree company, this will end at end of 2024. They have grown 8,000 trees per acre in here. The trees are grown in pots and they have a trickle irrigation system throughput the field with 60cm spacing. They have removed 30,000 trees this year but there are more than this left, due to be cleared by end of 2024. The trees cannot be easily moved even though they are in pots due to the irrigation system. In 2025 will likely plant maize or sugar beet. PM has advised that he will come back with a firm date when West Country Trees are due to finish with the field.	N	National Grid welcomes your support for programme of non-intrusive survey works. Ongoing landowner dialogue will seek to ensure site-specific issues are understood and reflected in the work schedules.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Land rights and CPO	**HOTs:** SG has agreed HOTs for other clients on BTNO and had extensive negotiation on these terms -JL to see if we can get these HOTs for reference going forward. There should not be any occupiers on the land owned by Peter Mann that would need to be party to HOTs. SG indicated that they will sign up to voluntary agreement if we can agree appropriate terms. PM + SG explained that there have been quite a lot of high value land sales in the area in last 5 years which will help with agreeing land values. JL explained the NG LRS – they will receive 80% of land value across the easement width and any additional construction will be subject to disturbance/crop loss. PM raised queries about future compensation and JL/SG explained crop loss/disturbance/severance/IA that will be applicable.	N	National Grid's new LRS has now been published and is available on the National Grid website. The Lands agent - Dalcour Maclaren - will be contacting landowners in due course to discuss voluntary agreements, which will be in line with the compensation code.
		Design, Alternative solutions	Other Concerns: Concerns over locations of joint bays – they would prefer these to be in margins/tracks/hedges if possible. Access track from Snape Road – owned in part by Fielden Ltd (June Bloomfield) and part by Heald. The Manns (in all capacities) have access rights across this track to access all fields there which they own and farm. They are concerned how use of this track will affect their use of the track. Is this a permanent future access to the joint bay (on Heald land) or is it a construction access? – JL to find out. They have suggested an alternative route would be shorter/easier from Grove Road – this is all owned by Heald, to access apparatus on Heald land. This would make more sense to them in terms of logistics. JL to see if this is a justified DCC request.	Y	Access tracks to joint bay locations are for maintenance of the joint bays only. These have been altered following the feedback. National Grid will look to put all joint bays on the edge of fields where possible to ensure access is available from existing routes.

Table 1.49 SL-PIL-0779, SL-PIL-0414

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Traffic and transport	**Background** The land is occupied by D H Clifton which is a trading Partnership made up of Pippa Southorn and James Southorn. D H Clifton is a statutory tenant on the land and will be directly affected by National Grid's Sea Link scheme. The land that will be affected is productive land in an arable rotation and according to the Agricultural Land Classification is Grade 2 which produces high yielding, valuable crops. **Concerns** Below we have set out a list of concerns which we will need a response from National Grid. 1. Single track (details on Map 1 included) - On 935 meters of track that will be used to traffic large pylon transport there are hard to navigate corners on a single track with no passing places, you are not able to see on coming traffic. There is a watercourse on one side and drop on the other. - - Impact on harvest with tight deadlines. During the entire operation the track will need to be kept an acceptable level to be used by farm traffic. It is not appropriate for the level of traffic involved.	N	Management Plans have been prepared for both Suffolk and Kent as part of the DCO application. These have been developed in consultation with the relevant local planning authorities and provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent** is provided to help mitigate any potential impacts. These documents include construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase.
	Traffic and transport, Design	2. Cricket Crossing (as detailed on Map 1 included) - Crickets Crossing is a blind crossing with manual gates. - - - Tight bend for oncoming trains before they approach the crossing. You can not see if vehicles are waiting to cross the other side. If a vehicle is coming along the single track route to the crossing one vehicle will need to reverse either back over the railway line or in the other direction down a unsuitable single track route with a water course on one side and a drop on the other. Once over Cricket Crossing the preferred access route is to remain next to the train line Railway crossing (as outlined in green on Map 1 included).	Y	The Cricket Crossing, which is an existing level crossing located circa 900 m southeast of Minster railway station, will be used to access the overhead line works to west of the railway line and to the south of the River Stour. The existing farm access track and level crossing will be upgraded with ramping and protection to accommodate construction vehicles, and surveys will be carried out to determine the level of improvement works required to ensure this can be used safely. This activity will involve ongoing engagement with Network Rail. Once construction vehicles have used the upgraded level crossing, they will then use the preferred access route adjacent to the railway line (as identified), in order to avoid crossing fields. Temporary culverts will also be provided to allow construction vehicles to cross the Minster Stream.
	Water environment, Socio-economic. recreation and tourism	3. Irrigation - We are part of a large salad group of which we are an essential link in the chain of the business. Pollution from run off at substation site will not allow us to fill our reservoirs if we are abstracting during that period. If a pollution incident occurs, we would need to be notified asap.	N	National Grid will work with landowners on an ongoing basis to understand the nuances of site drainage. However, assurances can be given insofar as the converter station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems. The Proposed Project has secured through commitments within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Water levels are kept high in the system during the summer. This is system needs to remain and be uninterrupted.		**and Commitments (REAC)** that where there are interactions with existing land drainage and irrigation systems, National Grid will ensure the integrity of these systems, providing for temporary alternatives during construction, as necessary. In addition, there are a range of commitments to safeguard the quality of the water environment and to control and manage the risks of pollution during the construction phase. All Proposed Project infrastructure will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems. Further information is contained in **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment**.
		Agriculture and soils, Design, Traffic and Transport	4. Soil - We have been using a no-till and cover crop agricultural system on the marsh at financial loss to improve the soil structure, this has taken 10 years to finally see the benefits, it is not a quick process to reverse the damage caused on this soil type. Matting and anything to avoid compaction please. Soil assessment before and after use. Please can National Grid confirm that this will be done. To avoid crossing fields access route once over Cricket crossing is from https://w3w.co/snitch.albums.reissued along the side of the railway line to https://w3w.co/informs.thudding.parsnip where a bridge into the field where pylons are being installed will need to be put in. This will avoid traffic over Abbots Wall.	N	Potential impacts on agricultural operations and soils have been assessed based on the final design presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** issues such as fragmentation of land parcels identified, soil management where applicable and mitigation set out (**Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils**). In terms of the proposed access route once construction vehicles have used the Cricket railway crossing (which will be upgraded to ensure this can be used safely), construction vehicles will use the preferred access route adjacent to the railway line (as identified), in order to avoid crossing fields. Temporary culverts will also be provided to allow construction vehicles to cross the Minster Stream. Documents relating to access routes and their use include **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice.** All mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1)**. The cable route will be reinstated to its previous use and therefore farming operations are able to continue post construction. Compensation claims for disturbance are considered on an evidence basis and landowners and farmers will therefore be encouraged to keep records to support their claims.
		Terrestrial ecology, Onshore mitigation	5. Natural England Higher Level Scheme - We completed the scheme in 2018, since the completion of Nemo Link we have seen huge improvements in the number of species, the reports you will have received will speak for themselves. How you will be able to keep the beavers from burrowing and flooding or collapsing your site? They will be attracted to warmer environments, same applies to eels. - We will need to acquire mitigation from the Environment Agency from the scheme for relevant areas.	N	The evidence from surveys for the Proposed Project is that the beavers are largely confined to the Stour corridor. While they will venture into ditches there are not likely to move into terrestrial habitat away from watercourses. The Kent Onshore Scheme includes specific mitigation for eels to ensure passage is maintained. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Water environment, Cultural heritage	6. Abbotts wall - Flood defence and monument requires protection according to the Natural England requirements. Please may you provide details on how you intend to do this?	N	The Project has secured through commitments within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** that where there are interactions with existing flood defences, appropriate monitoring will be undertaken in accordance with Environment Agency specifications, and appropriate actions triggered should the monitoring detect any change.
		Safety, onshore Mitigation, Health and wellbeing	7. Security - River Stour has been used for drugs and arms smuggling, hare coursers are very active. Security gates and security required if you put a bridge in between farms. The bridge installed for Nemo Link had children jumping off it into the river and multiple people using it, motorbikes which drove all over crops and even a caravan was dragged over and dumped in the middle of the field. Although security was promised it was never put in place. Please can National Grid confirm that suitable security measures will be provided.	N	As an operator of national infrastructure, National Grid commit significant resources and investment into maintaining the security of their sites and assets. National Grid will ensure that its contractors provide the relevant levels of security and where gates are installed these shall be locked out of hours and mobile and static security patrols or CCTV will be installed where it is deemed required. **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** states that where working areas are fenced, the type of fencing installed will depend on the area to be fenced and will take into consideration the level of security required in relation to the surrounding land and public access, rural or urban environment and arable or stock farming. Consultation on the type of fencing will be undertaken with the relevant landowner and tenant where required. For some locations the fence used may also serve to provide acoustic and visual screening of the work sites and reduce the potential for disturbance of users in the surrounding areas. Fencing will be regularly inspected and maintained and removed as part of the demobilisation unless otherwise specified. This will be secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore route location, ornithology	8. Bury cables - To enable the Natural England Higher Level Environmental scheme to continue to be successful pylon cables need to be buried to ensure flight path remains. We would support the wide response for National Grid to bury the cables.	N	Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Mitigation measures for the Proposed Project can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					and Commitments (REAC) which is secured through Requirement 6 of schedule 3 of the draft DCO (**Application Document 3.1**).
		Converter station location, Water environment, Alternative solutions	9. Location of Converter and Substation - If you are required to build up the current proposed site to protect from flooding, it would make sense to build up the site next to Nemo Link station (as approximately set out in Map 2 included It could connect straight into pylons and the access route is simple for the build. Please can National Grid confirm why this is not possible.	Y	All siting options are set out in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. The land adjacent to the existing Nemo Link is not large enough to site the new Sea Link Converter Station. The land opposite the Nemo site on the other side of the river is in a Flood Zone 1 and therefore any building up of land in this area would require flood compensation in other areas to be provided. The land is being build up at the existing site to assist with the drainage and laying of cross site cables not due to flooding.
		Consultation	10. Following consultation meeting with National Grid it was confirmed that no further environmental work is required at Abbey Farm on behalf of National Grid with regards to Sea Link.	N	National Grid will maintain ongoing dialogue with landowners affected by the Proposed Project. In the event that circumstance should change from that which was explained during a consultation event, further engagement will be sought as necessary.
		Needs case, Combined effect of the proposed Project, Onshore mitigation, consultation, agricluture	**Conclusion** In direct response to National Grid's proposal, we disagree and object on the basis to the overwhelming impact to environmental impact and the impact on the farming operations. My client would consider withdrawing their objection if protective provisions can be provided to cover the above concerns and the cable can be underground. We look forward to a response to this letter and a proposed date for a meeting in the near future with National Grid to discuss its contents.	N	In developing the Proposed Project, National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. Alternative options have been extensively assessed and while there may be perceived visual benefits associated with use of underground cables, on balance, overhead lines involve less impact on the marshes during construction and over the lifetime of the asset. This is explained in more detail in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and **Application Document 7.2 Strategic Options Back Check Report**. National Grid will maintain ongoing dialogue with affected landowners with a view to identifying the most appropriate means of securing protection of assets as identified on a case-by-case basis.

Table 1.50 SL-PIL-0594, SL-PIL-0350

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Landfall location, Onshore environmental impact, Alternative solutions, coordination with other projects	In Nov 2023 the term AONB was changed to National Landscapes, but references to the designation in law and policy remain as AONB, hence this response uses the AONB nomenclature. It seems clear that there are a number of difficulties associated with the proposed Aldeburgh to Thorpeness landfall, namely: 1) Damage to the SSSI between the shoreline and the old railway line even with the use of 'trenchless techniques'. This is explained fully by the RSPB in their 18th December email to you. 2) Damage to the AONB, National Landscape, by trenching techniques. This is explained fully by the RSPB correspondence 18th December email and the National Landscape Office in its email to you on the 13th of December 2023. 3) The chosen landfall does not suit co-location of infrastructure as a consequence of the greater impact to designated SSSI and AONB landscapes. This is explained fully in the RSPB correspondence, 18th December email. 4) The presence of the large deer herd located on the inland side of the old railway line where the current plan is to surface the cables and start open trenching techniques. This deer herd is established and substantial. The RSPB, who manage the area, confirmed to me in writing that "…your estimate of the deer herd does not conflict with our understanding of the population". These large animals are wild and, if panicked, could present dangers to the public. I have first-hand experience of the potential problems arising and Sealink would need a definitive plan. In summary, the Aldeburgh to Thorpeness landfall clearly needs reviewing including further consideration of alternatives.	N	The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. Impacts from construction of the onshore cable on the RSPB Reserve, Leiston-Aldeburgh SSSI and Sandlings SPA have all been considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration,** informing the design, construction methods and programme for the Proposed Project. This assessment has been discussed with Natural England, Suffolk Council and East Suffolk Council. Significant disturbance is to be ensured against by a combination of construction methods (adopting a trenchless construction solution rather than open cut trenching), technical mitigation (noise fencing), moving the construction compound further from the SPA than it was identified at Statutory consultation, and phasing the most potentially disturbing elements of work in that area to avoid the bird nesting season National Grid has followed a rigorous assessment process to choose the locations of the landfalls at each end of the Proposed Project and understand the concerns about the Aldeburgh location. National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. This is explained in more detail in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and **Application Document 7.2 Strategic Options Back Check Report**. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. Details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. In addition, National Grid has an established and effective code of construction practice which has been used on many projects and covers the matters of concern raised in these comments (refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**).

Table 1.51 SL-PIL-0823, SL-PIL-0122

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Land rights and CPO, Socio-economic. recreation and tourism	The land is owned by the Church Commissioners for England and occupied by D H Clifton. D H Clifton farms the holding as a tenant under an agricultural tenancy and will be directly affected by National Grid's Sea Link scheme. The land that will be impacted by the proposed works is classified as Grade 2 and is productive land producing high yielding and valuable crops including salad.	N	National Grid acknowledges the comments and concerns. The impact of the entire project on BMV land is set out in **Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils**. Potential impacts on agricultural operations have been assessed based on the final design presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** issues such as fragmentation of land parcels identified, where applicable and mitigation set out.
		Traffic and transport, Onshore mitigation	**Concerns** We wish to bring the following concerns to your attention and would appreciate a clear response from National Grid on how they will be mitigating the issues set out below. 1. Single track (details on Map 1 enclosed) It is not appropriate for the level of traffic involved. The access track will be used by large and heavy goods vehicles. There are corners that the tracks are difficult navigate, with no passing places and with a watercourse on one side and a drop on the other it is not possible to create new passing places as part of the scheme. The access will be shared with the tenant which could have a significant impact during harvest with tight deadlines, particularly if they are faced with poor weather. During the works the track will need to be kept an acceptable condition to be used by farm traffic at all times.	N	Outline PRoW Management Plans have been prepared for both Suffolk and Kent as part of the DCO application. These have been developed in consultation with the relevant local planning authorities and provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent** is provided to help mitigate any potential impacts. These documents include construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. National Grid will maintain ongoing discussions with landowners and tenants in order to understand the impacts of the Proposed Project and ways and means of mitigating adverse impacts.
		Traffic and transport, Design	2. Cricket Railway Crossing (as detailed on Map 1 included) - Cricket Railway Crossing is a blind crossing with manual gates. There is a tight bend for oncoming trains before they approach the crossing. You cannot see if vehicles are waiting to cross the other side. If a vehicle is coming along the single track route to the crossing, one vehicle will need to reverse either back over the railway line or in the other direction down an unsuitable single track route with a water course on one side and a drop on the other. Once over Cricket Crossing the preferred access route is to remain next to the train line (as shown shaded green on Map 1 enclosed).	Y	The Cricket Crossing, which is an existing level crossing located circa 900 m southeast of Minster railway station, will be used to access the overhead line works to west of the railway line and to the south of the River Stour. The existing farm access track and level crossing will be upgraded with ramping and protection to accommodate construction vehicles, and surveys will be carried out to determine the level of improvement works required to ensure this can be used safely. This activity will involve ongoing engagement with Network Rail. Once construction vehicles have used the upgraded level crossing, they will then use the preferred access route adjacent to the railway line (as identified), in order to avoid crossing fields. Temporary culverts will also be provided to allow construction vehicles to cross the Minster Stream. Documents relating to access routes and their use include **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice.** All mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC) which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Water Environment, Safety, Onshore mitigation	3. Irrigation D H Clifton form part of a large salad group of which they are an essential link in the chain of the business. Notification of any potential and or confirmed pollution from any runoff at the substation site is critical. In the event of any pollution incident, D H Clifton will have to cease use of their reservoirs, particularly at times of abstraction. -The irrigation system supplying D H Clifton's operations needs to remain uninterrupted throughout the duration of the project.	N	National Grid acknowledges the significance and importance of drainage and irrigation land-based enterprises. National Grid will work with landowners on an ongoing basis to understand the nuances of site drainage. However, assurances can be given insofar as the converter station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems. In addition, **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** set out good practice measures relating to drainage, irrigation, groundwater and protection of private water supplies. These actions are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Agriculture and soils, Onshore mitigation, traffic and transportation	4. Soil As a landowner, the Church Commissioners are working with their tenants to improve soil structure and move towards regenerative farming practices that assist with carbon capture. D H Clifton have been using a no-till and cover crop agricultural system on the marsh at financial loss to improve the soil structure, this has taken 10 years to finally see the benefits. It has not been a quick process and if any damage is caused to the soil as a result of the works, it will take a significant period of time to reverse any damage. As a result, it is imperative that National Grid complete a soil assessment pre and post any work being completed across the land in question. It is also essential that track matting and any other appropriate methods are used to mitigate compaction. To avoid crossing fields, the proposed access route once over Cricket railway crossing is from https://w3w.co/snitch.albums.reissued, along the side of the railway line to https://w3w.co/informs.thudding.parsnip where a bridge into the field where pylons are being installed, will need to be erected. This will also avoid traffic over Abbots Wall.	N	All soil handling (stripping, stockpiling and reinstatement) will be undertaken in accordance with good practice. **Application Document 7.5.10.1 Outline Soil Management Plan - Suffolk** has been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site-specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. This includes the requirement for the suitable storage of topsoil and subsoil and erosion/weed growth prevention. In terms of the proposed access route once construction vehicles have used the Cricket railway crossing (which will be upgraded to ensure this can be used safely), construction vehicles will use the preferred access route adjacent to the railway line (as identified), in order to avoid crossing fields. Temporary culverts will also be provided to allow construction vehicles to cross the Minster Stream. Documents relating to access routes and their use include **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice.** All mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Terrestrial ecology, Onshore mitigation	5. Natural England Higher Level Stewardship Scheme D H Clifton completed a scheme in 2018. Since the completion of Nemo Link there has been significant improvements species diversity and richness across the managed stewardship areas. These improvements will be negatively impacted by the proposed Sea Link project. Having carried out research in the local area, you will be aware that the locality is a hotspot for beaver activity. Please confirm how you intend to keep the beavers from burrowing and flooding or collapsing your site and what other accommodation works will be implemented to mitigate the impact of the works on local biodiversity.	N	Potential impacts on agricultural operations have been assessed based on the final design presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Issues such as fragmentation of land parcels has been identified and, where applicable, mitigation set out. Where agri-environmental commitments are identified, National Grid is engaging with landowners and other relevant stakeholders to understand the potential effects of development. All landowners and occupiers affected by the Proposed Project have been consulted and feedback taken into account. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.
		Safety, onshore Mitigation, Health and wellbeing	6. Security D H Clifton have faced a number of security issues relating to the River Stour and the bridge installed for Nemo Link. This includes health and safety matters, including children jumping off the bridge into the river. We would therefore require security gates if a bridge is erected between farms. Security has been promised previously, however it has never been put in place.	N	As an operator of national infrastructure, National Grid commit significant resources and investment into maintaining the security of their sites and assets. National Grid will ensure that its contractors provide appropriate levels of security and where gates are installed these shall be locked out of hours and mobile and static security patrols or CCTV will be installed where it is deemed to be required. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This will be secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Onshore route Location, Design, Ornithology	7. Bury cables To enable the Natural England Higher Level Environmental scheme to continue to be successful, pylon cables need to be buried to ensure flight paths remain for birds. The Church Commissioners would support the wide response for National Grid to bury the cables.	N	Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. The commitment to a trenchless solution is through in Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Mitigation measures for the Proposed Project can be found in A**pplication Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Converter station location, Design, Alternative solutions	8. Location of Converter and Substation If you are required to build up the current proposed site to protect it from flooding, it would make sense to build up the site next to Nemo Link station (as approximately set out in Map 2 enclosed).It could connect straight into pylons and the access route is simpler for the build. Please can National Grid confirm why this is not possible? "	N	All siting options are set out in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** which considers flood risk. The land adjacent to the existing Nemo Link is not large enough to site the new Converter Station. The land opposite the Nemo Link site on the other side of the river is in a Flood Zone 1 and therefore any building up of land in this area would require flood compensation in other areas to be provided. The land is being built up at the existing site to assist with the drainage and laying of cross site cables not due to flooding.
		Needs case, Intra-Project cumulative effects, ecology and biodiversity	**Conclusion** To conclude, The Church Commissioners for England are supportive of net zero and renewable energy schemes and infrastructure. However, they are also very supportive of their tenants' businesses and the environmental farming practices that are implemented by D H Clifton in this specific situation. As set out above, there are many practical issues which need to be addressed by National Grid in order to deliver this scheme successfully without detriment to the tenant's business and the local environment and biodiversity. We look forward to receiving a response to our concerns set out above.	N	National Grid welcomes support for schemes designed to aid the transition to Net Zero. Concerns about the potential impacts of the Proposed Project upon both the land itself and the tenants are acknowledged and assessed in **Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture & Soils and Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism.** National Grid will maintain ongoing discussions with affected parties to ensure that concerns are fully understood and appropriately addressed. Further details relating to the ecology assessment are contained in A**pplication Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.

Table 1.52 SL-PIL-0934, SL-PIL-0417

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs Case	General Statement of Objection: We have prepared the following objection to the National Grid SEA LINK project on behalf of our above clients, as freehold and occupiers who are directly affected by the Project. Our Clients currently object to theProject and reserves the right to formally object to the application proposed for the Development Consent Order both at the time of application and at any subsequent Pre-examination, Examination and PostExamination Procedures. All confidential information from this submission and the attached must be redacted if any documents are subject to FOI requests.	N	National Grid acknowledges your objection to the Proposed Project. Personal details in the Consultation Report have been handled responsibly and where necessary redacted to ensure that National Grid complies with the requirements of the Data Protection Act 2018 in production and publication of this Report.
		Consultation, Land Rights and CPO	Background: It is understood that National Grid undertook an initial non-statutory consultation to inform impacted parties of the proposed scheme at its inception. However, despite our clients being one of the most impacted parties within the scheme limits, it was not informed of the consultation and was not aware of the project until much later. Meetings have been held with National Grid's agent to outline the impacts from the scheme upon our Client and more importantly, upon the holding, Kings End Farm, Richborough. As a overview to the history of Kings End Farm, the holding comprises 493.66 acres of predominantly arable Grade II land bordered by the mainline railway and the River Stour to the east and north. The holding forms part of the Quex Park Estate which farms 1400 acres in house with a further 1200 acres under various agreements or contract farmed. Over the course of the previous 20 years, the estate has sought to be a pioneer of regeneration agriculture and sustainability, promoting biodiversity and championing wildlife. The whole of the holding at Kings End Farm is part of a Higher Tier Countryside Stewardship Agreement, with the land north of the Monk's wall reverted from arable land to grassland and employed in Wading Bird options. The estate has worked in close consultation with Natural England to create habitats for numerous endangered species and promote wading birds in particular. The estate has spent large sums of money over the course of 2 decades enhancing the biodiversity of the holding, installing scrapes, and installing a management programme that enhances the habitats for wildlife. The farm is part of the Nature Friendly Farming Network: Home | Nature Friendly Farming Network, NFFN	N	National Grid's approach to Non-statutory consultation is set out in Section 5 of this report. Prior to the Non-statutory consultation, National Grid developed a Primary Consultation Zone (PCZ) and a Secondary Consultation Zone (SCZ). These zones were geographical areas that sat within a certain distance from the Proposed Project footprint. The PCZ included properties that lay within a 1 km radius of the proposed underground cables and overhead line and 2 km around the proposed converter station sites. Where appropriate, the PCZ was extended to whole streets rather than dissecting hamlets or neighbourhoods. The SCZ included properties that lay within a 4 km radius of the swathes that were proposed to be constructed on and, as with the PCZ, where appropriate, the SCZ was extended to whole streets rather than dissecting hamlets or neighbourhoods. At Non-statutory consultation stage, a desktop referencing exercise was undertaken for all route options; however, contact referencing to confirm the records was not undertaken at this stage. Once the options were refined, contact referencing commenced. During Non-statutory consultation, in addition to the main stakeholder engagement events described above, there were two landowner-focused events. For these events, written invitations were sent to all contacts identified via the desktop referencing exercise. National Grid will engage with affected landowners on an ongoing basis in order to understand the potential impacts of the Proposed Project and seeking to identify the most appropriate means of addressing these where necessary.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Furthermore, the farm is taking part in an RSPB scheme known as 'Operation Turtledove' which seeks to restore Turtledove populations through providing suitable habitat: About us - Operation Turtle Dove The farm was recently subjected to the Richborough Connection with much of the land north of the Monks Wall blighted by pylons and overhead transmission wires. National Grid failed to effectively mitigate the impacts of this scheme, whilst the imposed Land Rights Strategy and rigid impositions has resulted in few easements or wayleaves being agreed despite the project having been completed for the best part of 3 years. Notwithstanding the clients' general statement of objection, we would request ongoing engagement with National Grid with the ability to further influence and understand the proposed design of the Scheme prior to conclusion of the consultation report that will be submitted with the anticipated application for the Development Consent Order.		
		Alternative Solutions	Grounds for objection: First, it is acknowledged that projects such as SeaLink are a vital part of ensuring energy security for the United Kingdom, achieving vital Net Zero goals and aiding in keeping energy costs down for the public consumer. It is accepted by our Client that the project provides a public benefit and enables the connection of vital off-shore wind turbines, providing green energy. Nonetheless, the undoubted necessity for the project should not be at the detriment of wildlife, biodiversity and irreplaceable habitat. Our Client's objections are based almost wholly upon the failure by National Grid to provide extensive evidence that all engineering options have been considered to provide an underground link to the Richborough Connection instead of the installation of an overhead line that will undoubtedly have a substantial negative impact upon wildlife and the unique habitat along the estuary of the River Stour. Our concerns are set out below:	N	Whilst acknowledging the respondent's principal support for projects supporting Net Zero, National Grid seeks to stress the Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. A robust alternatives assessment has been undertaken for the Proposed Project to determine if it could be located elsewhere. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 7.2 Strategic Options Back Check Report** contains further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**, **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report (October 2023)**.
		Consultation, Land Rights and CPO, Alternative Solutions, ecology and biodiversity, ornithology	Consultation As noted above, as a main affected party of the Sea Link project, Quex Park Estate was not consulted from the outset of the project and excluded from the initial non-statutory consultation. Whilst still at an early stage of the project, through experience of the Richborough Connection, our client has concerns that National Grid will fail to give assurances on, duration of accountability of National Grid to the affected sites, methods of	N	National Grid will maintain ongoing discussions with affected landowners throughout the development of the Proposed project. At Non-statutory consultation stage, a desktop referencing exercise was undertaken for all route options; however, contact referencing to confirm the records was not undertaken at this stage. Once the options were refined, contact referencing commenced. During Non-statutory consultation, in addition to the main stakeholder engagement events described above, there

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			recording of soils both before and after works, and methods of surveying drainage both before and after works. During construction, it is our client's concern that National Grid will not be willing to class the whole affected area as no longer viable to farm and instead encourage our client to unrealistically attempt to farm around their "works". During this consultation process, there has been minimal evidence that any alternatives or amendments will be genuinely pursued, with the proposed project appearing to be largely finalised. Our Client has expressed clear concerns from the outset on the impact of overhead wires and pylons upon nesting and transitory bird species along the Stour Estuary, with no indication that an alternative underground solution has been thoroughly assessed, or whether it is excluded purely on a cost basis. National Grid has failed to provide answers to our client on the reasoning behind the use of overhead pylons with specific details known only to National Grid. Ecological surveys carried out to date have appeared piecemeal, with no overarching methodology or strategy for their undertaking provided to our Client. It is unclear how National Grid intend to demonstrate that the proposals avoid impacts to irreplaceable habitats and protected species, which it is contended that it is not possible to mitigate the effects on. There has been insufficient information provided that strategic options for the provision of Sealink have given considered to the differing environmental impacts of alternative methods of construction beyond simply an economical-based assessment.		were two landowner-focused events. For these events, written invitations were sent to all contacts identified via the desktop referencing exercise. Details of the approach to consultation for Statutory consultation are set out in Section 7 of this Report. The land referencing process was ongoing throughout the pre-application period and in some instances diligent inquiries led to new interests being identified after the initial issue of Section 42(1)(d) consultation materials in October 2023. A robust alternatives assessment has been undertaken for the Proposed Project to determine if it could be located elsewhere and why the crossing of the River Stour must be by overhead line. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**, **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report (October 2023)**. A full suite of terrestrial ecological surveys have been undertaken to inform the ES for the Proposed Project including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants – see **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Terrestrial Ecology, Ornithology, Onshore Mitigation	Biodiversity Impacts As detailed above, Kings End Farm has been managed in a nature friendly manner for the best part of the last 2 decades. Working with Natural England, our client has established habitats for numerous protected bird species, including Golden Plover< lapwings, Curlews and cormorants, amongst many more. The estate has installed numerous scrapes, reverted arable land to grassland under wading bird options within Countryside Stewardship requirements. This has complemented the pre-existing high biodiversity credentials of the farm, which is now threatened by the proposals under the Sealink Project. The estate has carried out its own Baseline Assessments through the Kent Wildlife Trust, following the imposition of Biodiversity Net Gain rules under the Environment Act 2021. The baseline assessment establishes, using the BNG Metric 4.0, that Kings End Farm has a substantially high existing Baseline.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Meetings have been held with Natural England where the approach to addressing loss of functionally linked land for golden plover has been discussed at length. Various strategies have been discussed with Natural England. Options, including the possibility of creating new wetland south of the River Stour have been explored, but technical challenges identified in the course of discussions led to an alternative approach being pursued (discussed and agreed in principle with Natural England) to instead enhance an area of arable land close to the coast for non-breeding golden plover. There are extensive proposals for woodland and grassland planting around the converter station and new wetland creation in the same locations.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Furthermore, the proposed works as part of the Sealink Project, will create a substantial loss in Biodiversity. Whilst Natural Grid will be bound to provide Biodiversity Net Gain as part of the Sealink Project, it is not yet apparent whether this will form part of the proposed order limits, nor whether it will be secured through mitigation land elsewhere or within the immediate vicinity of the project. Our client is concerned that no assessment has appeared to have been made yet of the loss of biodiversity directly attributable to the project. Nor will it provide any recompense to the land at Kings End Farm is vital habitats are destroyed and merely accounted for with mitigation land elsewhere. The estate is opposed to the loss of biodiversity from Kings End Farm, which it has spent considerable time and expense to achieve over the duration of the last 2 decades.		An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Terrestrial Ecology, Ornithology	Environmental/Ecological The land affected at Kings End Farm forms a vital habitat for wading birds and an extension of the Ramsar site at Pegwell Bay, with numerous bird species transiting from Pegwell Bay along the Stour Estuary. Some evidence of this is provided within Appendix 1 which contains nesting bird surveys and non-nesting bird surveys carried out by National Grid as part of the Richborough Connection. These detail how the river stour is a transitory route for a number of protected species, as well as detailing the number of nesting birds. It should be acknowledged by National Grid that the Sealink project should build upon these surveys, incorporating and adding to them, rather than undertake ecological surveys anew and from a blank starting point. As detailed above, no methodology or strategy has yet been provided which outlines the parameters of ecology surveys undertaken. The estate has serious concerns that ecological surveys undertaken merely provide a snapshot of the presence or otherwise of species at a particular time and date. This fails to take account of the various elements which affect transitory routes of wading bird species, particularly the tides. The estate has undertaken bird surveys at Kings End Farm in coordination with East Kent Wildlife Group. A copy of an objection by Mr Peter Findley of the East Kent Wildlife Group is attached at Appendix 2, detailing the counts of birds undertaken by Kent Ornithological Society at Kings End Farm and along the River Stour. Numerous protected species are recorded, regularly using the river as a transitory route and regularly in time with the high tides at Pegwell Bay. It is the estates contention that the presence of overhead pylons at Kings End Farm will cause	N	Ecological data are considered out of date once approximately two years have passed. The Richborough Connection project surveys were undertaken a long time ago and therefore we cannot rely on them without undertaking updated surveys. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. This assessment includes a collision risk assessment for the new section of overhead line, based upon 12 months of robust vantage point survey work, which has been discussed with Natural England. Further details relating to the ecology assessment are contained in A**pplication Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			irreparable damage to bird flight paths for numerous protected species.		
		Land Rights and CPO	Land Rights Strategy We understand that National Grid are reviewing their Land Rights Strategy and await the detail to be provided within it. However, the former Land Rights Strategy imposed fixed payments that failed to take into account context, situation, wider sterilisation impacts. Applying fixed rates for pylons regardless of location, and the site-specific situation is in contrast to valuation practice and principles of valuation as set out by the RICS. Furthermore, it is not apparent how the Land Rights Strategy will seek to address compensation for the loss of biodiversity as a direct result of the project.	N	The new LRS has been published and is available on the National Grid website and our lands supplier will be in contact with the landowner to discuss voluntary agreements and all compensation claims will be in line with the compensation code.
		Terrestrial Ecology, Alternative Solutions	Impact on a neighbouring SSSI It is unclear how the proposed project design establishes a priority of options. It is, in our opinion, not demonstrated how the project has discounted alternative options that would remove of reduce the impact upon a SSSI, when the current proposal would have such a clear impact. The estates views align strongly with objections lodged by Kent Wildlife Trust and the RSPB.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Careful consideration has been given to alternative options, set out in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 7.2 Strategic Options Back Check Report, Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Terrestrial Ecology, alternative solutions	Wider Effects upon RAMSAR and SPA Whilst Kent Wildlife Trust, Natural England and the RSPA have lodged concerns within their representations to Sealink on the Pegwell Bay RAMSAR and Stodmarsh SPA. The proposed route for the overhead line and converter site will directly and indirectly impact Sandwich Bay to Hacklinge Marshes SSSI, Ash Level and South Richborough Pasture Local Wildlife Site (LWS) and Woods and Grassland Minster Marshes LWS. An EcIA should be provided to understand all direct and indirect impacts, including how much habitat will be directly lost as well as temporary habitat loss for access, works area and work compounds during the construction phase. The Stour estuary and surrounding marshes are vital connective habitat to both Pegwell Bay and Stodmarsh. The provision of overhead power lines crossing the river will undoubtedly have substantial impacts, whilst alternatives exist that would remove them, or at least ensure there are only temporary impacts.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Careful consideration has been given to alternative options, set out in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.2 Strategic Options Back Check Report** and **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**.
		Water Environment, Agriculture and Soils, Terrestrial Ecology, traffic and transport, Land rights and CPO	Practical Implications The scheme has a significant impact on the broader running of the farming activities of our client, to include potentially requiring altered crop rotations, and the effect that the scheme will have on the land concerned and its drainage and soil structure. The livestock enterprise may also be materially affected, together with loss of associated employed labour. Our client has serious concerns over the effects that the works will have in relation to Countryside Stewardship Schemes and in-hand proposals put in place in coordination with Natural England. All of the land affected is entered into the Higher-Tier Countryside Stewardship scheme, and National Grid has given no assurances as to how the implications of the loss of land entered into this scheme will be dealt with, not only in terms of potential penalties on our client for breach of contract, but also the loss of the environmentally improved land on a permanent basis. The installation of habitat features such as bird scrapes are now under direct threat of destruction, despite now having become established features attracting numerous protected species. The immediate impacts will take considerable time to rectify, in addition to likely permanent detriment to important wildlife habitats. Our client has concerns regarding National Grid's access to the site and the measures put in place regarding the restrictive access to other parties, and how National Grid intends to fulfil this obligation.	N	Potential impacts on agricultural operations have been assessed based on the final design presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Issues such as fragmentation of land parcels has been identified and, where applicable, mitigation set out (**Application Document 6.2.3.6 Part 3 Kent chapter 6 Agriculture and Soils**). All landowners and occupiers affected by the Proposed Project have been consulted and feedback taken into account. Accommodation works will be discussed and agreed prior to construction commencing to minimise the impact and disturbance as far as possible. Where agri-environmental commitments are identified, National Grid is engaging with landowners and other relevant stakeholders to understand the potential effects of development. The impact of the Proposed Project on species and habitats has been considered in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A register of all mitigation measures that National Grid will undertake as part of the Proposed Project are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Alternative Solutions	Requested Changes It is our client's contention that an alternative underground proposal would suitably mitigate a considerable number of the impacts caused by the proposal in its current stead. The irreparable damage to habitats and bird flight paths can be largely entirely mitigated in the long term through the removal of overhead power lines and the installation of an underground alternative. With the vast majority of the project already intended to be undergrounded, it is particularly frustrating that such sensitive areas within the proposed order limits are proposed to be subjected to overhead lines. It is our contention that overhead power lines in the locations proposed, perpendicular to the route	N	A collision risk assessment has been undertaken for the new section of overhead line and has been shared with, and commented upon by, Natural England. This has been based upon 12 months of vantage point bird survey of the alignment of the new overhead line and three months of bird carcass searching along the existing Richborough to Canterbury overhead line. The collision risk assessment has identified that collision risk would not be significant but nonetheless hanging deflectors, such as those with fluorescent markings, will be incorporated to making the lines visible in adverse weather or low light conditions. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places it will be necessary to

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			of the river, will cause substantial harm to numerous protected species and have long-lasting impacts to important habitats. An alternative engineering solution is a ready solution to avoiding the majority of the impacts of the scheme and removing the long-lasting harm to wildlife and the habitats at Kings End Farm. Undergrounding of the pylons proposed from the converter station to the Richborough Connection is requested by our client. Whilst National Grid have suggested that the alternative is beyond the engineering parameters available to National Grid, it has failed to demonstrate how this is the case, nor whether this is simply owing to the cost of such an undertaking. The inability to underground cables is met with scepticism by our client and is deemed to be a readily available alternative that would substantially reduce the impact of Sealink upon the vicinity and remove long-terms detrimental impacts to biodiversity and ecology.		install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Further details of the option selections are contained in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**. As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Mitigation measures for the Proposed Project can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Ornithology	Conclusion: We would formally request that National Grid consider these representations listed above in conjunction with those included within the Appendices 1 & 2 attached.	N	National Grid welcomes feedback from local landowners and the information that is provided alongside these comments. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	Although the route goes through some sensitive areas in Kent, there has to be a balance between being able to share energy, especially between different areas. Once the construction stage has finished the remaining infrastructures will have little impression on the landscape compared to large scale house building currently taking place in nearby Ramsgate.	N	National Grid welcomes the respondent's views on the effect of the Proposed Project on the landscape. The assessment of effects arising from the Kent Onshore Scheme on landscape and visual amenity is set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation?			
Local community	Assuming the Friston substation will be built it is the most logical place to connect to the grid, if measures are taken to ensure the landscape and environment does not become overly industrialised.	N	National Grid acknowledges this comment and thanks the respondent for the support.
Local community	Friston is an Area of Outstanding Natural Beauty and the proposed substation is excessively tall.	N	The designated status of the landscape is acknowledged by National Grid. The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment takes into account the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	It would destroy an Area of Outstanding Natural Beauty.	N	
Local community	The Friston Substation will result in significant adverse landscape and visual impacts. The cumulative impacts arising from another site/convertor station of enormous size, at a higher elevation (approximately 25 – 3 0m AOD) and within relatively close proximity will result in a further industrialisation of the area. There will be harmful impacts on the setting of Saxmundham St John's church, Hurts Hall, the valley landscape and associated	N	Inter-project cumulative effects resulting from the Proposed Development have been assessed within the ES and are reported within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The potential for impacts on the setting of heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England and, as part of this procedure, a list of assets to fully assessed was agreed. The assessment of landscape impacts is contained within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and the impacts on cultural heritage in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	vegetation (from the access road) and rural setting of Saxmundham on its south eastern aspect.		National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q4 What do you think about our proposed HVAC cable route in Suffolk? Comments			
Sudbourne Parish Council	The Parish welcomes the undergrounding of cables from the landing point to the substations. However, the PC has concerns regarding the impact on the special landscape of the area and wishes to have assurance that this is minimised and suitable mitigation is put in place.	N	The special nature of the landscape is acknowledged by National Grid. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This Chapter includes proposed mitigation measures that have been embedded in the design to minimise the effects. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	I feel the size of the converter station would completely overwhelm the current landscape. This is a very underdeveloped part of the local area.	N	The sensitivity of the area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.
Local community	This is not the right location. The proposed location of up to 3 massive convertors is at the southernmost point of Wood Farm to minimise the view from the road. Why it is more important for passing traffic to have a better view than the residents of Sternfield is beyond my understanding. Most cars driving past will take no notice of fleeting buildings in the peripheral view. With the convertor station being at 26 m high, it will be visible from the road irrespective of how far down the field it is positioned and any cover from Bloomfield Covert will be minimal. The suggestion of shielding by planting new trees it unrealistic as to reach the required cover and density will take many years for the trees to meet maturity.	N	
Q6 We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? Comments			
Local community	The converter station should fit in with the surroundings so that the visual impact is removed. They could look like farm buildings.	N	National Grid welcomes comments relating to the design of the proposed converter station in Suffolk and feedback received will be taken into account when developing the detailed design.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	It should be hidden from view and trees should be planted.	N	The sensitivity of the area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). All mitigation planting associated with the permanent access road and Converter Station and Substation will be maintained for the lifetime of the assets. Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.
Local community	It must be as natural-looking and environmentally friendly as possible. It must blend in to the surroundings and provide opportunities for sustainable planting and biodiversity.	N	
Local community	Suffolk landscape is flat! The style and size of these structures, built at ground level, will be a massive eye-sore on the countryside. Every attempt to minimise the level of these building above ground must be a major consideration; not currently applied in the design stage. Electrical sub-station(s) will require to be exposed; closed buildings (converter stations?) not requiring physical deployment of personnel should be completely or partially sub-ground level. Planting of trees and landscaping will not provide adequate screening. Illumination of the site must be designed to reduce intrusion of light disturbance to the community and environment.	N	
Local community	This question presumes the converter station will be built. It should not be, it can never be landscaped or designed to blend into the area which is not industrial. The buildings will be a blight on the natural landscape and ruin the historic country landscape.	N	
Q7 What do you think about our proposed HVDC cable route in Suffolk?			
Local community	Do not want cable trenches through our protected landscapes and beautiful countryside.	N	The designated status of the landscape is acknowledged by National Grid. The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment takes into account the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. National Grid acknowledges that there will be some temporary impacts on the landscape as a result of the proposed HVDC cable route. Efforts have been made to ensure that the design of the Proposed Project is compliant with the purpose of National Landscapes, which is to 'to conserve and enhance the beauty of the area'. As such, no above ground infrastructure will be constructed within the National Landscape, while careful consideration has been given to the ways in which development outside of the designation may affect its setting. Following construction, the HVDC cable route will be fully reinstated. All mitigation planting associated with the permanent access road and Converter Station and Substation will be maintained for the lifetime of the assets. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This development should not be built. Natural England's National Character Map descriptions say 'The distinctive landscape character is a product of its underlying geology, shaped by the effects of the sea and the interactions of people. It is mainly flat or gently rolling, often open but with few commanding viewpoints. In many places, and especially near the coast, wildlife habitats and landscape features lie in an intimate mosaic, providing great diversity in a small area'. 45% of this character area is designated as the Suffolk Coasts and Heaths National Landscape (formerly called AONB). In addition, the matrix of wetlands is part of the globally important migratory route, the East Atlantic Flyway which is being out forward as a UNESCO World Heritage Site. The wider landscape and network of commons, fields and woodlands support the National Landscape and wildlife significance.	N	
Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness?			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Ruining an area of outstanding natural beauty.	N	The sensitivity of the area is noted. The routeing and siting of the Suffolk Onshore Scheme has taken into consideration designations, including the Suffolk Coast & Heaths AONB and Suffolk Heritage Coast. The effects arising from the Suffolk Onshore Scheme on the AONB (and Heritage Coast) are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**).
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Environmental impact also means visual impact. In helping to solve the environmental problems we are facing, built solutions need to be visually compelling in adding quality to the landscape. And where hard landscaping is concerns, compelling design can play a decisive role in furthering the green energy agenda. The proximity of new green infrastructure should then be seen in an immediately attractive and self-explanatory way - as a factor adding value to neighbouring towns and properties. Proximity to new, green, grid infrastructures should additionally be compensated and rewarded by clear economic measures such as low energy bills and property-related taxes.	N	The ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. Opportunities of connecting to and enhancement of green infrastructure within the outline landscape mitigation proposals are identified in Proposed Project Design and Embedded Mitigation section of **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process. Compensation claims for disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
Q12 What do you think about our proposed landfall at Pegwell Bay?			
Local community	This is an area of natural beauty and should not be developed on.	N	The sensitivity of the area is noted. The assessment of effects arising from the Kent Onshore Scheme on landscape and visual amenity is set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	You are not ruining the landscape too much there.	N	National Grid welcomes the respondent's views on the effect of the Proposed Project on the landscape.
Q14 What do you think about our proposed converter station and adjacent substation near Minster?			
Local community	The size of these buildings is staggering and will forever ruin a beautiful area.	N	The sensitivity of the area is noted. The assessment of effects arising from the Kent Onshore Scheme on landscape and visual amenity is set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D Appendix 3.1.D Visual Amenity Baseline and Assessment**. This includes reference to the Kent Converter Station. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All mitigation planting associated with the permanent access road and Kent Converter Station and Substation will be maintained for the lifetime of the assets. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. The area of search included land at Sandwich Discovery Park. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Local community	The converter station will be an ugly addition to an area that has beautiful natural views.	N	
Local community	The scale, height and massing of the converter station would have a significant adverse impact on the landscape. It would dramatically alter the views and vistas over this open land and adversely impact on the sense of remoteness and the wildlife in the area. The buildings would be better sited adjacent to an existing commercial/industrial area such as Sandwich Discovery Park or adjacent to the A256 highway not in the centre of a marshy, rural landscape.	N	
Local community	Maintaining the views from the Richborough present Fort should be a consideration. Height and design of the converter station and substation should be determined in part by how these will impact the views from the Roman fort across the countryside.	N	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including Kent County Council and Historic England and, as part of this procedure, a list of assets to fully assessed was agreed. The assessment of landscape impacts is contained within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** and the impacts on cultural heritage in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual.** Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All mitigation planting associated with the permanent access road and Kent Converter Station and Substation will be maintained for the lifetime of the assets.
Q15 We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? Comments			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Contoured flow looks more pleasing on the eye. Maybe more trees on the slopes either side.	N	National Grid welcomes comments relating to the design of the proposed converter station in Kent and feedback received will be taken into account when developing the detailed design. An assessment of the Converter Station is contained in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO(**Application Document 3.1**). All mitigation planting associated with the permanent access road and Kent Converter Station and Substation will be maintained for the lifetime of the assets.
Local community	These options blend into the landscape and if plantings are strategically placed will enable the station to sit comfortably in the environment.	N	
Local community	Visually the design should mould into the landscape and the converter station should not be obvious to the passing onlooker.	N	
Local Community	Your proposed height of 26 m is very high and a significant blot on the flat Kent countryside. Everything must be done to reduce the height, e.g. increase footprint and the colour must blend, preferably a green, close to the colour of the neighbouring Thanet waste buildings.	N	
Local community	I think the visual impact on the landscape will be pretty bad no matter what design is chosen. The building will be taller than anything else around and be visible from a great distance on what is a flat landscape. While I would rather not have any development in this area if there has to be a building it should at least try to blend in and be disguised by native tree, hedgerow planting, etc.	N	
Local community	Viewed from the south, which I will do, this is going to look dreadful in the landscape. South means from Ash, specifically from the junction of the Cop Street Road & A257. From here the land slopes gently north to the flat marshes of the Ash Level before rising again towards the Manston Ridge. Richborough Power Station, as was, had large rectangular buildings that were demolished, along with the rest of the site. What replaced it is not so bad bearing in mind it has replaced something similar. This new build in the proposed site, must be made to blend in with the landscape. It must be coloured and preferably it would have a rounded form to bear up the box like structure.	N	National Grid acknowledges the comments regarding the design of the converter station to fit in with its surrounding. The assessment on potential landscape and visual impacts is set out in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All mitigation planting associated with the permanent access road and Kent Converter Station and Substation will be maintained for the lifetime of the assets.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.
Local community	I appreciate some of the ideas proposed to minimise the impact of such large structures should they go ahead. However, I am concerned about the lack of clarity about the size of the buildings. I'd like the communication to include very clear information to the public about the size of the area covered - which makes it clear just how big these buildings will be. We also need a clear picture of the height of the buildings. A height is mentioned but this does not make it clear if this will be the height relative to the current ground level, of if there will need to be bases raised in order to keep the buildings above the water/flood levels and hence measurements stated will be a true height above current ground level.	N	The Statutory consultation documents, including the 'Converter Station Design – Background to Potential Architectural Approaches Document', provided as much information as was available at that time, setting out the scale and parameters for the building's construction. However, this makes clear that the design was at concept stage. While it is recognised that consultees may have wished to see something more definitive, the detail of the design will be informed by consultation responses to the principles the consultation presented. The design will be further refined through consultation with the local planning authority, ensuring that the converter station is designed to minimise adverse impacts on the surrounding environment, integrating sustainable drainage and landscaping accordingly. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** sets out the details of the scale of development and the impact of the scale of the buildings is addressed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
Q16 What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line?			
Local community	Overhead wires are not aesthetically pleasing and there are many already in the area.	N	National Grid acknowledges these concerns. The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Impacts on heritage assets in Kent are considered in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
Local community	This will be a devastating eyesore cutting across swathes of the East Kent landscape.	N	
Local community	Visual character landscape must be considered and do no harm, including beauty and an area which brings joy, reducing impact on widespread views is essential	N	
Local community	As an area of historic, heritage and natural significance the setting has an important contribution on its special interest if changes are being made there needs to be information made available to help us understand what the impacts of the changes are. The visual appearance impacts how the area relates to its history. Overhead lines that are more than double the current infrastructure is a significant change which is more than substantial harm to the site.	N	
Q17 Anything else? Comments			
Local community	Your proposals in Kent seem to take no account of the character of the landscape, the flat lands of the Minster and Stour Marshes with their dykes and ditches and ancient fields and their associated wetland birdlife. There is a beauty here that the construction and erection of your pylons and overhead lines and substation and converter station buildings can only make uglier.	N	The siting of the Kent Onshore Scheme has been influenced by a range of disciplines including landscape and visual. The indicative landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** which includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Through engineer's eyes this may be just a drawing on a flat map. But it is not the same if you look through the eyes of the country-loving farmer, the naturalist, the tourist rambler and walker, the sketcher, painter and photographer, the lugworm digger and the bird-spotter. You cannot disguise the scope and size of this electrification project and I doubt if you can mitigate the destruction of a living landscape and the blighting of its long views.		Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All mitigation planting associated with the permanent access road and Kent Converter Station and Substation will be maintained for the lifetime of the assets. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.
Q18 Do you have any key concerns regarding the construction stage of Sea Link?			
Local community	Light pollution should be considered. The Suffolk skies are known for dark start-lit nights. Some elements of the Project will be the end of the dark skies.	N	National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The assumptions made about the lighting design that have informed the landscape and visual impact assessment are set out in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Consideration of the landscape and visual effects of light pollution during construction and operation is presented in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment, Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment, Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**.
Local community	You have omitted light pollution. When the evenings are dark, or foggy weather prevails, industrial lighting will be needed, thus causing a flood of light on the marshes, which will severely impact the nocturnal wildlife and bats. The proposed pylons will also be illuminated.	N	
General commentary			
Local community	You currently propose to deliver a project necessitating the construction of an industrial scale substation and convertor stations in open countryside on the edge of an Area of Outstanding Beauty whilst digging many kilometres of cable trenches from land fall ultimately to Friston through fragile, statutorily protected SSSI's, an AONB and Heritage Coastline. This proposal continues to make the erroneous assumption that achieving net zero by 2030 trumps the contribution that this precious landscape makes to people's welfare. It is self-evident that humankind needs electricity to power its modern lifestyles, yet it also needs unspoilt landscapes such as that on and around this Heritage Coastline for its wellbeing. Projects such as the one you are promoting have no place in the landscape you intend to route through and build on.	N	The designated status of the landscape is acknowledged by National Grid. The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment takes into account the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. The assessment concluded that there would not be any significantly adversely designated landscapes within the landscape and visual study area arising from the Suffolk Onshore Scheme. No direct habitat loss would arise from internationally, nationally or locally designated sites due to the Suffolk Onshore Scheme, with the most sensitive sites (i.e. North Warren RSPB Reserve, Leiston-Aldeburgh SSSI) being traversed by using trenchless methods. The trenchless bore would be approximately 8 m below the RSPB Reserve/ SSSI. The commitment to use a trenchless construction solution is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Southwold and Reydon Society	The Society remains unconvinced that a scheme designed to bring electricity from Suffolk to the Greater London area, dependent on the already consented plans for a major substation at Friston and a new proposal for a convertor station near Saxmundham, will not drastically disrupt the AONB during what is bound to be a protracted construction period and during its working lifetime. The proposed structures are substantial and obtrusive, totally inappropriate in an Area of Outstanding Natural Beauty with the probability of significant disruption to countryside and habitats by the onshore landing point near Thorpeness and the cabling works to Friston and Saxmundham.	N	The special nature of the landscape is acknowledged by National Grid. The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. This Chapter includes proposed mitigation measures that have been embedded in the design to minimise the effects. The assessment concluded that there would not be any significantly adversely designated landscapes within the landscape and visual study area arising from the Suffolk Onshore Scheme. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Reydon Parish Council	The scheme is needed to bring electricity from Suffolk to Kent so that it can be used in the Greater London area where it is needed. This approach, therefore, rests on the already consented plans for a major substation at Friston and a new proposal for a converter station near Saxmundham. These will both be extremely large and high structures in an Area of Outstanding Natural Beauty (AONB).	N	The special nature of the landscape is acknowledged by National Grid. The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. This Chapter includes proposed mitigation measures that have been embedded in the design to minimise the effects. The assessment concluded that there would not be any significantly adversely designated landscapes within the landscape and visual study area arising from the Suffolk Onshore Scheme. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Southwold Town Council	Sea Link's proposed project is only needed to bring electricity from Suffolk to Kent if the major substation at Friston (already given consent but subject to judicial review) is built. This substation with Sea Link's and other projects' proposed convertor stations in nearby vicinities would create a number of extremely large, high and imposing structures in an AONB with the further disruption of precious countryside and habitats by cabling works from multiple potential landfalls ranging from Aldeburgh to Southwold.	N	Based on the inter-project cumulative effects indicative screening matrix, significant cumulative effects on landscape and visual receptors are expected from the combined effects of the Suffolk Onshore Scheme with East Anglia ONE and TWO Offshore Windfarms and LionLink Offshore Interconnector at all project stages on landscape character and visual amenity (**Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**). During construction and decommissioning stages only, there is the potential for significant cumulative effects as a result of the combined effects of the Suffolk Onshore Scheme and the Saxmundham South Green Neighbourhood. When considering the total potential cumulative effect of all the other developments combined with the Suffolk Onshore Scheme, there is the potential for significant cumulative effects for a short term and temporary period on the Suffolk Coast and Heaths AONB as a result of the potential simultaneous or sequential construction of the Suffolk Onshore Scheme, East Anglia ONE and TWO Offshore Windfarms and LionLink Offshore Interconnector. The concentration of construction activity associated with the landfalls and HVDC cable corridors within part of the Suffolk Coast and Heaths AONB has the potential to alter the perception of the AONB with construction of major energy projects becoming a temporary characteristic feature of the landscape. These total cumulative effects are unlikely to remain once all projects are operational, particularly once the cable corridors are reinstated and mitigation plantings become established over time. Total cumulative effects on LCAs only have the potential to be significant for LCA L1 [Heveningham and Knodishall Estate Claylands] as a result of the construction of additional converter stations and the connection at Friston associated with the LionLink Offshore Interconnector development. There would also be total cumulative effects for a temporary and limited duration for LCA K3 (Aldringham and Freston

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Sandlands) as a result of the construction of Saxmundham South Green Neighbourhood and the Suffolk Onshore Scheme. Similarly, for SCT 03 Nearshore Waters there would be significant temporary cumulative effects experienced during construction as a result of the combined effects of the construction of the Suffolk Onshore Scheme, Sizewell C, East Anglia ONE & TWO Offshore Windfarms and LionLink Offshore Interconnector. Total cumulative effects on representative viewpoints have the potential to be significant as a result of the combined effects of East Anglia ONE and TWO Offshore Windfarms during construction for viewpoints 6, 7, 8 and 22 with only viewpoint 6 remaining significant during operation and maintenance stages, and with LionLink Offshore Interconnector development (viewpoints 1 – 7, 15-17, 19 – 21) at all project stages. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Cllr T-J Haworth-Culf	Comment on the Suffolk on shore scheme in context of the current energy NSIPs that are known of: By definition, 'An Area of Outstanding Natural Beauty (AONB/Natural Landscapes) is a designated exceptional landscape whose distinctive character and natural beauty are precious enough to be safeguarded in the national interest.' The latest of a stream of energy applications, Sea Link offers nothing to enhance or protect this area, the precise reverse. In fact, none of the onshore infrastructure options contained within this application and the other similar applications presented would be anything other than profoundly and permanently damaging to the area.	N	Please see the above response to Southwold Town Council regarding the landscape and visual cumulative impact of the Suffolk Onshore Scheme.
Local community	The height of 26 m convertor stations with a ground coverage of 12 football pitches will dominate the villages of Friston, Sternfield and town of Saxmundham and all will be an eyesore and will change the landscape forever.	N	National Grid acknowledges the potential impacts of the Proposed Project on landscape and visual amenity in the local villages close to the proposed converter station location. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	New duties on Statutory Bodies: 'The Levelling Up and Regeneration Act (2023) will come into force on 26th December 2023. From this date onwards an updated duty on relevant authorities will be active. This includes changes to Section 85 of the Countryside and Rights of Way Act (2000) to: In exercising or performing any functions in relation to, or so as to affect, land in an area of outstanding natural beauty in England, a relevant authority other than a devolved Welsh authority must seek to further the purpose of conserving and enhancing the natural beauty of the area of outstanding natural beauty. The change from 'pay regard' to 'further the purpose' is welcomed by many and it is understood that guidance on what this will mean for local planning authorities and other statutory authorities will be available in the new year.'	N	National Grid is cognisant of the changes in legislation. Alongside other duties imposed upon National Grid by other pieces of legislation, efforts have been made to ensure that the design of the Proposed Project is compliant with the purpose of National Landscapes, which is to 'to conserve and enhance the beauty of the area'. As such, no above ground infrastructure will be constructed within the National Landscape (AONB), while careful consideration has been given to the ways in which development outside of the designation may affect its setting. **Application Document 7.1 Planning Statement** provides and assessment of the impacts of the Proposed Project upon the National Landscape, concluding that it has been demonstrated that exceptional circumstances exist to justify the development in this nationally designated landscape. While the process of site identification for the converter station is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints have been key considerations. The proposed approach for colocating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Can you please confirm that it is your understanding that this legislation will further enshrine Central Government, ESC and SCC's duty of care as all relevant bodies to prevent damage to our Suffolk & Essex Coast & Heaths National Landscape as it pertains to the SEALINK application and any others, large or small within the National Landscape.		National Grid is cognisant of the requirements of national policy legislation and has given careful consideration to how it will approach infrastructure design at a project and strategic level across all Great Grid Upgrade projects in light of this change. This includes the development of design principles for the Suffolk project elements (**Application Document 7.12.1 Design Principles – Suffolk**). The scope of the principles is not limited to any one design discipline and instead reflect a multi-disciplinary approach for coordinated design in the round. As such the design principles cover several design disciplines including architecture, landscape architecture, ecology, hydrology, civil engineering, wider engineering disciplines, town planning, archaeology and heritage.
Local community	I honestly cannot understand why, when you say you are trying to minimise impact on the area, you pick the most visible site for many miles around to suggest placing a 45 m high industrial substation. This is a very high piece of land for this area; it is on the main road out from Leiston to the shops in Saxmundham and the A12 so every single time I go to and from Saxmundham I am going to have to see this enormous substation? It will completely change the landscape of a rural area and displace a family from their home and farm. At night it will be lit up like a Christmas Tree. This light pollution is unacceptable in a rural area like this. There are 2 small substations near me - Greater Gabbard and Galloper wind farms already have substations at Sizewell but they have been sited to be virtually invisible unlike your options for this Sealink substation. You have produced a lot of interesting camouflage options but most of them won't work. Why would you disguise it as a rolling hill when you are in a largely flat area? I know that farm buildings have been getting bigger but I don't think that tractors have reached a height of 26 m yet so those are just mad. According to your plan you want not just one but 3 of these enormous industrial structures here. Co-locating more than one project at your proposed Sea Link site is only going to add to the chaos. They will be operated by separate developers so the actual impact will be 3 times as much as one. And what if you choose to have a rolling hill disguise and they prefer to have a different disguise? Will you be able to get it together to design the outsides to complement each other disguise or will you revert to pretending that you don't work together when it comes to that?	N	The Proposed Project description is contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The sensitivity of the area is noted. The assessment of sites to accommodate the converter station is set out in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**, which was published alongside other consultation material. This explains the operational needs of the converter station and the factors that influenced decision making underpinning the choice of this location. National Grid will seek to conserve and enhance the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The assumptions made about the lighting design that have informed the landscape and visual impact assessment are set out in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Consideration of the landscape and visual effects of light pollution during construction and operation is presented in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment, Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment, Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**. National Grid is seeking to coordinate efforts with other energy infrastructure developers operating in this area, in order to avoid more widespread impacts, however, the Proposed Project is only seeking consent for a single converter station. The assessment of effects arising from the Suffolk Onshore Scheme on landscape and visual amenity is set out in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Views were sought over the architectural design approaches for both the Suffolk and Kent converter stations and National Grid is considering feedback, alongside ongoing discussions with local authorities to inform the detailed design approach within its DCO application in **Application Document 7.12.1 Design Principles – Suffolk**. The design contractor(s) will be required to follow the specific design codes and principles within this document. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the colocation of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. There are benefits to co-location with other projects because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst a coordinated master-planning supports a joined-up approach towards consideration of landscape designations and other sensitive receptors. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
The Aldeburgh Society	The proposed converter stations would be located in the wrong place. The one proposed for Saxmundham would be located on one of the highest points within the Saxmundham area. Each converter station would be 26 m high, standing taller than local church towers, and in covering 12 football pitches they would dominate the town of Saxmundham and the village of Sternfield changing the landscape in a rural area.	N	The sensitivity of the area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process. The outcomes of these discussions will, where relevant, are reflected in **Application Document 7.10 Coordination Document**. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Local community	I do not think the converter station(s) are in the right location and strongly oppose the proposal. Your PEIR does not demonstrate full assessment of the impacts. On approaching Saxmundham from road B1121, the much-valued historic views across The Layers, Grade II Listed Hurts Hall and the Grade II* Listed St John the Baptist Church will be significantly harmed by the 26 m high converter stations which will become part of its backdrop, incongruous to its setting and against the good practice advice provided by Historic England and is against the Saxmundham Neighbourhood Plan which notes these particular views are to be protected: 1. 'View from the B1121 looking across to Hurts Hall and St John's Church: The road undulates and at the top of two rises, there are open views across to the Church and Hurts Hall which are both important landmarks'. 2. 'View from the high point of The Layers looking across the River Fromus to Hurts Hall: Looking due east from the tree line which marks the western edge of The Layers, across open farmland and the River Fromus. This gives a wide view of Hurts Hall and its associated buildings, and the backdrop of rising wooded land. It demonstrates the contrast between the open	N	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including Suffolk County Council and Historic England and, as part of this procedure, a list of assets to fully assessed was agreed. The assessment of landscape impacts is contained within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and the impacts on cultural heritage in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. It is acknowledged that there will be some residual localised impacts arising from the Proposed Project, however, National Grid has considered the important viewpoints identified within the Neighbourhood Plan and these have informed the assessment of the ES, alongside engagement with the Town Council and the local planning authority. This has also informed the proposed mitigation plans, including proposed woodland on the western edge of the converter station site. Mitigation planting along the permanent access route has also been developed in collaboration with the cultural heritage team. Details are contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Analysis of the site within the context of the surrounding area indicates that historically there is evidence of blocks of woodland on this site. In addition, National Grid has assessed the potential noise impacts arising from the Proposed Project in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	landscape of the valley and wooded ridge, below which the town sits." If the converter station is to be built, it will cause significant harm and change to the attractive, rural landscape to one dominated by electrical infrastructure, it is a gross overdevelopment. You have indicated some proposed planting of native woodland planting and hedgerow (with reference to Figure 1.4.6 of the PEIR Vol 3 Part 1 Chapter 4) these will only offer very limited screening to the converter stations. The converter station(s) will dwarf their surrounding and be completely alien in the rural landscape. The proposed access road to the south of Hurts Hall will also cause significant harm to its setting, it would introduce development into the very visible eastern valley slopes of the Fromus Valley which currently is free from development and provide "memorable views" to Grade II Listed Hurts Hall Manor House, its setting and Grade II* Listed St John Baptist Church beyond. The road will draw attention to the converter stations at the top of the valley. The East Suffolk Local Plans: The Suffolk Coastal Settlement Sensitivity Assessment Volume 2 (2018) recognises the B1121 was the historic approach to Saxmundham prior to the opening of the A12 bypass. It is the only approach to the town that has remained unspoilt by development and serves as the "gateway into Saxmundham", where the agricultural landscape still provides a setting for its historic core. This is recognised in the fact that the Conservation Area runs right to the urban edge. So the introduction of the permanent access will cause significant harm to this established historic relationship and be against the Local Plans. Apart from the negative visual impacts, there will also be significant noise impact from the heavy vehicles during construction which could last between 10 to 12 years if all 3 convertor stations are to be constructed.		
Suffolk coastal Friends of the Earth	Such a huge industrial building (converter station) is totally out of keeping with the character and landscape of rural East Suffolk, where the local architecture is predominantly of low build. Clearly, at 26m tall, it would dominate the landscape in an extremely unsightly way. If two others were to be added, then of course the impacts would be greatly magnified. We ask you to take note of paragraph 174 of the National Planning Policy Framework (NPPF), which states that developments should recognise 'the intrinsic character and beauty of the countryside and the wider benefits from the natural capital and ecosystem services'. The proposed plans fail to do this. The Suffolk Nature Strategy mirrors national policy when it	N	These concerns are acknowledged and it is recognised that there will be some residual impacts arising from the development of the Proposed Project. The assessment of landscape impacts is contained within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	states that energy infrastructure 'should be sensitive to place'. The building as proposed completely disregards these policies.		the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.1 Design Principles – Suffolk**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. **Application Document 7.1 Planning Statement** provides and assessment of the impacts of the Proposed Project upon the National Landscape, concluding that it has been demonstrated that exceptional circumstances exist to justify the development in this nationally designated landscape. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process. It should be noted that the Planning Act 2008 states that the National Policy Statements for Energy (NPS) provide the primary basis for decisions taken by the SoS on applications for development consent he or she receives for electricity network infrastructure, and in turn, the Proposed Project. Paragraph 5 of the NPPF makes it clear that the NPPF does not contain specific policies for developments requiring development consent and that applications in relation to developments requiring development consent are to be determined in accordance with the decision-making framework set out in the Planning Act 2008.
CPRE Kent	The existing landscape of the proposed location of the converter station and substation within Minster Marshes and Ash Levels is characterised by open, low-lying marshland landscapes in which development is typically sparse. These are agricultural landscapes where pastoral and arable farmland is actively managed. The construction of the converter station and substation will result in a permanent land-use change and direct loss of these landscape elements. Accordingly, the relevant section of the PEIR accepts that there will be significant landscape effects on the landscape character areas Wantsum North Slopes, Stour Marshes and Ash Levels, and well as one viewpoint east of Minster. Likewise, the PEIR accepts that this significant effect will be significantly exacerbated should the option of overhead cable lines be pursued, not least as this would result in a concentration of additional pylons and yet further permanent external lighting. Again it is impossible to fully assess the extent of landscape impact when the design options for the converter station and substation are unknown. The potential size of the converter station, though, is of significant concern. Far more detail is required as to design, location, size and scope, along with anticipated landscape mitigation measures appropriate to such, to be able to make any firm conclusions as to just how bad the landscape impact will be. What, however, is clear is that the choice of location within the open countryside isolated from any similar built form alone creates what would already be a significant landscape effect. It is also clear that this effect will be significantly exacerbated should the option of overhead lines be pursued. We would object to the overhead lines on the basis of two main grounds, namely landscape impact and environmental harm.	N	National Grid acknowledges your objection and it is recognised that there will be some residual impacts arising from the development of the Proposed Project. The assessment of landscape impacts is contained within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	With respect to landscape, any such impact would be reduced should the cables to the Richborough to Canterbury 400 kV overhead line be underground rather than overhead. Whilst the proposed converter station and substation alone is likely to result in a significant effect from a number of assessed viewpoints, in almost all cases this would be exacerbated by the presence of overhead lines and associated pylons.		
Local community	There would be a loss of dark skies during construction (4 to12 years) and light pollution with permanent security lights from convertor station and substation.	N	National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The assumptions made about the lighting design that have informed the landscape and visual impact assessment are set out in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Consideration of the landscape and visual effects of light pollution during construction and operation is presented in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment, Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment, Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**.
Local community	Should the converter stations be built in the area, planting of adequate tree or hedge line needs to be implemented ahead of the construction so that these can become established as soon as possible to hide and minimalise any impact of the view of the area and to make this as appealing as possible. As the buildings are so high these will be clearly visible from all around so would it not be possible to reduce the level of the ground where the converters may sit to lessen any impact of the eyeline.	N	National Grid is taking a comprehensive masterplanning approach towards the development of the Converter Station site, seeking to utilise the site's topography and natural features within the design as much as possible, to lessen the visual impact. Landscape planting required for screening will be undertaken in advance of construction wherever possible. However, it should be acknowledged that such measures take time to establish, meaning that there will be some residual effects remaining. Details of landscaping are contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk and Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent** which are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All planting associated with the reinstatement of the landfalls and HVDC and HVAC corridors will be maintained for a five year period. All mitigation planting associated with permanent access roads, Converter Stations and Substation will be maintained for the lifetime of the assets.

Table 1.2 Terrestrial ecology

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	I support the principle of reinforcing the network in Thanet but NOT on the site of Minster Marshes, which is an SSSI and is home to some Nationally important wildlife which will be disturbed and their habitat will be permanently removed. There are also RAMSAR sites on Minster Marshes. Pegwell Bay is a NNR, SSSI, SPA, SAC and RAMSAR site. How can you consider doing what you are proposing here. There are alternative sites, why choose this one.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Local community	The construction of this converter on the Minster Marshes will be disastrous for the local ecosystem. Minster marshes are not a brownfield or even a greenfield, monocultural site. They are a thriving eco-system and home to a huge range of valuable wildlife. Once these marshes are gone - they are gone and the harm to our environment here will be irreparable.	N	
Local community	Minster Marshes is the wrong location for this infrastructure. I accept that population behaviour will require increased capacity, but it must not be at the expense of important wildlife habitat, which can never be replaced. Especially when National Grid has many under- or un-used sites around the county and nearby. Alternative sites have not been adequately explored -- or National Grid has not explained its rationale for choosing the site in Thanet, which homes many endangered species and is adjacent to Sites of Special Scientific Interest.	N	
Local community	Yes, the impact on Minster Marshes & Pegwell Bay will be significant and disruptive to wildlife and have permanent ramifications in the future. This area has suffered dramatic development already, there is a chance to save what we have left, then let’s do that!	N	
Local community	Any reinforcement of the network between Suffolk and Kent must acknowledge the importance of Pegwell Bay, and Minster Marshes as an area of natural conservation. Previous links from the Wind farm dealt the area with the minimum of disturbance. Environmental power schemes should not ride rough shod over the natural environment. The very reason for naturally produced power is to protect the natural balance of the natural environment. An alternative route is required even if more expensive. The area is a place of calm carefully managed to protect the wildlife for many years. I have been coming since the 1990's. During COVID it was a space where local people could walk. Cheaper energy if it kills wild life is only cheap in monetary terms not in environmental terms.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	I don't agree with the proposed plans, of particular concern is the destruction of Pegwell bay, a National nature reserve and one of the last remaining 'wild' spots in the area. There has already been a project, the Nemo project, running through which broke promises on replanting nature. Off-setting, with replanting elsewhere is no substitute for years of developed habitat.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. As part of the DCO application, National Grid has undertaken an inter-project cumulative impacts assessment for any potential of cumulative or in-combination effects, **Application Document ES 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
Local community	I think the Sealink to support the infrastructure we need is important for the renewable future, but it should never be at the expense of Britain's already struggling wildlife and biodiversity. There are other sites that the cable could be routed through without impacting the important species at Sandwich and Pegwell bay, the marine conversation zones and other wildlife sites. You can do better, and Britain's wildlife needs you to do better.	N	
Local community	I am extremely concerned about the locations being proposed for Sealink and its associated infrastructure in Kent and do not support development on the locations being proposed. I think it must be taken into consideration that we are in a nature and biodiversity crisis, therefore conservation of sensitive sites must be a priority and any negative impacts avoided. The proposed site is in close proximity to the National and Internationally protected marine environments namely Thanet Coast and Sandwich Bay Special Protection Area, Special Area of Conservation and Ramsar site, Sandwich Bay and Hacklinge Marshes SSSI, Sandwich and Pegwell Bay National Nature Reserve, Minster Marshes SSSI. The development and its associated infrastructure will certainly have severe consequences. The land proposed for the structures and infrastructure is adjacent to the Minster Marshes SSSI, which is a biodiverse rich habitat which supports an extensive variety of wildlife, the list is endless and many of which are protected by the Wildlife and Countryside Act 1981 with key species endangered and on the Red List. This area's diverse wildlife has already been impacted by previous developments and therefore the impact of Sealink cannot be assessed in isolation but the cumulative effect on the diversity of wildlife must be taken into account especially as it is now accepted that we are in a nature crisis.	N	
Local community	There are many other viable options that do not include the destruction of a protected nature reserves, particularly Pegwell Bay which is already under strain through an additional infrastructure project in the last 10 years. We are supportive of steps taken to develop renewable energy solutions, but it must not be at the cost of wildlife. We are not convinced that the proposed route can be adequately mitigated for and I have found no evidence of a mitigation fund to be provided based upon detailed ecological reports to ensure subsequent damage to marine and land based wildlife. Will the national grid commit to a mitigation fund spanning the lifetime of the new connection under law and which will match inflation?	N	The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. A mitigation fund has not been developed because the approach has been to design mitigation into the Proposed Project so that it can be delivered as part of the Proposed Project and form part of the DCO.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	My concern at the use of desktop surveys as a replacement to fuller and more detailed ecological surveys. The failure to carry out reptile, bat, water vole, otter, beaver, badger, invertebrate, and river aquatic surveys before the plans are submitted for a Development Consent Order. The loss of connectivity for wildlife through the development of 13.6 hectares of wildlife-rich land which will be irreversible.		A thorough review is being undertaken and defined impacts are assessed with suitable mitigation measures proposed. This information will be submitted for examination and National Grid will abide by the requirements imposed by the development consent order. Moreover, it is committed to providing 10% Biodiversity Net Gain, a means of achieving this will, to an extent, be by funding suitable schemes for a period of 30 years. Furthermore, the mitigation hierarchy has been utilised throughout project progression, as demonstrated by the approach to avoid Goodwin Sands MCZ, as well as the commitment to trenchless techniques at the landfall sites. As part of the ES, in addition to desk study data National Grid has undertaken an extensive programme of environmental surveys (not available at the time of Statutory consultation) has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, aquatic wildlife, riparian mammals, dormice and plants. The potential impacts on ecology are considered in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Meetings have been held with Natural England where the approach to addressing loss of functionally-linked land for golden plover has been discussed at length. Various strategies have been discussed with Natural England. The possibility of creating new wetland south of the River Stour has been explored prior to Statutory consultation, but technical challenges were identified in discussion with hydrologists and Natural England with keeping it sufficiently wet. Therefore, an alternative approach has been pursued (discussed and agreed in principle with Natural England) to instead enhance an area of arable land close to the coast and adjacent to the A256 for non-breeding golden plover. This was consulted on at Targeted consultation. Connectivity for wildlife will be preserved around the Converter Station and Substation be retention and enhancement of boundary features such as hedgerows, ditches and woodland. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Your proposed site is next to and overhanging national and internationally protected marine environments, i.e. Thanet Coast and Sandwich Bay Special Protection Area, Special Area of Conservation and Ramsar site, Sandwich Bay and Hacklinge Marshes SSSI, Sandwich and Pegwell Bay National Nature Reserve. While your converter and substation buildings are not on the sites their very close proximity will have a major, negative and harmful, impact on wildlife. These areas are vital in themselves but are also crucial links to adjacent wildlife corridors. Worse still are the associated infrastructure, much of which will be under or on these protected areas. I also believe you will extend the buildings in future making the damage far worse. The Minster Marshes SSSI is protected land which supports a large range of wildlife, many protected by the Wildlife and Countryside Act 1981 with key species endangered and on the Red List. Your proposal is a direct threat to this protected area and wildlife.	N	A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document Habitats Regulations Assessment Report** . Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council, Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). It is of note that Minster Marshes is not designated as a SSSI and is not a protected site.
Sandwich Town Council	Whilst Sandwich Town Council supports the intention to reinforce the network on the basis that it will increase the capability to carry low carbon and renewable energy, thus contributing to the UK	N	National Grid acknowledges the mentioned designated sites which have been taken into account in the Proposed Project EIA.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Government's commitment to achieving net zero emissions by 2050 and delivering energy security for the future, it does not support the choice of location of Minster Marshes. The siting of the Sea Link convertor station and associated infrastructure will negatively impact the resident wildlife and the surrounding protected areas. These specially designated sites include: - Two Special Areas of Conservation: Thanet Coast SAC and Sandwich Bay SAC - A Special Protection Area: Thanet Coast and Sandwich Bay SPA - A Wetland of International Importance: Thanet Coast & Sandwich Bay Ramsar site - Site of Specific Scientific Interest: all Thanet Coast SSSI, and the Sandwich Bay to Hacklinge Marshes - Kent's largest National Nature: Sandwich and Pegwell Bay NNR - A Marine Conservation Zone: Thanet Coast MCZ The site is also adjacent to the Minster Marshes SSSI, a strip of protected land which supports an extensive variety of wildlife, many of which are protected by the Wildlife and Countryside Act 1981 with key species endangered and on the Red List.		Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. Details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	With regard substation and converter stations why do they have to be lit at night? This will have a very serious and negative impact on birds and other wildlife.	N	Lighting impacts on wildlife are considered as part of the ES. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	It seems to me as a person interested in wildlife and the development of our society that extreme factions will object to any change in the status quo. If this continues no-one in future will take any notice of reasonable argument. "OBJECT TO EVERYTHING" is a recipe for representational disaster. Remember that humans are animals too - superbly developed animals who have developed amazing facilities. From my technical knowledge and knowledge of the adaptability of nearly all species, I see no reason at all to raise fundamental objection to the scheme - quite the reverse in fact. Crying 'Wolf' too often removes credibility.	N	National Grid acknowledges this comment and thanks the respondent for the support.
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation?			
Local community	Least negative impact on Suffolk Countryside.	N	National Grid acknowledges this comment and thanks the respondent for the support.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	I think you need to involve the Suffolk Wildlife Trust at the planning stage. From the diagram it looks as if the work is potentially invasive and likely to damage wildlife & their habitats. Also the damage done in the process of any construction is also likely to be harmful to the environment, long term. You need to consider all aspects and potential harm before proceeding. Discussions with Kent and Suffolk Wildlife Trusts should be a key part of the process. This scheme must ensure that the work involved must not endanger the natural habitats and wildlife. You cannot afford to proceed at the expense of nature. Natural biodiversity must be supported, which is also essential for health and prosperity of people and society. Has National Grid carried out bat and bird and mammal surveys to see how the proposals will impact on the local environment. Suffolk and Kent Wildlife Trusts have worked had to involve local people in building biodiversity and your solutions must involve them for a successful outcome. You need to assesses the environmental impacts and merits of the options to prevent avoidable damage to the natural environment.	N	National Grid has engaged with both Suffolk and Kent Wildlife Trusts throughout the development of their proposals as a non-prescribed consultee. Other bodies consulted with regard to biodiversity were Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council, Thanet Council, Dover Council and Kent Council. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. Further details relating to the ecology assessment are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q4 What do you think about our proposed HVAC cable in Suffolk? Comments			
Sudbourne Parish Council	The PC supports the response from the Nature conservation organisations (including Suffolk Wildlife Trust and RSPB) with regard to the protection of vulnerable species impacted by your proposed works. Full and accurate environmental impact assessments must be carried out and all mitigation works, including the realignment of the route (where necessary) must be undertaken.	N	National Grid acknowledges this feedback and confirms that a comprehensive EIA was undertaken culminating in the production of an ES to accompany the DCO application. Details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. The approach to mitigation is set out in each of the specialist ES chapters and a list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q7 What do you think about our proposed HVDC cable in Suffolk?			
Local community	Again it comes down to the question "is it necessary"? Alternative solutions would avoid having to plough through Suffolk's precious landscapes. The level of disruption to the countryside, wildlife, and local residents will be devastating. The location of the joint bay also beggars belief close proximity an AONB and the North Warren RSPB reserve.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. The needs case for the Proposed Project has identified that a connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. As set out in the needs case, the Proposed Project will send power either from Suffolk to Kent or from Kent to Suffolk depending on system conditions and faults that occur in either Suffolk or Kent. Therefore, power is not being sent in one direction all the time and therefore locating generation elsewhere in the system would not solve the entire needs case. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in:
Local community	The joint bay has been located immediately adjacent to the Area of Outstanding Natural Beauty and North Warren RSPB reserve which should be protected from development.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the HVDC cable in Suffolk. The high importance of the RSPB reserve and the AONB is noted. This is a major reason why a trenchless construction solution will be used from the transitional joint bay eastwards under the reserve and AONB. The use of a trenchless construction solution is committed to through **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This corridor runs through habitat patches which support a range of threatened and near-threatened species (including turtle dove, nightingale, adder, grayling). Losing and altering these habitat patches will negatively impact overall species abundance in the area, working against government's apex legally-binding biodiversity target. It will disrupt ecological functioning in the landscape, making it less permeable to species movements and reducing buffering effects for core habitat locally.	N	National Grid acknowledges these concerns and has embedded measures to reduce and, where possible, avoid adverse effects. No direct habitat loss would arise from internationally, nationally or locally designated sites due to the Suffolk Onshore Scheme, with the most sensitive sites (i.e. North Warren RSPB Reserve, Leiston-Aldeburgh SSSI) being traversed by using trenchless methods. Sandlings SPA lies within the Suffolk Onshore Scheme (since an existing track to be used for monitoring traverses it) and is approximately 20 m north of a proposed construction compound (S10). The trenchless bore would be approximately 8 m below the RSPB Reserve/ SSSI. Approximately 2.5 ha of acid grassland would be temporarily lost adjacent to Sandlings SPA due to the trenchless construction compound (S10) and associated section of cable trench east of Leiston Road. However, this field showed no evidence of nightjar/woodlark nesting but is well within 1 km of the nearest woodlark territories in the SPA and adjacent to a field where the nearest woodlark territory outside the SPA was recorded in surveys. This loss of foraging habitat would last for a single nesting season. As part of the broader habitat mitigation proposals (unrelated to HRA considerations) the Proposed Project would restore and enhance approximately 6 ha of acid grassland that would be managed in a favourable way for 10 years following creation. Other incorporated measures include sensitive routeing and siting of infrastructure and temporary works, and commitments made within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). There will also be creation of woodland, grassland and pond habitat around the Saxmundham Converter Station and Friston Substation (for the scenario where the substation is built as part of the Proposed Project).

Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness?

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Habitat will recover quickly once work has been completed.	N	National Grid acknowledges this feedback and thanks the respondent for the support.
Local community	I think that the destruction of the unique soundlings habitat, of the destruction of an AONB is abhorrent.	N	National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the landfall site Suffolk. The high importance of the local habitats and the AONB is noted. This is a major reason why a trenchless construction solution will be used from the transitional joint bay eastwards under the sensitive habitat and AONB. The use of a trenchless construction solution is committed to through **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). Impacts on the setting of the AONB are assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and further details can be found in Table 1.1 of this Appendix.
Local community	This is totally unacceptable in an Area of Outstanding Natural Beauty, SSSI, part of the North Warren RSPB nature reserve and internationally important for our tourism economy, enjoyed by everyone for their mental and physical health and well-being. This option has been discounted by other developers.	N	The potential impacts of the Proposed Project on the AONB and North Warren Nature Reserve are acknowledged. The assessment of effects on the AONB is set out within **Application Document Part 2 Suffolk Chapter 1 Landscape and Visual,** and the effects on the North Warren site in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The mitigation hierarchy has been applied to lessen effects where possible. Potential impacts on the tourism economy are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. Health and wellbeing impacts are assessed in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This is a beautiful unspoilt piece of coast - a very unusual mix of shingle, grassland, marsh, meadows and heath. It's the oldest RSPB reserve and SSSI and AONB and the Sandlings SPA. This proposed work will be most damaging to wildlife and its habitats and the amenities of visitors - both during construction and for years afterwards.	N	National Grid acknowledges the sensitivity of the mentioned sites. Separate assessments of the Sandlings SPA and the Leiston to Aldeburgh SSSI as well as details of the necessary mitigation is included within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Trenchless methods will be used to minimise disruption. The use of a trenchless construction solution is committed to through **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**).
Q11 Do you have any comments or issues that you would like us to take into consideration regarding out marine proposals?			
Local community	You have already destroyed the local marine environment through your Nemo Link project. Your failure to have adequately planned to avoid digging up the same fragile ecosystems you destroyed so recently demonstrate your utter disdain for the environment. For Sea Link you have failed to carry out any surveys of habitats or taken those into consideration in your plans. Unless and until thorough ecological marine surveys have been completed, all your marine plans should be put on hold.	N	The Nemo Link interconnector is a joint venture between National Grid Interconnector Holdings Limited, a subsidiary company of the UK's National Grid Plc, and the Belgian Elia group which is a separate entity to National Grid Electricity Transmission. While the Proposed Project does make landfall in Pegwell Bay, National Grid has committed to a trenchless technique to go beneath the sensitive saltmarsh habitat. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). It has undertaken two campaigns of marine surveys which have included geophysical and geotechnical surveys which have covered the marine route. It has also undertaken intertidal surveys at each landfall which included phase I and phase II surveys to characterise intertidal habitats and species. These can be found in **Application Document 6.3.4.2.C ES Appendix 4.2.C Intertidal Surveys 2023**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Depending on the location of the cable, between 10-20 m of seabed would be cleared. Drop Down Video or Remotely Operated Vehicle mounted cameras may be used to confirm the locations and extents of sensitive benthic habitats or features. This would inform micro-routeing of submarine cable systems to avoid or minimise interactions with these features in so far as practicable. A total area of 0.15 km^2 of permanent loss of habitat is expected due to cable protection. Many of the habitats comprise subtidal muds and mixed sediments, which are widespread and of low value. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. The Offshore Scheme is designed for a lifespan of approximately 40-60 years. The cable system installation is designed such that a regular maintenance regime is not required to maintain the integrity of the link. The impacts on benthic ecology are presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. A full suite of terrestrial ecological surveys have been undertaken to inform the ES for the Proposed Project including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q12 What do you think about our proposed landfall at Pegwell Bay?			
Local community	With limited land fall available around the area you have no choices as coming ashore in Ramsgate Harbour will cause additional costs and more issues. As long as the breeding season for wildlife is taken into account when start works.	N	National Grid acknowledges the feedback. National Grid has held discussions with relevant prescribed bodies regarding the timing of works and will avoid certain types of work within breeding and/ or wintering seasons depending on which is the most sensitive in a particular location. The breeding season for wildlife will be taken into account and an assessment of impacts on breeding wildlife has been undertaken, informed by surveys, noise modelling information and other data. Details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**).
Local community	This is one of the few wildlife areas left around here. It is used by a huge variety of birds and animals. Please don't destroy it.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place
Local community	This is a location of national wildlife importance. I strongly think the proposal is a criminal act. Please stop.	N	
Local community	The Minster Marshes and the River Stour Valley are important areas for wildlife and are highly sensitive ecological areas. Pegwell Bay is an iconic part of the coastal landscape, the location could hardly be any worse.	N	
Local community	Negative impact on the environment and native wildlife including barn owls partridge, skylarks, warblers, curlew, plovers, snipe and turtle doves. Also grass snakes, slow worms, brown hares and water voles.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	It seems incredible that you would consider this route through the NNR and SSSI. These designations mean they should be protected from inappropriate development.	N	and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding biodiversity net gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	What my biggest issue is the disruption to Pegwell Bay and the environment there. Having grown up myself in the local area as well as parents grow up in the local area Pegwell Bay is the most popular nature reserve for miles. Locally people are extremely passionate about it and even minimal disruption such as boats breaking speed limits or straying into the wrong area is a major talking point and source of frustration and anger locally. Part of the Sea Link plan is talking about a 10% biodiversity net gain (BNG) which in my mind will be next to impossible if there is any disruption or damage to the Pegwell Bay area. The entire area is a RAMSAR site for a reason.	N	
Local community	Running the cable straight into this extremely sensitive and fragile wildlife area will cause incalculable and irrevocable harm to the habitat. This is the only remaining wildlife haven in an area which has seen enormous amounts of construction in the last ten years, and it is crucial for the ecosystem of the area that this is maintained and protected. The bay, SSSI and marshes combine to create a superhighway of bird movement both for wetland birds and migratory birds which will be destroyed by your proposals.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). This construction solution will minimise potential impacts on terrestrial biodiversity. National Grid recognises the importance of the English East Coast and its coastal wetlands as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the scheme on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure.
Local community	Minster marshes is a critical ecological super highway connecting a site of special scientific interest with the rest of the country. It is home to hundreds of bird species many of which are on the endangered list. The National Grid are proposing to build across this vital landscape devastating the local ecology.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Through the EIA process, National Grid has developed mitigation measures to offset the impact on birds. One solution will be to convert an existing area of farmland to marshland/wet grassland, as has been done throughout the Stour Valley under Natural

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	It is an environmental haven where many species have been forced to live due to the excessive building elsewhere in Thanet. Environmentalist have recently seen species such as barn owls, partridges, skylarks, grasshopper warbler, garden warbler, curlew, golden plover, Lapwings, Hen harrier, Marsh harrier, Yellow hammer, Sparrow hawk ,Jack snipe , Common snipe and turtle doves Additionally living there are numerous reptiles and amphibians including grass snakes and sloe worms. Brown hares and water voles also call this space home. This area acts as a super highway connecting Pegwell Bay Nature Reserve with the rest of the south east and further afield. Not only offering long-term residents a place to live but is vital in aiding migration patterns.		England stewardship. This will provide a net long-term enhancement in the extent of wetland habitat in the Lower Stour Valley. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	To be instrumental is the destruction of a haven for wildlife is immoral. You are already aware that “The Stour Valley is one of the most important places for wildlife in the whole of Kent and the area planned for the converter station is full of rare fauna, flora and fungi." As David Attenborough states, “All we require is the will. The next few decades represent a final opportunity to build a stable home for ourselves and restore the rich, healthy and wonderful world that we inherited from our distant ancestors. Our future on the planet, the only place as far as we know where life of any kind exists, is at stake.” Therefore, National Grid needs to take heed of this. It is the future of our planet, for us that we are trying to save and wiping out wildlife and nature will be the death of all of us.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q13 What do you think about our proposed HVDC cable route in Kent?			
Local community	Crossing Minster Marshes would be disastrous for local wildlife. This part of Kent is losing so many habitats already.	N	National Grid recognises the sensitivity of Minister Marshes and as such trenchless technology will be employed for the HVDC cable route in this area. This construction solution will minimise potential impacts on terrestrial biodiversity. The use of a trenchless construction solution is committed to through **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This is a mainly rural marsh area with diverse wildlife and plants. Not suitable for this mega scheme.	N	
Q14 What do you think about our proposed converter station and adjacent substation near Minster?			
Local community	It is an SSSI and an important sanctuary for many species of wildlife as follows: - It is adjacent to Pegwell Bay which is an important sanctuary for migrating birds: Ravens, Peregrine falcons, an old Heronry (an important breeding site for generations), Egrets, Nightingales, Marsh Harriers, Cuckoos, Turtle Doves, Yellow Hammer, Sedge Warbler, many Owls to name some of the species seen there. The removal of the Lattice Mast will mean the Ravens and Peregrine Falcons will lose their nest site. - Insects (e.g. damsel flies) and butterflies will be disturbed and their habitat will be gone forever.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	- I know many orchids are there, but I am not familiar with these and other wildflowers which will be destroyed. - Mammals- Bats, Beavers, Water voles that I know of. I understand that Beavers have European protection and it is against the law to deliberately injure, kill, capture or disturb beavers, damage or destroy a beaver breeding site or resting place, lodge or associated dam or transport a beaver or beavers. - Reptiles – Grass snakes and slow worms. The size of the works will be 30 m high and cover 6 hectares, making a blot on the landscape and a barrier to wildlife. It will irrevocably destroy habitat and the wildlife that lives there and has lived there for generations.		is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). It is of note that Minster Marshes is not designated as a SSSI and is not a protected site.
Local community	I do not support the plans as they are currently outlined. As with the cables, the converter station and substation likewise pose a direct risk Sandwich Bay and Hacklinge Marshes SSSI, Ash Level and South Richborough Pasture Local Wildlife Site (LWS) and Woods and Grassland Minster Marshes LWS. The environmental impact is too great to justify the current proposals, especially when alternatives can be found.	N	The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Impacts on landside habitats including Sandwich Bay to Hacklinge Marshes SSSI are discussed at length in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Local community	The selected location is situated too close to the SSSI and the land where some of the wildlife live and feed. Apart from the disturbance during construction the location chosen is where Badgers and Brown hare feed. It also covers a dyke where Grass snake and Slowworms live. Turtle Doves and Yellow hammer also use the bushes in that area. Two Barn Owl boxes are located very close to this area. These have been used in the past with Barn Owl chicks ringed. Marsh Harriers that breed in a nearby reed bed hunt along the dykes in that area crossing over the fields where you propose to build. Alongside the dyke is a strip of scrub where bird ringing is carried out. There is also a colony of Green hairstreak butterfly there.	N	The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The documentation supplied refers to the Richborough siting as a preferred option. I reject your preference. 11.2.6 (Strategic Options Report Oct 2023) states ."...whereas Richborough would present lesser challenges" in reference to the ecologic impacts of various options. I believe this underestimates the environmental significance of this area and demonstrates that the choice is based on a "least worst" approach rather than a "go for the best' approach. Please consider further the environmental and	N	The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	ecological destruction that would be caused on the site and its environs. I refer you to all of the designated areas nearby, SPA, SSSI, etc that would be impacted. It is a corridor connecting the National and Internationally protected marine environments of the Thanet Coast and Sandwich Bay Special Protection Area, Special Area of Conservation and Ramsar site, Sandwich Bay and Heckling Marshes SSSI, Sandwich and Pegwell Bay National Nature Reserve, inland to the Stodmarsh SSSI.		A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	This proposed site will have unacceptable short term effects during construction and long term effects in use on the local environment, landscape and wildlife. In particular it will almost cut off completely wildlife corridors to the adjacent part of the SSSI which if the proposal goes ahead will have development on all sides. There is little natural woodland on Thanet and one area is adjacent to the proposal within the SSSI. This is also Weatherlees Hill and whilst not very high, with the woodland it is a local landmark and views to it will be severely restricted by a 26m high building.	N	The features of the landscape around the Converter Station and Substation sites, including the woodland, have been taken into consideration within the iterative design process and the indicative landscape strategy. Tree surveys have been undertaken in accordance with BS5837:2012 and details are contained in **Application Document 6.10 Arboricultural Impact Assessment**. There would be localised significant effects for visual receptors as expected for the nature of this type of development. Mitigation design has been incorporated to reduce effect where possible. Careful attention has been paid in the design and construction programme/methods for the Proposed Project to the possibility of habitat severance. In the coastal zone this will be avoided through use of a trenchless construction solution. In those areas away from the coast, which will be crossed by open trench, a series of protected species surveys have been undertaken to inform mitigation measures and the works will be undertaken in such a way as to retain connectivity, such as through the inclusion of mammal ledges in culverts. Habitat connectivity around the Converter Station and Substation site will be preserved through enhancement of existing boundary features and the creation of new areas of woodland and wetland. There will be a net increase in woodland in the area as a result of the Proposed Project. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A list of mitigation measures and the commitment to a trenchless solution are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q17 Anything else? Comments			
Local community	Providing mitigation for species is not net gain, it is additionality and if you provide this it is not part of net gain calculations. I ask for 90% additional habitat, as so much is being lost. Also, that habitat is protected in perpetuity and bird areas away from overhead cables	N	Careful attention has been paid in the design and construction programme/methods for the Proposed Project to the possibility of habitat severance. In the coastal zone this will be avoided through use of a trenchless construction solution. The commitment to a trenchless solution is contained in **Application Document 7.5.3.2 CEMP Appendix B**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	but fully connected habitats linking designated areas and secure and create more marsh habitat before production of plant. Work with local community to create better proposal and increase vastly land for conservation. Including all the species identified by local knowledge and habitat for each. Native hedgerows for birds and dormouse, amphibians and reptiles, a place to create a Ramsar Marsh for Nature Recovery and landscape recovery. Water vole habitat. European Eel migration. Birds of prey, wetlands, farmland, create woodland bird areas. A mosaic around a Ramsar equivalent 90% increase. Ongoing conservation and management in perpetuity. Conservation covenants. Accessible nature and quiet protected areas. Be generous and forgiving of needs of wildlife community are distraught at loss. Can cables go underground.		**Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). In those areas away from the coast, which will be crossed by open trench, a series of protected species surveys have been undertaken to inform mitigation measures and the works will be undertaken in such a way as to retain connectivity, such as through the inclusion of mammal ledges in culverts. The cable will be buried as each section is installed and habitats restored above the cable. A collision risk assessment has been undertaken regarding the new section of overhead line over the River Stour to ensure it does not act as a barrier to wildlife movement. Habitat connectivity around the Converter Station and Substation site will be preserved through enhancement of existing boundary features and the creation of new areas of woodland and wetland. The Proposed Project has committed to achieving 10% Biodiversity Net Gain and that will involve contributions to delivering strategic biodiversity schemes in Kent. Details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. As part of the Proposed Project, National Grid is also providing habitat enhancement in an area of arable land close to the coast and adjacent to the A256. Where artificial features are to be retained in the landscape away from the Converter Station (i.e. culverts to support the permanent access road) these will be designed to ensure continued passage of water voles and eels. Further details of the above mitigation measures are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**)
Local community	We are supportive of steps taken to develop renewable energy solutions, but it must not be at the cost of wildlife. We are not convinced that the proposed route can be adequately mitigated for. Our concern at the use of desktop surveys as a replacement to fuller and more detailed ecological surveys. The failure to carry out reptile, bat, water vole, otter, beaver, badger, invertebrate, and river aquatic surveys before the plans are submitted for a Development Consent Order (DCO). The loss of connectivity for wildlife through the development of 13.6 hectares of wildlife-rich land.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. Careful attention has been paid in the design and construction programme/methods for the Proposed Project to the possibility of habitat severance. In the coastal zone this will be avoided through use of a trenchless construction solution. In those areas away
Local community	As an active member of SBBOT, (a bird and butterfly enthusiast) the list of wildlife that has been seen on Minster Marshes during the year is significant. It is an environmental haven where many species have been forced to live due to the excessive building elsewhere in Thanet. Wildlife enthusiasts have seen species such as Nightingale and Turtle Dove, as well as a heronry and owl roost. Little Egrets breed here as do barn owls, partridges, skylarks, grasshopper warbler, garden warbler, curlew, golden plover, Lapwings, Hen harrier, Marsh harrier, Yellow hammer, Sparrow hawk, Jack Snipe, Common Snipe and Turtle Doves.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Additionally living there are numerous reptiles and amphibians including grass snakes and slow-worms. Brown hares, water voles and bats also call this space home. The latest RSPB Wild Bird Indicator figures make grim reading. They show an ongoing decline across most groups of birds in England, with many farmland and woodland birds really struggling. This includes species like the Skylark, Cuckoo and Curlew which can currently be seen and heard in this area. Westminster Government has clear legally binding targets for both species abundance and protecting 30% of land in England by 2023. But right now, Defra and other departments within the Westminster Government the latest results are shocking, Wild Bird Indicator figures raise renewed fears that the Government is not doing anywhere near enough to reverse bird declines. Indicators show an ongoing decline across most groups of birds in England, particularly farmland and woodland species. Birds we all know and love, like skylark, cuckoo and curlew. Birds that bring us joy, colour and music. Prof Richard Gregory, the head of monitoring at the RSPB Centre for Conservation Science, said: “Setting aside the seabirds, which have only been partially updated, all the bird trends are dipping downwards, most prominently among woodland birds”. In the last five years, the index dropped by 15%; only three birds in the indicator have increased, compared to 23 that have declined. A range of factors weigh down on woodland birds and bird populations more generally, related primarily to land use and climate change. Not to mention the scarcity of the Raven and Peregrine Falcon clearly seem frequenting and were using the now lost wind Turbine! Worryingly, this proposal so close to SSSI land will cause huge disturbance and may have devastating impact during building and I have serious concerns the Government will agree to it and very sadly at the expense of a huge ecological loss. The disturbance will cause a wider loss of wildlife habitats and terrain during the site’s construction period, particularly the permanent loss of hedges, trees and other habitats. Yes, these may regrow and some species may return but this takes time and by then species numbers may be in a worse state. The area of the old disused Richborough Port railway track and Weatherlees Hill is a vital wildlife corridor that connects Pegwell Bay to Minster Marshes. The amount of wildlife seen in this area over the years is notable. It is designated SSSI for a reason. Nik Mitchell, from Wildlife Conservation in Thanet, said: “The Stour Valley is one of the most important places for wildlife in the whole of Kent and I cannot emphasise that enough.”		from the coast, which will be crossed by open trench, a series of protected species surveys have been undertaken to inform mitigation measures and the works will be undertaken in such a way as to retain connectivity, such as through the inclusion of mammal ledges in culverts. The cable will be buried as each section is installed and habitats restored above the cable. A collision risk assessment has been undertaken regarding the new section of overhead line over the River Stour to ensure it does not act as a barrier to wildlife movement. A list of mitigation measures and the commitment to a trenchless solution are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Regarding ecological surveys I think a full suite of surveys should be carried out including those for reptiles, invertebrates and plants.	N	National Grid acknowledges this comment and confirms that an extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. Details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
General commentary			
Local community	This proposal directly contravenes other aspects of government policy: - Gov policy to increase biodiversity [Environmental Improvement Plan (EIP23)]. - DEFRA's responsibilities: "Our mission is to restore and enhance the environment for the next generation, leaving it in a better state than we found it." - Thanet DC's designation as locally important wildlife site https://www.thanet.gov.uk/.../upl.../2018/03/LP-adjusted.pdf - Thanet DC's Biodiversity opportunity statementhttps://www.thanet.gov.uk/.../Thanet-LCA-Final-Report-09... - Disregard of specially designated sites - SSSI (Site of Special Scientific Interest, Ramsar (internationally designated wetland site) SPA (Special Protection Area) SAC (Special Area of Conservation) These are all commitments to protect and improve biodiversity, they cannot just be set aside when they're inconvenient.	N	The Proposed Project has committed to achieving 10% Biodiversity Net Gain and that will involve contributions to delivering strategic biodiversity schemes in Kent (**Application Document 6.12 Biodiversity Net Gain Feasibility Report**). As part of the Proposed Project, National Grid is also providing habitat enhancement in an area of arable land close to the coast and adjacent to the A256. A detailed impact assessment has been undertaken to inform the ES for the DCO application, and this includes extensive assessment of impacts on Sandwich Bay to Hacklinge Marshes SSSI, Sandwich Bay SAC and Thanet Coast & Sandwich Bay SPA. This has been discussed with Natural England, Thanet Council, Dover Council and Kent County Council in preparing the ES, and their views taken into account. Details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Landfall – impact on Aldeburgh Beach and RSPB North Warren - unsuitability and fragility of Aldeburgh Beach and RSPB North Warren as the proposed site for drilling a cable run - adjacent to protected lands such as AONB and SSSI - risking 75 years of conservation work and wildlife habitats - will disrupt bird migration - winter sanctuary for duck, Marsh Harrier, Bitterns and Red Deer.	N	National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the landfall and the high importance of the RSPB reserve and the AONB is noted. The potential impacts of the Proposed Project on the AONB and North Warren Nature Reserve are acknowledged. The assessment of effects on the AONB is set out within **Application Document Part 2 Suffolk Chapter 1 Landscape and Visual,** and the effects on the North Warren site in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The reserve will be traversed using trenchless methods. The commitment to using trenchless solutions is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	We would highlight the proposed site for drilling a cable run at Aldeburgh Beach and RSPB North Warren as highlighting one of the many arguments against Sealink. The thinking behind this shows a complete lack of understanding or appreciation of the Heritage Coast AONB and environment, which will be impacted irrevocably by the project: the question is, were the project team either unaware that the site was adjacent to protected AONB and SSSI land, or were they aware and discounted the importance of these designations; in either case National Grid's Responsible	N	National Grid recognises the importance of the English East Coast and its coastal wetlands as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity,**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Business Charter '...emphasising impact in environment and shaping our strategic priorities with a focus on responsibility' is seriously undermined when 75 years of conservation work and wildlife habitats are at risk, wildlife corridors will severed (as seen already from Sizewell C pre-works) and bird migration and winter sanctuary for wildfowl, Marsh Harriers, Bitterns and Red Deer will be severely - if not irrevocably - disrupted.		**Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the scheme on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway.
Local community	I'm writing to express my opposition to the proposed landfall and cable routes. The proposal to route cables through any of the important nature reserves on the Suffolk Coast is absolutely unacceptable. The landfall and cable routes can't be considered as truly separate – one must determine the other. The proposed landfall at Aldeburgh beach is unsuitable because this is an exceptional site for rare shingle flora (as I'm sure you're already aware). It's also unclear how the cable could be buried without admitting seawater to the fresh marshes of the RSPB reserve just inland, which are of outstanding importance for birds (winter ducks and geese, summer breeding waders and farmland birds) plus mammals including otter and water vole. And how then will the settlements of Aldeburgh and Thorpeness, and the campsite and golf course, be protected from seawater? The cable route across the RSPB marshes mentioned above, and the heathland part of the reserve, would be an absolute desecration of this nationally significant nature reserve. The reserve was originally established in 1939 – so 84 years (and counting) of dedicated conservation work are at risk because of this ill-considered proposal. Burying the cable (in line with policy concerning the AONB status) would not take away the problem. My experience with the East Anglia One cable, which was installed a few years ago near my home, is that the swathe of land needed to install it was as wide as a major road - and was in place for about two years. This would cause major disturbance to the species that use this very special site, either simply scaring them off, or preventing them from surviving or breeding – very possibly never to return. And it is wrong to suggest these creatures and plants can start a new life elsewhere; habitat re-creation and translocation is time-consuming, expensive and rarely successful. It is shocking that any responsible company or organisation could ever suggest that its preferred option is to trash a major nature reserve. In fact, most places on the Suffolk coast that are not built on and are low-lying, are important nature reserves.	N	An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall and cabling under sensitive sites at this location. This construction solution will minimise potential impacts on terrestrial biodiversity and the AONB. The commitment to using trenchless solution is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Furthermore, the width of the construction swathe has been minimised wherever possible through sensitive areas. Further details relating to the ecology assessment are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Impacts from construction of the onshore cable on the RSPB Reserve, Leiston-Aldeburgh SSSI and Sandlings SPA have all been considered in the design, construction methods and programme for the Proposed Project. This assessment has been discussed with Natural England, Suffolk Council and East Suffolk Council. This includes an assessment of disturbance impacts on the designated sites and wildlife generally. The Proposed Project is committed to not only mitigating its effects but delivering 10% Biodiversity Net Gain in the long term. The Proposed Project will result in net increase in woodland and wetland habitats around the Converter Station and Substation, will deliver biodiversity enhancements along the River Fromus, is committed to enhancing and securing management of areas of acid grassland in the area beyond the duration of construction and will be securing favourable long-term management of areas of arable land for wildlife such as skylark. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
The Aldeburgh Society	The proposed landfall would be totally unsuitable as the proposed site for drilling a cable run which would be adjacent to protected lands such as AONB and SSSI. The cable corridor would pass	N	Please see the response immediately above which discusses the impact of the Proposed Project on the SSSI and AONB.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	environmentally sensitive areas causing displacement of wildlife that could be permanent This would put at risk 75 years of conservation work and wildlife habitats, disrupting bird migration, a winter sanctuary for duck, Marsh Harriers, Bitterns and Red Deer. We have difficulty in believing National Grid's claim that its project would add to biodiversity in this area.		
Local community	The proposed road will have to cross the Fromus River, which is prone to flooding and is very close to some established ancient trees. In particular it is very close to an ancient chestnut tree grove which could be 200 to 300 years old. You have shown this area as broadleaved woodland plantation but in fact there is the ancient chestnut tree grove and other natural scattered trees. None of these have been surveyed and impact assessed. (With reference to Figure 2.3.2 of the PEIR Vol 3 Part 2 Chapter 4).	N	A detailed tree survey has been undertaken in accordance with BS5837:2012 and the findings and potential tree related impacts are detailed within **Application Document 6.10 Arboricultural Impact Assessment**. The Fromus Crossing has been sited in such a way to avoid impacts to notable trees in the area, and minimise impacts to other woodland habitats. All significant non-plantation trees will be retained in this location. **Application Document 6.8 Flood Risk Assessment** has been prepared that assesses all forms of flooding, accounting for the predicted effects of climate change over the Proposed Project lifetime. Controls, good practice and mitigation measures to manage flood risk, surface water and land drainage are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** and secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Coastal Friends of the Earth	We wish to object to the Sea Link proposals in the strongest terms, due to the chronic damage they would cause to East Suffolk's countryside, its protected landscape and designated wildlife sites, important locally, nationally and internationally for their rare and uncommon flora and fauna. Lack of completed surveys: It is difficult to make any detailed comments at this preliminary stage from an environmental perspective, simply because nearly all the surveys are incomplete. Many haven't even been started yet. This is a serious concern because if mitigation measures have to be carried out to protect habitats and wildlife, they must be commenced well ahead of any construction work. At present such measures are merely suggestions or examples of what might be done. Afterwards, monitoring is essential, because otherwise it is not possible to assess whether or not any mitigation or compensation work has been successful, but so far this appears to be an omission.	N	Since the production of the PEIR as part of the EIA, an extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. Monitoring and management of the reinstatement is covered within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Coastal Friends of the Earth	Loss of hedgerows: Hedges are protected by law under The Hedgerow Regulations 1997 if they constitute a variety of species, if they are ancient and if they are more than 20m in length. While surveys have begun to identify hedgerows of interest, these will not be completed until late spring 2024. This is a concern. The hedgerows, even if alongside arable fields, may be of considerable biodiversity value, if they are used for example by protected bats for navigation or foraging, if they shelter reptiles or if the adjacent ditches are important for water voles. These protected animals, and in some cases the locations that they need for their	N	The importance of hedgerows is acknowledged by National Grid and minimising the removal of hedgerows has been a key part of the iterative design process. The potential impacts on hedgerows have been included in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Mitigation measures relating to replacement of hedgerows are also contained herein and in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	survival, are covered by the law under The Wildlife and Countryside Act 1981 (UK) and The Conservation of Habitats & Species Regulations 2017 (EU including UK). Any hedge that contains mature trees, as they often do in Suffolk, greatly increases in biodiversity value, as they could, for example, provide roosting sites for protected bats. Trees and hedges do, of course, offer nesting sites for birds, some of which could be at least amber listed, if not red listed. Here again we cannot know this until surveys have been completed. Ideally, they should be done twice, over time, to be sure how they are being used. Taking out sections, typically 40m, even if 'temporary' (i.e. up to 5 years), can have serious impacts, especially on small mammals, many of which only live for one or two years. To them it is total loss of habitat. Long grass adjacent to and beneath hedges alongside arable fields can provide useful habitats for reptiles, moths and butterflies and other invertebrates. Such uses must be thoroughly investigated before any fields and hedges are taken out.		
Suffolk Coastal Friends of the Earth	Plantations: Because these are generally fir trees, often planted in rows for their timber, they also tend to be dismissed as being of low ecological value, as here. Compared with broad-leaved woodlands, the variety of species able to inhabit plantations is generally lower. However, the rides and clearings within the woodland can be of high biodiversity value for many protected species including reptiles, badgers and invertebrates, that all benefit from the shelter offered by the trees. Equally, uncommon plants such as orchids can be found in the open places. Badgers will use the tracks for commuting to and from their setts. Bats will also find roosting sites among the trees so long as food sources are nearby. The seeds of pinecones constitute part or most of the staple diet of some birds such as crossbills and siskins. They therefore often depend on plantation woodland for survival. Approximately 900 square metres would be felled just for the proposed access road to the converter station. It is crucial that these woodlands are not dismissed, but are properly surveyed and assessed, in particular the rides. We want to know what surveys you are putting in place.	N	Minimising the removal of trees and tree groups has been a key part of the iterative design process. **Application Document 6.10 Arboricultural Impact Assessment** details how trees located within and immediately adjacent to the Order Limits will be protected and what mitigation measures are embedded in the design to offset the loss of trees. The impact on biodiversity is assessed in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Coastal Friends of the Earth	Broadleaved woodlands: It is extremely concerning that 200 square metres of these rich habitats would be permanently lost purely for the proposed access road. They are Biodiversity Action Plan habitats, meaning that the local council should ensure that they are enhanced and protected, not damaged in any way. The mitigation suggested is re-planting, but saplings do not provide a home for birds and bats and it will be 20 years or more before the former wildlife would begin to return, if at all. It is important to note that any compensation should start well ahead of the onset of any construction work.	N	National Grid can confirm that impacts on Great Wood CWS can be avoided, and no other local wildlife sites will be significantly affected by the Proposed Project. Impacts from construction of the onshore cable on the RSPB Reserve, Leiston-Aldeburgh SSSI and Sandlings SPA have all been considered in the design, construction methods and programme for the Proposed Project. This assessment has been discussed with Natural England, Suffolk Council and East Suffolk Council. This includes an assessment of disturbance impacts on the designated sites and wildlife generally. A full suite of ecological surveys has been undertaken including for bats, birds and reptiles. The Proposed Project is committed to not only mitigating its effects but delivering 10% Biodiversity Net Gain in the long term. The Proposed Project will result in net increase in woodland and wetland habitats around the Converter Station and

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Where the cabling is concerned, the land above and around the open-cut routes could eventually be restored, but it would never be possible to plant trees and bushes directly above the cables. These areas would need to be kept clear indefinitely, meaning that almost 1ha would, in addition, be permanently lost. It is alarming to read that the intention as far as Great Wood is concerned, an ancient woodland and County Wildlife Site (CWS), is simply to 'avoid' working within the canopy area as far as possible. This is not good enough. There needs to be an absolute commitment that none of this woodland would be damaged and that any works would be kept well away from its edges. It is not possible to compensate for loss of ancient woodland, as it has evolved over centuries and can never be recreated.		Substation, will deliver biodiversity enhancements along the River Fromus, is committed to enhancing and securing management of areas of acid grassland in the area beyond the duration of construction and will be securing favourable long-term management of areas of arable land for wildlife such as skylark. The impact on biodiversity is assessed in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Coastal Friends of the Earth	Acid grassland This is now a relatively rare habitat within the UK, having been lost to agriculture and development. Historically, lowland acid grassland has been an important part of the Suffolk coastal landscape and any that remains needs to be treasured, not destroyed. It too is a BAP priority habitat, in need of conservation action. It is known to have high biodiversity value, especially for invertebrates and plants, some of which can only be found within this type of grassland. Yet here again as much as 11ha would be lost or suffer damage. This is completely unacceptable, bearing in mind the amount already lost. There is mention of possible compensation through the recreation of acid grassland on arable land, but there is no guarantee of success. The hydrology and structure and chemistry of the soil has to be just right and would not be helped by the presence of fertilisers.	N	There will be full reinstatement of landscape elements along the cable route and landfall. It is acknowledged that acid grassland will take longer to reinstate, as such there will be an acknowledgement of this in the Year 1 assessment. The operational assessment will include a sentence to confirm that by year 15 the cable corridor and landfall would be fully reinstated as far as practicable and that effects would not be significant. Monitoring and management of the reinstatement is covered within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Furthermore, **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** contains a commitment to enhance 10 ha of acid grassland which will be to be managed in an enhanced manner for 10 years. This commitment is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Coastal Friends of the Earth	The proposed landfall: You now propose that the landfall where cables would reach the shoreline should be between Aldeburgh and Thorpeness. It would be hard to find a less suitable place. This is directly adjacent to the Sandlings Special Protection Area (SPA) of European importance for its bird life, the Leiston-Aldeburgh Site of Special Scientific Interest (SSSI) of national importance for its wildlife, and the North Warren RSPB reserve which is also special for the abundance of its birds and other wildlife. These would all be subject to ongoing noise and disturbance during the construction work. Yet you consider that impacts would be insignificant. This is deeply concerning as you give the impression that impacts will not be properly assessed. The beach itself is part of County Wildlife Site (CWS) Suffolk Shingle Beaches, designated in particular for its rare plants such as sea pea and yellow horned poppy. There seems to be no recognition of the local importance of this beach. In fact, vegetated shingle beaches are rare globally and we have some of the best in the UK including this one. How would the beach be restored afterwards, if at all? Would seeds be kept for replanting? Any damage here would have to be added to that caused by the	N	National Grid acknowledges the sensitivity of the mentioned sites. Separate assessments of the Sandlings SPA and the Leiston to Aldeburgh SSSI as well as details of the necessary mitigation is included within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Trenchless methods will be used to minimise disruption. The commitment to a trenchless construction solution is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	construction of Sizewell nuclear power stations, including the proposed Sizewell C.		
Suffolk Wildlife Trust	We welcome NGET's commitment to delivering Biodiversity Net Gain (BNG) but note that a gain of 10% as mentioned in the consultation documents is within the standard range of statistical uncertainty for most ecological studies. Indeed, Defra acknowledge that a 10% gain is the minimum to have a reasonable level of confidence in achieving 'no-net-loss' of biodiversity. It is not enough to provide confidence in achieving a significant and meaningful increase in biodiversity.	N	A Biodiversity Net Gain assessment has been undertaken and is presented within **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
Suffolk Wildlife Trust	Once inland we note that a preliminary survey of the route has now been undertaken and published. We note that County Wildlife Sites (CWS) currently within the cable route corridor have been identified. It is detailed that potential impacts on Great Wood CWS will be avoided, and our expectation is that works will suitably avoid impacts to all CWSs. A diverse range of priority habitats, such as deciduous woodland, traditional orchards, acid grassland, and hedgerows also lie within the wider corridor boundary. These habitats provide landscape connectivity and support a huge variety of important wildlife. Detailed assessment of their ecological value, including for protected and priority species (Species of Principal Importance) such as bats, birds, and reptiles, is essential in determining a specific route and schedule of works. We welcome that fact that the potential for direct and cumulative impacts on such habitats is considered within the Preliminary Environmental Information Report, and again look to ensure that where possible impacts are avoided, mitigated, and compensated for in line with the mitigation hierarchy. Where compensatory measures are required for unavoidable residual ecological impacts (including temporary impacts) after mitigation has reduced these as far as possible, their design and location should be informed by expert advice and such strategies and plans as exist to help prioritise and target nature conservation and recovery activities. While we support the creation of new woodland and hedgerows highlighted within the Preliminary Environmental Information Report, we note also the exceptional value and opportunities to restore and enhance other habitats present in this area of Suffolk, including open habitats such as heathland and acid grassland associated with the Suffolk Sandlings SPA. We note that further surveys, informed by habitat suitability assessments, to determine the presence or absence of dormice will be undertaken. We encourage these surveys to follow standard methodology, but also highlight that dormice vocalisations can be picked up on devices used for monitoring bat activity, and therefore urge that consideration for the potential for dormice to be recorded on such devices is given during sound analysis. Obtaining presence data for dormice, rather than assuming presence, will give far	N	National Grid can confirm that impacts on Great Wood CWS can be avoided, and no other local wildlife sites will be significantly affected by the Proposed Project. Impacts from construction of the onshore cable on the RSPB Reserve, Leiston-Aldeburgh SSSI and Sandlings SPA have all been considered in the design, construction methods and programme for the Proposed Project. This assessment has been discussed with Natural England, Suffolk Council and East Suffolk Council. This includes an assessment of disturbance impacts on the designated sites and wildlife generally. A full suite of ecological surveys has been undertaken including for bats, birds and reptiles. The Proposed Project is committed to not only mitigating its effects but delivering 10% Biodiversity Net Gain in the long term. The Proposed Project will result in net increase in woodland and wetland habitats around the Converter Station and Substation, will deliver biodiversity enhancements along the River Fromus, is committed to enhancing and securing management of areas of acid grassland in the area beyond the duration of construction and will be securing favourable long-term management of areas of arable land for wildlife such as skylark.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	greater confidence in monitoring the outcomes of any mitigation and compensation measures.		
Westgate and Garlinge Action Group Against Housing Development on Farmland	We do not support the proposal to develop the Stour Valley and Minster Marshes to build a huge electricity converter station on Minster Marshes in Thanet, Kent because this is a precious wildlife habitat. This is a nature rich site which is close to an area of special scientific interest (SSI), which is an important stop off area for over-wintering birds. Species such as jack snipe, skylarks (which are on the red list and are already under pressure from mass housing developments being built on Thanet's best and most versatile farmland), woodcock, breeding turtle doves the fastest declining bird species in the UK, black stork, common crane, curlews and many other birds. The Stour Valley is one of the most important places for wildlife in Kent. The area proposed for the converter station to be built has an abundance of animals, birds, pollinators, flora and fungi. It is a unique ecosystem and should be protected not built on. The area is important to such birds and animals as native owls, peregrine falcon, ravens, grass snakes, lizards, slow worms, newts, bats, brown hare and many plant species as well. The infrastructure required will also have a negative impact on wildlife, the roads, lighting which will impact nocturnal species of birds and animals and overhead powerlines.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. It is of note that Minster Marshes is not designated as a SSSI and is not a protected site. The impact of multiple projects in the area is assessed in **Application Document 6.2.2.13 Part 3 Kent Chapter 13 Inter Project Cumulative Effects**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Sandwich Environmental Conservation Group	Sandwich Environmental Conservation Group feel that as a group we would welcome a project to aid the transition from fossil fuels to clean energy in Kent, however we cannot support a project that destroys a large area of precious natural habitat. This area is of vital importance to a vast number of our endangered plant and animal species, it also acts as a valuable natural carbon sink. Minster marshes will suffer immeasurable damage as this is being proposed alongside other projects that are close by and which will almost certainly impact on the area which is of great importance as an SSSI site. The combined proposals of this construction and the already agreed Grid stability plant (F/TH/23/0170), Battery plant (F/TH/22/0579) and the Lattice Mast removal (F/TH/23/0093) work and installations will add significant noise and light pollution to the area adversely affecting the ability of many creatures to forage and hunt as well as depleting the area over which they can do this, destroying the very things that they need to survive. Much of Thanet has had its habitat destroyed with the construction of houses and the infrastructure that goes with them, Minster marshes are one of the few remaining valuable refuges for our fellow wild creatures. An ecological disaster could well result please reconsider and find a more suitable site.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. It is of note that Minster Marshes is not designated as a SSSI and is not a protected site. The impact of multiple projects in the area is assessed in **Application Document 6.2.2.13 Part 3 Kent Chapter 13 Inter Project Cumulative Effects**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Kent Wildlife Trust	Disturbance to wildlife needs to be assessed in detail. During the site meeting, and outlined within our original response, KWT provided National Grid and their ecologists with the basic minimum survey effort we would expect to see for Pegwell Bay to enable a detailed assessment of the impacts to ensure appropriate bespoke mitigation can be provided. Prerequisites included: - Breeding and wintering bird surveys, as well as monthly intertidal, subtidal and supratidal bird surveys of Pegwell Bay to understand how birds are using the habitats for foraging and roosting throughout the tidal cycle, including species specific turnstone and golden plover surveys as these are the two named feature species of the Thanet Coast and Sandwich Bay SPA. Nocturnal surveys for golden plover should be undertaken, as they use farmland at night and therefore there is potential for the species to use agricultural fields assigned for the terrestrial cable route. - Detailed EcIA of functionally linked land (FLL) at Minster Marshes is needed as these habitats may support birds for which the SPA is designated. Non-designated landmust also be surveyed for birds, as some species move frequently between habitats. - Marine mammal surveys, particularly for seals as the Sandwich to Pegwell Bay National Nature Reserve (NNR) is a seal haul out location which is used all year round. The effects of underwater noise and displacement of prey also needs to be considered. - Invertebrate surveys of the saltmarsh and mudflats to better understand how it will respond and recover from the impacts. A healthy invertebrate community supports the structure and function of the habitats within the SPA, as well as providing food for many species of importance. - It is understood that even with HDD, it would include a construction period of several months, therefore there needs to be a comprehensive understanding of how this will impact and disturb all marine life and birds. - KWT requested early on that a list of the proposed ecological surveys were provided to us, to avoid delays due to absence of data that we need to adequately assess the impacts to our Nature Reserve.	N	Following consultation with Kent Wildlife Trust, marine mammal surveys of seals have been undertaken in Pegwell Bay. During these surveys, National Grid maintained contact with Kent Wildlife Trust to ensure it is targeting the correct areas. The data from these surveys has been used in the assessment in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**. This Chapter alongside **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish** assesses impacts of underwater noise. The construction period at the Kent landfall has been considered fully within these assessments. **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan** outlines the construction period of the Offshore Scheme in further detail. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Kent Wildlife Trust	From reviewing the consultation documents, it is disappointing to see that the vast majority of our previous concerns have not been addressed. A meeting between National Grid and KWT was held on 5th December 2023 to discuss these concerns and request further clarity on information provided within the PEIR. Whilst there were some reassurances around the ongoing bird surveys, KWT still have large concerns that at this stage of the Project's timeline, National Grid are unable to fully commit to trenchless techniques. It is also disappointing to learn that the complete survey results, detailed mitigation, and Environmental Statement are intended to not be published for an additional round of consultation and that		National Grid can confirm that geotechnical investigation has established that trenchless methods are appropriate for traversing RSPB North Warren and the SSSI, and these confirm the depth of the of bore (see Appendix A of **Application Document 7.3 Design Development Report**). The DCO will therefore not include an option for surface trenching in the SSSI. Further information on the construction methodologies is available within **Application Document ES 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid acknowledges the potential impacts of the Proposed Project on terrestrial ecology and has undertaken a rigorous impact assessment in line with guidance and legislation which has taken into consideration statutory designations. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals,

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	these will be provided with the Development Consent Order (DCO). It is understood however, that stakeholder meetings will be held in 2024 to discuss some of the omitted information. KWT strongly advise that a further public consultation ahead of the DCO submission is held to allow the public the opportunity to review this information. The purpose of the PEIR is to enable the local community, stakeholders, and government bodies to understand the likely significant environmental effects of an NSIP. The PEIR should present information on significant environmental effects, preliminary survey data and proposed mitigation to avoid and reduce such effects. This is to support consultees in developing an informed view of the Project and provide an assessment of impacts and the appropriateness of the proposed mitigation. Therefore, it is unacceptable that the vast majority of ecological surveys have not been undertaken and therefore no assessment on the likely impacts can be addressed, nor can survey data be used to inform the Project route. Likewise, no detailed mitigation has been presented at this stage and therefore consultees are unable to assess the suitability/validity of the mitigation until it is published within the DCO. Overall, KWT are not confident with National Grid's preliminary assessments and strongly urge that a more detailed PEIR is submitted once all the survey data has been collected, to adequately inform their proposed route and mitigation. Please note that our comments reflect only of the proposals and impacts to Kent and not of the scheme in its entirety.		dormice and plants. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). Since Statutory consultation, National Grid has held two further rounds of engagement, updating stakeholders with design information and additional Preliminary Environmental Information. These stages of consultation are summarised in **Application Document 5.1 Consultation Report**.
Kent Wildlife Trust	Regarding Margate and Long Sands SAC, more clarification is needed as to whether Annex I habitat 'sandbanks which are slightly covered by sea water all the time' are being directly impacted. We note that this habitat is within the Offshore Scheme, however from our understanding, these habitats fall outside of the Margate and Long Sands SAC with National Grid stating, "it is not specifically protected under any designated site." National Grid have stated that "rock placement is not being considered in any areas of designated Annex I habitat" despite confirming Annex I habitat 'sandbanks which are slightly covered by sea water all the time' being present. The scheme should avoid all Annex I habitats, regardless as to whether these habitats are within, or fall out of the Margate and Long Sands SAC. To quantify the cumulative impact from offshore development this kind of information is important to track change of the seabed and to properly assess the impacts.	N	The potential impacts on marine biodiversity have been assessed in the Proposed Project Environmental Statement. Details are contained in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals, Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology, Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology and Application Document 6.6 Habitats Regulations Assessment Report**. A detailed routeing and siting study was undertaken to ensure the complete avoidance of the Annex 1 habitat features within both Margate and Long Sands SAC. Based on feedback received at Statutory consultation, the marine cable has been re-routed to avoid the Goodwin Sands Marine Conservation Zone. This will avoid direct impacts, and reduce impacts to the known and potential benthic receptors located within the area including *Sabellaria spinullosa* and *Mytilus edullis*. Further details are contained in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. **Application Document 6.4.3.11 Offshore Scheme Inter-Project Cumulative Effects** contains an assessment of the potential cumulative impacts of the Proposed Project with other projects in the area.
Kent Wildlife Trust	Terrestrial Impacts The proposed terrestrial corridor route for the overhead cables and converter and substation will directly impact Sandwich Bay and Hacklinge Marshes SSSI, Ash Level and South Richborough Pasture Local Wildlife Site (LWS) and Woods and Grassland Minster Marshes LWS. These direct impacts include loss of 13.6ha of FLL within Minster Marshes, loss of habitats of regional	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	importance (hedgerow, broadleaved woodland, ditches), loss of scrub habitat of local importance, loss of Priority Habitats and land drainage. In our previous response we requested an EcIA to understand all direct and indirect impacts to the terrestrial habitats. However, only a preliminary assessment has been made, which highlights significant risks to the River Stour, Minster Stream, lowland mixed broadleaved woodland and hedgerows. From reviewing Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures we note that commitment to some mitigation measures have been outlined such as: • Maintaining a suitable buffer between the converter and substation with Sandwich Bay to Hacklinge Marshes SSSI • Ensuring the haul route is located beyond the root protection zone of the SSSI boundary • Install noise and visual disturbance screening measures • Remove hedgerows in sections, retaining intact root balls where possible • Deliver at least 10% biodiversity net gain (BNG) It is understood that these proposed measures will be secured through the Construction Environment Management Plan (CEMP) which will be submitted as part of the DCO. At this stage, there is not enough information to fully review the impacts and proposed mitigation and therefore we urge that a detailed EcIA is provided before the submission of the DCO.		Meetings have been held with Natural England where the approach to addressing loss of functionally-linked land for golden plover has been discussed at length. Various strategies have been discussed with Natural England. Options, including the possibility of creating new wetland south of the River Stour have been explored, but technical challenges identified in the course of discussions led to an alternative approach being pursued (discussed and agreed in principle with Natural England) to instead enhance an area of arable land close to the coast for non-breeding golden plover. There are extensive proposals for woodland and grassland planting around the converter station and new wetland creation in the same locations. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Note that the outline Schedule mentioned has been extensively updated for DCO submission.
CPRE Kent	Specifically, and based on the limited information that is available now, the primary grounds on which we object to the proposed converter station and adjacent substation are as follows: Having considered the relevant section PEIR4, it is extremely concerning to note that survey work is ongoing or has yet to commence for most receptors. Despite this, it is already acknowledged that effects have the potential to be significant for specific terrestrial ecology receptors through the permanent and direct loss of specific habitats and bird habitats (amounting to 13.6 ha of arable land), plus the removal of 310 m of hedgerow and temporary removal of approximately 2,000 m2 of bankside ruderal vegetation. It is similarly accepted that while the entire fields will not be occupied by the Proposed Project, they will effectively cease to support significant non-breeding bird assemblages. We would suggest that this would also be the case far beyond the draft order limits given the scale of the proposed project.	N	Since the production of the PEIR as part of the EIA, an extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. National Grid recognises the importance of the English East Coast and its coastal wetlands as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	In terms of the surveys that have been undertaken, these have already identified significant ornithological features. Most notably this includes a survey during winter 2022-23 when a significant assemblage of golden plover (700 birds) was recorded on a single survey visit in December 2022. Consequently, it is already accepted that the proposed site is functionally linked to Thanet Coast & Sandwich Bay SPA. It is noted that other Red-listed birds including hen harrier, ringed plover, lapwing, dunlin, ruff, black-tailed godwit, whimbrel, curlew, turtle dove, skylark and twite have been recorded there, sometimes in notable numbers.		impacts of the scheme on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**).
CPRE Kent	Despite this, avoidance measures do not appear to be being considered in line with and as required by the mitigation hierarchy. Instead, we are advised in vague terms that a Biodiversity Management Strategy will be produced to accompany the Development Consent Order once the impact assessment process is complete at the ES stage. Likewise, there is a similarly vague commitment to “investigate” mitigation opportunities to deliver long-term improvements to offset the permanent loss of fields currently used by nonbreeding golden plover and to enhance the Stour corridor. Overall, it is concluded that the loss of these fields will require offsetting, yet no firm details of this are provided.	N	National Grid is rigorously assessing the Proposed Project’s impact on terrestrial biodiversity and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
CPRE Kent	With respect to other fauna (reptiles, bats, riparian mammals, dormice, invertebrates, fish), again the impact is currently unknown on the basis that surveys are ongoing or will be undertaken in 2024. It is, however, acknowledged that potential impacts include direct loss (temporary or permanent) of habitats, spillages and introduction of non-native species, and killing and injury of fauna. The PEIR in this respect concludes “it is impossible to identify the relative importance of the habitat within the survey area for other faunal groups”.	N	Since the production of the PEIR as part of the EIA, an extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
CPRE Kent	While it can be accepted that the NSIP process is necessarily an iterative process to a degree, the difference here is that we are being told there is only this one possible option for Kent, yet even baseline ecological and environmental information is seemingly unknown. Further, where significant effects are anticipated, avoidance measures are not being considered; details and therefore effectiveness of mitigation are unknown, as is also the case with respect to compensatory measures. On this basis, it is impossible to be able to conclude that the proposed location is the right location in terms of ecological and biodiversity impact.	N	As part of the ES, National Grid has undertaken an extensive programme of environmental surveys (not available at the time of Statutory consultation) including for breeding and non-breeding birds, reptiles, invertebrates, badger, aquatic wildlife, riparian mammals, dormice and plants. As part of the Proposed Project, National Grid is also providing habitat enhancement along the banks of the River Stour, woodland and wetland habitat creation will take place around the Converter Station and Substation and off-site arable land will be enhanced for wintering and breeding birds such as skylark and golden plover. Connectivity for wildlife will be preserved around the Converter Station and Substation by retention and enhancement of boundary features such as hedgerows, ditches and woodland. The Proposed Project has committed to achieving 10% Biodiversity Net Gain and that will involve contributions to delivering strategic biodiversity schemes in Kent. As part of the Proposed Project, National Grid is also providing habitat enhancement along the banks of the River Stour, woodland and wetland habitat creation will take place around the converter station and substation and off-site arable land will be

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			enhanced for wintering and breeding birds such as skylark and golden plover. There will thus be a net increase in woodland and wetland in the area as a result of the Proposed Project. Where artificial features are to be retained in the landscape away from the Converter Station (i.e. culverts to support the permanent access road) these will be designed to ensure continued passage of water voles and eels. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Thanet Green Party	Thanet is one of most nature depleted places in UK, and the UK one of the most nature depleted in the world, coming 189th out of 200 in a recent survey. Thus, it is particularly important that we do everything we can to preserve and enhance nature in this area. The Minster Marshes are one of last wild places in Thanet– 75 acres of largely undisturbed scrubland hugely rich in wildlife which will be disturbed or destroyed by this project. They form a vital wildlife corridor at the side of Pegwell Bay. The area includes long-established breeding sites for herons & egrets, ravens and peregrines. Nightingales, which are in severe decline, breed here – one of very few places in Kent. The disused railway line that used to deliver coal & coke to the old Richborough power station has rewilded and become important corridor for bats. All of this is threatened by Sealink - as quite apart from the impact of the construction phase, if the converter station is built, we understand it will be 100 feet high, occupy 15 acres, be lit until 10pm and emit noise. We believe the likelihood of this area remaining any kind of wildlife haven is negligibly small. Wildlife living in the Marshes area includes: herons, egrets, buzzards, cormorants, swans, peregrines, ravens, foxes, yellow wagtails, water voles, kestrels, green hairstreak butterflies, grass snakes, long eared owls, cuckoos, turtle doves, pipistrelle bats, nightingales, sedge warblers, small copper butterflies, bee orchids, lizard orchids, slow worms, damselflies, kingfishers, barn owls, tawny owls, badgers, yellowhammers, skylarks, little owls, tawny owls, golden plovers, beavers… Natural England has recognised the vital importance of this area and has been working with local farmers on wildlife projects for some years. These have included creating scrapes for wading birds, encouraging beaver dams, strengthening valuable hedgerows and creating 30 hectares of habitat for bumblebees. In your submission to Secretary of State and your public documentation on this project you make no mention of the Environmental Stewardship scheme taking place in this area.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. It is of note that Minster Marshes is not designated as a SSSI and is not a protected site. National Grid has a duty to balance the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality, including a dark skies policy pertaining to use of lighting on new infrastructure. The assumptions made about the lighting design that have informed the landscape and visual impact assessment are set out in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Consideration of the landscape and visual effects of light pollution and the presence of new infrastructure in the landscape during construction and operation is presented in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment, Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment, Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**. An indicative assessment of operational noise from the Converter Station, based on current design information, is presented in **Application Document 6.3.3.9.D Operational Converter Station Noise Assessment**. With standard embedded mitigation measures, the impact of operational noise from the proposed Saxmundham Converter Station on all nearby Noise Sensitive Receptors, has been assessed as having a small magnitude impact, during both daytime and night-time periods, taking account of context. This would result in a minor adverse effect at all nearby Noise Sensitive Receptors, which is considered to be not significant. The assessment is indicative for the purpose of demonstrating that significant adverse effects can be avoided. The assessment is based on early design information and

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			standard noise mitigation measures. Further detailed design would be undertaken by the developers, including consideration of specific noise mitigation measures. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Where stewardship agreements are in place, implications for the agreement holder in terms of any necessary relocation of options, derogations, pay back of grant funding, scheme penalties, etc. will be dealt with through compensation agreements.
Ramsgate Town Council	Please may I provide the following comments in response to the plan by National Grid Electricity Transmission (NGET) to progress the proposed Sea Link; a new 2 gigawatt (GW) high voltage direct current (HVDC) cable link between Suffolk and Kent, approximately 145 kilometres (km) long and predominantly offshore: * The applicant must provide detailed plans for how they will achieve net biodiversity gain. * The flood risk is not fully considered or understood by the applicant. * The development is not appropriate on a Site of Special Scientific Interest (SSSI), Ramsar (internationally designation wetland site), Special Protected Area (SPA) and Special Area of Conservation (SAC). * There is a high risk of negative impact on nature conservation and protected species. * Noise and disturbance resulting from the proposed development will be detrimental to residents and wildlife. * Permanent loss of trees and hedges is not acceptable.	N	A BNG assessment has been undertaken and is presented within **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. National Grid acknowledges the importance of designated sites and these have been considered within **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The importance of trees and hedgerows is acknowledged by National Grid and minimising the removal of hedgerows has been a key part of the iterative design process. The potential impacts on hedgerows have been included in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Mitigation measures relating to replacement of hedgerows are also contained herein. **Application Document 6.10 Arboricultural Impact Assessment** details how trees located within and immediately adjacent to the Order Limits will be protected and what mitigation measures are embedded in the design to offset the loss of trees. Impacts relating to excessive noise are considered in **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
RSPB	The RSPB remains seriously concerned that the Sea Link proposals are a considerable threat to RSPB North Warren and the Leiston-Aldeburgh Site of Special Scientific Interest (SSSI) in Suffolk and Thanet Coast and Sandwich Bay Ramsar, Thanet Coast and Sandwich Bay Special Protection Area (SPA), Sandwich Bay Special Area of Conservation (SAC) and Sandwich Bay to Hacklinge Marshes SSSI in Kent. We are extremely disappointed that infrastructure development has been proposed within important wildlife sites. National Grid should consider how impacts on important wildlife sites can be avoided and mitigated as far as possible, in line with the mitigation hierarchy. This should include consideration of alternative options to avoid sensitive areas. We do not agree that this approach has been adequately demonstrated thus far and therefore we object to the proposals in their current form.		National Grid acknowledges the mentioned designated sites which have been taken into account in the Proposed Project EIA. Extensive consultation with key stakeholders such as Natural England, Environment Agency, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The assessment of impacts on biodiversity are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
RSPB	Biodiversity Net Gain (Suffolk Area)	N	The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained **in Application Document**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	We welcome the commitment in the PEIR, Vol. 2, Part 1, Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures to deliver net gain by at least 10% or greater on this project. Given the significance of the proposals, we request that consideration is given to a more ambitious net gain target of 20%. This project has potential to contribute to the conservation of important farmland bird species, including Turtle Dove. We recommend that habitat enhancements consider planting targeted at providing nesting, foraging and watering habitat for farmland birds, where appropriate. Further details of the types of measures that could be employed can be found on the Operation Turtle Dove website. The project also passes through areas that are of importance for breeding waders and therefore this suite of species could be a relevant target for environmental enhancements. It is, however, important that any enhancements targeted at breeding waders are clearly additional to any works required as mitigation for impacts on these species. The Suffolk Wader Strategy is led by a partnership of organisations working together to improve habitat management and increase populations of breeding waders in Suffolk, both on nature reserves and in the wider landscape. The project could consider supporting such work as part of its aspirations for environmental enhancements. Further details are available on the SWS website We would be pleased to advise further should BNG proposals targeted at farmland birds or breeding waders be developed.		**ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
RSPB	2016 Review of Special Protection Areas In respect of land with potential functional links to nearby SPAs we draw your attention to the 2016 UK review of Special Protection Areas9. The need to extend the UK's protection for scarce birds was set out in the third review of the UK's terrestrial Special Protection Area network, published by JNCC in 2016. This SPA Review examined whether existing SPAs sufficiently met the ecological needs of Annex 1 and regularly occurring migratory species. The review outlined that the current suite of SPAs is considered insufficient for many species. As a result, any potential impacts on the SPA and its associated species should be avoided, including on FLL. The SPA Review also looked at the boundaries of existing sites to assess whether they meet the needs of the species they are designated to protect. This included consideration of habitats outside the current SPA boundaries that species are reliant on. The RSPB strongly advises that the findings of the SPA Review are fully taken into account for any surveys or decisions associated with the potential cable route. This will ensure that recognised important sites for nature can be properly considered alongside the existing SPA citations in survey and monitoring, impact assessment and decision-making, as clearly intended by the SPA Reviews.	N	Meetings have been held with Natural England where the approach to addressing loss of functionally-linked land for golden plover has been discussed at length. Various strategies have been discussed with Natural England. Options, including the possibility of creating new wetland south of the River Stour have been explored, but technical challenges identified in the course of discussions led to an alternative approach being pursued (discussed and agreed in principle with Natural England) to instead enhance an area of arable land close to the coast for non-breeding golden plover. Further details are contained in **Application Document 6.6 Habitats Regulations Assessment Report** and the mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Table 1.3 Cultural heritage

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	It is clear that reinforcing the network between Suffolk and Kent is necessary. However, the choice of Pegwell Bay and Minster Marshes to locate the development is wholly inappropriate. Pegwell is an SSSI and also one of the most important historic sites in the country being where Julius Caeser landed in 54 BC, where the Angles and Saxons landed to create England and where St Augustine brought Christianity. If there was ever a site worth protecting this is it.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	The Sternfield site is a madness. My family have lived there for generations. My great grandfather was Rector of Sternfield Church. It's a pretty un spoilt historic village with abundant wildlife. Who is their right mind would support it as a good location for industry?	N	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England, and as part of this procedure, a list of assets to be fully assessed was agreed. The final assessment within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** has been informed by the Proposed Project design and construction methodology outlined within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Impacts on the setting of heritage sites is also considered in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation?			
Local community	We feel for the residents of Friston you are intending to ruin a medieval village.	N	The location and sensitivity of the Friston Substation site is acknowledged and is referred to within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Impacts on the setting of heritage assets have also been assessed and are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. The judicial review challenges at the Friston Substation have now been rejected by the Court of Appeal. Impacts on traffic are assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and impacts of noise are assessed in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. In agreement with the Planning Inspectorate, the impact of the operation of switchgear was scoped out of the EIA. However, indicative assessments undertaken of operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines has been conducted at the request of East Suffolk Council. The assessments indicate that operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines would not be significant.
Local community	Friston is a medieval village so why are you proposing to destroy this area of outstanding beauty.	N	
Local community	This is a rural hamlet and a medieval village which will be ruined by these proposals.	N	
Local community	The proposed substation at Friston has 2 outstanding Judicial Reviews. The area is very rural, with narrow lanes, unsuitable for heavy good traffic. The close proximity to listed buildings, and the medieval village will cause considerable distress and disturbance particularly during the construction phase, and the on-going noise particularly from the switchgear during operation.	N	
Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness?			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	There are also possibly important Roman remains, etc.	N	National Grid has engaged with Historic England and Local Authorities to inform understanding of potential impacts of the Proposed Project on the historic environment. This has been supported by extensive survey work, ground investigations and trail trenching. As part of the ES that accompanies the DCO application, National Grid has undertaken an assessment of the potential impacts on marine archaeology to include physical disturbance activities causing direct damage and/or loss of heritage receptors on and below the seabed, and physical disturbance activities causing changes to hydrodynamic and sedimentary regimes leading to sediment reduction on the seabed and scour, causing adverse indirect effects on seabed heritage receptors. Furthermore, the assessment has considered works that would change affect the setting of a known heritage receptors and the character of the historic seascape. These assessments have been undertaken using archaeological specialists in line with recognised good practice guidance documents. The results of the assessment are found in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**. A number of sources of primary and synthesised information were consulted for the assessment which are contained in **Application Document 6.3.4.6.A ES Appendix 4.6.A Marine Archaeological Technical Report**. The assessment did not identify any potential significant adverse effects of the Proposed Project on marine archaeology. The impact of the Suffolk Onshore Scheme on archaeological sites has been considered in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 2 Cultural Heritage**. Baseline surveys have been conducted and a review of secondary information made. Details are contained in **Application Document 6.2.2.3.A ES Appendix 2.3A Archaeological Baseline Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	It is also an important un-investigated archaeological site being the original Aldeburgh haven/harbour, the origins of which are below the church. By drilling through you will destroy any artefacts. You will also be entering at the original haven entrance which will cause more problems than you realise.	N	
Local community	It also damages the historic Thorpeness village.	N	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England, and as part of this procedure, a list of assets to fully assess was agreed. Details are contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 2 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q12 What do you think about our proposed landfall at Pegwell Bay?			
Local community	Your material does not make any reference to the protection of the historic sites. This needs to be more explicit.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Impacts on terrestrial biodiversity related to the proposed landfall at Pegwell Bay are discussed in Table 1.2 and landscape and visual impacts are discussed in Table 1.1 of this Appendix and the assessments are contained in **Application Document 6.2.3.2 Part 3**
Local community	The area is one of the archeologically most fascinating and under researched areas of England. Appropriate care should be taken.	N	
Local community	Look at all the historical areas which this has the potential to disturb!	N	
Local community	Pegwell Bay is of national and international historic and environmental significance.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	This is absolutely not a good idea. You are destroying wildlife and nature and our cultural heritage your also destroying a historical important area linked to ww1.	N	**Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	A bay painted by William Duce 1858 and held in The Tate Gallery, a bay with a rich history. It's priceless. Please don't slap a landfall point there…that's not a great legacy is it?	N	
Local community	St Agustine, and, separately, the Romans arrived in Britain at this location. Your plans risk destroying for ever a natural landscape that should be sacrosanct, religiously, historically and for its natural landscape.	N	
Local community	Pegwell Bay is a completely inappropriate site for these works. It's a protected site for wildlife, both marine and terrestrial, and as the map shows it's also a site of significant historical interest - it's where both St Augustine and Julius Caesar are supposed to have landed. For both reasons it should be protected from interference of this kind.	N	
Local community	Appalled! You intend to disrupt a SSSI and RAMSAR site as well as the entry point to mainland England for St Augustine, Roman, Saxon and Viking Traders - and the EH site of Richborough Fort - a remaining Roman fortified settlement.	N	
Q13 What do you think about our proposed HVDC cable route in Kent?			
Local community	Concerned about the St Augustine's site and any archaeological remains buried along the boarded groyne.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The potential for impacts on heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England, and as part of this procedure, a list of assets to fully assess was agreed. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	What impact will the proposed plans here on the historic site of the leading of the season and of St Augustine.	N	
Local community	You will ruin an historically important site (Ebbsfleet) and the beautiful unspoilt countryside and associated wildlife.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The proposed cable route appears to be very close to where archaeologists found evidence of a large Roman Fort at Ebbsfleet and of the landing of Julius Caesar at Pegwell Bay. Has disturbance of the ground there been taken into consideration?	N	
Local community	From what I can see, the cable route passes near/through/under some very ancient and important historic monument sites notably the landing sites of the Saxons and Romans.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	This is going to be damaging to large areas of land with huge historical interest of the first landings of the Romans, Christian's and Vikings to the UK. This cannot happen.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	One of the main concerns here is the archaeological element and the local Archaeological Society should be involved in any major digging across this site. They should be consulted before any work takes place to establish any conditions they would require.	N	During the construction phase of the Proposed Project, National Grid has committed to Archaeological Watching Brief which will be undertaken in pre-agreed areas of archaeological potential/features. The scope of work will be agreed with heritage stakeholders (including the relevant County Archaeologist) prior to works commencing in the relevant area and agreed in the mitigation strategy/site specific Written Scheme of Investigation. This commitment is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**).
Q14 What do you think about our proposed converter station and adjacent substation near Minster?			
Local community	This is an historically important area and further north would be more appropriate.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Impacts on terrestrial biodiversity related to the proposed landfall at Pegwell Bay are discussed in Table 1.2 of this Appendix. The assessment is contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This is completely wrong. This is an area of ancient history and natural beauty. It is completely unnecessary to build on it.	N	
Local community	Kept some distance from the river stour and historic sites at Minster.	N	
Local community	Are you seriously asking whether Pegwell Bay – a World Heritage Site and SSSI, could conceivably be a suitable site for such a project?	N	
Q15 Comments			
Local community	A key consideration should be how the converter station will look when viewed from Richborough Roman Fort.	N	An assessment of the potential for impacts on the setting of heritage assets has been included as part of **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. This includes assessing the impacts on the setting of Richborough Fort, with viewpoints agreed with Historic England and the Kent County Council Archaeological Advisor.
Q17 Anything else? Comments			
Local community	Could you keep the windmill? It's a landmark for walkers. I do my dog walks with cadets for D of E and it is a great marker for doing compass bearings or knowing where you are when are lost! Even if you move it somewhere nearby. It's like our Angel of the North! The birds use it for shelter. Also, the archaeology. It would be good to	N	The Proposed Project has no interface with the land that the windmill is located on. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Landscape and visual impacts are discussed in Table 1.1 of this Appendix.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	see if any burial grounds, etc. are in the area as we a lot of that sort of thing in Thanet.		
Local community	Please keep the Nautical Archaeology Society in mind for assistance with any community archaeology outreach work in this area.	N	Thank you for your comment. National Grid welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Q18 Do you have any key concerns regarding the construction stage of Sea Link?			
Local community	It seems to avoid most of the important known archaeological sites but in Thanet you can never be sure, so I do hope you are working with an archaeologist just in case.	N	National Grid welcomes feedback on all aspects of the Proposed Project and thanks you for your comments. National Grid has engaged with Historic England and the County Archaeological Advisors and their views were taken into account when developing the project. National Grid have continued to work with them regarding the heritage implications of the proposals, including regarding appropriate mitigation. An EIA has been undertaken, which includes assessment of the Proposed Project on the historic environment including archaeology, see **Application Document ES 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Check site for artifacts before going ahead with construction.	N	As part of the Proposed Project EIA, baseline data has been collated. Please see **Application Document 7.5.4.2 Outline Onshore Overarching Written Scheme of Investigation (OWSI) – Kent and Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) – Suffolk**. Baseline data is presented in **Application Document 6.2.2.3.A ES Appendix 2.3A Archaeological Baseline Report**.
Local community	Historical sites will be damaged / disturbed.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. An EIA has been undertaken, which includes assessment of the Proposed Project on the historic environment, see **Application Document ES 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
General commentary			
Goodwin Sands Conservation Trust	Overview The area of sea off Pegwell Bay on the east Kent coast is bordered to the north by the cliffs of Thanet and to the east by the Goodwin Sands. Up until the 15th century Sandwich boasted a large harbour capable of anchoring hundreds of ships (see attached map). This harbour encompassed the area that is now proposed for	N	National Grid notes this feedback.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	development by National Grid at Minster Marshes, Ebbsfleet, St Augustine's, Stonelees and Sevenscore. When the harbour started silting up in the early 1500s the fleets moved their anchorage into The Downs, the expanse of calm water lying between the Goodwin Sands and the East Kent foreshore. Despite being a safe anchorage, storms and errors of navigation led to thousands of ships foundering in these waters, leaving behind a wealth of maritime archaeology found nowhere else in the world. Wessex Archaeology has described the Goodwin Sands as 'archaeologically extraordinary' as they hold the highest density of shipwrecks in UK waters, if not the world (source: National Importance and Marine Assets – The Goodwin Sands and the Farne Islands, Wessex Archaeology March 2015). Over 2,000 shipwrecks have been recorded in the waters around the Goodwins including in Pegwell Bay and north towards Ramsgate, but the real number is probably twice this. The area contains seven Protected Wrecks and one Scheduled Monument – the highest density of heritage assets in UK waters. There are also several score of military aircraft crash sites and the remains of their aircrew scattered around the area and at least seven sunken submarines. There is therefore high potential for Underwater Cultural Heritage (UCH) - shipwrecks, sunken submarines and military aircraft crash sites to be located along the proposed cable route - and for shipwrecks to be present on the land identified for development. The map on page 119 of the Scoping Report (attached) shows about 70 sites recorded by the UK. Hydrographic Office together with 18 from the National Marine Heritage Record (NMHR) lying along the proposed cable route – although it seems that only three of the latter are separate sites. Since some of these could prove to be historically important any development in this archaeologically sensitive area must ensure that both known and unknown maritime heritage assets are not detrimentally impacted – both on land and underwater.		
Goodwin Sands Conservation Trust	Underwater Cultural Heritage (UCH) on Land. There is no evidence from the project documents that geophysical surveys have been carried out to identify the presence of any Underwater Cultural Heritage remaining on land, for which there is high potential. Please confirm what geophysical surveys have been carried out to detect the presence of UCH in both the land proposed for development and the route of the onshore cable.	N	PEIR report Appendix 4.7.A pages 15 - 18 for nearshore sets out technical specifications. Figure 4.7.A.1 in **Application Document 6.3.4.6.A ES Appendix 4.6.A Marine Archaeological Technical Report** shows the extent of the marine geophysical survey area extending into Pegwell Bay. Following the PEIR and design changes made after Statutory consultation, additional geophysical and benthic survey work was undertaken where the boundary changed. For the DCO application, a gradiometer survey was undertaken by SEP Hydrographic in 2024. The results of which have been integrated into **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology** and **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**. Extensive geophysical survey and evaluation trenching has been undertaken across the terrestrial element of the Kent Onshore scheme, as well as a geo-archaeological study

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			focused on areas where there is the potential for palaeo-environmental remains to survive (i.e. the Wantsum Channel). The scope of all works was agreed with stakeholders. Data from these surveys was incorporated into the baseline report (**Application Document 6.3.3.3.A ES Appendix 3.3.A Cultural Heritage Baseline Report**), and used to inform the assessment (**Application Document 6.2.2.3 Part 3 Kent Chapter 3 Cultural Heritage**), with the full reports supplied as appendices (**Application Document 6.3.3.3.D ES Appendix 3.3.D Geophysical Survey Report; Application Document 6.3.3.3.F ES Appendix 3.3.F Archaeological Evaluation Trial Trenching Report; Application Document 6.3.3.3.G ES Appendix 3.3.G Geo-archaeological Desk-Based Assessment**).
Goodwin Sands Conservation Trust	Written Scheme of Investigation (WSI) 1. In the Written Scheme of Investigation (WSI) Wessex has identified 41 anomalies along the Kent portion of the proposed cable route - 26 A1 sites and five A3 ones. However, the map on the Scoping Report shows at least 70 UKHO sites. Please clarify the inconsistency in the number of sites identified. 2. Wessex has listed 26 sites as A1 and five as A3 plus a further ten sites they decided not to include. Please clarify why these ten sites have been excluded from the WSI. Please clarify why none of the sites have been listed as A2. For reference: A1 = anthropogenic origin of archaeological interest A2 = uncertain origin of possible archaeological interest A3 = historic record of possible archaeological interest with no corresponding geophysical anomaly	N	The marine geophysical study area is constrained to the extents of the sidescan sonar dataset within the wider Offshore Scheme Scoping Boundary. The UKHO data search was undertaken for an area that included the whole of the Offshore Scheme Scoping Boundary, much of which was not covered by geophysical data (as is standard practice), and the results were incorporated into the Scoping Chapter for Marine Archaeology (**Application Document 5.1.5 Appendix D EIA Scoping**). See PEIR report Appendix 4.7.A page 11 for clarification and Figure 4.7.A.1. Sea Link PEIR Volume 3 Part 4 Appendix 4.7.A Figures.pdf. The WSI uses a more refined development area (Offshore Scheme Boundary) and only seabed features that may be impacted by the Proposed Project will be addressed and included, hence the 41 sites given Archaeological Exclusion Zones (AEZs).
Goodwin Sands Conservation Trust	3. Wessex Archaeology recommends the following Archaeological Exclusion Zones (AEZs): • 25m radius around debris fields • 25m– 50m radius around a wreck of a dangerous wreck • 100m radius around recorded wrecks BUT On the Thanet Offshore Windfarm project, Wessex set AEZs of 50m – 200m around anomalies they considered to be either shipwrecks or anomalies of medium archaeological potential (source: Thanet Offshore Wind Farm WSI Ref: 60071.03 March 2018) AND On National Grid's Interconnexion France-Angleterre 2 (IFA2) project (WSI also by Wessex Archaeology) they set AEZs of between 50 m – 100m around detected anomalies depending on	N	AEZs are determined on a project-by-project basis, based on a range of factors including data quality, interpreted type of site, how well constrained the site boundaries are, potential for burial of associated material, and confidence of interpretation. They are not applied universally as a standard size, and so will vary from project to project as appropriate. Seabed features identified from UKHO records and located beyond the extent of the marine geophysical survey area have been given appropriately sized AEZs (see Table 4.7.B.2 in the WSI Sea Link PEIR Volume 2 Appendix 4.7.B Written Scheme of Investigation. The size and extent of the AEZs recommended for the Proposed Project have been refined following the additional marine geophysical surveys undertaken in 2024 and the Technical Report will be updated with the results of these additional surveys, submitted as part of the DCO application.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	significance and 150m radius AEZs around known wrecks (source: IFA2 Offshore WSI ref: 116350.01 July 2017) Please clarify the inconsistency in the size of proposed AEZs between Sea Link and the other two similar projects (all WSIs have been written by Wessex Archaeology). In his letter of 10th March 2020 (see attached), Professor Dave Parham FSA MCIfA, Professor in Maritime Archaeology at Bournemouth University recommended that AEZs of at least 150m radius should be seen as a minimum for any anomaly. Please confirm that 150m radius AEZs will be placed around all anomalies.		
Goodwin Sands Conservation Trust	Buried cables depth Please confirm the proposed burial depth of the offshore and onshore cables – in the various supporting documents figures range from 0.3 – 2m (offshore cable). Please also confirm the sizes of the furrows created by the burial plough (offshore cable) and the mole boring machine (onshore cable).	N	With respect to offshore activities, the cable bundle will be lowered between 0.5 m (bedrock) and 1.0 to 2.5 m (sediment). Natural backfill is planned to be the main process of burial of the cable, except in areas of High Risk, where the cable will be buried by rock backfill. The cable trench profile will vary in geometry depending on the depth of lowering, nature of seabed geology and trenching method, but 800 mm wide at the trench base with a slope of 1:1 may be considered typical.
Goodwin Sands Conservation Trust	Mitigation If National Grid are to proceed with this proposal, we would suggest a substantial donation is made towards funding maritime archaeology in the area by way of mitigation. This is notwithstanding the fact that adequate measures should be taken to protect our Underwater Cultural Heritage.	N	In preparing the Proposed Project application for Development Consent, National Grid has embedded mitigation measures and, including avoidance and re-routeing around sensitive areas reducing impact on marine archaeological assets, with the potential for further investigative work to take place, if necessary. Should any further action be required as an outcome of examination it will of course work with stakeholders to agree a way forward.
Substation Action Save East Suffolk	Not all assets been identified, both designated and undesignated – see EA1N and EA2 examinations. Study areas have been identified at 500m and 2km; however, this has the effect of underrepresenting the impact on key heritage assets in and around Friston in particular the Grade II* assets of Friston Parish Church and the Post Mill which lie just outside the 500m line.	N	Both the 500 m Study Area for informing the Baseline, and the 2 km from permanent above ground infrastructure for assessing setting impacts were agreed with Stakeholders at the Scoping. A revised data search for both for designated and non-designated assets was undertaken for the final Order Limits, and the data was incorporated in the baseline (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**), as well as the gazetteers (**Application Document 6.3.2.3.B ES Appendix 2.3.B Cultural Heritage Gazetteers**). This data formed the basis for the heritage assessment (**Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage)**.
Local community	These proposals will devastate huge areas of natural beauty and leave a blot on the landscape for future generations, creating an industrial development across a Pilgrim's way whilst impacting on Friston's Grade 2 * listed church, St Mary the Virgin and damaging its views and vistas that have been uninterrupted for centuries. NG will not be thanked for destroying the village and its surroundings. I am all in favour of the windfarms and green energy but it's the way the hub and connection points and landfall points that need to be reviewed and reassessed.	N	The location and sensitivity of the Friston Substation site is acknowledged and is referred to within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Impacts on the setting of heritage assets have also been assessed and are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Cllr T-J Haworth-Culf	Put bluntly, this particularly incredible application proposes slicing a swathe apparently up to 130 metres wide through Suffolk, heading west from the beach where Benjamin Britten walked. At some points this would therefore be the equivalent of a 35-lane motorway. The terminus of this (35) multi-lane motorway is in a tiny Medieval village of Friston, with historic reference to the first Saxon Frislanders arriving with past occupiers centuries ago. The SPR applied for but still unconfirmed Friston 'Sub' Station upon which this application is completely dependent is disingenuously described, as this is potentially an astounding 35+ acre development of warehouse style buildings and industrial equipment with access roads and concrete hardstanding on what is currently greenfield productive farmland land, within shouting distance of Friston's Grade II* Church. St Mary's has defiantly remained in situ since before the 11th century, when the equally invasive Normans were subsuming the Suffolk culture. En route to this church of St Mary's from the RSPB reserve at the coast, this cable route slices adjacent to another site of very historic and ancient worship and importantly burial ground. Domesday refers to this second (to Aldeburgh's St Peter & St Paul)'s church, also dedicated to St Mary. Extract from 'Records of the Borough of Aldeburgh: The Church - By: Arthur T Winn (translation from Latin) 'Aldeburgh with the chapel of Haselwood Domesd. The abbot of Coloestria keeps a cell for his own use. Estimation of the Rectory 12 Marc. Estimate of the vicarage of the same 10 marks. Dealing with Haslewood vII vi. Snynodalia per annum, 3 Denarius of St. Peter xxi.' Agnes Neve of Aldeburgh in her Will dated 15th May 1476 gives direction to be buried in Aldeburgh Churchyard and leaves twelve pence to the high altar at Aldeburgh, and the same amount to the high alter at 'Haslewood' (Haselwood / Hazlewood),' so apparently the chapel was extant and in good repair at that date. Over the decades there have been many archaeological surveys and digs, findings indicating this was an important sacred site, there are exhibits of discoveries in the Aldeburgh Museum at the Moot Hall and elsewhere.	N	The location and sensitivity of the Friston Substation site is acknowledged and is referred to within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Impacts on the setting of heritage assets have also been assessed and are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Consent has been granted to SPR for the Friston Substation but this has not yet been implemented. National Grid have included the Friston National Grid substation element of the SPR consent so that, in the unlikely event that it is not built under this consent, it could be built as part of the Proposed Project. If the Substation is built under the existing consent, National Grid would only build a connection to it. Impact assessment examining setting impacts can be found in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. All assets where there was the potential for significant impacts on the setting of heritage assets were discussed with stakeholders at thematic meetings and viewpoint photography locations agreed with East Suffolk Council Conservation Officer and Historic England. Impacts on the setting of Saxmundham, including the Church of St Mary, are assessed as part of **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). St Peter and St Paul Church It is assumed that the Church of St Mary, Hazlewood, being referred to by the author is that recorded as ADB 005 on the Suffolk Historic Environment Record. This asset is located approximately 40 m north of the Order Limits and as such the Suffolk Onshore Scheme will not result in physical impacts on the asset. Furthermore, the asset is screened from the Suffolk Onshore Scheme by mature hedgerows, woodland, and existing buildings removing the potential for any temporary impacts on its setting. Impacts on the setting of the Grade II* Church of St Mary, Friston, (NHLE 1287864) were assessed as part of the consented SPR scheme, and also as part of the Suffolk Onshore Scheme as part of the baseline preparation where it was considered that the Suffolk Onshore Scheme would not result in a significant impact to the setting of the asset, and it was not taken forwards to full assessment (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The land to the east of Saxmundham is potentially of significant archaeological importance. The Church of St John the Baptist was recorded in the Domesday Book, there is also evidence of Bronze Age, Iron Age and Saxon settlement to the east side of the River Fromus. This has been recorded in the Suffolk Government Website (https://heritage.suffolk.gov.uk/Monument/MSF34332). You have not provided any analysis or studies of the proposed site areas and its potential impacts on possible important archaeological finds.	N	The land within the Order Limits has largely been subject to assessment and evaluation using various non-intrusive and intrusive methods including geophysical survey and evaluation trenching. This has included the land within the Order Limits east of Saxmundham where the Converter Station is proposed, as well as south of Saxmundham adjacent to the River Fromus. The results from these surveys have been included in the DCO submission (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**), and full reports of the result have also been provided (**Application Document 6.3.2.3.D ES Appendix 2.3.D Geophysical Survey Report** and **Application Document 6.3.2.3.F ES Appendix 2.3.F Archaeological Evaluation Trenching Report (Draft)**). The information formed the basis for the assessment which is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. This baseline report (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**), also includes significance statements which conclude the assets taken forward to full assessment. In a number of cases, designated assets within Saxmundham and the surrounding area where not taken forwards to full assessment as aspects such as existing buildings and intervening topography provide screening which will remove the potential for the Saxmundham Converter Station to result in a significant impact on the setting of assets. The assessment of potential impacts on a number of assets, including Saxmundham, the the Grade II* Church of St John the Baptist (NHLE 1268184), and the Grade II Hurts Hall (NHLE 1268178), are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**
Local community	St John the Baptist, Saxmundham The church of St John the Baptist, Saxmundham stands on a site near the bottom of Church Hill. It is mentioned in the Domesday Book. It is Grade II* listed for its historic significance. I stand in a long line of incumbents dating back 1,000 years. The proposed converter stations at the top of Church Hill will spoil the landscape in which the historic church sits. The proposed buildings themselves could potentially tower over the church itself. The peace and tranquillity that people seek when attending the church during the week will be shattered by noise pollution from construction and ongoing running of the converter station.	N	
Suffolk Energy Action Solutions	The PEIR does not demonstrate full assessment of the impacts to Cultural Heritage. You identified there are 154 Designated Heritage Assets within 2 km study area for the proposed converter station(s) in Saxmundham. (ref. Table 2.4.A.4 PEIR Vol 2 Part 2 Appendix 2.4.A Cultural Heritage Gazetteers). The PEIR only provides assessment to 4 of them and fails to evaluate the impacts on the others.	N	The land within the Order Limits has largely been subject to assessment and evaluation using various non-intrusive and intrusive methods, with the baseline also informed through a review of previously recorded assets as well as documentary sources and historic mapping. This data is synthesised in the baseline report (**Application Document 6.3.2.3.A ES Appendix 2.3.A Cultural Heritage Baseline Report**), which also includes significance statements which conclude the assets taken forward to full assessment. In a number of cases, designated assets within Saxmundham and the surrounding area were not taken forwards to full assessment as aspects such as existing buildings and intervening topography provide screening which will remove the potential for the Saxmundham Converter Station to result in a significant impact on the setting of assets. The assessment of potential impacts on a number of assets, including Saxmundham, the the Grade II* Church of St John the Baptist (NHLE 1268184), and the Grade II Hurts Hall (NHLE 1268178), are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.
Local community	The assessment of the impact that Sea Link will have on Sternfield has been woefully inadequate. My boundary abuts the proposed site and my house is a Grade 2 listed property of significant historic importance and yet it was not impact assessed. I was told by Sea Link representatives that Sternfield has been identified by National Grid as an industrial agricultural location because of the presence of several industrial duck barns and an international cold storage distribution centre. Actually, Sternfield is a tranquil Suffolk hamlet that has 18 listed buildings. The village has been powerless against further development of the duck barns at Redhouse Farm and the cold storage unit at Hill Farm that was built	N	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England, and as part of this procedure, a list of assets to fully assessed was agreed. The final assessment within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** has been informed by the Proposed Project design and construction methodology outlined within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	in 2020 without planning permission would never have been permitted had it gone through the proper prospective planning process. Sternfield has been truly let down by the planning process and has been side-lined by National Grid with respect to the proposals for the Sea Link Converter Station.		secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Proposed HVAC overhead line between the Minster converter station and substation, and the Canterbury to Richborough 400 kV overhead line = part of Kent we used to live in, so we have knowledge of the historic landing site of Julius Caesar – 52AD - Richborough Castle = historic site. Also Canterbury = historic city – centre of the Church of England and huge visitor footfall.	N	National Grid notes this feedback. An assessment of the Kent Onshore Scheme on historic sites is contained in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, and the Offshore Scheme in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. Impacts on tourism in Kent are considered in **Application Document 6.2.3.10 Part 3 Kent chapter 10 Socio-Economics, Recreation and Tourism**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Thanet Green Party	Landfall at Pegwell Bay: The adjacent Pegwell Bay site, where landfall for cabling is planned, is part of the Sandwich and Pegwell Bay National Nature Reserve and an SSSI. The converter & substation will be very close to this protected area and Sealink includes plans to run cables under this extremely sensitive area. We find NG's assurances that this can be done without causing damage and disruption unconvincing. It also happens that Pegwell Bay is believed to be the landing place in Britain of both Saint Augustine and Julius Caesar, giving rise to concerns that archaeological sites and artefacts may be disrupted or damaged by the proposed cabling and associated facilities.	N	National Grid acknowledges the potential for adverse impacts on historic sites. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce cultural heritage impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Impacts on cultural heritage from the Kent Onshore Scheme are assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Sandwich Heritage Harbour	We do note though that the proposal is within our sphere of influence being sited upon the heritage marshlands of the Kent River Stour, upon which river was carried the stone that built Canterbury Cathedral and which provided a haven for the marauding Roman, Saxon and Viking invading fleets. The shear mass of this proposal, without question, will impact the centuries of serenity of this undisturbed historical 'wetland'.	N	National Grid acknowledges your concerns. As part of the DCO application a comprehensive ES will be submitted which assesses the potential impacts of the Proposed Project on a wide variety of parameters. National Grid will seek to minimise the impacts of the building and is still in the process of considering feedback regarding the design approach which will inform the detailed design approach within their DCO application. National Grid have developed design principles for Kent Onshore Scheme. The scope of the principles is not limited to any one design discipline and instead reflect a multi-disciplinary approach for coordinated design in the round. As such the design principles cover several design disciplines including architecture, landscape architecture, ecology, hydrology, civil engineering, wider engineering disciplines, town planning, archaeology and heritage. Climate change is an important consideration as is developing the design to minimise light and noise intrusion, maximising the use of trenchless techniques in sensitive areas, and the use of sustainable construction techniques and efficient use of responsibly sourced materials. Details are contained in **Application Document 7.12.2 Design Principles – Kent**).

Table 1.4 Water environment

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The area proposed in Minster is called Minster Marshes for a reason; just a few hundred years ago this area was under water and, with rising sea levels, may well be again soon. There was a comment in the commons last week by another MP asking for a moratorium on building on marsh land due to the massive impacts it has on wildlife as well drainage and all aspects of water management. This proposal, should it go ahead, may not survive its predicted lifecycle.	N	**Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. The Proposed Project has engaged with the Environment Agency, the Lead Local Flood Authority (County Council) and Internal Drainage Boards regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime). In addition, where the Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments.
Local community	NASA sea flood predictions say for this area by as little as 2030 sea water will be invading these marshes. By 2040 the Isle of Thanet will be an island again.	N	**Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. The Proposed Project has engaged with the Environment Agency, the Lead Local Flood Authority (County Council) and Internal Drainage Boards regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). 			Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments.
Broadstairs and St Peter's Town Council	We do not support the location of Minster Marshes for the Sea Link convertor and associated infrastructure because it is in an area that is prone to flooding and is also at risk of total submersion with rising sea levels.	N	**Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. The Proposed Project has engaged with the Environment Agency, the Lead Local Flood Authority (County Council) and Internal Drainage Boards regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime). In addition, where the Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments.
Local community	The area you have chosen is obviously marshland and is often flooded, so much so it is on the Government flood Zone 3 and being highly likely. It is even more noticeable with the recent heavy rainfall. In fact, fairly new houses built in Cheney Road there are in fact sinking due to the instability of the land. We have extensive flooding at the bottom of the village in Foxborough Lane and if you walk all the farm track from Cliftons farm and cross the railway it is impassible through flooding. We live at the top of the village and from our window look across the marshes toward Richborough and Ash village, where there is often a mist over the area, looking like the sea has reappeared to where it once was. This surely indicates that the ground has high moisture retentive. A local scientist who knows the area well has in fact predicted due to global warming the nature of the flat land, the area mentioned above will return to sea. It is only the wall built by the ancient monks to hold back the sea so that they could farm the land that is protecting the bottom of Minster from catastrophic flooding. The convertor station will the sea-side of the wall and therefore won't be protected as much as Cheney Road houses and as mentioned, they are sinking!!	N	**Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. The Proposed Project has engaged with the Environment Agency, the Lead Local Flood Authority (County Council) and Internal Drainage Boards regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime). In addition, where the Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The area is prone to flooding sitting as it does on what used to be the Wantsum Passage. Rising sea levels mean it is likely to be under water by 2050. It would not therefore meet the Green Book threshold of 60 years of useful life considered by the Treasury to be advisable for a development of this scale.	N	Flood risk from all relevant sources has been assessed within **Application Document 6.8 Flood Risk Assessment**. The assessment considers flood risk to the Proposed Project in the present day and over its lifetime, accounting for the predicted effects of climate change, and describes the measures proposed to ensure a flood resilient design that does not cause any increase in offsite flood risk. Due to the extent and linear nature of the Proposed Project, some parts of the Project must necessarily be located in areas with a medium or high likelihood of flooding from rivers and surface water. The Flood Risk Assessment (**Application Document 6.8 Flood Risk Assessment**) demonstrated that with a range of control measures in place, including construction and operational drainage and watercourse crossing designs, the residual risk of flooding would be low and flood risk to neighbouring land would not be increased.
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation? Comments			
Local community	Friston is a rural community subject to flooding. It is highly unsuitable for any programme as this.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime). In addition, where the Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. Commitments and mitigation are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The area floods and the flooding at the north of the village has not been taken into consideration, it would be nice to bury the buildings but the ground is too wet.	N	
Local community	Friston has always been prone to flooding and the fields surrounding the village are a vital part of the flood plain. With the proposed Substation the village will be under constant threat of flash floods, and the proposed mitigation is far from adequate.	N	
Q4 What do you think about our proposed HVAC cable route in Suffolk? Comments			
Local community	This is an area prone to flooding, it is also set out for total submersion with rising sea levels. Global heating causes sea levels to rise due to ice cap melt as well as molecular expansion from heating. It also is evidently causing changes to rain patterns, rainfall heavier, more sustained and more frequent. Your buildings will be impacted by this parallel dynamic putting the site at severe risk.	N	A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in EIAs. A separate, more detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding.
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	Convertor station looks like it would be on a flood plain.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The Converter Station would be served by a surface water drainage system that provides for the collection and treatment of all rainfall runoff from newly created impermeable surface areas, such that discharges to the surrounding water environment would be made at rates no greater than in the undeveloped situation, inclusive of resilience for future climate change.
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The proposed area in a Flood Zone 3 is totally preposterous and delusional undermining the Natural Heritage marshland and marine wildlife, spoiling it all for future generations and more importantly the wildlife for which are already losing habitat all round Thanet and surrounding areas through housing.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. National Grid acknowledges the ecological sensitivity of Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Through the EIA process, National Grid has developed mitigation measures to offset the impact on terrestrial ecology. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This is 13.6 hectares of wildlife, rich lands and beyond minster marshes which would affect the surrounding villages of Cliffsend to minster and liable to flooding. The monks at minster abbey worked to create the drainage system hundreds of years ago which would be disrupted by such a large construction as you propose.	N	Commitment W12 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires National Grid and its contractors to monitoring existing flood defences during the cable installation in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q13 What do you think about our proposed HVDC cable route in Kent?			
Local community	This proposed route is close to our local Southern Water sewage treatment plant. The plant already struggles to cope and this proposal would presumably limit any development there. As an enormous amount of house building is being undertaken it seem short sighted to limit the possibility of expansion which undoubtedly will be needed.	N	National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the waste water treatment works. National Grid is continuing to negotiate with Southern Water in relation to the appropriate method of addressing protection of its assets. This may include protective provisions for the benefit of statutory undertakers in Schedule 14 of the DCO or a private asset protection agreement.
Q14 What do you think about our proposed converter station and adjacent substation near Minster? Comments			
Local community	This is a flood plain, (Marshes is the clue there!) and a building of this size will have flooding and climate implications for the local area. The area will lose a large part that soaks up water and will increase run off.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy.
Local community	As a person who worked in these fields in the 80s and 90s they may not flood but they definitely have wet pads and get saturated. With rising waters globally it makes sense to place this on high ground to future proof the rise of water, what happens to displaced flood water?	N	Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. Commitments and mitigation are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. Commitment W12 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires National Grid and its contractors to monitoring existing flood defences during the cable installation in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the wastewater treatment works. National Grid is continuing to negotiate with Southern Water in relation to the appropriate method of addressing protection of its assets. This may include protective provisions for the benefit of statutory undertakers in Schedule 14 of the DCO or a private asset protection National Grid acknowledges the ecological sensitivity of Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Through the EIA process, National Grid has developed mitigation measures to offset the impact on terrestrial ecology. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	These buildings are enormous and will no doubt need to be built even higher if ground saturation and flooding are taken into account. These land areas are invariably wet or flooded which means that during construction, creating access, using heavy plant, delivering materials etc. will inevitably cause untold damage to what is a wildlife sensitive environment and ecosystem. The risk of flooding in the area is high and the volumes of run off from the buildings will be significant. Predictions are that the area will be submerged by 2050.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. National Grid has designed construction access roads to minimise, where possible, impacts to the environment. All mobile construction plant and vehicles will be required to adhere to **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent.** Factors considered for all routes have included overall distance of access route, geometry, anticipated traffic management measures, vegetation clearance and other general constraints. Commitment to this Plan is secured in Requirement 6 of Schedule 6 of the draft DCO.
Broadstairs and St Peter's Town Council	We find the location for the converter station and adjacent substation quite unsatisfactory. As well as it being a haven for wildlife and supporting a unique biodiversity, the location is also very low and prone to flooding. A look at an OS map of the area clearly indicates that most of the area is less than 5 metres above	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	sea level and yet there is no acknowledgement of this or of the engineering that will be required to make the converter, substation and all associated infrastructure safe against the present flooding risk and now increased risk of flooding going forward. A topographic map of the site puts the Minster Marshes at between 1-3 metres above sea level at present. According to Climate Central forecasts this site will be underwater by 2050 with the situation already looking bad, resulting in the building of additional flood defences near the proposed cable landing site at Pegwell Bay and in Sandwich Town to stop the River Stour breaking its banks, as it has already done on several occasions. This consultation document makes no mention of the existing or future potential flood risk which is very worrying. Add to this the fact the plans involve building an extremely large building and associated infrastructure most of which is not porous, creating a massive amount of 'run-off'. It is easy to see how this development will further add to the serious flood risk the area already has. A large part of the marshes will no longer 'soak water up', the vast area of the building coverage will mean 'run off' in this area is increased, with nowhere for it to go. Creating holding lakes will be of little use as the area is already just above sea level and saturated most of the year. There is no modelling of this or assessment of how this would affect surrounding areas and buildings as well as the village of Minster itself. It is also hard to see how using lakes to hold run-off water would help given the water table is so close to the surface and the land often saturated anyway.		Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. Commitments and mitigation are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. Commitment W12 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires National Grid and its contractors to monitoring existing flood defences during the cable installation in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid acknowledges the ecological sensitivity of Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Through the EIA process, National Grid has developed mitigation measures to offset the impact on terrestrial ecology. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Flood risks: Only short term flood risks appear to have been considered. According to Climate Central forecasts, this site will be underwater by 2050. This will necessitate building additional flood defences near the proposed cable landing site at Pegwell Bay and in Sandwich Town to stop the River Stour breaking its banks, as it has already done on several occasions. Creating holding lakes or underground tanks will be of little use as the area is already just above sea level and saturated most of the year. The proposed construction will inevitably create massive amounts of 'run-off', even with mitigating measures such as a green roof. A large part of the marshes will no longer soak water up because the vast area of the building will mean there will be nowhere for the rainwater to go.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. Commitments and mitigation are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	We were not provided with modelling of this, or an assessment of how it would affect surrounding areas and buildings as well as the village of Minster itself. Water treatment for housing: In the short term, this will impact Southern Water's ability to expand its sewage treatment operations which will be critical to deal with the additional load created by the massive expansion of housing in Thanet.		A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. Commitment W12 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires National Grid and its contractors to monitoring existing flood defences during the cable installation in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the wastewater treatment works. National Grid is continuing to negotiate with Southern Water in relation to the appropriate method of addressing protection of its assets. This may include protective provisions for the benefit of statutory undertakers in Schedule 14 of the DCO or a private asset protection agreement.
Local community	Sandwich has been flooded in the past and now this project and rising sea levels will increase the risk. Sea defences should be built in advance, pump management upgraded, and sewer improvements carried out before this grid is planned.	N	The Proposed Project will not impact upon any sea defences, nor is it a requirement for unrelated new development to mitigate existing issues. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality, while National Grid has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy.
Sandwich Town Council	The proposals fail to provide sufficient modelling on how the risk of flood will be addressed: - The additional housing planned for the Thanet area will increase demand for sewage treatment operations; - The proposed construction will impact the capacity of the marshes to soak water up. This is particularly worrying as this area is predicted to be underwater by 2050, unless sufficient additional flood defences are built near the proposed cable landing site at Pegwell Bay and in Sandwich Town.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects** outlines potential effects that have been identified as a result of the Proposed Project alongside other developments in this area. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. Commitments and mitigation are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Commitment W12 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires National Grid and its contractors to monitoring existing flood defences during the cable installation in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid is continuing to negotiate with Southern Water in relation to the appropriate method of addressing protection of its assets. This may include protective provisions for the benefit of statutory undertakers in Schedule 14 of the DCO or a private asset protection agreement.
Q17 Anything else? Comments			
Local community	Could I point out that in the last one year, the big change to beach problem at Sandwich Bay. Effectively the profile at the end of Kings Ave has move to Prices, one mile towards Thanet. Sand has been washed away, told beach damage and at least one wrecked boat revealed. If this continues at the same rate, it will reach and affect the proposed landfill site in two years and affect the proposal. I am not sure if the deeper water and higher current will fill Pegwell Bay or if the deeper water and bigger waves will wash away present sand changes and if there is a danger of the old Channel re opening which the substation and concrete stations at Minster will be in the middle of. Has this recent alteration of the sea shore been noted and considered?	N	The changing nature of the shoreline in this location is assessed in Chapter 2 (Physical Environment), Table 4.2.17 of the PEIR, which assessed the impact of construction, operation and decommissioning on coastline morphology, including Sandwich Bay to Hacklinge Marshes SSSI and The Haven SSSI. A more detailed assessment at the Kent Landfall including consideration of coastal sediment cells, nearshore and regional sediment transport pathways is presented within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. This will also be supported by sediment modelling that is being undertaken for this location.
Monkton Parish Council	It is an area subject to flooding and, with rising sea levels, is predicted to be completely under water by 2050. The Stour is a tidal river and clearly any extra rainwater runoff will impact on villages further upriver, where there is already fluvial flooding in some fields. The management of marshland drainage is complicated by the use of a pumping station to control water levels. This pump system needs to be turned off at certain times to allow critically endangered European eels to pass through, leading to further possible field flooding. There is currently much new development both planned and under construction over the whole of the Isle of Thanet, with 250 new houses in Minster (plus an application for an additional 115) as well as a further 86 houses planned for Monkton. The sewerage system is already under great strain and further expansion of the water treatment works next to the proposed converter site will be required to handle the extra effluent. This will not be possible if the converter is sited at the proposed location.	N	The effects of the proposed permanent watercourse crossings have been assessed within **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment** and its supporting documents: **Application Document 6.8 Flood Risk Assessment and Application Document 6.9 Water Framework Directive Assessment**. The Proposed Project has engaged with the Environment Agency regarding the proposed crossings of main river watercourses, with key design parameters for the crossings having been agreed. Measures are embedded within the designs of these crossings to mitigate for any potential to increase fluvial flood risk. Commitment W12 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires National Grid and its contractors to monitoring existing flood defences during the cable installation in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the waste water treatment works. National Grid is continuing to negotiate with Southern Water in relation to the appropriate method of addressing protection of its assets. This may include protective provisions for the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			benefit of statutory undertakers in Schedule 14 of the DCO or a private asset protection agreement.
Local community	The Richborough site is on frequently flooded marshland and water displaced could cause further flooding downstream at Sandwich.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q18 Do you have any key concerns regarding the construction stage of Sea Link?			
Local community	The Kent terminus is historically important and is wetland. Ongoing maintenance of drainage may be an issue.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. With regard to the Kent terminus cited in this feedback, **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** identifies the former Pegwell Bay hoverport as a heritage asset, albeit one of low heritage significance.
Local community	It's being built on a flood plain which means areas around it such as Minster and Sandwich which are horrendously affected the weather is getting stormier and the sea levels are rising way too quickly for us to deal with, in a nutshell we need the flood plain to do its job not be covered in tons of concrete.	N	
Local community	Someone should look into the recent flooding (December 2023) which may affect transportation routes and construction. At one point Saxmundham was completely cut off for several days.	N	
General commentary			
Local community	Flooding is a major concern to the villagers of Friston. The village is already subject to sudden flash floods caused by run off from the fields around. With the planned construction of substations and convertors on the land above the village the threat is hugely increased. With global warming and wetter winters it is inevitable that the village will be at risk. I have personally witnessed the water flowing in full spate down through the village and crossing the A1094. North of Friston, the runoff is a major concern to the village of Sternfield and the pollution that the flooding will bring, again will cause serious damage to homes, businesses and traffic.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are secured through commitments within the DCO application. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Friston is prone to flooding due to surface water run-off from fields. This is bad enough now, but the substation construction at Friston will cover large areas with concrete, thus rendering them impermeable. We have no confidence in the mitigation measures proposed by SPR. Although not directly affected by the Sea Link structures at Saxmundham, this is related because NG have stated that, should SPR not go ahead with the Friston substation construction, that NG will do so instead. Whoever builds the substation, it will increase the risk of flooding in Friston, especially during construction when the inadequate mitigation measures will be not finished and therefore even less effective.	N	Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. National Grid is coordinating with SPR regarding the development of the substation at Friston, the approach to which is set out in **Application Document 7.10 Coordination Document**.
Substation Action Save East Suffolk	National Grid seems unaware of the water environment in the catchment to the north of Friston. The baseline plans are wrong. The surface water flood risk to the north and above the village and in the village has been ignored when National Grid knows there is a problem. Clearly it has chosen to pretend this issue does not exist. If these projects are to go ahead then FPC remains concerned that the mitigation proposed will not be adequate and the proposals for a discharge pipe under Church Road are not workable. Flood risk during construction is an even greater concern given the large area of land which will be rendered impermeable.	N	Flooding concerns are noted. National Grid has not ignored the flood risk highlighted in this comment but has undertaken detailed surveys to understand the local conditions, with **Application Document 6.8 Flood Risk Assessment** informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Surface water runoff arising from the Proposed Project during construction would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage infrastructure e.g. ditches, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. The Proposed Project has engaged robustly with the East Anglia ONE and TWO project teams to provide for holistic and complementary drainage solutions.
Local community	The land of Wood Farm (Suffolk) has a topsoil of deep heavy clay. Currently there is no problem with flooding as the fields are well drained into well maintained ditches. The building works, material storage areas and haul roads will decimate this well balanced system with the likelihood of water run off to the road. This will create pollution if the run-off enters water courses and also damage to roads with flooding.	N	The infiltration properties of the soils have been characterised by conducting compliant testing as part of the Proposed Project's Ground Investigations. The data has been used to inform the proposed surface water drainage designs of operational above ground infrastructure. Details of the drainage measures proposed are provided within **Application Document 6.8 Flood Risk Assessment** and space within the Order Limits has been included to accommodate surface water treatment and attenuation measures for both construction and operational stages of the Proposed Project.
Suffolk Coastal Friends of the Earth	It is truly an outrage that you want to tunnel directly under the RSPB North Warren nature reserve and also the Leiston-Aldeburgh SSSI. How might the hydrology be changed due to the tunnelling?	N	**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** confirms the use of trenchless technology under the Leiston to Aldeburgh SSSI and the North Warren RSPB reserve. This is in order to minimise surface-level disruption to this habitat. The commitment to use trenchless technology is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The characteristics of the geology beneath the reserve provide an impermeable barrier between surface water hydrology and ground water resources. The assessment has concluded that there would be no significant effects arising as a result of the tunnelling activity. Details are contained in **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology**. Furthermore, Commitment GH02 in **Application Document 7.5.3.1 Outline Code of Construction Practice** includes for the provision of a Foundation Works Risk Assessment,

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid loss. This is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Energy Action Solutions	Flood Risk and future climate change has not been assessed. The recent, almost monsoon, rain has caused unexpected flooding closing many roads and causing accidents. Redirecting traffic is not easy on the rural B roads and many alterative roads were also flooded cutting off communities. Areas affected were Aldeburgh, Aldringham, Knodishall, Leisten, Friston, Saxmundham, Kelsale cum Carlton, Sternfield, Benhall, Snape and many villages and towns up and down the A 12 (Suffolk Coast's main arterial road) were also affected. Suffolk Coast, as are many other regions in the UK, was not prepared for the significant effects of flooding which can only get worse with climate change. NGET has not adequately assessed the flooding issue and needs to do so in the light of Sea Link proposals significantly altering the landscape in the construction of the converter stations(s) and haul roads - a full hydrological report should be conducted before proceeding with anything else. The drainage of the land at Blackheath Corner - either above ground or through local aquifers - into the Aide marshes and protected environment has not been adequately addressed.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments.
RSPB	We note that Table 2.3.22 of the PEIR Vol. 1, Part 2, Chapter 3, Ecology and Biodiversity states that launch pit dewatering and the use of trenchless techniques could result in changes to water levels within the Leiston-Aldeburgh SSSI and RSPB North Warren. As a wetland site, maintenance of appropriate water levels is critical to enable it to continue to support specialist wetland plants and invertebrates, as well as provide suitable breeding and foraging habitat for birds. Whilst we welcome the commitment in the PEIR, Vol. 2, Part 1, Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures to “Implement measures to ensure no significant hydrological impact on water levels in North Warren RSPB Reserve”, further detail of the potential impact pathways, mitigation measures under consideration and the evidence regarding their effectiveness is required to provide confidence that hydrological impacts can be avoided.	N	Local ground condition data from recent ground investigation monitoring suggests that groundwater is unlikely to be intercepted in the launch/reception pit and that dewatering is unlikely to be required. Changes in groundwater levels or flow pathways are therefore not anticipated, which leads to a low risk of groundwater flooding or other adverse impacts in this location and negligible impacts on the existing groundwater regime. Up-to-date information on terrestrial ecology is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
CPRE Kent	It is noted that the baseline assessment of the relevant section of the PEIR that the proposed converter station and substation can be located within an area that avoids Flood Zone 2 (medium risk) and Zone 3 (high risk). This, however, does not reflect the reality on the ground, which see the proposed location subject to routine flooding. The applicant’s own evidence supports this reality, detailing ecological and ornithological surveys being undertaken at times of flooding. It is accepted that any flooding issues will be exacerbated when the likely future impacts of climate change are considered.	N	The chalk bedrock is overlain and confined by less permeable layers. This means that there is limited potential for groundwater heads in the Thanet Formation and Chalk Group to rise significantly above ground level given the setting and the confined aquifer units. Based on the available survey data, it has been concluded that the presence of a shallow water table impedes rainfall infiltration, and it is poor drainage, rather than emergence of groundwater from rising bedrock groundwater levels, that causes the boggy conditions that have been observed in this area.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The site's proposed location within an area prone to flooding is already causing additional detrimental impacts. For example, the now proposed 2.2km of overhead line was previously proposed to have been underground. It is, however, understood that this has been backtracked upon on the basis of "technical issues with the underground option and the area being in the flood zone". The River Stour and watercourses in the Stour Marshes including Minster Stream and Richborough Stream are rightly subject to the highest levels of protection as they form part of the waterbodies named within the Sandwich Bay Special Area of Conservation (SAC). Despite this, they are currently only deemed to be in a "moderate" rather than "good" condition due to existing pollution. We are therefore particularly concerned that the proposed location of the converter station and substation could exacerbate this further through pollution of watercourses from operational discharges and runoff from above-ground infrastructure. This would be significantly exacerbated should the site be subject to regular flooding events. As it stands, we have little to no detail of proposed mitigation measures. This includes details of any SuDS measures that are proposed to manage increased flood risk from operational discharges and runoff from the project. Again, we are told that such information is not available now, though will be included within the Flood Risk Assessment that will be prepared alongside the Environment Statement. This information will therefore not be available until the DCO is submitted for examination. The problem with such an approach is that again the FRA requires that a sequential approach within the site selection process be taken to avoid as far as possible new development within flood zone areas. By waiting until the point of submission, it will be too late to scrutinise whether this has actually taken place as by then the location will be presented as a done deal. As it is, it is again impossible to be able to conclude that the proposed location is the right location in terms of flood risk.		Mitigation measures will include ground improvements and raising the development platform level to facilitate better drainage, while a wide range of measures including surface water runoff will be set out in the Code of Construction Practice. National Grid has engaged with the Environment Agency, the Lead Local Flood Authority (County Council) and Internal Drainage Boards extensively during the pre-application phase of the Proposed Project. This engagement has helped to inform the surface water drainage principles and flood risk mitigation measures that will be integrated into the design. The engineering design that is proposed in the DCO application will incorporate SUDS, which include filtration prior to discharge into watercourses and demonstrate compliance with the Water Framework Directive. The Flood Risk Assessment within the ES includes a sequential test which, as above, has been informed by engagement with relevant bodies. Up-to-date information on terrestrial ecology is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
National Farmers Union	For the Kent section of the project there will be both a convertor station and substation located together near Minster. NFU members in Kent have raised concerns that the proposed location is in a floodplain that is frequently affected by incidents of flooding, and that there may be significant disruption both during construction and during its operation, should it be located here. The CoCP (1.4.A.2.61) mentions that a surface water drainage strategy will be prepared and submitted alongside the DCO application, and a Drainage Management Plan (DMP) will be prepared prior to the commencement of works. The NFU is pleased to see that there will be consultation with affected landowners on existing land drainage. However, it is essential that the Project appoints a local drainage consultant to help develop and design both pre and post construction drainage plans.	N	AS05 Consultation with affected landowners will be carried out to investigate the current extent of land drainage. A scheme of pre-construction land drainage will be designed with the intent of maintaining the efficiency of the existing land drainage system and to assist in maintaining the integrity of the working area during construction. The Proposed Project may include a system of 'cut-off' drains which feed into a new header drain and the Proposed Project will also take into account surface water runoff measures. National Grid has engaged with the Environment Agency, the Lead Local Flood Authority (County Council) and Internal Drainage Boards extensively during the pre-application phase of the Proposed Project. This engagement has helped to inform the surface water drainage principles and flood risk mitigation measures that will be integrated into the design. The engineering design that is proposed in the DCO application will incorporate SUDS, which include filtration prior to discharge into watercourses and demonstrate compliance with the Water Framework Directive.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Thanet Green Party	The proposed location is an area of marshland situated on the flood plain of the River Stour. Recent exploratory bores have found water 1.5 metres below the surface. This area is prone to flooding, with the area immediately around the Stour already flooding frequently. With climate change and rising sea levels, the Isle of Thanet is predicted to be an island again by 2050 at the latest, at which point this whole area is likely to be submerged. This project therefore promises wholesale wildlife destruction to achieve what may only be a very temporary solution to our electricity transmission challenges! To be even temporarily safe, the proposed converter station will need to be built up above the existing land. The building as designed is massive, and even if built at ground level would be hugely obtrusive across the flat plains surrounding it – but if built up higher it will be a monstrosity. Kent County Council is currently consulting on the update of its Local Flood Risk Strategy which concerns itself with flooding resulting from surface runoff, ordinary watercourses and groundwater. By choosing to build on this site, National Grid appears likely to affect all these adversely. Where there was marshland, we are already seeing concrete from the battery storage and grid stability facilities, and if the converter station is built here, we will see a further area of at least 15 acres covered in concrete. Where will the runoff from this building and the other NG buildings on the site go? A further concern is the way this proposal builds right round the Weatherlees sewage station. Southern Water have proved unable to manage their responsibilities in providing fresh water to and dealing appropriately with foul water from Thanet's existing homes, with frequent sewage releases into Thanet's bathing waters (crucial to our visitor economy) and some areas finding themselves with no piped water to their homes over summer periods. This can only get worse as the 17,000 new homes the Government has tasked us with building are constructed. Yet there will be no room for Weatherlees to expand if Sealink goes ahead, as all the available land will be occupied by NG projects.	N	Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage, there is a commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the waste water treatment works. National Grid therefore intend to include protective provisions for the benefit of statutory undertakers in Schedule 14 of the DCO (**Application Document 3.1**).
RSPB	Paragraph 1.4.5.70 - 72 of the PEIR Vol. 1, Part 1, Ch. 4 Description of the Proposed Project describes the risk of HDD drilling fluid frac-out and the mitigation that can be applied. Due to the potential for benthic smothering from releases of bentonite (or similar) in the aquatic environment, these risks require particular attention in the assessment of potential impacts on watercourses within the Leiston-Aldeburgh SSSI and RSPB North Warren.	N	Protocols for dealing within breakouts of drilling fluids during drilling activities are included within **Application Document 6.3.3.5.B ES Appendix 3.5.B Qualitative Groundwater Risk Assessment and Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**. In addition, commitment GH10 within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires that a drilling fluid breakout plan to be developed by the contractor. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Drilling fluid discharges from the construction of the cable will be single events over a short period of time. All drilling fluids used, such as bentonite, will be selected from the OSPAR List of Substances/Preparations Used and Discharged Offshore (2021) which are considered to 'Pose Little or No Risk to the Environment' (PLONOR).

Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness? Comments			
Local community	Bad idea for landfall! Crumbling cliffs, erosion.	N	A detailed assessment of the impact on the coastline and beaches is provided in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. A complete description is contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	There is no mention of infrastructure associated with the land fall and the possibility of beach erosion.	N	
Local community	Thorpeness is a delicate coastline enjoyed by people past and present who live and holiday in the network which runs through previous coastline of Aldeburgh. These proposals are a mess!	N	
Q11 Do you have any comments of issues you would like us to take into consideration regarding our marine proposals?			
Local community	The unique Suffolk Coraline Crag protects against coastal erosion. So, how will you avoid breaching the Coraline Crag that protects Aldeburgh without altering the tidal flow of the sea?	N	The Coralline Crag formation is considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The cable corridor route passes over a small section of the Crag, therefore, the potential impacts associated with suspended sediment deposition onto the Crag, cable installation burial and rock armouring are assessed in this Chapter. Furthermore, the potential for permanent damage to the Crag occurring and having a knock-on impact on sediment transport in the region and potentially altering coastal geomorphology is also assessed. A detailed assessment of the impact on the coastline and beaches is provided in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
Local community	Aldeburgh and the Suffolk coast has problems with erosion of the shoreline - issues worsened by the effect of global warming. I have not seen any proposals which address this in a meaningful way.	N	
Local community	I have great concern that disrupting the sea bed in this area will cause more erosion of this coastline.	N	
Local community	My comment is the Landfall location in Suffolk. The East Coast of Suffolk is prone to coastal erosion and any damage to the Coraline Greg in the North Sea that protects Aldeburgh would be devastating, altering the tidal flow in this area of Suffolk. Just look back in history how the sea has affected towns and villages along the Suffolk Coast. Dunwich which used to be the capital of Suffolk till a storm changed a sandbank out at sea and now there is only a handful of properties left, the sea has claimed the rest. Orford used to be an important shipping port till a storm moved vast amounts of shingle and the port was no longer accessible, which has lead to the demise of Orford. Sandbanks and shingle at sea are required to protect our towns and villages, so keep away from the Coraline Greg!	N	
Local community	The coastline along the east coast is very fragile. Long shore drift erodes the shore and cliffs and then dumps on the spit. High tides and NE winds have caused flooding and breaches at Aldeburgh and Thorpeness. There should be no interference which could make it worse.	N	
Local community	Some years ago there was a project to alter the sandbanks close to the Thorpeness shore line. It is thought this action by a public body has resulted in more and not less erosion to the cliff faces. This area is so fascinating and its nature at its best. The well-known	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Coraline crag, some of which can be seen on the beach, protects against coastal erosion. Leave well alone.		
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			
Local community	You are destroying wildlife habitat and geological structures unique to Pegwell that visitors want to see.	N	Potential impacts on the geology of Pegwell Bay are considered in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** contains an assessment of the potential impacts of the Proposed Project on tourism and concludes that there are no likely significant effects.
Local community	Too near coastal areas which due to erosion long term create liabilities.	N	A detailed assessment of the impact on the coastline and beaches is provided in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
Q26 Do you have further comments about our materials, consultation process or any suggestion for how we can improve our consultation?			
Local community	More environmental studies, you need to understand the geology of the area and how you need to adapt your plans for the future.	N	Available information on the geology of the Suffolk and Kent study areas has been collated and is presented in the relevant assessment Chapters: **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology and Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**.
General commentary			
Local community	The beach in this part of Suffolk is very fragile and subject to erosion in the coming years. Very recently houses at Hemsby (a little further north) have been dismantled as they have lost their access road due to erosion of the cliff. In January of this year, the most northerly house in Thorpeness was demolished as it was no longer safe for occupation due to the increase in the rate of erosion of the cliff and other houses nearby in Thorpeness are also at risk.	N	A detailed assessment of the impact on the coastline and beaches is provided in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The Coralline Crag formation is considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The cable corridor route passes over a small section of the Crag therefore, the potential impacts associated with suspended sediment deposition onto the Crag, cable installation burial and rock armouring are assessed in this chapter. Further, the potential for permanent damage to the Crag occurring and having a knock on impact on sediment transport in the region and potentially altering coastal geomorphology is also assessed.
Local community	At the proposed landfall site, I understand that the idea is to drill under North Warren Nature Reserve rather than dig through it. However the reserve is protected on the seaward side by a fragile shingle bank. Construction of any kind could impact the interaction of the sea and the bank, putting the whole reserve, and the low-lying farmland and chalets nearby under threat.	N	
Local community	How will you avoid damaging the Coralline Crag Formation? There is no information presented in your PEIR.	N	
Local community	The Friston site involves cables coming in under fragile cliffs, likely causing even faster erosion than the average of 1 m a year.	N	
Local community	I object to the proposal to bring the power cables in under the area between Aldeburgh and Thorpeness (essentially the nature reserve North Warren.) The proposal is to come in from the sea bed and emerge at the old railway line. My objection is that this area was a harbour in Elizabeth times and is not composed of rock but depths of peaty, muddy land and HDD cannot be guaranteed not to undermine the surface of this vital bird migration sanctuary. Questions at the consultation days could not be answered about the impact on the sea bed of the landfall point. This is a dynamic coast with shingle that moves in huge quantities both up and down the	N	An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. Information is contained in **Application Document 7.3 Design Development Report**. A detailed assessment of the impact on the coastline and beaches is provided in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. Commitment W12 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** requires National Grid and its contractors to monitoring existing flood defences during the cable installation in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This Code is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	shore and in and out to sea. It may not bear interference without affecting flood /sea defences up and down the coast.		National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway.

Feedback Form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	Suffolk has long been the "bread basket" of England, to destroy good arable land is little short of vandalism, especially as there are better options.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	Building and covering up agricultural land is unnecessary when alternative sites could be used.	N	
Tenant Farmers Association	The TFA does not believe that sufficient attention has been given to the impact of these proposals on farm businessParticularly those who are either wholly or mainly reliant upon let land. The TFA is concerned that many tenant farmers could lose access to land permanently due to the nature of the legislation and contracts of tenancy which currently operate across the farmland that will be affected. The rights, aspirations and impact upon tenant farmers need to be properly taken into consideration and we will be watching developments to that end. Tenant farmers must be included in all conversations and it should not be assumed that discussions with landlords alone will be sufficient.	N	National Grid is and will continue to work with all landowners including tenants who may be affected by the proposals to understand the impacts on their operations and to work with them as the construction programme is developed. National Grid will seek to work with the farming community to limit disruption where practicable. The cable route will be reinstated to its previous use and therefore farming operations are able to continue post construction. The cable width is relatively minimal, and accommodation works will be discussed and agreed prior to commencement of construction to ensure disruptions to normal farming operations are minimised. Compensation claims for disturbance are considered on an evidenced basis and landowners and farmers will therefore be encouraged to keep records to support their claims.
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	You are siting this on valuable farm land and should not have even been considered in the first place.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land
Local community	All National Grid's so called improvements did not consider the communities all their plans would be affecting. We are constantly told in media of all descriptions how precious our environment is for	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	our wellbeing and how prime farm land should be used more efficiently for the growing of vegetable and fruit crops as we attempt to move away from a meat based diet. National Grid ignores all of these recommendations and literally bull-dozes their way across communities.		may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation?			
Local community	East Suffolk is an agricultural area. We need in the UK greater food security and therefore cannot lose agricultural land for such projects.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q4 What do you think about our proposed HVAC cable route in Suffolk. Comments			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Stop destroying our valuable farm land needlessly.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	This cable run between Friston substation and the proposed converter station near Saxmundham would mean digging up productive farmland which will damage the soil structure for years.	N	A complete assessment of the impacts on agriculture and soil in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	Surely there is somewhere not on agricultural land which can be used.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**.
Local community	Population growth, global warming, all leading to needing as much agricultural land as possible to grow enough food. Do not cover up the farmland.	N	
Local community	Not living in Suffolk, however you do seem to be building and concreting over arable farm land, which we need desperately to grow crops.	N	
Local community	What effect do they have on the local farms?	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Huge trenches and buildings in areas of excellent agricultural land is disruptive.	N	
Q14 What do you think about our proposed converter station and adjacent substation near Minster?			
Local community	This is prime agricultural land. Why on earth would you even consider it at this time in our land's history when we should be working far more towards the UKs better self-sufficiency in producing our own produce. This piece of land currently produces in excess of 110 tons of wheat a year and everyone round here is aware of that.	N	**Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on.
Local community	Food Security: The proposed location for the converter station and adjacent substation is a very poor choice. The planned site is Grade 2 Agricultural Land – very good quality. Protecting the UK's food	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
