NATIONAL GRID ELECTRICITY TRANSMISSION PLC
SECTION 48 OF THE PLANNING ACT 2008 (AS AMENDED)
REGULATION 4, THE INFRASTRUCTURE PLANNING (APPLICATIONS: PRESCRIBED FORMS AND PROCEDURE) REGULATIONS 2009
NOTICE PUBLICISING A PROPOSED APPLICATION FOR A DEVELOPMENT CONSENT ORDER FOR THE SEA LINK PROJECT

Notice is hereby given that National Grid Electricity Transmission plc (NGET) of National Grid House, Warwick Technology Park, Gallows Hill, Warwick, CV34 6DA intends to apply to the Secretary of State for a Development Consent Order (DCO) under Section 37 of the Planning Act 2008 (as amended) (the Act) to authorise the construction of the Sea Link Project.

The Sea Link Project ('proposed Project') involves the reinforcement of the electricity transmission network between Suffolk and Kent, predominantly via offshore High Voltage Direct Current (HVDC) link. The proposed Project is split into three distinctive elements, as follows.

The Suffolk Onshore Scheme

- A connection from the existing transmission network via Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Sea Link project. A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below).
- A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham.
- A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900 m inshore from a landfall point (below) where the cable transitions from onshore to offshore technology.
- A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).

The proposals in Suffolk have been developed for Sea Link as a standalone project, but also include opportunities to co-locate infrastructure for up to two further projects at the converter station, cable corridors and the landfall location.

The Offshore Scheme

- Approximately 130 km of subsea HVDC cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness), and the Kent landfall location at Pegwell Bay.

The Kent Onshore Scheme

- A landfall point on the Kent coast at Pegwell Bay.
- A TJB approximately 800 m inshore to transition from offshore HVDC cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station (below).
- A 2 GW HVDC converter station, up to 26 m high plus external equipment (such as lightning protection & railings for walkways), near Minster. A new substation would be located immediately adjacent.
- Removal of approximately 1 km of existing HVAC overhead line, and installation of approximately 2.25 km of new HVAC overhead line from the converter station and substation near Minster and the existing Richborough to Canterbury overhead line.

The project also includes modifications to sections of existing overhead lines in Suffolk and Kent, diversions of third-party assets, and land drainage from the construction and operational footprint. It also includes opportunities for environmental mitigation, compensation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups). The construction phase will involve various temporary construction activities including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way (PROWs).

The proposed development will include other required works, for example, temporary access roads, highway works, temporary works compounds, work sites and ancillary works.

The proposed application will seek authorisation for the compulsory acquisition of land and interests in and rights over land, overriding easements and other rights, the temporary use of land, and other ancillary powers.

NATIONAL GRID ELECTRICITY TRANSMISSION PLC
SECTION 48 OF THE PLANNING ACT 2008 (AS AMENDED)
REGULATION 4, THE INFRASTRUCTURE PLANNING (APPLICATIONS: PRESCRIBED FORMS AND PROCEDURE) REGULATIONS 2009
NOTICE PUBLICISING A PROPOSED APPLICATION FOR A DEVELOPMENT CONSENT ORDER FOR THE SEA LINK PROJECT

The proposed project is an Environmental Impact Assessment (EIA) development, as defined by The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. An Environmental Statement will therefore be submitted as part of the proposed application, which will contain information about the environmental effects of the proposed project.

All documents, plans and maps showing the nature and location of the proposed development, including the preliminary environmental information, will be available to download free of charge from 24 October 2023 until 18 December 2023 on www.nationalgrid.com/sealink (via the document library page).

Reference copies of certain documents, plans and maps showing the nature and location of the proposed development will also be available to view free of charge from 24 October 2023 at the following locations in the vicinity of the project for the duration of the consultation (until 18 December 2023).

Materials will be available to view during the opening hours listed above, except in circumstances outside of NGET's control which prevent the locations specified from opening.

Requests for paper copies of the documents, plans and maps will be reviewed on a case by-case basis. To cover printing costs a reasonable copying charge may apply, to be paid for by the recipient and up-to a maximum value of £300 for the whole suite of consultation documents. These can be requested by contacting the Project Team via the details at the bottom of this notice.

How to respond to the consultation

The consultation is running between 24 October 2023 and 11:59pm on 18 December 2023.

Responses to the consultation can be submitted in the following ways:

- online via the Project's website (nationalgrid.com/sealink)
- scanning a paper copy of the response form or submitting a free text letter or email
- by post at Freepost SEA LINK
- by email (contact@sealink.nationalgrid.com)

A printed copy of the consultation feedback form can be requested by contacting the project team on the details below.

National Grid must receive all responses by 11:59pm on 18 December (or 2 January for postal feedback) to ensure their consideration. Please note that responses are likely to be made public, but that contact/personal details will be redacted.

When deciding on the final form of the proposed application for a development consent order for the proposed project, National Grid will take into account any response to this publicity or the consultation that is received before the specified deadline.

National Grid may be required to make copies of representations available to the Secretary of State. However, National Grid will request that personal details are not placed on the public record. Personal details will be held securely in accordance with the Data Protection Act 2018 and will be used solely in connection with the consultation process and the development of this project and, except as noted above, will not be disclosed to any third parties.

If you have any questions about the project or the consultation, please get in touch:

Email: contact@sealink.nationalgrid.com **Telephone:** 0808 134 9569

Crackdown on speeding drivers

Suffolk motorists to face more checks

Drivers will face an increased number of speed checks this month as part of a crackdown on dangerous driving.

The nationwide safety campaign Kill Your Speed, Don't Let Your Speed Kill You was launched yesterday, and will run until October 29.

ABYGAIL FOSSETT abygail.fossett@eastangliandaily.co.uk

Suffolk's Police and Crime Commissioner Tim Passmore said: "Speeding kills. It wrecks lives."

Suffolk Police estimate nearly 10 per cent of fatal or serious collisions involve a speeding driver.

Last year, 22 people died in crashes on Suffolk roads.

NATIONAL GRID ELECTRICITY TRANSMISSION PLC
SECTION 47 OF THE PLANNING ACT 2008 (AS AMENDED)
SEA LINK
NOTICE OF PUBLICATION OF A STATEMENT OF COMMUNITY CONSULTATION

Notice is hereby given that National Grid Electricity Transmission plc (NGET) of National Grid House, Warwick Technology Park, Gallows Hill, Warwick, CV34 6DA has now published a Statement of Community Consultation (SoCC) for the Sea Link project in accordance with section 47 of the Planning Act 2008 (as amended).

The Sea Link Project ('proposed Project') involves the reinforcement of the electricity transmission network between Suffolk and Kent, predominantly via offshore High Voltage Direct Current (HVDC) link. The proposed Project is split into three distinctive elements, as follows:

The Suffolk Onshore Scheme

- A connection from the existing transmission network via Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Sea Link project.
- A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below).
- A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham.
- A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900 m inshore from a landfall point (below) where the cable transitions from onshore to offshore technology.
- A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).

The proposals in Suffolk have been developed for Sea Link as a standalone project, but also include opportunities to co-locate infrastructure for up to two further projects at the converter station, cable corridors and the landfall location.

The Offshore Scheme

- Approximately 130 km of subsea HVDC cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness), and the Kent landfall location at Pegwell Bay.

The Kent Onshore Scheme

- A landfall point on the Kent coast at Pegwell Bay.
- A TJB approximately 800 m inshore to transition from offshore HVDC cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station (below).
- A 2 GW HVDC converter station, up to 26 m high plus external equipment (such as lightning protection & railings for walkways), near Minster. A new substation would be located immediately adjacent.
- Removal of approximately 1 km of existing HVAC overhead line, and installation of approximately 2.25 km of new HVAC overhead line from the converter station and substation near Minster and the existing Richborough to Canterbury overhead line.

The project also includes modifications to sections of existing overhead lines in Suffolk and Kent, diversions of third-party assets, and land drainage from the construction and operational footprint. It also includes opportunities for environmental mitigation, compensation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups). The construction phase will involve various temporary construction activities including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way.

Under section 47 of the Planning Act 2008, NGET has a duty to consult the community on its proposals. The SoCC explains how NGET will undertake the consultation, where the consultation documents can be viewed, where public events will be held and explain how people can comment on the proposals and provide responses to the consultation.

The proposed project is an Environmental Impact Assessment (EIA) development, as defined by The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017.

The consultation will take place between 24 October 2023 and 18 December 2023.

Between these dates the SoCC is available to view free of charge on the project website at: www.nationalgrid.com/sealink

Reference copies of the SoCC will also be available to view free of charge from 24 October 2023 for the duration of the consultation which ends at 11:59pm on 18 December 2023 at the following locations in the vicinity of the project:

PLANNING

NATIONAL GRID ELECTRICITY TRANSMISSION PLC
SECTION 48 OF THE PLANNING ACT 2008 (AS AMENDED)
REGULATION 4, THE INFRASTRUCTURE PLANNING (APPLICATIONS: PRESCRIBED FORMS AND PROCEDURE) REGULATIONS 2009
NOTICE PUBLICISING A PROPOSED APPLICATION FOR A DEVELOPMENT CONSENT ORDER FOR THE SEA LINK PROJECT

Notice is hereby given that National Grid Electricity Transmission plc (NGET) of National Grid House, Warwick Technology Park, Gallows Hill, Warwick, CV34 6DA intends to apply to the Secretary of State for a Development Consent Order (DCO) under Section 37 of the Planning Act 2008 (as amended) (the Act) to authorise the construction of the Sea Link Project.

The Sea Link Project ('proposed Project') involves the reinforcement of the electricity transmission network between Suffolk and Kent, predominantly via offshore High Voltage Direct Current (HVDC) link. The proposed Project is split into three distinctive elements, as follows:

The Suffolk Onshore Scheme

- A connection from the existing transmission network via Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Sea Link project.
- A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below).
- A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham.
- A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900 m inshore from a landfall point (below) where the cable transitions from onshore to offshore technology.
- A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).

The proposals in Suffolk have been developed for Sea Link as a standalone project, but also include opportunities to co-locate infrastructure for up to two further projects at the converter station, cable corridors and the landfall location.

The Offshore Scheme

- Approximately 130 km of subsea HVDC cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness), and the Kent landfall location at Pegwell Bay.

The Kent Onshore Scheme

- A landfall point on the Kent coast at Pegwell Bay.
- A TJB approximately 800 m inshore to transition from offshore HVDC cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station (below).
- A 2 GW HVDC converter station, up to 26 m high plus external equipment (such as lightning protection & railings for walkways), near Minster. A new substation would be located immediately adjacent.
- Removal of approximately 1 km of existing HVAC overhead line, and installation of approximately 2.25 km of new HVAC overhead line from the converter station and substation near Minster and the existing Richborough to Canterbury overhead line.

The project also includes modifications to sections of existing overhead lines in Suffolk and Kent, diversions of third-party assets, and land drainage from the construction and operational footprint. It also includes opportunities for environmental mitigation, compensation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups). The construction phase will involve various temporary construction activities including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way (PRoWs).

The proposed development will include other required works, for example, temporary access roads, highway works, temporary works compounds, work sites and ancillary works.

The proposed application will seek authorisation for the compulsory acquisition of land and interests in and rights over land, overriding easements and other rights, the temporary use of land, and other ancillary powers.

The proposed project is an Environmental Impact Assessment (EIA) development, as defined by The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. An Environmental Statement will therefore be submitted as part of the proposed application, which will contain information about the environmental effects of the proposed project.

All documents, plans and maps showing the nature and location of the proposed development, including the preliminary environmental information, will be available to download free of charge from 24 October 2023 and 18 December 2023 on www.nationalgrid.com/sealink (via the document library page).

Reference copies of certain documents, plans and maps showing the nature and location of the proposed development will also be available to view free of charge from 24 October 2023 at the following locations in the vicinity of the project for the duration of the consultation (until 18 December 2023).

Materials will be available to view during the opening hours listed above, except in circumstances outside of NGET's control which prevent the locations specified from opening.

Requests for paper copies of the documents, plans and maps will be reviewed on a case by case basis. To cover printing costs a reasonable copying charge may apply, to be paid for by the recipient and up to a maximum value of £300 for the whole suite of consultation documents. These can be requested by contacting the Project Team via the details at the bottom of this notice.

How to respond to the consultation

The consultation is running between 24 October 2023 and 11:59pm on 18 December 2023.

Responses to the consultation can be submitted in the following ways:

- online via the Project's website (nationalgrid.com/sealink)
- scanning a paper copy of the responses form or submitting a free text letter or email
- by post at Freepost SEA LINK
- by email (contact@sealink.nationalgrid.com)

A printed copy of the consultation feedback form can be requested by contacting the project team on the details below.

National Grid must receive all responses by 11:59pm on 18 December (or 2 January for postal feedback) to ensure their consideration. Please note that responses are likely to be made public, but that contact/personal details will be redacted.

When deciding on the final form of the proposed application for a development consent order for the proposed project, National Grid will take into account any responses to this publicity or the consultation that is received before the specified deadline.

National Grid may be required to make copies of representations available to the Secretary of State. However, National Grid will request that personal details are not placed on the public record. Personal details will be held securely in accordance with the Data Protection Act 2018 and will be used solely in connection with the consultation process and the development of this project and, except as noted above, will not be disclosed to any third parties.

If you have any questions about the project or the consultation, please get in touch:

Free Christmas tree collections face axe

Council considering giving popular service the chop in name of climate change

By Brad Harper
bharper@thekmgroup.co.uk

A free Christmas tree collection service across the Canterbury district is facing the chop.

The city council is the only local authority in Kent still offering complimentary pick-ups, but is considering axing the scheme in the name of climate change.

Traditionally, people across Canterbury have had their festive firs collected during a two-week period in the new year.

But the council says the additional journeys and extra fuel needed for the drive-by service have "an impact on the environment".

Cllr Charlotte Cornell (Lab) – the member for waste and recycling – said: "We are declaring a biodiversity and climate change emergency and we need to reflect in our practice climate and biodiversity best choices."

See page 6.

The service could be axed

Why weren't we warned?

Anger grows in the aftermath of storm

Storm Babet's unexpected devastation has left many questioning why Suffolk wasn't better warned.

More than a month's worth of rain fell in a 24-hour period, despite the Met Office only issuing a standard yellow weather warning.

Suffolk County Council leader

KAIA NICHOLL

kaia.nicholl@newsquest.co.uk

Matthew Hicks said the coming weeks will see "questions asked of the way Storm Babet was anticipated and whether anything could have been done to lessen the impact".

"It is fair to say that the devastation caused by Storm Babet has shocked many," he added.

Ahmet Dagdelen, owner of Framlingham's Gentleman's Corner Barbershop, said his business suffered over £10,000 of damage.

PLANNING

NATIONAL GRID ELECTRICITY TRANSMISSION PLC

SECTION 48 OF THE PLANNING ACT 2008 (AS AMENDED)

REGULATION 4, THE INFRASTRUCTURE PLANNING (APPLICATIONS: PRESCRIBED FORMS AND PROCEDURE) REGULATIONS 2009

NOTICE PUBLICISING A PROPOSED APPLICATION FOR A DEVELOPMENT CONSENT ORDER FOR THE SEA LINK PROJECT

Notice is hereby given that National Grid Electricity Transmission plc (NGET) of National Grid House, Warwick Technology Park, Gallows Hill, Warwick, CV34 6DA intends to apply to the Secretary of State for a Development Consent Order (DCO) under Section 37 of the Planning Act 2008 (as amended) (the Act) to authorise the construction of the Sea Link Project.

The Sea Link Project ("proposed Project") involves the reinforcement of the electricity transmission network between Suffolk and Kent, predominantly via offshore High Voltage Direct Current (HVDC) link. The proposed Project is split into three distinctive elements, as follows.

The Suffolk Onshore Scheme

- A connection from the existing transmission network via Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Sea Link project.
- A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below).
- A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham.
- A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900 m inshore from a landfall point (below) where the cable transitions from onshore to offshore technology.
- A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).

The proposals in Suffolk have been developed for Sea Link as a standalone project, but also include opportunities to co-locate infrastructure for up to two further projects at the converter station, cable corridors and the landfall location.

The Offshore Scheme

- Approximately 130 km of subsea HVDC cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness), and the Kent landfall location at Pegwell Bay.

The Kent Onshore Scheme

- A landfall point on the Kent coast at Pegwell Bay.
- A TJB approximately 800 m inshore to transition from offshore HVDC cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station (below).
- A 2 GW HVDC converter station, up to 26 m high plus external equipment (such as lightning protection & railings for walkways), near Minster. A new substation would be located immediately adjacent.
- Removal of approximately 1 km of existing HVAC overhead line, and installation of approximately 2.25 km of new HVAC overhead line from the converter station and substation near Minster and the existing Richborough to Canterbury overhead line.

The project also includes modifications to sections of existing overhead lines in Suffolk and Kent, diversions of third-party assets, and land drainage from the construction and operational footprint. It also includes opportunities for environmental mitigation, compensation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups). The construction phase will involve various temporary construction activities including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way (PROWs).

The proposed development will include other required works, for example, temporary access roads, highway works, temporary works compounds, work sites and ancillary works.

The proposed application will seek authorisation for the compulsory acquisition of land and interests in and rights over land, overriding easements and other rights, the temporary use of land, and other ancillary powers.

The proposed project is an Environmental Impact Assessment (EIA) development, as defined by The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. An Environmental Statement will therefore be submitted as part of the proposed application, which will contain information about the environmental effects of the proposed project.

All documents, plans and maps showing the nature and location of the proposed development, including the preliminary environmental information, will be available to download free of charge from 24 October 2023 until 18 December 2023 on www.nationalgrid.com/sealink (via the document library page).

Reference copies of certain documents, plans and maps showing the nature and location of the proposed development will also be available to view free of charge from 24 October 2023 at the following locations in the vicinity of the project for the duration of the consultation (until 18 December 2023).

'Armed police left me traumatised'

Dad detained by firearms officers after 'malicious call' demands apology from force

By Ruth Cassidy
rcassidy@thekmgroup.co.uk

A dad-of-three says he was left shaken and in tears after being pulled over by armed police following what he claims was a malicious 999 call.

Daniel Pearce says officers with guns dragged him from his car and handcuffed him after he was stopped on the A28.

Police say they were investigating reports a man had been threatened with a baton in Canterbury half-an-hour before.

Daniel Pearce was detained by police

But after taking Mr Pearce's details and searching the car, the 42-year-old was told he was free to go.

He has since demanded an apology from the force for being subjected to an ordeal he claims was "unnecessary and totally wrong".

Leftists celebrate as far-right Milei places second in Argentina vote

Tom Phillips
Facundo Iglesia *Buenos Aires*

Leading Latin American leftists have celebrated the thwarting of Javier Milei's attempt to claim a first-round victory in Argentina's presidential election after the far-right populist was beaten by his centrist rival Sergio Massa.

Milei, an oddball economist who has called climate change a "socialist lie" and the pope "a lefty son of a bitch", had hoped an explosion of anti-establishment rage would catapult him into the presidency on Sunday as 27 million Argentinians turned out to vote amid the country's worst economic crisis in decades.

But Milei, who was regarded by many as the election frontrunner, was pipped to the post by the Peronist finance minister Massa, who received 36.6% of votes to Milei's 29.9%. The two men will now face off in a second-round showdown on 19 November.

Colombia's leftist president, Gustavo Petro, led the celebration of Milei's unexpected setback, which dealt a blow to members of the global far right hoping a Milei victory would allow them to make a show of strength. "Argentina has defeated barbarism," Petro tweeted. "This is the time of hope."

Brazil's leftwing president, Luiz Inácio Lula da Silva, also commemorated a result most polls failed to foresee. "Formidable, my friend," Lula reportedly wrote in a private message to Massa, according to the Argentinian newspaper Clarín.

Lula's chief foreign policy adviser, Celso Amorim, called the result one of "relief and renewed hope" although he cautioned that "the struggle is not over". Paulo Pimenta, Lula's communications minister, tweeted: "Long live democracy!"

Milei put a positive spin on his failure to win as he addressed supporters in Buenos Aires on Sunday night, calling his presence in the election runoff "a genuinely historic achievement".

Milei, a television celebrity who entered politics in 2021, called on all opponents of Massa's Peronist coalition to unite against what he called the "criminal organisation" he blames for triple-digit inflation and plunging 40% of Argentina's 46 million citizens into poverty.

"If we work together, we can win. If we work together, we can recover our country," said Milei, who will hope to lure some of the 6.3 million voters who backed the third-placed candidate, Patricia Bullrich, a conservative former security minister. Many of the 2.5 million votes that went to the fourth- and fifth-placed centre-left and leftwing candidates, Juan Schiaretti and Myriam Bregman, are expected to migrate to Massa.

Bullrich hinted on Sunday she would endorse Milei, vowing to never be an "accomplice" of the Peronist populists she accused of impoverishing Argentina and producing "the worst government in [its] history".

Members of Latin America's far right pushed back against portrayals of Milei's result as a flop. "Milei certainly goes into the second round as favourite," said Eduardo Bolsonaro, the congressman son of the former Brazilian president Jair Bolsonaro, who was in Buenos Aires hoping for a far-right triumph similar to his father's 2018 election win in Brazil.

Bolsonaro shared a viral video of one Argentinian casting his vote dressed as a chainsaw – the symbol of Milei's campaign to cut spending and sever Argentina's political establishment – as proof that his movement was an unstoppable "phenomenon".

But the frustration of Milei staus was palpable outside the luxury hotel where the self-styled "anarcho-capitalist" had set up his campaign headquarters. Crestfallen Milei supporters claimed, without evidence, that the vote had been rigged.

"It hurts my soul," said Ivan González, 22, a Milei supporter who wore a Donald Trump hat and carried a yellow Gadsden flag – an American revolution era banner used by the US extreme right and Milei's movement.

The centrist presidential candidate Sergio Massa

Liquefied natural gas storage at the Calcasieu Ship Channel in Louisiana
PHOTOGRAPH: MATTHEW D WHITE/VWPICSALAMY

24m
The number of tonnes of liquefied natural gas the CP2 hub on the Gulf coast would ship each year once it is completed

Biden under pressure to block 'carbon mega bomb' gas terminal

Oliver Milman

The Biden administration is under pressure to block construction of what would be one of the world's largest gas export hubs near the rapidly eroding Louisiana shoreline because of concerns over its impact on the climate and communities living amid an unprecedented expansion of infrastructure along the Gulf of Mexico.

The $10bn project known as CP2 would involve bringing gas extracted via fracking through a new pipeline to a terminal where it would be condensed into liquid and loaded on ships for export.

CP2, which would ship up to 24m tonnes of liquefied natural gas (LNG) each year, is at the vanguard of a surge in new gas pipelines and terminals along the Gulf coast. The Biden administration has talked up gas exports to European allies in the wake of Russia's invasion of Ukraine.

Environmental groups have said Biden risks blowing apart his own efforts to combat the climate crisis and endangering international climate goals by allowing CP2, which is likely to be decided upon by US regulators within the next month.

"That we would even consider doing anything like this in 2023, which scientists have told us is the hottest year we have experienced on this planet for 125,000 years, is obscene and dangerous," said Bill McKibben, a climate activist and co-founder of the movement 350.org. "Why on earth are we even talking about finding a way to spew even more greenhouse gases into the atmosphere?"

The gas-export industry argues that sending LNG to other countries not only creates domestic jobs, it displaces dirtier fossil fuels that are being burned overseas.

"The well-funded environmental activists opposing CP2 and all US LNG projects are completely out of touch with reality," said a spokesperson for Venture Global, the company behind CP2, which hopes to start construction of the project by 2026.

Studies have shown that while gas emits less CO_2 than coal it often involves the leaking of large quantities of methane, a greenhouse gas.

"This is a carbon mega bomb," said Jeremy Symons, a former US Environmental Protection Agency official. "The scale of the project is almost unfathomable and it locks us into a fossil fuel dependency for the next 30 years. If all we do is shift from coal to gas, we are cooked."

According to calculations by Symons, CP2 would create 197m tons of planet-heating gases each year once fully operational, including emissions from the production of the gas and its eventual burning overseas, which is not counted in the US's own emissions tally.

This scale of emissions is 20 times greater than the controversial Willow oil project in Alaska, which was approved by the Biden administration despite an outcry from Democrats, Native Americans and climate campaigners earlier this year.

'If all we do is shift from coal to gas, we are cooked'
Jeremy Symons
Former climate official

United Maritime closes in on Chinese leasing deals for veteran capesizes

GREEK DRY BULKER owner United Maritime, a spinoff of US-listed Seanergy Maritime, is nearing $30m financing pacts with Chinese leasing funds for three vintage capesizes, as growing competition spurs lessors to look harder for deals.

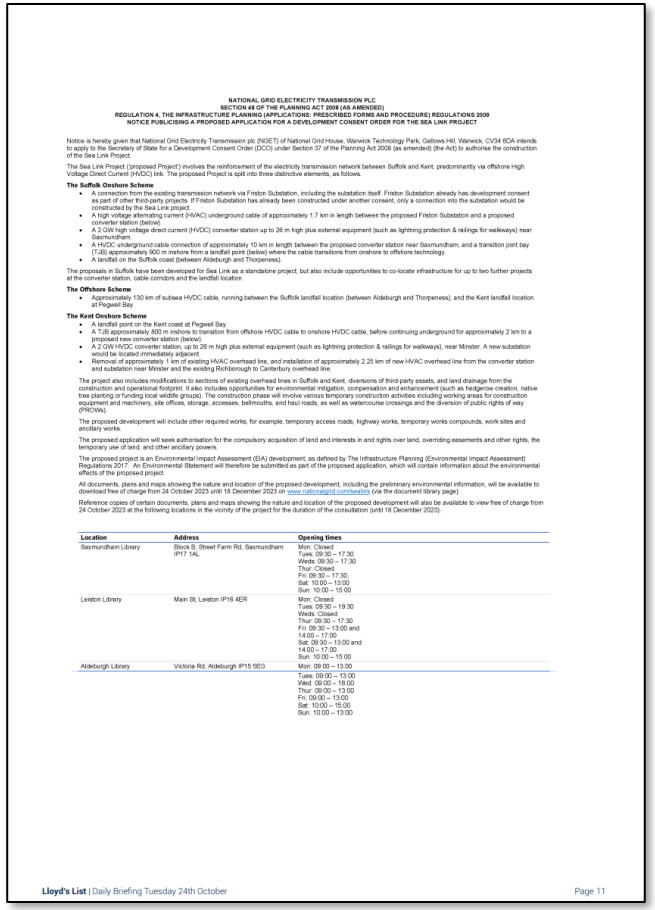
The shipowner has received terms from three Chinese lessors and anticipates finalising contracts by end-November, chief financial officer Stavros Gyftakis told Lloyd's List on the sideline of a Capital Link forum in Shanghai.

United Maritime's website shows it has three capesizes — *Gloriuship* (IMO: 9266944), *Goodship* (IMO: 9311476) and *Tradership* (IMO: 9310135) — built between 2004-2006. Its chairman and chief executive, Stamatios Tsantanis, also heads Seanergy, which owns 16 much younger vessels of similar size in service.

"Chinese leasing houses do not usually do such type of deals. I am very happy to see them adapting to the changing conditions," Gyftakis said.

He noted financiers historically had a short horizon on vessel age, ending financing at around 15 years old.

But amid energy transition uncertainties over future fuels and delays in ordering newbuildings that could replace ageing tonnage, existing ships need extended lifespans and financer support, he argued.



NATIONAL GRID ELECTRICITY TRANSMISSION PLC
SECTION 48 OF THE PLANNING ACT 2008 (AS AMENDED)
REGULATION 4, THE INFRASTRUCTURE PLANNING (APPLICATIONS: PRESCRIBED FORMS AND PROCEDURE) REGULATIONS 2009
NOTICE PUBLICISING A PROPOSED APPLICATION FOR A DEVELOPMENT CONSENT ORDER FOR THE SEA LINK PROJECT

Notice is hereby given that National Grid Electricity Transmission plc (NGET) of National Grid House, Warwick Technology Park, Gallows Hill, Warwick, CV34 6DA intends to apply to the Secretary of State for a Development Consent Order (DCO) under Section 37 of the Planning Act 2008 (as amended) (the Act) to authorise the construction of the Sea Link Project.

The Sea Link Project ('proposed Project') involves the reinforcement of the electricity transmission network between Suffolk and Kent, predominantly via offshore High Voltage Direct Current (HVDC) link. The proposed Project is split into three distinctive elements, as follows.

The Suffolk Onshore Scheme

- A connection from the existing transmission network via Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Sea Link project.
- A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below).
- A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham.
- A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900 m inshore from a landfall point (below) where the cable transitions from onshore to offshore technology.
- A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).

The proposals in Suffolk have been developed for Sea Link as a standalone project, but also include opportunities to co-locate infrastructure for up to two further projects at the converter station, cable corridors and the landfall location.

The Offshore Scheme

- Approximately 130 km of subsea HVDC cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness), and the Kent landfall location at Pegwell Bay.

The Kent Onshore Scheme

- A landfall point on the Kent coast at Pegwell Bay.
- A TJB approximately 1km inshore to transition from offshore HVDC cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station (below).
- A 2 GW HVDC converter station, up to 26 m high plus external equipment (such as lightning protection & railings for walkways), near Minster. A new substation would be located immediately adjacent.
- Removal of approximately 1 km of existing HVAC overhead line, and installation of approximately 2.25 km of new HVAC overhead line from the converter station and substation near Minster and the existing Richborough to Canterbury overhead line.

The project also includes modifications to sections of existing overhead lines in Suffolk and Kent, diversions of third-party assets, and land drainage from the construction and operational footprint. It also includes opportunities for environmental mitigation, compensation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups). The construction phase will involve various temporary construction activities including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way (PROWs).

The proposed development will include other required works, for example, temporary access roads, highway works, temporary works compounds, work sites and ancillary works.

The proposed application will seek authorisation for the compulsory acquisition of land and interests in and rights over land, overriding easements and other rights, the temporary use of land, and other ancillary powers.

The proposed project is an Environmental Impact Assessment (EIA) development, as defined by The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. An Environmental Statement will therefore be submitted as part of the proposed application, which will contain information about the environmental effects of the proposed project.

All documents, plans and maps showing the nature and location of the proposed development, including the preliminary environmental information, will be available to download free of charge from 24 October 2023 until 18 December 2023 on www.nationalgrid.com/sealink (via the document library page).

Reference copies of certain documents, plans and maps showing the nature and location of the proposed development will also be available to view free of charge from 24 October 2023 at the following locations in the vicinity of the project for the duration of the consultation (until 18 December 2023).

Materials will be available to view during the opening hours listed above, except in circumstances outside of NGET's control which prevent the locations specified from opening.

Requests for paper copies of the documents, plans and maps will be reviewed on a case by-case basis. To cover printing costs a reasonable copying charge may apply, to be paid for by the recipient and up-to a maximum value of £300 for the whole suite of consultation documents. These can be requested by contacting the Project Team via the details at the bottom of this notice.

How to respond to the consultation

The consultation is running between 24 October 2023 and 11.59pm on 18 December 2023.

Responses to the consultation can be submitted in the following ways:

- online via the Project's website (nationalgrid.com/sealink)
- scanning a paper copy of the response form or submitting a free text letter or email
- by post at Freepost SEA LINK
- by email (contact@sealink.nationalgrid.com)

A printed copy of the consultation feedback form can be requested by contacting the project team on the details below.

National Grid must receive all responses by 11.59pm on 18 December (or 2 January for postal feedback) to ensure their consideration. Please note that responses are likely to be made public, but that contact/personal details will be redacted.

When deciding on the final form of the proposed application for a development consent order for the proposed project, National Grid will take into account any response to this publicity on the consultation that is received before the specified deadline.

National Grid may be required to make copies of representations available to the Secretary of State. However, National Grid will request that personal details are not placed on the public record. Personal details will be held securely in accordance with the Data Protection Act 2018 and will be used solely in connection with the consultation process and the development of this project and, except as noted above, will not be disclosed to any third parties.

If you have any questions about the project or the consultation, please get in touch:

Email: contact@sealink.nationalgrid.com **Telephone:** 0808 134 9569

TOWN PLANNING

DEPARTMENT FOR TRANSPORT
TOWN AND COUNTRY PLANNING ACT 1990

The Secretary of State gives notice of an Order made under Section 247 of the above Act entitled "The Stopping up of Highways (East) (No.30) Order 2023" authorising the stopping up of 3 eastern part widths of the A134 Hythe Quay at Colchester in the City of Colchester. This is to enable development as permitted by Colchester City Council, under reference 211510.

Copies of the Order may be obtained, free of charge, from the Secretary of State, National Transport Casework Team, Tyneside House, Skinnerburn Road, Newcastle Business Park, Newcastle upon Tyne NE4 7AR or nationalcasework@dft.gov.uk (quoting NATTRAN/E/S247/5468). They may also be inspected during normal opening hours at Colchester City Council, Town Hall, Colchester, CO1 1FR.

Any person who wishes to challenge the validity of the decision to make the Order may apply to the High Court within 6 weeks from 24 October 2023.

S Zamenzadeh, Casework Manager (4470287)

DEPARTMENT FOR TRANSPORT
TOWN AND COUNTRY PLANNING ACT 1990

The Secretary of State gives notice of an Order made under Section 247 of the above Act entitled "The Stopping up of Highways (North East) (No.28) Order 2023" authorising the stopping up of 6 areas of unnamed highway adjoining the boundary of the Outer West Customer Service Centre, Library and Pool and an area of unnamed highway as lies off West Denton Way at Newcastle-upon-Tyne in the City of Newcastle-upon-Tyne. This is to enable development as permitted by Newcastle City Council, under reference 2022/0547/01/DET.

Copies of the Order may be obtained, free of charge, from the Secretary of State, National Transport Casework Team, Tyneside House, Skinnerburn Road, Newcastle Business Park, Newcastle upon Tyne NE4 7AR or nationalcasework@dft.gov.uk (quoting NATTRAN/NE/S247/5410). They may also be inspected during normal opening hours at Newcastle City Library, 33 New Bridge Street West, Newcastle upon Tyne, NE1 8AX.

Any person who wishes to challenge the validity of the decision to make the Order may apply to the High Court within 6 weeks from 24 October 2023.

NATIONAL GRID ELECTRICITY TRANSMISSION PLC
SECTION 48 OF THE PLANNING ACT 2008 (AS AMENDED)
REGULATION 4, THE INFRASTRUCTURE PLANNING (APPLICATIONS: PRESCRIBED FORMS AND PROCEDURE) REGULATIONS 2009
NOTICE PUBLICISING A PROPOSED APPLICATION FOR A DEVELOPMENT CONSENT ORDER FOR THE SEA LINK PROJECT

Notice is hereby given that National Grid Electricity Transmission plc (NGET) of National Grid House, Warwick Technology Park, Gallows Hill, Warwick, CV34 6DA intends to apply to the Secretary of State for a Development Consent Order (DCO) under Section 37 of the Planning Act 2008 (as amended) (the Act) to authorise the construction of the Sea Link Project.

The Sea Link Project ('proposed Project') involves the reinforcement of the electricity transmission network between Suffolk and Kent, predominantly via offshore High Voltage Direct Current (HVDC) link. The proposed Project is split into three distinctive elements, as follows.

The Suffolk Onshore Scheme

- A connection from the existing transmission network via Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Sea Link project.
- A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below).
- A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham.
- A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900 m inshore from a landfall point (below) where the cable transitions from onshore to offshore technology.
- A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).

The proposals in Suffolk have been developed for Sea Link as a standalone project, but also include opportunities to co-locate infrastructure for up to two further projects at the converter station, cable corridors and the landfall location.

The Offshore Scheme

- Approximately 130 km of subsea HVDC cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness), and the Kent landfall location at Pegwell Bay.

The Kent Onshore Scheme

- A landfall point on the Kent coast at Pegwell Bay.
- A TJB approximately 800 m inshore to transition from offshore HVDC cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station (below).
- A 2 GW HVDC converter station, up to 26 m high plus external equipment (such as lightning protection & railings for walkways), near Minster. A new substation would be located immediately adjacent.
- Removal of approximately 1 km of existing HVAC overhead line, and installation of approximately 2.25 km of new HVAC overhead line from the converter station and substation near Minster and the existing Richborough to Canterbury overhead line.

The project also includes modifications to sections of existing overhead lines in Suffolk and Kent, diversions of third-party assets, and land drainage from the construction and operational footprint. It also includes opportunities for environmental mitigation, compensation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups). The construction phase will involve various temporary construction activities including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way (PROWs).

The proposed development will include other required works, for example, temporary access roads, highway works, temporary works compounds, work sites and ancillary works.

The proposed application will seek authorisation for the compulsory acquisition of land and interests in and rights over land, overriding easements and other rights, the temporary use of land, and other ancillary powers.

The proposed project is an Environmental Impact Assessment (EIA) development, as defined by The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. An Environmental Statement will therefore be submitted as part of the proposed application, which will contain information about the environmental effects of the proposed project.

All documents, plans and maps showing the nature and location of the proposed development, including the preliminary environmental information, will be available to download free of charge from 24 October 2023 until 18 December 2023 on www.nationalgrid.com/sealink (via the document library page).

Reference copies of certain documents, plans and maps showing the nature and location of the proposed development will also be available to view free of charge from 24 October 2023 at the following locations in the vicinity of the project for the duration of the consultation (until 18 December 2023).

Materials will be available to view during the opening hours listed above, except in circumstances outside of NGET's control which prevent the locations specified from opening.

Requests for paper copies of the documents, plans and maps will be reviewed on a case by-case basis. To cover printing costs a reasonable copying charge may apply, to be paid for by the recipient and up-to a maximum value of £300 for the whole suite of consultation documents. These can be requested by contacting the Project Team via the details at the bottom of this notice.

How to respond to the consultation

The consultation is running between 24 October 2023 and 11:59pm on 18 December 2023.

Responses to the consultation can be submitted in the following ways:

- online via the Project's website (nationalgrid.com/sealink)
- scanning a paper copy of the response form or submitting a free text letter or email
- by post at Freepost SEA LINK
- by email (contact@sealink.nationalgrid.com)

A printed copy of the consultation feedback form can be requested by contacting the project team on the details below.

National Grid must receive all responses by 11:59pm on 18 December (or 2 January for postal feedback) to ensure their consideration. Please note that responses are likely to be made public, but that contact/personal details will be redacted.

When deciding on the final form of the proposed application for a development consent order for the proposed project, National Grid will take into account any response to this publicity or the consultation that is received before the specified deadline.

National Grid may be required to make copies of representations available to the Secretary of State. However, National Grid will request that personal details are not placed on the public record. Personal details will be held securely in accordance with the Data Protection Act 2018 and will be used solely in connection with the consultation process and the development of this project and, except as noted above, will not be disclosed to any third parties.

If you have any questions about the project or the consultation, please get in touch:

'Promising' results from *Nephrops* separator trial

– as NGO launches discards campaign

THIS PICTURE FROM AN upcoming *FN* feature on trials of two new trawls in the Farne Deeps *Nephrops* fishery – an innovative separator trawl and a coverless 'letterbox-style' trawl – was taken, by coincidence, the same week that NGO Open Seas wrote to UK retailers urging them to boycott scampi due to 'unacceptable' levels of bycatch in the fishery.

The two trawls are being trialled by North Shields skipper Peter Clark onboard his Gerry Smyth-built catamaran Lily James SN 36, in a FISP-funded project that will continue into 2024.

A separator grid ahead of the trawl's two codends has shown very promising initial results – so much so that Peter Clark is keen to keep it in operation after the end of trials.

See page 3 for the full story on the Open Seas campaign

The twin codends of the separator trawl coming over the stern of the Lily James.

Babet batters NE coast

Castlewood heading in to Peterhead last Wednesday, with severe weather warnings as Storm Babet approached. (Photos: Ryan Cordiner)

By Thursday lunchtime, Fruitful Bough was among the last vessels to make for shelter, with 65 knot winds forecast off North East Scotland that afternoon.

PUBLIC NOTICES

NATIONAL GRID ELECTRICITY TRANSMISSION PLC, SECTION 48 OF THE PLANNING ACT 2008 (AS AMENDED)
REGULATION 4, THE INFRASTRUCTURE PLANNING (APPLICATIONS: PRESCRIBED FORMS AND PROCEDURE) REGULATIONS 2009
NOTICE PUBLICISING A PROPOSED APPLICATION FOR A DEVELOPMENT CONSENT ORDER FOR THE SEA LINK PROJECT

Notice is hereby given that National Grid Electricity Transmission plc (NGET) of National Grid House, Warwick Technology Park, Gallows Hill, Warwick, CV34 6DA intends to apply to the Secretary of State for a Development Consent Order (DCO) under Section 37 of the Planning Act 2008 (as amended) (the Act) to authorise the construction of the Sea Link Project.

The Sea Link Project ('proposed Project') involves the reinforcement of the electricity transmission network between Suffolk and Kent, predominantly via offshore High Voltage Direct Current (HVDC) link. The proposed Project is split into three distinctive elements, as follows.

The Suffolk Onshore Scheme

- A connection from the existing transmission network via Friston Substation, including the substation itself. Friston Substation already has development consent as part of other third-party projects. If Friston Substation has already been constructed under another consent, only a connection into the substation would be constructed by the Sea Link project.
- A high voltage alternating current (HVAC) underground cable of approximately 1.7 km in length between the proposed Friston Substation and a proposed converter station (below).
- A 2 GW high voltage direct current (HVDC) converter station up to 26 m high plus external equipment (such as lightning protection & railings for walkways) near Saxmundham.
- A HVDC underground cable connection of approximately 10 km in length between the proposed converter station near Saxmundham, and a transition joint bay (TJB) approximately 900 m inshore from a landfall point (below) where the cable transitions from onshore to offshore technology.
- A landfall on the Suffolk coast (between Aldeburgh and Thorpeness).

The proposals in Suffolk have been developed for Sea Link as a standalone project, but also include opportunities to co-locate infrastructure for up to two further projects at the converter station, cable corridors and the landfall location.

The Offshore Scheme

- Approximately 130 km of subsea HVDC cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness), and the Kent landfall location at Pegwell Bay.

The Kent Onshore Scheme

- A landfall point on the Kent coast at Pegwell Bay.
- A TJB approximately 800 m inshore to transition from offshore HVDC cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station (below).
- A 2 GW HVDC converter station, up to 26 m high plus external equipment (such as lightning protection & railings for walkways), near Minster. A new substation would be located immediately adjacent.
- Removal of approximately 1 km of existing HVAC overhead line, and installation of approximately 2.25 km of new HVAC overhead line from the converter station and substation near Minster and the existing Richborough to Canterbury overhead line.

The project also includes modifications to sections of existing overhead lines in Suffolk and Kent, diversions of third-party assets, and land drainage from the construction and operational footprint. It also includes opportunities for environmental mitigation, compensation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups). The construction phase will involve various temporary construction activities including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way (PROWs).

The proposed development will include other required works, for example, temporary access roads, highway works, temporary works compounds, work sites and ancillary works.

The proposed application will seek authorisation for the compulsory acquisition of land and interests in and rights over land, overriding easements and other rights, the temporary use of land, and other ancillary powers.

The proposed project is an Environmental Impact Assessment (EIA) development, as defined by The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. An Environmental Statement will therefore be submitted as part of the proposed application, which will contain information about the environmental effects of the proposed project.

All documents, plans and maps showing the nature and location of the proposed development, including the preliminary environmental information, will be available to download free of charge from 24 October 2023 until 18 December 2023 on www.nationalgrid.com/sealink (via the document library page).

Reference copies of certain documents, plans and maps showing the nature and location of the proposed development will also be available to view free of charge from 24 October 2023 at the following locations in the vicinity of the project for the duration of the consultation (until 18 December 2023).

Requests for paper copies of the documents, plans and maps will be reviewed on a case by-case basis. To cover printing costs a reasonable copying charge may apply, to be paid for by the recipient and up-to a maximum value of £300 for the whole suite of consultation documents. These can be requested by contacting the Project Team via the details at the bottom of this notice.

How to respond to the consultation

The consultation is running between 24 October 2023 and 11:59pm on 18 December 2023.

Responses to the consultation can be submitted in the following ways:

- online via the Project's website (nationalgrid.com/sealink)
- scanning a paper copy of the response form or submitting a free text letter or email
- by post at Freepost SEA LINK
- by email (contact@sealink.nationalgrid.com)

A printed copy of the consultation feedback form can be requested by contacting the project team on the details below.

National Grid must receive all responses by 11:59pm on 18 December (or 2 January for postal feedback) to ensure their consideration. Please note that responses are likely to be made public, but that contact/personal details will be redacted.

When deciding on the final form of the proposed application for a development consent order for the proposed project, National Grid will take into account any response to this publicity or the consultation that is received before the specified deadline.

National Grid may be required to make copies of representations available to the Secretary of State. However, National Grid will request that personal details are not placed on the public record. Personal details will be held securely in accordance with the Data Protection Act 2018 and will be used solely in connection with the consultation process and the development of this project and, except as noted above, will not be disclosed to any third parties.

If you have any questions about the project or the consultation, please get in touch:

Man sentenced for biting friend on the leg after argument

A 21-year-old Suffolk man who bit a former friend on the leg during an argument has been given a suspended prison sentence.

JANE HUNT

Sentencing Kenny Sheldrick at Ipswich Crown Court, Judge Martyn Levett described the three or four bite marks as unpleasant and said that biting someone was the equivalent of using a weapon.

Sheldrick, who was homeless at the time of the incident, admitted assault causing actual bodily harm, two offences of criminal damage and breach of a suspended sentence order.

He was given a two-year prison sentence suspended for two years, a 60-day rehabilitation activity requirement and ordered to do 250 hours unpaid work.

Sheldrick was also banned from contacting the victim of the assault for five years.

Matthew Edwards, prosecuting, said that on February 13 this year Sheldrick had gone to his grandmother's home in Lowestoft and asked for money.

When she gave him £5 he had "gone berserk" and damaged her television, curtains and her BT and Sky boxes.

He had then gone next door to his great-aunt's house and damaged her garden fence.

She had called the police and described him as being "as drunk as a skunk".

Later the same evening Sheldrick went to a friend's house claiming he'd been robbed and asking to use his phone.

The friend and his partner didn't want him in their home because of his demeanour and Sheldrick had become violent and bit his friend on the leg several times.

The police were called and Sheldrick was arrested in Denmark Road, Lowestoft.

In a statement read to the court the victim of the assault said he'd had to have tetanus and hepatitis injections following the incident and had moved house.

Andrew Thompson, for Sheldrick, said his client had been in custody for eight months and had been a model prisoner.

He said Sheldrick had a history of alcohol and class B drug abuse and was homeless at the time of the offences.

» Golden moment for Ann and Michael

Congratulations to Ann and Michael on their golden wedding Image: SUPPLIED

Suffolk couple, Ann and Michael Boon have celebrated their golden wedding anniversary.

Ann and Michael first met at Gainsborough Ipswich Co-op in 1969.

Michael was then working in butchery and Ann, who had started in shelf-filling, was in charge of the fruit and veg stand.

The couple were married at Stoke Mary's Church in 1973 and had two sons, Mark, now 46 and Richard, now 43.

The couple have two grandchildren.

Ann said: "We had a wonderful surprise party given by our sons and planned and organised by Richard with help from my sisters and brother in law, Paul.

"It was amazing to have so many friends and family around and people we hadn't seen in such a long time."

The couple, who have lived in Glemsford since 1982, recorded their special day with photographs outside the church where they were married and outside the Co-op where they first met.

Congratulations Ann and Michael from all at the EADT.

If you would like us to mark a special anniversary or event, email our editor, Liz Nice, on liz.nice@newsquest.co.uk with details and a picture

» German restaurant

A new takeaway serving German delicacies has opened in a Suffolk coastal town.

German Street Food opened on October 11 at 69 Undercliffe Road in Felixstowe and serves up tradition German food such as schnitzel, frikadeller, and bratwurst.

Kimberly McConnachie, owner of the business, is half-German and has lived in the UK for the last 14 years.

"The only thing I have missed is currywurst," she said.

The food served is made from family recipes, and one customer from Germany said the food was "not like any other takeaway".

"It's as homely as I can make it," said Kimberly. "We haven't had a single complaint yet."

Despite only opening earlier this month, the business has been much busier than expected and already has five-star reviews on Just Eat, which customers can use to order their takeaway.

Future plans for German Street Food include celebrating holidays and events that are big in German such as Oktoberfest, Christmas and Easter.

For Christmas, Kimberly plans to decorate the building like a mini Christmas market and serve a selection of Christmas specialities such as Lebkuchen, traditional German cookies.

German Street Food is open from 12pm-8pm on Tuesdays through to Fridays, and 12pm to 9pm on Saturdays and Sundays.

» Suffolk hotspots

Lifestyle guide Muddy Stilettos has revealed its 2024 list of the best places to live and Suffolk has bagged 10 spots.

The list features 250 of the best places to live across 28 counties in England, using their insider knowledge of the loveliest villages, towns and cities.

The guide also compiles the best schools, best on categories such as early years and boarding, and weekend escapes.

The ten best places to live in Suffolk are East Bergholt, Framlingham, Bury St Edmunds, Woodbridge, Southwold, Long Melford, Beccles, Kersey, Halesworth, and Lavenham.

Muddy Stilettos describes Suffolk as "a county that has it all".

The organisation added: "Look no further than this Eastern idyll that is home to everything from charming medieval market towns and chocolate box villages to miles of stunning coastline and pretty open countryside."

Bury St Edmunds is described as "the jewel in the crown of Suffolk" with its streets lined with town houses and a lively food and arts scene.

The full list of all the best places to live in England can be found on the Muddy Stilettos website.

Staff at a care home in Woodbridge helped a stranded delivery driver

Image: HEALTHCARE HOMES GROUP

» 'Heroic' care home

Staff from a care home in Ipswich are being called heroic after battling waist-high water and high winds to reach stranded residents.

Barking Hall was cut off as flood waters rose as Storm Babet battered the county.

Manager Rebecca Watkins and other members of her team waded through waist-high water to reach the care home to ensure the safety and well-being of the residents.

Rover Rescue, a local emergency response organisation, arrived to rescue stranded staff and bring in additional carers who could not reach the home.

Ms Watkins said: "The team at Barking Hall has been amazing."

"Many have worked a 24-hour shift to ensure our residents' safety. I am honestly so proud of the team and their commitment to their residents".

Staff at Foxearth Lodge, in Woodbridge, are also being praised for their "exceptional compassion" after a driver delivering emergency medication was left stranded after his van submerged in flood water.

Staff at the care home offered him refuge, dry clothes, and a bed for the night.

Arrests and drugs seized in Suffolk county lines crackdown

Police engaged with more than 2,400 people as part of a national week of action which saw arrests and the seizing of drugs in a bid to tackle county line dealing.

PARIS MAREN-HUME

During County Lines Intensification Week, which took place from October 9 to 15, a number of warrants and police interactions took place with 31 arrests being made.

County lines is a term used to describe the involvement of organised criminal networks and street gangs in moving illegal drugs.

In total 66.6g of crack, 195.8g of cocaine, 16g of heroin, 1kg of cannabis, 1.5kg of ketamine, £49,242 in cash, and phones believed to be involved in the dealing and supplying of drugs were seized. Several weapons were recovered, these included knives, batons, and suspected imitation firearms.

Following the week, detective chief inspector Matt Bodmer said: "The results demonstrate that Suffolk Constabulary and its partners continue to disrupt those involved in county lines.

"I recognise that we cannot arrest ourselves out of county lines criminality, so the work carried out to visit those that live or work in our communities who are vulnerable to being exploited is a more considered approach."

Other work completed by Suffolk police included visiting schools to help children and young people spot the signs of exploitation and explain the different support available. In total police engaged with around 1,600 pupils at schools across the county.

Tim Passmore, inset, police and crime commissioner for Suffolk, said: "The threat from hardened criminals involved in this wicked crime cannot be overstated which is why this vital policing work must continue.

"No stone will be left unturned to bring these drug barons to justice."

Other initiatives that took place during the week included stops at HMP Highpoint, weapons sweeps, and the use of drug testing at Newmarket Racecourse.

Game shop marks two years' trading

A game and 'geek central' shop in Ipswich that has become a safe space in the town centre is marking two years of success.

TOM CANN

Geek Retreat Ipswich first opened its doors on October 23, 2021, and has received great acclaim for its inclusivity and community feel.

The Upper Brook Street shop has run hundreds of events for all ages over the past two years, including Pokémon, Crochet and Magic of the Gathering.

Owner Sharon Lockhart said: "This space has become more than we could have ever dreamed.

"Our community have become family and friends.

"We want to say thank you to our customers.

"This is their birthday celebration as much as it is ours."

Also over the past two years, the shop has held many events for charities in the area, including weekly meetups for adults and groups supporting Young Epilepsy and Autism Anglia.

Gary Scarboro, shop manager, said: "We are so proud of the fundraising we have done and helped support.

"We knew times are tough for many and we have helped raise funds for Ukraine, gathered food bank donations for University of Suffolk Student Support and given many vouchers and donations to charities in Ipswich."

Sharon continued: "Many people have said that we have changed their lives or helped when they have been struggling.

"We never knew this would happen."

More recently, Geek Retreat Ipswich became one of the first Lorcana Play shops and now holds events with the new trading card game by Ravensburger, featuring Disney characters.

Despite the success of the shop, there have been some moments of challenge for the site located on Upper Brook Street.

The shop has had to deal with anti-social behaviour, damage and shoplifting.

Shock as company behind Norwich walk-in centre collapses

DAVID HANNANT

Thousands of people could be left struggling for healthcare after the company behind the city's busiest GP surgery announced it is going bust.

One Norwich Practices, which runs the Rouen Road NHS walk-in centre, has confirmed it will be closing in "the coming months" due to financial turmoil.

It has left NHS bosses scrambling to find alternative providers for the services it provides - which also includes the vulnerable adults services and the GP surgery in Rouen House, which has more than 10,000 registered patients.

The decision places uncertainty over how the thousands of people who rely on the company will instead access healthcare should alternative providers not be found.

Tracey Bleakley, interim chief executive of NHS Norfolk and Waveney, said: "We are naturally disappointed that this decision has had to be made.

"Our priority now is to minimise the level of disruption to patient services and ensure that patients are able to receive the care they need.

"We have been and will continue to work closely with colleagues across the Norwich primary care network and ONP to continue to provide patient services through the transition period, while also securing alternative providers to take on the full suite of services that they were contracted to deliver."

It comes after a lengthy period of uncertainty around the future of the walk-in centre - which NHS bosses had considered closing.

Paul Wood, interim chief executive of ONP, said: "It is with great sadness that we have come to the difficult conclusion that ONP cannot remain financially and operationally sustainable beyond 2024.

"We will be working very closely with NHS Norfolk and Waveney ICB (Integrated Care Board) to ensure an orderly transition and we will assist in the development of service transfer plans to safeguard services and transfer over as many staff as possible to the new provider or providers once these are identified.

"We will not be making any statutory redundancies until we know the outcome of the service transfer plans."

It is hoped new providers will be found to replace the services offered by ONP - which also offers healthcare access for asylum seekers and runs an asthma service in schools.

But councillors fear it would have disastrous effects.

Lucy Galvin, Green city councillor, said: "This shocking news is highly concerning.

"It's potentially a disaster for healthcare in the city as there will be a huge knock-on effect on all other local provision - many services will struggle to fill in the gaps, as will A&E at the hospital.

Green councillor Lucy Galvin

Alex Stewart, Healthwatch Norfolk Image: Healthwatch

"Most importantly, patients at staff at all the One Norwich services deserve clarity on what this announcement means for them now and their access to vital healthcare, and for staff, their jobs."

Concerns about the organisation's financial situation were expressed earlier this year when a study into the walk-in centre conducted by Healthwatch found it was running at a loss.

Alex Stewart, chief executive of Healthwatch Norfolk, said: "We are very concerned about the circumstances that led to this announcement.

"Just 12 months ago, One Norwich was forecasting a growth in turnover and income and an ambition to develop new services.

"A lot appears to have changed in that time.

"Communication is key in the weeks ahead and we would urge ONP and NHS Norfolk and

Academy at accused of trying to be 'School of Rock'

An oversubscribed academy has been accused of trying to be a 'School of Rock' after it emerged it had been prioritising musically gifted applicants.

DAVID HANNANT

Officials have rapped Hethersett Academy over an admissions policy which means pupils with musical talent are more likely to get into the school.

The Inspiration Trust school is among the most oversubscribed in Norfolk which has seen it at the centre of a row over admissions.

It also has its own musical scholarship, which is available to 25 pupils each year, for which applicants have to take part in X Factor-style auditions.

After changes to its admissions policy this year sparked government officials to investigate, it is now facing accusations of trying to be Norfolk's own 'School of Rock'.

The investigation was sparked after the academy adopted Eaton Primary School as a named feeder earlier this year.

The move led to fears that pupils from another of its feeder schools - Mulbarton Primary - would miss out on places in the outstanding-rated school.

Then, after almost 40 Mulbarton pupils missed out on their chosen secondary schools, the case was referred to the Office of the Schools Adjudicator.

Hethersett Academy has been accused of trying to be a 'School of Rock' Montage: NEWSQUEST/PARAMOUNT PICTURES

Fears were expressed at the time that Eaton pupils would be given an unfair advantage over Mulbarton - despite it having other schools closer.

Officials investigating the school found insufficient evidence to back this claim - but did express concerns about the musical scholarship.

It found that when the school is oversubscribed, children with musical abilities are being given higher priority than both feeder schools involved in the row.

This, the officials say, falls foul of admission rules and will have to be changed.

An Inspiration Trust spokeswoman said: "A full audit of the Hethersett Academy admission policy has been carried out.

"As a result, some of the wording and processes of our musical scholars' scheme will be amended for the 2024 admissions process."

EAT MY WORDS

‘Pub’s French bistro is best restaurant I’ve been to in UK’

The delicious filet mignon at Bistro Valerie

The moules frites - mussels and chips; and, right, the chicken liver parfait starter

By Max Chesson
mchesson@thekmgroup.co.uk

I could be accused of being ignorant of French cuisine and culture, despite my insistence Pinga’s 2007 film Ratatouille is a work of art underappreciated by the masses.

I’ve simply never found the idea of mussels and snails appetising.

But on a gorgeous Saturday evening in Hythe, my colleagues and I’m excited to try one of Kent’s newest eateries.

Bistro Valerie - offering a full traditional French menu - has recently opened at The Old Coach and Horses pub.

Our booking is for 6.30pm and when we arrive it’s eerily quiet - our arrival doubles the number of people present in the main bar area.

But upstairs is where we will dine for the night, with elegant crimson red and various pieces of art adorning the walls. Subtle lighting and half-melted candles add to the gentle atmosphere.

It’s just as quiet here too, though this is actually to our benefit as it allows for a far more intimate start to the meal.

I stare at the menu, knowing full well I should push the boat out and try something new, while also knowing my girlfriend will order more traditional food I can sample.

For starters, I opt for the garlic prawn skewer. My partner chooses the chicken liver parfait, served with red onion chutney.

Coming out on a slate rather than a plate, the bronzed prawns glisten under the candlelight and look fit to burst.

My fresh I can still see them swimming, they almost explode in my mouth as I bite into them - a herby, deliciously juicy treat.

I sample the parfait too and I’m pleasantly surprised by how much I enjoy the smooth, rich meaty flavour of the spread. It’s effortless to devour.

The only fault in this course would be a lack of bread - but given the size of the filet mignon that comes out of the kitchen, that might have actually been a saving grace.

Two five-ounce, chargrilled prime cuts of medallion cooked to medium-rare perfection arrive at our table, with confit potatoes and a piping hot peppercorn sauce.

The meal is clearly off to a winner when people stop and stare when the waiter brings it out of the kitchen, with a great cut next to me salting the food.

By this point the bistro has welcomed a few more people and it’s satisfying to see our hard-low diners also tapping up the meals that come their way.

My knife glides through the meat as if it were butter and each bite is flavoursome, perfectly seasoned and tender.

As for the other main course, the mussels slosh around an interesting little pot and I find the technique of using the shells to eat them rather fascinating.

But now it’s time for the tasting. I chuck my eyes, ready to recoil in horror the second the mussel hits my mouth - with hands firmly on a glass of Pepsi to wash away the taste.

Instead, in what has become a recurring theme of this piece and my dining experience, I find myself surprised and even savouring something I would usually never have given the time of day.

A creamy white wine sauce complements the slightly salty, tender mussel meat and nothing about the assortment hits it down - the balance is brilliant.

Though I have nothing to compare it to, my partner rates somewhat to recipe quality food high praise all round.

Throughout the night the possibility of dessert has almost taunted us, but the truth is I’m adequately satiated and anything else will tip me over the edge.

But despite only managing two courses, I have to say how impressed I am with how the chefs here have brought that slice of Paris to Hythe’s doorstep.

I’ve gone from being afraid of anything that might rock the boat to wishing I’d been braver a lesson learned for next time.

I’m by no means a regular fine diner but I’ve been lucky enough to eat out all across the country. Yet right here on my doorstep is the best restaurant I’ve been to in the UK.

It beats a visit to Gordon Ramsay’s Restaurant and it completely blows dining experiences at The Shard in London out of the water.

In fact, I’d go as far as to say it’s in my top three favourites across the globe (though it doesn’t quite have me as a chokehold like Hestonas Paris in Pulgeras, Montenegro).

I don’t know the ins and outs of how the Michelin Guide works - but I wouldn’t be surprised at all to see it feature this Tin Valerie at some point in the future - the sooner the better as far as I’m concerned. This place deserves a lot more attention, and having been open for just a matter of weeks, the future is very exciting.

Ratings out of five

Food: It was a truly tasty experience and there is a good range on the menu without being overwhelming *****

Drink: Pepsi’s and a Strawberry Daiquiri aren’t really an French as the food but they do the job and there’s a fantastic range for those more sophisticated than me *****

Decor: I’ve only been to Paris a few times, all of them as a child, so I can’t compare it to the real thing, but I found it to be charming *****

Staff: The two teenage waiting staff were keen to impress and carried a fine air of composure *****

Price: With the meal costing £85, it’ll be a luxury for many families and some will be priced out altogether. However, for the quality of food, it’s justified *****

Stay in the loop...

VILLAGE LANE TO SHUT FOR MONTHS

A2 closures for ‘vital’ bridge works

By Chantal Weller
cweller@thekmgroup.co.uk

Overnight closures and lane restrictions on a dual carriageway will be implemented while “critical safety work” takes place on a bridge.

National Highways will be completing the repairs on the structure along the A2 at Bridge near [redacted].

The country road it passes over is also set to shut for several months.

Patrixbourne Road will be shut of action for about four months from Monday until the work is completed in the spring.

Some 56 bearings will be replaced on the bridge which carries the dual carriageway over the lane.

A National Highways spokesperson said the essential maintenance work will replace the joints that attach the road deck to the supports below.

They added: “We know that living, working, and travelling in the area while we make these vital safety improvements won’t be easy, so we are grateful for the patience and understanding shown.”

Ahead of the start of the vital maintenance work National Highways project manager, Nicola Thorp, said: “It’s vital that structures on National Highways’ motorways and major A roads are kept in good condition to make sure they remain safe, reliable, and keep traffic moving.

“Like any bridge, it requires regular maintenance to ensure it remains safe and reliable for the thousands of motorists who use it daily. This upcoming scheme is part of our ongoing efforts and investment in keeping key routes in the south east in good condition.”

A diversion will be in place via Patrixbourne Road, The Street, Bifrons Hill, Bekesbourne Road, Town Hill and High Street.

For the safety of the workforce, narrow lanes and a reduced speed limit will be in place on the A2 where it passes over Patrixbourne Road while work is done.

This means the A2 eastbound will be closed between Harbledown (A2000) and Cold Harbour Lane on Saturday, November 4 and Sunday, November 5, between 8pm and 6am.

The A2 towards London will also be shut between Bonny Bush Hill and Roman Road (A2000) on Saturday, November 18 and Sunday, November 19 between 8pm and 6am.

Finally, the A2 will also be out of action in both directions from 8pm on Saturday, December 9 until 6am Sunday, December 16.

During the closures, a 15-mile signed diversion will be in place via the A299 Thanet Way and A256 to the Whitfield roundabout from Bromley Corner adding an extra 14 miles on to the journey.

The bridge which carries the A2 over Patrixbourne Road in Bridge, Canterbury is to have 24 bearings replaced in essential maintenance work

The A2 will have lanes narrowed and speed restrictions as well as overnight closures during the works

Appeal after serious crash

POLICE are appealing for information regarding a serious collision near Hadlow.

At 5.28pm on Sunday, a white Yamaha 125 motorcycle and a second motorcycle were travelling along Carpenters Lane towards Hadlow, when the Yamaha was involved in a collision with a silver DAF horsebox van.

The bike rider and passenger suffered serious injuries. Both were taken to a London hospital - a 17-year-old boy is in a critical condition and a 15-year-old boy is in a serious but stable condition.

The second motorcyclist did not stop and the rider, an 18-year-old man, has since been arrested.

Anyone who saw what happened, or has relevant dashcam or CCTV footage, should call 01622 798538, or email scu.td@kent.police.uk, quoting reference SM/JM/115/23.

Girlguiding activity centre put up for sale

SADNESS AS POPULAR SITE GOES ON THE MARKET FOR £4 MILLION

Blackland Farm training and activity centre

A SPRAWLING activity centre which has provided fun, life lessons and treasured memories for thousands of children in the Girlguiding and Scouting movements for decades has gone up for sale.

Girlguiding UK confirmed its controversial decision to sell all five of its activity centres last month – including Blackland Farm, near East Grinstead.

The land, which includes fields, woodlands and streams, has now gone on the market with Savills with a guide price of £4 million.

The brochure states prospective buyers have "the opportunity to acquire a significant 123-acre estate located in the unspoiled Sussex countryside, with a wide range of accommodation across the site offering a range of potential alternative uses, subject to obtaining the necessary planning permission".

The sale includes the site's 34 campsites, with toilet and shower blocks, which can accommodate 3,000 people. It also includes three self-catering holiday houses, heated indoor swimming pool, activity areas which include an abseil tower, abseil wall, indoor and outdoor archery, bouldering wall, bungee trampoline, tunnels, high ropes and zip wire, plus an array of support and storage buildings.

There is also a substantial private four-bedroom home with two-acre garden, and another private three-bedroom cottage on the site.

The sale of Blackland Farm, and the other sites being disposed of, has caused an outcry and tens of thousands of people have signed petitions calling for them to be saved.

Girlguiding UK says it cannot afford the investment the centres need, which resulted in its board of trustees recommending they be sold in May.

The news that the site, off Grinstead Lane, was on the market has sparked more sadness and more questions about if it could be saved.

Reacting on Facebook, Fiona Watkins said: "As a local Guiding leader I was there on Sunday with 27 of our five to seven-year-old Rainbows for a full day's activities.

"It's an amazing place – the staff are awesome. I'm truly gutted it's come to this. It's such a busy place with Guiding, DofE, schools, baby swim lessons, bike clubs..."

Others said they were "heartbroken" and commented on the "terrible loss" to the young people of the area and beyond.

Girlguiding UK says there has been "historic underinvestment in the activity centres due to financial pressures and they have been running at a loss for some years".

"The centres would need significant funding of over £20 million in the coming years to be fit for future use and regrettably we cannot afford this level of investment.

"Furthermore, the activity centres have been used by less than 10% of our membership each year for the past decade."

It said funds from the sale of the activity centres will be put into a designated investment fund to support Girlguiding activities.

Shop worker struck with bottle

A CCTV image of the suspect

A SUSPECTED shop thief repeatedly beat a supermarket security guard around the head with a glass bottle.

Kent Police have issued a CCTV image of someone they would like to speak to in relation to the assault in Tonbridge.

It happened on Thursday, September 28, at Sainsbury's in the Angel Centre.

It is reported that at around 8.40pm the victim challenged a man inside the store following suspicions he was trying to steal several bottles of spirits.

The suspect is alleged to have used one of the bottles as a weapon and repeatedly beat the victim around the head, before he fled the scene. The victim was taken to hospital with laceration injuries.

DC Jo Slevin of West Kent CID said: "The violence used against the victim was appalling, he was struck with such force that the bottle shattered."

Anyone with information should call 01622 604100, quoting reference 46/174352/23. You can also contact Crimestoppers, anonymously, on 0800 555111, or by using the form on their website.

Row over council plan to close down recycling sites

By HUW OXBURGH

A ROW has erupted over Wealden District Council plans to close its community recycling points.

The issue arose after the council's Conservative group issued a statement calling for a reversal of plans to close the sites, where residents can drop off glass, cardboard and some other forms of household waste for recycling.

The council has confirmed it is moving forward with plans to decommission these sites both as a way to tackle issues of fly-tipping and to save money, as the sort of waste collected can already be put out on the kerbside.

In the statement, Hadlow Down councillor Michael Lunn criticised the impending closure of the site in his ward, saying residents wished to keep the facility.

He said: "There is no reason for it to be closed, it is well-used and well-liked. We have not experienced fly-tipping, the site is hidden within the compound of Wilderness Wood.

"My appeal for the council to reconsider fell on deaf ears and now it's time for the community to speak.

"Under Conservative control, Wealden had the highest recycling rate in East Sussex. Rather than doing the bare minimum required of it by legislation, Wealden should continue to lead the way in recycling initiatives."

Conservative group leader Ann Newton added to the criticism saying the council's Green/Lib Dem administration should be "encouraging recycling as much as possible".

However, a council spokesman said the plans to close the sites began in 2020 – a time when Conservatives controlled the council.

The Conservative group have disputed this, saying the previous administration had never signed off on such a policy. Former cabinet members acknowledged that several sites have closed in recent years, but said these closures were on a 'case-by-case' basis, typically where fly-tipping was present.

They say the council can and should prevent further closures.

In briefing notes, officers told councillors that the decision to close the sites had been made by the council's head of service in July 2019, shortly after the authority moved its waste contract to Biffa.

Cllr Michael Lunn At Hadlow Down Recycling Point

£1,000 meat stolen during 3 burglaries

AROUND £1,000 worth of meat was stolen during burglaries in Five Ashes and Mayfield.

Police have made an appeal following the three separate incidents, which took place in the early hours over one weekend, September 1 to 3.

Two quadbikes, a mini-motorbike and electrical tools were also stolen from an area near the A267.

Police have confirmed that these items were stolen from three properties near the busy A road. An appeal for witnesses has now been launched to find those responsible.

A spokesman for Sussex Police said: "Police would like to speak to anyone who saw any suspicious behaviour in the area around this time, or who may have captured any relevant CCTV, doorbell or dash cam footage.

"Anyone with any information is asked to report it to police online or via 101, quoting 47230122362." No arrests have yet been made.

East Kent Mercury- Advert

More giant cruise ships set to dock at harbour

By Ollie Leonard
oleonard@thekmgroup.co.uk

More giant cruise ships could be set to dock in the district after plans to upgrade a historic pier were revealed.

Bosses at the Port of Dover want to replace cast iron bollards on Admiralty Pier - first built in 1847 - with new quick-release hooks in a bid to attract larger vessels.

The site already welcomes a number of cruise liners each year but chiefs say they now require "substantial mooring capacity beyond what is currently available".

They have submitted plans to Dover District Council for five powered quick-release hooks on the Grade II listed site.

In a statement submitted with the application, port bosses say the scheme will enable the harbour to accommodate modern cruise liners.

A statement said: "The proposals are to install five new, powered, Quick Release Hooks (QRH) to enable the harbour to accommodate modern cruise liners. The existing cast iron bollards are not capable of providing the required mooring due to their maximum load capacity of 26-tonne each.

"It will require the removal of tarmac covering and carefully lifting the granite setts beneath. The visual change, on completion of the works, would amount to the bollards themselves, the immediate concrete slabs on which they sit.

"Various options for the installation of the required mooring capacity have been considered and the current proposals have been chosen since they cause the least visual and physical harm to the heritage asset."

Bosses at tourism group Visit Kent have backed the proposal, which has also been supported by The Dover Society.

"We fully support the plans the Port of Dover has submitted, which forms part of routine work on its operational facilities to maintain high standards for the diverse range of cruise ships that choose Dover as their UK port of choice," Visit Kent chief executive Dorothy Wells said.

"We know that the cruise industry contributes about £10 billion to the UK economy and supports more than 80,000 jobs so any initiative that helps to deliver more visitors to Kent can only be a good thing."

During lockdown, Disney cruise ships docked in Dover amid restrictions on worldwide travel.

The Disney Magic liner spent 15 months in the town during the height of the pandemic.

Family face agonising wait after dad's crash

By Sam Lennon
slennon@thekmgroup.co.uk

A family is facing an agonising wait as a father-of-four remains unconscious abroad after a suspected stroke.

Kie Mathias, 37, of Lydden near Dover, is in hospital with broken bones and head injuries after an accident on his hired motorcycle.

He was involved in a collision with a trolleybus - a cross between a tram and a bus - in Athens last Friday.

Because he is too unwell to talk, his family do not know if he has the insurance for his medical care and transportation home.

Kie's brother, Dan Mathias, who flew to Greece to be by his side, said: "It is an agonising waiting game but someone to

Kie Mathias is currently unconscious in a Greek hospital after being injured in a crash

the family will be with him all the time.

"I haven't even bought a return ticket back from Greece but I am staying at least until our mum and dad come over."

Dan says their father, Steven, flew to Greece almost immediately after hearing the news, but travelled home on Monday night and will return with their mother Bernice tomorrow (Thursday).

Kie - who was travelling alone - has a broken leg, multiple fractured ribs, internal bruising and head injuries, although no surgery is needed.

But he is completely unconscious, under sedation and on a ventilator.

Dan has now set up a GoFundme page to help raise vital funds.

The page states: "Kie was unfortunately involved in a serious motorcycle accident while visiting Athens in Greece.

"As it stands we are unable to confirm if his holiday package included insurance as we are not able to access his phone.

"We are assuming no at this stage.

"He is currently in a serious condition and sedated while they assess the full extent of his injuries.

"Once he is in a stable condition our number one priority is to fly him back to the UK for continued treatment.

"Me and my dad arrived in Greece just hours after being informed about the accident.

"We managed to track down where he was staying as he had hotel keys with his personal items.

"I was deeply saddened by the conditions he was staying in.

"The hotel was in a run down area and the room was horrendous.

"I imagine he hired a bike to make the most of his trip and get out of the hotel.

"Kie is a father to four beautiful girls who really need him home and well.

"We desperately need help paying his medical bills and getting him back home as soon as possible please help by donating anything you can afford."

Experienced motorcyclist Kie - a plumbing engineer - had been on a five-day solo trip when the accident happened. He was due to fly home on Sunday.

The crowdfunding page had raised £9,210 out of a target figure of £50,000 as the Mercury went to press.

Once Kie is stable the family plan to fly him home for continued medical treatment at the UK.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	**STATUTORY CONSULTATION FOR THE PROPOSED SEA LINK PROJECT** Thank you for the opportunity to comment on the statutory consultation for the Sea Link project and the Preliminary Environmental Impact Report (PEIR). Anglian Water is the sewerage undertaker for the proposed onshore project area for the grid connection and substation within the Suffolk element of the project.	N	This comment has been noted by National Grid.
		DCO process, construction, onshore mitigation	Anglian Water has welcomed preliminary discussions with the Sea Link team regarding the proposed Suffolk Onshore Scheme and interfaces with our assets, which has assisted our understanding of the project and our response to this consultation. As part of our ongoing pre submission engagement, we would welcome continued dialogue regarding: • The Draft DCO Order including protective provisions specifically to ensure Anglian Water's services are maintained during construction • If for wastewater services are required for onshore infrastructure (e.g. substation and converter station) • The impact of development on Anglian Water's assets and the need for mitigation • Pre-construction surveys	N	Continued dialogue on all these aspects is welcomed. Draft protective provisions text is being produced and will be shared for consideration by Anglian Water. Wastewater services would be required for the substation and converter stations and applications for these would be processed. A statement of common ground would be produced based on the current Memorandum of Understanding to identify agreed mitigation. National Grid intends to include protective provisions for the benefit of statutory undertakers in **Application Document 3.1 draft Development Consent Order Schedule 15 Protective Provisions** and will continue ongoing discussions with the relevant statutory undertakers.
		Coordination with other projects, design	**CHAPTER 4 DESCRIPTION OF THE PROPOSED PROJECT** **Proposed Friston Substation** We welcome the approach taken in coordinating as far as possible with both the Five Estuaries and North Falls Offshore Wind Farm proposals, which are nationally significant infrastructure projects we are also in engagement with. It is noted from the PEIR [1.4.2.15] that the proposed project does not include alterations to Friston Substation to accommodate co-location as any changes will be part of the separate project consents. There are no proposed sewer connections to our network regarding this element of the proposed project.	N	This comment has been noted by National Grid.
		Converter station location, DCO process, design	**Saxmundham Converter Station** We are aware that there are currently three options for accessing the Converter Station, one of which will require a diversion of an Anglian Water foul sewer [S-BM09]. Early engagement has been undertaken with Anglian Water regarding the interfaces with our apparatus, and we would welcome continued dialogue going	N	Continued dialogue on all these aspects is welcome. Draft protective provisions text is being produced and will be shared for consideration by Anglian Water taking into consideration the text provided by Anglian Water, wastewater services will be required for the substation and converter stations and applications for these will be processed. A Statement of Common Ground

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			forward regarding the necessary measures for diversionary works should this access option prove to be the most feasible. Anglian Water has previously provided our template Protective Provisions for inclusion in the draft DCO. We would wish the consideration of our Protective Provisions to be taken forward by NGET, as part of a regular pre-submission engagement programme between both parties. We would advise that preliminary pre-planning enquiries are made by NGET on our Inflow system regarding a sewerage connection for the Saxmunham Converter Station, to enable NGET to consider the most feasible option. If an alternative onsite option should prove to be more practicable, such as a package treatment plant resulting in no foul drainage connections to our network, we would request that the statutory power to connect to our network is not included in the draft DCO. Furthermore, we note on the General Arrangement Plan Suffolk Colocation of Converter Stations [S42_S/IGA/SS/0008] that there are proposed permanent attenuation ponds for each of the proposed locations, with outfalls proposed to nearby watercourses. This would suggest that no surface water connection is required to a public sewer, and surface water will be managed onsite via sustainable drainage systems. We would support this approach and seek confirmation through a Statement of Common Ground between NGET and Anglian Water.		will be produced based on the current Memorandum of Understanding to identify agreed mitigation. National Grid intends to include protective provisions for the benefit of statutory undertakers in **Application Document 3.1 draft Development Consent Order Schedule 15 Protective Provisions** and will continue ongoing discussions with the relevant statutory undertakers. National Grid acknowledges your comment regarding a sewerage connection for the Saxmundham Converter Station; however, the treatment of wastewater arisings is still subject to engineering design. National Grid confirms that there is currently no intention to discharge surface water to the public sewer. A Statement of Common Ground will be pursued.
		Landfall location, design, water environment	**Suffolk Landfall – Transition Joint Bay (TJB)** Anglian Water notes that the PEIR 1.4.2.57 references that no below ground vertical limit of deviation has been proposed. We would agree that this is sensible given that we have assets between the landfall and TJB, and the potential to avoid having to divert our assets and ensure a sufficient depth and distance for the protection of our assets can be achieved.	N	This comment has been noted by National Grid.
		Construction, water environment, design	**Construction Sites** Anglian Water would seek to engage with NGET further regarding any temporary connections to our network for the proposed construction compounds illustrated on Figures 1.4.16 and 1.4.17, and request, like our comments regarding the Saxmundham Converter Station, that similar pre-planning enquiries are made to our Inflow system should connections to our network be a consideration. We note [para. 1.4.5.14] that temporary drainage during the construction process would use sustainable drainage systems (SuDS) where necessary, and we would support this approach.	N	This comment has been noted by National Grid. Applications will be raised where necessary.
		Water environment,	**PEIR CHAPTER 5 WATER RESOURCES**	N	It has been agreed with Anglian Water that further investigation on the asset will be required to determine the mitigation approach to be progressed.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		intra-project cumulative effects, construction	Anglian Water notes that the potential for likely significant effects on the water environment receptors during operation and maintenance has been scoped out. The overall effects during construction are likely to be limited to localised and temporary changes at watercourse crossings. Access option S-BM09 crosses the River Fromus and is likely to include a diversion of our asset in this location, which the Flood Risk Assessment would need to document and report in the Environmental Statement, should this option be taken forward. 2.5.7.16 We welcome that the PEIR states that further information on the sewer network will be collected and information regarding any connections to or potential for effects on our network will be provided in the Flood Risk Assessment.		Further information regarding the potential for requiring connections to the sewer network is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The main sewer runs along the bank of the River Fromus with the exact location to be confirmed in discussions with Anglian Water and via site trial holes. National Grid has agreed that if it is within 5 m of the proposed abutments then National Grid will protect or divert it depending on how close it is. If it does need to be diverted, National Grid would need to bring the sewer away from the river and agree an alignment with Anglian Water that falls within the Order Limits. Ongoing discussions to agree the final solution are being held with Anglian Water including discussions over Protective Provisions.
		DCO process, consultation	**CONCLUSION** In conclusion, Anglian Water would want to minimise the disruption to customers and cost to the project of diverting, relocating and provision of wastewater pipelines and infrastructure, and certainly the onshore route through Suffolk has limited impact on our assets. Continued engagement would serve to enable pre-submission agreement on Protective Provisions for those assets within the proposed order limits, and the submission by NGET of an agreed Statement of Common Ground with Anglian Water. This in turn reduces the Examining Authority questions for statutory undertakers and removes the possible need for changes to the project during Examination.	N	This comment has been noted by National Grid. National Grid has continued to liaise on minimising impacts to Anglian Water's assets. Further detail on engagement can be found in **Application Document 5.1 Consultation Report** and **Application Document 7.4 Statement of Commonality**.

Table 1.2 Cadent Gas

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, onshore mitigation	I understand that yesterday was the closing date however due to a staff illness our response was not submitted yesterday. I hope our response can be considered in the normal manner. I refer to your letter dated 1st November 2023 regarding the above proposed DCO. Cadent has reviewed the project plans provided and wishes to make the following comments: In respect of existing Cadent infrastructure, Cadent will require appropriate protection for retained apparatus including compliance with relevant standards for works proposed within close proximity of its apparatus, **Cadent Infrastructure within or in close proximity to the development** Cadent has identified the following apparatus within the vicinity of the proposed works: High and Intermediate pressure (above 2 bar) Gas Pipelines and associated equipment Low and Medium pressure (below 2 bar) gas pipes and associated equipment. (As a result, it is highly likely that there are also gas services and associated apparatus in the vicinity, these are not shown on plans, but their presence should be anticipated) *Note: No liability of any kind whatsoever is accepted by Cadent Gas Limited or their agents, servants or contractors for any error or omission.*	N	This comment has been noted by National Grid.
		Traffic and transport, legislation and policy, land rights and CPO	**Diversions:** Where diversions of apparatus are required to facilitate the scheme, Cadent will require adequate notice and discussions should be started at the earliest opportunity. Please be aware that diversions for high pressure apparatus can take more than two years to plan and procure materials. Cadent will require the party requesting the diversion works to obtain any necessary land rights, planning permissions and other consents to enable the diversion works to be carried out. Details of these consents should be agreed in writing with Cadent before any application is made. Cadent requires a minimum of C4/ Design study to have been carried out to establish an appropriate diversion route, temporary and permanent land take ahead of any application being made. Where diversions sit outside the highway boundary the party requesting the diversion will be responsible for obtaining at their cost and granting to Cadent the necessary land rights, on	N	This comment has been noted by National Grid. National Grid thanks the respondent for the information and is aware of the requirements. National Grid intends to include protective provisions for the benefit of statutory undertakers in **Application Document 3.1 draft Development Consent Order Schedule 15 Protective Provisions** and will continue ongoing discussions with the relevant statutory undertakers.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Cadent's standard terms, to allow the construction, maintenance, and access of the diverted apparatus. As such adequate land rights must be granted to Cadent (e.g. following the exercise of compulsory powers to acquire such rights included within the DCO) to enable works to proceed to Cadent's satisfaction. Cadent's approval to the land rights powers included in the DCO prior to submission is strongly recommended to avoid later substantive objection to the DCO. Land rights will be required to be obtained prior to construction and commissioning of any diverted apparatus, in order to avoid any delays to the project's timescales. A diversion agreement may be required addressing responsibility for works, timescales, expenses, and indemnity.		
		Construction, legislation and policy, onshore mitigation	**Key Considerations:** Cadent has a Deed of Grant of Easement for each pipeline, which prevents the erection of permanent / temporary buildings/structures, change to existing ground levels or storage of materials etc within the easement strip. Please be aware that written permission is required before any works commence within the Cadent easement strip and a Crossing Agreement may be required if any apparatus needs to cross the Cadent easement strip The below guidance is not exhaustive and all works in the vicinity of Cadent's asset shall be subject to review and approval from Cadent's plant protection team in advance of commencement of works on site.	N	This comment has been noted by National Grid. National Grid thanks the respondent for the information and is aware of the requirements. National Grid intends to include protective provisions for the benefit of statutory undertakers in **Application Document 3.1 draft Development Consent Order Schedule 15 Protective Provisions** and will continue ongoing discussions with the relevant statutory undertakers.
		Safety, construction, onshore mitigation	**General Notes on Pipeline Safety:** You should be aware of the Health and Safety Executives guidance document HS(G) 47 "Avoiding Danger from Underground Services", and Cadent's specification for Safe Working in the Vicinity of Cadent High Pressure gas pipelines and associated installations - requirements for third parties GD/SP/SSW22. Digsafe leaflet Excavating Safely - Avoiding injury when working near gas pipes. There will be additional requirements dictated by Cadent's plant protection team. Cadent will also need to ensure that our pipelines remain accessible throughout and after completion of the works. The actual depth and position must be confirmed on site by trial hole investigation under the supervision of a Cadent representative. Ground cover above our pipelines should not be reduced or increased. If any excavations are planned within 3 metres of Cadent High-Pressure Pipeline or, within 10 metres of an AGI (Above Ground Installation), or if any embankment or dredging works are proposed then the actual position and depth of the pipeline must	N	These concerns have been noted by National Grid which are acknowledged and understood. National Grid is engaging with Cadent Gas regarding its pipelines and will continue to do so.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			be established on site in the presence of a Cadent representative. A safe working method agreed prior to any work taking place to minimise the risk of damage and ensure the final depth of cover does not affect the integrity of the pipeline.		
		Consultation, safety, onshore mitigation	Below are some examples of work types that have specific restrictions when being undertaken in the vicinity of gas assets therefore consultation with Cadent's Plant Protection team is essential: • Demolition • Blasting • Piling and boring • Deep mining • Surface mineral extraction • Landfilling • Trenchless Techniques (e.g. HDD (Horizontal Directional Drilling), pipe splitting, tunnelling etc.) • Wind turbine installation • Solar farm installation • Tree planting schemes	N	These comments have been noted by National Grid. National Grid thanks Cadent Gas for the information and is aware of the requirements. National Grid intends to include protective provisions for the benefit of statutory undertakers in **Application Document 3.1 draft Development Consent Order Schedule 15 Protective Provisions** and will maintain ongoing discussions with stakeholders where necessary.
		Onshore mitigation, traffic and transport, construction	**Pipeline Crossings:** • Where existing roads cannot be used, construction traffic should ONLY cross the pipeline at agreed locations. • The pipeline shall be protected, at the crossing points, by temporary rafts constructed at ground level. The third party shall review ground conditions, vehicle types and crossing frequencies to determine the type and construction of the raft required. • The type of raft shall be agreed with Cadent prior to installation. • No protective measures including the installation of concrete slab protection shall be installed over or near to the Cadent pipeline without the prior permission of Cadent. • Cadent will need to agree the material, the dimensions and method of installation of the proposed protective measure. • The method of installation shall be confirmed through the submission of a formal written method statement from the contractor to Cadent.	N	These comments have been noted, and National Grid thanks Cadent Gas for the information.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• A Cadent representative shall monitor any works within close proximity to the pipeline.		
		Onshore mitigation, design, consultation	**New Service Crossing:** • New services may cross the pipeline at perpendicular angle to the pipeline i.e. 90 degrees. • Where a new service is to cross over the pipeline a clearance distance of 0.6 metres between the crown of the pipeline and underside of the service should be maintained. If this cannot be achieved the service shall cross below the pipeline with a clearance distance of 0.6 metres. • A new service should not be laid parallel within an easement strip • A Cadent representative shall approve and supervise any new service crossing of a pipeline. • An exposed pipeline should be suitable supported and removed prior to backfilling • An exposed pipeline should be protected by matting and suitable timber cladding • For pipe construction involving deep excavation (<1.5m) in the vicinity of grey iron mains, the model consultative procedure will apply therefore an integrity assessment must be conducted to confirm if diversion is required	N	These comments have been noted, and National Grid thanks Cadent Gas for the information.

Table 1.3 East Anglia One North

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	DCO process, consultation	**Feedback on Non-Statutory Public Consultation– Sea Link Multi-Purpose Interconnector Project** We refer to the above consultation and write to provide feedback from the perspective of East Anglia ONE North Limited (EA1N). EA1N is a wholly owned subsidiary of ScottishPower Renewables (SPR). EA1N was granted a Development Consent Order (DCO) by the Secretary of State, Department of Business, Energy and Industrial Strategy (BEIS), on 31st March 2022, under the Planning Act 2008, for the East Anglia ONE North Offshore Windfarm (EA ONE North). The DCO granted consent for the development of an offshore windfarm and associated infrastructure, including offshore and onshore transmission infrastructure. By virtue of the DCO, EA1N is a statutory undertaker for the purposes of this project and the land within the Order Limits should be treated as operational land required in connection with its statutory undertaking. EA1N notes that the proposed Sea Link Multi-Purpose Interconnector project ('the Project') is at an early stage and therefore detailed information is not available to allow a full evaluation of potential impacts on EA1N. However, this letter sets out EA1N's preliminary comments on the Sea Link Project based on the information available at this stage. Based on the current available information, SPR has identified a number of key areas where Sea Link will interact with EA1N:	N	National Grid notes the status of East Anglia ONE North.
		Onshore route location, design, intra-project cumulative effects	**02- Suffolk Onshore Scheme** The 400kV HVAC cable corridor routes from the proposed Sealink Convertor Station into the NGET Friston 400kV substation will impact upon the landscaping and other infrastructure, including drainage and PRoW in and around the onshore substations area. Therefore, further detailed route planning is required to be provided to EA1N. Further information on potential future projects is shown on design drawings and will require detailed discussions of crossing points and routeing for planned infrastructure before final designs can be agreed.	N	The colocation of multiple routes will not form part of the Proposed Project submission as only the assets required for Proposed Project will be included. However, colocation will continue to be discussed between all parties including East Anglia TWO. Cable routes have been provided and National Grid is maintaining dialogue regarding routing within the confines of the Limits of Deviation provided.
		Onshore route location, design, intra-project	**03- Converter Colocation** The 400kV HVAC cable corridor routes from the proposed Convertor Station Colocation Options are not shown but it is assumed they would follow a similar route into the NGET Friston 400kV substation, which would impact upon the landscaping and	N	The co-location of multiple routes will not form part of the DCO submission as only the assets required for the Proposed Project will be included. However, co-location will continue to be discussed between all parties including East Anglia ONE North.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		cumulative effects	other infrastructure, including drainage and PRoW in and around the onshore substations area. Therefore, further detailed route planning is required to be provided to EA1N.		
		Offshore route location, design, landfall location	**05- Offshore Scheme** The Sea Link order limits are to the south of the EA1N order limits with no overlap, but the projects are in close proximity as the offshore cable routes approach landfall. This is assuming the Sea Link 'marine corridor alternative' illustrated in Figure 2.7 of the Sea Link Non-statutory Consultation Report is not realised. The 'marine corridor alternative' route would make landfall at Sizewell to the north of the EA1N (and EA1N) landfall and would cross the EA1N export cables both onshore and offshore. However, based on the Project Overview Document, it appears that this option is no longer being considered.	N	The alternative marine corridor is no longer being considered as part of this DCO application.
		Offshore ordnance/UXO, timescales/ programme, marine mammals	EA1N offshore UXO clearance and HDD works are currently programmed for 2026 with offshore export cable installation expected in mid-2027. Therefore, based on the Sea Link programme provided, EA1N offshore works are programmed approximately one year ahead of the Sea Link project. The EA1N wind turbine foundation piling campaign is programmed for 2027 which may coincide with Sea Link project UXO clearance and the projects may, therefore, need to co-ordinate these activities to manage noise disturbance to harbour porpoise in the Southern North Sea Special Protection Area	N	A separate Marine Licence will be submitted for the UXO works associated with the Proposed Project. Within this application, cumulative effects with other projects including East Anglia ONE North, will be assessed and appropriate mitigation considered. Further information is contained in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Landfall location, design	**Landfall location between Aldeburgh and Thorpeness** Based on the information available, there may be potential impacts on EA1N's Landfall location and further detail will have to be provided to EA1N to allow for a full technical assessment	N	The Order Limits of the Proposed Project and East Anglia ONE North do not intercept one another at the landfall location. Full details relating to the landfall design and location are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The cumulative impact assessment contained within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** assesses the combined environmental impacts associated with the Proposed Project and East Anglia ONE North.
		Onshore route location, design	**Transition Joint Bay** Transition joint bay between Aldeburgh & Thorpeness has no obvious impact to EA1N transition joint bay from drawings reviewed.	N	This comment has been noted by National Grid.
		Landscape and visual, water environment, design	**Preliminary Environmental Report** Full detail for the development at Friston is to account for the landscaping and drainage design for the EA1N development to ensure that where there may be interaction these are	N	The design presented in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** has been developed in collaboration with the East Anglia ONE North team to ensure that the design accounts for the East Anglia ONE North development. This has also been reflected in the indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			incorporated into the designs to provide the same landscaping objectives.		**Management Plan - Suffolk**) and is explained further within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Design, timescales/ programme, inter-project cumulative effects	Similarly, the connecting cable between the proposed Friston and Saxmundham sites also need to account for any interference with these features. Assessment for construction impacts and final design should also include for cumulated effects and potential environmental impacts such as noise, dust, lighting, surface water management and protected species. The programme and detail design will aid review of these aspects as these develop.	N	Relevant cumulative impacts will be considered in line with the assessment methodology in **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects** and **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Cultural heritage, design, consultation	**Heritage Sites** It has been noted from our review that not enough information exists to assess heritage impacts and therefore we cannot comment at this stage. We reserve our position to do so at a later date when more detailed information becomes available.	N	This comment has been noted by National Grid. The complete heritage assessment is located within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.
		Terrestrial ecology, onshore mitigation, landscape and visual	**Landscape Ecology** The consultation identifies that the Underground Cable Search Area and all proposed Converter Station Search Area Sites have taken recognition of ecological and landscape sensitivities. It should be further noted that the EA1N project is committed to developing offsite compensation areas for protected species and habitats, and designated sites, to reduce environmental impacts from construction as well as to deliver post-construction enhancements. As noted above the search areas have potential to interact with these areas, particularly around the Friston Substation location (species specific mitigation, landscape and drainage) and areas within the cable search area to the south/ southeast of this location. As such the development area may give rise to both direct (e.g. direct loss of mitigation habitat) and indirect impacts (e.g. disturbance resulting in lack of establishment). EA1N will need to be consulted on these matters as detailed designs are developed. It is requested that National Grid liaise with EA1N through David Lewis ([redacted]	N	The design presented in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** has been developed in collaboration with the East Anglia ONE North team to ensure that the design accounts for the East Anglia ONE North development. This has also been reflected in the indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**). The main habitat creation activities required for ecology are coincident with those required for landscape (except along the River Fromus) and therefore this has also been taken into account in developing the ecology proposals for the Suffolk Onshore Scheme. **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** sets out management and monitoring. National Grid is maintaining ongoing discussion with SPR regarding development of the Proposed Project and interfaces with East Anglia ONE North.

Table 1.4 East Anglia Two

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	DCO process, consultation	**Feedback on Non-Statutory Public Consultation– Sea Link Multi-Purpose Interconnector Project** We refer to the above consultation and write to provide feedback on behalf of East Anglia Two Limited (EA2). EA2 is a wholly owned subsidiary of ScottishPower Renewables (SPR). EA2 was granted a Development Consent Order (DCO) by the Secretary of State, Department of Business, Energy and Industrial Strategy (BEIS), on 31st March 2022, under the Planning Act 2008, for the East Anglia Two Offshore Windfarm (EA2). The DCO granted consent for the development of an offshore windfarm and associated infrastructure, including offshore and onshore transmission infrastructure. EA2 notes that the proposed Sea Link Multi-Purpose Interconnector project ('the Project') is at an early stage and therefore detailed information is not available to allow a full evaluation of potential impacts on EA2. However, this letter sets out EA2's preliminary comments on the Sea Link Project based on the information available at this stage. Based on the current available information, SPR has identified a number of key areas where Sea Link will interact with EA2:	N	National Grid notes the status of East Anglia TWO.
Onshore route location, design, intra-project cumulative effects			**02- Suffolk Onshore Scheme** The 400kV HVAC cable corridor routes from the proposed Sealink Convertor Station into the NGET Friston 400kV substation will impact upon the landscaping and other infrastructure, including drainage and PRoW in and around the onshore substations area. Therefore, further detailed route planning is required to be provided to EA2. Further information on potential future projects is shown on design drawings and will require detailed discussions of crossing points and routeing for planned infrastructure before final designs can be agreed.	N	The colocation of multiple routes will not form part of the Proposed Project submission as only the assets required for Proposed Project will be included. However, colocation will continue to be discussed between all parties including East Anglia TWO. Cable routes have been provided and National Grid is maintaining dialogue regarding routing within the confines of the Limits of Deviation provided.
Onshore route location, design, intra-project cumulative effects			**03- Converter Colocation** The 400kV HVAC cable corridor routes from the proposed Convertor Station Colocation Options are not shown but it is assumed they would follow a similar route into the NGET Friston 400kV substation, which would impact upon the landscaping and other infrastructure, including drainage and PRoW in and around the onshore substations area. Therefore, further detailed route planning is required to be provided to EA2.	N	The co-location of multiple routes will not form part of the DCO submission as only the assets required for the Proposed Project will be included. However, co-location will continue to be discussed between all parties including East Anglia TWO.
Offshore route location,			**05- Offshore Scheme** The Sea Link order limits are to the south of the EA2 order limits with no overlap, but the projects are in close proximity as the	N	The alternative marine corridor is no longer being considered as part of this DCO application.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		design, landfall location	offshore cable routes approach landfall. This is assuming the Sea Link 'marine corridor alternative' illustrated in Figure 2.7 of the Sea Link Non-statutory Consultation Report is not realised. The 'marine corridor alternative' route would make landfall at Sizewell to the north of the EA2 (and EA1N) landfall and would cross the EA2 (and EA1N) export cables both onshore and offshore. However, based on the Project Overview Document, it appears that this option is nolonger being considered.		
		Offshore ordnance/UXO, timescales/ programme, marine mammals	EA2 offshore UXO clearance and HDD works are currently programmed for 2026 with offshore export cable installation expected in mid-2027. Therefore, based on the Sea Link programme provided, EA2 offshore works are programmed approximately one year ahead of the Sea Link project. The EA2 wind turbine foundation piling campaign is programmed for 2027 which may coincide with Sea Link project UXO clearance and the projects may, therefore, need to co-ordinate these activities to manage noise disturbance to harbour porpoise in the Southern North Sea Special Protection Area	N	A separate Marine Licence will be submitted for the UXO works associated with the Proposed Project. Within this application, cumulative effects with other projects including East Anglia TWO, will be assessed and appropriate mitigation considered. Further information relating to the cumulative effects assessment is contained in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Landfall location, design	**Landfall location between Aldeburgh and Thorpeness** Based on the information available, there may be potential impacts on EA2's Landfall location and further detail will have to be provided to EA2 to allow for a full technical assessment.	N	National Grid notes the status of East Anglia TWO and will maintain ongoing dialogue with the developer in order to resolve any outstanding issues.
		Onshore route location, design	**Transition Joint Bay** Transition joint bay between Aldeburgh & Thorpeness has no obvious impact to EA2 transition joint bay from drawings reviewed.	N	This comment has been noted by National Grid.
		Landscape and visual, water environment, design	**Preliminary Environmental Report** Full detail for the development at Friston is to account for the landscaping and drainage design for the EA1 North and Two developments to ensure that where there may be interaction these are incorporated into the designs to provide the same landscaping objectives.	N	The design presented in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** has been developed in collaboration with the East Anglian ONE North and TWO teams to ensure that the design accounts for the East Anglian ONE North development. This has also been reflected in the indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) and is explained further within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Design, timescales/ programme, inter-project cumulative effects	Similarly, the connecting cable between the proposed Friston and Saxmundham sites also need to account for any interference with these features. Assessment for construction impacts and final design should also include for cumulated effects and potential environmental impacts such as noise, dust, lighting, surface water management and protected species. The programme and detail design will aid review of these aspects as these develop.	N	Relevant cumulative impacts will be considered in line with the assessment methodology in **Application Document 6.2.2.12 Part 2 Chapter 12 Intra-Project Cumulative Effects and Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage, design, consultation	**Heritage Sites** It has been noted from our review that not enough information exists to assess heritage impacts and therefore we cannot comment at this stage. We reserve our position to do so at a later date when more detailed information becomes available.	N	This comment has been noted by National Grid.
		Terrestrial ecology, onshore mitigation, landscape and visual	**Landscape Ecology** The consultation identifies that the Underground Cable Search Area and all proposed Converter Station Search Area Sites have taken recognition of ecological and landscape sensitivities. It should be further noted that the EA2 project is committed to developing offsite compensation areas for protected species and habitats, and designated sites, to reduce environmental impacts from construction as well as to deliver post-construction enhancements. As noted above the search areas have potential to interact with these areas, particularly around the Friston Substation location (species specific mitigation, landscape and drainage) and areas within the cable search area to the south/ southeast of this location. As such the development area may give rise to both direct (e.g. direct loss of mitigation habitat) and indirect impacts (e.g. disturbance resulting in lack of establishment). EA2 will need to be consulted on these matters as detailed designs are developed. It is requested that National Grid liaise with EA2 through David Lewis ([redacted]	N	The design presented in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** has been developed in collaboration with the East Anglia ONE North team to ensure that the design accounts for the East Anglia ONE North development. This has also been reflected in the indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**). The main habitat creation activities required for ecology are coincident with those required for landscape (except along the River Fromus) and therefore this has also been taken into account in developing the ecology proposals for the Suffolk Onshore Scheme. **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk** sets out management and monitoring.

Table 1.5 East of England Ambulance Service

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, DCO process	We write in response to the National Grid (NG) statutory (pre - application) consultation concerning the proposed reinforcement of the electricity transmission network between Suffolk and Kent, known as **THE SEALINK PROJECT**, which runs from 24th October to 18th December 2023. The Sealink Project (SP) is a Nationally Significant Infrastructure Project (NSIP) and NG intend to apply to the Secretary of State for Business, Energy & Industrial Strategy for a Development Consent Order (DCO) under Section 37 of the Planning Act 2008, to authorise its construction.	N	This comment has been noted by National Grid.
		Safety, health and wellbeing, DCO process	EEAST is an **INTERESTED PARTY** in this process and a 'health and blue light partner organisation' operating in close association with the Suffolk & North East Essex Integrated Care Board, Suffolk Constabulary and Suffolk Fire & Rescue Service across Suffolk and North East Essex within the East of England. EEAST also operates in close association with the Helicopter Emergency Medical Services (HEMS) such as the East of England and Essex & Herts Air Ambulances, the Maritime & Coastguard Agency (MCA) and the Royal National Lifeboat Institution (RNLI). EEAST's response forms an 'Appendix' to the overarching submission made by the NHS Suffolk & North East Essex Integrated Care Board (ICB). EEAST previously engaged in the **SP** EIA Scoping process, and its response dated 17th November 2022 is included within the Planning Inspectorate's Scoping Opinion dated 1st December 2022. EEAST now welcomes the opportunity to update its position following review of the Preliminary Environmental Information Report (PEIR).	N	This comment has been noted by National Grid.
		Health and wellbeing, onshore mitigation, DCO process	EEAST has reviewed the PEIR and considers that the Project is likely to have a significant impact on its operations, service capacity and resources (staff, vehicle fleet and estate assets) requiring appropriate mitigation and management measures to be identified at an early stage, and secured and implemented either as DCO Requirements and/ or via a Planning Obligation.	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project.
		Onshore mitigation, intra-project cumulative effects, safety	EEAST and its health and blue light partners therefore look forward to working with NG in order to: • Determine the baseline service capacity position(s)	N	Comment noted. National Grid will seek to engage directly with EEAST and other blue light services in the area in order to understand and address the issues of concern regarding the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• Scope the likely type & extent of scheme impacts (effects) • Identify an appropriate type(s) level & duration of mitigation & management measures, including communication & liaison procedures. This is necessary to ensure that EEAST can continue to meet its targets and deliver on its priorities (and statutory duties) as a key healthcare and emergency services provider. The relevant considerations from EEAST's perspective are summarised below.		
		Health and wellbeing, onshore route location, safety	**East of England Ambulance Service NHS Trust** EEAST is commissioned by Suffolk and North East Essex ICS (SNEE) on behalf of all ICSs to provide emergency and urgent care services throughout Bedfordshire, Cambridgeshire, Essex, Hertfordshire, Norfolk and Suffolk. EEAST transports patients to 17 acute hospitals amongst other healthcare settings, including within the East Suffolk Council area covered by the 'Suffolk Onshore' scheme component of the **SP**. EEAST covers an area of approximately 7,500 sq miles with a resident population of over six million people and employs approximately 4,000 staff operating from 130 sites. The 999 service is free for the public to call and is available 24 hours a day, 7 days a week, 365 days a year, to respond to the population with a personalised contact service when patients: • Require rapid transportation with life threatening illness/injury or emergencies - category 1 and 2 • Present with lower acuity urgent and less urgent conditions - category 3 and 4 requiring clinical interventions • Patients may be passed to 999 via other NHS health care systems, including NHS 111 • EEAST receives over 1 million emergency (999) calls per year and 800,000 calls for patients booking non-emergency transport. EEAST also provides urgent and emergency responses to Healthcare Professionals requiring ambulance assistance, and inter-facility transfers between hospitals and other healthcare settings, where patients require treatment at alternative sites to their current setting. Details of EEAST's service remit, priorities, staff, vehicle fleet and estate assets, service targets, co-working relationship with other	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			healthcare and blue light partners, along with its quality standards and thresholds, are set out for information at Annex 1 & Annex 2.		
		Design, onshore route location	**Sea Link Proposals – Project Overview** **Scheme Components Summary** It is evident from NG's Preliminary Environmental Information Report (PEIR) Volume 1, Part 1 Introduction Chapter 4 Description of the Proposed Project, that the Project proposes to reinforce the electricity transmission network between the proposed Friston Substation in Suffolk and the existing Richborough to Canterbury 400kV overhead line in Kent. The reinforcement would be approximately 145 km in length, primarily comprising a High Voltage Direct Current (HVDC) offshore transmission link, with both HVDC and High Voltage Alternating Current (HVAC) onshore elements. The principal areas of geographical interest affecting EEAST's operations (working in partnership with its health and blue light partners, including the Maritime & Coastguard Agency and Royal National Lifeboat Institution, relate to the Onshore components of the Project within East Suffolk District and the Offshore components within the East Inshore Marine Plan area, along with a further section of inshore waters running south of Felixstowe to the mouth of the River Thames. EEAST is therefore principally interested in the Suffolk Onshore Scheme and the Offshore Scheme	N	This comment has been noted by National Grid.
		Converter station location, onshore route location	The Project would comprise of the following elements; **Suffolk Onshore (Kent Onshore not directly relevant to EEAST)** A connection from the existing transmission network via the proposed 400kV Friston Substation, including the substation compound buildings, services, fencing, parking & access road 1.7 km underground HVAC cable between the proposed Friston substation & a new converter station near Saxmundham, Suffolk, with the cable routed south of the B1119 & north of the B1121 A 2 GW high voltage direct current (HVDC) converter station up to 26 m in height plus external equipment, on an area of 6.5 ha sited south of the B1119 near Saxmundham, A 10 km underground HVDC cable between the new converter station near Saxmundham, routed south of Great Wood & north of the A1094 then north of the Old Broom & Eight Acre Coverts crossing the B1122 Leiston Road (connecting with a transition joint bay)	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			A transition joint bay sited approximately 900 m inshore from a landfall point between Aldeburgh & Thorpeness, where the cable transitions from onshore to offshore technology		
		Landfall location, offshore route location	**Offshore** Suffolk landfall, where the cable route transitions between the marine & terrestrial environment in Suffolk, located between Aldeburgh & Thorpeness A 130 km marine HVDC cable route, between the transition joint bay at the landfall in Suffolk & the transition joint bay at landfall in Kent	N	This comment has been noted by National Grid.
		Landfall location	Kent landfall, where the cable route transitions between the marine & terrestrial environment in Kent, located in the Pegwell Bay area to the south of Cliffsend	N	This comment has been noted by National Grid.
		Construction, timescales/ programme	**Construction Phase Summary** The PEIR (Table 1.4.11: Indicative Construction Programme) envisages a 5 year construction phase, with the Suffolk and Kent Onshore works and all Offshore works generally running concurrently, starting in Q3 2026 and finishing in Q3 2031. A construction workforce is envisaged comprising - approximately 414 in Suffolk increasing to 454 with co-location (where additional cable ducts are provided to serve other projects) and approximately 292 in Kent, with a peak Offshore Scheme workforce of 250, amounting to approximately 996 workers across the whole project. Construction working hours comprising - Monday to Friday 0700 am – 1900 pm, Saturday 0700 am – 1700 pm and no working on Sundays and Bank Holidays. 24-hour working would take place where necessitated by construction activities which cannot be safely stopped, activities necessary in emergencies where there is a risk to persons, the delivery of electricity and property, marine works and survey works. Marine cable construction would be a 24-hour operation in order to minimise the overall installation time, maximise the use of suitable weather periods and optimise vessel/ equipment availability.	N	Construction hours have been changed to include Sundays and Bank Holidays to enable greater efficiency in delivery of the Proposed Project and to meet the Government's Clean Power Action Plan target delivery date of 2030. Further details are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Construction, landfall location, converter station location	The main construction activities are summarised below: **Suffolk Onshore including Landfall (Kent Onshore is not directly relevant)** Enabling works, including vegetation clearance, the establishment of construction compounds, widening of	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			existing accesses & new accesses to the public highway, top soil stripping, formation of access tracks, watercourse culverting, watercourse bridging, drainage & construction works area fencing Substation & Converter Station construction involving; – overhead Line (OHL) works – earthworks – civil engineering works – building works – cable installation – provision/installation of permanent services – mechanical & electrical works – commissioning/energisation works – reinstatement & landscaping works		
		Construction	Overhead HVAC Connection involving; – topsoil stripping, temporary drainage installation – excavation & disposal of arisings for pad & chimney foundations – installation of pylon foundations – layout, assembly & erection of steelwork for the pylons – installation of insulator strings/ fittings/protection prior to stringing of conductors, including scaffolding – use of 8-ton conductor drums envisaged – establishment of machine sites for conductor stringing – sites to sit on Equipotential Zones (mat of linked conducting metal panels) to protect personnel from the effects of potential differences arising whilst lowering, raising or restringing overhead line conductors – conductor sagging/ clamping & damper installation & spacer installation – reinstatement works – including the removal of construction equipment, soil restoration, removal of access tracks/ construction compounds & reinstatement of ground – Use of 250-ton mobile cranes to erect the overhead line structures	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			– Removal of existing overhead lines & provision of temporary towers/ masts to keep the overhead line live at all times, including planned outages as necessary		
		Construction	Installation of underground HVAC & HVDC cables involving – 800 m – 1000 m trench excavation to enable cables to be installed with dewatering (open cut method) with the use of hand dug (if buried utilities present) & excavator techniques, with topsoil stockpiling – Trenches left open for up to 4 days – Installation of cement bound sand, cable laying/ bedding/backfilling with subsoil & topsoil reinstatement – Open duct method as an alternative – ducts installed in trench with shorter excavations & trenches left open for up to 2 days Use of the 'trenchless method' for constraint areas with obstacles such as major watercourses, roads, railway lines, flood defences or other utilities to be crossed – drilling under the obstacles & installation of a duct or tunnel through which cables can be pulled employing a range of methods comprising – pipe jacking, with a hydraulic ram or jack & associated boring equipment located in a launch pit, to create a tunnel for each cable – horizontal directional drill rig, with drill bit/head & drilling fluid to create a bore hole to insert cable ducting – micro tunnel boring machines to create a tunnel through which cable ducting is pulled – all open tunnels/ pits backfilled Joint bays involving the excavation of 2-3m depth concreted pits (joint bays) covered by scaffold to carry out cable jointing – all pits backfilled Cable landfalls to form the transition between the underground HVDC cable & marine cable, with the Suffolk landfall installed by trenchless technique – 920 m borehole length (total 3280 m) with 24 hour/ 7 day a week working required Barge mounted excavators for working in the inter-tidal zones in landfall locations	N	This comment has been noted by National Grid.
		Construction, offshore route location	**Offshore Marine Cable**	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Marine pre-installation activities, including cable clearance, pre-sweeping, removal/ disposal of any unexploded ordinance Marine HVDC cable installation – incorporating ground cable preparation & cable laying within the inter-tidal zones Pre-lay seabed activities along the route Installation & burial of subsea cables Placement of external pipe protection, incorporating rock placement, concrete mattresses, rock/gravel/sand/grout bags or cast-iron shells Marine Vessel activities, incorporating cable lay vessels, cable burial vessels, guard vessels, support vessels, rock placement vessels & cable lay barges 24 hour/ 7 day a week working required In light of the above, it is evident that the implementation of the **SP** would involve major construction processes, incorporating complex and specialised activities and equipment working at offshore and onshore locations (and at height) including under floodlights during the hours of darkness and during periods of low lighting level within a range of weather conditions.		
		Traffic and transport, construction	**Traffic Impacts & Highway Network Delay** The PEIR (Volume 1, Part 2 Suffolk Onshore Scheme, Chapter 8 Traffic & Transport) considers the location of construction access points and traffic routes, and forecasts the level of traffic (including HGV's) during peak construction periods, including the likely impact on the local highway network and highway users (receptors). Chapter 8 indicates that the **SP** will be accessed via 13 x access points during the construction phase. The 5 x main access points are outlined overleaf; **Access Points** B1121 Northwest: Ref S-BM12 or S-BM09 – access to Area 7 (Saxmundham Converter Station) for preparation works, haul road & compound installation, bridge & converter station installation, demobilisation & reinstatement (to be used between 2027-2031) B1119: Ref S-BM08 – access to Area 4 for utility crossings, preparation works, haul road & compound installation, cable installation, works, trench works, drainage, demobilisation & reinstatement (to be used between 2027 – 2031) B1069 Western Side: Ref BM04 – access to Area 3 for access works, utility crossings, haul road & compound	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			installation, cable jointing, testing, demobilisation & reinstatement (to be used between 2027-2030) B1069 Eastern Side: Ref BM03 – access to Area 2 for cable installation, building Joint Bay Shed, cable jointing & joint bays (to be used between 2028 – 2029) B1122 Eastern Side: Ref S-BM01 – access to Area 1 for preparation works, haul road, & compound installation, trenchless crossing & cable installation (to be used between 2027 – 2028)		
		Traffic and transport, construction	**Construction Vehicle Routes** The primary construction routes to /from the **SP** would include journeys from the A12 to the chosen access either north or south of Saxmundham via the B1121. Construction vehicles would also use the B1119, A1094, A1069 and Leiston Road, with the A1069/ Leiston Road routes being accessible from the A1094 via a junction with the A12 to the west, to access **SP** in the east. Secondary access routes would also be required for construction access as follows; Rendham Road, Mill Road & Chantry Road (Saxmundham) B1121 from Church Hill to A1069 Aldeburgh Road junction Unnamed lane between B1121 & B1119 via Moor Farm/ Redhouse Barn B1119 from access point S-BM08 to the west to the junction with Grove Road & then towards access point S-BM05 & S-BM06, & subsequently the B1121 Saxmundham Road junction to the south Snape Road & Sloe Lane Access track west of B1122 Leiston Road, north of Warren Hill	N	This comment has been noted by National Grid.
		Traffic and transport, construction	**Articulated Indivisible Loads (AIL's)** Transformer and Cable Drum deliveries would require the use of AIL's with transit via the A12 to the destination access points as follows; routed via the B1122 & B1069 for access point S-BM03 routed via the B1069 & the B1121 Saxmundham Road for access point S-BM13 (Saxmundham Converter Station) or via the B1121 Main Road for access point S-BM09 (south option) or S-BM12 (north option)	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			routed via A1094/ B1069 for access point S-BM03 (Cable Drum AIL's) & Aldringham Lane/B1122 further to the east for access points S-BM01 & S-BM02 AIL transit would necessitate the *closure of these roads during such deliveries, requiring a Temporary Traffic Order from the Highway Authority. AIL deliveries would also incorporate 'hazardous loads' including the transport of oil for the transformers, and gases to be used in the Gas Insulated Switchgear.		
		Traffic and transport, construction	**HGV Trip Attraction/Distribution** The forecast HGV trip attraction/ distribution is summarised below for the period 0700-1900 hours during the peak construction phase in 2029; B1069 (Snape Road) – 94 arrivals + 94 departures = 188 HGV movements A1094 (between the A12 & B1069) - 96 arrivals + 96 departures = 192 HGV movements B1121 (Aldeburgh Road) – 42 arrivals + 42 departures = 84 HGV movements B1121 Main Road (North & South Options) – 65 arrivals + 65 departures = 130 HGV movements B1119 (East) – 32 arrivals + 32 departures = 64 HGV movements	N	This comment has been noted by National Grid.
		Traffic and transport, legislation and policy, construction	**Preliminary Highway Impact Assessment** A preliminary highway impact assessment (all vehicles) is outlined to identify the forecast increase in construction traffic levels on the surrounding highway network during the peak construction phase. Table 2.8.42: Preliminary Assessment of Driver Delay - forecasts 'significant impacts' arising (in EIA terms) to the following road network; B1121 Main Road - southern section between A12 & B1119 Church Hill junctions (southern option) B1121 Main Road – northern section between B1119 Church Road & A12 junctions (northern option) B1121 Main Road/B1119 Church Hill Signalised junction All other road network/ highway user receptors are not forecast as being subject to significant 'driver delay' impacts in EIA terms	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the B1121 Main Road in the vicinity of Kelsale. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network (including the B1121 Main Road, B1119 Church Hill and the A12), with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This includes with respect to driver delay. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Whilst this approach is designed to convey the likely severity of construction phase impact from an 'EIA perspective' as assessed against the highway network standards/ characteristics and vehicle trip baselines, the methodology would not be wholly applicable to the effect upon EEAST's operations, ***which would be subject to an increased severity of highway related impact and driver delay.*** From EEAST's perspective, any form of highway network delay which leads to a Category 1 (life threatening) call mean arrival time of >7 minutes, could have a significant adverse impact on a patient health event outcome. It would also constitute a 'breach' leading to EEAST being issued with a Contract Performance Notice (CPN). The requirement for road closures/ diversions, along with other highway network delay attributable to HGV movements (including any unforeseen HGV breakdowns) associated with the Project, increases the probability of significant operational disruption to EEAST. These circumstances would be akin to a ***'Major Adverse' effect on EEAST in EIA*** terms, requiring avoidance and/or mitigation, as detailed below, which ought to be addressed either within the Environmental Statement (ES) under 'Other Effects' or in a separate technical assessment to accompany the ES – to inform future DCO Requirements and/or a Section 106 planning obligation. EEAST's operational standards & thresholds, which include Contract Performance Notice penalties in association with specified delays, are set out for information in Annex 2.		network (including with regard to Driver Delay), with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. If there is any requirement for road closures, these would be agreed in advance with the local highway authority, information signage advising road users of upcoming road closures would be provided several weeks in advance of them happening and diversions would be put in place/ identified to minimise disruption. National Grid is engaging with EEAST and other blue light services to discuss issues raised with the Proposed Project and identify approaches for addressing any concerns.
		Major accidents and disasters, construction	**Major Accidents & Disasters** NG's Scoping Report (October 2022) 'scoped out' major accidents and disasters from the EIA process on the following basis; The vulnerability of the Project to major accidents & disasters can be mitigated or reduced by the processes & standards in place The Project is unlikely to generate any potential significant effects on the environment if a major accident or disaster were to occur Volume 1, Part 1, Chapter 6 of the PEIR includes the Planning Inspectorate's EIA Scoping Opinion which has considered the Scoping Report, and 'scoped out' major accidents and disasters from the SP EIA process. Whilst the above position is noted, EEAST considers that procedures are necessary to manage construction phase	N	This comment has been noted by National Grid. **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan and Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan** provide details relating to the incident procedure and response. It should be noted that in advance of construction, contractors will develop and implement an Incident Response Plan which will detail their response in the event of any incident on site. As detailed within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan and Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**, National Grid is committed to ensuring the health and safety of persons working on projects is maintained in accordance with the Construction (Design and Management) Regulations 2015 (CDM) and the principles and philosophy behind them. The contractors will prepare a construction phase Safety Health and Environment (SHE) Plan prior to

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			accidents and incidents, both onshore and offshore, in liaison with EEAST and its health and blue light partners, and should be implemented, as outlined in further detail in the 'Principal Areas of Concern' section below.		construction works commencing. A construction phase SHE Plan will be prepared by the contractors for each element of the Proposed Project.
		Health and wellbeing, DCO process, legislation and policy	**Human Health** The PEIR (Volume 1, Part 2 Suffolk Onshore Scheme Chapter 12 Health & Wellbeing) considers the likely health and wellbeing effects arising from the Sealink Project, which include access to healthcare services. Chapter 12 concludes that the health and wellbeing effects arising from the Project would be 'Not Significant'. These findings have been reviewed, including the reference to an 'Emergency Action Plan' for the construction phase in response to 'unplanned emergency events' which is noted under Control & Management Measures (section 2.12.8.3). The overall approach is not, however, considered to address the likely impacts (effects) on EEAST as summarised below in the 'Principal Areas of Concern', which should be addressed either within the Environmental Statement (ES) under 'Other Effects' or in a separate technical assessment to accompany the ES – to inform future DCO Requirements and/or a Section 106 planning obligation. The **SP** control and management measures summarised in the Outline Code of Construction Practice, Outline Construction Traffic Management Plan and Construction Management Plan should be updated to have direct regard to EEAST's concerns.	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project. **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** and **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan** provide details relating to the incident procedure and response. It should be noted that in advance of construction, contractors will develop and implement an Incident Response Plan which will detail their response in the event of any incident on site. As detailed within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** and **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**, National Grid is committed to ensuring the health and safety of persons working on projects is maintained in accordance with the Construction (Design and Management) Regulations 2015 and the principles and philosophy behind them. The contractors will prepare a construction phase Safety Health and Environment (SHE) Plan prior to construction works commencing. A construction phase SHE Plan will be prepared by the contractors for each element of the Proposed Project. It should also be noted that the construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. National Grid is pursuing engagement with the Ambulance Trust to discuss and identify issues of concern and identify appropriate mechanisms for resolution.
		Health and wellbeing, DCO process, onshore mitigation	**Potential Impacts on EEAST Service Areas & Capacity** **Project Environmental & Social Effects** Review of the NG Preliminary Environmental Information Report and related documentation, indicates that the Project's potential impacts (effects) on EEAST's operational capacity, efficiency and	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			resources (staff, vehicle fleet and estate assets) have not been baselined, sufficiently assessed or mitigated to date. EEAST is therefore keen to work with NG to ensure this omission is addressed by further information being prepared to inform - either a topic in the Environmental Statement under 'Other Effects' or in a separate technical assessment, to provide the basis for a robust DCO Application for Examination. In particular, EAST wishes to agree and secure suitable mitigation and management measures as part of the DCO Requirements and/ or via a Section 106 planning obligation, and have this position reflected within documentation to be submitted as part of the forthcoming DCO Application, and thereafter in a Statement of Common Ground in advance of the Examination. EEAST's principal areas of interest and concern are summarised below.		
		Health and wellbeing, onshore mitigation	**EEAST Principal Areas of Interest & Concern** **Information for Inclusion Within Scope of the Environmental Statement or Accompanying Documentation & Related Mitigation & Management Measures** The principal areas of Project interest and concern which significantly impact on EEAST's operational capacity, efficiency and resources - requiring necessary and appropriate mitigation and management measures are outlined below, in light of the information and assumptions presented in the PEIR at this Stage 2 Consultation.	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project.
		Traffic and transport, construction, onshore mitigation	**Highways, Traffic, Transport & Articulated Indivisible Loads (AIL's)** It is evident that a major level of onshore and offshore construction works with significant transport and freight implications arise from the Sealink Project. The scope of the construction phase activities is wide-ranging, incorporating access/ highway works, OHL and earthworks, bulk materials/plant freight/handling/storage, a Converter Station, HVDC/HVAC cable corridors, trenchless crossings, haul roads and works compounds, potentially requiring road closures and route diversions. The potential for significant HGV (and an unspecified number of additional/ AIL led) traffic movements are envisaged. This is likely to lead to significant driver delay and inconvenience, and would take place as part of an extensive 5-year construction phase program, required to implement the Sea Link Project. Information to determine the effects arising from the construction phase of the Project and the likely impact on EEAST's	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			operational capacity, efficiency and resources (including likely highway disruption and delay) is currently absent from the PEIR documentation, including appropriate mitigation and management measures. This information therefore needs to be presented and assessed, either as part of the Environmental Statement (under 'Other Effects') or in accompanying documentation, with necessary mitigation and management measures secured and implemented through DCO Requirements, and/ or via a Section 106 planning obligation, as part of any Development Consent Order approval.		
		Major accidents and disasters, DCO process, onshore mitigation	**Major Accidents & Disasters** It is evident that a significant level and duration of construction phase work reliant on the use of sea-based construction vessels, heavy lift plant and specialist land and marine based plant/machinery and equipment, producing noise, heat, vibration and dust (with work carried out under flood lights and during adverse weather conditions) is likely to present construction site hazards and dangers both on land and at sea. Working at sea and on land, including within coastal/ intertidal zones, and on uneven, soft ground, with moving machinery lifting and transporting materials, and working at both height and depth, with the potential for trench collapse, underlines the risks associated with the construction related activities – requiring both urgent and other medical interventions and transport conveyance (including specialised airborne tasking/ conveyance) to be appropriately planned for and provided. Indeed, HSE's construction publications (for Great Britain) indicate that work related incidents involving serious injury and fatalities, are statistically significantly higher for the construction industry as compared to the 'all industry' rate. Information to determine the effect of the construction phase and its impact on EEAST's operational capacity, efficiency and resources is currently absent from the PEIR documentation, along with any mitigation and management measures. In the event of a construction phase accident, on land or at sea, appropriate procedures would need to be put in place for emergency access, on-site triage, medical assessment and patient identification, stabilisation and transfer to an appropriate healthcare setting. The processes and procedures developed by NG, and any outsourced construction organisations, should refer to legislation and technical guidance which places a duty on NG to have its	N	This comment has been noted by National Grid. **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** and **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan** provide details relating to the incident procedure and response. It should be noted that in advance of construction, contractors will develop and implement an Incident Response Plan which will detail their response in the event of any incident on site. As detailed within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** and **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**, National Grid is committed to ensuring the health and safety of persons working on projects is maintained in accordance with the Construction (Design and Management) Regulations 2015 and the principles and philosophy behind them. The contractors will prepare a construction phase Safety Health and Environment (SHE) Plan prior to construction works commencing. A construction phase SHE Plan will be prepared by the contractors for each element of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			own response and medical mitigation to take the patient to a place of 'normal access' and handover to EEAST crews. EEAST would expect any trench collapse to fall under the confined space regulations and NG, the construction company and/or contractor(s) should have access to a confined space trained team that could extricate a casualty safely. Plans and contingencies for facilitating emergency access, on-site triage, medical assessment, patient identification, stabilisation, clinical information, safe and efficient handover to EEAST responders, whilst sustaining operationally optimal attendance times (noting the likely delay factors above) which in urgent cases may require Helicopter Emergency Medical Services (HEMS) and/or Air-Sea Rescue/ RNLI access/ assistance, is therefore considered necessary. The incidence and impact of major accidents (and disasters) on EEAST and its HEMS partner operational capacity, efficiency and resources, including EEAST hazardous area response teams – HART, (which may also require co-ordination and joint tasking with the Maritime & Coastguard Agency and RNLI) needs to be presented and assessed, with necessary mitigation and management measures secured and implemented through DCO Requirements, and/ or via a Section 106 planning obligation, as part of any Development Consent Order approval.		
		Health and wellbeing, construction, DCO process	**Population Increase, Health & Wellbeing** It is evident that during the 5 - year construction period, a significant number of construction workers are required to implement the wide-ranging components of the Scheme. Information to determine the nature of the construction workforce, their home origin, health status, clinical dependencies, location of any temporary accommodation, which are factors likely to directly impact on EEAST's operational capacity, efficiency and resources, including its co-ordinated response with healthcare and blue light partners, is insufficiently dealt with in the PEIR documentation. This information therefore needs to be presented and assessed as part of the ES or accompanying documentation, with necessary mitigation and management measures secured and implemented through DCO Requirements, and/ or via a Section 106 planning obligation, as part of any Development Consent Order approval.	N	**Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** outlines the impact of the construction workforce on the local community. A comprehensive assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and includes an assessment of impacts on the construction workforce which concludes that there are no anticipated significant effects as a result of the Proposed Project
		Traffic and transport, health	**Joint Working With EEAST, Health & Blue Light Partners**	N	National Grid acknowledges these comments and welcomes the opportunity to engage with the EEAST and related bodies across the Proposed Project

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		and wellbeing, safety	**Transport, Community Safety, Health & Wellbeing Working Group** In the light of the above, EEAST recommend that appropriate Terms of Reference, Membership and a Communications Strategy for a Transport, Community Safety, Health and Wellbeing Working Group - is established at an early stage in the DCO preparation process, and in advance of the Examination. This would help to inform and assist the management of relevant aspects of the Project requiring a coordinated response from 'health and blue light partners', incorporating representatives from EEAST, the SNEE ICB, Suffolk Constabulary and Suffolk Fire and Rescue Service, with liaison maintained with other relevant organisations such as HEMS operators, Air-Sea Rescue and RNLI. The South East Coast Ambulance Service NHS Foundation Trust would need to be contacted in relation to similar Project impacts arising within its own administrative area, covering Kent.		area. National Grid will use this engagement to ensure that matters of concern are identified and addressed. National Grid is engaging with EEAST and other blue light services to understand issues associated with the Proposed Project. This will inform ongoing engagement and identify approaches for addressing any concerns.
		Health and wellbeing, onshore environmental impact, needs case	**Concluding Remarks** EEAST is an **INTERESTED PARTY** in this process operating in close association with the Suffolk & North East Essex Integrated Care Board, Suffolk Constabulary and Suffolk Fire & Rescue Service across Suffolk and North East Essex within the East of England. EEAST welcomes the opportunity to respond to the Stage 2 (statutory) consultation for the Sealink Project, and following review of the PEIR documentation raises Points of Concern, due to its omission to address EEAST's principal areas of interest and concern outlined above. EEAST considers that the Project is likely to have a significant impact on its operational capacity, efficiency and resources (incorporating its staff, vehicle fleet and estate assets) which have not been baselined or sufficiently assessed in the PEIR and associated documentation to date. The Project is therefore considered to adversely affect EEAST's ability to meet and deliver its targets and priorities (statutory duties) as a key healthcare and emergency services provider.	N	This comment has been noted by National Grid.
		Health and wellbeing, DCO process, onshore mitigation	Information including identified impacts arising from the development should therefore be presented and assessed, either as part of the Environmental Statement (under 'Other Effects') or in other technical documentation, with necessary mitigation and management measures secured and implemented through DCO Requirements, and/ or via a Section 106 planning obligation, as part of any Development Consent Order approval	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			It is recommended that an agreed approach is then reflected in a future Statement of Common Ground, to clarify the position reached and inform the Examination process. The measures ought to include a process to assist EEAST and its health and blue light partners to plan for and implement co-ordinated responses to construction phase (and any operational and decommissioning phase) Scheme impacts and incidents arising, to optimise patient outcomes. Early information exchange and liaison is therefore important to ensure an effective scheme design is developed, with robust EIA and related technical assessments carried out, in order to inform the basis for mitigating and managing the impacts arising on EEAST and its health and blue light partners. We trust this is of assistance and look forward to working with NG to satisfactorily address the points raised.		
		Health and wellbeing, safety	**ANNEX 1** **EEAST KEY FACTS & SERVICE INFORMATION** **This section summarises EEAST's service remit, priorities, staff, vehicle fleet & estate assets, & co-working relationship with other healthcare & blue light partners & service targets** **Service Remit & Priorities** The East of England Ambulance Service NHS Trust provide accident and emergency services and non-emergency patient transport services across the East of England. The Trust Headquarters is in Melbourn, Cambridgeshire and there are Ambulance Operations Centres (AOC) at each of the three locality offices in Bedford, Chelmsford and Norwich who receive over 1 million emergency calls from across the region each year, as well as 800,000+ calls for patients booking non-emergency transport. The 999 service is part of the wider NHS system providing integrated patient care. Provision of 999 services is aligned closely with national and regional initiatives driven by: Sustainability and Transformational Partnerships Integrated Care System Integrated Urgent Care systems, i.e. NHS 111, Clinical Assessment Services, Urgent Treatment Centres, GP Out of Hours Services. Additionally, regional Ambulance Trusts may collaborate closely with other ambulance services, the wider emergency services or wider system providers to deliver appropriate patient care.	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			To support the service transformation agenda, the key requirements are: • To deliver the core response and clinical outcome standards as defined by the Ambulance Response Programme • To fulfil statutory duties relating to emergency preparedness, resilience and response (EPRR) • Optimisation of call handling and appropriate responses through virtual alignment of NHS 111/999 and call/CAD transfer between ambulance services • Increase the percentage of lower acuity calls managed through “hear and treat” and “see and treat” options • Utilise a virtual delivery model to support wider workforce integration for paramedics, call handlers and specialist staff with local urgent care delivery models • Facilitate cross boundary working and the flexible use of ambulance service resources to support the development of regional Sustainability and Transformational Plans and Integrated Care Systems. The 999 service is free for the public to call and is available 24 hours a day, 7 days a week, 365 days a year, to respond to the population with a personalised contact service when patients: • Require rapid transportation with life threatening illness/injury or emergencies - category 1 and 2 • Present with lower acuity urgent and less urgent conditions - category 3 and 4 requiring clinical interventions • Patients may be passed to 999 via other NHS health care systems, including NHS 111 • EEAST receives over 1 million emergency (999) calls per year and 800,000 calls for patients booking non-emergency transport. EEAST also provides urgent and emergency responses to Healthcare Professionals requiring ambulance assistance, and inter-facility transfers between hospitals and other healthcare settings, where patients require treatment at alternative sites to their current setting. Non-Emergency Patient Transport Services (NEPTS) provide an essential lifeline for people unable to use public or other transport due to their medical condition. These much-needed journeys support patients who are: • Attending hospital outpatient clinics or other healthcare location		

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Being admitted to or discharged from hospital wards Needing life-saving treatments such as radiotherapy, chemotherapy, renal dialysis or DVT treatment.		
		Health and wellbeing, safety	**Service Assets** EEAST clinicians: Emergency Care Support Workers Emergency Medical Technicians Paramedics Specialist Paramedics Critical Care Paramedics. Types and models of response: Community First Responder (CFR) Patient Transport Service (PTS) Clinical See and Treat Clinical Hear and Treat (telephone triage) Early Intervention Team (EIT) Rapid Response Vehicle (RRV) Double Staff Ambulance (DSA) Hazardous Area Response Team (HART) Specialist Operations Response Team (SORT) Helicopter Emergency Medical Service (HEMS), EEAST utilise 5 aircraft across 3 charities within the region – Magpas – 1 x aircraft from RAF Wyton – East Anglian Air Ambulance – 2 x aircraft form Cambridge and Norwich Airport – Essex and Herts Air Ambulance – 2 x aircraft form North Weald and Earls Colne Ambulance Operations Centre (AOC) staff: 999 Call Handlers Emergency Medical Dispatchers Tactical Operations Staff. EEAST support services staff cover all other corporate and administrative functions across the region.	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Health and wellbeing, safety	**Estates** The Trust is rolling out a Hub and Spoke network with up to 18 hubs to provide regional premises for delivery of operational responses to calls, flow of ambulance preparation via the Make Ready function (cleaning and restocking of ambulances) and despatch of ambulances to local spokes (reporting posts/response posts/standby locations). Support services such as workshop facilities, clinical engineering (medical equipment store and workshop), consumable product stores and support office accommodation are also provided from Hubs. Ambulance Station Central Reporting Post - A 24/7 - Permanent reporting base for staff and primary response location for one or more vehicles. Provision of staff facilities. Ambulance Station Response Post - A primary response location, which includes staff facilities but is not a reporting base for staff. Standby Location - Strategic locations where crews are placed to reach patients quickly. Facilities used by staff are provided on an informal basis only by agreement with the relevant landowner. Ambulance Stations in the Sea Link Suffolk Onshore Project area are: Saxumundham Ambulance Stations in the Sea Link Suffolk Onshore Project surrounding area which may support are: Beccles Lowestoft Martlesham Ipswich Stowmarket Diss	N	This comment has been noted by National Grid.
		Health and wellbeing, safety	**Vehicle Fleet** 387 front line ambulances 178 rapid response vehicles 175 non-emergency ambulances (PTS and HCRTs vehicles) 46 HART/major incident/resilience vehicles located at 2 x Hazardous Area Response Team (HART) bases with a number of specialist vehicle resources.	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Health and wellbeing, safety	**Workforce & Equipment** Approximately 4,000 staff and 800+ volunteers across 120 sites. Each resource has equipment specific to the operational function of the vehicle and skill level of the staff.	N	This comment has been noted by National Grid.
		Health and wellbeing, legislation and policy, safety	**Specialisms** EEAST works collaboratively across our blue light partners and have joint working groups with Police and Fire Services across the region, working in partnership managing responses to incidents and undertaking joint exercises with our dedicated resources to prepare for specialist rescue, major incidents and mass casualty incidents. EEAST is a Category 1 Responder under the Civil Contingencies Act, 2004, playing a key role in developing multi-agency plans against the county and national risk registers. EEAST also works closely with the Military, US Air Force, Royal Protection Service, Stansted Airport and the Port of Felixstowe Police, Fire and Ambulance services. EEAST's Emergency Preparedness Resilience Response (EPRR) team lead on the Joint Emergency Services Interoperability Principles (JESIP) working in close partnership with all blue light agencies, the Coastguard and Local Authorities. Specialist resources work with the Police in counter terrorism and developing response plans in the event of a major incident. EEAST are an integral part of the locality's resilience response sitting on a number of safety advisory groups, east coast flood working groups and hospital emergency planning groups.	N	This comment has been noted by National Grid.
		Health and wellbeing, safety	**Co-working Relationship with other Blue-Light and Healthcare Partners** EEAST is an integral part of the wider healthcare system working closely with the North Essex Integrated Care System (ICS) to deliver emergency and urgent care and are key stakeholders in supporting wider healthcare initiatives. Within North Essex, EEAST work with the ICSs in delivering additional care pathways focussing on hospital admission avoidance, this is a partnership with the local acute providers and local authorities. EEAST operate Early Intervention Response vehicles and a Rapid Intervention Vehicle. These resources work collaboratively within the system to offer holistic care to patients whilst reducing pressure on Emergency Departments. This is EEAST's response to the requirements of the **NHS Long Term Plan**, with the clear narrative that in order to bring the NHS into financial balance all NHS providers must find mechanisms to	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			treat patients in the community and out of the most expensive care setting, which are acute hospitals. This not only saves the NHS critical funding, but it also improves patient outcomes. EPRR and Specialist Operations teams routinely train with other blue light agencies in preparedness for major incidents such as terrorist attacks and major incidents with statutory training obligations to respond to local and national incidents. In continuing to respond to the COVID-19 Pandemic, EEAST is working collaboratively with Private Ambulance providers, the Military, volunteer Ambulance Services (such as St John Ambulance and British Red Cross) and local Fire and Rescue Services, to increase its capacity and maintain service delivery to meet the additional demand.		
		Health and wellbeing, safety	**EEAST Service Targets** All NHS organisations are required to report against a set of Core Quality Indicators (CQIs) relevant to their type of organisation. For ambulance trusts, both performance and clinical indicators are set as well as indicators relating to patient safety and experience. NHS organisations are also required to demonstrate their performance against these indicators to both their commissioners and Regulators (NHS England/Improvement). It is important to note that EEAST is also measured on how quickly a patient is transported to an appropriate location for definitive care, often in time critical circumstances. Failure to deliver against these indicators will result in a Contract Performance Notice and could result in payment being withheld, as prescribed in NHS Standard Contract 20/21 General Conditions (Full Length) GC9 9.15.	N	This comment has been noted by National Grid.
		Health and wellbeing, safety	**ANNEX 2** **NHS Standard Contract National Quality Requirement Ambulance Service Response Times** **National Quality Requirement:** Category 1 (life-threatening) incidents – proportion of incidents resulting in a response arriving within 15 minutes **Threshold:** Operating standard that 90th centile is no greater than 15 minutes **National Quality Requirement:** Category 1 (life-threatening) incidents – mean time taken for a response to arrive **Threshold:** Mean is no greater than 7 minutes	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			National Quality Requirement: Category 2 (emergency) incidents – proportion of incidents resulting in an appropriate response arriving within 40 minutes **Threshold:** Operating standard that 90th centile is no greater than 40 minutes **National Quality Requirement:** Category 2 (emergency) incidents – mean time taken for an appropriate response to arrive **Threshold:** Mean is no greater than 30 minutes **National Quality Requirement:** Category 3 (urgent) incidents – proportion of incidents resulting in an appropriate response arriving within 120 minutes **Threshold:** Operating standard that 90th centile is no greater than 120 minutes **National Quality Requirement:** Category 4 (less non-urgent "assess, treat, transport" incidents only) – proportion of incidents resulting in an appropriate response arriving within 180 minutes **Threshold:** Operating standard that 90th centile is no greater than 180 minutes **For above Indicators:** **Method of Measurement:** See AQI System Indicator Specification at: https://www.england.nhs.uk/statistics/statistical-workareas/ambulance-quality-indicators/ Review of Service Quality Performance Reports **Period over which the Standard is to be achieved:** Quarterly for all indicators **National Quality Requirement E.B.S. 8:** Following handover between ambulance and A+E, ambulance crew should be ready to accept new calls within 15 minutes and no longer than 30 minutes **Threshold:** >0 **For above Indicator:** **Method of Measurement:** See Contract Technical Guidance Appendix 2 at https://www.england.nhs/nhs-standard-contract **Period of which the Standard is to be achieved:** Ongoing		

Table 1.6 EDF Energy Nuclear Generation Limited

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
14 October 2023	18 December 2023	Consultation	We act on behalf of EDF Nuclear Generation Ltd (ENGL), owners and operators of Sizewell B Power Station. ENGL are grateful you for the opportunity to comment on the above Consultation. The Suffolk onshore element of the scheme identifies a proposed Sea Link cable landfall on the Suffolk coast (between Aldeburgh and Thorpeness), together with an HVDC cable connection form the landfall to a proposed Convertor Station near Saxmundham and an HVAC cable connection from the proposed Convertor Station to a Grid Sub Station at Friston. Sizewell B Nuclear Power Station is a nationally significant power generator. ENGL has no objection in principle to the Suffolk onshore element of the proposed Sea Link scheme, but National Grid's detailed proposals are not currently available. ENGL therefore reserves its position to provide comment on any detailed proposals should these be forthcoming and/or on any subsequent DCO scheme. We look forward to learning of the outcome of this Statutory Consultation.	N	National Grid acknowledges the feedback and thanks EDF for its response.

Table 1.7 Environment Agency

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, DCO process	**SECTION 42 CONSULTATION ON SEA LINK DEVELOPMENT CONSENT ORDER.** **SEA LINK, SUFFOLK AND KENT** Thank you for consulting the Environment Agency on the materials prepared to support the consultation on the Sea Link project. We look forward to continuing to work with you as the detailed proposals for the Sea Link project continue to develop, and to reviewing and providing advice on relevant supporting documents as these are generated. Our key issues are identified below. Detailed comments are included in Appendices A-J. Our views are in response to the materials that have been provided as part of the consultation. This response does not represent our final view in relation to any future Development Consent Order (DCO) application, or any Environmental Permit applications made to us. Our final views will be based on all relevant information, including applications and guidance available at the time of submission.	N	This comment has been noted by National Grid.
DCO process, consultation, onshore environmental impact			Our key issues at this time: 1. Submission of information: Further information is required for the Environment Agency to provide a definitive response on relevant environmental impacts. We recommend using our pre-application advice service to discuss and resolve any matters in advance of the Inquiry process.	N	This comment has been noted by National Grid. Regular engagement has taken place with the Environment Agency. This has included thematic environmental meetings and general monthly meetings with National Grid to discuss the Proposed Project. In addition to this, National Grid has been in communication with the Environment Agency permitting team.
Water environment			2. Flood Risk: The disruption of fluvial river flows needs to be considered during the construction, operation and decommissioning phase. River crossings will influence the flow path of rivers, which will increase the risk of flooding on site, and elsewhere (See Water Crossing impacts below). 3. Flood modelling: The Environment Agency modelling data is not designed for site-specific Flood Risk Assessment; rather they are designed for strategic flood risk mapping purposes. It is important that third parties check that these models are suitable for their needs, if they are being used in a site-specific context.	N	**Application Document 6.8 Flood Risk Assessment** has assessed the effects of proposed temporary and permanent watercourse crossings on flood risk within the order limits and to surrounding lands. The assessment has been informed by data from Environment Agency flood models. These models have been reviewed, and where necessary, refined and updated. Measures are embedded within the designs of these crossings to mitigate for any potential to increase fluvial flood risk.
Onshore mitigation, terrestrial ecology, water framework directive			4. Biodiversity Net Gain (BNG): a) We advise that the applicant considers opportunities to link with Local Nature Recovery Strategies, and any mitigation measures listed for the affected waterbodies under the Water Framework Directive (WFD). There may also be opportunities for coastal habitat enhancement/creation by restoring meadows, marsh and reef	N	This comment has been noted by National Grid and has been considered in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		screening assessment			
		Coordination with the projects	b) We advise that BNG connectivity between Sea Link, Lion Link and Nautilus is strategically considered in Suffolk.	N	National Grid is exploring the opportunity for strategic delivery of Biodiversity Net Gain mitigation to be considered across the three projects; this will continue following the DCO submission. However, it should be noted that the Proposed Project is committed to delivering 10% Biodiversity Net Gain for the project alone. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Water framework directive screening assessment, water environment, terrestrial ecology	5. Water Framework Directive: The scope of WFD assessments is not sufficient. Two WFD waterbody's have not been included as part of the WFD screening assessment. Aspects of the project will have an impact on protected species, which will not be assessed due to this.	N	The two Water Framework Directive waterbodies highlighted have been included within **Application Document 6.9 Water Framework Directive Assessment** which has been completed to inform the DCO application.
		Geology and hydrogeology , water environment	6. Contaminated land (Geology and Hydrogeology): Appropriate pollution prevention measures for preventing the pollution of groundwater need to be included in the hydrogeological risk assessment.	N	Pollution prevention measures relating to groundwater are included within **Application Document 7.5.3.2 CEMP Appendix A Outline Code of Construction Practice**. In addition, the ES is supported by groundwater risk assessments (**Application Document 6.3.2.5.B ES Appendix 2.5.B Qualitative Groundwater Risk Assessment** and **Application Document 6.3.3.5.B ES Appendix 3.5.B Qualitative Groundwater Risk Assessment**) which identify where additional hydrogeological risk assessment including consideration of additional mitigation may be required. Commitment GH09 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** secures the requirement for Hydrogeological Risk Assessment. The code of practice is secured through Requirement 6 of Schedule 3 of the DCO (**Application Document 3.1**).
		Geology and hydrogeology , legislation and policy	7. Water resources (Geology and Hydrogeology): Further information is required regarding any proposed dewatering, and identification of groundwater licenses.	N	Locations where dewatering is anticipated is included within **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology and Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**. Please see the response below regarding the groundwater licences.
		Coordination with other projects, inter-project cumulative effects	8. Nemo Link: The Nemo Link project (a completed NSIP)) needs to be considered for incombination and t cumulative impacts.	N	This comment has been noted by National Grid. Nemo Link has been added to the list of projects associated with the Offshore Scheme and can be found within **Application Document 6.3.4.11.A ES Appendix 4.11.A Descriptions of Other Projects** and is considered in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Legislation and policy	9. Protective Provisions: Any requests to disapply any permits or consents should be sent to us in writing as soon as possible to allow	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			us sufficient time to consider them (minimum 6 months). Depending on the outcome this will have implications on the content of the DCO.		National Grid has not requested to disapply any consents or permits. Any additional consents or permits will be applied for through the normal environmental permitting regime.
		Construction, legislation and policy	10. Code of Construction Practice (COCP): It is not clear at this time if your strategy is to have an outline code of construction practice, which will be followed up by a full COCP (secured as a requirement) later in the process once the relevant contractors are in place. Please clarify as this will influence our expectations for this document.	N	Since Statutory consultation (October 2023), the Code of Construction Practice has been updated as the Proposed Project has evolved to include additional measures identified through the engineering design, the EIA process and from engagement with stakeholders. **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** contains **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. As suggested this document comprises an outline version which will be developed further in advance of construction commencing which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Water environment, geology and hydrogeology	11. Water crossing impacts: We note that physical disturbance, impact to flow regimes (watercourse crossings) from operational infrastructure (AGI and watercourse crossings) was scoped out. It is unclear whether there could be physical impacts on hydromorphology arising from the operational stage of the project. Further assessment is necessary to look at potential permanent physical modifications to the watercourses, and their impact of this on flooding and ecology. The effect on flooding may need to be modelled.	N	The effects of the proposed permanent watercourse crossings have been assessed within **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment and Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment** and its supporting **Application Document 6.8 Flood Risk Assessment** and **Application Document 6.9 Water Framework Directive Assessment**. These assessments conclude that, due to the proposed designs of operational infrastructure (including permanent watercourse crossings) there would be no likely significant effects on hydromorphology. This has been supported by modelling of the proposed permanent crossing of the River Fromus.
		Water environment, onshore mitigation, legislation and policy	**Appendix A – Suffolk and Kent: Groundwater contamination, water resources and water quality** **Volume 1, Part 1, Chapter 4: Description of the Proposed Project** **1.4.5.70 to 1.4.5.77** **Issue**: There are no mitigation measures for unplanned losses of drilling fluid on groundwater. **Impact**: Input of hazardous materials to groundwater, is a risk to the Environment and protected species. WFD status of waterbodies may deteriorate. **Solution**: Incident management plan to be included in the Construction Code of Practice (COCP). The principes of the incident management plan will need to be included in the outline COCP.	N	Commitment GH02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** includes for the provision of a Foundation Works Risk Assessment, where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid loss. Mitigation against drilling fluid loss via frac outs is also included within **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**.
		Water environment, geology and hydrogeology, legislation and policy	**Volume 1, Part 2 Suffolk Onshore Scheme, Chapter 6 Geology and Hydrogeology** **Volume 1, Part 3 Kent Onshore Scheme, Chapter 6 Geology and Hydrogeology** **2.6.7.35 and table 2.6.18 (Suffolk) 3.6.7.70 and table 3.6.18 (Kent)**	N	Information on groundwater abstractions within the study area has been obtained and an assessment on the potential impacts on groundwater receptors including the abstractions is included within **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology and Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**, the locations of the abstractions are also shown on the accompanying figures. The Proposed Project description, as detailed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Issue: A number of groundwater licences exist within the area of the Kent and Suffolk onshore boundaries, which abstract water. These groundwater licences have not yet been incorporated in the ground water assessments. **Impact**: The impacts on groundwater have not been fully assessed. Therefore, the risks to the environment have not all been identified, and this undermines the mitigation strategy of the development. There is a risk that groundwater abstraction (dewatering) will affect the water table, and derogate other lawful groundwater abstractors, or adversely impact surface water features, causing a detrimental impact on protected species. **Solution**: The hydrogeological risk assessment needs to include an assessment of the impacts of ground water abstraction. It needs to demonstrate that any dewatering is a fully non-consumptive transfer of water with no intervening uses.		**of the Proposed Project**, indicates that there would be no consumptive abstractions or intervening consumptive use of any abstracted water based on the description that the water supply for the Proposed Project would be sourced either from mains supply or where reasonable connections are not available, then water would be tankered in.
		Water environment, geology and hydrogeology	**2.6.7.35 and table 2.6.18 (Suffolk) 3.6.7.30 and table 3.6.18 (Kent)** **Issue**: The report does not yet include details of the extent to which dewatering will take place, and whether the nature of the dewatering will be to pump out from excavations, or to lower the water table by pumping from depth. **Impact**: There is a risk that groundwater abstraction (dewatering) will affect the water table, and derogate other lawful groundwater abstractors, or adversely impact surface water features, causing a detrimental impact on protected species. **Solution**: Include details of the extent to which dewatering will take place, and whether the nature of the dewatering will be to pump out from excavations, or to lower the water table by pumping from depth.	N	Details on the likely locations of dewatering is included within **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology** and **Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**. Information on groundwater abstractions within the study area has been obtained and an assessment on the potential impacts on groundwater receptors including the abstractions is included within **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology and Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**. Details of how dewatering will be undertaken will be confirmed by the Main Works contractor once detailed design has been undertaken but it is currently assumed that dewatering would be undertaken by pumping out of seepages of water, rather than active lowering of the groundwater table.
		Onshore mitigation, water environment, geology and hydrogeology	**2.6.8.3 (Suffolk) 3.6.8.3 (Kent)** **Issue**: Current mitigation measures for groundwater protection are insufficient. **Impact**: Without using the hydrogeological risk assessment (HyRA) to propose robust mitigation measures, deterioration of groundwater, in terms of both quality and quantity, is possible. **Solution**: Where potential risks to groundwater are identified, robust mitigation measures need to be proposed, and Control Measures amended, to confirm that any impacts to groundwater will be remediated. We see W08 and W09 as a last resort and should not be relied upon as the sole means of preventing deterioration of the groundwater; more robust mitigation measures should be in place.	N	Pollution prevention measures relating to groundwater (GH02, GH07) are included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, which are in addition to commitments W08 and W09. In addition, the ES is supported by a groundwater risk assessment, which identifies where additional hydrogeological risk assessment is likely to be required, which is included as commitment GH09 within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and will be undertaken following detailed design including any additional mitigation measures required.
		Water environment,	**2.6.8.3 (Suffolk) 3.6.8.3 (Kent)**	N	Information on private water supplies within the study area has been obtained and an assessment on the potential impacts on groundwater receptors

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		geology and hydrogeology	**Issue**: Impacts on private water supplies have not been adequality assessed, as no suppliers have been mentioned. **Impact**: Without identifying the water suppliers at the appropriate stage, groundwater resources may be put at risk of pollution. **Solution**: We would expect the applicant to include all groundwater users in the hydrogeological risk assessment. In relation to control measures W08 and W09, any private water supplies should be identified during the HyRA.		including the abstractions is included within **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology for Suffolk** and **Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**.
		Construction, onshore environmental impact, onshore mitigation	**2.6.8.3 (Suffolk) 3.6.8.3 (Kent)** **Issue**: Measures are required to ensure developers have full oversight of their contractors. **Impact**: Failure to adequately monitor contractors may result in deviation from the Construction Environment Management Plan (CEMP) and COCP, resulting in increased risk to the environment and protected species. **Solution**: We recommend the inclusion of monitoring, reporting, and reviewing procedures, to ensure the project team and principal contractor have sufficient oversight of employed contractors.	N	National Grid would implement management processes and briefings so that the works are carried out in accordance with current legislation and guidance. This would be achieved by application of well-established work processes that apply the recognised British Standard (BS) EN ISO 14001:2015 or equivalent. The contractor would have an Environmental Policy that meets the requirements of ISO 14001 or equivalent, through their internal Business Management System procedures. The policy statement would be displayed on the site notice boards, publicised to all site staff and operatives, and made available to interested parties upon request. Control and management measures have been identified within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction**. These are generally measures that would normally be implemented on a well-run construction site, but also include a number of good practice measures that have been identified through the EIA process in order to support a proportionate assessment. They also include measures that have typically been employed on other National Grid projects and the contractor(s) would be expected to demonstrate compliance with these measures during construction. Further details are contained in **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**.
		Construction, onshore mitigation, water environment	**Volume 2, Part 1, Appendix 1.4A: Outline Code of Construction Practice** **Table 1.4.A.2** **Issue**: Mitigation measures for heavy rainfall events need to be included in the outline CEMP. **Impact**: Heavy rainfall events will spread contaminants around the site, which will pose a contamination risk to water resources in the area. **Solution**: To reduce this risk, we recommend ensuring that the CEMP includes pollution prevention measures that can withstand significant heavy rainfall events.	N	A commitment is included within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** for the contractor to prepare an emergency incident response plan, which would include measures to manage construction working areas during heavy rainfall and other extreme weather events.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Construction, geology and hydrogeology	**Table 1.4.A.2** **Issue**: The first sentence of GH02 is missing words at the end, presumed to be 'new pathways', but should be clarified. **Impact**: We are unable to understand how this control and management measure will minimise the risk of aquifers mixing. **Solution**: Clarify the missing words.	N	This comment has been noted by National Grid, and it can confirm that 'pathways' was the missing word in commitment GH02. This has been checked and updated within the ES. Information is contained in **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology and Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**.
		Water environment, benthic ecology, offshore mitigation	**Volume 1, Part 4 Offshore Scheme, Chapter 10 Other Sea Users** **4.10.7.17** **Issue**: Any offshore or coastal installation/maintenance activity will significantly alter the mobilisation of sediment. **Impact**: Mobilisation of sediments can affect bathing water quality, through increased turbidity, which reduces the UV kill rate of bacteria, or though re-animation of bacteria in sediment. This will have an impact on local ecology and protected species, and thereby reduce WFD quality to an unsustainable level. **Solution**: The Environmental Statement should consider likely impacts, and risks, to the Designated Bathing Waters from mobilisation of sediments during construction. Controls and mitigation measures to reduce these risks, should be included as either embedded measures, or control and management measures, within their respective documents.	N	The assessment of Designated Bathing Waters has been considered in **Application Document 6.2.4.9 Part 4 Marine Chapter 9 Other Sea Users**. Further detail, including regarding impacts and risks from mobilisation of sediments and controls and mitigation measures to reduce these risks, is included in the Marine Tourism and Recreation assessment within this chapter and also **Application Document 6.9 Water Framework Directive Assessment**.
		Water environment, offshore environmental impact	**Appendix B – Suffolk and Kent: Fisheries, Biodiversity and Geomorphology** **Volume 2, Part 1, Introduction Appendix 1.4.D Crossings Schedule** **1.4.D** **Issue**: Large amounts of data are supplied in a table, in a way that cannot be meaningfully interpreted. An analysis of the watercourses affected cannot be carried out. **Impact**: The risks to the environment are not understood. **Solution**: This data needs to be provided as GIS layers and as an easily manipulated Excel spreadsheet. Please supply the data in both forms as specified.	N	This comment has been noted by National Grid. National Grid is maintaining ongoing dialogue with the Environment Agency through regular catch-up meetings and thematic working group meetings, where National Grid has shared data and further information requested by the Environment Agency.
		Terrestrial ecology	**Volume 1, Part 1, Introduction Chapter 1 Introduction, 1.1.7 Net Gain Commitments** **1.1.10**	N	This comment has been noted by National Grid. The wording has now been amended to avoid confusion. Please refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report** for updated wording.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Issue: Biodiversity enhancements cannot be measured from a baseline using Defra's Biodiversity Calculator, as this does not exist. This is an incorrect term for the biodiversity metric. **Impact**: Confusion will be caused over the incorrect use of the term. **Solution**: Enhancements can be measured with the Department for Environment Food and Rural Affairs' (DEFRA) Biodiversity Metric.		
		Water environment, onshore mitigation, landscape and visual	**Volume 1, Part 1, Introduction Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures** **Table 1.4.F.6** **Issue**: We need clarification on when riparian planting will start. **Impact**: It is not acceptable to leave river corridors unrestored for 5 years, due to the ecological impacts of the scheme. **Solution**: Replanting of damaged river corridors should occur in the first planting season following decommissioning.	N	Replanting of vegetation would occur in the first season following cessation of works in the affected area. This mitigation measure is set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Legislation and policy, fish and shellfish ecology, onshore mitigation	**Volume 1, Part 2 Suffolk Onshore Scheme, Chapter 3 Ecology and Biodiversity** **Volume 1, Part 3 Kent Onshore Scheme, Chapter 3 Ecology and Biodiversity** **2.3.2.3 to 2.3.2.19, and Table 2.3.10.10 (Suffolk) 3.3.2.3 to 3.3.2.19, and Table 3.3.10.10 (Kent)** **Issue**: Refers to the legislation but does not include Salmon and Freshwater Fisheries Act 1975 (as amended, Salmon and Freshwater Fisheries Act 1975). This includes offences for the introduction of "poisonous matter and polluting effluent" into waters causing specified effects. **Impact**: The appropriate legislation needs to be referenced, to ensure that mitigation measures effectively reduce the risk to ecology. **Solution**: Please ensure the Salmon and Freshwater Fisheries Act 1975 is included.	N	This comment has been noted by National Grid. This reference is now included in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Water environment, onshore environmental impact	**Table 2.3.6 (Suffolk) Table 3.3.7 (Kent)** **Issue**: A river condition assessment is not mentioned in the survey types. **Impact**: The condition of the river and riparian area are not understood, and potential impacts may occur that may damage the environment and lower WFD status. **Solution**: Include river condition assessment as a survey type.	N	A river conditions assessment (River Morphology) survey has been completed and has been used to inform the Biodiversity Net Gain assessment in the DCO (**Application Document 6.12 Biodiversity Net Gain Feasibility Report**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Fish and shellfish ecology, onshore mitigation, legislation and policy	**Appendix C – Suffolk: Fisheries, Biodiversity and Geomorphology** **Volume 1, Part 2 Chapter 3: Ecology and Biodiversity** **Table 2.3.5, 3.2.6** **Issue**: The ecological baseline is insufficient as it does not incorporate sufficient fisheries data. Without this data it's not possible to identify impact on protected species. **Impact**: Without the appropriate fisheries data included in the desk study, there will be no assessment of whether protected fish species will be impacted by the development. Furthermore, there will be no measures proposed to mitigate this impact. There are brook lamprey (Lampetra planeri) and eel (Anguilla anguilla) in the River Fromus, that will be put at risk. Brook lamprey are listed in annexes IIa and Va of the Habitats Directive, Appendix III of the Bern Convention, and as a Long List Species in the UK Biodiversity Action Plan. Maitland (2000) considers this species to be vulnerable. Eel are a critically endangered species and are protected by The Eels (England and Wales) Regulations 2009. **Solution**: Include Fisheries data and assess potential impacts to the species identified, including an assessment of potential impacts to eel and brook lamprey. Undertake fish surveys at proposed disturbance sites on the Fromusand Hundred River.	N	Impacts on fish in the River Fromus, including eel and trout, are assessed within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** based upon desk study records including fisheries data and fish surveys that were undertaken on the Hundred River (dry at time of survey) and at the proposed bridge crossing location on the River Fromus during 2024.
		Water environment, fish and shellfish ecology, legislation and policy	**Volume 1, Part 2 Suffolk Onshore Scheme, Chapter 5 Water Environment** **2.5.7.4** **Issue**: The scope of environmental assessments have not been sufficient, as the Alde & Ore waterbody has not been included. **Impact**: The Alde & Ore is a WFD surveillance waterbody and has a breeding population of smelt (Osmerus eperlanus) present. Smelt are very sensitive to anthropogenic disturbance. The Environment Agency have a statutory duty to ensure the conservation of smelt and their aquatic environment under the Environment Act 1995. Smelt are listed as a Biodiversity Action Plan (BAP) species and are a key indicator species under the WFD. **Solution**: The Alde & Ore waterbody needs to be included in assessments. This includes the impacts to Smelt and their migratory pathway, as a result of both the onshore and offshore impacts.	N	An assessment of smelt from the Alde and Ore waterbody has now been considered and assessed within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**, with a focus on potential effects from underwater sound and subsea cable thermal emissions. No likely significant effects have been identified on fish and shellfish species, including smelt in the Alde and Ore waterbody. Impacts on the Alde-Ore waterbody are also considered and assessed in **Application Document 6.9 Water Framework Directive Assessment**. Consideration has also been given to the migratory periods of smelt. Smelt has also been considered within the **Application Document 6.3.2.2.F ES Appendix 2.2.F Aquatic Ecology Survey Report**.
		Onshore route location,	**2.5.8.3**	N	The typical details show that the depth of the crossing and protection would be taken to 2 m either side of the watercourse before rising to the standard burial depth. National Grid will maintain ongoing dialogue with the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		design, water environment	**Issue**: We are concerned that the criteria for intended depths of the cables are too rigid, not reflecting local conditions. **Impact**: Cables could potentially reach or approach the surface in locations which are still subject, or might be subject, within the lifetime of the project, to active fluvial processes. This would increase the risk of exposure, and therefore have consequences for natural processes. **Solution**: Ensure the distance from the bank before rising is tailored to the specific crossing location, considering the potential for future channel movement. This will also help ensure the presence of the cables still allow for future river and floodplain restoration opportunities.		Environment Agency, ensuring that there will be scope to identify and consider bespoke solutions where the conditions dictate.
		Offshore physical environment, water environment, geology and hydrogeology	**Volume 1, Part 4 Offshore Scheme, Chapter 2 Physical Environment** **4.2.7.3 and 4.2.11.1** **Issue**: The comments on the Shoreline Management Policy (SMP) are incorrect. The stated maintain existing defences and hold the line where possible, does not apply to the whole frontage from Thorpeness to Orford Ness. The shoreline is divided into management units/areas, to which different policies correspond. Thorpeness (Min 13.3 – PDZ 4) is covered by No Active intervention (NAI) for the first 2 epochs and managed realignment (MR) for epoch 3. Policies for Thorpness Haven property (Alb 14.1 – PDZ 5) and Thorpeness Haven Beach (Alb 14.2 – PDZ 5) are indicated in the table below.	N	The most recent details from the SMP, including the specific management units are now included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.

SUMMARY OF SPECIFIC POLICIES

Policy Unit		Policy Plan			
		2025	2055	2105	Comment
ALB 14.1	Thorpeness Haven property	NAI	NAI	NAI	This would not preclude minor works to sustain property, subject to impact assessment.
ALB 14.2	Thorpeness Haven Beach	MR	MR	MR	Consider allowing flooding with secondary defence but maintain the road.
ALB 14.3	Aldeburgh	HTL	HTL	HTL	Control at Fort Green.
ALB 14.4	Slaughden	HTL	HTL	HTL	Detailed management subject to an estuary management plan.

Key: HTL - Hold the Line, A - Advance the Line, NAI – No Active Intervention
* HR – Hold the Line on a retreated alignment, MR – Managed Realignment

		Summary of specific policies				N	This comment has been noted by National Grid.

							subject to impact assessment.		
			ALB 14.2	Thorpeness Haven Beach	MR	MR	MR	Consider allowing flooding with secondary defence but maintain the road.	
			ALB 14.3	Aldeburgh	HTL	HTL	HTL	Control at Fort Green	
			ALB 14.4	Slaughden	HTL	HTL	HTL	Detailed management subject to an estuary management plan.	
			Key: HTL – Hold the Line, A – Advance the Line, NAI – No Active Intervention, HR – Hold the Line on a retreated alignment, MR – Managed Realignment.						
			SMP – 7 was published in 2010 – but some attributions still refer to former designations, such as Sub-Cell 3C, especially in the PDZ sections, possibly due to older templates being used. **Impact**: Not taking into account the right SMP policy could mean that the development is designed in such a way that it's put at increased risk of flooding in the future. **Solution**: Ensure that the correct SMP position is reflected into the development proposals. Take account of "Section 8 - Plan Updates" of SMP - 7 (previously SubCell 3C), where changes to PDZ4 and PDZ5 are expressed (sanctioned in 2015). Use "SMP – 7 (formerly SMP2 – Sub-Cell 3C)" to avoid confusion. In addition – Please note SMP Explorer – a map based single portal interface to all SMPs, is due for release in the new year (2024). An output of the recent SMP refresh exercise, this online tool aims to allow easier access to and interrogation of SMP policies and data.					N	It is noted that SMP Explorer was released. The most recent details from the Shoreline Management Policy (SMP), including the specific management units are now included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Fish and shellfish ecology	**Volume 1, Part 4 Offshore Scheme, Chapter 3 Benthic Ecology, Volume 1, Part 4 Offshore Scheme, Chapter 4 Fish and Shellfish** **4.3.6.3, 4.4.7.22 to 4.4.7.27, 4.4.11.1, table 4.4.18** **Issue**: Potential disturbance from project activities has not included an assessment of potential impacts to Smelt. Smelt migrate to sea from the Alde & Ore waterbody as adults to feed, and return to the estuary to spawn. A migratory pathway exists in the proposed area of Sea Link's offshore works. The Environment Agency have a statutory duty to ensure the conservation of smelt and their aquatic					N	An assessment of smelt has now been considered and assessed within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology and Application Document 6.9 Water Framework Directive Assessment**. The Alde & Ore waterbody is over 3 km from the Offshore Scheme. This considered to be beyond the zone of influence of potential effects to smelt and their migration into the river.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			environment under the Environment Act 1995. Smelt are listed as a BAP species. **Impact**: The Alde & Ore is a WFD surveillance waterbody and has a breeding population of smelt present. Smelt are very sensitive to anthropogenic disturbance, and HDD will disrupt the Smelt's migration route, and therefore risk population numbers of this protected species. **Solution**: Assess potential impacts to smelt, and their migratory pathway, as a result of both the onshore and offshore elements of the project. This will need to include the construction, operation, and decommissioning phases. An assessment of impacts of HDD on this protected species will need to be provided. This includes providing the depth, and timings of HDD. Please be aware the depth will need to be enough to avoid interference with coastal processes that may in-turn affect Smelt. The timing will need to be appropriate to avoid their migratory period, and thereby avoid disruption of the Smelt's migratory route.		
		Fish and shellfish ecology, inter-project cumulative effects, legislation and policy	**Volume 1, Part 4 Offshore Scheme, Chapter 4 Fish and Shellfish, Volume 1, Part 5 Project Wide effects, Chapter 2 Combined Effects of Onshore and Offshore** **Elements of the Proposed Project** **Tables 4.12.2 to 4.12.16 and Table 5.2.4** **Issue**: Potential cumulative and in combination effects need to be assessed for Smelt and WFD TraC fish deterioration in the Alde & Ore. The Environment Agency have a statutory duty to ensure the conservation of smelt and their aquatic environment under the Environment Act 1995. Smelt are listed as a BAP species. **Impact**: Smelt migrate through the proposed project area, and have already been a species identified as being impacted from other NSIP's in the area. The Alde & Ore is a WFD surveillance waterbody and has a breeding population of Smelt present. Smelt are a significant species in the Alde & Ore TraC fish assemblage and are a key indicator species under the WFD. **Solution**: Include disturbance effects on this species, this should include potential thermal plume avoidance from cables. Assess the potential for a WFD TraC fish deterioration in the Alde & Ore.	N	An assessment of smelt has now been considered and assessed within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology and Application Document 6.9 Water Framework Directive Assessment**. Consideration has also been given to potential thermal plume avoidance from cables and the potential effects to fish migration and avoidance of these plumes. Target burial depth of the cable has been incorporated into the project design. Previous heat dissipated modelling (Eastern Link 1 and 2) has suggested that for bundled HVDC cables buried at a depth of 1.5 m, within 50 cm of the seabed surface the increase in sediment temperature is limited to approximately 3°C and considered negligible at the seabed surface due to the cooling effect of the sea water. Therefore, there is considered to be no thermal effects to smelt migration. In combination effects (intra-project effects) have been assessed within **Application Document 6.2.4.10 Part 4 Marine Chapter 10 Intra-Project Cumulative Effects** and inter-project cumulative effects have been assessed within **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. No significant cumulative effects were found for Smelt and WFD TraC fish deterioration in the Alde & Ore, as this estuary is approximately 20 km from the cable.
		Terrestrial ecology, onshore mitigation	**Appendix D – Kent: Fisheries, Biodiversity and Geomorphology** **Volume 1, Part 1 Introduction Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures** **Table 1.4.F.6**	N	Beaver surveys have been undertaken in Kent to inform the assessment within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. No requirement for beaver habitat or lodge creation mitigation has been identified.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Issue: Current proposals do not include the protection of beaver lodges that are within the Kent footprint of this project. Beavers are protected by law. **Impact**: Beaver habitats within the Kent footprint of this project would be threatened. **Solution**: Please ensure beaver habitats and their lodges are included in the mitigation measures for this project.		
		Terrestrial ecology	**Volume 1, Part 3 Kent Onshore Scheme Chapter 3 Ecology and Biodiversity** **3.3.5.37 and 3.3.5.39** **Issue**: Reference is made to surveys for various aquatic mammals, and identifies in section 3.3.5.37 that otters create “slides”. This point should be made in section 3.3.5.39 for beavers too, as their slides are more numerous, and much more obvious in the project area than those of otters. **Impact**: Beaver habitats would be detrimentally affected, if not included in the surveys; impacts to their habitats will not be avoided or mitigated. **Solution**: Beavers need to be included in the surveys for aquatic mammals. In consideration of the Assessment Criteria – Sensitivity for beavers, please be advised by the surveys completed in 2022 and 2023 by Natural England. **Table 3.3.7** **Issue**: It is suggested that surveys for beavers can take place at any time of the year; this is not the case. **Impact**: Surveys carried out at the wrong time of year would give an inaccurate estimate of the beaver population. This would increase the likelihood of beavers being disturbed by the project in all phases. **Solution**: Surveys for beavers should take place between December to mid March.	N	Beaver surveys have been undertaken in Kent to inform the assessment within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The Eurasian Beaver Handbook indicates beaver surveys can be undertaken any time of year, although evidence can be more visible in winter.
		Terrestrial ecology	**Volume 2 Part 3 Kent Onshore Scheme Appendix 3.3.A Phase 1 Habitat Survey Report** **3.3.A.3.44** **Issue**: We have data that shows Otters, Beavers and Water voles within much closer proximities to the project than reported: An otter was seen (Environment Agency record) at TR3340761157. This is less than the 1.7km reported. We have records that Water Voles are found throughout the area. There are publicly available records showing that beavers are much closer than 424km.	N	This comment has been noted by National Grid. Riparian mammal surveys including otters, water voles and beaver have been undertaken to inform the assessment. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The Environment Agency data referenced has been used in the report.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Impact: Inaccurate data would mean that the project disturbs habitats of the protected species found in the area. **Solution**: Please check and update your records.		
		Fish and shellfish ecology, onshore mitigation	**3.3.A.3.60** **Issue**: A number of fish species have been overlooked in the desk study. We have good anecdotal evidence of Salmon in the Great Stour estuary. Sea Trout in the river to the Normal Tidal Limit, Shad and Sea Lamprey. In addition, eels are present in large numbers. **Impact**: Without consideration for these species, appropriate mitigation measures won't be in place, therefore putting their population and habitat at risk. **Solution**: Mitigation measures need to be considered to avoid putting these species at risk. For data on fish in the river, please access the National Fish Population Database at Freshwater fish surveys (NFPD) - data.gov.uk.", and contact the Environment Agency fisheries team.	N	These transitional species have been considered as part of the fish and shellfish baseline **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**, where National Grid has referred to the River Stour. National Grid has updated the terminology within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology** to reflect that consideration has been given to the Great Stour estuary, in addition to the River Stour. Mitigation has been adopted where required in relation to these species and the estuary.
		Terrestrial ecology, legislation and policy	**Volume 1 Part 3 Kent Onshore scheme chapter 3 Ecology and Biodiversity** **3.3.9.3** **Issue**: Measures to protect Beavers are not sufficient. B03 relates to the risk of animal entrapment and suggests that "a means of escape will be installed into all excavations left open overnight". Should a beaver become entrapped in pits or other parts of the works, more than merely leaving an excavation open will be needed. **Impact**: Beaver's may be put at risk if they are trapped, and appropriate measure aren't in place for their safe exit. **Solution**: The applicant should consult with Natural England, to consider what licences should be sought, and what equipment needs to be readily available to safely manage such animals. Ramps from works could either be installed, or be available to be placed into works if an animal should become trapped. Whatever measures are adopted by the applicant, they must comply with the legislation that protects beavers, and covers their management.	N	The reference to a means of escape was a reference to ramps, as suggested by the Environment Agency. This has been clarified.
		Terrestrial ecology, water environment, onshore mitigation	**3.3.9** **Issue**: Current suggestions for BNG schemes are not appropriate. Current suggested proposals will be located in areas that will become flooded by the sea, or become intertidal habitat, with up to 10 metres water depth over the next century.	N	This comment has been noted by National Grid. Biodiversity Net Gain mitigation proposals have progressed since Statutory consultation and now no longer includes this land. Full details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report** including an outline of the requirement for monitoring and consideration of wider environmental benefits.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Impact: BNG schemes will be located in areas that will become subtidal, and therefore fails to achieve long term maintenance obligations. **Solution**: BNG monitoring and management plans, will need to consider the Isle of Gain to South Foreland SMP, to ensure they are resilient to rising sea levels. Isle of Grain to South Foreland – South East Coastal Group (secoastalgroup.org.uk)		
		Terrestrial ecology, water environment, onshore mitigation	**3.3.10** **Issue**: Habitat management and monitoring plans are not mentioned, in regards to riparian habitat creation for BNG. **Impact**: Habitat management and monitoring are integral to effective BNG implementation. Without a habitat management and monitoring plan in place, riparian habitat created for BNG will not be secure for the future. **Solution**: Include monitoring and management plans, following this guidance Creating a Habitat Management and Monitoring Plan for Biodiversity Net Gain - Land use: policies and framework (blog.gov.uk)	N	Details relating to the Proposed Project's approach to Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. At this stage, **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk and Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent** have been modified to include management and monitoring prescriptions and as such will act at as Habitat Management and Monitoring Plans.
		Intra-project cumulative effects, design, alternative solutions	**Volume 1, Part 3 Kent Onshore Scheme, Chapter 13 Kent Onshore Scheme Intra-Project Cumulative Effects** **Volume 2, Part 3 Kent Onshore Scheme, Appendix 3.12.A Kent Onshore Intra-Project Cumulative Effects Screening Tables** **Volume 1, Part 4 Offshore Scheme, Chapter 11 Offshore Scheme Intra-Project Cumulative Effects** **Volume 1, Part 4 Offshore Scheme, Chapter 12 Offshore Scheme Inter-Project Cumulative Effects** **Table 3.13.A, 4 4.12** **Issue**: It is not clear where the intertidal connector is situated, this must be outside of the salt fringe before directional drilling takes it underneath the saltmarsh, lagoon and road. **Impact**: If the Intertidal connection is within the saltmarsh fringe, the protective ridge salt marsh feature could be further damaged, allowing greater inundation of the saltmarsh and lagoon habitats. **Solution**: The intertidal connection needs to be located outside of the saltmarsh fringe.	N	The intertidal works are entirely located outside areas of saltmarsh since the saltmarsh and saltmarsh fringe will be crossed by employing a trenchless construction solution. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Inter-project cumulative effects	**Table 3.13.A 4, 4.12** **Issue**: The cumulative and in combination impacts of the Nemo Link project in Kent has not been recognized and considered for assessment, therefore risks to protected species are not fully	N	The effects of Nemo Link have been considered in the design and construction method for the Proposed Project. The saltmarsh (including the ridge feature) and lagoon will be entirely avoided by construction plant, and (unlike for Nemo Link) no surface works through the saltmarsh are proposed.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			understood. A previously installed power cable (Nemo Link) runs from the top of the redline landfall area of the Sea Link cable route to the south running through the nature reserve. The Nemo Link cable runs along the top of the lagoon and is buried underneath a chalk bund throughout the length of the nature reserve. The Sea Link cable is shown to cross this cable at the back of the lagoon. **Impact**: Heavy plant used to install the Sea Link cable could compact and further damage the salt marsh ridge feature that is in recovery. WFD status would deteriorate, and wetland habitats would be put at risk. **Solution**: Sea Link's interaction with Nemo Link needs to be considered for in combination and cumulative effects. Topographic surveys of cable route across saltmarsh/lagoon pre and post drilling are needed, to ensure that the saltmarsh ridge is not reduced in height by the cable installation. There will need to be a preapproved action plan ready to be applied should this occur due to subsidence etc. Please note, the saltmarsh is also a Special Protection Area; Natural England should therefore be consulted on any works relating to it. As the marsh area is a wetland habitat, we would also need to be involved in these discussions.		There is no surface trenching in the intertidal environment as this will be done entirely using trenchless construction solutions. There will be a receiving location and jack up barge or similar in the intertidal mudflats, but not in the saltmarsh. Full details of the Proposed Project design and construction methodology is included within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Water environment, construction, onshore mitigation	**Issue**: It is not stated the exact location where drilling works will place. **Impact**: Heavy plant used to install the Sea Link cable could compact and further damage the salt marsh ridge feature that is in recovery. WFD status would deteriorate, and wetland habitats would be put at risk. **Solution**: Outline how the saltmarsh and lagoon will be protected. For example: Start directional drilling away from the edge of the salt marsh. Plant and other heavy equipment used for the installation, should move out from the old hoverport pad site, rather than across the saltmarsh, which would further compact the ridge and feature. Ensure that the drilling is deep enough, to safely pass under the existing Nemo Link power cable that runs along the back of the lagoon. Please note, the saltmarsh is also a Special Protection Area; Natural England should therefore be consulted on any works relating to it. As the marsh area is a wetland habitat, we would also need to be involved in these discussions.	N	A trenchless solution is envisaged to pass below the saltmarsh and the associated utilities located to the landward side of the saltmarsh (Thanet OFTO cables and Nemo Link Interconnector terrestrial cables). A ducted solution will be drilled from land, under the saltmarsh and to an exit point on mudflats (exit point below MHWS). At the point of the terrestrial crossings beneath the exiting third party assets and the lagoon, the ducting will be c. 15 to 20 m below the land surface. Controls will be put in place to ensure that the drilling of the trenchless solution uses environmentally sensitive materials, and that a mitigation plan is in place in the event of frack-out. This commitment is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Construction, terrestrial ecology, onshore mitigation	**Table 4.11.1** **Issue**: The potential for cable laying ships to impact environmental receptors has not been mentioned. **Impact**: Heavy plant used to install the Sea Link cable could compact and further damage the salt marsh ridge feature that is in recovery.	N	The potential for cable laying ships to impact environmental receptors is assessed within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**, **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**, **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals and Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. The saltmarsh habitat is located on the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			WFD status would deteriorate, and wetland habitats would be put at risk. **Solution**: Assess the impact that cable laying ships will have on the saltmarsh. Please note, the saltmarsh is also a Special Protection Area; Natural England should therefore be consulted on any works relating to it. As the marsh area is a wetland habitat, we would also need to be involved in these discussions. Cable laying ships that are grounded on the lower shore to pull the cable into the intertidal, need to be assessed with regard to their potential full footprint of mud disturbance. This includes the length of the vessels and all possible tidal movements form the anchor point. The habitat pre and post assessment must cover this width.		upper shore, away from the bore exit point in the intertidal area. There will be no vessels or plant interacting with the saltmarsh. Access to the exit pits in the intertidal zone will be from the former hoverport base rather than from the sea. Small numbers of plant and machinery will require access over the intertidal/lower shore mudflats. Assessment of construction phase impacts, including cable burial on the mudflat has been carried out and is contained within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** and **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. No likely significant effects have been identified on benthic ecological features.
		Water environment, geology and hydrogeology, climate change	**Appendix E – Suffolk and Kent: Flood modelling** **Volume 1, Part 2 Suffolk Onshore Scheme, Chapter 5 Water Environment** **Volume 1, Part 3 Kent Onshore Scheme, Chapter 5 Water Environment** **2.5.4.16 (Suffolk)** **3.5.4.16 (Kent)** **Issue**: The suggested modelling approach and assumption is not appropriate. The Environment Agency modelling data is not designed for site-specific Flood Risk Assessment; rather they are designed for strategic flood risk mapping purposes. It is important that third parties check that these models are suitable for their needs, if they are being used in a site-specific context. **Impact**: Inappropriate modelling will result in key flood risk sources, and associated impacts, being represented inaccurately or missed. This could have implications for any resultant design, and mitigation, which is based on detailed hydraulic modelling data resulting in increased flood risk to the surrounding area. **Solution**: It is important to check that any modelling or hydrological data that the Environment Agency holds is suitable for project. Please evaluate the model and hydrological data for the Rivers Alde, Fromus, and Stour. Listed below are some key things to think about, which are also applicable to models for other watercourses: 1. Hydrological data used in the modelling - Is this still representative? 2. Climate change allowances - Do these reflect the most recent guidance for fluvial and tidal uplifts?	N	Flood risk models have been obtained from the Environment Agency and have been reviewed for their suitability to inform the design and the Proposed Project has engaged with the Environment Agency to agree the scope of the Flood Risk Assessment, including the assessment work necessarily to suitably inform the Proposed Project design and the flood risk mitigation measures that are necessary. Subsequently updates were made to the Environment Agency model of the River Fromus (including a review of the model's inflows) and this refined model has been used to simulate pre development conditions, as well as 2 no. crossing design options. The results of the modelling, inclusive of a modelling technical note, are reported in the **Application Document 6.8 Flood Risk Assessment**, which has been shared with the Environment Agency for review and comment.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			3. Model digital terrain model data - Is this based on the best available data for representing the floodplain? Could this be updated to a more recent Lidar dataset? 4. Model grid resolution - Is this suitable considering the scale and nature of the development? 5. Model schematisation – is cross section spacing and structure representation sufficient in the location of interest? In Suffolk, the latest Environment Agency modelling for the River Alde and Fromus was completed by Mott Macdonald in 2020. This is an FM-TUFLOW model with a grid resolution of 8 metres. In Kent, the latest Environment Agency modelling forthe Lower River Stour was completed by JBA Consulting in 2010. This resulted in a linked 1D-2D hydrodynamic model with a grid resolution of 10 metres. The climate change allowances adopted in these models have since been superseded by more recent guidance (UKCP18). Furthermore, there may be more recent Lidar digital terrain model data available for the area of interest (available at environment.data.gov.uk).		
		Converter station location, water environment	**Appendix F – Suffolk: Flood Risk** **Volume 1, Part 2 Suffolk Onshore Scheme, Chapter 5 Water Environment** **Table 2.5.5 and figure 2.5.2** **Issue**: Figures 2.5.2 seems to be missing the proposed converter site options. **Impact**: Infrastructure may be built outside of Flood Zone 1, in areas at a higher risk of flooding. **Solution**: We need to see all above ground infrastructure included on figure 2.5.2, with proposed limits of deviation for reference, and a commitment to build within the limits of deviation.	N	Figures showing the locations of all above ground infrastructure are included within **Application Document 2.5.1 Works Plans – Suffolk, Application Document 2.5.2 Works Plans – Kent and Application Document 2.5.3 Works Plans – Offshore**, together with their proposed limits of deviation. This infrastructure is further discussed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Full details of the Proposed Project design and construction methodology is included within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. A commitment to build within the limits of deviation is secured within the draft DCO (**Application Document 3.1**).
		Water environment, geology and hydrogeology	**Appendix G – Suffolk and Kent: Flood risk** **Volume 1, Part 1, Chapter 4 Description of the Proposed Project** **1.4.2.53, 1.4.3.8, 1.4.5.49, 1.4.5.57** **Issue**: We are concerned that local Assets will be adversely affected by proposed works. **Impact**: This will increase flood risk. **Solution**: Assess the condition and geometry of assets adjacent to the proposed work, to ensure that there is appropriate setback of all infrastructure (above and below ground), and that the proposal does	N	National Grid will undertake monitoring of existing flood defence assets that the Proposed Project passes under or in close proximity to in agreement with Environment Agency protocols to ensure no detriment to the integrity of the defences. This will involve monitoring of these assets before, during and for a period after the construction works, with remediation of any defects as a result of the Proposed Project should they be detected by the monitoring. This is set out within the **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			not adversely affect the flood defence (such as damage, settlement, intersection etc). It would be advisable to carry out assessments of the assets, before and after works with remediation, to recognize any defects as they develop.		National Grid will maintain an ongoing dialogue with the Environment Agency, seeking to identify and resolve any issues arising as a result of asset interfaces.
		Noise and vibration, traffic and transport, construction	**1.4.5.61 to 1.4.5.63** **Issue**: Vibration and settlement from trenchless construction methods and traffic. **Impact**: There is a risk that vibration from construction works, and associated traffic, will damage the stability of flood defence assets and watercourses. **Solution**: Trenchless methods, such as Pipe jacking (auger bore), HDD, and micro boring (micro-tunnelling), as well as traffic, need to consider safe vibration limits. Settlement should be assessed post-works, with appropriate remediation if it exceeds agreed thresholds.	N	Construction vibration impacts on structures, including flood defences, have been assessed as part of the ES. Further detailed assessments would be conducted by the contractor. Where required, mitigation measures would be incorporated into any vibration generating works including the impacts on the stability of assets from vibration generating works and any agreed settlement thresholds will be monitored and remediated if necessary. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**.
		Water environment	**1.4.5.22, Table 1.4.D.1 and Table 1.4.D.1.2** **Issue**: Proposed crossing of main rivers will need to adequately assess impact on flood risk. **Impact**: Flood risk will increase if proposed crossings aren't adequately assessed. **Solution**: Assess possible risks to nearby flood defence assets that will need to be managed e.g., damage from collision, settlement, or vibration. This may depend on the proposed crossing type (if applicable). We would require setback. Note that the crossings may alter hydrology during a flood event. We will require specificity about the type of crossing to be implemented at each proposed crossing position within the crossing schedules. Crossings will need to consider the change in flood risk throughout the lifetime of the development to ensure appropriate design.	N	National Grid has engaged with the Environment Agency regarding the proposed crossings of main river watercourses, with key design parameters for the crossings having been agreed. The effects of these crossings on flood risk have been assessed within **Application Document 6.8 Flood Risk Assessment**. **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** secures a commitment to carry out surveys of any flood defence assets that the Proposed Project passes under or in close proximity to via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). In addition, National Grid will undertake monitoring of these assets before, during, and for a period after the construction works, with remediation of any defects as a result of the Proposed Project should they be detected by the monitoring.
		Water environment, onshore mitigation	**Volume 1, Part 2 Suffolk Onshore Scheme, Chapter 5 Water Environment** **Volume 1, Part 3 Kent Onshore Scheme, Chapter 5 Water Environment** **Table 2.5.5 (Suffolk) Table 3.5.6 (Kent)** **Issue**: We are concerned that the infrastructure proposed will result in loss of floodplain storage volume. **Impact**: A loss of floodplain storage volume will increase flood risk on site and elsewhere.	N	National Grid has engaged with the Environment Agency regarding the proposed works within Flood Zones 2 and 3 and has agreed flood risk mitigation. The mitigation measures are set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). Further details are also contained within **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Water Environment** and **Application Document 6.2.3.5 Part 3 Kent Chapter 5 Water Environment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Solution: The developer needs to ensure appropriate design of crossings, and infrastructure within the flood zones, to ensure no net loss of flood storage volume. Any compensation required must be localised, level-for-level, and volume-for-volume. The loss of floodplain storage will depend on the placement of above ground infrastructure. If any infrastructure is proposed to be located outside of Flood Zone 1, then this may alter Flood Zone 2 and 3 extents/depth. This will necessitate a consideration of flood storage compensation.		
		Alternative solutions, water environment, construction	**2.5.8.3 (Suffolk) 3.5.8.3 (Kent)** **Issue**: The developer has not committed to trenchless techniques for crossing main rivers. We are unlikely to accept a trenched method unless exceptional circumstances are demonstrated. **Impact**: Trenched methods would have significant adverse effects on the hydrology, geomorphology, and flood risks of the main river. **Solution**: Please confirm trenchless crossing techniques will be adopted. We require the developer to commit to trenchless methods for crossing the main river(s). We would need an understanding of the vertical limit of deviation beneath the watercourses and nearby assets. For trenchless methods, we suggest monitoring of settlement with agreed thresholds and associated actions for “undue settlement” which may adversely affect the watercourse or assets.	N	The cables proposed would not cross any main rivers using open cut techniques and crossings of main rivers for access would be made using clear span bridges. Suffolk - the only main river crossed by the works is the River Fromus which is a permanent access crossing only and will not require cables to be installed under it. Kent - the only main river crossed by the works is the River Stour which will have overhead lines strung over and a temporary bridge. Where the Proposed Project crosses the Minster Stream this is an ordinary watercourse. Details relating to the Proposed Project design and construction methodology are set out within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Climate change, water environment onshore mitigation	**2.5 (Suffolk) 3.5 (Kent)** **Issue**: Climate change has not been adequately considered in the context of flood risk and coastal erosion. The placement of infrastructure does not adequately account for future risks, within the lifetime of the development. **Impact**: Above ground infrastructure (AGI) could be within the future flood zones 2 and 3, and below ground infrastructure (BGI) could become exposed due to erosion. **Solution**: Factor climate change into the decision making for proximity-based decisions using the latest guidance (https://www.gov.uk/guidance/climate-change) with a design-life of at least 75 years. AGI will need to consider whether it will fall within future flood zones. This may require the developer to carry out their own modelling. For BGI, commit to an appropriate depth of cable below the riverbed, based on a evidence-based justification, which considers a design-life of at-least 75 years (in line with the NPPF) and cumulative rates of erosion. It is suggested that there will be two metres of cover for HVAC at watercourses, and two metres of cover for HVDC at watercourses.	N	A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. A separate, more detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Similarly, landfall infrastructure will require an evidence based justification which accounts for rates of erosion, the SMP, and a commitment to install infrastructure to an appropriate depth. This will ensure that it does not become exposed, due to erosion over the lifetime of the development. Proposed landfall position(s) will need to assess proximity to flood defence assets and watercourses, to ensure adequate setback and appropriate installation methodologies to mitigate risks to assets.		
		Water framework directive screening assessment, water environment	**Appendix H - Suffolk and Kent: Water Framework Directive and Marine** **Volume 1, Part 5 Chapter 5 Water Framework Directive Screening Assessment** **Tables 5.5.6, 5.5.7 and 5.5.12** **Issue**: It is unclear from the terminology used whether the applicant is talking about screening or scoping. The title of table 5.5.7 refers to screening of components, but column headers refer to scoping in/out. The reference to activities would suggest they are claiming to be carrying out WFD scoping here. The applicant would need to follow the guidance to decide whether there was a justification to “scope” out any activity for any WFD element. **Impact**: We are unable to determine what elements are being screened in, and will be scoped in as part of the next stage of the WFD assessment process. **Solution**: Amend the titles of tables 5.5.6, 5.5.7 and 5.5.12 to reflect whether an activity screened is in. Ensure that the proper procedure for WFD assessment is being followed, and justifications are made in accordance with the WFD assessment guidance document “Clearing the waters for all”, Water Framework Directive assessment: estuarine and coastal waters - GOV.UK (www.gov.uk). This guidance indicates which activities can be screened out. All other activities cannot be screened out, and must proceed to a WFD scoping stage. WFD scoping forms must be supplied, to indicate whether the activity has been scoped in or out of the need for a further impact assessment stage.	N	The Water Framework Directive information provided alongside the PEIR was intended to provide an initial screening. A full assessment, following the Clearing the Waters for All method for elements of the Proposed Project at the landfalls, has been completed and is included within **Application Document 6.9 Water Framework Directive Assessment**.
		Water framework directive screening assessment, fish and shellfish ecology	**Appendix I - Suffolk: Water Framework Directive and Marine** **Volume 1, Part 5 Chapter 5 Water Framework Directive Screening Assessment** **5.5.4.2** **Issue**: The Alde & Ore waterbody has been screened out of the WFD assessment.	N	Accounting for the Environment Agency advice, the Alde & Ore waterbody has been screened into **Application Document 6.9 Water Framework Directive Assessment**. An assessment of smelt from the Alde and Ore waterbody has been considered and assessed within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**, with a focus on potential effects from underwater sound and subsea cable thermal emissions. No likely

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Impact: The Alde & Ore is a WFD surveillance waterbody and has a breeding population of smelt (Osmerus eperlanus) present. Smelt are very sensitive to anthropogenic disturbance. The Environment Agency has a statutory duty to ensure the conservation of smelt and their aquatic environment under the Environment Act 1995. Smelt are listed as a BAP species and are a key indicator species under the WFD. **Solution**: Screen in the Alde & Ore waterbody. Assess potential impacts to smelt and its migratory pathway, as a result of both the onshore and offshore impacts.		significant effects have been identified on fish and shellfish species, including smelt in the Alde and Ore waterbody.
		Water framework directive screening assessment, fish and shellfish ecology	**Table 5.5.2** **Issue**: Potential disturbance from offshore activities has not included an assessment of potential impacts to the WFD Transitional and coastal (TraC) fish assemblage in the Alde & Ore waterbody. Smelt are a key indicator species and a significant species in the Alde Ore Transitional Fish Classification Index (TFCI). Smelt migrate to sea from the Alde & Ore as adults to feed and return to the estuary to spawn. A migratory pathway exists in the proposed area. The Environment Agency have a statutory duty to ensure the conservation of smelt and their aquatic environment under the Environment Act 1995. Smelt are listed as a BAP species. **Impact**: The Alde & Ore is a WFD surveillance waterbody and has a breeding population of smelt present. Smelt are a significant species in the Alde & Ore TraC fish assemblage and are a key indicator species under the WFD. **Solution**: Include the WFD TraC fish assemblage in the Alde & Ore waterbody. This should include an assessment of potential impacts to smelt and its migratory pathway as a result of both the onshore and offshore impacts.	N	Accounting for the Environment Agency advice, the Alde & Ore waterbody has been screened into **Application Document 6.9 Water Framework Directive Assessment**; alongside an assessment of smelt from the Alde and Ore waterbody has been considered within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. Both documents have taken TraC data into consideration.
		Water framework directive screening assessment, water environment	**Appendix J – Kent: Water Framework Directive and Marine** **Volume 1, Part 5 Chapter 5 Water Framework Directive Screening Assessment** **5.5.5.1 to 5.5.5.3** **Issue**: The Kent North WFD waterbody has not been screened in for assessment. The study refers to only two WFD waterbodies being relevant to the “offshore” zone of influence, named Suffolk Coastal (5.5.5.2) and Stour (transitional) (5.5.5.3). It would appear however that the offshore scheme cable corridor passes through Suffolk Coastal, then Kent North (coastal) before reaching the Stour transitional waterbody. All three of these waterbodies need to be included in WFD assessments, as activities requiring a marine license (or equivalent DCO) will take place in all of them.	N	Accounting for the Environment Agency advice, the Kent North Waterbody has been screened into **Application Document 6.9 Water Framework Directive Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Impact: The Kent North WFD waterbody will be impacted in terms of habitats and water quality. Without screening it in, appropriate mitigations won't be in place to prevent its deterioration. **Solution**: Screen in the Kent North Waterbody.		
		Water framework directive screening assessment, water environment, benthic ecology	**Table 5.5.7** **Issue**: The cable corridor may cross areas where sediment that will be "disturbed" contains either EQSD chemicals, or CEFAS-list chemicals at concentrations above CEFAS action level 1. **Impact**: Risk of WFD waterbody deterioration. **Solution**: An impact assessment will be required which will need to establish that the contaminants mobilized (albeit most may be only temporarily mobilized) into the water column, will not significantly deteriorate the waterbody, or prevent achievement of WFD water quality objectives. Short term spikes in levels hypothetically may influence the annual averages. However, they may affect relatively small proportions of a waterbody, and both the extent and duration of the impact needs to be considered, when looking at waterbody concentration criteria phrased as annual averages.	N	Within **Application Document 6.9 Water Framework Directive Assessment**, a more detailed assessment of the temporary mobilisation of contaminants has been conducted. Additionally, the assessment of contaminant mobilisation has been included as an impact pathway within: • **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology;** • **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology; and** • **Application Document 6.2.4.1 Part 4 Chapter 1 Physical Environment.**
		Fish and shellfish ecology, water framework directive screening assessment	**Table 5.5.6** **Issue**: Works in the marine environment will elevate suspended solids in nearby shellfish waters. **Impact**: WFD quality will deteriorate in nearby shellfish waters. **Solution**: Construction and maintenance activity should not elevate ambient suspended solids in the shellfish water by more than 30% above baseline levels.	N	Within **Application Document 6.9 Water Framework Directive Assessment**, a more detailed assessment of suspended sediment concentration and turbidity has been conducted, with consideration of the 30% threshold above baseline levels. Additionally, the assessment of SSC and turbidity has been included as an impact pathway within the following chapters of the ES: • **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology;** • **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology;** • **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals; and** • **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Land rights and CPO	**Appendix K – Informatives** **Advice to applicant – Environment Agency owned land** A parcel of Environment Agency registered land falls within the Suffolk onshore boundary of the project. In Kent, there is a parcel land in close proximity to the Kent onshore boundary. Please ensure that our Estates team is contacted in regards to any planned works within proximity to this land	N	These comments are acknowledged. National Grid would ensure that the Environment Agency Estates Team is duly engaged with regard to this matter.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			(estateslandenq@environment-agency.gov.uk). The details for the land parcels are as follows: • Suffolk: HMLR title SK307770 (Estateman reference: AN01041) • Kent: HMLR title SN00746 (Estateman reference: K335437)		
		Geology and hydrogeology	**Advice to applicant – Groundwater and contaminated land** We would like to point out, in relation to control measure GH02, our guidance 'Piling and Penetrative Ground Improvement Methods on Land Affected by Contamination' is currently being updated, so please ensure that the most up to date version is used.	N	This advice has been noted by National Grid. The most up to date version has been used and referenced within the ES. Further details are contained in **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology and Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**.
		Geology and hydrogeology, water environment, legislation and policy	**Advice to applicant – water resources and water quality** Since 01 January 2018, most cases of new planned dewatering operations above 20 cubic meters a day will require a water abstraction license from the agency, prior to the commencement of dewatering activities at the site, if it doesn't meet the criteria for exemption in The Water Abstraction and Impounding (Exemptions) Regulations 2017 Section 5: Small scale dewatering in the course of building or engineering works. The discharge will require a permit if it falls outside of our regulatory position statement for dewatering discharges. A water discharge activity permit is required to carry out discharges of sewage and trade effluent. Given the size of the development, it is unlikely that the Regulatory Position Statement on Temporary dewatering from excavations to surface water can be met. Therefore, a permit will likely be required to discharge dewatering effluent or surface water run-off generated from areas of exposed soil during construction. Given the timeframe to determine environmental permits, we encourage the applicant to engage with us on permit requirements at the earliest possible stage.	N	This advice has been noted by National Grid.
		Legislation and policy, agriculture and soils	**Advice to applicant - Waste** The Environmental Protection (Duty of Care) Regulations 1991 for dealing with waste materials are applicable to any off-site movements of wastes. The code of practice applies to you if you produce, carry, keep, dispose of, treat, import or have control of waste in England or Wales. The law requires anyone dealing with waste to keep it safe and make sure it's dealt with responsibly and only given to businesses authorised to take it. The code of practice can be found here: Waste duty of care code of practice - GOV.UK (www.gov.uk)	N	This advice has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			If you need to register as a carrier of waste, please follow the instructions here: https://www.gov.uk/register-renew-waste-carrier-broker-dealer-england		
		Legislation and policy, agriculture and soils	**Advice to applicant - Waste** The developer must apply the waste hierarchy as a priority order of prevention, re-use, recycling before considering other recovery or disposal options. Government guidance on the waste hierarchy in England can be found here: https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_da ta/file/69403/pb13530-waste-hierarchy-guidance.pdf Site Waste Management Plans (SWMP) are no longer a legal requirement, however, in terms of meeting the objectives of the waste hierarchy and your duty of care, they are a useful tool and considered to be best practice.	N	This advice has been noted by National Grid. A Site Waste Management Plan would be produced prior to construction which sets out the framework for the management of wastes generated during the construction of the Proposed Project. Further details are contained in **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**.
		Legislation and policy, agriculture and soils	**Advice to applicant - Waste** If materials that are potentially waste are to be used on-site, the applicant will need to ensure they can comply with the exclusion from the Waste Framework Directive (WFD) (article 2(1) (c)) for the use of, 'uncontaminated soil and other naturally occurring material excavated in the course of construction activities, etc…' in order for the material not to be considered as waste. Meeting these criteria will mean waste permitting requirements do not apply. Where the applicant cannot meet the criteria, they will be required to obtain the appropriate waste permit or exemption from us. A deposit of waste to land will either be a disposal or a recovery activity. The legal test for recovery is set out in Article 3(15) of WFD as: • any operation the principal result of which is waste serving a useful purpose by replacing other materials which would otherwise have been used to fulfil a particular function, or waste being prepared to fulfil that function, in the plant or in the wider economy. • We have produced guidance on the recovery test which can be viewed at https://www.gov.uk/guidance/waste-recovery-plans-and-permits#waste-recovery activities. You can find more information on the Waste Framework Directive here: https://www.gov.uk/government/publications/environmental-permitting-guidance-the-waste framework-directive More information on the definition of waste can be found here:	N	This advice has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			https://www.gov.uk/government/publications/legal-definition-of-waste-guidance More information on the use of waste in exempt activities can be found here: https://www.gov.uk/government/collections/waste-exemptions-using-waste Non-waste activities are not regulated by us (i.e. activities carried out under the CL:ARE Code of Practice), however you will need to decide if materials meet End of Waste or By products criteria (as defined by the WFD). The 'Is it waste' tool, allows you to make an assessment and can be found here: https://www.gov.uk/government/publications/isitwaste tool-for-advice-on-the-by-products-and-end-of-waste-tests

Table 1.8 Forestry Commission

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Landscape and visual, Legislation and policy inc. permits	As a Non-Ministerial Government Department, the Forestry Commission provide no opinion supporting or objecting to an application. Rather we provide advice on the potential impact that the proposed development could have on trees and woodland including ancient woodland. We note the presence of several small blocks of woodland within the proposed development order limits and some areas of ancient woodland adjacent to the order limits – Grove Wood ancient re-planted woodland and Great Wood, ancient semi natural woodland. Ancient woodlands are an irreplaceable habitat. They have great value because they have a long history of woodland cover, being continuously wooded since at least 1600AD with many features remaining undisturbed. This applies equally to Ancient Semi Natural Woodland (ASNW) and Plantations on Ancient Woodland Sites (PAWS). As highlighted in Paragraph 180 (c) of the National Planning Policy Framework, which states: “Development resulting in the loss or deterioration of irreplaceable habitats (such as ancient woodland and ancient or veteran trees) should be refused, unless there are wholly exceptional reasons and a suitable compensation strategy exists”. While Nationally Significant Infrastructure Projects are not subject to the NPPF, it sets out the importance of these habitats.	N	Information on the location and importance of ancient woodlands is included within **Application Document 6.10 Arboricultural Impact Assessment**. Information from the National Planning Policy Framework and the relevant National Policy Statements is included within the Arboricultural Impact Assessment.
	Landscape and visual, Water environment, Agriculture and soils	We note that your PEIR documents state that the construction swathe will not be located within the tree canopy or Root protection areas of the ancient woodlands. However, it is essential that the ancient woodlands are considered appropriately to avoid any direct or indirect impacts. Such as polluting the ground around them, changing the water table or drainage of woodland or individual trees. It is also essential that fuels, chemicals or waste materials such as topsoil are not stored on the ancient woodland soils or under the woodland canopy.	N	A 15 m buffer zone is shown on the Tree Constraints Plans and Tree Protection Plans as per standing advice from Natural England and the Forestry Commission. Direct and indirect impacts to trees and woodlands are considered within **Application Document 6.10 Arboricultural Impact Assessment**. All storage or mixing of materials will take place in agreed allocated areas at least 5 m from the edge of the RPA of retained trees and at least 5 m from the edge of an ancient woodland buffer zone. This commitment is contained within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
	Landscape and visual, Air quality	Due to the irreplaceable nature of ancient woodland, most ‘temporary’ uses will result in irreplaceable damage. Therefore a buffer zone should be provided to protect these woodlands from any potential impacts of the development. For ancient woodlands, there should be a buffer zone of at least 15 metres to avoid root damage. Where assessment shows other impacts are likely to extend beyond this distance, you’re likely to need a larger buffer zone. For example, the effect of air pollution from	N	A 15 m buffer zone is shown on the Tree Constraints Plans and Tree Protection Plans as per standing advice from Natural England and the Forestry Commission. In Suffolk, no veteran or ancient trees are to be removed, and this commitment is secured via **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			development that results in a significant increase in traffic or dust. Appropriate fencing should be installed to prevent unintended incursions into the Root Protection Areas and track dampening can be used to minimize the potential for dust.		A total of 41 individual trees, six tree groups, four woodlands and ten hedgerows are likely to require RPA incursions to facilitate access and for the installation of new services. Providing the principles outlined in **Application Document 6.10 Arboricultural Impact Assessment** are adhered to, RPA incursions are considered unlikely to negatively impact the physiological or structural condition of the trees. Of the RPA incursions 14 will be required for veteran and ancient trees. This includes six veteran tree RPA incursions to facilitate proposed access routes and one ancient tree and five veteran tree RPA incursions to facilitate proposed monitoring and maintenance access routes. In addition, two veteran tree RPA incursions are required to facilitate both proposed access routes and monitoring and maintenance access routes. In Kent, no veteran or ancient trees are to be removed, and this commitment is secured via **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). A total of 32 individual trees, 37 tree groups, two woodlands and nine hedgerows are likely to require RPA incursions to facilitate access and existing utility line diversions. All RPA incursions will be achieved in accordance with principles set out within **Application Document 6.10 Arboricultural Impact Assessment** and therefore RPA incursions are considered unlikely to negatively impact the physiological or structural condition of the trees. Of the RPA incursions two will be required for a veteran and ancient tree to facilitate monitoring and maintenance access. Providing the principles detailed in **Application Document 6.10 Arboricultural Impact Assessment** are adhered to, soil structure can be maintained, resulting in no likely adverse impact on the physiological or structural condition of the trees. Any impacts to Ancient Woodland are detailed within **Application Document 6.10 Arboricultural Impact Assessment**. The final level of arboricultural impacts will be assessed and recorded as part of an Arboricultural Method Statement which will be secured through Requirement 8 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Landscape and visual	There are also several fragmented woodlands within the proposed development order limits, it is unclear which of these are proposed to be removed. We would expect to see a thorough assessment of any loss of all trees and woodlands within the project boundary with the development of mitigation measures to minimise any risk of net deforestation as a result of the scheme. A scheme that bisects any woodland will not only result in significant loss of woodland cover but will also reduce ecological value and natural heritage impacts due to habitat fragmentation.	N	**Application Document 6.10 Arboricultural Impact Assessment** details the likely tree related impacts from the Proposed Project and mitigation measures required. Proposed woodland across the Kent Onshore Scheme and Suffolk Onshore Scheme is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk and Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**. These documents set out the planting proposals and how this relates to species and habitats. The Proposed Project does bisect woodland in some locations and this is highlighted and assessed within **Application Document 6.10 Arboricultural Impact Assessment**. **I**n addition, **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** assess the impacts of habitat fragmentation.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landscape and visual, Terrestrial ecology	There may be ancient or veteran trees along the route, including within hedgerows, therefore any surveys should have regard to these to avoid any impact on the Ancient or veteran trees. Losses to connectivity should be avoided by retaining trees and hedgerows wherever possible with any compensatory planting placed to be of maximum benefit for biodiversity and connectivity between hedgerows, trees, woodland areas and other habitats. With the Government aspirations to plant 30,000 ha of woodland per year across the UK by 2025. The Forestry Commission is seeking to ensure that tree planting is a consideration in every development not just as compensation for loss. However, there are a number of issues that need to be considered when proposing significant planting schemes: Biosecurity of all planting stock needs to be considered to avoid the introduction of pests and diseases. Woodlands need to be climate and pest and disease resilient. Maximise the ecosystem services benefits of all new woodland wherever possible e.g. for flood reduction and also to ensure the planting contributes to a resilient treescape by maximising connectivity across the landscape. Plans are in place to ensure long term management and maintenance of woodland.	N	A tree survey in accordance with BS5837:2012 has been undertaken which included the identification of ancient or veteran trees and this information is included within **Application Document 6.10 Arboricultural Impact Assessment**. The landscape and visual team have been involved in the routeing and siting of the Kent Onshore Scheme and Suffolk Onshore Scheme, which involved avoiding impacting existing vegetation, including trees and hedgerows, wherever possible to avoid impacts such as connectivity. Following the construction of the Proposed Project, reinstatement to hedgerows that have been removed to facilitate the underground cables will be made where possible. The reinstatement measures as well as further information on maintenance and management and on biosecurity, climate and pest resilience is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk and Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**. These documents also present the indicative landscape strategy for the Suffolk and Kent Onshore Schemes, illustrating the proposed mitigation measures such as woodland planting.
		Landscape and visual, Onshore route location	We would particularly draw your attention to an area of woodland approximately located at Grid Reference TM 3955 6209 that is within the order limits, it is part of a larger woodland, the majority of which stands outside the order limits. This woodland has received public money under a legacy grant scheme - the English Woodland Grant Scheme and is still under obligation. The landowner is expected to meet all of the Terms and Conditions of the agreement contract. Failure to do so is likely to require the Forestry Commission to seek to recover all of the relevant grant that has been paid. We hope these comments have been useful to you. If you require any further information, please do not hesitate to contact me.	N	National Grid would like to thank the Forestry Commission for bringing the presence of the English Woodland Grant Scheme to its attention. However, National Grid understand that the scheme comprises a private agreement and therefore at this point in time it does not hold the appropriate information to allow consideration of appropriate mitigation, although it is anticipated the landowner will be able to seek recovery of losses arising from delivery of the scheme through the compensation code as further details emerge.

Table 1.9 GridLink Interconnector Ltd

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Yes.	N	National Grid acknowledges your support for the principle of network reinforcement.
		Design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are neither positive nor negative.	N	This comment has been noted by National Grid.
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Onshore route location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Coordination with other Projects	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects. **Response:** I support co-location.	N	This comment has been noted by National Grid.
		Converter station location, Design	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham. **Response:** I support co-location.	N	This comment has been noted by National Grid.
		Coordination with other Projects	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness. **Response:** I support co-location.	N	This comment has been noted by National Grid.
		Offshore route location, coordination with other projects	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** The Sea Link subsea cable route crosses the GridLink interconnector cable route. GridLink has pre-existing rights to install its cable by way of an Option Agreement for Licence with the Crown Estate and a Marine Licence granted by the MMO. Whilst GridLink is prepared to cooperate with Sea Link and recognises that Sea Link has already initiated preliminary discussions, we would like to re-state that a formal crossing agreement to the satisfaction of GridLink must be in place prior to the start of any route preparation or cable installation activities on behalf of Sea Link. GridLink should not be subject to any significant technical, consenting and financial costs or risks due to the design of the crossing or the conditions associated with the crossing agreement.	N	National Grid acknowledges the requirement for a crossing agreement. Costs arising as a result of the interaction of the Proposed Project with GridLink will form part of ongoing negotiations about the crossing agreement. National Grid and GridLink are in the early stages of negotiating the Crossing Agreement. GridLink has requested detailed technical information which is currently unavailable, due to the generic nature of the cable design, at this stage. After RfP Cable responses have been received and technical designs are available (providing the required technical detail), technical discussions will continue. This does not preclude further discussions / negotiations, especially with regard to the crossing agreement contents. Given that neither party has a secured date for the installation of the cables (2028/2029 proposed for the Proposed Project), the crossing agreement requires to address both crossing over a pre-installed GridLink, or GridLink crossing over a pre-installed Proposed Project. This has legal implications and technical implications, given that the crossing will take place in shallow waters and will be subject to restrictions on the height of the protection installed after installation. Note that this is an opportunity via co-operation in

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					the design of the crossing to ensure both cable links comply with regulatory / 3rd Party restrictions.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Onshore Route Location	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Converter station location	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? **Response:** I have no preference either way.	N	This comment has been noted by National Grid.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? Response: Good.	N	This comment has been noted by National Grid.
			Feedback form question 23: Response: None	N	This comment has been noted by National Grid.
			Feedback form question 27: Response: Prefer not to say	N	This comment has been noted by National Grid.
			Feedback form question 28:	N	This comment has been noted by National Grid.

Table 1.10 Harwich Haven Harbour Authority

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Shipping and navigation	Harwich Haven Authority acknowledges the importance of developing the UK power network and is supportive of all initiatives that reduce carbon emissions and are aligned to net zero targets. As the Statutory Harbour Authority and Trust Port our core remit is to provide safety of navigation to vessels using the waters within our 150 square mile jurisdiction area. Our jurisdiction covers a 12-mile approach to Harwich Harbour, the River Stour, and parts of the River Orwell. We are responsible for the conservancy of the main navigation channel into the Haven, which requires an ongoing maintenance dredging programme to maintain the depth required to accommodate the very largest and deepest container vessels in operation. We operate a 24/7, 365 day a year service to provide pilotage services to five port operators in the Haven, Port of Felixstowe, Navyard, Harwich International Port, Port of Mistley and the Port of Ipswich. The continuous, and uninterrupted flow, of vessels into the Port of Felixstowe is critical to UK trade, with almost 40% of all containerised goods entering the UK via this gateway.	N	These details about Harwich Haven Authority are noted and factored into **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.
		Shipping and navigation	**The largest trade gateway in the UK** In the early Autumn, 2023 we completed a £130m large-scale project to deepen the navigational approach channel into Harwich Harbour to 16.0m below chart datum. The purpose of the project is to accommodate the ever-growing breed of Megamax vessels in operation that (400 metres with a draught of 17.3 metres) call at the Haven ports. With a deeper navigational channel, and new deeper berths at the Port of Felixstowe, we envisage the combined value proposition will attract many more shipping lines to use the Port of Felixstowe and therefore vessels arriving and departing the Haven will increase. The worldwide maritime industry trend for less ship movements but larger vessels carrying equivalent tonnage looks set to continue. The Haven trade gateway is critical to UK PLC and our pilotage services cannot be interrupted. Delayed or missed Megamax arrivals would cause significant cost implications to Harwich Haven Authority. The ports industry is highly competitive and dissatisfied shipping lines are highly likely to look for an alternative port, potentially in Europe, if they do not receive the service standards they require.	N	These details about Harwich Haven Authority are noted and factored into **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment** in particular the comments on implications of potential disruption.
		Shipping and navigation, Legislation	**Harwich Haven Authority's Trust Port stakeholder values** As a Trust Port we operate commercially but we do not have shareholders, which allows us to reinvest a percentage of our surplus profits back into the Haven for the benefit of	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		and policy inc. permits	stakeholders. We define a stakeholder as anyone that uses, or has an interest in, the Haven and/or our operations. Harwich Haven Authority acts as a custodian of the Haven, and we have responsibility to Protect, Conserve and Improve our area of jurisdiction. We understand that regulatory bodies such as Natural England and the Environment Agency will have been included within your consultation. We would therefore echo any concerns they may have raised in relation to the legally protected and designated areas that exist within the Haven.		
		Timescales / programme, Coordination with other Projects	Our formal responses to your consultation documentation are as follows: We request that no works conducted by the Sea Link project should run concurrently with works already planned by the Five Estuaries and North Falls project operators in the area. It is our opinion that this would cause an unacceptable level of navigational risk. Therefore, we insist that the Sea Link project liaise with other planned project teams and ourselves to avoid this situation.	N	Communication with other stakeholders and projects is highlighted in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**. National Grid has initiated discussions with the respondent. These discussions will explore in more detail the issues raised, which will subsequently be addressed in **Application Document 7.4.9 Draft Statement of Common Ground Harwich Haven Authority**.
		Shipping and navigation	Exclusion zone(s) must not be put in place in the Sunk area or channel that would restrict 24/7/365 vessel access requirements or pilot boarding operations etc.	N	National Grid confirms that no exclusion zones would be sought for either installation or operation of the HVDC cable system. This is specified in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.
		Shipping and navigation, Safety	Safety zone(s) will not be able to impede vessel traffic movements within the Sunk area or normal operations such as pilot boarding.	N	Rolling 500 m radius Safety Zones will be in place around operation fleet vessels, to protect both operation fleet vessels (restricted in their ability to manoeuvre) and passing vessels from collision, as standard practise. This would not appear to impact the Pilot boarding station at the Sunk, as the DF3 Marine Scheme is over 2 km distant from the Sunk pilot station at all points along the route. However, these will nonetheless be in force by guard vessel at all times during the operation including whilst passing through the Sunk Traffic Separation Scheme. Safety zones would be established with communication to stakeholders and advanced notice to all and in liaison with Harwich and Sunk Vessel Traffic Services. This is detailed in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.
		Offshore route location, Design, Alternative solutions	We suggest that no cable joints to be in locations in the Sunk area, due to extra work required in this busy shipping area, leading to increased navigational safety risk.	Y	This suggestion has been factored into routing, and noted in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**. This is included in Design Freeze 3 after discussions with Harwich Haven. The number of campaigns is currently projected to be 2, each of c. 60 km. The jointing point of the cables will be outside the SUNK area and the higher risk area to the cables in this heavily trafficked portion of the route. If a single

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					lay campaign is proposed by the Installation Contractor, there will be no need for a joint (only if the cable is accidentally damaged or suffers a technical failure within the SUNK area (i.e. post installation campaign) will a repair joint will be required).
		Offshore route location, Design, Shipping and navigation	In the Sunk area, cable depth needs to consider that the world's largest vessels may anchor and dredge anchors in emergency scenario. The cable depth must take into account the draught of current and future vessels and future dredging. Consider a maximum draught of 20m plus 10% UKC, as such minimum depth required 22m below chart datum.	N	Noted, cables depths are considered in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation**). **Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment** identifies regions where deep draught vessels are present and considers the risk of anchoring in detail in the assessment process. Consideration of this issue is given in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** should be referred to for specifications on burial depth for the Proposed Project.
		Shipping and navigation	Suggest that no project vessels with restricted ability to manoeuvre (cable laying, UXO clearance, survey etc) are to operate in the wider Sunk area when visibility below nautical 2 miles.	N	This is included as an additional risk control measure in **Application Document 6.2.4.7 Part 4 Chapter 7 Shipping and Navigation** and **Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.
		Offshore route location, Design, Alternative solutions	Due to the location of the Sunk Pilot station and the large vessel transiting the Sunk area, we require that the cable installation (and associated works) is north of both the Storm Buoy and the W1 buoy, and south of the charted Sunk deepwater anchorage. Moving south of the Storm or W1 buoys would not be considered safely achievable and would add an unacceptable level of navigational risk (not ALARP).	Y	Through discussion with Harwich Haven Harbour Authority, the route has been refined to route north of the W1 buoy. This is discussed in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**. Concerns over proximity to the charted Sunk deepwater anchorage are noted. This matter will be discussed further and be addressed in the Statement of Common Ground. While routing is currently highlighted in the comment, the route does not enter the Sunk Deepwater Anchorage. However, given the risk from the vessels in the Anchorage, National Grid is in discussions with the relevant authority to understand the possibility of moving the southern boundary of the SUNK DW Anchorage north, to reduce the anchor drag risk to the cable in this high risk area. This discussion is expected to take time but it is highly recommended that this is undertaken to further mitigate accidental damage to the cable from the anchor risk. At Design Freeze 3, the route of the corridor is in compliance with the HHA limits as described.
		Major accidents and disasters, Shipping and navigation, Offshore environmental impact	It must be considered that should a serious incident occur, there may be a significant irreversible environmental harm. As the risk of the worst credible outcome is not precisely calculable in advance, the precautionary principle alongside the ALARP principle must be used when considering navigational risk assessment.	N	The consequence of the worst-case outcome (collision) has been identified as the highest consequence category and the likelihood of collision has also been considered remote (note that the true likelihood of a major spill would be considerably more remote). This is based largely upon stakeholder hazard identification and consultation process. Calculating the numerical risk of such a Major Environmental Incident for this project scenario is impracticable as it depends on the details and actions of numerous unidentifiable vessels. The process is therefore qualitative, based on the judgement of a number of expert mariners, stakeholders and collision risk specialists.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Given the control and monitoring at the Traffic Separation Scheme, the level of ordered and disciplined vessel movement patterns in general and the safety zones, guard vessel presence and other measures, the risk has been identified as “Tolerable if ALARP (As Low As Reasonably Practicable)” and applying the precautionary principle is not considered necessary.

Table 1.11 Health and Safety Executive

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Major accidents and disasters, DCO process, Consultation	HSE's land use planning advice: **Will the proposed development fall within any of HSE's consultation distances?** According to HSE's records, the proposed DCO application boundary for this Nationally Significant Infrastructure Project is not within the consultation zones of any major accident hazard sites or major accident hazard pipelines. This is based on the scheme boundary 'redline' in drawings 'NSIP - EN020026 - Sea Link - Sea Link general arrangement plans' downloaded from https://www.nationalgrid.com/electricity-transmission/document/150991/download which is a section of the Preliminary Environmental Information Report (PEIR) Volume 1 Version A dated 24/10/2023 (PEIR).	N	This comment has been noted by National Grid.
		Needs case, DCO process	HSE's Land Use Planning advice is dependent on the location of areas where people may be present within HSE's land-use planning zones. As the project area 'redline' is not within any of HSE's land-use planning zones, under HSE's existing policy for providing land-use planning advice, HSE would not advise against the development. HSE's advice in response to a subsequent planning application may differ should HSE's policy or the scope of the development change by the time the Development Consent Order application is submitted.	N	This comment has been noted by National Grid.
		Safety, Legislation and policy inc. permits	**Would the Hazardous Substance Consent be needed?** Based on Sea Link Project overview document and PEIR, it is not clear whether the applicant has considered the hazard classification of any chemicals that are proposed to be present at the development. This may be because there are no relevant hazardous substances. Hazard classification is relevant to the potential for accidents. For example, hazardous substances planning consent is required to store or use any of the Categories of Substances or Named Hazardous Substances set out in Schedule 1 of The Planning (Hazardous Substances) Regulations 2015 as amended, if those hazardous substances will be present on, over or under the land at or above the controlled quantities. There is an addition rule in the Schedule for below-threshold substances. If hazardous substances planning consent is required, please consult the relevant Hazardous Substance Authority (usually the Local Planning Authority) on the application.	N	Typically on this type of project this is not a requirement. However, comments are noted and National Grid will review the schedule of substances with their supply chain to ensure that, if necessary, suitable consent is applied for in accordance with the Hazardous Substance Regulations 2015.
		Legislation and policy inc. permits, Major accidents and	**Consideration of Risk Assessments** Regulation 5(4) of the Infrastructure Planning (Environmental Impact Assessment) Regulations 2017 requires the assessment	N	This comment has been noted by National Grid. As noted in **Application Document 6.14 Environmental Scoping Report 2022**, it was determined that Major Accidents and Disasters can be mitigated or reduced by the processes and standards in place. It also outlined that the Proposed Project is

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		disasters, Safety	of significant effects to include, where relevant, the expected significant effects arising from the proposed development's vulnerability to major accidents. HSE's role in NSIPs is summarised in Advice Note 11 'working with public bodies in the infrastructure planning process' Annex G on the Planning Inspectorate's website [Advice notes | National Infrastructure Planning (planninginspectorate.gov.uk)] - Annex G – The Health and Safety Executive. This document includes consideration of risk assessments under the heading "Risk assessments". In the PEIR it was not clear if there was consideration of risk assessments arising from the development's vulnerability to major accidents. We would advise this is considered further in line with Advice Note 11 Annex on the Planning Inspectorate's website - Annex G – The Health and Safety Executive taking account of the following: "it may be beneficial for applicants to undertake a risk assessment as early as possible to satisfy themselves that their design and operation will meet the requirements of relevant health and safety legislation as design of the Proposed Development progresses."		unlikely to generate any potential significant effects on the environment if a major accident or disaster were to occur.
		Safety	**Explosives sites** Explosives Inspectorate response remains the same as of 2nd November 2022: no comment to make as the proposed development does not fall into the safeguarding zones of the HSE licenced explosive sites in the area. Please send any further communication on this project directly to the HSE's designated e-mail account for NSIP applications at nsip.applications@hse.gov.uk.	N	This comment has been noted by National Grid.

Table 1.12 Historic England

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	22 December 2023	Consultation	**Summary** Historic England is the Government's lead advisor on the historic environment, and we are a non-departmental public body sponsored by, and reporting to the Secretary of State for Culture, Media and Sport. For the purposes of Section 42 of the Planning Act 2008 and Regulation 11 of Infrastructure Planning (Environmental Impact Assessment) Regulations 2009, we are a statutory a consultee. In addition to our responsibilities within the terrestrial landscape, the National Heritage Act (2002) enabled Historic England to assume responsibility for maritime archaeology in the English area of the UK Territorial Sea. This consultation relates to the Sea Link Project ('the Project'), which is defined as a Nationally Significant Infrastructure Project in relation to Section 15(3) of the Planning Act 2008 (as amended) (the Act). The consultation is accompanied by a full suite of documents, including the main PEI Report. Our response is provided based on the information provided at this time. Please find Historic England Advice below, all references to section, paragraph and table numbers relate to the main Chapters of the PEIR. Our response has been put together by a team of specialist within our organisation, who form our project team.	N	This comment has been noted by National Grid.
	Cultural heritage, Marine archaeology, Terrestrial ecology	**Historic England Advice** **General comments** Broadly speaking we support the approach taken by the applicant towards the historic environment. We appreciate it is a complicated scheme which encompasses both marine and terrestrial elements and multiple different heritage environments. We are therefore pleased with the way the terrestrial and marine archaeological assessment presented within the PEIR chapters are progressing, and we acknowledged there are gaps in the data and analysis that has been presented, and that this is to be anticipated at this stage.	N	This comment has been noted by National Grid.
	Onshore mitigation, Offshore mitigation, Legislation and	We note mitigation measures are presented within the both the Marine and terrestrial chapter, for example the Outline Marine Archaeology Written Scheme of Investigation (Volume 2, Part 4, Appendix 4.7.B), the Outline Schedule of Environmental Commitments and Mitigation Measures (Volume 1, Part 1,	N	This comment has been noted by National Grid. Mitigation required specific to each technical environmental assessment is outlined within the corresponding ES chapter. The mitigation required has been outlined within **Application Document 7.5.3.2 CEMP Appendix A**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		policy inc. permits	Appendix 1.4.F), and the Outline Code of Construction Practice (Volume 2, Part 1, Appendix 1.4.a). We Recommend that all proposed mitigation are secured through an appropriate mechanism. For the marine elements this would be a deemed marine licence (dML) within the DCO supported by the Outline Marine WSI. For the terrestrial environment the key document would be a suitable worded requirement within the DCO supported by an Outline WSI, REAC and CoCP documents.		**Outline Code of Construction Practice and Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, **Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) - Suffolk**, **Application Document 7.5.4.2 Outline Onshore Overarching Written Scheme of Investigation (OWSI) - Kent and Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**. **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		DCO process, Cultural heritage	We recommend Historic England is a named party with the DCO and that we are consulted on the DCO wording in due course. Please note that also we recommend further archaeological evaluation is undertaken in the terrestrial environment prior to the submission of the full ES and with enough detail to inform the DCO application. We appreciate there can be factors that limit access and availability of land however there are several key locations along within your proposal where it would be sensible to target your resources. These are areas where there is a high archaeological potential, where the cable route is highly constrained and where there are limited mitigation options available. Specifically, cable landing areas in Kent and Suffolk, the substation areas and key pinch point locations along the cable routes.	N	Since submission of the PEIR, further works were undertaken including a geophysical survey, a review of aerial photographs and LiDAR data, and evaluation trenching (all of which form appendices to the Cultural Heritage assessment (**Application Documents 6.3.2.3.A-6.3.2.3.F**). While there are no designated assets within the Order Limits, and designated assets in the wider 2 km Study Area adopted for the setting assessment are largely Grade II listed, Historic England were provided with updates relating to the assessment work through regular thematic group meetings. A full detailed assessment is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.2 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the project design as detailed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, DCO process, Consultation	**Specific Comment by Volume and Chapter** **Volume 1, Part 1, Chapter 4: Description of the Proposed Project** We appreciate that the design of the various elements of the proposed scheme have not yet been finalised, but in addition to the size of the various elements of the scheme, we would need details of foundation designs and depths to fully appreciate the potential impacts (Section 1.4.2.37, Section 1.4.5.34). The PEIR is based on the selected route SL2 and limited archaeological investigative works. The following comments are limited by these factors. We understand that the route may yet change, and that additional investigative works are going to inform the ES. Overall, the PEIR is a good preliminary assessment and we agree on the need for further works to improve the heritage baseline, calculations of the Significance of Effects and mitigation strategies. We look forward to reviewing the ES prior to the submission of the DCO.	N	It is noted that the references provided by the respondent relate to the Preliminary Environmental Information Report. A full detailed assessment is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the Proposed Project design as detailed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Although a draft version of the Cultural Heritage chapter was not shared with Historic England between Statutory consultation (PEIR) and the DCO submission, ongoing dialogue between National Grid and Historic England was held prior to DCO submission. National Grid look forward to ongoing engagement with Historic England post submission. Further detail is contained in **Application Document 7.4.3 Draft Statement of Common Ground Historic England**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Coordination with other projects, Onshore mitigation	1.4.2.7 Co-location options for cabling would potentially reduce the flexibility of the scheme to avoid any significant archaeological remains that might be identified in the subsequent surveys, which have not been undertaken yet. Even though co-location would be subject to separate consents the overall lack of flexibility an opportunity to mitigate through design may cause significant effect and this needs to be balanced against the benefits of co-location.	N	National Grid is seeking consent for its own HVDC and HVAC cables only; however, the cable route selection has ensured that there is scope for other developers to co-locate additional infrastructure outside of the Proposed Project's red line boundary. Each project will be responsible for their own constraints assessment. The Proposed Project's work to identify archaeological assets will be undertaken jointly with the local authority heritage specialists.
		Cultural heritage, Construction – general, Onshore mitigation	1.4.5.9 It is clear that a number of the construction activities have the potential to impact the historic environment (e.g. vegetation clearance, topsoil stripping, drainage works, fencing, foundations, cable trenches, construction of culverts etc.).The impact that these works may have on the historic environment needs to be considered and mitigated appropriately.	N	This comment has been noted by National Grid. A full detailed assessment and the proposed mitigation is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, which includes assessment of the construction phase impacts, and is based on the Proposed Project design as detailed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Agriculture and soils, Design	1.4.5.15 outlines the different types of access tracks that could be used, which includes the use of stone, interlocking panels and subsoil stabilisation. It is noted that stabilisation will include mixing chemical treatments into the subsoil. It is stated that following the completion of the works, additional chemicals will be added to "return it to its original state".	N	
		Cultural heritage, Agriculture and soils	1.4.5.18. It is important to note that the addition and mixing of chemicals into the subsoil is likely to have a negative impact on any buried archaeological and palaeoenvironmental remains, and that this impact will be permanent. We recommend potential impacts are assessed and addressed in Cultural Heritage chapter.	N	
		Water environment, Design, Onshore mitigation	1.4.5.47 outlines the open-cut approach to the proposed underground HVAC and HVDC cables, which will include the excavation a trench into which the cables are directly laid. It is stated that dewatering and protection from surface water runoff are specific constraints on this method. It is important to note that dewatering may impact the local groundwater levels, which may in turn impact any waterlogged organic archaeological remains that may be preserved in adjacent areas. The zone impacted by dewatering would need to be defined so that any heritage assets which may be at risk from this technique are identified and impacts mitigated. This may involve assessing the water environment using a staged approach, following the principles outlined in the Historic England document 'Preserving Archaeological Remains' (2016): https://historicengland.org.uk/images books/publications/preserving-archaeological-remains/.	N	This comment has been noted by National Grid. A full detailed assessment and the proposed mitigation is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, which includes assessment of the construction phase impacts, and is based on the Proposed Project design as detailed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Construction –	1.4.5.57 & 1.4.5.66 state that trenchless crossings may be used where cables would need to cross obstacles (such as major watercourses, roads, railway lines, flood defences etc.) as well	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		general, Cultural heritage	as at the Landfall locations. This would be achieved using a drill. It should be noted that these approaches could physically impact any buried archaeology, which would need to be investigated.		The potential for impacts resulting from trenchless installation techniques has been considered, with consultation also undertaken with the GI team and engineers. The results of this engagement was taken into account when considering the presence of archaeological remains, or the archaeological potential of the areas where trenchless solutions will be used. A full detailed assessment and the proposed mitigation is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, which includes assessment of the construction phase impacts, and is based on the Proposed Project design as detailed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, Construction – general, Cultural heritage	1.4.5.62 & 1.4.5.67 In addition, the potential direct and indirect impacts associated with the lubricants used in these sorts of drilling approaches (e.g. bentonite slurry outbreak) will need to be considered. It is noted that issues of bentonite slurry outbreak have been discussed in Section 1.4.5.70), but the potential impacts to buried archaeological remains would also need to be considered, such as changing the preservation conditions of the archaeological site. This should be refenced and referred back to in the main heritage chapter of the ES.	N	Protocols for dealing within breakouts of drilling fluids during drilling activities are included within **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan** and **Application Document 6.3.2.5.B ES Appendix 2.5.B Qualitative Groundwater Risk Assessment**. To mitigate the risk of potential breakouts of drilling fluid, a Frac Out Management Plan will be developed by the specialist drilling contractor (once appointed) in accordance with commitment GH10 of **Application Document 7.5.3.1 CEMP Appendix A Code of Construction Practice**. The Frac Out Management Plan will be informed by sufficient appropriate ground investigation to provide information on the strata that will be encountered during any drilling, and the nature/properties of the strata. A full detailed assessment is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the project design, and construction methods being used.
		Construction – general, Shipping and navigation, Offshore mitigation	1.4.5.92 to 1.4.5.99 A range of vessels will need to be utilised to carry out work in the marine area. We are pleased to see that heritage will be considered in terms of the activities carried out by the vessels but also their anchorage (anchors and jack-up feet). This will help mitigate impacts to any buried or near-surface archaeological remains (Appendix 4.7B, Outline WSI, Section 4.7.B.7.15).	N	This comment has been noted by National Grid. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** outlines the parameters for vessel anchoring considered in the Marine Archaeology assessment.
		Cultural heritage, Offshore physical environment, Geology and hydrogeology	1.4.5.100 & 1.4.5.101 It is noted that multiple seabed surveys (e.g. Multi-beam Echo Sounder (MBES), Side Scan Sonar (SSS), Sub-bottom Profiler (SbP), magnetometry and ROVs) will need to be carried out prior to installation activities to reconfirm existing geotechnical and geophysical information about the seabed conditions.	N	Results from the marine geophysical surveys and further work undertaken in the intertidal area of the landfalls are incorporated into **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Offshore ordnance / UXO, Design, Geology and hydrogeology	1.4.5.106 In addition, high-resolution geophysical surveys will be carried out to investigate the potential for unexploded ordinance (UXO) to be present. All of these data, including existing geotechnical and geophysical is of value to assess the archaeological potential of the proposed development area. We are therefore pleased to see that archaeological specialists will be included in the design and implementation of these surveys,	N	This comment has been noted by National Grid. Input into and results of the geophysical and geotechnical surveys are provided and incorporated into **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**. The UXO survey has not yet been undertaken, but available geophysical and geotechnical survey datasets will be made available and utilised for this survey.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			and that the resulting data will be shared (Appendix 4.7.B, Outline WSI, Sections 4.7.B.7.37-40). We recommend a joined-up, collaborative approach is taken that will ensure that opportunities are maximised for analysis during the survey campaigns, whilst reducing the risk of duplication of effort.		
		Cultural heritage, Offshore route location, Offshore mitigation	1.4.5.104 It is stated that pre-sweeping may be required in areas of large sand waves within the cable corridor. These activities have the potential to directly impact any buried or near-surface archaeological remains. We would recommend that the potential impact to the historic environment is considered so that an appropriate mitigation strategy can be developed.	N	This comment has been noted by National Grid. The impacts from pre-sweeping have been assessed in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**. Mitigation measures relevant to the marine archaeology assessment are contained within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Offshore Physical Environment	1.4.5.134 The potential use of cable protection is discussed. It should be noted that the use of cable protection has the potential to change the local coastal processes, which in turn may result in localised areas of scour. If scour occurs it could directly impact any buried or near-surface archaeological remains located in the area, which could lead to their damage and loss.	N	This comment has been noted by National Grid. The indirect impacts caused by cable protection are assessed within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Cultural Heritage	We are pleased to see that the potential indirect impacts to heritage have been discussed in the Outline WSI (Appendix 4.7.B, Section 4.7.B.8.2), and that Post Construction monitoring will assess whether the impacts are being managed as expected.	N	This comment has been noted by National Grid.
		Cultural Heritage	1.4.6.9 discusses the need for regular monitoring surveys offshore following construction as part of the Inspection, Maintenance and Repair inspection programme. These surveys at the same time would provide an opportunity to carry out monitoring of any archaeological sites or other anthropogenic remains identified within the development that were avoided (for example through the establishment of an Archaeological Exclusion Zone, AEZ). We are therefore pleased to see that the Post-Construction monitoring would include archaeological input and be agreed with the Archaeological Curator(s) and the Regulator (Outline WSI, Appendix 4.7.B, Section 4.7.B.8.1-8.3).	N	This comment has been noted by National Grid.
		Legislation and policy inc. permits, Landscape and visual, Cultural heritage	**Volume: 1 Part 2 (Onshore) Chapter 2 Landscape and Visual** Table 2.2.3 'NPPF requirements relevant to landscape and visual'. References to paragraphs in Chapter 16 concerned with setting of heritage assets are omitted. We recommend they should be included and cross referenced to part of the	N	Whilst cultural heritage is a key discipline that interfaces with landscape and visual matters, the disciplines work closely together, particularly regarding the iterative design process and cultural heritage assets that influence landscape value, however, effects arising from the Proposed Project on the setting of heritage assets are solely assessed within **Application Document 6.2.2.3**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			document that addresses impact and mitigation on setting of heritage assets. National Planning Practice Guidance for Historic Environment should also be referenced where it deals with setting of heritage assets. Reference should also be made to our guidance GPA3 in appropriate places.		**Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Therefore, it is not appropriate to reference such sections of the NPPF and NPPG for Historic Environment or GPA3 in the landscape and visual ES chapter. The Landscape and Visual ES Chapter refers to the Historic Landscape Character context, which is considered to be appropriate and is referred to within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Legislation and policy inc. permits, Landscape and visual, Cultural heritage	Table 2.2.4 'Local Planning Policies relevant to landscape and visual'. Policies dealing with Historic Environment are omitted. Elements of Suffolk Coastal Local Plan dealing with setting of heritage assets should be referenced and appropriately cross referenced.	N	Whilst cultural heritage is a key discipline that interfaces with landscape and visual matters, the disciplines work closely together, particularly regarding the iterative design process and cultural heritage assets that influence landscape value, however, effects arising from the Proposed Project on the setting of heritage assets are solely assessed within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Landscape and visual, Cultural heritage	Inspector comment 3.1.11 (as shown in Table 2.2.4). The heritage specific viewpoints have not been agreed with Historic England for the Suffolk onshore part of the scheme. We do not consider that historic environment has been adequately addressed in the assessment. We would welcome further engagement and inclusion of the agreed heritage specific viewpoint in the assessment.	N	Assets for which there is the potential for significant impacts on their setting have been discussed with relevant stakeholders, with viewpoint photography agreed with both East Suffolk Council and Historic England in January 2024, and captured in summer 2024. Winter photography was also captured in February 2025. The summer visualisations are provided in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**, while the winter visualisations will form part of a supplementary submission. A full detailed assessment is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Landscape and visual, Cultural heritage	Figure 2.2.7 Showing location of viewpoints. Although we are aware this is party to on-going discussion, we are concerned by lack of heritage specific viewpoints at this stage. Lack of viewpoints on key heritage assets such as Buxlow Manor, Wood Farm, Hill Farm, Hurst Hall, Church of St John the Baptist in case of Converter Station and High House, Little Moor Farm, Friston House, Friston Hall, Woodside Farmhouse, Church of St Mary's in case of Friston Substation.	N	Heritage Viewpoint photography was agreed with the East Suffolk Council Conservation Officer and Historic England in January 2024, and forms a key part of the assessment of potential setting impacts. Locations where the Suffolk Onshore Scheme has the potential to result in a significant impact on the setting of an asset, and therefore where viewpoint photography was required for heritage, comprise Wood Farm, Hurts Hall and Hill Farm.
		Landscape and visual, Cultural heritage	Paragraph 2.2.8.24 states that LVIA will not consider effects on listed buildings and scheduled monuments as this has been addressed in Cultural Heritage Chapter. Identified effects should be considered when considering overall impacts on the receptors. Whilst we note this approach, in our view appropriate assessment is not possible without visualisations from heritage specific viewpoints and heritage receptors play a role in landscapes particularly in an isolated and rural setting. We recommend this is revised and an integrated approach to landscape is adopted that recognises time-depth and the positive role heritage receptors have on landscapes.	N	Whilst cultural heritage is a key discipline that interfaces with landscape and visual matters, the disciplines work closely together, particularly regarding the iterative design process and cultural heritage assets that influence landscape value, however, effects arising from the Proposed Project on the setting of heritage assets are solely assessed within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** makes reference to the interface between the two disciplines. This includes that heritage specific viewpoints are included within the Cultural Heritage Chapter.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landscape and visual, Cultural heritage	Table 2.2.23 and 2.2.47: Preliminary assessment of Viewpoint 1 – Preliminary magnitude assessment does not take into account impact on the listed Woodside Farm. This should be addressed. Generally, in assessment of all viewpoints impacts on heritage assets are not specified. This should be amended after assessment of setting of heritage assets have been revised based on analysis of appropriate heritage specific viewpoints.	N	Whilst cultural heritage is a key discipline that interfaces with landscape and visual matters, the disciplines work closely together, particularly regarding the iterative design process and cultural heritage assets that influence landscape value, however, effects arising from the Proposed Project on the setting of heritage assets are solely assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. This includes an assessment of the potential impacts on the setting of Wood Farm Grade II listed buildings, and this assessment was informed by a heritage specific viewpoint (CH1). **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** makes reference to the interface between the two disciplines. This includes that heritage specific viewpoints are included within the Cultural Heritage Chapter. The baseline description for Viewpoint 1 notes Wood Farm (Grade II listed building); however, the assessment focuses on the changes that the Suffolk Onshore Scheme will result on visual amenity. The listed building is not the receptor. This can be referred to within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Landscape and visual, Geology and hydrogeology, Cultural heritage	**Volume 1, Part 2, Suffolk Onshore Scheme Chapter 4: Cultural Heritage** Table 2.4.1 'NPS EN-1 requirements relevant to cultural heritage' indicates that results of desk-based assessment, geophysical survey and trial trenching will inform ES. Historic England would want to highlight the need for appropriate assessment prior to preparation of ES to enable understanding of significance of the affected heritage assets and degree of any harm. The extent of the surveys should be agreed with Historic England and other stakeholders. The area covered by the surveys should be enough to enable flexibility and mitigation through avoidance of impact, in case of encountering previously unknown archaeological remains of demonstrably equal significance to designated heritage assets. We would expect to be consulted on the Written Schemes of Investigations (WSIs) for any elements of work. The paragraph also states that the requirement for visualisations will be agreed through ongoing consultation with heritage stakeholders. We welcome this approach and would expect further engagement. So far heritage specific viewpoints for the Suffolk onshore part of the scheme have not been agreed.	N	Since submission of the PEIR, further works were undertaken including a geophysical survey, a review of aerial photographs and LiDAR data and evaluation trenching. Historic England were provided with updates relating to this work through regular thematic group meetings. All works were undertaken in line with an appropriate WSI which was approved by Suffolk County Council. Viewpoint photography locations were also agreed with East Suffolk Council and Historic England in January 2024. A full detailed assessment is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and is based on the project design as detailed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Cultural heritage, geology and hydrogeology	Table 2.4.3 We note the statement that no designated heritage assets are present within the draft Consent Order boundary and there will be no direct impacts. This statement is correct; however, we would like to stress that archaeological surveys are required to rule out possibility of presence of previously	N	After submission of the PEIR further works were undertaken including a geophysical survey, a review of aerial photographs and LiDAR data, and evaluation trenching (**Appendices 6.3.2.3.A-6.3.2.3.F**). Historic England were provided with updates relating to this work through regular thematic group meetings. A full detailed assessment is provided in **Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			unknown archaeological remains of demonstrably equal significance to designated heritage assets. If such remains are identified they would need to be considered according to policies for designated heritage assets (as specified by footnote 68 of NPPF). This consideration is recognised in Table 2.4.6.		**Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the project design as detailed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Cultural heritage, geology and hydrogeology	2.4.3.6 Historic England would like to highlight that the desk-based assessment and geophysical survey would not be sufficient to establish with certainty 'areas of high risk and potential' as certain categories of buried archaeological remains are not readily detectable through use of these methods. Trial trench evaluation would be necessary to ground truth the results of geophysical survey and provide adequate heritage baseline information for the ES. Use of desk-based assessment and geophysical survey results might be helpful to identify priority areas and to decide order in which different areas within the project boundaries are subject to subsequent trail trenching, however all surveys should be undertaken prior to preparation of ES.	N	
		Cultural heritage, geology and hydrogeology	2.4.4.9 does not identify results of trial trench evaluation as informing preparation of the ES. We assume this is clear error as preceding paragraphs refer to inclusion of this source of information. Trial trenching is mentioned also in paragraph 2.4.7.2. This will need to be clarified.	N	Since submission of the PEIR further works were undertaken including evaluation trenching which targeted previously recorded features as well as blank areas. Historic England were provided with updates relating to this work through regular thematic group meetings. A full detailed assessment is provided in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the final project design as detailed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Cultural heritage, DCO process	2.4.4.21 we understand that all archaeological surveys as outlined in Table 2.4.1 will be finalised before submission of the DCO application and will inform ES. This is necessary to accurately assess significance of the heritage assets and impact of the scheme.	N	This comment has been noted by National Grid. All surveys have been completed as part of the baseline collection and assessment stage, with the exception of the evaluation trenching. While the majority of the evaluation trenching is completed (Phases 1 and 2a), a limited number of areas (Phase 2b) will not be subject to trenching until March 2025, and as such the reporting on these areas will be submitted after the DCO has been submitted.
		Cultural heritage	2.4.5.4 and Table 2.4.9 We welcome assumption of maximum flexibility within LoD for conducting assessments. We would recommend taking the same approach to forthcoming archaeological survey and analysis i.e. geophysical surveys, archaeological trial trenching, etc. to allow modifications to the scheme at a later date and within entire LoD.	N	The areas covered by the geophysical survey, as well as the LiDAR and aerial photo review are detailed in the individual reports reproduced as appendices (6.3.2.3.D and 6.3.2.3.E). This work was followed by evaluation trenching which targeted the main areas where there was the potential for physical impacts and covered all areas of the LoD in these areas to allow for flexibility. The scope of this work was agreed with stakeholders including Historic England.
		Cultural heritage	Paragraphs 2.4.6.2- 2.4.6.3 and Table 2.14.2.1 Study Areas for environmental topics indicate assessment being limited to 500	N	The final assessment of setting impacts was based on consultation with the landscape and visual impact assessment team and informed by the zone of

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			m from draft Order Limits for baseline, and 2 km for impacts on setting. Historic England supports the proposal to refine the study area from that used in the Scoping Assessment but cannot confirm if 2 km is enough. The applicant should clearly demonstrate that the extent of the proposed study area is of the appropriate size to ensure that all heritage assets likely to be affected by this development have been included and can be properly assessed.		theoretical visibility as presented within the Landscape and Visual assessment, as well as continued consultation with Historic England and East Suffolk Council. This consultation included agreeing the assets where photomontages/full detail assessment would be required in January 2024. Details of the consultation undertaken to agree viewpoints are detailed in Table 3.7 of **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.
		Cultural heritage	Figure 2.2.8-2.2.11 show for example that scheduled monument of Leiston Abbey is located outside of the study area but within Zone of Theoretical Visibility. This asset should be assessed and the ZTV used as the basis for the assessment rather than 2 km limit addressed in the document.	N	The final assessment of setting impacts was based on consultation with the landscape and visual impact assessment team and informed by the zone of theoretical visibility as presented within the Landscape and Visual assessment, as well as continued consultation with Historic England and East Suffolk Council. This consultation included agreeing the assets where photomontages/full detail assessment would be required. Leiston Abbey was not included in the final assessment due to its distance from the Order Limits, and as it was over 4 km from the nearest permanent above ground infrastructure. This distance, as well as intervening screening from the built environment and woodland, removed the potential for significant impacts on its setting.
		Cultural heritage, Coordination with other projects, Consultation	2.4.7.1 It is noted that existing geophysical data produced as part of the SPR East Anglia 1 and East Anglia 2 projects have been utilised. We would recommend that the SPR East Anglia teams should also be approached to discuss the evaluation works if possible, as this would add to the understanding of the archaeological potential of the proposed development areas, the possible risks and the lessons learned form some of this work.	N	National Grid has worked collaboratively with the SPR scheme with data shared throughout.
		Cultural Heritage	2.4.7.1 and 2.4.7.2 note that a series of surveys and investigations will be carried out to characterise and understand the archaeological potential of the draft Order Limits, which will include a review of aerial photography and Lidar data, a geophysical survey, a desk-based assessment, the historic mapping, a walkover survey, as well as a series of intrusive archaeological investigations (assessment of GI works, evaluation trenching etc.). We are pleased to see that this work will be carried out to inform the ES and look forward to reviewing the reports in due course. We would recommend that a geoarchaeologist is included in the GI works from the beginning and will be able to have direct access to the cores when necessary. This is because it is better, more effective and potentially most cost efficient to record and assess continuous core sequences rather than isolated deposits as this allows for greater reliability and confidence in the resulting conclusions.	N	A review of Ground Investigation works was undertaken, with archaeological monitoring of trial pits. The method of borehole works undertaken resulted in it not being possible for a geo-archaeologist to review, and as such it was agreed with Suffolk County Council that geo-archaeological monitoring would not be required.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			We would also recommend that field-walking is added to the evaluation approaches used to investigate the Order Limits.		
		Cultural heritage, Design, Timescales / programme	2.4.7.2. We are pleased to see that geophysical survey will be carried out to inform the ES, but we would recommend that the choice of survey approaches are considered carefully. For example, while magnetometry is generally applied across most archaeological sites, it may not be the most effective technique over areas of peat and alluvium, and may not identify certain types of remains, such as the ephemeral structural remains. We recommend alternative approaches are considered in order to maximise the evidence available to inform the design and siting of elements of the scheme, and to reduce the risks of unexpected remains being discovered that could disrupt the construction timetable.	N	The geophysical survey was followed by evaluation trenching, and this confirmed that the geophysical survey had worked successfully throughout the Order Limits. Details of the geophysical survey can be found in **Application Document 6.3.2.3.D ES Appendix 2.3D Geophysical Survey**, while the Phase 1 trenching report is included as **Application Document 6.3.2.3.F ES Appendix 2.3 F Archaeological Trial Trenching Reports**.
		Cultural heritage, Coordination with other projects	2.4.7.2 In addition to listed sources an effort should be made to obtain the results of archaeological works undertaken in the study area for other infrastructural projects. These results might not yet be incorporated into local Historic Environment Records. The relevant data should also be taken into account when conducting an assessment.	N	Data from other schemes, including the SPR and Sizewell works, has been obtained and incorporated into the baseline report. Further details are contained in **Application Document 6.2.2.3.A ES Appendix 2.3.A Archaeological Baseline Report** for Suffolk and **Application Document 6.3.3.3.A ES Appendix 2.3.A Archaeological Baseline Report** for Kent.
		Cultural heritage	2.4.7.10 We understand that this paragraph relates also to remains datable to Anglo Saxon period (early medieval remains are mentioned). If this is the case then the assumption for presence of remains predominantly within build up areas is not entirely correct. The nature of these remains makes them hard to detect without intrusive investigations. Extensive and previously unknown Anglo-Saxon remains have been identified in recent years in the wider area of coastal Suffolk during intrusive archaeological works.	N	The baseline has been updated based on data from the final study area, as well as investigations undertaken as part of the Proposed Project including geophysical survey and evaluation trenching. These have not identified any Anglo-Saxon remains.
		Water environment, Construction – general, Cultural heritage	2.4.7.14 considers the changes to the baseline conditions that may occur during the time period over which the Proposed Project will be in place. It concludes that the changes are likely to be minimal, but it is assumed that this statement does not consider the direct and indirect impacts to the historic environment through the construction of the proposed development. It is not clear if this statement considers the potential of the proposed development to alter the local groundwater environment. It should be noted that even temporary dewatering could result in a change to the preservation conditions present on a waterlogged archaeological site. We would also recommend that the Historic England document ‘Preserving Archaeological Remains’ (2016) is referred to.	N	The final impact assessment is based on additional design information, as well as information gained from evaluation trenching. The final assessment takes into account the potential for dewatering resulting from construction activities. Further details are contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and is based on the project design as detailed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Construction – compound areas, Onshore mitigation, Cultural heritage	2.4.8.2 We welcome inclusion of embedded measures to avoid harm to heritage assets. We would like to stress that results of archaeological surveys would need to be considered, therefore undertaking these surveys early in the process is crucial to inform the design of the scheme. We note that the easternmost construction compound is located partially on and partially adjacent to area of high archaeological sensitivity at Gorse Hill (figure 1.4.16). Early archaeological surveys (including intrusive evaluation) are needed to establish extent of the archaeological site and its significance, before the embedded mitigation measures can be applied.	N	The baseline has been updated based on data from the final study area, as well as investigations that were undertaken for the Proposed Project assessment including geophysical survey and evaluation trenching. This information was used to undertake the impact assessment based on the final design which is based on the project design in **Application Document 6.2.4.1 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Works proposed in the Gorse Hill area have been reduced in scale to reduce the physical impacts, and the evaluation trenching has been used to inform the mitigation developed. These works have also confirmed the remains at Gorse Hill are not considered to be of National Significance, and this has been agreed with Stakeholders.
		Onshore mitigation, Landscape and visual, Cultural heritage	2.4.8.2 also refers to 'Volume 2, Part 1, Appendix 1.4.F: Outline Schedule of Environmental Commitments and Mitigation Measures'. These measures are also referred to in tables 2.427-2.4.30. We are concerned that no cultural heritage specific embedded mitigation measures for onshore Suffolk part of the scheme have been identified at this point even though it would be possible for example in case of an impact on the setting of the designated heritage assets. Only 'enhancing the historic setting of Wood Farm' listed building is mentioned in table 1.4.F.5 (and additionally paragraph 2.2.9.4). It is however unclear how this is to be achieved and what the magnitude of the harmful impact would be. Due to lack of heritage specific viewpoint level of impact cannot be established, however available viewpoints indicate that the magnitude of impact can be significant in this case. The mitigation of the harmful impact on the setting is not mentioned in this case and it should be a priority. A clear outline of the embedded mitigation measures for specific heritage assets should be provided.	N	Work undertaken since submission of the PEIR has been used to inform the baseline and develop the impact assessment and mitigation strategy. This has included impacts on the setting of heritage assets. Where significant impacts on setting were predicted, these were discussed with stakeholders including Historic England and East Suffolk Council, with photomontage locations agreed. Mitigation was also developed in co-ordination with the landscape and visual impact assessment team. Further details are contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Onshore mitigation, Construction – general, Cultural heritage	2.4.8.2 & 2.4.8.3 We are pleased to see that avoidance of archaeological remains where possible forms the basis of the embedded mitigation strategy and that heritage has been included in the Code of Construction Practice (CoCP). The approaches that will be included in the CoCP seem sensible and appropriate (HO1-HO6). It is stated that any archaeological remains that cannot be avoided will be excavated, recorded and published, which we support.	N	This comment has been noted by National Grid.
		Cultural heritage, Geology and hydrogeology	2.4.8.3 We also support the use of deposit modelling in areas with palaeoenvironmental potential but recommend that HO6 includes provision for a geoarchaeologist to be included in this work.	N	This comment has been noted by National Grid. Any geo-archaeological works required as mitigation will be undertaken by a suitably qualified geo-archaeologist.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Construction – general, Cultural heritage	2.4.9 The potential impacts identified during the construction phase includes the direct physical impacts on heritage assets within the Suffolk Onshore Scheme Boundary resulting from construction works. The dewatering activities mentioned in Chapter 4 have not been included in the discussion, but it is important to note that any changes to preservation conditions of an archaeological site are classed as a direct impact.	N	The potential for dewatering has been discussed with the engineering team as well as stakeholders and the results are considered as part of the final assessment as set out in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Design, Cultural heritage	2.4.9.5 It is stated that 62 non-designated assets on the Suffolk HER have not been included in the preliminary assessment of the cultural heritage effects as a trenchless technique will be used in these areas. It is important to note that there will be the potential for additional, more deeply buried archaeological remains to be present beneath the known heritage recorded on the Suffolk HER. 2.4.9.5 In addition, the full extent of the 62 non-designated assets may not be well understood. We would therefore recommend that the archaeological potential is assessed on a case-by-case basis. It cannot be assumed that there will be no impacts, as sated in this section. We recommend this is reconsidered.	N	Please refer to **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** for more details of the final assessment. Assets within the Order Limits are discussed in the baseline report (**Application Document 6.2.2.3.A ES Appendix 2.3.A Archaeological Baseline Report** for Suffolk), with assets taken forwards to full assessment where there is the potential for the Suffolk Onshore Scheme to result in impacts. Furthermore, since Scoping and PEIR the Order Limits have been reduced and as a result a number of non-designated assets now fall outside of the Order Limits.
		Landfall location, Onshore mitigation, Cultural heritage	2.4.9.5 also states that impacts on several archaeological sites near the landfall site have not been assessed as no impacts are predicted. The lack of impact is not supported by the information contained in paragraphs 1.4.5.67-1.4.5.72 which discuss Horizontal Directional Drilling. Possible loss of drilling fluid has been identified as one of the risks. Historic England's response to scoping report also highlighted need for assessment of such scenario in context of cultural heritage. The assets which can be directly affected should be included in the assessment and heritage specific mitigation measures should be identified.	N	The potential for chemical/liquid breakout has been discussed with the engineering team as well as stakeholders and the results are included in the final assessment as set out in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Agriculture and soils, Cultural heritage	2.4.12 to 2.4.26 present the preliminary assessment of direct physical impacts on non-designated heritage assets, which includes a statement of preliminary sensitivity and likely significance of effect. It is not clear how these aspects were determined as no report appears to have been included as part of the PEIR. For example, the cropmarks described in Table 2.4.23 have not been excavated so it is unclear how it has been determined that the remains are of low sensitivity and therefore that the effect of the potential loss of the feature would be low. We recommend that the evidence behind these decisions is clearly presented, and each asset is assessed on a case-by-case basis.	N	The impacts presented within the PEIR were based on current information and assumptions made based on aspects such as their form and other similar examples in the area. Many of these have now been updated on the results of further works such as geophysical survey and evaluation trenching.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage	2.4.9.11 We are pleased to see that it is acknowledged that there is the potential for previously unrecorded archaeological remains to survive throughout the proposed development area, but that based on current knowledge any remains are likely to be of local or regional sensitivity. We would recommend that this conclusion is reassessed as more information becomes available. It should also be noted that large parts of the proposed development area have not been investigated in the past; limited evidence does not mean that the potential is low, but rather unknown. We would recommend that if the potential of a feature is unknown, then they should be classed as being of high sensitivity and high value until further evidence is obtained.	N	The impacts in the PEIR were based on current information and assumptions made based on aspects such as their form and other similar examples in the area. Many of these have now been updated on the results of further works such as geophysical survey and evaluation trenching. No assets of National Significance have been identified within the Order Limits.
		Onshore mitigation, Cultural heritage	Table 2.4.13 Suggest that engagement with stakeholders have identified that remains present at Gorse Hill are of national significance. Historic England position is that these remains should be subject to geophysical surveys and intrusive evaluation as a matter of priority to establish their significance. This must in turn inform mitigation measures. At present the preliminary likely impact is identified to be significant. Magnitude of the impact can be reduced by embedded design solutions, for example cable routing avoiding most sensitive part of the site and/or re-location of the works compound.	N	The Gorse Hill area has now been subject to geophysical survey and evaluation trenching, while the proposed construction works have also been reduced. The trenching confirmed that the remains in this area were not of National Significance as set out in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Cultural heritage	Paragraph 2.4.9.14 Provides list of assets scoped out of the initial assessment. It is unclear at the moment what was the basis of the decision in each case. The evidence base for scoping out for each asset should be provided.	N	A rationale for the scoping out of heritage assets from construction phases is provided in **Application Document 6.3.2.3.A Appendix 2.3.A Cultural Heritage Baseline Report**. The assessment of impacts is contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Landscape and visual, Cultural heritage	Paragraph 2.4.9.15 Visualisations form heritage specific viewpoints should be used to inform the preliminary assessment. They should be provided in appendices. Without reviewing the evidence base it is not possible to verify if the level of harm has been appropriately assessed.	N	Locations for viewpoint photography was agreed through consultation with stakeholders including Historic England and East Suffolk Council. This is set out in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Inter-Project cumulative effects, Cultural heritage	Table 2.4.29 It has yet to be established if the proposed development would be visible from the upper storeys of the Buxlow Manor. This might influence assessment of harm from changes to its setting and decision on the mitigation measures. The cultural heritage chapter does not consider effects associated with construction of the Friston Substation as part of the consented scheme. This is addressed in Chapter 14 - Suffolk Onshore Scheme Inter-Project Cumulative Effects. Table 2.14.32 Historic Environment CEA. It has been stated	N	Locations for viewpoint photography was agreed through consultation with stakeholders including Historic England and East Suffolk Council, and photography from Buxlow Manor was scoped out at this stage as set out in **Application Document 6.4.2.1 Landscape and Visual**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			that no significant setting impacts during the operations phase are expected. Integrating cumulative effects into the onshore assessment would be appropriate.		
		Landscape and Visual, Cultural heritage	**Volume: 1 Part 2, Chapter 13 Suffolk Onshore Scheme Intra-Project Cumulative Effects** Table 2.13.1 Landscape and Visual effects have not been identified in context of designated and non-designated sites. We note that paragraph 2.13.2.4 signposts to relevant chapter to for detailed description of Landscape and Visual effects, however, we recommend the effects on the cultural heritage should be indicated in this table for clarity and consistency.	N	Landscape and Visual effects have been identified in context of designated and non-designated landscapes within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Therefore, there is no requirement to reassess this relationship within the intra-project cumulative effects assessment. However, this relationship has now been highlighted within Table 2.12.1 in **Application Document 6.3.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**.
		Intra-Project cumulative effects, Cultural heritage	Table 2.13.2 ‘Preliminary assessment of intra-project cumulative effects. Loss of archaeological remains and ‘direct loss of site’ have been identified. It has been assessed as a not significant effect. The appropriate archaeological surveys have not been undertaken yet, so there is potential for presence of undesignated archaeological remains within Draft Order Limits that would be of equivalent significance to designated sites. Complete loss of any such site would be a significant effect. We recommend this section is amended to reflect this risk.	N	The impacts in the PEIR were based on current information and assumptions made based on aspects such as their form and other similar examples in the area. Many of these have now been updated on the results of further works such as geophysical survey and evaluation trenching, and no assets on National Significance were recorded within the Suffolk Order Limits, although the remains on the Ebbsfleet Peninsula in Kent are considered to be of National Significance. The assessment is contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Geology and hydrogeology, Cultural heritage	**Volume 1, Part 3 Kent Onshore Scheme Chapter 4: Cultural Heritage** We welcome that the PEIR clearly states that further archaeological investigative works will be detailed in the ES in agreement with consultees. We are encouraged to see that Historic England consultees will be informed of other assessments, such as Geology and Hydrology.	N	This comment has been noted by National Grid.
		Cultural heritage	3.4.2.9, Table 3.4.1 & 5.8.9: we recommend walkover surveys are added to the approaches used to inform evaluation trenching.	N	This comment has been noted by National Grid. Trenching was based on results of geophysical survey data, as well as LiDAR and aerial photographs, and a walkover survey.
		Cultural heritage	3.4.3.4: we recommend you change “palaeo-archaeologist” to “geoarchaeologist”.	N	This comment has been noted by National Grid. Terminology has been revised as recommended.
		Cultural heritage	Table 3.4.9: The title of the table should be Criteria for Assessing the effect on the Significance of Heritage Assets.	N	This comment has been noted by National Grid.
		Onshore mitigation, Cultural heritage	3.4.4.10 In addition to the further data gathering exercises listed in this paragraph, archaeological evaluation trenching and test pits will be needed as advised and agreed by the local authority archaeological advisor. We recommend evaluation works proposed at the Roman site north of Ebbsfleet Farm and Wood be undertaken at the earliest opportunity	N	The baseline has been updated based on data from the final study area, as well as investigations as part of the Proposed Project including geophysical survey and evaluation trenching. This information was used to undertake the impact assessment based on the final design.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The results of these works should be used to inform the ES and support the potential for further mitigation measures. If significant archaeological remains which are determined to be demonstrably of national significance are identified, we would expect retention in situ to be the appropriate mitigation.		The evaluation trenching was all agreed through consultation with the Kent Archaeological Advisor, with trench locations and the WSI approved prior to works commencing.
		Geology and hydrogeology, Cultural heritage	3.4.7.2: Geoarchaeological investigations are not mentioned in the list of prospection works. We would recommend geoarchaeological boreholes are collected as part of the pre-determination works, and that a geoarchaeologist is given direct access to geotechnical cores in order to assess archaeological potential.	N	A review of the borehole and trial pit data was undertaken, with a focus on the Minster Marshes area. This was agreed with the Kent Archaeological Advisor and used to inform the impact assessment. This assessment focused on the GI factual report, as well as geo-archaeological works undertaken in the surrounding area for the Richborough Connection Scheme and the Weatherlees Pumping Station Scheme. The results of this assessment is provided in **Application Document 6.3.3.3.G ES Appendix 3.3.G Geo-Archaeological Baseline Report**. Further detail is contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Cultural heritage	3.4.8.3, H06: we recommend you change the first sentence to “Geoarchaeological modelling/profiling in areas of potential archaeology and palaeoenvironmental records.	N	National Grid acknowledges this feedback and the recommendation for the change has been made within the ES.
		Onshore mitigation, Cultural heritage	3.4.8.4: the use of the past tense in this section suggests mitigation measures have already been put in place, but more details are needed to clarify this. Please add that further site-specific mitigation measures may be necessary once the investigative works, to take place for the ES, have made the heritage and archaeology baselines more comprehensive.	N	National Grid acknowledges this feedback and the request for the change has been made within the ES.
		Cultural heritage	3.4.9.5: the use of a trenchless technique does not guarantee no impacts to heritage assets. Details of the approach and the potential for the presence and type of archaeology will need to be assessed on a case by case basis before the level of impact can be ascertained. We therefore recommend that the 105 non-designated assets are not removed from this preliminary assessment.	N	This comment has been noted by National Grid. The final impact assessment is based on additional design information, as well as information gained from evaluation trenching. The final assessment takes into account the potential for dewatering and chemical breakout during cable construction operations. **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** contains further details.
		Cultural heritage	Table 3.4.13: the calculated significance of effect to ‘Not Significant’ may not reflect the value of potential archaeology; the effect may be significant. Although the size of the impacted area may be considered small, this does not guarantee that significant buried archaeology will not be present. For example, the Ebbsfleet area has a high potential for significant archaeology of all periods such that the effects could be significant. Levels of effects cannot be determined until informed by further evaluation.	N	The final impact assessment is based on additional design information, as well as information gained from evaluation trenching which has been used to define significance/value. Further detail is contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage	Table 3.4.16: the same comment as above is pertinent here; the sensitivity cannot be assumed to be low when the nature and type of archaeology associated with the cropmarks is unknown.	N	
		Onshore mitigation, Cultural heritage	Table 3.4.19: we cannot agree with the 'Not Significant level of effect' without understanding the impact on Abbots Wall. If directly affected, the effect will be significant and mitigation measures will need to be determined in agreement with stakeholders.	N	Impacts on the Abbotts Walls based on the design presented in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and is covered in the final impact assessment. **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** contains further details.
		Cultural heritage	Table 3.4.23: we cannot agree with the 'Not Significant level of effect'. Although the size of the impacted area may be considered small, this does not guarantee that significant buried archaeology will not be uncovered. We agree that the effect to palaeoenvironmental remains will not be significant, as they are likely to be preserved to the same level across a larger area. However, the exact location of archaeological remains is unknown. These remains are likely to be very well preserved within the channel and may be of national or higher significance.	N	The final impact assessment is based on additional design information, as well as information gained from evaluation trenching and a review of GI data by a geoarchaeologist which has been used to define significance/value. **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** contains further details.
		Landscape and visual, Cultural heritage	Table 3.4.24 Preliminary assessment of impacts on the setting of Richborough Castle & Volume 3 Part 3 Chapter 2 Figures Viewpoint 8: Richborough Roman Fort, viewing tower (Figure 3.2.8-H) We recognise that due to access restrictions, views from the viewing platform within the site have not been undertaken at this stage. It is proposed that the summer views will be taken from height, which we would welcome. We considered this is necessary in order to gain an understanding of the full extent of the harm to the significance of this monument through development within its setting. This development may also potentially affect the monuments relationship with the potential Roman Port north of Ebbsfleet Farm (in this document referred to as AECOM Kent 001) through physical harm to the non-designated site. We consider that the magnitude of impact cannot be fully understood until the view from height is provided. We therefore recommendation that viewpoints from height are provided from the viewing platform at Richborough fort in line with the way in which the site can be experiences. This should be presented as part of an assessment that sets out heritage specific viewpoints. We also recommend winter and summer views are taken in line with our guidance. Furthermore, a more comprehensive understanding of the significance of the Roman site north of Ebbsfleet Farm and Wood and its relationship to Richborough Roman Fort is required in order to understand its relationship to the fort.	N	Viewpoint photography locations were agreed in consultation with Historic England and the Kent Archaeological Advisor. Visualisations from the viewing platform at Richborough Fort have been carried out as included within **Application Document 6.4.2.1 Landscape and Visual** (specifically **Application Document 6.4.3.1.8 Representative Viewpoint Visualisations**), which has been used to inform the assessment contained within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Geophysical survey and evaluation trenching has also been undertaken across the Ebbsfleet Land site to help assess its value/significance, and assess the potential level of impact. **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** contains further details.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			We also recommend further evaluation works are undertaken at the Roman site north of Ebbsfleet Farm and Wood. Our view is this work should be undertaken at the earliest opportunity and prior to the delivery of the ES so that the results can be incorporated into the Environmental Statement and used to inform the assessment of impact on Richborough Fort.		
		Construction – general, Cultural heritage	Table 3.4.14 Preliminary assessment of direct physical impacts during construction on non-designated (possible Roman port) near Ebbsfleet Farm. We agree with the recognition that these non-designated remains may be of national significance and therefore 'high' sensitivity. Further details of the design information in relation to the identified archaeological remains will be required in the ES in order to substantiate the claim that the magnitude of impact is 'small'. We consider that total removal of even a small percentage of the total area of archaeological remains could still result in a 'high' magnitude of impact; for example, if it were to remove key features.	N	Geophysical survey and evaluation trenching has also been undertaken across the Ebbsfleet Land site to help assess its value/significance, and assess the potential level of impact. This information was used to undertake the impact assessment based on the project design in **Application Document 6.2.4.1 Part 1 Introduction Chapter 4 Description of the Proposed Project Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** contains further details.
		Water environment, Onshore mitigation, Cultural heritage	**Volume 1, Part 3, Chapter 13, Appendix 3.13A: Kent Onshore Intra-Project Cumulative Effects; Volume 2, Part 2, Appendix 2.13A: Suffolk Onshore Intra Project Cumulative effect.** Tables 2.13.A.4 & 2.13.A.5 (Suffolk) and 3.13.A.4 & 3.13.A.5 (Kent) could include cultural heritage as one of the relevant topics since prospection and mitigations strategies may impact upon, and be limited by, ecological receptors. Tables 2.13.A.6 & 2.13.A.13 (Suffolk) and 3.13.A (Kent) should include cultural heritage as one of the relevant topics. Changes to water levels, even is only temporary, may have adverse effects on heritage assets. Significance of effects should consider known and unknown heritage assets within the full extent of the affected zone (this may be larger than the project boundaries).	N	Within **Application Document 6.3.3.12.A ES Appendix 3.12.A Kent Onshore Intra-Project Cumulative Effects Screening Tables**, cultural heritage is considered as a relevant topic within Table 3 Designated/non-designated heritage assets receptors – Summary of environmental information. It has not been considered within Table 4 Designated and non-designated sites – Summary of environmental information and Table 5 Ecological receptors – Summary of environmental information, as these receptor groups are not referred to within the residual assessments assessment of **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Within **Application Document 6.3.2.12.A ES Appendix 2.12.A Suffolk Onshore Intra-Project Cumulative Effects Screening Tables**, cultural heritage is considered as a relevant topic within Table 3 Designated/non-designated heritage assets receptors – Summary of environmental information. It will not be considered within Table 4 Designated and non-designated sites – Summary of environmental information and Table 5 Ecological receptors – Summary of environmental information as these receptor groups are not referred to within the residual assessments assessment of **Application Document 6.2.3.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Within **Application Document 6.3.2.12.A ES Appendix 2.12.A Suffolk Onshore Intra-Project Cumulative Effects Screening Tables**, cultural heritage will not be considered as a relevant topic within Table 6 Water resources (existing abstractions and discharges) – Summary of environmental information and Table 13 Human Health – Summary of environmental information as these receptor groups are not referred to within the residual assessments assessment of **Application Document Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Changes to water levels has not been deemed to have an adverse residual effect on heritage assets. Within **Application Document 6.3.3.12.A ES Appendix 2.12.A Kent Onshore Intra-Project Cumulative Effects Screening Tables**, cultural heritage will not be considered as a relevant topic within Table 6 Water resources (existing abstractions and discharges) – Summary of environmental information and Table 13 Human Health – Summary of environmental information as these receptor groups are not referred to within the residual assessments assessment of **Application Document Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Changes to water levels has not been deemed to have an adverse residual effect on heritage assets. Within **Application Document 6.2.3.12 Part 3 Kent Chapter 12 Kent Onshore Intra-Project Cumulative Effects and Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects** increased run off rates, impacts to land drainage, the temporary loss of floodplains and increased flood risk is judged to have Negligible to Minor adverse (not significant) effects on floodplains, watercourses, land drains and existing land uses. No changes to heritage asset would be expected.
		Marine archaeology, Offshore physical environment, DCO process	**Volume: 1 Part 4 Offshore Scheme Chapter 7 Marine Archaeology** We understand that the Offshore scheme is based on survey work done to date but that additional investigative works are going to inform the ES. We welcome the approach that “cultural heritage receptors are therefore considered to be of high sensitivity and high value, until further information is available to refine this”. We look forward to reading the ES. The marine assessment of archaeological potential is further ahead compared to the terrestrial areas of the scheme. For example, a Stage 1 geoarchaeological assessment of 65 vibrocores has already been carried out (Section 4.7.4.7), the known maritime and aviation archaeology have been reviewed (Section 4.7.4.8), and an initial programme of marine geophysical surveys have been completed (Section 4.7.4.12). It is imperative this assessment work is completed and submitted with the ES. It would therefore be useful for confirmation that this chapter, the Outline Marine WSI and the Marine Archaeological Technical report will be updated with this information prior to the DCO submission. Similarly, we understand no intertidal walkover surveys have been conducted yet and were also planned for summer 2023. We recommend confirmation is given as to whether this will be included within the Technical report or reported separately.	N	Confirmation was provided to Historic England, during an online meeting on 27 March 2024, that the Marine Archaeological Technical Report and draft Written Scheme of Investigation will be updated and appended to the ES, although the PEIR chapter will remain unchanged. Additional available datasets have been incorporated into these reports, including geophysical assessment results, geotechnical investigation results, and walkover survey data. Further details are now available within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI), Application Document 6.3.4.6.A ES Appendix 4.6.A Marine Archaeological Technical Report and Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			We note the gaps in both geophysical and geotechnical data coverage acknowledged within this chapter, and appropriately within the Outline Marine Written Scheme of Investigation (WSI) and other PEIR documents.		
		Geology and hydrogeology, Marine archaeology	4.7.4.14 & 4.7.4.55 It is for example noted that the initial Geophysics reports have not been included as part of the PEIR and so it has not been possible to review the work done to date. In particular, the resolution of the survey work carried out so far has not been clearly stated. It is further noted that the geophysical surveys do not cover the entire area of the proposed Order Limits, but that additional survey work was planned for Summer 2023. It would be useful to know if this work already been carried out.	N	The results of the initial geophysical survey were integrated into the Technical Report (4.7.A), which was appended to the PEIR. Equipment specifications are in table 4.7.A.4: Summary of survey equipment: line spacing information for nearshore (variable between approx. 10 - 30 m) and offshore (50 m spacing for geophysical main lines; 2000 m spacing for geophysical cross lines). Additional marine geophysical survey data was obtained in 2024 and has been archaeologically assessed and the results are included in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology	4.7.4.18 & 4.7.4.51 It is noted that the 65 vibrocores were collected in 2021 and initially assessed for their geoarchaeological potential (Stage 1 assessment). The cores were subsequently used for engineering purposes and so were not available for further archaeological assessments.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.4.19 We are pleased to see that despite this, additional cores (including some duplicates from the original campaign) will be collected and assessed for their archaeological potential.	N	The Stage 1 results of the archaeological assessment of these cores are included in the ES. Details are contained in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology	4.7.4.32 – 46 the 'Assessment Criteria' only includes details of the value of maritime heritage assets. There is no detail provided in the text regarding the criteria for aviation or prehistoric heritage assets. This should be addressed in the full ES.	N	Table 4.7.9 (Criteria to assess the archaeological value of heritage assets) contains criteria for maritime, aviation and submerged prehistory heritage assets. Accompanying text within this section has been reviewed for the ES to ensure all assets are referred to proportionately. Details are contained in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Intra-Project cumulative effects, Marine archaeology	4.7.4. 10 Whilst there is consideration for transboundary effect provided within Section, there is no consideration for cumulative or in-combination impacts from this project considered. This should be considered for inclusion in the ES or a rationale presented for its exclusion.	N	Cumulative and in-combination impacts are dealt with in separate chapters to the Marine Archaeology ES chapter. Further details are contained in **Application Document 6.2.4.10 Part 4 Marine Chapter 10 Intra-Project Cumulative Effects and Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Marine archaeology	4.7.4.48 It is acknowledged that the data sources used to assess the historic environment offshore are incomplete, and so there is the potential for previously unknown remains to be present, in particular the potential for buried archaeological remains.	N	This comment has been noted by National Grid and relates to data accessed from archival organisations (including the UKHO, NMHR and local HERs) not being refreshed during the timeline of the Proposed Project. It is possible that additional records have been included in these archives since the data was requested which will not be included in the latest archaeological assessment. It was agreed with the onshore and offshore cultural heritage teams that data would not be refreshed as stakeholders have not suggested there have been significant changes in the data. Furthermore, marine geophysical and geotechnical survey work has been undertaken to better understand the marine archaeological nature of the seabed, and the results have been

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					integrated into **Application Document 6.3.4.6.A ES Appendix 4.6.A Marine Archaeological Technical Report**.
		Marine archaeology	4.7.4.56 It is stated that some of the SSS and Magnetometer geophysical data was considered to be of 'average' quality. It would be useful to understand the implications of this for the archaeological assessment and the confidence that can be held in the conclusions drawn at this stage.	N	Table 6.8 within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology** shows the criteria for assigning data quality rating - the average quality data rating for the SSS data was primarily due to weather noise visible in the data, given the SSS data overlap and the MBES data quality of 'Good'; confidence that the data is suitable for archaeological assessment is good.
		Marine archaeology	4.7.7.4, 4.7.7.6 & 4.7.7.7 It was noted that the palaeogeographic and ground investigation work has identified a few potential features of archaeological value, including channels that may contain deposits such as peat. These sorts of features and deposits have been classed as being of high palaeoenvironmental potential and very high sensitivity, which we would agree with.	N	This comment has been noted by National Grid. These features have been taken forward for inclusion within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Offshore mitigation, Construction – general, Marine archaeology	4.7.8.2 & 4.7.8.3 We are pleased to see that avoidance will be the primary mitigation approach for marine heritage and that mitigation options for heritage have been included in the Outline Code of Construction Practice (CoCP). The mitigation approaches outlined in the Outline CoCP seem sensible and appropriate and include the option to investigate potential sites in more detail, protect known sites using an exclusion zone and apply a reporting protocol for any unexpected finds.	N	This comment has been noted by National Grid. These mitigation approaches have been taken forward within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology	4.7.8.4 It is further stated that methods of ground truthing should include diver and/or ROV surveys in conjunction with other surveys. We are pleased to see that all of the data will be shared with appropriate specialists and that specialists will be involved in the development of the different survey campaigns.	N	This comment has been noted by National Grid. These methods have been taken forward within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Offshore physical environment, Offshore mitigation, Marine archaeology	4.7.8.4 We are pleased to see that indirect impacts to marine heritage have also been considered, such as impacts from erosion or scour. It is stated that physical buffers may be applied to mitigate these sorts of impacts.	N	This comment has been noted by National Grid. Indirect impacts have been assessed within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Offshore mitigation, Marine archaeology	4.7.8.5 All of the mitigation approaches will be set out in a method statement which will be approved by Historic England. We look forward to seeing these method statements in due course.	N	This comment has been noted by National Grid. Method Statements will be prepared as necessary throughout the Proposed Project, to support the overall marine WSI.
		Offshore physical environment, Offshore	Table 4.7.19 states that there will be no significant effect on heritage receptors on the seabed, the sub-seabed heritage and in the intertidal zone following the implementation of the relevant mitigation measures. Given the full assessment has not	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		mitigation, Marine archaeology	been completed and surveys are on-going we do not agree this is the case and this will need to be revisited in the ES		**Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology** has included all the survey results, covering the entirety of the offshore development area. Following implementation of embedded and additional mitigation measures and enhancement measures presented in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**, the residual effects of all potential impacts should be reduced to between negligible adverse and minor beneficial, which are considered not significant in terms of EIA.
		Construction – general, Offshore physical environment, Marine archaeology	**Volume 2, Part 1, Appendix 1.4.A Outline Code of Construction Practice** H01 could be reworded to be more applicable to marine works that cannot be 'fenced off'. H03, H05, and H06 should be considered for inclusion within the marine chapter, as they may also be relevant. MA05 states that "… will agree a solution that protects the significance of the new discovery, so far as is practicable, within the project parameters." We request that further detail is required to explain this statement.	N	National Grid acknowledges this feedback H01 has been amended as follows: Locations of known archaeological interest/value, or areas where archaeological work is planned, will be signposted/fenced off (onshore cultural heritage) or avoided using AEZs visible in project GIS mapping and micro-siting (offshore marine archaeology) to avoid unintentional damage. H01 is covered by MA07 and MA08; H05 is covered by MA07 and MA10; and H06 is covered in MA02. MA05 has been re-worded as follows: Where a previously unknown heritage asset is discovered, or a known heritage asset proves to be more significant than foreseen at the time of application, the project will inform the MMO, as advised by Historic England, and will agree a solution that protects the significance of the new discovery, utilising agreed mitigation measures such as AEZs and avoidance.
		Construction – general, Cultural heritage, Marine archaeology	Table 1.4.A.2 outlines the control management measures, including those for cultural heritage and marine archaeology. The measures seem sensible and appropriate and we look forward to seeing the detailed method statements for each of the different measures.	N	Method Statements will be prepared as necessary throughout the Proposed Project, to support the overall marine WSI. Please refer to **Application Document 7.6 Marine Archaeological Method Statements** for further details. Outline Overarching Written Schemes of Investigation form part of the DCO application (**Application Document 7.5.4.1 Outline Onshore Overarching Written Scheme of Investigation (OWSI) – Suffolk, Application Document 7.5.4.2 Outline Onshore Overarching Written Scheme of Investigation (OWSI) and Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**. These will be followed by detailed Overarching Written Schemes of Investigation as well as Site Specific Written Schemes of Investigation.
		Marine archaeology	**Volume 2, Part 4, Appendix 4.7.A: Martine Archaeological Technical Report** The document is a good overview of known and unknown heritage assets. It correctly identifies the limitations of the data utilised so far and takes a welcome precautionary approach.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.A.3.8 It is good to see that the known and potential unknown archaeological receptors dating from the Palaeolithic period onwards are considered in this document.	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Marine archaeology	4.7.A.3.26 presents the geophysics survey methodology, but no information has been provided about the resolution of the surveys. For example, it would be useful to state the line spacings used for the different geophysical techniques as this would indicate whether it was possible to resolve certain types of archaeological features and the confidence that could be held in the resulting conclusions. 4.7.A.3.44 Only the line spacings used for the magnetometry data have been stated here and it has been concluded that smaller ferrous features which weren't directly covered by a line of magnetic data may not have been picked up in the data. 4.7.A.3.87 It was noted that the MBES and SbP data was classed as being of 'Good' quality, while the SSS and Magnetometry data was classed as being of 'Average' Quality. It would have been useful to include a statement of how average quality data impacts the interpretation of the archaeological and other evidence.	N	The results of the initial geophysical survey were integrated into the Technical Report (document reference: 4.7.A), which was appended to the PEIR. Equipment specifications are in table 4.7.A.4: Summary of survey equipment: line spacing information for nearshore (variable between approx. 10 - 30 m) and offshore (50 m spacing for geophysical main lines; 2000 m spacing for geophysical cross lines). Table 4.7.A.6 shows the criteria for assigning data quality rating - the average quality data rating for the SSS data was primarily due to weather noise visible in the data, given the SSS data overlap and the MBES data quality of 'Good' confidence that the data is suitable for archaeological assessment is good. An additional marine geophysical survey was completed in 2024 and the datasets have been archaeologically assessed and the results are integrated with the original 2021 survey and are presented in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Geology and Hydrogeology, Marine archaeology	4.7.A.4.30 It is acknowledged that 12 palaeochannel features have been identified within the study area that have the potential to contain Pleistocene and Holocene sediments. The geophysical survey has identified gas blanking that may be indicative of organic material, and the initial geoarchaeological assessment identified alluvium and peat (for example, Sections 4.7.A.4.31 & 4.7.A.4.54). These features are of high archaeological and palaeoenvironmental potential and so we are pleased that they will be investigated in more detail (see Section 4.7.A.5.4).	N	This comment has been noted by National Grid. A Stage 1 geoarchaeological assessment of these features has been taken forward within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology** and a Stage 2 geoarchaeological assessment of high potential deposits has been undertaken and the assessment report will be formally submitted at Deadline 1, due to a delay in the 2024 geotechnical survey.
		Marine archaeology	Table 4.7.A.11 A total of 837 anomalies of archaeological potential have been identified within the study area. Although several unknown wrecks have potentially been identified, the largest category of anomalies recorded relates to A2 features, in particular magnetic anomalies (496 in total). The A2 anomalies will need to be investigated in more detail in order to determine the most appropriate mitigation strategy.	N	The primary mitigation measure is avoidance. Where the Proposed Project cannot avoid A2 features, further investigative work will be undertaken to better understand the nature, extent and significance of the anomaly and an appropriate mitigation strategy put in place.
			4.7.A.6.17 We are pleased to see that the potential for buried archaeological remains dating from the Palaeolithic period onwards has been recognised for the intertidal zone.	N	This comment has been noted by National Grid. These features have been taken forwards within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology	4.7.A.8.5 & 4.7.A.8.7 We agree that any palaeogeographic features and peat should be considered to be of high archaeological and palaeoenvironmental potential.	N	This comment has been noted by National Grid. These features have been taken forwards within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology, Legislation and	**Volume: 2 Part 4 Offshore Scheme Appendix 4.7.B, Outline Written Scheme of Investigation**	N	Reference to this document has been updated to 'draft OWSI' throughout the DCO application.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		policy inc. permits	The WSI should be referred to in the title as either Outline or Draft, to avoid confusing with the final Marine WSI to be agreed post-consent with the licensing authority and their advisors.		
		Marine archaeology, DCO process	Table 4.7.B.1 Reference is made here that the Outline Marine WSI will be agreed with archaeological curators prior to commencement. This should be secured with appropriate requirements in the DCO wording in this Outline Marine WSI and other project documentation with a clear timeframe for delivery.	N	This comment has been noted by National Grid. A Written Scheme of Investigation (WSI) including a Protocol for Archaeological Discoveries will be agreed with the Archaeological Curator via the Regulator and implemented (**Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**) prior to works commencing. This is set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Marine archaeology	Table 4.7.B.1 We note research framework themes that could be addressed are set out here. This is primarily derived from 'People and the Sea'. It should also include themes from the updated North Sea Prehistory Research and Management framework.	N	Relevant themes from the updated North Sea Prehistory Research and Management framework have been taken forwards within **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology, Timescales / programme	4.7.B.4.1 timescales are required for the delivery of method statements to archaeological curators for review. This is to ensure clarity between all parties, enough time to review documents, and for any comments to be implemented prior to commencement.	N	This has been discussed with Historic England at an online meeting 27 March 2024. At this meeting it was stated that a minimum of 20 working days is required to review documents. This will be included in relevant documents, including updates to the draft WSI and any method statements.
		Consultation	4.7.B.4.17 Specific contacts details for Historic England should be removed from the paragraph, reference to the Marine Planning Unit, London and South East and East of England regions is sufficient.	N	These sections have been updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**.
		Timescales / programme	4.7.B.4.19 relating to method statements for archaeological works (surveys) and work packages impacting heritage interests (construction) should set out timeframes	N	This has been discussed with Historic England at an online meeting 27 March 2024. At this meeting it was stated that a minimum of 20 working days is required to review documents. This has been included in relevant documents, including **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI) and Application Document 7.6 Marine Archaeological Method Statements**.
		Marine archaeology	4.7.0B.4.12 -16 The retained archaeologist should also have responsibilities to provide awareness training to contractors to facilitate the application of a PAD as set out in paragraph 4.7.B.7.28. Additionally, a PAD should be appended to the Outline Marine WSI submitted for the DCO application. The summary of the baseline included within the Outline Marine WSI is enough for the PEIR, but it should be noted that further detail may be required later so the Marine WSI can act as a standalone document post consent.	N	These comments have been updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**. An outline of the Protocol for Archaeological Discoveries has been presented in the OWSI along with flow charts showing how the Protocol will operate. The Retained Archaeologist will prepare the bespoke Protocol for Archaeological Discoveries document for the Proposed Project along with providing awareness training for relevant contractors based on the outline presented in the OWSI once information regarding project work requiring the Protocol is confirmed. The baseline summary has been updated with the latest available archaeological assessment results.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Marine archaeology, Timescales / programme	4.7.B.7.32 - 36 Within the mitigation measures presented within the Outline Marine WSI, provision should also be included within for method statements for work packages, including timeframes for delivery.	N	This has been discussed with Historic England at an online meeting 27 March 2024, at this meeting it was stated that a minimum of 20 working days is required to review documents. This has been included in relevant documents, including **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI) and Application Document 7.6 Marine Archaeological Method Statements**.
		Marine archaeology	4.7.B.7.44 - 57 should consider all relevant dating techniques for stage 4 analysis, not just radiocarbon dating.	N	Table 4.7.B.4 has been amended to cover additional scientific dating techniques including Luminescence dating.
		Offshore ordnance / UXO	4.7.B.7.58 - 65 & 4.7.B.7.66 - 68 “Archaeological assessment of UXO ROV survey data gathered for non-archaeological purposes” and “Archaeological Investigations Using Divers and/or ROVs” should be reviewed as the two sections seem to overlap and be confused in part.	N	These sections have been reviewed and updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**.
		Marine archaeology	4.7.B.11.1 we recommend the reference to washing finds is removed as it can remove surface residues prior to archaeological assessment.	N	These sections have been reviewed and updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**.
		Marine archaeology, Timescales / programme	4.7.B.11.9 - 11 The reporting section must include timeframes for submission of reports to the archaeological curators for comment.	N	This has been discussed with Historic England at an online meeting 27 March 2024. At this meeting it was stated that a minimum of 20 working days is required to review documents. This has been included in relevant documents, including **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI) and Application Document 7.6 Marine Archaeological Method Statements**.
		Consultation	**Volume 2, Part 4, Appendix 4.7B: Outline WSI** 4.7.B.2.5: please note that AONBs are now known as National Landscapes	N	This comment has been noted by National Grid. This has been reviewed and updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**.
		Marine archaeology	4.7.B.7.33 It is acknowledged that this document represents an Outline WSI, and that detailed method statements will be produced for each package of works.	N	This comment has been noted by National Grid.
		Marine archaeology	Table 4.7.B.1 The Maritime Archaeological Research Agenda is referenced in the WSI, however we would recommend that the North Sea Prehistoric Research and Management Framework and associated research questions and themes are also referred to (https://researchframeworks.org/nsprmf/).	N	Relevant themes from the updated North Sea Prehistory Research and Management framework have been incorporated into **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology	Table 4.7.B.1 It is clear from the research themes and questions that the development of a robust chronology will be important.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.48 we are pleased to see that cores will be collected using light-proof sleeves and will be split and stored under safe-light laboratory conditions, in order to allow techniques such as OSL dating to be applied to the sampled material. It may also	N	This comment has been noted by National Grid. This has been reviewed and updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			be useful to consider the application of Bayesian approaches to aid the construction of a robust and precise chronology.		
		Marine archaeology	4.7.B.6.3 & 4.7.B.6.7 We are pleased to see that direct and indirect impacts are being considered, and that archaeological remains will be avoided through the use of Archaeological Exclusion Zones, AEZs.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.8 It is noted that the size, shape and extent of the exclusions zones as more information becomes available, and after discussion with Historic England.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.15 It is also good to see that heritage is being considered for activities that utilised vessels such as jack-up vessels and or platforms.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.5 We recommend that the geomorphological units are added to the deposit model figures in Appendix 4.7.A.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.5.10 The initial work carried out to date has identified many anomalies within the proposed development area. The largest category of remains relates to A2 features of likely or possible anthropogenic origin, and it is concluded that there is potential for additional, previously unknown remains to be present offshore and in the intertidal zone.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.16 It is stated that AEZs have not been recommended for A2 anomalies, but that the features will be avoided by micrositing where possible.	N	This comment has been noted by National Grid. This has been taken forward to **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.
		Marine archaeology	4.7.B.7.18 Additional surveys will be carried out on a case-by-case basis in order to accurately position the elements of the site, which is good to see.	N	This comment has been noted by National Grid.
		Marine archaeology, Offshore mitigation	Section 4.7.B.7.19 A robust strategy to investigate the A2 anomalies is particularly important considering the large number of remains identified to date. It is also acknowledged that in some cases it may not be possible to avoid the A2 anomalies and so appropriate mitigation would be needed. This could include the survey, recording and/or excavation. The additional survey and mitigation approaches cited are what we would expect to see, but we look forward to reviewing the subsequent detailed method statements.	N	Further method statements will be prepared as required, where A2 anomalies cannot be avoided. Please refer to **Application Document 7.6 Marine Archaeological Method Statements**.
		Marine archaeology	4.7.B.7.21 It is stated that Protocol for Archaeological Discoveries (PAD) will be developed to address any unexpected archaeological material recovered during the lifetime of the project.	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Marine archaeology	4.7.B.7.28 The application of the PAD will include training to the Project Staff from the Retained Archaeologists, which is good to see. We look forward to reviewing this document in due course.	N	This comment has been noted by National Grid.
		Marine archaeology, Construction - general	4.7.B.7.37 & 4.7.B.8.4 It is stated that additional geophysical surveys will be carried out in areas that have not been surveyed thus far, for various pre-construction activities and for post-construction monitoring during Operation and Maintenance phases.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.37, 4.7.B.7.39, 4.7.B.7.60 & 4.7.B.8.5 We are pleased to see that archaeological specialists will be involved in the design of these survey campaigns and in the review of the data. This will ensure that the resolution of any surveys will be enough in order to maximise the opportunities to identify any archaeological remains.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.40 We are also pleased to see that provision will be made to include an archaeological specialist on-board the survey vessel during the acquisition of the data.	N	Consideration will be given to the provision of an archaeologist or geophysicist on-board a survey vessel.
		Marine archaeology	4.7.B.7.46 It is acknowledged that additional cores will be recovered for geoarchaeological assessment, including duplicate cores to replace the ones that were used for engineering purposes following the Stage 1 assessment.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.47 & 4.7.B.7.48 We are pleased to see that a geoarchaeologist will be involved in the design of the sampling campaign to ensure that cores are recovered and stored appropriately, and that detailed method statements will be submitted for review prior to this work taking place.	N	This comment has been noted by National Grid.
		Marine archaeology	4.7.B.7.49 Provision will also be made for a geoarchaeologist to be on the vessel if material is to be assessed on-board, an approach we support. We would recommend that where possible the geoarchaeologist is given direct access to the cores themselves in addition to the core logs, as it is better to record and assess continuous core sequences as this allows for greater reliability and confidence in the resulting conclusions.	N	This comment has been noted by National Grid.
		Landscape and Visual	4.7.B.3 It is also good to see that the potential complexity of the landscape is acknowledged and addressed through the research questions is discussed.	N	This comment has been noted by National Grid.
		Cultural heritage, Marine archaeology	4.7.B.7.54 It is stated that the results of any terrestrial, intertidal and offshore works will be shared between the different teams. This will ensure a consistency of approach but also allow the data to be interpreted at the landscape level.	N	This comment has been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage, Marine archaeology	Table 4.7.B.4 We are pleased to see that the marine and intertidal zone samples will be assessed following a staged approach.	N	This comment has been noted by National Grid. This survey will be undertaken in the summer of 2025.
		Cultural heritage, Marine archaeology	Section 4.7.B.8.2 We are pleased to see that a programme of post-construction monitoring will be implemented to confirm and demonstrate that impacts have been as negligible as impacted.	N	This comment has been noted by National Grid.
		Cultural heritage, Marine archaeology	4.7.B.10 & 4.7.B.11.5 summarises the work that will be carried out on the environmental samples. These sections read as if it is talking about a terrestrial site, and not the sort of samples outlined earlier in the document. For example, it discusses the collection of 40L bulk samples, kubiena and monolith samples and the assessment of cremations. Can this section be checked to ensure that it discusses the sort of samples recovered from the offshore and intertidal zones? We would also recommend that samples are recovered to assess micro-remains that can provide information about past wet environments (e.g. foraminifera, ostracods etc.). We would also recommend that separate samples are recovered for plant macrofossils, insect remains, pollen and other paleoenvironmental proxies.	N	This comment has been noted by National Grid. This has been reviewed and updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**.
		Cultural heritage	4.7.B.12.6 A reference should be included to the CIFA Dig Digital toolkit when discussing the data management plan.	N	This comment has been noted by National Grid. This has been reviewed and updated within **Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI)**.
		Consultation, DCO process	**Summary** Thank you for sharing the PEIR and associated documents with Historic England. We have provided comments above both detailed and more generic in nature. Where appropriate we have also made recommendations to improve the final ES and DCO application and we also recommend further engagement with Historic England before the ES if finalised.	N	This comment has been noted by National Grid. There has been ongoing dialogue between National Grid and Historic England prior to DCO application submission, and National Grid look forward to ongoing engagement with Historic England post submission.

Table 1.13 Joint Nature Conservation Committee

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, Offshore Environmental Impact	Please find below our comments which relate to Question 11 “Do you have any comments or issues you would like us to take into consideration regarding our marine proposals”. **General Comments:** JNCC is not the statutory SNCB for marine operations within territorial waters and therefore we shall not be commenting on general environmental impacts of this project. We are joint site managers with Natural England for the Outer Thames Estuary SPA and the Southern North Sea SAC so we request to remain involved in the consultation process so that we may review the project in relation to these two MPAs. Our comments below are therefore entirely related to those sites.	N	National Grid notes that the Joint Nature Conservation Committee is not the Statutory Nature Conservation Body for marine operations within territorial waters. The ES includes an assessment of the Outer Thames Estuary SPA and the Southern North Sea SAC in **Application Document 6.6 Habitats Regulations Assessment Report**.
		Offshore ordnance / UXO, Legislation and policy inc. permits, Offshore mitigation	**Marine Mammal Comments:** **Volume 1 Part 4 Chapter 5 Marine Mammals** Page 4, Table 4.5.2 – JNCC agrees with the decision to apply for a separate marine licence for Unexploded Ordnance (UXO) detonation, as this means that the application will be for a definite (or close estimate) number of UXOs to be cleared, as opposed to a potentially unrealistic, worse-case scenario. Page 14, Paragraph 4.5.4.5 – we highlight that the SCANS programme recently published the results of the SCANS IV survey (Gilles et al. 2023). We encourage the use of these results in addition to SCANS III. Paragraph 4.5.8.4 – While we understand the reasons for not including mitigation for geophysical surveys in this document, we highlight that due to the proposed works being within the winter area of the Southern North Sea (SNS) SAC, undertaking the works in the summer months (April - September inclusive), would avoid the peak abundance of harbour porpoise within this area of the site. We agree that mitigation for UXO clearance should be discussed in that licence application if one is needed. Page 33, Table 4.5.17 – underwater sound from UXO: we highlight the UK Governments joint position statement (UK Government 2022) on UXO clearance which states that low-noise alternatives to high order clearance, such as deflagration, are prioritised when planning UXO clearance. This should be considered if a licence is needed for UXO clearance. We also highlight the JNCC mitigation guidelines for explosive use and UXO clearance are currently under	N	This comment has been noted by National Grid. SCANS IV data and the most up to date mitigation have been included in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			review and the most up to date version should be considered when developing the mitigation plan.		
		Marine conservation zone assessment, Benthic ecology, Legislation and policy inc. permits	**PEIR Volume 1 Part 5 Chapter 3 HRA Screening Report** JNCC notes the potential impact pathways identified in this report for the Southern North Sea SAC (summarised in Table 5.3.16, page 93) and agree there may be a likely significant effect on the site. We agree with screening INSS and thermal emissions out of the assessment, and that increase in suspended sediment, will be an indirect effect. Section 5.3.10 – We would like to point out that Refs 3.42 and 3.43 are in fact JNCC documents, not Natural England.	N	These comments have been noted by National Grid. Referencing errors have all been addressed in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Ornithology, Offshore mitigation, Coordination with other Projects	**Offshore Ornithology Comments:** **PEIR Part 4 Offshore Scheme Chapter 6 Ornithology Version A October 2023, Table 4.6.14, page 53-54:** The Likely Significant Effect (LSE) test is a course filter of likely impact, and would usually be failed (i.e. further Appropriate Assessment (AA) is required), where an impact pathway can be established. Where an impact pathway exists, only where the impact could be demonstrated to be so small as to be inconsequential for the conservation objectives of the site, could it be confidently concluded that no LSE exists. In the People Over Wind judgement (Case c-323/17 Peter Sweetman v Coillte Teoranta [2018]), the CJEU concluded that mitigation measures designed to reduce or avoid impact should not be considered at the LSE stage, but should be considered within any AA. The judgement went further and considered that the very fact that mitigation measures were proposed at the screening stage by the developer confirms that the proposed project would have a significant effect. That mitigation is proposed in 4.6.8 to counter disturbance impacts, and that this table states that further mitigation measures may be incorporated suggests that there is not confidence that there would be no LSE. It should also be noted that the LSE test applies both to the project alone and in-combination with other Plans or Projects.	N	These comments have been noted by National Grid. **Application Document 6.6 Habitat Regulations Assessment Report** has not considered any mitigation measures, such as seasonal restrictions, at the Likely Significant Effect (LSE) test. These are considered as mitigation and dealt with at the Appropriate Assessment stage.
		Inter-Project cumulative effects, Ornithology	**Volume: 1 Part 5 Project Wide Effects Chapter 3 Habitat Regulations Screening Report Version A** October 2023 para 5.3.9.6 explicitly states ""... it is not possible to screen out ‘in combination’ effects at this stage. Impact pathways that may arise ‘in combination’ with the Proposed Project include ... disturbance of red-throated diver of Outer Thames Estuary SPA ...”" Given that this project may add additional disturbance to red-throated diver of Outer Thames Estuary SPA, we cannot therefore currently agree with the conclusions presented in this table, i.e. “The preliminary assessment concludes that the	N	These comments have been noted by National Grid. For red-throated diver, the Proposed Project is committing to a full seasonal restriction (1 November – 31 March) for offshore cable installation activities in the Outer Thames Estuary SPA and a reduced seasonal restriction (1 January – 31 March) for landfall cable installation activities at the Suffolk landfall in Aldeburgh. **Application Document 6.6 Habitat Regulations Assessment Report** and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** reflect this mitigation

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			displacement of red-throated diver during construction of the offshore scheme alone only result in temporary displacement that is not significant."		measure. The REAC is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Ornithology, Construction – general, Inter-Project cumulative effects	We agree that "There are high levels of shipping activity and recreational use in the Outer Thames Estuary and southern North Sea, with this part of the North Sea being busy with fishing vessels, cargo vessels and increasingly, vessels associated with the offshore renewables industry". However, the boundary of the SPA reflected the situation in regards to anthropogenic disturbance and consequences for distribution at the time of survey, and was defined to exclude the shipping routes to/from Harwich, Felixstowe and Ipswich ports as the levels of shipping result in red-throated diver densities that did not meet the maximum curvature threshold established for inclusion. Any development will be in the context of a background level of impact. It is not satisfactory to merely state an existing impact as justification for a conclusion of no adverse effect on integrity. An assessment needs to establish whether the project will meaningfully add to that existing background level of disturbance, either alone or in-combination with other plans or projects.	N	These comments have been noted by National Grid. For red-throated diver, the Proposed Project is committing to a full seasonal restriction (1 November – 31 March) for offshore cable installation activities in the Outer Thames Estuary SPA and a reduced seasonal restriction (1 January – 31 March) for landfall cable installation activities at the Suffolk landfall in Aldeburgh. **Application Document 6.6 Habitat Regulations Assessment Report** and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** reflect this mitigation measure. The REAC is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Timescales / programme, Ornithology	The PEIR Non-technical Summary states that works will be occurring over the course of 4 calendar years (Table 3-1). Therefore, while the works will be transitory, they will be repeated over a number of seasons during which red-throated diver are present. Diving birds may not return for several hours, so depending on the duration and frequency of activity, this may not be considered 'temporary and short term'. There is an existing high level of activity within and around the SPA, and surveys have shown densities shifted away from windfarms within the SPA, i.e., there is less 'optimal' habitat available for the birds to move into when disturbed, so it is increasingly not the case that 'Birds are therefore likely to find alternative feeding/loafing grounds in the short term'. This is reflected in the 'Reduce' target for the Conservation Objective on disturbance.	N	These comments have been noted by National Grid. For red-throated diver, the Proposed Project is committing to a full seasonal restriction (1 November – 31 March) for offshore cable installation activities in the Outer Thames Estuary SPA and a reduced seasonal restriction (1 January – 31 March) for landfall cable installation activities at the Suffolk landfall in Aldeburgh. **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** reflect this mitigation measure. The REAC is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Construction – general, Ornithology	**Further clarification required.** Table 4.6.14 states "During the construction phase, there would be several vessels present within the marine environment". Clarity will be needed on the number of vessels as each one will be additive in their disturbance effect on red-throated diver.	N	The requirement for further clarity on the number of vessels during construction is noted and further clarification provided in **Application Document 6.6 Habitat Regulations Assessment Report**. For red-throated diver, the Proposed Project is committing to a full seasonal restriction (1 November – 31 March) for offshore cable installation activities in the Outer Thames Estuary SPA and a reduced seasonal restriction (1 January – 31 March) for landfall cable installation activities at the Suffolk landfall in Aldeburgh. This commitment is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Ornithology, Construction – general,	**Displacement assessment.** To carry out a full assessment of red-throated diver and common scoter disturbance by vessel activity, we advise that a buffer of 2km for red-throated diver (Burt et al., 2017, Burger et al., 2019) and 2.5km for common scoter (Fliessbach et al., 2019) is applied around vessels, and 100% of the birds within this buffer assumed to be displaced. Density distribution maps should be used to overlay the location of the vessel and relevant buffer to determine the number of birds displaced. This value can then be calculated as a proportion of the SPA population. The area of impact can also be calculated and again as a proportion of the SPA area. We recommend that the APEM 2013 and Irwin et al 2019 distribution maps of red-throated diver are used as the baseline environment to use for a vessel disturbance assessment. These provide a range of distributions and abundances. Therefore, JNCC advise that a disturbance assessment is carried out using each of the distribution maps, and from this a range of minimum and maximum number of birds disturbed can be presented. This can then be compared to the mean population estimates presented in the site Supplemental Advice on Conservation Objectives (available here: Outer Thames SPA - UK9020309A (naturalengland.org.uk)) (this estimate was derived from the results of two sets of APEM (?) surveys). We suggest contacting Natural England for access to APEM 2013. Please contact me with any questions regarding the above comments.	N	The requirement for displacement assessment to red-throated diver is noted and further clarification provided in **Application Document 6.6 Habitat Regulations Assessment Report**. For red-throated diver, the Proposed Project is committing to a full seasonal restriction (1 November – 31 March) for offshore cable installation activities in the Outer Thames Estuary SPA and a reduced seasonal restriction (1 January – 31 March) for landfall cable installation activities at the Suffolk landfall in Aldeburgh. This commitment is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Table 1.14 Kent and Essex Inshore Fisheries and Conservation Authority

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, Legislation and policy inc. permits	KEIFCA's role is to manage inshore fisheries and seek to ensure that Marine Protected Areas (MPAs) achieve their Conservation Objectives in the Kent and Essex district 0 - 6 NM offshore (from 1983 fishery baseline). In addition, the Marine and Coastal Access Act (MaCCA) requires KEIFCA to balance a sustainable thriving fishery and marine environment. As part of our duties, we manage the Thames Estuary Cockle Fishery Order 1994 (TECFO) and the Cockle Fishery Flexible Permit Byelaw (CFFPB), combined, the most valuable fishery in the district. The management of the cockle harvesting beds is currently at a critical point in time with the introduction of the new T24 Regulating Order that will take over management from September 2024 for the next 28 years, within which the cockle beds of Pegwell Bay are of vital importance.	N	Cockle harvesting is acknowledged as an important regional industry governed by KEIFCA byelaws. Further information is presented in **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**.
		Offshore physical environment, Fish and shellfish ecology, Onshore environmental impact	We are concerned about the impacts of the planned works on: Sabellaria reefs (including processes and supporting habitats) and lack of recovery of designated features in the Goodwin Sands MCZ to cable laying; and habitat, shellfish beds and supporting habitats of Pegwell Bay (Thanet Coast & Sandwich Bay SACs, and Thanet Coast and Sandwich Bay SPA and RAMSAR site, hereafter MPA* for ease of reading).	Y	The re-routing of the Offshore Scheme to avoid Goodwin Sands MCZ will reduce direct impacts to the known and potential benthic receptors located within the area, including Sabellaria reef. See **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. The impact on the shellfish beds (specifically cockle and whelk fisheries) and supporting habitats with statutory designations in Pegwell Bay have been considered further in **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**, **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** and associated assessments. **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries** concludes that with additional mitigation, no significant effects on any commercial fisheries receptors are to be expected in UK waters. **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** assesses that there is no additional mitigation required because there are no likely significant effects to benthic ecology identified. Mitigation is secured within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Fish and shellfish Ecology, commercial fisheries	Furthermore, we are concerned about potential impacts on: protected cockle beds in Pegwell Bay; and permanent restrictions imposed on drift net fishing over the cable route.	N	Cockle harvesting is acknowledged as an important regional industry governed by KEIFCA byelaws. Further information is presented in **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**. Communication of the timings and locations of installation activities and exclusion zones will also be provided; the Fisheries Liaison Officer will also disseminate information and maintain dialogue with fishers. This commitment is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Actions (REAC) which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Drift nets have some potential to unintentionally overlap in range with the Offshore Scheme if the environmental conditions and deployment location are not carefully considered. However, most drift nets hang vertically near the surface or in mid water, usually avoiding the seabed where the snag risks are present. While no defined restrictions on fishing over the buried cable have been proposed during the operational phase, current guidance advises the avoidance of demersal trawling (and anchoring) in the vicinity of subsea cables.
		Fish and shellfish ecology, Alternative solutions, Offshore mitigation	We are in the process of developing management for the Goodwin Sands MCZ as part of our statutory role under MaCAA, and we are concerned that the impacts of the works to the site would undermine our efforts to limit fishing impacts to the seabed in this site. We feel there is a need for greater consideration of alternative options that would not require going through two highly esteemed MPAs, namely, Goodwin Sands MCZ and Pegwell Bay MPA*. Our comments highlight areas requiring clarification or mitigation to minimize our concerns of effects on designated protected areas and the local fishing industry.	Y	The re-routing of the Offshore Scheme to avoid Goodwin Sands MCZ will reduce direct impacts to the known and potential benthic receptors located within the area, including Sabellaria reef, subtidal sand and subtidal coarse sediment, see **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This follows the mitigation hierarchy, avoiding impacts to the features and conservation objectives of Goodwin Sands MCZ. The cable makes landfall in Pegwell Bay. The impact on the shellfish beds (specifically cockle and whelk fisheries) and supporting habitats with statutory designations in Pegwell Bay have been considered further in **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**, **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** and associated assessments. No likely significant effects have been identified.
		Offshore physical environment, Benthic ecology, Offshore route location	**The Offshore Scheme** Goodwin Sands MCZ Impacts on designated features. Goodwin Sands MCZ has some of the best examples of Sabellaria reefs in the District (note it is a recent (November 2023) addition to the National Marine Evidence Base maintained by Natural England). The Evidence Base now includes a substantial inshore Sabellaria reef based on ground truthed sidescan sonar surveys carried out by KEIFCA in 2021 and 2022. This health of this biogenic reef is underpinned by the availability of sand and coarse sediment as reef building materials and the circulation patterns within this insular unit. Impacts to any of these features or processes could therefore undermine the site integrity of Goodwin Sands MCZ (Figure 1). Furthermore, we have recent (2021 and 2022) sidescan sonar imagery evidence to support our concerns about the lack of recovery of subtidal sand and subtidal coarse sediments in the Goodwin Sands MCZ and lasting impacts from previous cable laying. This site-specific evidence of lasting impacts from cable laying in the MCZ should be taken into account as a	Y	The re-routing of the Offshore Scheme to avoid Goodwin Sands MCZ will reduce direct impacts to the known and potential benthic receptors located within the area, including Sabellaria reef, subtidal sand and subtidal coarse sediment, see **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This follows the mitigation hierarchy, avoiding impacts to the features and conservation objectives of Goodwin Sands MCZ. No likely significant effects have been identified.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			precautionary approach over and above standard (MarESA) sensitivity assessments to provide a realistic sensitivity assessment of the designated features to pressures from cable laying activities.		
		Fish and shellfish ecology, Marine archaeology, commercial fisheries	In addition to potential impacts on designated habitats we are also concerned about the disturbance to shipwrecks that form an important habitat supporting a wide variety of marine life within the MCZ as well as the commercial fisheries benefits derived from enhanced richness around shipwrecks.	Y	The Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ and will therefore reduce potential impacts to receptors within the area. This has been considered within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology and Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**.
		Commercial Fisheries, Socio-economic. recreation and tourism, Construction - general	Impacts on fisheries around Goodwin Sands MCZ. Fishing activity within the Goodwins Sands MCZ is conducted by vessels with home ports of Ramsgate, Deal, Dover and Folkestone and supports half a dozen fishing vessels throughout various times of the year. The cable route will impact on potting and netting within the Goodwin Sands MCZ and may lead to the displacement or permanent loss of preferred and valuable fishing grounds which could severely impact the livelihoods of local fishers. KEIFCA welcome the appointment of a Fisheries Liaison Officer (FLO) and fisheries working groups and ask that timely communications are maintained with the commercial fishing industry during the construction phase and clear information is provided via notice to mariners throughout the duration of the installation. In addition, we seek greater clarity regarding the inclusion of bottom drifting nets being regarded as mobile gear use of which would be restricted in the vicinity of the cable route, while not making a clear distinction from anchored nets. The outcome of the impact assessment to the mobile gear fishery as "medium" sensitivity but later on then downrated to "not significant" (apparently because of the vast amount of space available to fishers) is unsatisfactory because it represents a displacement and permanent loss of fishing ground to some fishers who rely on the use of this area for drift netting. We suggest it is critical that there is better liaison with the fishing industry to avoid unnecessary loss of key fishing grounds.	Y	There are ongoing communications via the Fisheries Liaison Officer with Thanet Fishermen's Association and other regional fisheries stakeholders, see **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**. The Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ and will therefore reduce potential impacts to fisheries receptors within the area. With regard to the grouping of fixed and drift nets as mobile fishing gears in the PEIR, this was based on the Marine Management Organisation's data categorisation, whereby fixed and drift nets are not separated from one another within the available datasets. How gear types are grouped and subsequently assessed has been carefully considered in **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**. Drift nets have been assessed as static gears within this assessment.
		Commercial fisheries	Figure 1. Gear and.fishing vessel (of all lengths) sightings in Goodwin Sands MCZ area from 2017 to 2023 using KEIFCA patrol data. Sabel/aria reefs (Ross worm reef) and other designated habitat shown on map.	N	This comment has been noted by National Grid.
		Landscape and visual, Commercial fisheries, Ornithology	Pegwell Bay MPA * Pegwell Bay has multiple overlapping MPA designations and is a site of international importance including the most important landward sand dune and grassland system in the Southeast of	N	Pegwell Bay and the overlapping nature of its designated features has been carefully considered as part of **Application Document 6.11 Marine Conservation Zone Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			England as well as sand and mudflats supporting rich marine invertebrate life that sustains nationally and internationally protected bird species and serve as a vital food supply to underpin commercially important fisheries.		
		Fish and shellfish, ecology, Marine mammals, Ornithology	In addition to this important landfall for birds, the Stour and adjacent saltmarsh is important for the recruitment of and a juvenile nursery for commercially valuable fish species like sea bass; the river is also used by grey and harbour seals during haul out and feeding.	N	The importance of the Stour and adjacent saltmarsh to important receptors has been considered as part of: • **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries;** • **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology; and** • **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals.**
		Construction – general, Fish and shellfish, ecology, Benthic ecology	Penetrative and abrasive pressures from vessel scouring during installation. We are concerned about abrasive impacts from vessels that would be operating in the vicinity of Pegwell Bay to conduct the works such as drilling and cable laying. Vessels on anchor that are moved by in-tidal streams while over the shallow seabed may abrade and penetrate (deep abrasion) the substrate and thereby impact on the designated features, supporting habitats and cockle beds. We are concerned about the abrasive and penetrative impacts arising from towing the grapnel chain and cable ploughing equipment owing to the sensitivity and slower than expected recovery of site-specific features, and ask for better evidence regarding expected recovery periods, and greater consideration of alternative route options that would avoid these sites. While we appreciate horizontal directional drilling (HDD) will minimise impacts on the seabed, we would be concerned on any breaches of the landward chalk and sand dune system and chalk berm could lead to drowning of saltmarsh habitat (given its importance to juvenile fisheries habitat) that may arise indirectly from the works - such as equipment used to install the duct/pipe for the trenchless solution on the landward side requiring access. We would like greater clarity in terms of what equipment and what process will be used at various points along the route to better understand the level and likelihood of these impacts.	N	Upon approach to Pegwell Bay, the Order Limits have been widened in order to accommodate temporary construction activities (anchors, jack-up legs, and vessels). Ground investigations have confirmed the use of trenchless solutions at both landfalls. In Pegwell Bay, due to the extent of the intertidal area, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats such as mudflats including temporary and physical disturbance, temporary increased suspended sediment concentrations during construction, operation and decommissioning are scoped back into the ES. An assessment of impacts associated with installation have been provided in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**, and no likely significant effects have been identified. Embedded mitigation measures and commitments for benthic ecology are included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** (BE01, BE02, BE03 and BE04). The REAC is secured by Regulation 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Fish and Shellfish Ecology, Offshore Mitigation	Impacts on Pegwell Bay area fisheries. As stated, Pegwell Bay is an important and valuable cockle harvesting area which overlaps with the proposed works. The southern section of the Offshore Scheme, including the southern landfall at Pegwell Bay - ICES 31F1 - passes through the cockle fishery bed. We therefore ask that the appropriate mitigation	N	Upon approach to Pegwell Bay, the Order Limits have been widened in order to accommodate temporary construction activities (anchors, jack-up legs, and vessels). Ground investigations have confirmed the use of trenchless solutions at both landfalls. In Pegwell Bay, this technique will avoid the sensitive saltmarsh habitats in the upper intertidal area. However, due to the extent of the intertidal area at Pegwell Bay, impacts during cable

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			measures are applied to limit the disturbance of cockles and the impact on the fishery.		trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats and species such as mudflats including temporary and physical disturbance, temporary increased suspended sediment concentrations during construction, operation and decommissioning are scoped back into the ES. An assessment of impacts on cockles and the fishery associated with installation have been provided in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** and **Application Document 6.2.4.8 Part 4 Marine Commercial Fisheries**, where no likely significant effects have been identified. Mitigation measures are provided in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** (CF01 – CF08, and BE01 – BE04) and **Application Document 7.5.3.2 CEMP Appendix A Outline Code of Construction Practice**. These are secured by Regulation 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Offshore route location, Commercial fisheries, Socio-economic. recreation and tourism	As well as a cockle fishery, Pegwell Bay is also an important fishing ground for the local fishing fleet as a key area for potting and netting activity. KEIFCA are concerned that the proposed cable route will lead to the displacement or potential loss of preferred and valuable fishing grounds and impact on the livelihoods of local fishers. The overlap and proximity of the works to important fishing grounds means precautionary measures must be taken, wherever possible, to ensure site integrity. If you require any further information on any of the above, please to not hesitate to contact KEIFCA.	N	Upon approach to Pegwell Bay, the Order Limits have been widened in order to accommodate temporary construction activities (anchors, jack-up legs, and vessels). Ground investigations have confirmed the use of trenchless solutions at both landfalls. In Pegwell Bay, this technique will avoid the sensitive saltmarsh habitats in the upper intertidal area. However, due to the extent of the intertidal area at Pegwell Bay, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats such as mudflats including temporary and physical disturbance, temporary increased suspended sediment concentrations during construction, operation and decommissioning are scoped back into the ES. An assessment of impacts associated with installation have been provided in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**, where no likely significant effects have been identified. An assessment of impacts on the local fishing fleet has been provided in **Application Document 6.2.4.8 Part 4 Commercial Fisheries**, where no likely significant effects have been identified.

Table 1.15 Kent Downs AONB

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Landscape and visual	Thank you for your notification of the current non-statutory consultation for the Sea Link Project. On 22 November 2023, all designated Areas of Outstanding Beauty (AONBs) in England and Wales became 'National Landscapes' (NLs). As such, the Kent Downs AONB is now the Kent Downs National Landscape. Its legal designation and policy status remain the same.	N	This comment has been noted by National Grid.
		Legislation and policy, landscape and visual	However, on 26th October 2023, the Levelling-Up and Regeneration Bill received Royal Assent and is now the Levelling-Up and Regeneration Act 2023.[1] The Act amends the Countryside and Rights of Way Act, replacing the current Duty of Regard in AONBs set out above with a new, strengthened requirement that: 'In exercising or performing any functions in relation to, or so as to affect, land in an area of outstanding natural beauty in England, a relevant authority other than a devolved Welsh authority must seek to further the purpose of conserving and enhancing the natural beauty of the area of outstanding natural beauty'. (Part 12 - Miscellaneous; Section 245. Protected Landscapes; paras (5) - (10). This new duty will come into legal effect on 26th December 2023 and clearly places a much stronger duty on relevant authorities (including local authorities, the Planning Inspectorate and other Government Departments, Statutory Undertakers etc) to ensure that their actions and decisions seek to conserve and enhance AONBs, marking a significant change to the legal context of AONB policy. This important change is supported by various provisions in the Act which enable secondary legislation for compliance with the new duty. Having assessed the relevant documentation, the Kent Downs National Landscape Unit has no particular observations or concerns to raise in respect of the Project and potential impacts to the Kent Downs National Landscape. I hope this is of assistance to you.	N	National Grid thanks the respondent for its response and notes the feedback.

Table 1.16 Kent Fire & Rescue Service

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	Thank you for sharing the consultation documentations on the planned works to reinforce the electricity transmission network between Suffolk and Kent (project Sea Link). We have reviewed the documents provided and would like to provide the below feedback.	N	These comments have been noted by National Grid.
		Construction – general, Safety	The construction phase of the project will involve various temporary construction activities, including working areas for construction equipment and machinery, site offices, storage, accesses, bellmouths, and haul roads, as well as watercourse crossings and the diversion of public rights of way (PROWs). Site-Specific Risk Information (SSRI) should be made available for these temporary sites, to allow effective Emergency Response Planning.	N	These comments have been noted by National Grid. **Application Document 7.5.3 Onshore Construction Environmental Management Plan** provides details relating to the incident procedure and response. It should be noted that in advance of construction, contractors will develop and implement an Incident Response Plan which will detail their response in the event of any incident on site. As detailed within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**, National Grid is committed to ensuring the health and safety of people working on projects is maintained in accordance with the Construction (Design and Management) Regulations 2015 (CDM) and the principles and philosophy behind them. The contractors will prepare a construction phase Safety, Health and Environment (SHE) Plan prior to construction works commencing. A construction phase SHE Plan will be prepared by the contractors for each element of the Proposed Project.
		Safety, Design, Landfall location	The project includes a landfall point on the Kent coast at Pegwell Bay, a transition joint bay approximately 800 metres inshore to transition from offshore high voltage direct current (HVDC) cable to onshore HVDC cable, before continuing underground for approximately 2 km to a proposed new converter station and a 2 GW HVDC converter station, up to 26 metres high, plus external equipment (such as lightning protection and railings for walkways), which is near Minster. Further information to inform our emergency response plans would need to be provided, as factors such as site access, water provisions, and firefighting systems would need to be considered before, during, and after construction.	N	National Grid acknowledges your comments. As part of National Grid's standard design and consultation processes they are required to consider the impact of all constructed assets with regard to fire risk as part of their duties under CDM, and they will ensure that suitable liaison with local fire services is carried out at appropriate stages of the design and build process.
		Traffic and transport	From a business continuity (BC) element, we would need to consider the impact these works have on the surrounding road network, and if there is a potential for increased traffic flows within the local areas effected by the project.	N	These comments have been noted by National Grid. **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent**.
		Consultation	Please ensure all future planning documents and detailed plans for the project are shared with our Fire Engineering Team via FET@kent.fire-uk.org and please feel free to contact me directly	N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			on the above details if you wish to discuss the matter in more detail.		

Table 1.17 Marine Management Organisation

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy inc. permits, DCO process	**The MMO's role in Nationally Significant Infrastructure Projects** The MMO was established by the Marine and Coastal Access Act 2009 (the 2009 Act) to make a contribution to sustainable development in the marine area and to promote clean, healthy, safe, productive and biologically diverse oceans and seas. The responsibilities of the MMO include the licensing of construction works, deposits and removals in English inshore and offshore waters and for Welsh and Northern Ireland offshore waters by way of a marine licence. Inshore waters include any area which is submerged at mean high water spring (MHWS) tide. They also include the waters of every estuary, river or channel where the tide flows at MHWS tide. Waters in areas which are closed permanently or intermittently by a lock or other artificial means against the regular action of the tide are included, where seawater flows into or out from the area. In the case of Nationally Significant Infrastructure Projects (NSIPs), the 2008 Act enables Development Consent Order's (DCO) for projects which affect the marine environment to include provisions which deem marine licences. As a prescribed consultee under the 2008 Act, the MMO advises developers during preapplication on those aspects of a project that may have an impact on the marine area or those who use it. In addition to considering the impacts of any construction, deposit or removal within the marine area, this also includes assessing any risks to human health, other legitimate uses of the sea and any potential impacts on the marine environment from terrestrial works. Where a marine licence is deemed within a DCO, the MMO is the delivery body responsible for post-consent monitoring, variation, enforcement and revocation of provisions relating to the marine environment. As such, the MMO has a keen interest in ensuring that provisions drafted in a deemed marine licence (DML) enable the MMO to fulfil these obligations. Further information on licensable activities can be found on the MMO's website3. Further information on the interaction between the Planning Inspectorate and the MMO can be found in our joint advice note4.	N	National Grid notes the Marine Management Organisation's role in relation to DCO applications and will continue to liaise with the Marine Management Organisation as the Proposed Project develops. **Application Document 3.1 draft Development Consent Order** includes a deemed marine licence.
		Design, Consultation, DCO process	1. Sea Link 1.1. The Proposed Project is required to accommodate additional power flows generated from renewable and low carbon energy generation, as well as additional new interconnection with mainland Europe. NGET owns, builds and maintains the	N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			electricity transmission network in England and Wales. Under the Electricity Act 1989, NGET holds a transmission licence under which it is required to develop and maintain an efficient, coordinated, and economic electricity transmission system. 1.2. The Proposed Project involves the reinforcement of the electricity transmission system in the south east of England and East Anglia. This would be achieved by reinforcing the network with a predominantly HVDC Link between the proposed Friston substation in the Sizewell area of Suffolk and the existing Richborough to Canterbury 400 kilovolts (kV)overhead line close to Richborough in Kent. This reinforcement would be approximately145 km long, comprising of a principally offshore HVDC link. 1.3. The MMO has reviewed the consultation documents received 23 October 2023 in consultation with our scientific advisors at the Centre for Environment, Fisheries and Aquaculture Science (CEFAS) and sets out our initial comments below. The MMO has focused on 'Part 4' of the PEIR and all other related sections and appendices. 1.4. The MMO reserves the right to make further comments on the Project throughout the preapplication process and may modify its present advice or opinion in view of any additional information that may come to our attention.		
		Legislation and policy inc. permits	2. Part 1, Chapter 2: Regulatory and Planning Policy Context 2.1. Section 1.2.7 correctly identifies that the proposed development is within the East and South East Marine Plan areas and the MMO welcomes the developer's commitment to produce a marine plan technical assessment. 2.2. The MMO requests that all policies are reviewed to ensure compliance. This must be produced as the Secretary of State must use the East and South East Marine Plan when making planning decisions for the sea, coast, estuaries and tidal waters, as well as developments that impacts these areas, such as infrastructure. 2.3. The Marine Plan policies can be accessed using Explore Marine Plans: https://www.gov.uk/guidance/explore-marine-plans.	N	A Marine Plan Policy Assessment is presented in **Application Document 6.13 Marine Plan Policy Assessment**.
		Construction – general, Offshore mitigation, Benthic ecology	3. Part 4, Chapter 3: Benthic Ecology 3.1. The MMO notes that the introduction and spread of Invasive Non-Native Species (INNS) has been scoped out. Regarding the relevant mitigation measures included in Section 4.3.8.3 of the PEIR, it is noted that the Applicant commits to "where possible, cable protection materials will be selected to match the environment". The MMO agree with and welcome this approach	N	The mitigation measure "where possible, cable protection materials will be selected to match the environment" is also included in the assessment within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			which acts to minimise the opportunity for recruitment of INNS and taxa not normally present within the environment where cable protection is deployed by reducing the variation between the receiving physical habitat and that altered through cable protection works, should this mitigation be implemented.		
		Benthic ecology, Offshore route location, Offshore environmental impact	3.2. “Disturbance to benthic habitats and species due to subsea cable thermal emissions” is acknowledged as a potential impact from the Project. However, the heating of sediment above the buried cable may result in the “direct loss of subtidal benthic habitats and species” and the MMO recommend that this impact is included in any assessment of thermal emissions because of the cable installation works.	N	An assessment of the impact of thermal emissions on marine ecological receptors is included in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology and Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**.
		Intra-Project cumulative effects, Inter-Project cumulative effects, Benthic ecology	3.3. The MMO is content there is adequate description of the potential cumulative and interrelated impacts on the benthic environment, which are discussed in chapter 12 of the PEIR. The MMO notes that a study area of 10km from the offshore scheme Boundary is used for the benthic ecology assessment, which is deemed appropriate. Table 4.12.3 in Chapter 12 of the PEIR considers the cumulative impact of Sizewell C Nuclear Power Plant and the Proposed Project and states that “the Proposed Projects will not physically overlap and are located over 5 km apart”. This appears to contradict the use of a 10 km boundary around the Offshore Scheme, and the MMO recommends this is clarified.	N	The study area and Proposed Project scoping boundary for cumulative effects in relation to benthic ecology is now 10 km and included in **Application Document 6.2.4.10 Part 4 Marine Chapter 10 Intra-Project Cumulative Effects and Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Fish and shellfish ecology, Offshore route location, Timescales / programme	4. Part 4, Chapter 4: Fish and Shellfish - Fish 4.1. The MMO agree with the proposed approach to the assessment set out in the PEIR, however there are some concerns in respect to Herring and Sandeel. Cable laying is currently proposed to be carried out year-round from 2028 to 2029 so there is potential for the proposed works to occur during the Herring and Sandeel spawning seasons. Some additional information and data are required in order to better interrogate the mapped data layers and more accurately determine whether the cable route crosses herring spawning habitat and Sandeel habitat, and if so, to what degree. This will enable the MMO to consider in more detail the likelihood of potential impacts to Herring and Sandeel, and whether any additional temporal or spatial mitigation is necessary. Details of the presentation of data required for the final Environmental Statement (ES) are outlined in points 4.3 – 4.6 for Herring and 4.7 – 4.8 for Sandeel below. Details regarding the preferred methods of determining potential Herring spawning habitat and Sandeel habitat are outlined in points 4.9 – 4.10 below.	N	A full herring and sand eel spawning assessment, including potential effects to these receptors has been undertaken in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. Responses to 4.3 - 4.10 are provided below.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Geology and hydrogeology, Benthic ecology	4.2 The MMO notes that sediment sampling has been carried out at 37 stations along the proposed cable corridor with particle size analysis (PSA) carried out on each sample. These were classified according to the modified Folk (1954) scale and combined with a drop-down camera to provide broadscale habitat mapping. Whilst the use of a drop-down camera can be used to make observations on general seabed sediments and habitats, it isn't effective for determining the component fractions of sediments in detail, for example whether the percentage of mud/silt present in a sand/gravel sample is greater than 5% / 10%. British Geological Survey (BGS) data can provide appropriate broadscale information on the sediment types in the study area and should be used as a background layer with which to compare the ground-truthed sediment samples and make observations on correlations between the two data sets.	N	The benthic habitat mapping comprises a combination of side-scan sonar (SSS), drop-down video (DDV), and grab samples (37 in total). The resulting backscatter from SSS, in combination with the other data collection methods, can determine the broad sediment type (i.e. the presence of mud, fine sand, coarse sand and coarse sediment). This can then be used to inform the habitat mapping at locations where grab samples have not been taken. This approach follows the approach detailed within the JNCC (2018) monitoring guidance for marine benthic habitats. Although DDV is not effective for determining the component fractions of sediment (i.e. the presence of mud), the habitat mapping is based on the Folk 7 classifications. Therefore, this is considered to be an over representation of the sediment present, in the context of herring and sand eel spawning; i.e. if an area is identified as coarse sediment then presence of mud (0-5%) would make it unsuitable to herring. If an area is identified as mud then the presence of gravel or sand (0-5%) would not make it suitable for herring (mud always has to be <10%). However, in order to inform the herring and sandeel assessment, BGS data has been included to allow for observations and correlations between the two datasets.
		Geology and hydrogeology, Fish and shellfish ecology, Benthic ecology	4.3 Of the 37 sediment samples collected, only 2 sites, (S026 and S037) contained sediments considered suitable as spawning habitat for herring, based on the Reach et al., (2013) criteria which classifies sediment suitability as potential herring spawning habitat. However, Figure 4.4.7 indicates that multiple sections of the cable route are comprised of 'preferred' or 'marginal' habitat. It would be useful if you could re-present these figures by using a base layer of BGS data, overlaid with their own ground-truthed sediment classifications, including the point data along the cable route where the grab samples consisted of 'preferred' or 'marginal' spawning habitat type sediments.	N	The figures presented within the herring and sandeel assessment **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology** have been updated to include BGS data as a base layer. The project benthic survey data as well as the Cefas One Benthic data has been groundtruthed using the BGS data. However, it is important to note that the BGS data is based on a limited number of grab samples and is interpolated. Therefore, conformity between these datasets is mixed, noting that sediment classifications in the study area can be variable. National Grid considers the Proposed Project benthic survey data to be the most recent dataset and most representative of the current sediment conditions along the cable route.
		Fish and shellfish ecology, Offshore Route location, Timescales / programme	4.4 Ten years of International Herring Larvae Survey (IHLS) data for the years 2008 – 2017 has been presented. Whilst more recent data are available (up to 2022) and would have provided a more robust assessment, the MMO accept that due to recent changes with this survey (the discontinuation of one of the three Downs herring surveys in 2018 which took place between 16-31 January), making direct comparisons between the pre-2017 data and 2018 onwards would be difficult. Taking into account the nature of the proposed cable laying activities and timescale for this project, the MMO is content that the 10-year data set used is adequate to provide a broadscale picture of the extent and intensity of herring larvae in the study area.	N	The 2008 - 2017 IHLS data will continue to be considered within the herring and sandeel assessment, as the 10-year data set (rather than 2018-2022, which is not comparable with previous years).
		Fish and shellfish	4.5. The PEIR presents the broadscale herring spawning and nursery grounds according to Coull et al., (1998) and Ellis et al., (2012) in Figure 4.4.4. These maps indicate that the cable route	N	A full herring and sandeel spawning assessment, including potential effects to these receptors has been undertaken in **Application Document 6.2.4.3 Part**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		ecology, Benthic ecology	does not cross the historic spawning grounds, as per Coull et al. (1998), which somewhat contradicts the sediment data and IHLS data. Much of the cable route is shown to pass through the herring nursery grounds as per Coull et al., (1998) and Ellis et al., (2012).		**4 Marine Chapter 3 Fish and Shellfish Ecology**. This assessment has considered the data sources of Coull et al., (1998) and Ellis et al., (2012).
		Fish and shellfish ecology, Offshore route location, Benthic ecology	4.6 For the ES, it is important you present the IHLS data (shown in Figure 4.4.6) as a mapped layer overlaid onto the sediment data layer (as outlined in point 13). This will help by providing a better visual representation of the areas of the cable route which have suitable sediments for herring spawning and have a consistent presence of herring larvae. Please indicate the kilometre point (KP) distances along the cable route on the map.	N	The IHLS data has been overlaid on the BGS data and Proposed Project benthic survey data to provide better context of the presence of herring larvae. The KP distances have now been added. Further details are contained in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**.
		Fish and shellfish ecology, Benthic ecology	4.7 Of the 37 sediment samples collected, six sites (S023, S025, S026, S029, S035 and S037) contained sediments classified as 'preferred' Sandeel habitat and nine sites (S004, S014, S016, S019, S020, S022, S024, S030 and S036) were classified as 'marginal' habitat. The MMO notes the Greenstreet et al., (2010) has been used to classify sediment suitability for Sandeel. A more appropriate approach would have been to use the method from Latto et al., (2013) as this considers the strengths and limitations of Greenstreet et al., (2010) and Holland et al., (2005) and is therefore the method supported by the MMO and CEFAS Fisheries. Greenstreet et al., (2010) in isolation is considered to potentially overestimate habitat suitability, and therefore is not the method used by Latto et al., (2013). You should follow Latto et al., (2013) when characterising sediment suitability for Sandeel.	N	These habitats have now been reclassified based on the methods provided by Latto et al. (2013) for better comparison. Of the 37 sediment samples, there are now 15 sites classified as 'preferred' and one site classified as 'marginal'.
		Fish and shellfish ecology, Offshore route location, Benthic ecology	4.8 Figure 4.4.8 indicates multiple sections of the cable route are comprised of 'preferred' or 'marginal' Sandeel habitat. As with herring, for the ES it would be useful if the Applicant could re-present this figure by using a base layer of BGS data, overlaid with their own ground-truthed sediment classifications, including the point data along the cable route where the grab samples consisted of 'preferred' or 'marginal' Sandeel habitat type sediments. Please indicate the KP distances along the cable route on the map.	N	The figures presented within the herring and sandeel assessment within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology** have been updated to include BGS data as a base layer. The KP distances have also now been included.
		Fish and shellfish ecology, Benthic ecology	4.9 The MMO notes from paragraph 4.4.3.1 that detailed Herring and Sandeel spawning ground/habitat assessments will be undertaken for the ES, using multiple data layers including but not limited to; BGS, OneBenthic and IHLS data for the production of 'heat maps'. The production of heat maps following the MarineSpace (2013a) and (2013b) methods, for herring and Sandeel respectively, was suggested by CEFAS fisheries advisors at the scoping stage and in a meeting with CEFAS on 31st May 2023. As stated in the documents these methods use a suite of data to determine potential herring spawning habitat and potential Sandeel habitat this should include PSA data, BGS	N	The herring and sandeel spawning assessment has been updated so that it follows the Marine Space 2013 guidance, including the production of heat maps. The data considered includes: BGS sediment data, IHLS data, VMS fishing data, and Coull et al. (1998) important spawning areas. One Benthic data has been used for ground-truthing, but is not included within the heat map as it only comprises point data. The Regional Seabed Monitoring Plan (RSMP) data is considered to be encompassed within the One Benthic data. The Proposed Project benthic survey data has also not been included within the heat map, as it does not provide a regional perspective and provides too much weight on the cable route, without

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			data, Regional Seabed Monitoring Plan (RSMP) data, IHLS data (for herring assessments), as well as fishing fleet data and scientific publications. This data should then be methodically layered to generate a single 'heatmap' output. The result should show areas of 'heat' which represent areas with potential herring spawning habitat, and potential Sandeel habitat. Areas of 'heat' are assigned a score based on confidence of the data. The MarineSpace methods were developed in consultation with CEFAS and are considered appropriate for use for other offshore activities and have been widely used in Environmental Impact Assessments (EIA).		providing context on other available habitats present nearby (i.e. the extension of this data).
		Fish and shellfish ecology, Benthic ecology	4.10. You have calculated that 42.7% of the cable corridor is classified a suitable Herring spawning habitat and 51.6% of suitable and/or marginal Sandeel habitat (Tables 4.4.14 and 4.4.16). Please note that the MMO do not support the calculation of total spawning habitat as this approach can over or underrepresent spawning grounds and is solely based on either substrate suitability or broadscale historic spawning or nursery ground mapped data. The MMO has provided a summary of the reasons why we do not support the calculation of total spawning habitat below and recommend that the Applicant updates the ES to reflect MMO comments: Spawning areas can change over time or become recolonised. Whilst spawning and nursery ground maps are used to provide the most recent and appropriate information to identify spawning areas, they do not fully define/consider/identify the following: All potential areas of spawning, Any habituation that may occur i.e., identify areas where higher densities of spawning are present, Specific substrate requirements e.g., substrates which are most suitable within the wider broadscale sediments, More suitable topography e.g., ridges/edges of sandbanks where Sandeel may spawn or furrows where herring may spawn, Environmental factors that may influence spawning intensity such as temperature, oxygenation, natural disturbance, anthropogenic disturbance etc.	N	National Grid acknowledges the Marine Management Organisation's comments on the use of quantitative calculations to inform the spawning assessment. However, calculations are used to inform "potential spawning habitat". These calculations represent an over-representation of potential spawning habitat. Environmental factors will generally reduce the area used within areas of preferred habitat, such as temperature, oxygenation, natural disturbance, anthropogenic disturbance, etc. This is particularly true when considering the habituation of certain areas for spawning. These calculations do not inform the conclusions of the assessment, but contextualise the BGS data analysed. National Grid acknowledge that sediment types will vary over time (outside the BGS data temporal resolution), but consider these calculations to represent a worst-case.
		Fish and shellfish ecology, Offshore EMF,	4.11. The mitigation measures outlined in section 4.4.8.3 and 4.9.8.3 remain the same as those provided at the scoping stage and seem appropriate given the scope of the works. The MMO notes the Applicant has now committed to a cable burial depth of between 1.5 metres (m) – 2.5m (subject to local geology and	N	These comments have been noted by National Grid. The commitment to this burial depth has not changed as part of **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Offshore mitigation	obstructions) (mitigation measure FSF01) in accordance with the Department of Energy and Climate Change Report (DECC 2011). The MMO welcome and support this measure which will reduce the effects of electric magnetic field (EMF) on fish receptors by increasing the distance between the electrical current and fish receptors. The proposed cable burial depth will also serve as mitigation for the effects of sediment heating (from heat emitted from the cables) on Sandeel which burrow in the sediment and lay eggs on the sediment, and for Herring eggs and larvae during their developmental stages.		
		Offshore mitigation, Fish and shellfish ecology	5. Part 4, Chapter 4: Fish and Shellfish - Shellfish 5.1. The MMO notes apart from embedded mitigation measures, there are no mitigation measured directly related to shellfish and shellfisheries. At this stage (PEIR), the impacts are only preliminary and mitigation measures, if required, will be presented in the ES.	N	This is correct, no additional mitigation measures are proposed as part of the fish and shellfish impact assessment in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**.
		Marine mammals, Noise and vibration	6. Part 4, Chapter 5: Marine Mammals 6.1. The MMO notes no receptors have been scoped out of the PEIR. A preliminary assessment of the effects of the Offshore Scheme is provided in section 4.5.9 of Chapter 5 Marine Mammals, specifically Table 4.5.17. Several activities will be undertaken during the lifetime of the project that will generate underwater sound. The duration of the noise sources will be approximately one year (during construction and decommissioning), and intermittent during the operational phase. These sources will include: Pre-installation geophysical surveys comprising multi-beam echo sounder (MBES), side-scan sonar (SSS), sub-bottom profiler (SBP) and USBL (acoustic positioning); Geotechnical sampling (vibrocore/cone penetration test (CPT); Clearance of obstacles and debris (including unexploded ordnance [UXO] clearance); Sand wave sweeping; Cable trenching – may include various methods depending on seabed conditions (e.g., ploughing, jet trenching, and/or mechanical trenching); Cable protection placement (e.g., rocks, concrete mattresses); Cable repair or replacement; Cable and cable protection removal; and	N	Both impulsive and non-impulsive noise metrics are included within the impact assessment and the impact on marine mammals has been assessed, which is provided in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Vessel movements including vessels operating with dynamic positioning (DP). The MMO are content all potential noise generating sources have been appropriately identified. However, not all these sources have been fully considered in terms of their potential impacts on marine mammals. For instance, Table 4.5.17 refers to cable installation and cable lay vessels, rock placement and support vessels, which are all continuous or non-impulsive sources. In the case of non-impulsive sound, the Permanent Threshold Shift (PTS) / Temporary threshold Shift (TTS) thresholds are not explicitly defined for the Sound Pressure Levels peak (SPLpeak) metric. The thresholds are based on the cumulative sound exposure level (SELcum). National Marine Fisheries Service (NMFS) (2018) intends for the weighted SELcum metric to account for the accumulated exposure, i.e., over the duration of the activity within a 24-hour period. For any given activity and receptor, the accumulated exposure depends not only on the spatial distribution of the noise generated by the activity, but also on the position of the receptor in the field which might change over the duration of the activity within a 24-hour period.		
		Marine mammals, Noise and vibration, Intra-Project cumulative effects	6.2. It appears that the effects of underwater noise disturbance from pre installation and cable/ cable protection activities during the construction, maintenance and decommissioning phases have not been taken through to stage 2, on the basis that the preliminary assessment of effects indicates that there are no likely significant effects from project activities on marine mammals associated with the Offshore Scheme – see Table 4.11.5 in Chapter 11 Offshore Scheme Intra-Project Cumulative Effects. The MMO do not believe that the PEIR can confidently conclude that there are no likely significant effects from project activities based on the information (or lack of information) currently presented.	N	These activities have been assessed further in the impact assessment stage and a further detailed assessment is provided in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine mammals, Noise and vibration	6.3. The following comments, in points 6.4 to 6.10 below, are specifically in relation to Table 4.5.17 in Section 4.5.9 of Chapter 5 Marine Mammals which presents a preliminary assessment of effects. 6.4 The MMO somewhat agree with the information presented in Table 4.5.17. The assessment refers to appropriate peer-reviewed noise exposure criteria for marine mammals (i.e., Southall et al., 2019): “The most up to date sound exposure criteria (Ref 5.73) for auditory injury defines thresholds for PTS based on instantaneous peak Sound Pressure Levels (SPLpeak) which are provided for each group below”. Note that the thresholds for PTS (and TTS) are dual criteria consisting of (i) both the peak sound pressure level (SPLpeak) and the cumulative sound exposure level (SELcum) for impulsive sources, and (ii) the SELcum for non-impulsive sources.	N	Underwater sound metrics for both impulsive and non-impulsive sources are now included within the assessment. Further details are contained in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Noise and vibration, Marine mammals, Construction - general	6.5 Table 4.5.17 refers primarily to continuous sources of noise, such as cable installation and cable lay vessels, rock placement and support vessels. Thus, as noted in point 6.2 above, the thresholds based on the SELcum for non-impulsive sources will be the most appropriate to apply.	N	Both impulsive and non-impulsive sound thresholds have been considered where appropriate and are now included within **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine mammals, Noise and vibration	6.6 For geophysical surveys such as SBP, one could argue that the peak pressure is likely to be the greater risk since even if the receptor is stationary the source will be passing by, so the exposure will probably be low. Therefore, presenting SPLpeak source levels is appropriate (and an assessment can be undertaken using appropriate SPLpeak thresholds for impulsive sources, as per NMFS (2018) and Southall et al., 2019)).	N	These comments have been noted by National Grid. This approach has been followed again in **Application Document 6.2.4.4 Part 4 Chapter 4 Marine Mammals**.
		Marine mammals, Noise and vibration	6.7 Please note that as per NMFS (2018), the generalised hearing rage for Phocid pinnipeds is 50 Hz to 86 kHz.	N	The correct hearing range is now included within **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine mammals, Noise and vibration	6.8 The MMO agree that certain project activities (e.g., MBES, SSS) will be operating at a frequency beyond hearing ranges for species of interest and are not assessed further. Project activities which are expected to operate at frequencies within the hearing range of harbour porpoise, harbour seal, and grey seal are provided in Table 4.5.17. While it is appropriate that information on the operating frequency and source level are provided for each source, it is not clear where this information has been obtained from. References or relevant data sheets should be provided.	N	References and equipment data sheets, as relevant, have been included in the description of the sound sources within **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Offshore ordnance / UXO, Noise and vibration, Marine mammals	6.9 “The PTS impact range is the most appropriate to use for an assessment of injury from UXO (e.g. permanent damage to hearing PTS). The distance at which the PTS SEL (sound exposure level) threshold for harbour porpoise, a [Very High Frequency] VHF cetacean with the most sensitive hearing, for the maximum assumed NEQ, has been calculated to be met at 3.6 km (based on the application of this formula for the East Anglia ONE assessment”. Please note that instantaneous auditory injury (PTS) based on the SPLpeak metric needs to be considered. For a charge size of up to 700 kg, one can expect an instantaneous PTS range of ~ 14 km for very high-frequency cetaceans using the (recommended) methodology from Soloway and Dahl (2014).	N	A separate marine licence application will be made for any unexploded ordinance (UXO) detonation in line with MMO advice to allow for appropriate consideration of potential UXO impacts once sufficient information is available to identify any potential UXO risk. Therefore, there will be no UXO assessment in the ES and comments will be taken forward to the UXO ML application process.
		Noise and vibration, Offshore ordnance /	6.10. Following on from the previous point, please note that the standard Joint Nature Conservation Committee (JNCC) UXO mitigation measures alone (i.e., the adoption of an observation zone, acoustic deterrent devices (ADDs) etc.) will not likely be sufficient to reduce the risk of auditory injury in marine mammals.	N	The necessary permissions, including a separate Marine Licence application for UXO clearance, will be submitted prior to UXO surveys and clearance.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		UXO, Offshore mitigation	Appropriate low-order disposal methods will need to be considered in the first instance, with any high order detonation taking place by exception only, with evidence provided to demonstrate low order has not been successful. Further mitigation in the form of noise abatement must be considered for any proposed high-order clearance. Please note, all UXO clearance campaign activities will be subject to separate marine licence application/s. The MMO currently recommend the “two-licence” approach, where one licence should be obtained for surveying and a second licence for clearance.		
		Geology and hydrogeology, Offshore physical environment	7. Part 4, Chapter 2: Physical Environment 7.1. The MMO would like to highlight that whilst Coastal processes are normally considered as the pathway in the Source-Pathway-Receptor framework, they are also receptors especially in this area of the Suffolk coastline where sandbanks and alterations to sediment transport pathways can have wider impacts. Therefore, the impacts on sandbanks and the coastline should be considered.	N	An assessment of the impacts associated with changes to sediment transport patterns and regimes, including sandbanks and the coastline is now included in the assessment within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Geology and hydrogeology, Offshore physical environment, Timescales / programme	7.2 Table 4.11.12 – Until the source sediment particle size of any disturbed sediment can be characterised the horizontal footprint cannot be determined. Therefore, any alterations to the suspended sediment regime at Sizewell B and C cannot be determined. The MMO therefore suggest that these are taken through to a stage 2 assessment. This should entail estimating the plume “buffer” zone and the duration of these plumes as well as the timings in the construction.	N	In order to assess the impact of the Proposed Project on the Sizewell B and C sites, the scheduling of the two developments are considered. The sediment dispersion model also helps define a buffer/ ZOI associated with the Proposed Project. The results of which are assessed within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		DCO process	7.3 Whilst the reference style e.g. (Ref 1.1.9) in the documents is logical and appears fully cross referenced, in terms of readability it is very poor as the reviewer is constantly needing to confirm the appropriateness of the reference. The traditional style of (e.g., Smith, 2010) gives a significantly better shorthand and an age.	N	Referencing style has been updated across the ES to Harvard.
		DCO process, Offshore physical environment, Offshore environmental impact	7.4 Part 4, chapter 2 has the following amendments required: Section 4.2.7.69 (and Figure 4.2.8) – A section of the Suffolk coast is missing. Section 4.2.71 – Please describe “Block 1” i.e., KP 0.0 to 14. Section 4.2.7.78 – Please describe the last section i.e., KP 113 to the shoreline. Section 4.2.7.83 - A map showing the rates of sediment transport and directions, and the proposed cable route would aid the discussion on scour and free spanning. Table 4.2.17 - Reference 2.68 appears to be an organisation not a document.	N	The Nearshore Blocks at Kent (Block 5) and Suffolk (Block 1) are described in the PEIR in sections: 'Suffolk Landfall Nearshore Geology' and 'Kent Landfall Nearshore Geology'. Ref 2.68 is: Rampion 2 Wind Farm Category 6: Environmental Statement. Volume 4, Appendix 9.5: Technical Note Cable Corridor area mitigation for sensitive features - the full reference is included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The modelling of sediment dispersion is carried out for discrete locations along the cable route at intervals of 10-15 km allowing changes in dispersion characteristics along the cable route to be accounted for. The model uses sediment grain size distributions associated with material from within the trench. The results of the dispersion model are included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Table 4.2.17 – Establishing the footprint of any suspended sediment plume during installation will depend on the particle size distribution on the surface (and sub surface to the proposed depth of burial) in order to estimate the settling velocity and hence the horizontal footprint. Section 4.3.7.68 – The Southern North Sea Sediment Transport Study should also be referenced (see Southern North Sea Sediment Transport Study - Phase 2 - Sediment Transport Report (including executive summary, report figures and appendices) - https://eprints.hrwallingford.com/1461/) .		The Southern North Sea Sediment Transport Study is now referenced within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Offshore physical environment, Timescales / programme	7.5. As mentioned above in point 7.4, the impact of operations on GridLink should be demonstrated in terms of buffers and timings.	N	In order to assess the impact of the Proposed Project on the GridLink interconnector, the scheduling of the two developments is considered. The sediment dispersion model also helps define a buffer/ ZOI associated with the Proposed Project. The results of which are assessed within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Offshore physical environment, Offshore environmental impact	7.6. Table 4.2.14 as Suspended sediment plumes have been taken forward to phase 3 and 4, then logically changes in the geomorphology on the same projects should be included in Phase 3 and 4.	N	Changes to coastal and seabed geomorphology are assessed within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Ornithology	8. Part 4, Chapter 6: Ornithology 8.1. The MMO defers to Natural England and JNCC regarding the potential impacts to marine ornithology and will maintain a watching brief on anything that may fall within the MMO's remit – such as DML conditions.	N	These comments have been noted by National Grid.
		Marine archaeology	9. Part 4, Chapter 7: Marine Archaeology 9.1. The MMO defers to Historic England regarding the potential impacts to marine archaeology that may occur. 9.2 The MMO will maintain a watching brief on anything that may fall within the MMO's remit – such as DML conditions.	N	These comments have been noted by National Grid. Responses from Historic England have been integrated into the assessment relating to marine archaeology. Please refer to **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology** for further details.
		Shipping and navigation	10. Part 4, Chapter 8: Shipping and Navigation 10.1. The MMO defers to the Maritime and Coastguard Agency and Trinity House and relevant Harbour Authority's regarding the potential impacts on shipping and navigation that may occur because of the Projects. 10.2. The MMO will maintain a watching brief on anything that may fall within the MMO's remit – such as DML conditions.	N	These comments have been noted by National Grid. Consultation with the stakeholders identified has been conducted, and taken into account in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A Appendix 4.7.A Navigational Risk Assessment**.
		Commercial fisheries	11. Part 4, Chapter 9: Commercial Fisheries	N	These comments have been noted by National Grid. Consultation is being undertaken with several local and national fisheries stakeholders, including the NFFO. Communication with a Fisheries Liaison Officer and fisheries

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			11.1. The MMO recommends early engagement with National Federation of Fishermen's Organisations (NFFO) and local harbour authorities, including the early appointment of a Fisheries Liaison Officer.		working groups is included as part of **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** (CF01). Further information is provided in **Application Document 6.2.4.8 Part 4 Marine Commercial Fisheries**.
		Marine Conservation zone assessment	12. Part 5, Chapter 4: Marine Conservation Zone Assessment (MCZ) 12.1. The MMO defers to the statutory advice provided by the relevant Statutory Nature Conservation Body's (SNCB's) regarding the potential impacts to the protected features of the identified nature conservation areas that may occur because of the Projects.	N	All potential impacts on MCZs have been assessed in **Application Document 6.11 Marine Conservation Zone Assessment**.
		Fish and shellfish ecology, Marine conservation zone assessment, Offshore environmental impact	12.2. Three MCZs which fall within the 15km buffer are designated for the protection of blue mussel (Mytilus edulis) or native oyster (Ostrea edulis) beds. Goodwin Sands MCZ partially falls within the offshore scheme boundary and is designated for the protection of blue mussel beds. Furthermore, blue mussels were recorded during the benthic characterisation surveys carried out for the Offshore Scheme by Ocean Infinity Company and was one of the top ten most abundant species recorded with a total of 4003 individuals recorded at an occurrence frequency of 15% across the survey area. Due to their importance, the MMO would expect blue mussel (Mytilus edulis) and native oyster (Ostrea edulis) to be assessed at species level. The PEIR doesn't seem to have assessed the impacts of the works on blue mussel and native oyster as they do not feature in the preliminary assessment of the effects of the Offshore Scheme (Chapter 4).	N	Impacts on blue mussel and native oyster have been assessed at species level in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology, Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology** and **Application Document 6.11 Marine Conservation Zone Assessment**.
		Fish and shellfish ecology, Construction – general, Offshore mitigation	12.3. The MMO notes there will be a potential three degree increase in sediment temperature because of subsea cable installation (calculated based upon a maximum seabed ambient surface sediment temperature of 15°C). Noting this, and the general management approach of "Recover to a favourable condition" for blue mussel beds and Ross worm reefs (Sabellaria spinulosa), the MMO would consider the installation of the HVDC cable to negatively affect this conservation measure as the benthic assemblage may avoid these conditions and thus the area directly over the HVDC cable may become significantly altered and unable to recover to blue mussel beds or Ross worm reef.	N	An assessment of the impact of thermal emissions on marine ecological receptors is included in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** and **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** assesses that based on the low sensitivity of benthic ecological receptors, the impact of disturbance from thermal effects has been assessed as having a negligible magnitude which results in a **negligible effect**, which is not significant. **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology** assesses that considering the low sensitivity of diadromous species to localized and minor thermal emissions, and the negligible magnitude of impact, the overall significance of the effect on these species is considered to be negligible and not significant. Thermal heating is expected to be minimal in upper sediment depths greater than 50 cm, where sandeel are expected to be buried (or herring egg mats on the surface). Overall, the effect is considered to be **negligible** and not significant. Any thermal effects to the sediment as a result of the cables, will be limited to depths very close to the cable (target burial depth of 2 m and minimum burial depth of 1.5 m) and will be contained to the location of the cable route only. Thus, for all shellfish species, the effect

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					of thermal emissions is considered to be negligible and therefore Not Significant.
		Marine conservation zone assessment, Offshore environmental impact	12.4. The mapping of candidate MCZs (Figure 5.4.1) was not presented with mapping of process pathways and areas of impact which would be helpful support for the screening out of MCZ from further assessment (i.e., Orford Inshore, Dover to Deal and Foreland MCZs, which are described as outside the Zone of Influence (ZoIs) of impact pathways).	N	This has been taken into consideration, with greater clarity regarding the relationship between the Study Area, ZoIs, and the MCZs screened out of assessment provided within **Application Document 6.11 Marine Conservation Zone Assessment**.
		Marine conservation zone	12.5. The MMO will maintain a watching brief on anything that may fall within the MMO's remit – such as DML conditions.	N	Anything that falls within the Marine Management Organisation's remit has been included in the MLA and supporting ES. Additionally, impacts on the designated features of the MCZs screened into assessment have been considered in: • **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**; • **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish** Ecology; • **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Marine Mammals; and** • **Application Document 6.6 Habitats Regulations Assessment**.
		Habitat regulations screening	13. Part 5, Chapter 3: Habitat Regulations Screening Report 13.1. The MMO defers to the statutory advice provided by the relevant SNCB's regarding the potential impacts to the protected features of the identified nature conservation areas that may occur because of the Projects.	N	These comments have been noted by National Grid. National Grid is in discussion with Natural England over the Habitat Regulations Assessment for the Proposed Project. Further details are contained in **Application Document 6.6 Habitat Regulations Assessment Report**.
		Habitat regulations screening, Construction - general	13.2. The Habitats Regulations Assessment (HRA) should consider the possibility of re-work (e.g., reburial of cable exposures, fault-fixing etc) during the operational period, particularly for any habitats or areas with a significant sensitivity to disturbance affecting its re-establishment.	N	These comments have been noted by National Grid. This is being considered in the Habitat Regulations Assessment; for example, a fourth duct is being installed in order to avoid the need for surface excavation in areas where trenchless solutions are employed. Further details are contained in **Application Document 6.6 Habitat Regulations Assessment Report**.
		Habitat regulations screening	13.3. The MMO will maintain a watching brief on anything that may fall within the MMO's remit – such as DML conditions.	N	These comments have been noted by National Grid. Anything that falls within the Marine Management Organisation's remit has been included in the MLA and supporting ES. Additionally, impacts on the features of the Designated Sites screened into assessment have been considered in: • **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**;

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology and;** • **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		DCO process, Offshore environmental impact	14. Conclusion The MMO welcomes the progress NGET has made to date to assess the environmental impacts of the Sea Link project. However, the MMO requires the points raised in this response to be addressed within the ES.	N	The ES has considered the responses provided by the Marine Management Organisation, with updates made to the assessment as required.

Table 1.18 Maritime & Coastguard Agency

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Shipping and navigation	Statutory Consultation for the Proposed Sea Link Project. Section 42 Planning Act 2008 (as amended): Duty to consult on a proposed Application The Infrastructure Planning (Applications and Prescribed Forms and Procedure) Regulations 2009 (as amended) Notification under The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017. Thank you for your email dated 23rd October 2023 inviting the Maritime and Coastguard Agency (MCA) to comment during the statutory consultation on the proposed Sea Link project; a High Voltage Direct Current (HVDC) Link between the proposed Friston substation in the Sizewell area of Suffolk and the existing Richborough to Canterbury 400 kV overhead line close to Richborough in Kent. The Shipping and Navigation chapter of the Environmental Statement, along with the Navigation Risk Assessment (NRA) and supporting appendices, have been considered by representatives of UK Technical Services Navigation. The MCA has an interest in the works associated with the marine environment, and the potential impact on shipping, safe navigation, access to ports and harbours, and any impact on our search and rescue obligations.	N	The interest of the Maritime and Coastguard Agency is noted. Consideration of potential impacts to shipping, navigation, ports and harbours, and search and rescue are considered in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.
		Safety, Shipping and navigation	Although the MCA will consider the application and supporting documentation in full at formal application submission, the MCA would like to make the following initial observations at PEIR stage: 1) Hazard Identification Please can the applicant confirm whether the hazard log and a risk scoring matrix have been discussed and agreed with the relevant Statutory Harbour Authorities (SHAs), Competent Harbour Authorities (CHAs), and other stakeholders? I note the hazard log table at Annex 4.8.A.1 does include all hazards identified as part of stakeholder hazard workshops. It would be useful to know if the scoring matrix and the resulting risk mitigation measures have been accepted by the SHA and CHAs.	N	Key harbour authorities were invited to dedicated consultation sessions where a hazard log workshop was conducted to capture hazards identified by stakeholders and confirm established hazards and critical mitigation measures to form the basis of Navigational Risk Assessment. The hazard log is detailed in **Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.
		Offshore route location, Design, Offshore mitigation	2) Cable Burial We note that a “risk based burial approach will be used where cables will be buried to a minimum depth of lowering (DOL) of 0.5 m (in areas of bedrock), with a target DOL of 1.5 m to 2.5 m, assessing cable protection risk factors such as sediment type,	N	Details on the planned DOL and burial can be found in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. However, a contractor is yet to be assigned to the Proposed Project, and it is anticipated (given the seabed sediment) that conventional cable lay, followed by post lay burial is the likely option. National Grid has proposed a rock backfill into the trench as soon as is practicable after cable lowering within the high risk areas. Areas of lower risk will use

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			shallow geology, sediment mobility, fishing activity, shipping movements and anchor deployment along the route". The MCA would expect a post lay cable burial survey to be carried out to confirm where the target depths have or have not been met. Any locations where the cable remains as either surface laid or shallow buried should be reassessed, considering the traffic levels and types of vessel activity in that area as further risk mitigation may be required, such as an anchor penetration study. This should be discussed further once the final installation techniques have been identified, with relevant stakeholders including the SHAs, CHAs and the MCA.		natural backfill as the primary post-installation burial, with regular monitoring to ensure that the process is progressing at an acceptable rate. Where backfill is not progressing at an acceptable rate, remedial burial will be undertaken. Surveys of lowering depth and rates of backfill will take place during protection work, and a full survey will be undertaken to define the baseline survey of the complete route prior to acceptance. The details of the surveys and monitoring works will not be known, however, until the final scheme is in place from the appointed Contractor. A Cable Burial Risk Assessment has been undertaken which defines the target DOL. The 1.5 m target DOL, is lowering relative to the seabed and/or a Non-Mobile Reference Level and not burial; 0.5 m is lowering in bedrock areas. the actual DOL is between 1.5 m to 2.5 m where geological conditions allow in sediment areas. National Grid acknowledges the MCA's expectation that further discussions will take place with named parties once the final techniques are available and this will be part of the ongoing discussions with third party asset holders and stakeholders as the Proposed Project progresses.
		Offshore route location, Shipping and navigation, Consultation	We note in the documentation that "In line with MCA guidance, it is not planned to reduce the existing navigable water depth by more than 5% along any section of the cable (with respect to Chart Datum). It is therefore expected that under-keel clearance is only reduced at a very small number of locations, which are anticipated to be located close into shore". The MCA would expect any locations where this is identified, such as at cable crossings or close in shore, to be discussed further with relevant stakeholders including the SHAs, CHAs and the MCA, as appropriate. We note there are several active, planned and out of services cables which will require crossings. The cable passes through key navigational routes and areas where vessels might be constrained in manoeuvrability because of available depth of navigable water. Any depth reduction of more than 5% must be discussed and agreed with the SHAs and MCA.	N	The issue of potential impact to under keel clearance and navigation is discussed in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**. National Grid welcomes this comment and notes the consultee's requirement. The route and burial depths contained within the DCO application do not reduce the existing navigable water depth by more than 5%, ongoing stakeholder engagement will address this matter should this change in the future.
		Shipping and navigation, Offshore route location, Design	We note the NRA states "…., the use of aids to navigation should be considered where sections of the cable are expected to be exposed for significant lengths of time prior to burial. Marking requirements should be according to recommendations/approvals from Trinity House". It would be useful to know the expected length of time cables may be left exposed and Trinity House's views on this approach.	N	Cable exposure at seabed will be for a minimal length of time with cable lowering taking place within days of cable lay (presuming cable lay followed by post-lay burial). Where cable is exposed immediately after lay and prior to lowering, the cable will be protected using guard vessels. In areas of high risk, the trench will be backfilled with rock as soon as is practicable (i.e. SUNK and North Foreland approaches). Natural backfill will be adopted as the filling method in areas of lower risk, but the rate of backfill will be monitored regularly. Where rate is slow and cable may be at risk the trench will be backfilled by Contractor. Trinity House has been consulted and National Grid is maintaining ongoing dialogue with them regarding issues of concern and appropriate means of mitigation.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Offshore EMF, Design, Shipping and navigation	3) Electromagnetic Deviation We note the NRA states that “CBRA identifies that 5 degrees deviation may be exceeded in shallow areas” however this is thought to be unlikely now due to cable configuration chosen. Please can the applicant confirm the chosen option as Appendix 4.8B Electro Magnetic Deviation Study document implies that all 4 options are still open for consideration.	N	Information regarding compass deviations is presented in the **Application Document 6.3.4.7.B ES Appendix 4.7.B Electromagnetic Deviation Study**. Only a bundled configuration is being taken forward for the Proposed Project.
		Offshore EMF, Offshore route location, Shipping and navigation	Section 4.8.A.7.61 of the NRA states ‘……, as most of the bundled cable arrangement will be laid in water deep enough to minimise EMF effects and achieve the MMO criteria for less than 3% deviation over 95% of the route, the probability of disruption is assessed as ‘Remote. These combine to produce a ‘Broadly Acceptable’ risk rating and no requirement for further consideration’. The MCA would appreciate further discussion on the chosen option and the implications for the MMO and MCA’s requirements. Although we agree that there will be limited number of vessels solely relying on magnetic compass for navigation, it’s important to note that magnetic compasses are an essential navigation instrument required under SOLAS Ch V and it is also a secondary device which is connected to vessels steering systems should the gyrocompass fail. Therefore, they should be given the equal weightage in terms of navigation safety.	N	**Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment** identifies the importance of magnetic compass as back up navigation devices. Information regarding compass deviations is presented in **Application Document 6.3.4.7.B ES Appendix 4.7.B Electromagnetic Deviation Study**.
		Offshore EMF, Shipping and navigation	We agree that the deviation may exceed our criteria regarding the compass deviation limits closer to the shore, and we are likely to be content with options 1,3 and 4 as detailed in the Appendix 4.8.B Electro Magnetic Deviation Study. We would be willing to discuss this in the post PEIR pre-submission period. Additionally, as this area falls within the SHA of Sandwich Port and Haven Authority, they are responsible for navigation in the area, and they should also be consulted on the EMF impact on vessel compasses.	N	Information regarding compass deviations is presented in **Application Document 6.3.4.7.B ES Appendix 4.7.B Electromagnetic Deviation Study**. These comments are noted. National Grid is maintaining a dialogue with the stakeholder and is progressing a SoCG (**Application Document 7.4.10 Draft Statement of Common Ground Maritime and Coastguard Agency**). The recommendation to consult with Sandwich Port and Haven Authority is also noted.
		Consultation, Offshore mitigation	The MCA would finally recommend ongoing engagement with the SUNK VTS User Group in particular to discuss and agree the approach for the risk mitigation measures as detailed in the NRA.	N	Communication with key stakeholders such as the Sunk Vessel Traffic Service group is identified as a key recommendation of **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.

Table 1.19 National Highways

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy, traffic and transport, safety	As you may be aware Highways England is a strategic highway company under the provisions of the infrastructure Act 2015 and is the highway authority, traffic authority and street authority for the Strategic Road Network (SRN). As such we have responsibilities for managing the SRN in accordance of our licence and in general conformity with the requirements of the Highways Act 1980 and to satisfy the reasonable requirements of road safety. In respect of this proposal, the nearest trunk road is the A12 (Suffolk) A2 (Kent).	N	These comments have been noted by National Grid.
		Onshore environmental impact	As detailed in the accompanying Correspondence I have the following comments to make 1. The applicant considers that the scheme falls under Schedule 2 of the EIA Regulations 2017 and therefore an Environmental Statement will be required to support any planning application. National Highways agrees with this position.	N	These comments have been noted by National Grid.
		Traffic and transport, walking, cycling and horse-riders	2. A transport Assessment will be required. The assessment should be undertaken in accordance with Dft Circular 01/22 “The Strategic Road Network and the Delivery of Sustainable Development” 3. The Transport Assessment should be informed by a Walking Cycling and Horse Riding Assessment Report (WCHAR) The Historic National Rail Asset Team have confirmed none of their structures are affected by the proposed works.	N	Following further consultation, National Highways confirmed by email on 21 October 2024 that the production of a Transport Assessment Note (TAN) would be appropriate in place of a full Transport Assessment. A TAN has therefore been prepared for the Proposed Project (**Application Document 6.3.2.7.A ES Appendix 2.7.A Transport Assessment Note**) which supports each of the respective traffic and transport chapters. In addition, it was agreed (with National Highways, by email on 21 October 2024) that a Walking Cycling and Horse Riding Assessment Report (WCHAR) would not be necessary given that the Order Limits are sufficiently far from the Strategic Road Network (SRN), the Proposed Project would not result in any pedestrians or cyclists near the SRN and there are not expected to be any construction vehicle impacts on the SRN for non-motorised users. Therefore, a WCHAR has not been prepared as agreed.

Table 1.20 NATS En-Route Safeguarding

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case and consultation	I refer to the consultation received by surface mail and dated 19th October 2023. NATS operates no infrastructure within 10km of the site in question. Accordingly it anticipates no impact from the proposal and has no comments on the Application. We also wish to take this opportunity to respectfully request you update the contact details for NATS as indicated below, and note our preference to receive consultations electronically.	N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore Environmental Impact and Offshore Environmental Impact	**Natural England's Remit** Natural England is a non-departmental public body. Our statutory purpose is to ensure that the natural environment is conserved, enhanced, and managed for the benefit of present and future generations, thereby contributing to sustainable development. Natural England's remit extends out to 12nm. Pursuant to an authorisation made on the 9th December 2013 by the JNCC under paragraph 17(c) of Schedule 4 to the NERC Act 2006, Natural England is also authorised to exercise the JNCC's functions as a statutory consultee in respect of applications for offshore renewable energy installations in offshore waters (12-200nm) adjacent to England. **Evidence Plan Process** Natural England recognises the importance of the pre-application stage of the consenting regime, and we welcome the opportunity to engage at this stage. As such we seek to make this process as effective as possible. Natural England will be engaging in the applicant's Evidence Plan Process and Expert Topic Group (ETG) meetings. **Best Practice Advice** Natural England has produced a series of documents to provide Environmental Assessments: Best Practice Advice for Evidence and Data Standards for offshore wind farm development in English inshore and offshore waters. The advice is provided in a series of documents which range from baseline characterisation surveys and pre-application engagement, through to expectations at application and post-consent monitoring. The project is divided into four phases: Baseline characterisation surveys Pre-application engagement and the evidence plan process Data and evidence expectations at examination Post-consent monitoring and other environmental requirements. The above link also provides access to the Nature Conservation Considerations and Environmental Best Practice for Subsea Cables for English Inshore and UK Offshore Waters. This project provides Natural England and JNCCs joint environmental best practice advice for subsea cable projects in English inshore and UK offshore waters. It is the expectation that developers follow our Best Practice through the application and consenting process. As such our advice and recommendations to the PEIR are framed around this advice. If you have any issues using SharePoint Online, please contact the site owners or contact: NEOffshoreWindStrategicSolutions@naturalengland.org.uk. Natural England has also produced terrestrial guidance 'Developers: get environmental advice on your planning proposals' which is also relevant to the		

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			onshore transmission assets for offshore windfarms please follow the links to our standard advice.		
		Onshore Environmental Impact and Offshore Environmental Impact	**Approach to EIA Methodology** Natural England notes that the approach to the EIA assessment is proposed to align with other Nationally Significant Infrastructure Projects (NSIPs). This matrix approach has been used throughout Environmental Statements (ESs) to date to support the assessment of the magnitude and significance of impacts. Natural England notes numerous instances where significance has been presented as a range (i.e., slight, or moderate, or large) and it is nearly always the lower value that has been taken forward. In the absence of evidence to support the use of the lower value in a range, Natural England's view is that the higher value should always be assessed in order to ensure that impacts on features haven't been incorrectly screened out of further assessment. This is in line with the principles of the Rochdale envelope approach.	N	The PEIR, as set out in Regulation 12(2)(b) of the EIA Regulations 2017, provided information that 'is reasonably required for the consultation bodies to develop an informed view of the likely significant environmental effects of the development'. Whereas the ES now presents the full results of the EIA undertaken for the Proposed Project. The assessment of effects presented within each of the technical ES chapters provides clarity on whether the residual effects following mitigation result in significant environmental effects, this includes the justification for the level of residual effect assigned using the agreed methodology and applying professional judgement where required. Further details relating to the methodology applied within the ES are contained in **Application Document 6.2.1.5 Part 1 Introduction Chapter 5 EIA Approach and Methodology**.
		Consultation	**Natural England's Structure/Framework for Attributing Risk** The comments provided within this letter and its Annexes have been colour coded using the structure/framework as specified in the risk table in Appendix A of this letter. In this letter, the coloured headings are coded based on the highest risk associated with the topic in question. Natural England would like to highlight that at this stage all comments highlighted as yellow, amber, or red need to be addressed, with the potential for these issues to become more significant if not resolved at application (Appendix 1 provides detailed explanations of the coloured risk ratings). "	N	These comments have been noted by National Grid.
		Onshore Environmental Impact and Offshore Environmental Impact	**2. Impacts on the Natural Environment – Natural England's Key Concerns** **Approach to PEIR consultation** The purpose of the PEIR is to provide members of the public, statutory consultees and other stakeholders with preliminary information about the Project's likely significant environmental effects and the measures that are being considered to avoid and minimise them. This information will help readers to develop an informed view of the Project. (A good PEI document is one that enables consultees (both specialist and non-specialist) to understand the likely environmental effects of the Proposed Development and helps to inform their consultation responses on the Proposed Development during the pre-application stage.) It is Natural England's opinion that the PEIR would have benefited from being submitted with additional information to demonstrate a clear baseline of the environmental receptors and allow a robust and accurate assessment of the Proposed Development's impacts. It also would have been valuable for Natural England to be consulted with when designing survey methodology, and we welcome the Applicant to fully engage with us post the PEIR consultation to	N	The PEIR, as set out in Regulation 12(2)(b) of the EIA Regulations 2017, provided information that 'is reasonably required for the consultation bodies to develop an informed view of the likely significant environmental effects of the development'. Since publication of the PEIR, the EIA has been progressed and the complete assessments are now presented within the ES. Since submission of the PEIR, National Grid has held numerous thematic meetings with Natural England to cover topic specific matters (notably Air Quality, Ecology and Biodiversity and Landscape and Visual). Further details regarding the meetings held are contained in **Application Document 5.1 Consultation Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			ensure data of sufficient quality and quantity is collected and assessed. Detailed advice is provided in Annex 1-8.		
		Geology and Hydrogeology, Cultural Heritage and Landscape and Visual	**Suffolk Onshore Scheme** It is currently unclear as to whether the Horizontal Directional Drilling (HDD) technique will damage any of the interest features for which Leiston – Aldeburgh Sites of Special Scientific Interest (SSSI) is notified. It will be important to assess whether HDD is technically feasible through pre consent geotechnical investigations and to determine the risk of bentonite breakout. As well as a HDD feasibility study, a bentonite management/break out plan will be required. The mitigation hierarchy, focusing on avoidance first, should be followed. Natural England notes that the proposed route, has the potential to impact ancient woodland identified by the Ancient Woodland Inventory. Notably, some of these woodlands are also designated as a County Wildlife Site. The proposed route is planned to come within close proximity to ancient woodland. In these circumstances' impacts may be avoidable or mitigation may be possible to prevent deterioration or loss of ancient woodland from occurring. However, to achieve this, it will be integral to consider Natural England and the Forestry Commission's standing advice1 for planning authorities in relation to ancient woodland and ancient and veteran trees. Natural England advises Sea Link to follow Natural England and the Forestry Commission's standing advice for planning authorities in relation to ancient woodland and ancient and veteran trees.	N	As discussed with Natural England in thematic meetings, investigation work has been undertaken to confirm that a trenchless solution is feasible and therefore no potential for open trenching across the SSSI will be included in the DCO. It has also been confirmed that at its shallowest the construction will be approximately 8 m below the SSSI and therefore will not affect surface features. Frac out has been considered in the ES, but geotechnical investigation shows it is only a risk in the last approximate 100 m of the cable. It is also confirmed that no development proposals are proposed within Ancient Woodland or its 15 m buffer zone.
		Ornithology, Intra-Project Cumulative Effects and Benthic Ecology	Natural England highlights the importance and possible challenges of scheduling works around the Leiston-Aldeburgh SSSI and Sandlings Special Protection Area (SPA) to avoid noise, vibration, light and visual disturbance to notified breeding and non-breeding bird features. If the current proposed route alignment is followed, it may not be possible to avoid disturbance of both the breeding and non-breeding interest features of Leiston – Aldeburgh SSSI and the breeding interest features of Sandlings SPA. Additionally, the project may result in the loss of functionally linked land for Sandlings SPA, and therefore robust assessment and mitigation measures will be required to ensure no Adverse Effects on the Integrity (AEOI) of the site. We draw your attention to the examination documents and considerations given to these sites by East Anglia 1N and East Anglia Two. Natural England is concerned about possible effects of dewatering on the water dependent SSSI, wider hydrological effects including saline incursion from the cabling on the coastal side, pollution and air quality. The effects of dewatering, wider hydrological effects including saline incursion from the cabling on the coastal side, pollution, air quality, and the possible amplification of these effects because of co-location, should be thoroughly assessed before the route is finalised. The mitigation hierarchy, focusing on avoidance first, should be followed.	N	Constraints imposed by Sandlings SPA and the adjacent SSSI will be addressed through noise and visual mitigation methods (e.g. close board fencing) and the use of a seasonal restriction on those works where fencing would not reduce LAmax noise levels below 60dB (specifically compound establishment) in order to avoid the nightjar and woodlark breeding season. Noise mapping as shared with Natural England shows that this will reduce noise levels to an acceptable degree for HDD or otherwise avoid an impact. An assessment of functionally linked habitat for Sandlings SPA, has been undertaken and is presented in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. The conclusion is that such a loss will not be significant. The restrictions advised for East Anglia ONE and TWO are concerned with working within the SPA, which is not proposed for the Proposed Project. This has been discussed with Natural England at thematic meetings. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** also contains an assessment of pollution and air quality impacts on the SPA and SSSI as well as an assessment of frac out risk and of the potential for the trenchless installation to affect surface hydrology.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Coordination with other projects, inter-project cumulative effects	Given the possibility of co-locating the project with LionLink, there is a possibility that the effects of the project will be extended over a considerably longer time scale, if the timetables for construction do not align. This will need to be considered in the in-combination assessment. Conversely, if the timetables align, the effects may be greater in magnitude. We advise that the in-combination assessment needs to consider how the potentially co-located projects construction timetables align. And that were possible impacts are reduced through bundling of cables and/or the first project installing the ducts for sequent projects. The East Anglia and Norfolk Project Offshore windfarms have set a precedence for doing this.	N	National Grid is coordinating with other developers of large scale infrastructure projects where possible, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. These comments have been noted by National Grid.
		Onshore Mitigation and Construction - General	**Kent Onshore Scheme** Natural England recognise that there is a risk of an overreliance on trenchless crossings as an embedded mitigation measure, to avoid adverse effects upon numerous designated sites located at Pegwell Bay (Sandwich Bay SAC, Thanet Coast & Sandwich Bay SPA and Ramsar site, and Sandwich Bay to Hacklinge Marshes SSSI). No detailed feasibility assessment (which takes into account local ground conditions) of the proposed trenchless crossings has been undertaken. Therefore, it is difficult to know the likelihood of success of this measure, and understand the associated risks (i.e. sink holes, frac out). The commitment register describes trenchless crossing techniques as the 'preferred' method, however, fails to determine this as a viable method.	N	As discussed with Natural England in thematic meetings, investigation work has been undertaken to confirm that a trenchless solution is feasible and therefore no potential for open trenching across the SSSI will be included in the DCO. It has also been confirmed that the tunnel will be approximately 12 m below the SSSI saltmarsh and therefore will not affect surface features. The cable will emerge in the intertidal mudflat, but this will involve a static jack up barge or similar. Frac out has been considered within the ES. Further details of this assessment are contained within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Intra-Project Cumulative Effects, Ornithology and Onshore Environmental Impact	Natural England note that little assessment has been undertaken to date, to assess the likely impacts of the development upon qualifying bird features of neighbouring designated sites. Initial wintering bird surveys have demonstrated that land at Minster marshes is functionally linked habitat for the golden plover, a qualifying feature of the Thanet Coast & Sandwich Bay SPA. The development in its current form is likely to lead to the loss and disturbance of functionally linked habitat, therefore robust mitigation will be required to ensure AEOI upon the SPA can be avoided. Natural England recognise that there is a risk that the introduction of additional pylons and overhead lines may bring impacts to qualifying bird features of nearby designated sites. In the event that mitigation is required to avoid adverse effects, we would emphasise that impacts to designated sites should follow the mitigation hierarchy and be avoided in the first instance, before resorting to mitigation, and as a last resort turn to compensation after consideration of alternative options (as stated in the NPPF and NPS).The close proximity of the proposed substation and converter station to Sandwich Bay to Hacklinge Marshes SSSI represents a clear risk that the breeding bird assemblages of the SSSI could be adversely affected by all phases of the development. This includes impacts from noise, visual and light disturbance. It is disappointing that insufficient information has been submitted in the PEIR to adequately assess these likely impacts. We therefore	N	The mitigation hierarchy has been followed when assessing the impacts of the Proposed Project. Consideration has been given to whether impacts can be avoided including looking at alternative locations e and why the crossing of the River Stour must be by overhead line before considering mitigation. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design Development Report and Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report (October 2023)**. In thematic meetings National Grid has been discussing with Natural England proposals for mitigating the loss of functionally linked habitat for golden plover, as well as for mitigating any disturbance

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			expect these assessments to be included within the environmental statement.		effect on the nearby SSSI and ensuring no significant bird strike results from the new section of overhead line.
		Landfall location and Design	Impacts to both Suffolk & Kent landfall and nearshore areas through the lifetime of the project. An updated baseline, conceptual understanding, WCS, trenchless methodology feasibility, are needed to inform the impact assessment for the Landfall and nearshore areas.	N	Impacts to both Suffolk and Kent landfall and nearshore areas through the lifetime of the Proposed Project are considered in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Intra-Project Cumulative Effects, Terrestrial Ecology and Construction - General	**Landscape and Visual Impact Assessment (LVIA) and Suffolk Heath and Coast Area of Outstanding Natural Beauty (AONB)** We advise that cumulative effects of other energy generation and transmission developments within the Onshore Scheme should be broadened to include consideration for the Suffolk Heath and Coasts Area of Outstanding Natural Beauty (AONB) in both construction and operational phases, as the consequences may result in the area being unable to deliver the AONB's statutory purpose and functionality. We disagree with the conclusions for magnitude of effect and significance of effect, particularly as this is based on the recoverability of habitats post construction and further evidence is required for high confidence of recoverability.	N	The assessment of effects on the AONB is within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** which makes reference to the statutory purpose and functionality. The assessment highlights that construction effects are considered to be temporary, acknowledges that reinstatement would take longer for some habitats and focuses on each of the published Natural Beauty indicators and the relevant Area of Outstanding Natural Beauty indicators to landscape and visual matters. **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** provides information regarding the reinstatement of habitats. The assessment of cumulative landscape and visual effects is contained within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Design, Onshore Mitigation and Onshore Environmental Impact	**Goodwin Sands Marine Conservation Zone (MCZ) and Measures of Equivalent Environmental Benefit (MEEB)** Natural England strongly advise that every effort should be made to adopt the Mitigation Hierarchy for Goodwin Sands MCZ. Natural England advise that based on the information provided to date, the avoidance of the site or a commitment of no rock armouring in the MCZ appears to be the only option that would avoid the need for the decision-maker to proceed to Stage 2 of the MCZ assessment process and consideration of MEEB. Currently, there is no justification in the PEIR for the placement of the cable route within Goodwin Sands MCZ, nor detailed information provided on the locations of cable laying and external cable protection activities. As a result, we are unable to agree with the conclusions of the MCZ Assessment (MCZA) and related documents as they do not include the necessary evidence to support the conclusions drawn. All potential impacts on the features of Goodwin Sands MCZ have not been fully assessed. The Applicant regards the presence of Mytilus edulis within the MCZ as inconsequential. However, Mytilus edulis beds are a feature with a recover objective in the site. Therefore, the proposed development has the potential to hinder the recovery of this feature. The potential impacts on Goodwin Sands MCZ should be assessed throughout the lifetime of the project. Natural England advise that an updated baseline is presented, with repeated surveys across a wider area to enable conceptual understanding of the Worst-Case Scenario and potential mitigation measures. A review of post-installation evidence from existing projects and lessons learned should be used to inform the MCZ assessment.	Y	Natural England's advice has been taken into consideration within **Application Document 6.11 Marine Conservation Zone Assessment**. Notably, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ and will avoid direct impacts and reduce the impacts to the known and potential receptors located within the area.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Marine Conservation Zone, Assessment Marine Archaeology and Geology and Hydrogeology	**Marine Processes** Please see our comments on Goodwin Sands MCZ and the requirement for MEEB. Natural England are concerned that the baseline is currently insufficient to inform the impact assessment. The conceptual understanding of the physical environment baseline of the cable route and wider study area has not been established. A more robust conceptual understanding of the physical environment and marine and coastal processes operating along the cable route and wider study area needs to be essential to the Environmental Impact Assessment (EIA), Habitats Regulations Assessments (HRA) and Marine Conservation Zone (MCZ) assessments, and sufficient quantity of accurate data should be obtained which adequately describes both the contemporary conditions within the study area and the longer term historical change is vital to the development of the conceptual understanding. In particular, we advise that the assessments should fully consider impacts to nearshore, offshore sandbanks and other significant seabed morphological features throughout the entire lifetime of the project. The worst-case scenario (WCS) is unclear and several of the project design parameters are still to be established. We advise that realistic WCS options of the project design for marine processes and the physical environment need to be established. Additionally, a cumulative impact assessment needs to be carried out for impacts to the physical environment and marine and coastal processes.	Y	Natural England's advice has been taken into consideration within **Application Document 6.11 Marine Conservation Zone Assessment**. Notably, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ and will avoid direct impacts and reduce the impacts to the known and potential receptors located within the area.
		Benthic Ecology, Geology and Hydrogeology and Inter-Project Cumulative Effects	**Subtidal and Intertidal Benthic Ecology** Please see our comments on Goodwin Sands MCZ and the requirement for MEEB. Natural England advises that for trenchless landfall techniques to be considered as viable, pre-consent geotechnical investigations are required to confirm what is achievable. It should be noted that, as no alternative methodology has been assessed should trenchless techniques fail a variation to the Development Consent Order (DCO) may be required. The benthic survey data presented is incomplete. The PEIR would have benefited from being submitted with completed surveys from 2023 as Natural England are unable to agree to the approach that is presented. We advise that engagement is carried out as soon as possible with Natural England, to determine the further information and mitigation measures required. We wish to remind the Applicant that under the NERC Act 2006, they have a duty to avoid, reduce, mitigate impacts on the environment. We advise that further assessment and information is required to fully assess impacts and conceptualise Worst Case Scenarios on sensitive habitats and species. Additionally, Natural England notes that the cumulative impact assessment is incomplete as there are offshore developments, such as Nemo Link interconnector and Thanet Offshore cable, not scoped in and which will likely interact with Sea Link during the construction phase.	N	Based on updates to the design and construction methodology as presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data located in **Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)** support the baseline and fully assess impact pathways is presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. The assessment of inter-cumulative effects with other proposed developments that have the potential to interact with the Proposed Project offshore is fully assessed within **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Fish and Shellfish Ecology, Onshore Mitigation and Onshore Environmental Impact	**Fish & Shellfish Ecology** Please see our comments on Goodwin Sands MCZ and the requirement for MEEB. Natural England's comments on fish and shellfish ecology should be considered alongside those of Cefas, where they are not features of designated sites or a prey species associated with the feature of a designated site. Natural England advises that it is important to establish a sound baseline, using the best available evidence for herring and sandeel, upon which to base the assessment of impacts. Furthermore, it is essential that limitations and uncertainties regarding the datasets used should be clearly laid out. Natural England defers to Cefas in relation to appropriate mitigation but note that based on the overlap of herring and sandeel spawning and nursery areas as well as the extent of priority/marginal habitats, and interaction with Outer Thames Estuary Special Area of Protection (OTE SPA) and Southern North Sea Special Area of Conservation (SNS SAC) designated features, it is possible that mitigation measures will need to be explored further.	N	National Grid has had early engagement with Cefas on the approach to the herring and sandeel spawning assessment. This included meetings held on 31 May 2023 and 08 February 2024. This approach has been approved by Cefas. Cable protection areas have been plotted with layers of suitable habitat and have been assessed as part of the herring and sandeel assessment within the fish and shellfish impact assessment **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. The potential effects to prey items is considered within **Application Document 6.6 Habitat Regulations Assessment Report**.
		Marine Mammals and Offshore ordnance / UXO	**Marine Mammals** Natural England advise that recent survey data included SCANS IV and SCOS data are considered and assessed appropriately to reflect any cetacean abundance and distribution updates. The most significant impact on marine mammals comes from underwater noise associated with UXO clearance, appropriate licencing should be obtained prior to construction. Natural England will continue to engage with the applicant throughout ETG meetings to provide further advice for future reports and assessments.	N	SCANS IV and the most recent SCOS data has been considered in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**. A separate marine licence application will be made for any unexploded ordinance (UXO) detonation in line with MMO advice to allow for appropriate consideration of potential UXO impacts once sufficient information is available to identify any potential UXO risk
		Inter-Project Cumulative Effects and Onshore Mitigation	**Impacts on Outer Thames Estuary Special Protected Area (OTE SPA) Red-Throated Diver (RTD)** Natural England's position is that an Adverse Effect on Integrity (AEOI) is arising on the OTE SPA Red Throated Divers (RTD) due to displacement impacts from existing and consented Offshore Wind Farms (OWF). Natural England's primary point of concern is regarding the potential for displacement of RTD, a designated feature of the OTE SPA. Therefore, Natural England's advice for RTD has been updated for the core over-wintering period. We advise that 1st November to 31st March is applied as a seasonal restriction for works in the OTE SPA and that this restriction is secured through consent conditions.	N	As discussed with Natural England, National Grid has committed to a seasonal restriction of 01 November to 31 March for offshore cable installation activities and a seasonal restriction of 01 January to 31 March for cable installation activities at landfall. This mitigation is set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Ornithology, Intra-Project Cumulative Effects and DCO Process	**Intertidal Ornithology Impacts** Coastal Sites of Special Scientific Interest (SSSI), Ramsar and SPAs which overlap with intertidal works have not been thoroughly assessed for impacts on breeding and over-wintering ornithological features. Natural England is of the opinion that the PEIR would have been more valuable to be presented with complete over-wintering and breeding bird data to create a robust assessment of potential impacts. We are unable to advise on the most appropriate mitigation or agree with the conclusions. We request that the applicant consider obtaining additional assessments to appropriately assess the impact	N	Likely Significant Effects from noise and visual disturbance at Thanet Coast to Sandwich Bay SPA, Ramsar and Sandwich Bay to Hacklinge Marshes SSSI and Leiston to Aldeburgh SSSI, Alde-Ore Estuary SPA, Ramsar and SSSI have been considered in **Application Document 6.6 Habitat Regulations Assessment Report, Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			to breeding and non-breeding bird features that utilise the intertidal habitat within the study area. Natural England advises that the proposed intertidal works have the potential to create Likely Significant Effects from noise and visual disturbance at Thanet Coast to Sandwich Bay SPA, Ramsar and Sandwich Bay to Hacklinge Marshes SSSI and Leiston to Aldeburgh SSSI, Alde-Ore Estuary SPA, Ramsar and SSSI. We advise that mitigation is considered to reduce these impacts, and this should be secured through condition / requirement in any DCO submitted with the application. Please refer to our detailed comments in Annex 8.		Additional data since the PEIR has been used to supplement this assessment and inform mitigation.
		Consultation	**Appendix A** The following framework has been used in Natural England's advice to attribute risk to the project. **Structure / Framework** **Purple** Note for the developer. **Red** Natural England considers that unless these issues are resolved it will have to advise that (in relation to any one of them, and as appropriate) it is not possible to ascertain beyond reasonable scientific doubt that the project will not affect the integrity of an SAC/SPA/Ramsar and/or significantly hinder the conservation objectives of an MCZ and/or damage or destroy the interest features of a SSSI and/or comply fully with the Environmental Impact Assessment requirements. Addressing these concerns may require the following: 1. new baseline or survey data; and/or 2. significant revisions to baseline characterisation and/or impact modelling and/or 3. significant design changes; and/or 4. significant mitigation Natural England feels that issues given Red status are so complex, or require the provision of so much outstanding information, that they are unlikely to be resolved during the Examination, and respectfully suggests that they be addressed beforehand. **Amber** Natural England does not agree with the developer's position or approach and consider that this could make a material difference to the outcome of the decision-making process for this project. Natural England considers that these matters may be resolved through:	N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			provision of additional evidence or justification to support conclusions; and/or revisions to impact assessment methodology and/or assessment conclusions; and/or minor to moderate revisions to impact modelling; and/or well-designed mitigation measures that are adequately secured through the draft DCO/dML and/or amendments to draft plans If these issues remain at the time of the application and are not addressed or resolved by the end of the Examination, then they may become a Red risk as set out above. **Yellow** Natural England doesn't agree with the developer's position or approach. We would ideally like this to be addressed but are satisfied that for this particular project it is unlikely to make a material difference to our advice or the outcome of the decision-making process. However, we reserve the right to revise our opinion should further evidence be presented. It should be noted by interested parties that just because these issues/comments are not raised as significant concerns in this instance, it should not be understood or inferred that Natural England would be of the same view in other cases or circumstances. **Green** Natural England is in broad agreement with the developer's approach and has no significant outstanding concerns. As above, we reserve the right to revise our opinion should new evidence be presented.		
		Consultation	**Annex 1_PEIR_Specialist Advice_Suffolk Onshore Scheme** **Preliminary Environmental Information Report (PEIR) Review** **Annex 1 – Suffolk Onshore** In formulating these comments, the following documents have been considered: Part 2 Suffolk Onshore Scheme; Chapter 1 Evolution of Suffolk Onshore Scheme Part 2 Suffolk Onshore Scheme; Chapter 2 Landscape and Visual Part 2 Suffolk Onshore Scheme; Chapter 3 Ecology and Biodiversity Part 2 Suffolk Onshore Scheme; Chapter 5 Water Environment Part 2 Suffolk Onshore Scheme; Chapter 6 Geology and Hydrology Part 2 Suffolk Onshore Scheme; Chapter 7 Agriculture and Soils	N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Part 2 Suffolk Onshore Scheme; Chapter 9 Air Quality Part 2 Suffolk Onshore Scheme; Chapter 10 Noise and Vibration Part 2 Suffolk Onshore Scheme; Chapter 13 Intra-Project and Inter-Project Cumulative Effects Part 2 Suffolk Onshore Scheme; Chapter 13 - Appendix 3.14.A Descriptions of Other Projects **Natural England's Advice and Recommendations** A summary of Natural England's advice in relation to Suffolk Onshore Scheme is set out in Table 1. Our key concerns along with recommendations are presented in further detail in Table 2. "			
		Ornithology	**Summary of Key Concerns** **Table 1 Summary of Key Issues - Suffolk Onshore Scheme** Marsh harrier and botanical surveys have not been undertaken within the North Warren RSPB section of Leiston – Aldeburgh SSSI.	**Natural England's Recommendations to Resolve Issues** Natural England advises that these surveys are undertaken prior to application submission.	N	In the February 2024 ecology thematic meeting it was explained to Natural England that there was no value in undertaking a dedicated marsh harrier survey since National Grid know where they nest and it is far from the Proposed Project. The conventional breeding bird surveys have detected foraging marsh harrier. Botanical surveys of the RSPB reserve/SSSI are not necessary since it can now be confirmed that these will be traversed with a trenchless solution.
		Terrestrial Ecology	Due to Leiston – Aldeburgh SSSI's notified breeding and non-breeding interest features, and the breeding features of the adjacent Sandlings SPA, Natural England highlights the importance and possible challenges of scheduling works around the SSSI and SPA to avoid noise, vibration, light and visual disturbance to the interest features.	If the current proposed route alignment is followed, it may not be possible to avoid disturbance of both the breeding and non-breeding interest features of Leiston – Aldeburgh SSSI and the breeding interest features of Sandlings SPA. We draw your attention to the examination documents and considerations given to these sites by East Anglia 1N (EA1N) and East Anglia Two (EA2).	N	Constraints imposed by Sandlings SPA and the adjacent SSSI will be addressed through noise and visual mitigation methods (e.g. close board fencing) and moving the compound further from the SPA than it was shown during statutory consultation. It is considered that this will reduce noise levels to an acceptable degree for a trenchless construction solution. **Application Document 7.5.3.2 Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**) sets out seasonal restriction on compound set-up for the trenchless bore such that it occurs outside the nesting season (February to August). The most potentially disturbing elements of trenchless installation (set up of trenchless compound S10) will take place between September and January, to minimise disturbance of breeding nightjar and woodlark in the adjacent Sandlings SPA. . However, it is considered that noise from the construction itself can be rendered acceptable.
		Geology and Hydrogeology	It is currently unclear as to whether the HDD technique will damage any of the interest features for which Leiston – Aldeburgh SSSI is notified.	It will be important to assess whether HDD is technically feasible through pre consent geotechnical investigations and to determine the risk of bentonite breakout. As well as a HDD feasibility study, a bentonite management/break out plan will be required. The mitigation hierarchy, focusing on avoidance first, should be followed.		Commitment GH02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** includes for the provision of a Foundation Works Risk Assessment, where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid breakout/loss. Mitigation against frac outs is included within **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**. Within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**, the Leiston-Aldeburgh SSSI is assessed in

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
						association with trenchless solution related works, including the geomorphological alteration of the intertidal zone, the beach and the impact on the water column due to the release of drilling fluids and disturbed sediment that has become suspended. The impact on ecological receptors are assessed in: • **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology;** • **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology; and** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity.**
		Intra-Project Cumulative Effects	Natural England is concerned about possible effects of dewatering on the water dependent SSSI, wider hydrological effects including saline incursion from the cabling on the coastal side, pollution and air quality. When considering the possible co-location in this area, it is also important to consider that if construction is staggered, and each project cannot properly avoid or mitigate its effects, the magnitude of the effect will be amplified considerably. All these challenges should be considered when selecting the route.	The effects of dewatering, wider hydrological effects including saline incursion from the cabling on the coastal side, pollution, air quality, and the possible amplification of these effects because of co-location, should be thoroughly assessed before the route is finalised. The mitigation hierarchy, focusing on avoidance first, should be followed.	N	The ES is supported by groundwater risk assessments that identifies potential impacts on groundwater receptors including from potential dewatering and saline intrusion. Commitments GH02 and GH07 in the outline CoCP relate to groundwater. Further details are contained in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**.
		Consultation	Volume 1 Part 2 Chapter 3 Ecology and Biodiversity, Table 2.3.19 states “IAQM guidance (Ref. 2.3.15) indicates that dust can significantly affect ecological receptors up to 50m from the source, by coating vegetation and blocking photosynthesis. Sandlings SPA/Leiston-Aldeburgh SSSI/RSPB North Warren Reserve is the most sensitive features with regard to dust and will lie within 50m of construction or decommissioning activities or the haul rout.” Further information is required on why 50m is the limit of dust impacts on the SSSI and European site.	Further information required.	N	This distance was discussed at the February 2024 thematic meeting but National Grid noted that using a greater distance (200 m) would not affect the assessment. Therefore it was agreed to use a greater distance of 200 m in the ecological assessments.
		Terrestrial Ecology	The project may result in the loss of 116ha of foraging habitat for woodlark and nightjar.	Given the scale of the loss of foraging habitat, we advise that this impact pathway could result in a	N	The extent of loss of potential functionally linked habitat for Sandlings SPA has been considered, particularly with regard to how much habitat would be lost at any one time (the PEIR figure did not

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				likely significant effect and should proceed to the Appropriate Assessment stage. Again, we draw you attention to the commitments made by EA1N and EA 2 in relation to these species, with an expectation that similar measures would be implemented by Sea Link.		take account of this), given the cable trench will be restored immediately after the cable is installed in each section. The shadow habitats regulations assessment has screened this impact in for stage 2 Appropriate Assessment. The assessment has concluded that such a loss will not be significant and therefore that there will be no adverse effect on site integrity of Sandlings SPA. The restrictions advised for East Anglia ONE and TWO appear to be concerned with working within the SPA, which is not proposed for the Proposed Project.
		Coordination with other Projects and Timescales / programme	Given the possibility of co-locating the project with LionLink and Nautilus, there is a possibility that the effects of the project will be extended over a considerably longer time scale, if the timetables for construction do not align. This will need to be considered in the in-combination assessment. Conversely, if the timetables align, the effects may be greater in magnitude.	We advise that the in-combination assessment needs to consider how the potentially co-located projects construction timetables align. And that were possible impacts are reduced through bundling of cables and/or the first project installing the ducts for sequent projects. The East Anglia and Norfolk Project Offshore windfarms have set a precedence for doing this.	N	National Grid is coordinating with other developers of large scale infrastructure projects where possible, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Consultation	It is not clear from the information currently provided what extent of worker access, vehicle access, and construction works are required within the Leiston - Aldeburgh SSSI footprint.	Further information required.	N	**Applicant Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** has been updated to include this information. The only access required within the SSSI is a monitoring access using an existing track.
		Landscape and Visual and Cultural Heritage	Natural England notes that the proposed route, has the potential to impact ancient woodland identified by the Ancient Woodland Inventory. Notably, some of these woodlands are also designated as County Wildlife Site (CWS). The proposed route is planned to come within close proximity to ancient woodland (outside the footprint of the woodland), in these circumstances' impacts may be avoidable or mitigation may be possible to prevent deterioration or loss of ancient woodland from occurring. However, to achieve this, it will be integral to consider Natural England and the Forestry Commission's standing advice1 for planning authorities in relation to ancient woodland and ancient and veteran trees.	Natural England advises Sea Link to follow Natural England and the Forestry Commission's standing advice for planning authorities in relation to ancient woodland and ancient and veteran trees.	N	The Proposed Project has been devised to avoid ancient woodland. The nearest ancient woodland, Grove Wood, is 25 m from the Suffolk Onshore Scheme (a section of buried cable corridor) at its closest. No development proposals are proposed within the Ancient Woodland or its 15 m buffer zone.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			(1)https://www.gov.uk/guidance/ancient-woodland-and-veteran-trees-protection-surveys-licences"			
		Terrestrial Ecology	**Comment** **Table 2 Natural England's Key Advice and Recommendations – Suffolk Onshore Scheme** **Baseline Characterisation – Document(s) Used: PEIR Part 2 Chapter 3 Ecology and Biodiversity** ***Survey Data Acquisition*** 2.3.5.11 states "The North Warren RSPB Reserve is a botanically diverse site, however as it will be traversed by a trenchless technique (drilling beneath the reserve) it was not deemed necessary to survey the vegetation on the surface in any detail." Given that it has not been confirmed that Horizontal Direct Drilling (HDD) will be technically feasible beneath the footprint of Leiston – Aldeburgh SSSI, it is recommended that the area within the development boundary is surveyed. Additionally, should bentonite breakout occur, this survey information will provide useful data to monitor the effects and determine a suitable course of action if required. "	**Recommendation** We advise that botanical surveys are undertaken on the areas of Leiston – Aldeburgh SSSI within the development boundary, including the area intended for HDD.	N	In the February 2024 ecology thematic meeting with Natural England it was explained to Natural England that there was no value in undertaking a botanical survey of the RSPB reserve/SSSI since it can now be confirmed that these will be traversed with a trenchless solution.
		Terrestrial Ecology	2.3.5.28 states "Although the RSPB North Warren Reserve is suitable for marsh harrier, the crossing will be undertaken using a trenchless cabling technique. As such, no dedicated breeding marsh harrier survey will be undertaken." Given that it has not been confirmed that Horizontal Direct Drilling (HDD) will be technically feasible beneath the footprint of Leiston – Aldeburgh SSSI and additionally, if HDD is used, there is still the potential for noise, vibration, visual and light disturbance, this justification does not seem sufficient. "	We advise that a marsh harrier survey should be undertaken for Leiston – Aldeburgh SSSI.	N	In the February 2024 ecology thematic meeting with Natural England it was explained to Natural England that there was no value in undertaking a dedicated marsh harrier survey since National Grid know where they nest and it is far from the Proposed Project. The conventional breeding bird surveys have detected foraging marsh harrier.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Ornithology	**HRA - Document Used: Part 2 Chapter 3 Ecology and Biodiversity, Part 5 Chapter 3 Habitat Regulations Screening Report, Part 2 Appendix 2.9.A Construction Dust Assessment and Methodology** ***Screening*** 2.3.8.18 states that "Although bird surveys are ongoing, it is clear that the bird assemblage at Suffolk is of regional importance, rising to national importance for RSPB North Warren Reserve and for some species, such as nightjar and woodlark." Please note that the nightjar and woodlark interest features of Sandlings SPA are of international importance.	The bird assemblage in Suffolk should be considered of international importance in future documentation. We draw your attention to the assessments and comments of EA1N and EA2 for these species.	N	These comments have been noted by National Grid. While part of the bird assemblage (notably around Sandlings SPA and Leiston-Aldeburgh SSSI) is of international importance, and this has been reflected in the ES, other areas (notably open farmland between the River Fromus and the golf course) are not of international importance according to survey data. National Grid has therefore taken a nuanced approach to assigning importance depending on the survey results.
		Onshore Environmental Impact and Onshore Mitigation	"2.3.9.4 states that "Where feasible and necessary, the most potentially disturbing elements of the trenchless installation will take place between September and February, to minimise disturbance of breeding nightjar and woodlark in the adjacent Sandlings SPA." It also states "Consider undertaking potentially disturbing (noisy) maintenance activities during August and September, where practicable, reducing risk of disturbance of breeding or non-breeding birds using RSPB North Warren Reserve or breeding nightjar and woodlark using Sandlings SPA. Where areas of acid grassland are to be trenched, and where space allows, explore cutting the best quality grassland as turves and storing them to one side in order that they can be restored after trenching is complete." Due to the Leiston – Aldeburgh SSSIs notified breeding and non-breeding interest features, and the breeding features of the adjacent Sandlings SPA, Natural England highlights the importance and possible challenges of scheduling works around the SSSI and SPA to avoid noise, vibration, light and visual disturbance to the interest	Until such a time as it can be demonstrated that the construction schedule will not affect the breeding and non-breeding interest features of the designated sites, the project should be considered to have a likely significant effect because of disturbance and be taken through Appropriate Assessments as such.	Y	Constraints imposed by Sandlings SPA and the adjacent SSSI will be addressed through noise and visual mitigation methods (e.g. close board fencing). Moreover the compound has been moved further from the SPA than previously shown during Statutory consultation. This will reduce noise levels to an acceptable degree for a trenchless construction solution. Site set up for the construction compound does include a seasonal constraint that avoids the nesting season. However, it is considered that noise from the construction itself can be rendered acceptable. The impact assessment is set out in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and the mitigation measures referenced above are set out in **Application Document 7.5.3.2 Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			features. Given this difficulty, it is unlikely that the "magnitude of the effects" and "sensitivity test" within Tables 2.3.17 & 8, 2.3.23 & 4 within Volume 1 Part 2 Chapter 3 Ecology and Biodiversity are appropriate. Table 2.3.18 also states that the preliminary sensitivity is of "At least district importance for ornithology" which is inappropriate, given the SPA is designated for its breeding bird interest features of international importance, and national importance regarding the SSSI. Given the issues highlighted, we disagree with the preliminary likely significance of effect as "Not Significant" for all tables listed above. "			
		Terrestrial Ecology	Table 2.3.15 Report 5.3.5.6 Table 2.3.15 of Volume 1 Part 2 Chapter 3 and paragraph 5.3.5.6 of Volume 1 Part 5 Chapter 3, state that "Sandlings SPA is designated for nightjar and woodlark. […] While there will be temporary loss of up to approximately 116 ha of potentially suitable foraging habitat within 2 km of the SPA, this represents a maximum 0.6% of available foraging habitat within 2 km of the SPA, and the vast majority will be restored within 2-3 years (as the entire route will not be excavated at once). There will be no permanent loss within 2 km of the SPA except for a few square metres occupied by some link kiosks. It is therefore concluded that no likely significant effect on Sandlings SPA due to loss of functionally linked habitat will occur." Natural England does not currently consider that this assessment is sufficiently rigorous or robust. We understand that the full survey data on nightjar and woodlark has not yet been collected and therefore it will not be possible to conclude this assessment until it has been collected and assessed. Furthermore, 116ha of foraging habitat is a considerable loss even in the span	Given the scale of the loss of foraging habitat, we advise that this impact pathway could result in a likely significant effect and should proceed to the Appropriate Assessment stage.	N	Further investigation has been undertaken into the extent of loss of potential functionally linked habitat for Sandlings SPA, particularly with regard to the relative importance of that habitat (2.5 ha of acid grassland adjacent to the SPA whereas most affected habitat is arable land), and how much habitat would be lost at any one time given the cable trench will be restored immediately after the cable is installed in each section. The conclusion is that the temporary loss will not be significant particularly given the intention to enhance an existing plot for improved acid grassland for a 10 year period given that acid grassland is a priority habitat. This is reported in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.6 Habitats Regulations Assessment Report**. The restrictions advised for East Anglia ONE and TWO appear to be concerned with working within the SPA, which is not proposed for the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			of 3 years and could reduce the possible extent and distribution of these species. The assessment appears to have been undertaken considering foraging land across the entire SPA, however, the assessment should focus on the loss of foraging habitat for pairs within the local area. Whilst it may be a “loss of 0.6% of available foraging habitat within 2km of the SPA”, for pairs nesting locally, this percentage may be far greater. Given the scale of the loss of foraging habitat, we advise that this impact pathway could result in a likely significant effect and should proceed to the Appropriate Assessment stage.			
		Construction – General and Terrestrial Ecology	Table 2.3.19 Report 5.3.5.3 Table 2.9.A.5 Volume 1 Part 2 Chapter 3, Table 2.3.19 states “IAQM guidance (Ref. 2.3.15) indicates that dust can significantly affect ecological receptors up to 50m from the source, by coating vegetation and blocking photosynthesis. Sandlings SPA/Leiston-Aldeburgh SSSI/RSPB North Warren Reserve is the most sensitive features with regard to dust and will lie within 50m of construction or decommissioning activities or the haul rout.” Volume 1 Part 5 Chapter 3 Habitats Regulations Screening Report, paragraph 5.3.5.3 states “In addition to traffic exhaust emissions, guidance from the Institute of Air Quality Management (Ref 3.55) identifies that significant dust soiling can arise on ecological receptors located within 50m of construction sites. A small part of Sandlings SPA is located within 50m of the eastern-most construction compound.” Further information is required on why 50m is the limit of dust impacts on both Sandlings SPA and Leiston – Aldeburgh SSSI. Please note that these questions around the 50m dust impact zone, also applies	Further information required on how this conclusion was reached.	N	This distance was discussed at the February 2024 thematic meeting with Natural England but National Grid noted that using a greater distance (200 m) would not affect the assessment. It was therefore agreed to use the greater distance of 200 m in the ecological assessments.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			to Volume 2 Part 2 Appendix 2.9.A Construction Dust Assessment and Methodology Table 2.9.A.5.			
		Onshore Environmental Impact	2.3.11.4 states “It is likely that the Suffolk Onshore Boundary constitutes functionally linked habitat for Sandlings SPA, RSPB North Warren Reserve and possible Alde-Ore Estuary SPA/Ramsar site and Minsmere Walberswick SPA/Ramsar site. This habitat will only be lost temporarily (approximately 5 years) but will require offsetting. This could be done through converting arable land to acid grassland, securing permanent wide grassed field margins and crop regimes. favourable to farmland birds and creating areas of species-rich structurally diverse grassland, to compensate.” This compensation/offsetting is not mentioned within the Habitats Regulations Assessment (HRA). Clarity is required on what is proposed and this needs to be assessed through the HRA.	This compensation/offsetting is not mentioned within the Habitats Regulations Assessment (HRA). Clarity is required on what is proposed and this needs to be assessed through the HRA.	N	The need for mitigation for the temporary loss of functionally linked habitat is assessed in **Application Document 6.6 Habitat Regulations Assessment Report** and has been discussed with Natural England prior to DCO submission. This is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). The quoted text was included in the PEIR as a precaution, but survey work was still ongoing at time of writing.
		Construction – General and Landscape and Visual	5.3.5.16 states “Moving from noise to visual disturbance, disturbance from visual intrusion such as lighting is likely to be most relevant if the works are immediately adjacent to an SPA. Lighting is likely to be an issue if the works result in the introduction lighting within close proximity to a European site which is currently unlit. There is currently a fence separating the construction compound and trenchless installation pit location from the Sandlings SPA. Therefore, to ensure no visual disturbance, screens will need to be erected. Since these would constitute mitigation, they cannot be taken into account in the Likely Significant Effect test. Therefore, visual disturbance of nesting woodlark and nightjar at Sandlings SPA is also screened into Appropriate Assessment.” Currently only visual disturbance as a result of lighting is considered, however, other visual disturbance is likely to	Further consideration of visual disturbance beyond lighting is required. Screening will not prevent all lighting spill and given the proximity of the proposed landfall, TJB and construction compound, further mitigation may therefore be required.	N	These comments have been noted by National Grid. It is considered that standard noise mitigation such as close board fencing and other visual screens can be used (along with controls on height and use of lighting) to protect the designated sites. Visual disturbance including lighting is assessed in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			occur. Additionally, screening will not prevent all light spill alone and at the Appropriate Assessment additional mitigation may need to be considered.			
		Consultation	5.3.5.18 - 24 Further information is required on the hydrological connectivity and possible impact pathways between the development site and European sites to determine if there will be a likely significant effect.	Further information required.	N	These comments have been noted by National Grid. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		DCO process	5.3.5.25 - 29 The developer/public body will need to consider its general S28G duty towards Leiston - Aldeburgh SSSI and seek prior assent from NE (under Section 28H of the Wildlife and Countryside Act 1981 (as amended)) for future potentially disturbing or polluting maintenance activities within or in close proximity to a SSSI, which are captured under the designated sites Operations Requiring Natural England's Consent list. Further information on the assent process can be found here: Give notice and get assent for a planned activity on or near a SSSI - GOV.UK (www.gov.uk)2.	It is important to consider that future maintenance activities within or close to SSSIs may be subject to assent from Natural England and therefore we advise that all potential operation and maintenance activities are considered at the consenting phase.	N	These comments have been noted by National Grid. Operational and maintenance impacts including on the SSSI are assessed in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Coordination with other Projects and Timescales / programme	**In- combination** 5.3.8 Given the possibility of co-locating the project with LionLink and Nautilus, there is a possibility that the effects of the project will be extended over a considerably longer time scale, if the timetables for construction do not align. This will need to be considered in the in combination assessment. Conversely, if the timetables align, the effects may be greater in magnitude.	We advise that the in-combination assessment needs to consider how the potentially co-located projects construction timetables align. And that were possible impacts are reduced through bundling of cables and/or the first project installing the ducts for sequent projects. The East Anglia and Norfolk Project Offshore windfarms have set a precedence for doing this.	N	National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**.
		Intra-Project Cumulative Effects	Paragraph 1.3.4.17 of Chapter 3 Main Alternatives states that the Suffolk Onshore route has been selected on the basis that "It was considered likely that significant effects on the designated sites for nature conservation could be	We advise that the technical feasibility of HDD under Leiston - Aldeburgh SSSI, the feasibility of scheduling works to avoid disturbance of breeding and non breeding interest features of the	N	An initial ground investigation survey has been completed to confirm the viability of a trenchless installation technique at the landfall. Noise modelling of the drilling operation has shown that the noise from the drilling operations can be mitigated. Construction working will be undertaken within the agreed working hours set out within the DCO. Best practicable means (e.g. screening) to reduce

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			avoided or mitigated through construction techniques." Natural England understands that the assumption that avoidance and mitigation for Leiston - Aldeburgh SSSI can be achieved is on the basis that Horizontal Direct Drilling (HDD) will be used to lay the cabling beneath the surface of the SSSI. It is currently unclear as to whether the HDD technique will damage any of the interest features for which the SSSI is notified. It will be important to assess whether HDD is technically feasible through pre consent geotechnical investigations and to determine the risk of bentonite breakout. As well as a HDD feasibility study, a bentonite management/break out plan will be required. Additionally, to carry out the HDD, a Transition Join Bay (TJB), landfall and construction compound is located (Volume 3 Part 1 Chapter 4 Figures: Fig. 1.4.7 and 1.4.8) adjacent to the SSSI and Sandlings SPA boundary. Due to the Leiston – Aldeburgh SSSI notified breeding and non-breeding interest features, and the breeding features of the adjacent Sandlings SPA, Natural England highlights the importance and possible challenges of scheduling works around the SSSI and SPA to avoid noise, vibration, light and visual disturbance to the interest features. Given this difficulty, it is unlikely that the "magnitude of the effects" and "sensitivity test" within Tables 2.3.17 & 8, 2.3.23 & 4 of Volume 1 Part 2 Chapter 3 Ecology and Biodiversity are appropriate. Table 2.3.18 also states that the preliminary sensitivity is of "At least district importance for ornithology" which is inappropriate, as the SPA is designated for its breeding bird interest features of international importance, and national importance for the SSSI. Given the issues highlighted, we disagree with	SSSI and Sandlings SPA, and the effects of dewatering, wider hydrological effects including saline incursion from the cabling on the coastal side, pollution, air quality, and the possibly amplification of these effects as a result of co-location, should be thoroughly assessed before the route is finalised. The mitigation hierarchy, focusing on avoidance first, should be followed.		construction noise are set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). Commitment GH02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** includes for the provision of a Foundation Works Risk Assessment, where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid breakout/loss. Within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**, the Leiston-Aldeburgh SSSI is assessed in association with trenchless construction solution related works, including the geomorphological alteration of the intertidal zone, the beach and the impact on the water column due to the release of drilling fluids and disturbed sediment that has become suspended. The impact on ecological receptors are assessed in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology and Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			the preliminary likely significance of effect as “Not Significant” for all tables listed above. There are also concerns around the possible effects of: dewatering on the water dependent SSSI, wider hydrological effects including saline incursion from the cabling on the coastal side, pollution and air quality. When considering the possible co-location in this location, it is also important to consider that if construction is staggered, and each project cannot properly avoid or mitigate its effects, the magnitude of the effect will be amplified considerably. All these challenges should be considered when selecting the route. It will be important to establish early any impacts which could occur to the SSSI and follow the mitigation hierarchy as per the soon to be adopted Overarching National Policy Statement for Energy (NPS EN-1)3 (paragraphs 4.3.4, 5.4.42, 5.9.9) and National Planning Policy Framework (section 15.)4, considering the sites status as a SSSI (paragraphs 175, 179 and 180).			
		Water Environment and Benthic Ecology	1.4.5.19 states: “Culvert installations would be required for temporary access tracks to cross ditches and watercourses. The size of each culvert would vary depending on the dimensions of the crossing, and sensitivity and importance of the watercourse.” It is not clear from the information provided in the PEIR whether culvert installation will be required within Leiston – Aldeburgh SSSI.	Further information is required on culvert installation across Leiston – Aldeburgh SSSI. If required, the effects of these culverts on the features of the SSSI should be assessed.	N	No culverts are proposed within the SSSI.
		Construction – General and Climate Change	1.3.4.17, 1.3.5.64, 1.3.6.4, 1.4.2.52-56, Appendix 2.3.A It is not clear from the information currently provided what extent of worker access, vehicle access, and construction works are required within	Further information is required on the worker and vehicle access, and construction works required within the Leiston - Aldeburgh SSSI footprint.	N	It was confirmed in the February 2024 thematic meeting with Natural England that there is no need for vehicular or construction access through the SSSI. The only access required would be foot access for monitoring the chosen trenchless construction solution. No vegetation clearance or any works would be required, existing footpaths could be used.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			the Leiston - Aldeburgh SSSI footprint. The SSSI is comprised of a range of designated habitat and supporting habitat for sensitive species. For example, within the Phase 1 Habitat Survey Report, various important coastal/shingle vegetation communities were found which are a feature of Leiston – Aldeburgh SSSI. There has been no assessment of the effects of construction works required on the beach on the coastal vegetated shingle interest feature. Coastal vegetated shingle is highly susceptible to disturbance from both people and vehicles. Chapter 31. Coastal vegetated shingle of the Climate Change Adaptation Manual5may provide useful information on the ecology and vulnerability of coastal vegetated shingle, as well as links to further information, advice and evidence.			
	Onshore Environmental Impact and Onshore Route location	2.3.8.2 states that Leiston – Aldeburgh SSSI is adjacent to the proposed Suffolk Onshore Scheme, however, the development is within the footprint of the SSSI and should be referred to as such.	Clear figures should be included in the Application demonstrating any overlap with designated site features.	N	These comments have been noted by National Grid. No further response required. Designations are shown in **Application Document 2.8.1 Statutory and Non Statutory Sites of Nature Conservation, Geological and Landscape Importance - Suffolk**, **Application Document 2.8.2 Statutory and Non Statutory Sites of Nature Conservation, Geological and Landscape Importance – Kent** and **Application Document 2.8.3 Statutory and Non Statutory Sites of Nature Conservation, Geological and Landscape Importance - Offshore**.
	Geology and Hydrogeology and Onshore Environmental Impact	2.6 There is no mention of the geological SSSI, Crag Pit, Aldeburgh SSSI in this document. The SSSI is under 400m from the development site. We advise that given the proximity, this should be screened in for any possible damage as a result of the proposals.	Further consideration within the Environmental Statement (ES)	N	The study area for Sites of Geological Interest is 250 m which has been accepted at scoping. It is not considered there is a mechanism for impact to this site located 400 m away and therefore no further consideration will be given to this site in the ES.
	Ornithology and Onshore Environmental Impact	**Assessment** Table 2.3.19 states “IAQM guidance (Ref. 2.3.15) indicates that dust can significantly affect ecological receptors up to 50m from the source, by coating vegetation and blocking photosynthesis. Sandlings SPA/Leiston-Aldeburgh	Further information required on how this conclusion was reached.	N	This distance was discussed at the February 2024 thematic meeting with Natural England but National Grid noting that using a greater distance (200 m) would not affect the assessment. It was therefore agreed to use a greater distance of 200 m in the ecological assessments.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			SSSI/RSPB North Warren Reserve is the most sensitive features with regard to dust and will lie within 50m of construction or decommissioning activities or the haul rout." Further information is required on why 50m is the limit of dust impacts on the SSSI and European site.			
		Geology and Hydrogeology and Onshore Environmental Impact	Table 2.3.20: Preliminary assessment of spillages and introduction of non native species on habitats during construction or decommissioning states: "Preliminary magnitude: If it occurred the magnitude of impact would be at least moderate adverse, but with mitigation the magnitude would be minor adverse to negligible as spillages". The Preliminary likely significance of effect is stated as "Not Significant". Given that the technical feasibility of HDD beneath the Leiston – Aldeburgh SSSI has not yet been confirmed, the assessment of magnitude and significance of effects is not currently considered appropriate. We have similar concerns with relation to Table 2.3.25: "Preliminary assessment of spillages on habitats and introduction of invasive species during operation".	These assessments will need to be revisited after the pre consent geotechnical investigations.	N	These comments have been noted by National Grid. Geotechnical investigation has now confirmed that a trenchless construction solution is feasible and the risk of frac out is low and confined to the final 100 m of the bore. Further consideration of the impact of frac out is included within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Geology and Hydrogeology	Table 2.3.22: Preliminary assessment of hydrological impacts on designated sites during construction or decommissioning. It is not clear how a non-significant effect was identified based on the preliminary magnitude.	Further information required.	N	Further detail is now provided within both **Application Document 6.2.2.5 Part 2 Suffolk Chapter 5 Geology and Hydrogeology and Application Document 6.2.3.5 Part 3 Kent Chapter 5 Geology and Hydrogeology**.
		Water Environment	Table 2.6.18: Preliminary assessment for changes to groundwater levels, quality and groundwater flow direction caused by dewatering. We highlight that dewatering within the catchment of a water dependant designated site such as Leiston – Aldeburgh SSSI would be a concern.	Further information required.	N	The ES is supported by groundwater risk assessment which identifies potential impacts on groundwater receptors including from potential dewatering. Commitments GH02 and GH07 relate to groundwater and are included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**.
		Onshore Environmental	Tables 2.9.A.2 2.9.A.11 2.9.A.12 We consider that SSSIs with dust sensitive features should be considered	Dust sensitivity should be assessed based on the sensitivity of the	N	These comments have been noted by National Grid. However, the 'sensitivity' reflects the importance of the receptor and therefore it is appropriate to consider dust impacts on (for example)

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Impact and Air Quality	to have high receptor sensitivity. It does not seem logical that the features are less sensitive depending on the hierarchy of designation e.g., international, national or local, as this does not take into account ecological sensitivity.	feature and not the designation hierarchy.		an SAC more important than dust impacts on a local wildlife site. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Geology and Hydrogeology and Terrestrial Ecology	**Priority Habitats and Species listed under Section 41 list of the Natural Environmental and Rural Communities (NERC) Act, 2006.** **Potential impact pathways where further info/assessment required.** 2.3 Natural England notes that the proposed cable route crosses or lies near to a range of CWS, local nature reserves (LNR) and priority habitats. You should consider the impacts of the proposed development on any local wildlife or geodiversity sites, in line with paragraphs 175 and 179 of the NPPF and any relevant development plan policy. Further advice regarding local sites, priority habitats and species can be found on page 104 (para 5.4.12 - 13, 5.4.16) and page 107 (para 5.4.32 - 5.4.34) of the soon to be designated NPS EN-16. There may also be opportunities to enhance local sites and improve their connectivity. Natural England does not hold locally specific information and recommends further information is obtained from appropriate bodies such as the local records centre, wildlife trust, geo-conservation groups or recording societies. Priority habitats and species are considered as of particular importance for nature conservation and included in the England Biodiversity List published under section 41 of the Natural Environment and Rural Communities Act 2006. Most priority habitats will be mapped either as Sites of Special Scientific Interest, on the Magic website or as Local Wildlife Sites; a list of priority habitats and species can be found here.	Natural England advises that consideration is given to potential impacts of the proposed development on any local wildlife or geodiversity sites.	N	These comments have been noted by National Grid. These impacts and receptors have been considered in the ES. Further information is contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Consideration should also be given to the potential environmental value of brownfield sites, often found in urban areas and former industrial land, further information including links to the open mosaic habitats inventory can be found here.			
		Air Quality and Terrestrial Ecology	2.3.8.4 states that CWS do not have specific citations. Please note that CWS do have citations available from the local records centre.	The Applicant should seek the relevant CWS citations to support their assessments and survey requirements. We recommend consideration of the effects of dust on the adjacent Disused Railway Line (Aldringham – Aldeburgh) CWS.	N	Noted, no further response required. This has been amended and taken on board. Further information is contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Air Quality and Terrestrial Ecology	Table 2.3.19 states IAQM guidance (Ref. 2.3.15) indicates that dust can significantly affect ecological receptors up to 50m from the source, by coating vegetation and blocking photosynthesis. Sandlings SPA/Leiston-Aldeburgh SSSI/RSPB North Warren Reserve is the most sensitive features with regard to dust and will lie within 50m of construction or decommissioning activities or the haul rout. There is no mention of the effects of dust on the Disused Railway Line (Aldringham – Aldeburgh) CWS which is adjacent to the proposed landfall, construction site and TJB. "	We recommend consideration of the effects of dust on the adjacent Disused Railway Line (Aldringham – Aldeburgh) CWS.	N	**Application Document 6.2.2.2 Part 2 Chapter 2 Ecology and Biodiversity** includes a section considering dust impacts on all designated sites including the CWS.
		Terrestrial Ecology	**Other Onshore Related Matters** **Onshore Protected Species** 2.3 A guide on the effect of nationally significant infrastructure projects on protected species can be found here9. Advice on the avoidance and mitigation in regard to bird species in the context of this project, can be found on pg. 17 para 2.9.3 – 4 and pg. 28 para 2.10.2 – 4 of the National Policy Statement for Electricity Networks Infrastructure (NPS EN-5)10.	We strongly advise that, for each protected species likely to be affected by the project, you obtain additional pre-licensing species advice from Natural England (consultations@naturalengland.org.uk) prior to the application submission to further reduce uncertainty and risk of delay at the formal application stage. Please note that any charges for the provision of a Letter of No Impediment (LONI) will be through our existing Discretionary Advice Service contract.	N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Geology and Hydrogeology	**Documents used – Part 2 – Chapter 7 – Agriculture and Soils** **Soils and Best and Most Versatile Agricultural Land** 2.7.2.8 Natural England notes the applicants' commitments to providing a Soil Management Plan (SMP). The Environmental Statement and associated SMP needs to clearly demonstrate how the ALC Grades and soil types will inform soil handling and restoration, setting out the site specific mitigation measures with reference to the best practice guidance (Defra Construction Code of Practice), i.e. secondary mitigation measures. The British Society of Soil Science has published the Guidance Note Benefitting from Soil Management in Development and Construction which also contains useful guidance. Natural England support the inclusion to provide an outline SMP at ES submission. This should be informed through a site-specific soil survey. "	As part of the Application please submit a soil management plan.	N	The development of an Outline Soil Management Plan, for both Suffolk and Kent, is committed to and is produced in line with best practice guidance including the Defra Construction Code of Practice. Individual outline SMPs have been produced for both Suffolk and Kent and contain measures informed by the site-specific desk-based information. Outline Soil Management Plans are committed to be updated in line with pre-construction information. Further details are contained in **Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk and Application Document 7.5.10.2 Outline Soil Management Plan – Kent**.
		Geology and Hydrogeology	2.7.2.11 Natural England support the commitment to determine the extent of BMV land within the Draft Order Limits (DOL). We require that land quality and soil resources information is gathered for any land that is disturbed by the development. Ideally a full detailed Agricultural Land Classification (ALC) survey would have been carried out across the whole site.	Please provide further information and management plans within the Application	N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.2.6.A ES Appendix 2.6.A Predictive Agricultural Land Classification Report - Suffolk** and **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report - Kent** present the results of the ALC predictive modelling, which will include plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred, the implications for soil type and land grade have been assessed. Preconstruction surveys are committed to, and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Geology and Hydrogeology	2.7.4.2 Bullet 5 Bullet 7. The British Standard reference is only necessary for imported soil use, not for site-won soil re-use on site. The MAFF good practice has been superseded by the IQ Soils Guidance (quarrying.org) (2021).	We advise that the MAFF good practice guidance is replaced by the IQ Soils Guidance (2021).	N	Guidance section has been updated in line with this change.
		Geology and Hydrogeology	2.7.4.4 A detailed ALC and soil survey of the agricultural land should be undertaken across the full Study Area to inform the EIA. This should normally be at a detailed level, e.g., one auger boring per hectare, supported by pits dug in each main soil type to confirm the physical characteristics of the full depth of the soil resource, i.e., 1.2 metres. Soil data collected as part of an ALC survey can also be used to inform the soil resource and management plan as set out in the Defra Construction Code of Practice for the Sustainable Use of Soils on Construction Sites.	We advise that the ALC survey should follow the Guide to assessing development proposals on agricultural land - GOV.UK (www.gov.uk). All land which may experience temporary or permanent disturbance should be subject to a detailed ALC survey, to inform suitable handling and restoration. The Environmental Statement should clearly demonstrate how the master planning has considered the ALC grades and avoided BMV where possible in line with paragraph 5.10.8 of the Draft NPS EN1.	N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.2.6.A ES Appendix 2.6.A Predictive Agricultural Land Classification Report - Suffolk** and **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report – Kent** present the results of the ALC predictive modelling, which will include plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred the implications for soil type and land grade have been assessed. Preconstruction surveys are committed to, and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice.
		Geology and Hydrogeology	Table 2.7.9 Full surveys have not yet been carried out, this should be undertaken as part of a comprehensive set of baseline soil and ALC information given that soil disturbance will take place in these areas. The soil survey will inform suitable soil handling and restoration criteria.	We advise that the soil and ALC surveys should be undertaken by qualified and experienced soil surveyors. The temporary displacement of soil as a result of the underground cable installation and temporary haul roads/construction compounds can result in permanent land quality change and soil damage if undertaken inappropriately, therefore, Natural England advise this should be considered in the SMP. This is required for consultees and decision makers to understand the extent (ha) and likely long-term impacts on agricultural land quality (ALC grade). The ES should present simple breakdowns for each of the individual components. For example, total	N	The survey approach will be in line with published guidance; survey density is 1 auger per 100 m within linear areas, and 1 auger per ha within wider sections. Where survey access is not possible (note there is an elevated UXO risk across the Proposed Project area) a predicative modelling approach may be utilised. Due to an elevated UXO risk across the Proposed Project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.2.6.A ES Appendix 2.6.A Predictive Agricultural Land Classification Report - Suffolk** and **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report - Kent** present the results of the ALC predictive modelling, which will include plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred, the implications for soil type and land grade have been assessed. Preconstruction surveys are committed to and will be undertaken in line with published guidance and will be used to

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				agricultural area impacted by scheme (split by scheme component and by ALC grade), total area of BMV agricultural land (split by component) and total BMV agricultural area permanently and temporarily required for the development (split by component). The outline SMP needs to be clear that the aim is for BMV agricultural land to be returned to its original quality and all soils to be suitable for the planned end use. For example, this could be actioned by a target specification for the restored soils according to location and soil types, end use and required ALC grade. All soils should only be handled in a dry and friable condition, and it is expected that soil handling will be confined to the drier summer period to minimise risk of soil damage. Soil handling methods should normally be as specified as in the Defra Construction Code of Practice for the Sustainable Use of Soils on Construction Sites (including accompanying Toolbox Talks).		update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice. Site specific soil information will then be used to inform the production of the Soil Management Plans as set out in the Defra Construction Code of Practice. The SMP will include requirements for soil handling, including wet weather cessation criteria, details of measures required for soil restoration as well as requirements for toolbox talks and training, as well as the competencies expected for the individuals responsible for these tasks. Please refer to **Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk and Application Document 7.5.10.2 Outline Soil Management Plan – Kent** which accompany the DCO application and will be developed into the SMP for the Proposed Project in advance of construction. The requirement to produce a soil management plan is set out within the **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). **Application Document 6.2.3.6 Part 2 Suffolk Chapter 6 Agriculture and Soils and Application Document 6.2.2.6 Part 3 Kent Chapter 6 Agriculture and Soils** have assessed the impacts of the Proposed Project in further detail (for both soil and for BMV), examined the impacts both during construction and operation, as well as the temporary and permanent take for different aspects of the infrastructure.
		Geology and Hydrogeology	2.7.5.5 The installation of overhead pylons typically requires substantial temporary development in the form of temporary access tracks, as well as the smaller permanent land take from the pylon footprint. It is acknowledged that the pylon footprint locations are subject to micro siting and the precise location is often not confirmed till late in the design process. Therefore, regarding the potential cable route (yet to be determined) the focus of the survey should be on the general route (to inform micro-siting).	Natural England advises that as well as considering micro siting the pylons consideration is given within the application to under grounding of all cables.	N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.2.6.A ES Appendix 2.6.A Predictive Agricultural Land Classification Report - Suffolk** and **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive ALC Report - Kent** present the results of the ALC predictive modelling, which will include plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred the implications for soil type and land grade have been assessed; this therefore allows for sufficient information to inform micro sitting where required. Any options appraisal work undertaken prior to the predictive mapping, such as that undertaken during the route selection, uses the Department for Environment, Food and Rural Affairs (Defra) ALC mapping layer to identify area potentially comprising BMV land. As

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
						this layer does not differentiate between 3a and 3b, a precautionary assumption that all Grade 3 is BMV land is usually made.
		Design	2.7.7.4 Natural England support the use of existing detailed ALC mapping. Copies of the reports and mapping are available through Natural England's Access to Evidence Portal via MAGIC map.		N	Information from the Evidence Portal and MAGIC maps has been used to inform the preliminary assessment to date.
		Design	2.7.8.2 Sensitive routeing or micro-siting should be informed by the ALC survey to avoid long term impacts.	We advise that the Environmental Statement should clearly demonstrate how the master planning has considered the ALC grades and avoided BMV where possible in line with paragraph 5.10.8 of the Draft NPS EN1.	N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.2.6.A ES Appendix 2.6.A Predictive Agricultural Land Classification Report - Suffolk** and **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report - Kent** present the results of the ALC predictive modelling, which will include plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred, the implications for soil type and land grade have been assessed; this therefore allows for sufficient information to inform micro sitting where required. Any options appraisal work undertaken prior to the collection of site-specific survey information (such as detailed ALC and/or soil information), such as that undertaken during the route selection, uses the Department for Environment, Food and Rural Affairs (Defra) ALC mapping layer to identify area potentially comprising BMV land. As this layer does not differentiate between 3a and 3b, a precautionary assumption that all Grade 3 is BMV land is usually made.
		Geology and Hydrogeology	2.7.8.3 GG19 All soil stockpiles intended to remain in situ for more than 6 months or over the winter period are to be grassed over and weed control and other necessary maintenance carried out. AS01 Natural England support the provision of an SMP as part of the Construction Environmental Management Plan (CEMP). See comment above (2.7.2.7). We note there is no commitment for a programme of supervision, monitoring and reporting as proposed, given the	We advise that the Environmental Statement and associated SMP needs to clearly demonstrate how the ALC Grades and soil types will inform soil handling and restoration, setting out the site specific mitigation measures with reference to the best practice guidance (Defra Construction Code of Practice), i.e. secondary mitigation measures. The British Society of Soil Science has published the Guidance Note Benefitting from Soil Management in	N	The development of an Outline Soil Management Plan is committed to and has been produced in line with best practice guidance including the Defra Construction Code of Practice. Individual SMPs have been produced for both Suffolk and Kent and contain measures informed by the site-specific information collated from surveys. The outline SMP includes the requirements for on-going supervision and monitoring as well as the required competencies to be held by the responsible parties. Where agricultural land is to be returned to productive use the handling methodologies will outline the methods to minimise potential function loss as far as is practicable. Please refer to **Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk** and **Application Document 7.5.10.2 Outline Soil Management Plan – Kent** which

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			very high quality of the land. This should include supervision of soil handling by a competent soil specialist. AS02 The spatial distribution of ALC grades determined from a detailed ALC survey are necessary to inform the reinstatement criteria, which allows the area of each ALC Grade temporarily disturbed to be returned to the same quality as far as practicable to minimise potential loss.	Development and Construction which also contains useful guidance.		accompany the DCO application and will be developed into the SMP for the Proposed Project in advance of construction.
		Design	General comment: Decommissioning is mentioned multiple times throughout both volume 1 part 2 and part 3 of the PEIR.	Natural England advises that within the ES, there is a commitment to decommissioning and an outline decommissioning plan.	N	**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Proposed Project Description** contains details relating to decommissioning. The technical environmental assessments contained within the ES have assessed the decommissioning phase; in the specific topic chapters. As stated within **Application Document 3.1 draft Development Consent Order**, a written scheme of decommissioning is to be submitted for approval by the relevant planning authority in advance of any decommissioning works.
		Agriculture and Soils	Figure 3.7.1 When mapping ALC data Natural England advise the ALC grades are defined by a standard colour notation. It is important this is complied with to avoid confusing users. The RGB codes in ArcGIS systems used by Natural England are as follows: Grade 1 : Red = 0, Green = 129, Blue = 254 Grade 2 : Red = 194, Green = 251, Blue = 254 Grade 3a : Red = 1, Green = 129, Blue = 0 Grade 3b : Red = 165, Green = 254, Blue = 164 Grade 4 : Red = 254, Green = 251, Blue = 105 Grade 5 : Red = 178, Green = 136, Blue = 100 Non-Agricultural : Red = 254, Green = 196, Blue = 85	Natural England advises the ALC grades are defined by a standard colour notation.	N	Subsequent ALC figures will utilise the standard colour notations.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Urban : Red = 255, Green = 99, Blue = 85			
		Terrestrial Ecology and Landscape and Visual	**Ancient Woodland and Ancient/Veteran Trees** 1.1.4.4 2.3.9.4 Natural England notes that the proposed route, has the potential to impact ancient woodland identified by the Ancient Woodland Inventory. Notably, some of these woodlands are also designated as CWS. The proposed route is planned to come within close proximity to ancient woodland (outside the footprint of the woodland), in these circumstances' impacts may be avoidable or mitigation may be possible to prevent deterioration or loss of ancient woodland from occurring. However, to achieve this, it will be integral to consider Natural England and the Forestry Commission's standing advice11 for planning authorities in relation to ancient woodland and ancient and veteran trees. Natural England advises that the applicant should read this standing advice and applies this information to the design of their scheme. In particular, it will be important to consider Natural England's buffer zone advice at the earliest possibly stage. Please note the advice around the 15m buffer zone, and the instances upon which this buffer zone should be extended. You should consider any impacts on ancient woodland and ancient and veteran trees in line with paragraph 180 of the NPPF. Further advice regarding ancient woodland can be found on page 104 (para 5.4.14 & 15) and page 107 (para 5.4.32) of the soon to be designated NPS EN-112. Natural England maintains the Ancient Woodland Inventory13 which can help identify ancient woodland. It should be taken into account by planning	Natural England advises Sea Link to adopt Natural England and the Forestry Commission's standing advice14 for planning authorities in relation to ancient woodland and ancient and veteran trees.	N	15 m buffer zones around both Ancient Woodland sites within Suffolk are shown on the Tree Constraints Plans and Tree Protection Plans. In addition, the root protection areas for all veteran and ancient trees have been increased to 15 times the stem diameter (measured at 1.5 m) or 5 m from the edge of the tree canopy (whichever is greatest) as per standing advice from Natural England and the Forestry Commission. All impacts to ancient woodland and ancient or veteran trees are considered within the **Application Document 6.10 Arboricultural Impact Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			authorities when determining relevant planning applications.			
		Walking, Cycling and Horse-riders	**Connecting people with nature (National Trails, open access land and England Coast Path)** 2.11 Natural England notes that the proposed cabling route crosses public rights of way (PRoW). Paragraphs 100 and 174 of the NPPF highlight the important of public rights of way and access. Further advice is provided on this topic within the soon to be designated NPS EN-1 (pg. 152 - 3, para 5.11.24 & 5.11.30). Development should consider potential impacts on access land, common land, rights of way and coastal access routes in the vicinity of the development. Consideration should be given to the King Charles III England Coast Path. The stage between Aldeburgh to Hopton-on-Sea15 has been partially approved and we advise the applicant to make sure there is suitable provision for the ECP in this development proposal and we would welcome discussion about how this might be achieved. Consideration should also be given to the potential impacts on the any nearby National Trails. The National Trails website www.nationaltrail.co.uk provides information including contact details for the National Trail Officer. Appropriate mitigation measures should be incorporated for any adverse impacts.	Sea Link should contact Natural England if they believe the development may affect the King Charles III England Coast Path and consider potential impacts on access land, common land, rights of way and coastal access routes in the vicinity of the development.	N	A complete assessment of socio-economics effects has been undertaken has be undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-economics, Recreation and Tourism and Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-economics, Recreation and Tourism**. The assessment considers potential impacts on access land, common land, rights of way and coastal access routes in the vicinity of the development. The assessment has not identified a significant effect on the King Charles III England Coast Path.
		Landscape and Visual	**Landscape and Nature Recovery – please see our detailed landscape comments (Annex 3) for advice on Protected Landscapes** 2.3, 2.7 We advise that the draft order limits contain land parcels which form part of a live Agri-environment scheme which is currently delivering benefits for nature, including the management of priority habitats. Consideration must therefore be given to any permanent and/or temporary impacts from the	Consideration must be given to any permanent and/or temporary impacts from the proposals on the scheme and implications for the agreement holder in terms of any necessary relocation of options, derogations, pay back of grant funding, scheme penalties etc.	N	The requirement to consider impacts on agri-environment and stewardship schemes is noted. The Proposed Project would have an impact on land under agri-environment/stewardship schemes. The implications for the agreement holder in terms of any necessary relocation of options, derogations, pay back of grant funding, scheme penalties, etc. will be dealt with through compensation agreements, which lie outwith the scope of the EIA. Any impacts on ecology and how these schemes support the current and future ecological baseline has been assessed as part of the individual habitat and species assessments presented in the ES, and mitigation proposed where required. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			proposals on the scheme and implications for the agreement holder in terms of any necessary relocation of options, derogations, pay back of grant funding, scheme penalties etc. Loss of habitat under Countryside Stewardship (CS) Higher Tier and Mid Tier, may result in direct land take or damage to land under agreement. Any land removed from Agri-Environment schemes may result in repayment of subsidies dating back to year 1 of the scheme, and with additional penalty. Construction and operational activities that pose an impact to agreement land in terms of water resources and quality of habitat and species, loss and fragmentation and disturbance (noise, vibration, light and visual) should be considered. Timing and dates of work should be considered to ensure that habitats retained can be sufficiently maintained. Required mitigation should be included with the Code of Construction Practice and secured in the DCO. It should also be noted that any compulsory land purchases which are subject to agri-environment schemes would also need to be repaid.		**and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. National Grid understand that grant funding schemes are private agreements and therefore at this point in time we do not hold the necessary information to allow consideration of appropriate mitigation. However, it is anticipated the landowner will be able to seek recovery of losses arising from delivery of the scheme through the compensation code as further details emerge and discussions between landowners and National Grid continue.
		Terrestrial Ecology	**Appendix 1** **Biodiversity Net Gain** Natural England considers that ambitious BNG targets for Nationally Significant Infrastructure Projects are integral to halting development's role in biodiversity loss. It should be noted that a significant amount of other valuable and sensitive habitats and species could be affected by this project, including priority habitats and species, County Wildlife Sites and Local Nature Reserves, SSSIs and European sites. Priority habitats and species listed under section 41 of the NERC Act are, in the Secretary of State's opinion, of principal national importance for the purpose of conserving biodiversity. Neither the Environment Act 2021 or BNG change existing legal protections for important habitats, wildlife species and designated sites. It maintains the mitigation hierarchy of avoid impacts first, then mitigate and only compensate as a last resort. As a first principle, the project should therefore represent no 'biodiversity net loss' in these regards.	N	Please refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report** for further details regarding Biodiversity Net Gain.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			In this regard, Natural England advises that a project of this scale has the potential to provide a positive environmental legacy for the area within which it is proposed, with considerable long-term benefits to people and wildlife.		
		Terrestrial Ecology	We welcome the commitment to delivering BNG on this project. We recommend that the target increase in BNG of 10% across all biodiversity unit types is secured by a suitably worded requirement in the DCO and we would be keen to work with the applicant to help realise any such ambition. Natural England may be able to help identify priority opportunity areas for BNG, which will achieve a 'strategic significance' multiplier through the metric. In the future, Local Nature Recovery Strategies (LNRS)16 will be used to help inform how and where biodiversity net gain should be delivered, i.e. which habitats are ecologically appropriate in which locations. In particular, LNRS can be used to target offsite BNG so that it contributes to the Nature Recovery Network17 and the LNRS can be used to determine the 'strategic significance' score that is part of the Biodiversity Metric scoring approach. The 'strategic significance' score is a landscape scale factor, which gives additional unit value to habitats that are located in preferred locations for biodiversity and other environmental objectives. Currently, other local strategies can be used to inform offsite targeting prior to implementation of LNRS, such as: biodiversity action plans green infrastructure strategies catchment management plans biodiversity opportunity areas local nature partnership documentation river basin management plans intertidal habitat creation/restoration plans the relevant local plan Any decisions around BNG you make, should seek to contribute to the Nature Recovery Network in the most beneficial way possible. The Nature Recovery Network is a flagship government policy of the 25 Year Environment Plan which aims to reverse the declines in UK nature. We strongly encourage you to use the Nature Networks Evidence Handbook18 when designing your BNG proposals. In simple terms, the Statutory Biodiversity Metric should compare the current biodiversity value of all habitats within the development boundary (excluding irreplaceable habitats) with those to be delivered (retained, enhanced or created) post-development, plus, any off-site biodiversity units attributed to the development. This is with the intention of demonstrating an overall increase in biodiversity (minimum 10 % uplift from the baseline). Whilst 10% is the minimum requirement, Natural England encourage the applicant to consider a more ambitious percentage biodiversity net gain target than the minimum. Additionally, further benefits could be achieved by securing and managing any habitat created to achieve BNG for longer than the typical 30-year period, as	N	National Grid agrees. Please refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report** for further details.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			well as considering additional enhancements after the initial 30-year period has been completed.		
		Terrestrial Ecology	The proposals should align closely with the existing suite of 'good practice principles'19 for biodiversity net gain that have been developed and published. These same principles also form the basis of the BS8683:2021 Process for designing and implementing biodiversity net gain20. The biodiversity net gain approach embeds a fundamental principle for spatial hierarchy of habitat delivery, where there is a preference for onsite or local enhancements. Biodiversity Metric 4.0 incentivises habitat delivery on or close to the development site through a 'Spatial Risk Multiplier', which reduces the biodiversity value of habitats delivered further away from the development. Good Green Infrastructure planning and design can also help to deliver gains for biodiversity, as well as wider benefits for nature and people. The Green Infrastructure Framework Green Infrastructure Home (naturalengland.org.uk)21 includes a range of tools and guidance, including design principles to support developers in planning and delivering more and better-quality GI. It was a commitment within the 25 Year Environment Plan and is referenced within the National Model Design Code. A key purpose is to define what good green infrastructure looks like for local planners, developers, parks and greenspace managers and communities, and how to plan it strategically to deliver multiple benefits for people and nature. The Urban Nature Recovery Standard is focused on increasing the proportion of GI that is designed and managed for nature recovery, which directly links into the ambitions around Biodiversity net gain. We consider that achieving BNG could, following completion of the project, provide significant benefits through: Enabling wildlife to adapt to the challenges of the future including habitat fragmentation, climate change etc. Providing a wealth of natural capital benefits such as flood prevention, improved air quality, improved soils, clean water etc. Providing inspiration and enjoyment for people through regular access to a high-quality natural environment, improving community health and wellbeing (both mental and physical). This should include enhancement of public access where practical (i.e., where it would not compromise the biodiversity interest, for example) and could also involve local stewardship of any new habitat creation.	N	It is considered that the use of a Biodiversity Net Gain parameters line as the boundary for the Biodiversity Net Gain Assessment, rather than the Order Limits, is proportionate to the potential impacts of the Proposed Project. These Biodiversity Net Gain parameters line will include all works areas but will not include land affected, based on the current design, therefore encompasses 'all land necessary to carry out the Proposed Project'. National Grid's aim is to provide habitats that are adaptable and resilient to climate change, provide natural capital benefits where possible and where suitable will be public access. Further information is contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Terrestrial Ecology	We advise that such an approach would be in line with: The Environment Act 202122, NSIPS granted development consent in England will have to deliver at least 10% BNG from no later than November 2025. BNG will be measured using the Statutory Biodiversity Metric and habitats will need to be secured for at least 30 years. This sits alongside a strengthened legal duty for public bodies to conserve and enhance biodiversity. The construction industry research and information association (CIRIA), the Chartered Institute of Ecology and	N	Date of Biodiversity Net Gain requirement for NSIPs is not currently known. The Proposed Project is still committed to delivering 10% Biodiversity Net Gain. All other points are agreed. Please refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report** for further details.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Environmental Management (CIEEM) and the Institute of Environmental Management and Assessment (IEMA) have launched Biodiversity Net Gain Best Practice guidance23 to which Natural England provided input to and further best practice guidance including BS8683:2021 Process for designing and implementing biodiversity net gain24 is also now available. Many major infrastructure projects in the UK have now committed to delivering a biodiversity net gain and some examples of these are included in this guidance. The NPS for Energy (NPS EN – 1): this provides the primary basis for decisions on applications for development consent for energy projects. Section 4.6 'Environmental and Biodiversity Net Gain' of the soon to be designated NPS provides detailed advice on BNG. The Government's 25 Year Environment Plan25 sets out the aspiration to mainstream BNG in the planning system and move towards approaches that integrate natural capital benefits. This has also been referenced in the Environmental Improvement Plan. The National Planning Policy Framework (NPPF)26: The NPPF identifies that one of the three overarching objectives to achieving sustainable development through the planning system is an environmental objective "to protect and enhance our natural…environment; including making effective use of land, improving biodiversity…". The current version of the NPPF was published on 5 September 2023 and is supported by Planning Practice Guidance (PPG). Whilst the NPPF does not contain specific policies for NSIPs it may be a relevant consideration in their determination. The NPPF includes policies to protect and enhance the natural environment, importantly including policies on biodiversity and wider environmental net gain; specifically, planning policies and decisions should contribute to and enhance the natural and local environment by providing net gains for biodiversity and are to identify and pursue opportunities for biodiversity net gain (paras 174,179 and 180) and wider environmental gain (paras 120, 180). Delivering biodiversity net gain is also referred to in the National Infrastructure Commission's Design Principles27 and the National design guide28. Latest Government guidance on Biodiversity net gain: Biodiversity net gain - GOV.UK (www.gov.uk)29."		
		Consultation	**Annex 2_PEIR Specialist Advice_Kent Onshore Scheme** **Preliminary Environmental Information Report (PEIR) Review** **Annex 2– Kent Onshore Scheme In formulating these comments, the following documents have been considered:** Part 1 Introduction; Chapter 3 Figures Part 1 Introduction; Chapter 4 Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures Part 3 Kent Onshore Scheme; Chapter 1 Evolution of Kent Onshore	N	These comments have been noted by National Grid.

Our key concerns along with recommendations are presented in further detail in Table 2.			
	Ornithology	**Summary of Key Concerns** **Table 1 Summary of Key Issues - Kent Onshore Scheme** Our comments on the PEIR have been limited by the lack of baseline survey data provided, specifically data relating to breeding and wintering birds and collision risk modelling.	**Natural England's Recommendations to Resolve Issues.** All baseline surveys adopting Natural England's Standard Advice should have been undertaken by the DCO submission. The survey methodologies, areas of survey and survey conditions (e.g., weather, time of day) should be clearly stated to enable a robust assessment of impacts. Full datasets should be provided rather than highlighting where significant species populations have been found.	N	The first season of wintering and breeding bird reports, the vantage point survey report, the collision risk assessment and the mitigation proposals for loss of golden plover habitat have all been shared with Natural England. Further survey reports were shared as they are produced. These are contained in: • **Application Document 6.3.2.2.B ES Appendix 2.2.B Suffolk Wintering Bird Report;** • **Application Document 6.3.2.2.C ES Appendix 2.2.C Suffolk Breeding Bird Report;** • **Application Document 6.3.3.2.B ES Appendix 3.2.B Wintering Bird Survey Report 2022-2023;** • **Application Document 6.3.3.2.C ES Appendix 3.2.C Wintering Bird Survey Report 2023-24;** • **Application Document 6.3.3.2.D ES Appendix 3.2.D Breeding Bird Survey Report 2023; and** • **Application Document 6.3.3.2.E ES Appendix 3.2.E Breeding Bird Survey Report 2024.**
	Terrestrial Ecology, Design and	Direct loss of Thanet Coast & Sandwich Bay SPA/Ramsar has been screened	No detailed viability assessment which takes into account local ground conditions, has been	N	Geotechnical investigation has now confirmed that a trenchless construction solution is feasible and an open trench option will therefore not be included in the DCO application. Nonetheless, it is

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Onshore Mitigation	out of further assessment, due to trenchless techniques being used.	conducted for the proposed trenchless crossing at Pegwell bay. Without a detailed feasibility assessment, it is difficult to understand the likelihood of success, and the associated risks of trenchless crossings. Natural England advise that trenchless crossing techniques utilised to cross designated sites should be considered as a mitigation measure, which should be assessed in further detail at the appropriate assessment stage. Detailed assessment should determine whether this proposed mitigation measure can avoid adverse effects on integrity upon the Thanet Coast & Sandwich Bay SPA/Ramsar and Sandwich Bay SAC.		noted that this construction methodology should be considered a mitigation measure at appropriate assessment rather than an avoidance measure at HRA screening. Therefore, **Application Document 6.6 Habitats Regulations Assessment Report** covers this in the Appropriate Assessment section.
		Ornithology and Onshore Mitigation	The preliminary conclusions relating to functionally linked land (FLL) appear to take the view that should no more golden plover be recorded, the areas surveyed would not be functionally linked.	Loss of functionally linked land for golden plover should be assessed through an appropriate assessment regardless of subsequent survey data, as 700 individuals have been surveyed using the land previous and any data is a snapshot in time which doesn't take into account variability in usage. Natural England advise that mitigation measures should be considered, to mitigate for the direct loss of FLL linked to the Thanet Coast & Sandwich Bay SPA, as well as to mitigate against disturbance to adjacent FLL from the construction phase.	N	Although no significant congregations of golden plover have been recorded in the second season of non-breeding bird surveys, National Grid is assuming as a precaution that although only recorded on one survey visit the converter station field is functionally linked land for golden plover. Therefore, **Application Document 6.6 Habitats Regulations Assessment Report** covers this in the Appropriate Assessment section and sets out that loss of functionally linked land will be mitigated through enhancement of 10 ha of arable land off site as discussed with Natural England. Mitigation is set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Noise and Vibration, Ornithology and Landscape and Visual	Noise assessments have not included ecologically sensitive receptors, such as breeding bird populations of Sandwich Bay to Hacklinge Marshes SSSI, or designated bird features of the Thanet Coast and Sandwich Bay SPA and Ramsar site.	We advise that noise assessments for all phases of the development should consider impacts to the qualifying features of the Thanet Coast and Sandwich Bay SPA and Ramsar site, and Sandwich Bay to Hacklinge Marshes SSSI. Natural England also advise that visual and light assessments for all phases of the development should	N	Detailed noise modelling has been undertaken for the DCO using criteria discussed with Natural England. Further information is contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. This does consider impacts on breeding birds. The assessment contained within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** has considered visual and light impacts to the breeding bird populations of Sandwich Bay to Hacklinge Marshes SSSI, as well as impacts to golden plover

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				consider impacts to the breeding bird populations of Sandwich Bay to Hacklinge Marshes SSSI, as well as impacts to golden plover (linked to the Thanet Coast & Sandwich Bay SPA) which utilise FLL within and adjacent to the draft order limits.		(linked to the Thanet Coast and Sandwich Bay SPA). Noise and visual disturbance on the breeding bird populations of Sandwich Bay to Hacklinge Marshes SSSI, as well as impacts to golden plover following mitigation are not considered to be significant. Mitigation measures are set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Onshore Route location, Design and Ornithology	Little information has been provided to demonstrate that the least damaging connection option to the existing overhead lines has been carefully considered. Introduction of new overhead lines could result in significant long-term impacts to qualifying bird features of neighbouring intonationally designated sites (Thanet Coast & Sandwich protected bird species. Whereas the buried cable option would have predominantly short-term impacts.	Natural England questions whether trenchless crossing techniques have been considered for the combined crossing of the Sandwich Bay to Hacklinge Marshes SSSI, railway and river Stour. Further assessment should be conducted, to quantify the impacts to designated sites and protected species from all grid connection options (overhead lines or buried cables). Selection of the final option should demonstrate that it has adhered to the mitigation hierarchy of avoid, mitigate, compensate is following as per paragraph 180 of the NPPF.	N	The alignment of the overhead line was considered in developing the Kent Onshore Scheme. It was ultimately determined that a much longer overhead line connection to the north would have a more detrimental effect environmentally (considering all topics, not just ecology) than the short section across the River Stour. Opportunities for buried cables under the River Stour were also considered but engineering issues partly related to the high water table rendered that less favourable than an overhead line connection. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** sets out the main alternatives considered in relation to the Kent Onshore Scheme including the reasons behind the decision to cross the River Stour with an overhead line.
		Onshore Mitigation	At points the applicant has not followed the mitigation hierarchy, often proceeding immediately to mitigate rather than exploring options to avoid impacts in the first instance.	We advise that the mitigation hierarchy of avoid, mitigate, compensate is following as per paragraph 180 of the NPPF.	N	When developing the Proposed Project, the mitigation hierarchy has been applied and the following steps have been considered: Avoidance, Minimisation, Rehabilitation/Restoration and Offsetting. Each topic chapter of the ES has identified proposed mitigation measures that are required to address potential significant adverse effects of the Proposed Project, following the mitigation hierarchy. Mitigation has been categorised as follows: - Embedded Measures: are those that are intrinsic to and built into the design. They include the avoidance of potential receptors, such as designated sites, through sensitive routeing, siting and design. - Control and Management Measures: These are good practice measures that are included within the Code of Construction Practice (CoCP) and other control and management plans such as the use of road sweepers and the implementation of measures to control silt-laden runoff during construction. - Mitigation Measures: These are measures over and above embedded measures, for example anything that has been added to the design purely to mitigate an effect such as landscape planting. Further details are contained in **Application Document 6.2.1.5 Part 1 Introduction Chapter 5 EIA Approach and Methodology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Onshore Route location and Design	Little information has been provided relating to the decommissioning phase and the impact it could have on Thanet Coast and Sandwich Bay SPA/Ramsar.	Further clarity should be provided around whether cables are to be left in situ or removed. If they are to be removed, can this be done using trenchless techniques or would loss of European site (however temporary) be required.		If the Proposed Project is required to be decommissioned, the proposed underground cables would be decommissioned. Dependent on specific requirements, the redundant cables could either be left in-situ, or all or parts of the cable could be removed for recycling. Where this is not possible, removed cables would be disposed of in accordance with the relevant waste disposal regulations at the time of decommissioning. **Application Document ES 6.2.1.4 Part 1 Introduction Chapter 4 Proposed Project Description** provides further details relating to the decommissioning phase of the Proposed Project. Each technical ES chapter assesses the decommissioning phase impacts of the Proposed Project. The assessment on ecological receptors relating to the decommissioning phase is included within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. It should be noted that these chapters assume that the cables and ducts may be left in situ where the methods for removal would be more damaging than their method of installation.
		Design	**Project Parameters- Documents Used: Part 1 Chapters 1, 3, 4 and 5** **Project Description** 1.4.3 The elements of the Kent Onshore Scheme have been clearly defined and options explained where necessary. It is clear what will occur during construction, operation and decommissioning.		N	These comments have been noted by National Grid.
		DCO process	**Natural England's Position on Worst Case Scenario** 1.5.5 Natural England supports the use of the Rochdale Envelope Approach in assessing the worst-case scenario of a project.		N	These comments have been noted by National Grid.
		Design	1.5.7.22 The two alternative scenarios for the Kent Onshore Scheme have been clearly explained and the methodology for when these are used in assessment is clear.		N	These comments have been noted by National Grid.
		Terrestrial Ecology	**Baseline Characterisation – Document(s) Used: PEIR Part 3 Chapter 3 Ecology and Biodiversity** **Survey Data Acquisition** 3.3.5.5 The amount of field survey data available in the PEIR is disappointing as	We note that most surveys have either just started or are due to take place in 2024. Natural England will provide our full advice on these once a complete data set is available, for now we will focus our comments on	N	All survey progress was shared with Natural England and survey reports shared as they were produced.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			it limits the advice and recommendations that Natural England can give at this stage. We do however acknowledge the difficulty in accessing certain land parcels to enable surveys to be completed. "	the methodologies and any early findings.		
		Ornithology	3.3.5.203. 3.5.23 Though the methodologies for the breeding and wintering bird surveys is clearly explained, it would have been beneficial to provide a map demonstrating survey points/routes for us to review.	Provide a map or detailed explanation to clearly demonstrate the areas surveyed for breeding and wintering bird species.	N	The breeding and wintering bird survey reports including maps showing survey transects have now been shared with Natural England. The surveys include nocturnal visits where relevant and take account of weather conditions and crop types. These are contained in: • **Application Document 6.3.2.2.B ES Appendix 2.2.B Suffolk Wintering Bird Report 2022-23;** • **Application Document 6.3.2.2.C ES Appendix 2.2.C Suffolk Breeding Bird Report 2023-34;** • **Application Document 6.3.3.2.B ES Appendix 3.2.B Wintering Bird Survey Report 2022-2023;** • **Application Document 6.3.3.2.C ES Appendix 3.2.C Wintering Bird Survey Report 2023-24;** • **Applicant Document 6.3.3.2.D ES Appendix 3.2.D Breeding Bird Survey Report 2023; and** • **Application Document 6.3.3.2.E ES Appendix 3.2.E Breeding Bird Survey Report 2024.**
		Ornithology	3.3.5.203 3.5.23 Currently no information has been submitted concerning the date on which bird surveys were undertaken, the weather conditions, the tidal state (if relevant) or the crop type on fields (if relevant). It is important to conduct surveys at different times of day/night and in different weather conditions as this impacts bird behaviour. At this time, it is unclear whether a sufficient range of circumstances have been surveyed.	The applicant should ensure that bird surveys are conducted at varying times of day/night, in different weather conditions and take account of the tidal state and crop type (if relevant). This information should be clearly displayed in the Environmental Statement to enable us to review whether a sufficient range of circumstances have been surveyed.	N	The breeding and wintering bird survey reports including maps showing survey transects have now been shared with Natural England. These are contained in: • **Application Document 6.3.2.2.B ES Appendix 2.2.B Suffolk Wintering Bird Report 2022-23;** • **Application Document 6.3.2.2.C ES Appendix 2.2.C Suffolk Breeding Bird Report 2023-34;** • **Application Document 6.3.3.2.B ES Appendix 3.2.B Wintering Bird Survey Report 2022-2023;** • **Application Document 6.3.3.2.C ES Appendix 3.2.C Wintering Bird Survey Report 2023-24;** • **Applicant Document 6.3.3.2.D ES Appendix 3.2.D Breeding Bird Survey Report 2023; and** • **Application Document 6.3.3.2.E ES Appendix 3.2.E Breeding Bird Survey Report 2024.**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Ornithology	Table 3.3.26 The collision risk modelling discussed in the preliminary assessment of killing and injury of birds during operation will use the tallest pylon scenario to determine risk, however it is unclear why this has been chosen. It is our view that the different pylon height options would have different levels of risk for different bird species dependant on their typical flight height, as the cables would cut across different heights.	We advise that flight line surveys that demonstrate collision risk should record bird species and their flight heights in bands, which can then be compared against the pylon options rather than using just the tallest pylon scenario. This will help to inform the types of pylons used if a collision risk is recorded for a specific option.	N	Vantage point survey results have been shared with Natural England along with the output of the collision risk report. Since the difference in height between the different pylons is 10 m this is insufficiently great to make much difference to collision risk. This assessment is detailed within **Application Document 6.3.2.2.C ES Appendix 2.2.C Suffolk Breeding Bird Report**, **Application Document 6.3.3.2.D ES Appendix 3.2.D Breeding Bird Survey Report 2023**, and **Application Document 6.3.3.2.E ES Appendix 3.2.E Breeding Bird Survey Report 2024.**
		Terrestrial Ecology	**Data Gaps** Part 3 Chapter 3 There are significant gaps in survey data for the majority of species listed in this chapter meaning that we are currently unable to provide full comment on potential impacts.	It is recognised that the required surveys are commencing in late 2023 and continuing through 2024. We would expect all surveys to have been completed, data analysed, and, if necessary, mitigation proposed by the DCO submission.	N	All survey progress has been shared with Natural England and survey data has been shared as they were produced and all bird surveys have been completed. Bird survey reports were shared with Natural England, as was the Kent Vantage Point Survey Report and collision risk assessment, and a complete draft of **Application Document 6.6 Habitats Regulations Assessment Report**. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and their associated appendices.
		Ornithology	**Data Analysis, Modelling and Reporting** 3.3.8.19 Though only one year of bird surveys have been undertaken, it would have been beneficial in the interim for a table to have been provided demonstrating the bird species recorded in the more recent surveys, and in what numbers to enable a thorough review of data.	When the DCO application is made and the full Environmental Statement submitted, we would expect the complete bird survey data to be provided within the documents so it can be assessed.	N	All survey progress has been shared with Natural England and survey reports have been shared as they have been produced. The bird survey data is contained in: • **Application Document 6.3.2.2.B ES Appendix 2.2.B Suffolk Wintering Bird Report 2022-23;** • **Application Document 6.3.2.2.C ES Appendix 2.2.C Suffolk Breeding Bird Report 2023-34;** • **Application Document 6.3.3.2.B ES Appendix 3.2.B Wintering Bird Survey Report 2022-2023;** • **Application Document 6.3.3.2.C ES Appendix 3.2.C Wintering Bird Survey Report 2023-24;** • **Application Document 6.3.3.2.D ES Appendix 3.2.D Breeding Bird Survey Report 2023; and** • **Application Document 6.3.3.2.E ES Appendix 3.2.E Breeding Bird Survey Report 2024.**
		Onshore Mitigation	**HRA - Document Used: PEIR Part 5 Chapter 3 Habitat Regulations Screening Report** **Screening**	Natural England advises that further consideration is given to the Mitigation Hierarchy and design modifications which can be adopted	N	A robust alternatives assessment has been undertaken for the Proposed Project. Further information is contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design Development Report and Application Document 7.2 Strategic**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			5.3.1.6 “It also includes opportunities for environmental mitigation, compensation, and enhancement…”. Natural England advises that impacts to designated sites should be avoided in the first instance, before resorting to mitigation, and as a last resort turn to compensation once the Alternatives test and IROPI have been met.	to avoid, reduce and mitigate the impacts.		**Options Back Check Report** on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report October 2023)**.
		Onshore Route location, Habitat Regulations Screening and Terrestrial Ecology	5.3.5.31 Natural England notes that Sandwich Bay SAC has not been considered or screened for Likely Significant Effect (LSE) with regard to direct habitat loss, even though the cable route will pass directly through this designated site.	LSE screening exercise (from direct habitat loss) should also consider Sandwich Bay SAC.	N	There will be no loss of sand dune habitat for which Sandwich Bay SAC is designated. Further details regarding the assessment of impacts to Sandwich Bay SAC are included within **Application Document 6.6 Habitats Regulations Assessment Report**.
		Onshore Route location, Habitat Regulations Screening and Terrestrial Ecology	5.3.5.31 Natural England notes that LSE due to direct habitat loss has been screened out for all international designated sites (Sandwich Bay SAC, Thanet Coast & Sandwich Bay SPA and Ramsar Site). Whilst we acknowledge that permanent habitat loss of designated sites is avoided by the measure of burying the cables and the likelihood of recovery post installation. We still recognise that there is a riskof medium to long-term habitat loss or habitat degradation if open trench techniques are used to cross the designated sites. This has been the case for the Nemo interconnector cable, which crossed the designated sites at Pegwell bay via open trenched techniques in 2017/2018 – after 5 years since construction was completed, there is still a large area of saltmarsh that has failed to re establish. Whilst we acknowledge that trenchless crossings would result in these impacts being avoided. It is difficult to agree with this conclusion without understanding the feasibility of such an embedded	Natural England advises that medium to long term habitat loss to designated sites is still a possibility, if trenchless techniques are not used for the landfall crossing. Whilst we acknowledge that trenchless crossings are an embedded measure, the feasibility of such a measure has not been assessed in any detail. Moreover, with any trenchless crossings, there always remains the risk of unintended effects such as sink holes or frac out. And potentially impacts from transiting between the jointing bay and exit pit. For the above reasons, we advise that LSE for medium to long term habitat loss, and habitat disturbance, should be screened in at this stage of the assessment. Trenchless crossings through designated sites should be considered as a mitigation measure and assessed in detail within the appropriate assessment. Natural England advise that the commitment register should be	N	As discussed with Natural England at thematic meetings, geotechnical investigation has been undertaken which demonstrates that a trenchless construction solution is feasible. Therefore, an open trench option through the SSSI will not be included in the DCO application. HVDC cables would be installed using a trenchless technique at the landfall to avoid direct impacts on Thanet Coast & Sandwich Bay SPA/Ramsar and Sandwich Bay SAC, this is set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			mitigation measure at this ecologically sensitive location. Without a detailed feasibility assessment, which takes into account local ground conditions, there is a clear risk that the open trench could be utilised as a backup option, if trenchless crossings operations were to fail. This risk is identified in commitments register EC-KT-PW-001 & EC-KT-001, where trenchless crossings have been described as being the 'preferred installation method'.	amended, to clearly state whether or not open trenched is a considered option for the cable landing at Pegwell bay. If open trenching method cannot be ruled out, then the worst-case scenario should assess the impacts associated with open trenching through the designated sites. As previously mentioned, Natural England advise that impacts to designated sites should be avoided in the first instance, before resorting to mitigation, and as a last resort turn to compensation once the Alternatives test and IROPI have been met.		
		Ornithology, Habitat Regulations Screening and Onshore Mitigation	5.3.5.33 to 36 Natural England notes that the first years' worth of wintering bird surveys has identified land at and around the proposed Minster converter station as being functionally linked land (FLL) for golden plover, a designated feature of the Thanet Coast & Sandwich Bay SPA.	Natural England advises that impacts to designated sites should be avoided in the first instance, before considering mitigation, and as a last resort turn to compensation. As FLL for golden plover has been identified, if loss of FLL cannot be avoided (via siting the development in an alternative location), then comprehensive mitigation measures will need to be provided to mitigate against the loss of FLL of the Thanet Coast & Sandwich Bay SPA.	N	A robust alternatives assessment has been undertaken for the Proposed Project to determine if it could be located elsewhere. In thematic meetings National Grid has been discussing with Natural England proposals for mitigating the loss of functionally linked habitat for golden plover, as well as for mitigating any disturbance effect on the nearby SSSI and ensuring no significant bird strike results from the new section of overhead line. Loss of functionally linked land will be mitigated through enhancement of 10 ha of arable land off site as discussed with Natural England.
		Ornithology, Noise and Vibration and Landscape and Visual	5.3.5.37 to 39 Natural England notes that no detailed noise assessment has been conducted for the terrestrial Kent end of the development, which considers sensitive ecological receptors such as the Thanet Coast and Sandwich Bay SPA/Ramsar site. Considering that land at Minster marshes has been demonstrated to be FLL for the golden plover, it is likely that all phases of the development would introduce noise, as well as visual and light disturbance to the adjacent FLL used by the golden plover	Natural England advises that detailed noise, visual and light disturbance assessments should be conducted, in order to understand the likely impacts to golden plover that utilise FLL located within and adjacent to the draft order limits.	N	Detailed noise modelling has been undertaken for the DCO using criteria discussed with Natural England. The operational development will not be lit (except for emergency access routes) and will not generate significant noise. There will be displacement of wintering golden plover during construction but a 10 ha area of mitigation land is being delivered in the long term to address this displacement. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The timing of delivery (before the loss of the existing habitat) is set out in **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent** which is secured through Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Ornithology, Habitat	5.3.5.49 We agree that collision risk should be screened in at this stage for	We note that precautionary mitigation (line markers for earth	N	The alignment of the overhead line was considered in developing the Kent Onshore Scheme. It was ultimately determined that a much

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Regulations Screening and Onshore Mitigation	Stodmarsh SPA/Ramsar pending the final vantage point survey results.	wires) has been proposed in the event of a collision risk. We advise that the mitigation hierarchy should be followed if proceeding to appropriate assessment. Currently, no evidence has been provided as to why impacts cannot be avoided in the first instance (i.e., trenchless crossing). Natural England questions whether trenchless crossing techniques have been considered for the combined crossing of the Sandwich Bay to Hacklinge Marshes SSSI, railway and river Stour.		longer overhead line connection to the north would have a more detrimental effect environmentally (considering all topics, not just ecology) than the short section across the River Stour. Opportunities for buried cables under the River Stour were also considered but engineering issues partly related to the high water table rendered that less favourable than an overhead line connection. Trenchless methods for installing the cables rather than overhead line were considered but are not feasible. The vantage point survey report and collision risk assessment have been shared with Natural England. A robust alternatives assessment has been undertaken for the Proposed Project to determine if it could be located elsewhere and why the crossing of the River Stour must be by overhead line. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design Development Report and Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project. In thematic meetings National Grid has been discussing with Natural England proposals for mitigating the loss of functionally linked habitat for golden plover, as well as for mitigating any disturbance effect on the nearby SSSI and ensuring no significant bird strike results from the new section of overhead line
		Terrestrial Ecology and Onshore Route location	5.3.5.55 Decommissioning impacts are 'considered to be very similar to construction period impacts' however it is not clear as to whether the cables will be left in situ or removed via trenchless/trenched technology.	This should be specified to confirm that there will be no more of an impact on Thanet Coast and Sandwich Bay SPA/Ramsar than that identified during the construction phase.	N	If the Proposed Project is required to be decommissioned, the proposed underground cables would be decommissioned. Dependent on specific requirements the redundant cables could either be left in-situ, or all or parts of the cable could be removed for recycling. Where this is not possible, removed cables would be disposed of in accordance with the relevant waste disposal regulations at the time of decommissioning. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** provides further details relating to the decommissioning phase of the Proposed Project. Assessment on ecological receptors relating to the decommissioning phase is included within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document ES 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. It should be noted that these chapters assume that the cables and ducts may be left in situ where the methods for removal would be more damaging than their method of installation.
		Inter-Project Cumulative Effects	**Documents used: Volume 1 - Part 5 - Chapter 3 Habitat Regulations Screening Report, Volume 1 – Part 3 – Appendix 3.14.A Descriptions of other projects, Volume 2 – Part 1 – Introduction – Appendix 1.5.B Inter-**	Natural England advises that the in combination assessment should include all plans and projects and assessed in greater detail within the Environmental Statement.	N	KCC/SCR/TH/0172/2022 - This has been added to the longlist and whilst an EIA is not required, this proposal will progress to the shortlist as it is situated 0.03 km from the Kent Order Limits and has therefore been included in the cumulative effects assessment.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			project cumulative effects initial long list **In- combination** 5.3.8.17 Natural England is aware of a previous Kent County Council EIA Screening opinion (KCC/SCR/TH/0172/2022) for a proposed photovoltaic array adjacent to the Weatherlees Hill WwTWs. In addition, Natural England are also aware of F/TH/23/0170, which received planning permission from Thanet District Council in August 2023.			F/TH/23/0170 - This has been added to the longlist and the shortlist and has therefore been included in the cumulative effects assessment.
		Terrestrial Ecology	**Assessment of SSSI impacts – Documents used – Volume 1 – Part 3 – Chapter 3 – Ecology and Biodiversity** **Screening** 3.3.8.2 Natural England agrees that only impacts to Sandwich Bay to Hacklinge Marshes SSSI should be considered as part of the Environmental Statement.		N	National Grid has noted this comment.
		Terrestrial Ecology and Onshore Mitigation	**Assessment** Table 3.3.14 It is our advice that the Applicant should follow the mitigation hierarchy (i.e., avoid, reduce, mitigate) when looking at direct loss of designated sites. Currently, it is stated that the project 'will minimise land take from Sandwich Bay to Hacklinge Marshes SSSI' however it is not clear why loss of SSSI cannot be avoided in the first instance and if not, how impacts will be reduced and/or mitigated.	It should be clearly stated why loss of SSSI cannot be avoided before mitigation is proposed in line with paragraph 180 of the NPPF.	N	It can be confirmed there will be no loss of SSSI. Some height reduction of trees/scrub in the adjacent area of SSSI will be required for the overhead line but it is understood the interest feature of this management unit is grassland. Further assessment is contained within **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Terrestrial Ecology and Onshore Mitigation	**Documents used – Part 1 – Chapter 3 – Figures** **Assessment** Figure 1.4.13 Natural England note that the Sandwich Bay to Hacklinge Marshes SSSI has not been appropriately considered in the indicative landscaping	Natural England advises that full boundary of the Sandwich Bay to Hacklinge Marshes SSSI should be considered.	N	The full boundary is considered in the ecology chapter. Further information is contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and the indicative landscape strategy shown in **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			strategy. A section of the SSSI has been proposed for native woodland planting. This would seem inappropriate as the main habitat type list for unit 11 of the SSSI is neutral grassland. We would also expect landscaping strategies to be located outside of designated sites.			
		Terrestrial Ecology	**Priority Habitats and Species listed under Section 41 list of the Natural Environmental and Rural Communities (NERC) Act, 2006.** **Potential impact pathways where further info/assessment required.** General comment: Natural England defer to our standing advice for protected species, which can be found on Protected species and development: advice for local planning authorities - GOV.UK (www.gov.uk).	Natural England defer to standing advice	N	National Grid has noted this comment.
		Inter-Project Cumulative Effects	**Cumulative Impact Assessment (CIA)** General comment As previously mentioned, Natural England are aware of a previous Kent County Council EIA Screening opinion (KCC/SCR/TH/0172/2022) for a proposed photovoltaic array adjacent to the Weatherlees Hill WwTWs. In addition, Natural England are also aware of F/TH/23/0170, which received planning permission from Thanet District Council in August 2023.	Natural England advises that the cumulative assessment should include all plans and projects and assessed in greater detail within the Environmental Statement.	N	KCC/SCR/TH/0172/2022 - This has been added to the longlist and, whilst an EIA is not required, this proposal will progress to the shortlist as it is situated 0.03 km from the Kent Order Limits and has therefore been included in the cumulative effects assessment. F/TH/23/0170 - This has been added to the longlist and the shortlist and has therefore been included in the cumulative effects assessment. **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Inter-Project Cumulative Effects** and **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Inter-Project Cumulative Effects** contain the full inter-project cumulative effects assessment.
		Terrestrial Ecology and Noise and Vibration	**Document used: Volume 1 – Part 3 – Chapter 13 Kent Onshore Scheme Intra-Project Cumulative Effects** **Cumulative Impact Assessment (CIA)** Table 3.13.1 & Table 3.13.2 Natural England question why prescreening has excluded noise and vibration for ecological receptors and designated sites. The proposal is likely to impact	Natural England advises that noise and vibration should be screened in and assessed for ecological receptors and designated sites.	N	Detailed noise modelling has been undertaken to inform the ecological assessment for the DCO. Mitigation measures are committed to in **Application Document 7.5.3.2 Register of Environmental Actions and Commitments (REAC)** including standard noise controls such as noise fencing, and timing of the most disturbing works (notably converter station platform creation and construction of the permanent access road north of the SSSI). These enable a conclusion of no likely significant effect. Further information is contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			designated breeding and wintering bird populations.			**Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Legislation and Policy inc. Permits and Terrestrial Ecology	**Other Onshore Related Matters** **Other Onshore Related Matters - Documents used – Volume 1 – Part 3 – Chapter 3 – Ecology and Biodiversity** **Onshore Protected Species** Table 3.3.7 Natural England recognises that much of the survey work relating to protected species is yet to commence. Therefore, it is our advice that should survey work determine a mitigation license be required, you engage with us as early as possible to secure a Letter of No Impediment (LONI).	Further advice on the process is provided on the Planning Inspectorate website.	N	National Grid has noted this comment.
		Legislation and Policy inc. Permits and Terrestrial Ecology	3.3.5.5 It has been agreed previously that impacts to Great Crested Newts can be addressed through our District Level Licensing (DLL) scheme.	Further advice on the process is provided on the Planning Inspectorate website.	N	National Grid has noted this comment.
		Terrestrial Ecology	**Biodiversity Net Gain** Table 1.4.F.4 The proposed project has committed to providing a 10% net gain in biodiversity; however, insufficient information has been provided beyond this to allow Natural England to comment at this stage.	Submission of ecological baseline data for the project limits and a biodiversity net gain strategy.	N	Please refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report** for further details. In addition to the Environmental Gain Report, further ecological baseline information is contained within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Terrestrial Ecology	**Documents used – Part 1 – Chapter 3 – Figures** **Biodiversity Net Gain** Figure 1.4.13 Natural England also notes that sections of the proposed enhanced riparian vegetation fall within areas which has already been enhanced under the Countryside Stewardship Scheme, to deliver wetland, scrapes and grazing marsh enhancements.	We advise that existing enhancements of the land should be considered, as this could limit the level of ecological improvements that can be achieved from the proposed enhanced riparian vegetation at these locations.	N	The baseline habitat surrounding the overhead line tie in location at the Kent site is currently under a stewardship agreement with Natural England and is in the process of being enhanced to Floodplain wetland mosaic and CFGM. To capture this and the habitats potential condition once construction starts in this area, this has been input into the metric as floodplain wetland mosaic and CFGM at good condition. Please refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report** for further details. The assessment of Biodiversity Net Gain is based on data collected as part of the ecological surveys undertaken.
		Agriculture and Soils and	**Documents used – Part 3 – Chapter 7 – Agriculture and Soils**		N	**Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk and Application Document 7.5.10.2 Outline Soil Management Plan – Kent** have been produced in line with best practice guidance including the Defra Construction Code of Practice.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Onshore Mitigation	**Soils and Best and Most Versatile Agricultural Land** 3.7.2.8 Natural England notes the applicants' commitments to providing a Soil Management Plan (SMP). The Environmental Statement and associated SMP needs to clearly demonstrate how the ALC Grades and soil types will inform soil handling and restoration, setting out the site specific mitigation measures with reference to the best practice guidance (Defra Construction Code of Practice), i.e. secondary mitigation measures. The British Society of Soil Science has published the Guidance Note Benefitting from Soil Management in Development and Construction which also contains useful guidance. Natural England support the inclusion to provide an outline SMP at ES submission. This should be informed through a site-specific soil survey			An individual Soil Management Plan will be produced for both Suffolk and Kent and will contain measures informed by the site specific information collated from the modelled assessment. There is a further commitment to complete surveys pre-construction, with the relevant soil management plans to be updated in line with pre-construction survey findings. The production of site specific pre-construction Soil Resource Plans is also committed to, and will allow for the adaptation of handling and management strategies in line with on-site soil resources and site-specific constructional activities. surveys. Please see the responses regarding the surveys for further information.
		Agriculture and Soils	3.7.2.11 Natural England supports the commitment to determine the extent of BMV land within the Draft Order Limits (DOL). We require that land quality and soil resources information is gathered for any land that is disturbed by the development. Ideally a full detailed ALC survey would have been carried out across the whole site.		N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach will be discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. Preconstruction surveys are committed to within **Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk** and **Application Document 7.5.10.2 Outline Soil Management Plan – Kent** which are secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**), and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice.
		Agriculture and Soils	3.7.4.2 Bullet 5 The British Standard reference is only necessary for imported soil use, not for site-won soil re-use on site. Bullet 7 The MAFF good practice has been superseded by the IQ Soils Guidance (quarrying.org) (2021).	We advise that the MAFF good practice guidance is replaced by the IQ Soils Guidance (2021).	N	Guidance text has been updated in line with this change.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Agriculture and Soils	3.7.4.4 We advise that a detailed ALC and soil survey of the agricultural land should be undertaken across the full Study Area to inform the EIA. This should normally be at a detailed level, e.g., one auger boring per hectare, supported by pits dug in each main soil type to confirm the physical characteristics of the full depth of the soil resource, i.e., 1.2 metres. Soil data collected as part of an ALC survey can also be used to inform the soil resource and management plan as set out in the Defra Construction Code of Practice for the Sustainable Use of Soils on Construction Sites.	The ALC survey should follow the Guide to assessing development proposals on agricultural land - GOV.UK (www.gov.uk). All land which may experience temporary or permanent disturbance should be subject to a detailed ALC survey, to inform suitable handling and restoration. The Environmental Statement should clearly demonstrate how the master planning has considered the ALC grades and avoided BMV where possible in line with paragraph 5.10.8 of the Draft NPS EN1.	N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach will be discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. Preconstruction surveys are committed to, and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice.
		Agriculture and Soils	Table 3.7.9 Full surveys have not yet been carried out. We advise that this should be undertaken as part of a comprehensive set of baseline soil and ALC information given that soil disturbance will take place in these areas. The soil survey will inform suitable soil handling and restoration criteria.	The soil and ALC surveys should be undertaken by qualified and experienced soil surveyors. The temporary displacement of soil as a result of the underground cable installation and temporary haul roads/construction compounds can result in permanent land quality change and soil damage if undertaken inappropriately, therefore, Natural England advise this should be considered in the SMP. This is required for consultees and decision makers to understand the extent (ha) and likely long-term impacts on agricultural land quality (ALC grade). The ES should present simple breakdowns for each of the individual components. For example, total agricultural area impacted by scheme (split by scheme component and by ALC grade), total area of BMV agricultural land (split by component) and total BMV agricultural area permanently and temporarily required for the development (split by component). The outline SMP needs to be clear that the aim is for BMV agricultural land to be returned to its original	N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach will be discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. Preconstruction surveys are committed to, and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice. The SMP will include requirements for soil handling, including wet weather cessation criteria, as well as requirements for toolbox talks and training, as well as the competencies expected for the individuals responsible for these tasks. The ES Chapter assesses the impacts of the development in further detail (for both soil and for BMV), examines the impacts both during construction and operation, as well as the temporary and permanent take for different aspects of the infrastructure.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				quality and all soils to be suitable for the planned end use. For example, this could be actioned by a target specification for the restored soils according to location and soil types, end use and required ALC grade. All soils should only be handled in a dry and friable condition, and it is expected that soil handling will be confined to the drier summer period to minimise risk of soil damage. Soil handling methods should normally be as specified as in the Defra Construction Code of Practice for the Sustainable Use of Soils on Construction Sites (including accompanying Toolbox Talks).		
		Onshore Route location and Design	2.7.5.5 The installation of overhead pylons typically requires substantial temporary development in the form of temporary access tracks, as well as the smaller permanent land take from the pylon footprint. It is acknowledged that the pylon footprint locations are subject to micro siting and the precise location is often not confirmed till late in the design process. Therefore, regarding the potential cable route (yet to be determined) the focus of the survey should be on the general route (to inform micro-siting).		N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach will be discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.2.6.A ES Appendix 2.6.A Predictive Agricultural Land Classification Report - Suffolk** and **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report – Kent** present the results of the ALC predictive modelling, which will include plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred the implications for soil type and land grade have been assessed; this therefore allows for sufficient information to inform micro sitting where required. Any options appraisal work undertaken prior to the predictive mapping, such as that undertaken during the route selection, uses the Department for Environment, Food and Rural Affairs (Defra) ALC mapping layer to identify area potentially comprising BMV land. As this layer does not differentiate between 3a and 3b, a precautionary assumption that all Grade 3 is BMV land is usually made.
		Agriculture and Soils	3.7.7.4 Natural England supports the use of existing detailed ALC mapping. Copies of the reports and mapping are available through Natural England's Access to Evidence Portal via MAGIC map.		N	Information from the Evidence Portal and MAGIC maps has been used to inform the preliminary assessment to date.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Agriculture and Soils	3.7.8.2 We advise that sensitive routeing or micro-siting should be informed by the ALC survey to avoid long term impacts.	The Environmental Statement should clearly demonstrate how the master planning has considered the ALC grades and avoided BMV where possible in line with paragraph 5.10.8 of the Draft NPS EN1.	N	Due to an elevated UXO risk across the project, detailed ALC site surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach will be discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. Following the published guidance the predictive assessment will be based on a 1 per ha or 1 per 100 m auger density, this therefore allows for sufficient survey information to inform micro sitting where required. Any options appraisal work undertaken prior to the collection of site-specific survey information (such as detailed ALC and/or soil information to be collected pre-construction), such as that undertaken during the route selection, uses the Department for Environment, Food and Rural Affairs (Defra) ALC mapping layer to identify potential extent of BMV land. As this layer does not differentiate between 3a and 3b, a precautionary assumption that all Grade 3 is BMV land is usually made.
		Agriculture and Soils and Onshore Mitigation	3.7.8.3 GG19 All soil stockpiles intended to remain in situ for more than 6 months or over the winter period are to be grassed over and weed control and other necessary maintenance carried out. AS01 Natural England support the provision of an SMP as part of the CEMP. See comment above (2.7.2.7). We note there is no commitment for a programme of supervision, monitoring and reporting as proposed, given the high quality of the land. This should include supervision of soil handling by a competent soil specialist. AS02 The spatial distribution of ALC grades determined from a detailed ALC survey are necessary to inform the reinstatement criteria, which allows the area of each ALC Grade temporarily disturbed to be returned to the same quality as far as practicable to minimise potential loss.	We advise that the Environmental Statement and associated SMP needs to clearly demonstrate how the ALC Grades and soil types will inform soil handling and restoration, setting out the site specific mitigation measures with reference to the best practice guidance (Defra Construction Code of Practice), i.e. secondary mitigation measures. The British Society of Soil Science has published the Guidance Note Benefitting from Soil Management in Development and Construction which also contains useful guidance.	N	**Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk and Application Document 7.5.10.2 Outline Soil Management Plan – Kent** have been produced in line with best practice guidance including the Defra Construction Code of Practice. Individual SMPs will be produced for both Suffolk Onshore Scheme and Kent Onshore Scheme and will contain measures informed by the information collated from the modelled assessment. There is a further commitment to complete surveys pre-construction, with the relevant soil management plans to be updated in line with pre-construction survey findings. The production of site-specific pre-construction Soil Resource Plans is also committed to and will allow for the adaptation of handling and management strategies in line with onsite soil resources and site-specific construction activities. This commitment is contained within **Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk** and **Application Document 7.5.10.2 Outline Soil Management Plan – Kent** which are secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). The SMP will include the requirements for on-going supervision and monitoring as well as the required competencies to be held by the responsible parties. Where agricultural land is to be returned to productive use the handling methodologies will outline the methods to minimise potential function loss as far as is practicable.
		Design	General comment: Decommissioning is mentioned multiple times throughout both volume 1 part 2 and part 3 of the PEIR.	Natural England advises that within the ES, there is a commitment to decommissioning and an outline decommissioning plan.	N	**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** provides further details relating to the decommissioning phase of the Proposed Project. No requirement for an Outline Decommissioning Management Plan has been identified at this stage.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
						A written scheme of decommissioning must be submitted for approval by the relevant planning authority at least six months prior to any decommissioning works. This is secured via Requirement 13 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Agriculture and Soils	Figure 3.7.1 Soilscapes mapping. When mapping ALC data Natural England advise the ALC grades are defined by a standard colour notation. It is important this is complied with to avoid confusing users. The RGB codes in ArcGIS systems used by Natural England are as follows: Grade 1 : Red = 0, Green = 129, Blue = 254 Grade 2 : Red = 194, Green = 251, Blue = 254 Grade 3a : Red = 1, Green = 129, Blue = 0 Grade 3b : Red = 165, Green = 254, Blue = 164 Grade 4 : Red = 254, Green = 251, Blue = 105 Grade 5 : Red = 178, Green = 136, Blue = 100 Non-Agricultural : Red = 254, Green = 196, Blue = 85 Urban : Red = 255, Green = 99, Blue = 85	Natural England advise the ALC grades are defined by a standard colour notation.	N	Subsequent ALC figures will utilise the standard colour notations.
		Terrestrial Ecology	**Other Onshore Related Matters - Documents used – Part 3 – Chapter 3 – Ecology and Biodiversity** **Ancient Woodland and Ancient/Veteran Trees** Natural England notes that there is no Ancient Woodland within the project limit, with the nearest site being Great Wood located 6km away at the closest point. We therefore advise that it is unlikely that there will be impacts on Ancient Woodland as a result of the Kent		N	As stated within **Application Document 6.10 Arboricultural Impact Assessment** no ancient woodlands have been identified within or near to the Order Limits in Kent.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Onshore scheme and have no further comments to make.			
		Walking, Cycling and Horse-riders and Construction - General	**Connecting people with nature (National Trails, open access land and England Coast Path)** 3.2.7.24 While visual impacts upon recreational users of the King Charles III England Coast Path have been considered in the landscape and visual chapter, impacts relating to access during construction have not been considered.	We advise that access to King Charles III Coast Path during construction is considered, implementing diversions if required to ensure pedestrians can safely continue their journey.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism and Application Document 6.2.3.10 Part 3 Kent Chapter 10 SociE-economics, Recreation and Tourism**. The assessment did not identify a significant effect on the King Charles III England Coast Path. In Kent, there are 16 locations where the proposed works would impact the existing PRoW network identified in **Application Document 6.3.1.4.A Appendix 1.4.A Crossing Schedules** and presented in **Application Document 6.4.1.4.5 PRoW, Highway and Railway Crossings**. As described in this document the King Charles III England Coast Path will be crossed via a trenchless crossing. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. An outline PRoW Management Plan has been prepared for Kent as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**.
		Walking, Cycling and Horse-riders and Construction - General	3.2.7.24 While visual impacts upon recreational users of the Saxon Shore PRoW have been considered in the landscape and visual chapter, impacts relating to access during construction have not been considered.	We advise that access to Saxon Shore PRoW during construction is considered, implementing diversions if required to ensure pedestrians can safely continue their journey.	N	Effects relating to the access requirements and PRoW diversions are included in the assessment of effects arising from the Kent Onshore Scheme on landscape character and visual amenity, as outlined within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Amenity effects on PRoW arising from changes in air quality, noise, vibration, visuals and transport are covered in **Application Document 6.2.2.11 Part 3 Kent Chapter 11 Health and Wellbeing**. An assessment of socio-economic effects has been undertaken which is set out in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. As documented in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**, the HVAC OHL route and restringing will interact with Saxon Shore Way on the southern bank of the River Stour. Safety scaffolding and netting will be installed for the installation and restringing of OHL conductors. This provision will remain in place for full construction phase of the project, allowing the route to remain open. A short-term closure (one to five days) will be required to install netting, which can be undertaken with stop/go boards and staff on site managing the public. In addition, a temporary bridge structure will span across River Stour interacting with Saxon Shore Way. Sufficient clearance will be provided between bridge soffit and PRoW route with safety scaffolding and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
						netting to be installed to ensure the route remains open and provides access for EA river maintenance. This provision will remain in place for full construction phase of the project. A short-term closure (one to five days) or local diversion (up to four weeks) will be required around the works (within Draft Order Limits) to install safety measures.
		Terrestrial Ecology, Agriculture and Soils and Ornithology	**Landscape and Nature Recovery** 3.3.8.11 While it is encouraging that the wetland scrapes at Abbey Farm have been highlighted for their local importance, Natural England would like to highlight that the arable land to the south of the river Stour is in a Higher-Level Stewardship agreement creating important habitat for bird species. It is currently unclear as to whether this land has been included in the baseline as habitat or under arable production.	We recommend that this land, some of which is within the project limits, is recognised as providing habitat rather than in arable production if it has not been done already.	N	The value of the land south of the River Stour to ornithology has been noted and is covered in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The habitat has been classed as grazing marsh (where it is wet grassland) or arable land where that is the habitat present as of January 2025, but its value for birds has been noted.
		Onshore Route location and Design	**Documents used – Part 1 Chapter 4 - Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures** **Commitments and Mitigation Measures Register** Table 1.4.F.2, EC-KT-PW-001 & EC-KT-001 "The preferred installation method for the Kent Landfall is a trenchless technique to minimise the loss of habitat within Sandwich Bay to Hacklinge Marshes Site of Special Scientific Interest (SSSI)" Natural England notes the use of the word 'preferred' in commitment EC-KTPW-001 implies that trenchless crossing techniques could revert to trenched techniques if trenchless crossing attempts were to fail.	Natural England were previously of the understanding that trenched crossings at the Pegwell bay landfall, had been fully ruled out of consideration. If open-trenched crossings at land fall are to be considered as a redundancy option (in the event that trenchless crossings fail), then the associated impacts to designated sites need to be appropriately assessed in the environmental statement. However, given impacts from existing projects, our default position is for HDD methods to be used.	N	National Grid confirm that a trenchless construction solution will be employed for the Kent landfall from the transition joint bay eastwards. An initial ground investigation survey has been undertaken to confirm the viability of this solution. Details are contained in **Application Document 7.3 Design Development Report**. The commitment to trenchless solutions is secured in Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Terrestrial Ecology	Table 1.4.F.2, EC-KT-PW-001 & EC-KT-001 Natural England notes that only Sandwich Bay to Hacklinge Marshes SSSI has been identified in the commitment description. The following designated sites are also crossed at the Kent landfall; Sandwich Bay SAC,	Natural England advises that all designated sites that are crossed at the landfall are appropriately referenced in the commitments register.	N	National Grid has noted this comment. All relevant designated sites are referenced in **Application Document 7.5.3.2 CEMP Appendix A Register of Environmental Actions and Commitments** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Thanet Coast & Sandwich Bay SPA and Ramsar site			
		Ornithology and Onshore Mitigation	Table 1.4.F.6 “Where feasible and necessary, the most potentially disturbing construction or decommissioning activities at the proposed Minster Converter Station and Minster Substation will take place between July and February to minimise disturbance of any breeding birds in the SSSI”. Natural England notes that the first season of wintering bird surveys have shown that the land in and around the proposed substation and converter stations is functionally linked land (FLL) for golden plover (qualifying feature of the nearby Thanet Coast & Sandwich Bay SPA). Aside from direct impact from loss of FLL, the construction and decommissioning activities will likely impact adjacent FLL. For this reason, mitigation measures should also be carefully considered to reduce impacts upon golden plover that use the land in the winter months.	As previously mentioned, Natural England advise that mitigation measures for disturbance of golden plover FLL need to be carefully considered for the construction and decommissioning phases.	N	Mitigation in the form of habitat creation (10 ha) for golden plover has been identified and proposals shared with Natural England. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Consultation	**Annex 3_PEIR Specialist Advice_Landscape & Visual** **Preliminary Environmental Information Report (PEIR) Review** **Annex 3 – Landscape & Visual** In formulating these comments, the following documents have been considered: Part 2 Suffolk Onshore Scheme; Chapter 2 Landscape & Visual Part 3 Kent Onshore Scheme; Chapter 2 Landscape & Visual **Natural England’s Advice and Recommendations** Our key concerns along with recommendations in relation to the Landscape and Visual Assessment are presented in Table 1 below.		N	National Grid has noted this comment.
		Landscape and Visual	**Comment** **Table 1 Seascape and Landscape Visualisation Assessment** **National designated landscapes**	**Recommendation** We advise that effects specifically on the Heritage Coast are separately considered and presented in the submitted ES.	N	Paragraph 178 of the NPPF has been included within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The approach to the assessment of the Suffolk Heritage Coast has been discussed with stakeholders, including Natural England. This included a thematic meeting held on 23 April 2024.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Table 2.2.3 This should also include NPPF para 178. Within areas defined as Heritage Coast (and that do not already fall within one of the designated areas mentioned in paragraph 176), planning policies and decisions should be consistent with the special character of the area and the importance of its conservation. Major development within a Heritage Coast is unlikely to be appropriate, unless it is compatible with its special character. We note that in the PEIR Heritage Coast effects are combined by the PEIR with effects on the AONB.			The assessment of the Heritage Coast is assessed separately to the AONB assessment, as set out within **Application Document 6.2.2.1 Part 2 Kent Chapter 1 Landscape and Visual**. Effects on the AONB are clearly set out, as requested by stakeholders through thematic meetings.
		Landscape and Visual and Onshore Mitigation	Table 2.2.41 This identifies a preliminary sensitivity as 'Very High' which we support. However, it identifies magnitudes of effect on a set range of natural beauty indicators as ranging from small/negligible to none. Consequently the effects of the construction phase are deemed to be not significant. Given that this scheme involves major construction activity within the AONB we are concerned that this underplays the actual effect on a very highly sensitive receptors.	We advise that the 'magnitude of effect' is reconsidered for the final LVIA and ES, and that the mitigation hierarchy is deployed to reduce impacts on sensitive landscape receptors to acceptable levels.	N	The support for the Very High sensitivity is noted. The assessment of effects on the AONB is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The mitigation hierarchy has been applied to lessen effects where possible.
		Landscape and Visual, Onshore Mitigation and Onshore Route location	Table 2.2.65 This identifies a preliminary sensitivity of Very High which we support. However the magnitude of effect on the AONB is deemed to be negligible / small and so the significance of effect is given as 'Not sgnificant'. The 'Confidence in prediction' for this is given as 'High'. However, given the known difficulties in fully reinstating cable routes so that they are not clearly discernible in the landscape (as a new and incongrous feature crossing the landscape) we would suggest that this level of confidence is not warranted. The principal embedded mitigation measure for the scheme as it affects the AONB is the undergrounding of the cables. We are familiar from other	We advise that the level of confidence given to full reinstatements is reviewed, and if an increased level of significance arises form the updated assessment, the mitigation hierarchy is deployed to reduce impacts to sensitive landscape receptors to acceptable levels.	N	The support for the Very High sensitivity is noted. The comment relates to the confidence prediction set out within the PEIR, however, this is not relevant for the ES so is not commented upon further. The mitigation hierarchy has been applied to lessen effects where possible. The assessment of effects on the AONB is within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** which makes reference to the statutory purpose and functionality. The assessment highlights that construction effects are considered to be temporary, acknowledges that reinstatement would take longer for some habitats and focuses on each of the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			schemes of this type with the assertion that because of this mitigation there would be no significant operational phase effects because the cable route would be fully reinstated. We also know however, that the latter cannot be guaranteed and that the cable route may be clearly visible running across the landscape, marked out by long-term and potentially permanent changes to surface vegetation due to a combination of soil structure disruption and/or drainage patterns altered by the buried infrastructure.			
		Inter-Project Cumulative Effects and Landscape and Visual	Table 2.14.30 This table summarises the residual cumulative effect of other energy generation and transmission developments with the Sea Link scheme. It identifies some significant construction phase effects but no significant operational phase effects. These assessments are based largely on the intervisibility of the schemes with Sea Link, and whether they occupy the same Landscape Character Area. However, there should also be consideration of how these schemes, with the addition of Sea Link, within this same part of the AONB: could alter public perceptions of this part of the AONB, with the area becoming principally associated with major development projects and energy infrastructure rather than natural beauty; and as a consequence of the above risk the area, in no longer delivering for that statutory purpose, being functionally removed from the AONB. This effect on the AONB does not depend on the schemes having intervisibility but will arise as people move through the area and repeatedly encounter energy developments, either in construction or operation.	We advise that the assessment of cumulative effects on the AONB is broadened to address this issue. The submitted ES should carefully consider how the potential impacts could be minimised and bring forward relevant measures.	N	The assessment of potential cumulative effects includes specific assessment on the Suffolk Coast and Heaths AONB and is set out within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. This assessment considers the statutory purpose of the AONB and the potential for people moving through the landscape repeatedly encountering energy development resulting in cumulative effects.
			Annex 4_PEIR Specialist Advice_Physical Environment		N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Preliminary Environmental Information Report (PEIR) Review **Annex 4 – Physical Environment** In formulating these comments, the following documents have been considered: Part 1 Introduction; Chapter 1: Introduction Part 1 Introduction; Chapter 4: Description of the Proposed Project Part 1 Introduction; Chapter 5: PEIR Approach and Methodology Part 2 Suffolk Onshore Scheme; Chapter 14: Inter-Project Cumulative Effects Part 2 Suffolk Onshore Scheme; Chapter 14: Figures Part 3 Kent Onshore Scheme; Chapter 14: Inter-Project Cumulative Effects Part 3 Kent Onshore Scheme; Chapter 14: Figures Part 4 Offshore; Chapter 2: Physical Environment Part 4 Offshore; Chapter 2: Figures Part 4 Offshore; Chapter 3: Benthic Ecology Part 4 Offshore; Appendix 4.3.A Benthic Characterisation Report Part 4 Offshore; Chapter 3: Figures Part 4 Offshore; Chapter 10: Other Sea Users Part 4 Offshore; Chapter 10: Figures Part 4 Offshore; Chapter 12: Offshore Scheme Inter-Project Cumulative Effects Part 5 Project Wide Effects; Chapter 1: Climate Change Part 5 Project Wide Effects; Chapter 3: Habitat Regulations Screening Report & Figures Part 5 Project Wide Effects; Chapter 4: Marine Conservation Zone Assessment & Figures **Natural England's Advice and Recommendations** A summary of Natural England's advice in relation to the Physical Environment is set out in Table 1. Our key concerns along with recommendations are presented in further detail in Table 2.		
		Geology and Hydrogeology	**Summary of Key Concerns** **Table 1 Summary of Key Issues - Physical Environment** The baseline is incomplete.	**Natural England's Recommendations to Resolve Issues.** We note that survey effort is underway and not all data has been presented. Sufficient quantity of	N	For the DCO submission the ES uses the full benthic data (PSA, Macrofauna and DDV) from the 2021 Benthic Characterisation Survey for the Proposed Project marine route as of the Environmental Scoping boundary. As previously discussed, an additional survey campaign has been underway to target 5 discrete areas along the revised Offshore Scheme currently being taken forward to ES and subsequent DCO submission. The results from

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				accurate data which adequately describes both the contemporary conditions within the study area and the longer-term historical change is vital to the development of the conceptual understanding.		the comprehensive geophysical survey, preliminary imagery and survey logs are being integrated with the existing 2021 data and supplemented with existing environmental information from available sources such as One Benthic to provide confidence in the assessment. Assessment of impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Geology and Hydrogeology and Offshore Physical Environment	The conceptual understanding of the Physical Environment baseline of the cable route and wider study area has not been established.	A more robust conceptual understanding of the Physical Environment and marine and coastal processes operating along the cable route and wider study area needs to be established in the Environmental Impact Assessment (EIA), Habitats Regulations Assessment (HRA) and Marine Conservation Zone Assessment (MCZA).	N	The baseline analysis of the Physical Environment along the cable corridor is considered in detail within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The HRA and MCZ are submitted as standalone documents and consider the marine and coastal processes **Application Document 6.6 Habitat Regulations Assessment Report and Application Document 6.11 Marine Conservation Zone Assessment** contain further details.
		Design	The worst-case scenario (WCS) is unclear and several of the Project design parameters are still to be established.	We advise that the realistic WCS options of the Project design for marine processes and the physical environment need to be established.	N	The worst case design parameters have been identified within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and have been assessed within the **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Design	Impacts to both Suffolk and Kent Landfall and nearshore areas through the lifetime of the Project.	An updated baseline, conceptual understanding, WCS, trenchless methodology feasibility, are needed to inform the impact assessment for the Landfall and nearshore areas.	N	The worst case design parameters have been identified within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and have been assessed within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Design and Marine Conservation Zone Assessment	Impacts on Goodwin Sands MCZ through the lifetime of the Project.	An updated baseline, conceptual understanding, WCS, and review of post-installation evidence from existing projects/lessons learned should be used to inform the MCZA.	N	The Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ, avoiding direct impacts, and reducing likely impacts to receptors located within the area. Details are contained in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Inter-Project Cumulative Effects	Potential cumulative impacts at landfall and along the cable route through the lifetime of the Project.	A cumulative impact assessment needs to be carried out for impacts to the Physical Environment and marine and coastal processes.	N	A cumulative impact assessment for Physical Processes is presented in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Offshore Physical Environment	Impacts to nearshore and offshore sandbanks and other significant seabed morphological features through the lifetime of the Project.	An updated baseline, conceptual understanding, WCS, should be used to inform the impact assessment on nearshore and offshore sandbanks and other significant seabed morphological features.	N	The WCS is used to carry out the impact assessment on nearshore and offshore sandbanks and other significant seabed morphological features within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Design, Landfall location and Offshore Route location	**Table 2 Natural England's Key Advice and Recommendations – Physical Environment** **Project Parameters. Document(s) Used: Part 1: Chapter 4 Description of Proposed Project** **Project Description** The Project design parameters are not fully defined. Surveys needed to inform the Project design are still to be reported and included in the impact assessment.	Project design parameters for landfall and offshore need to be adequately defined in the Environmental Statement (ES).	N	The Project Design parameters are presented in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and summarised within each of the marine technical chapters as the basis of assessment.
		Design, Offshore Physical Environment and Geology and Hydrogeology	Natural England's Position on Worst Case Scenario The worst-case scenario (WCS) is unclear.	We advise that the realistic WCS options of the Project design for marine processes and the physical environment will need to be provided in the ES.	N	The worst case design parameters have been identified within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and have been assessed within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Offshore Physical Environment and Design	Table 1.4.12 We welcome the Project's commitment to try to make landfall using a trenchless crossing technique (depending on feasibility). However, we note that the type of trenchless techniques to be used and Maximum Design Scenario (MDS) for Horizontal Directional Drilling (HDD) exit pit dimensions are still to be confirmed. However, the feasibility of the trenchless techniques is presently unknown. There is also no indication whether any cofferdams or access routes may be required for HDD exit pit excavation, or whether seabed impacts may occur due to cable laying vessels and machinery movement. Thus, we are unable to assess the full extent of potential impacts at landfall related to use of trenchless techniques."	We advise that the WCS for seabed excavation and sediment disturbance at both landfalls, for the project alone and coordinated options, should be clearly presented in the ES. The area and volume of disturbed sediment should be provided along with the anticipated location offshore and water depth. Evidence supporting the feasibility of trenchless techniques at landfall should be provided prior to submission of the ES for examination. Consideration should also be given to access routes, ancillary infrastructure, machinery movements and cable laying vessel impacts.	N	The area of sediment disturbed in association with cable installation techniques are based on the WCS and are outlined within **Application Document 6.2.4.1 Part 4 Chapter 1 Physical Environment**. Any associated impacts on the coastal morphology, seabed/beach disturbance are considered within the impact assessment.
		Offshore Physical Environment, Offshore ordnance /	Table 4.2.1.14 The MDS for pre-installation activities is currently indicative and subject to change following the additional 2023 surveys and confirmation of the final Route Position List (RPL). Therefore, we are unable to fully assess the impact of	The MDS should be provided in the ES for all pre-installation activities, including: UXO clearance Boulder clearance	N	The ES has considered the maximum design scenario for all offshore pre-installation activities. Following MMO advice, UXO clearance is subject to an additional Marine Licence post DCO submission.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		UXO and Design	these activities on marine processes and physical environment receptors.	Pre-lay grapnel run (PLGR) Sandwave lowering (side casting/Controlled Flow Excavator/pre-sweeping) Sea trials Specific locations should also be provided.		
		Offshore Route location and Design	1.4.5.105 We note that pre-sweeping may be required if areas of large sandwaves are identified within the cable corridor during the marine surveys which cannot be avoided. Given that this information is not yet available, we are unable to assess potential impacts to sandwaves or other significant bedforms (including in Goodwin Sands MCZ), which may require pre-sweeping.	The following information should be provided in the ES to assist the impact assessment: Specific locations informed by acoustic data. Total area of impact (both direct and indirect). Habitats impacted. Presence of sensitive habitats. Total volume of dredged material. Nature of material e.g., particle size Information on presence of contaminants in material to be dredged. Impacts from plumes. Sand disposal site information to include particle size. Impacts from sand disposal.	N	The information highlighted has been included in the following ES chapters and their associated appendices: • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project;** • **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment;** • **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology;** • **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology;** • **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals;** • **Application Document 6.6 Habitats Regulations Assessment Report;** • **Application Document 6.11 Marine Conservation Zone Assessment; and** • **Application Document 6.9 Water Framework Directive Assessment.** Pre-sweeping is expected be KP96.32 to KP113.883 Additionally, information and impact assessment regarding sand disposal have not been included in the ES due to displaced material from installation being either back filled or side cast within the Order Limits.
		Offshore Route location and Design	1.4.5.118 WCS for the proposed project assumes one inline cable joint. What is the anticipated footprint area and volume for sediment disturbance at the jointing location?	Please provide WCS for seabed impacts at cable jointing location, including impacts from sediment disposal.	N	Impacts from sediment disturbance during cable installation and HDD are assessed in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment and Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. Details on project footprints are provided in **Application Document 6.2.1.4 Description of the Proposed Project**.
		Offshore Route location and Design	Table 1.4.15 Table 1.4.15 presents indicative total footprint areas for several cable trenching activities, however, it states that the footprint area for CFE is	In the ES, the location, total area of impact (both direct and indirect), habitats impacted, presence of sensitive habitats and impacts from	N	Ground investigations have confirmed the use of trenchless techniques at both landfalls. Due to the extent of the intertidal area at Pegwell Bay, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore,

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			'to be confirmed after the 2023 surveys. Therefore, the WCS for cable trenching impacts is unclear at present.	sediment plumes and sediment deposition, should also be considered and assessed. WCS duration and rate of trenching should also be provided.		impacts to intertidal habitats such as mudflats including temporary increased suspended sediment concentrations during construction, operation and decommissioning are scoped back into the ES. Therefore, based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** all data to support the baseline and impact assessment is presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**, including a WCS for trenching.
		Benthic Ecology and Offshore Route location	1.4.5.91 It is stated that marine HVDC cable installation typically includes ground preparation and cable laying activities within the intertidal zone at landfall. These activities could disturb sensitive seabed areas and species.	The WCS needs to consider the extent to which sensitive areas of seabed (and species) may be disturbed during cable installation in intertidal and supratidal areas at landfall, including access, vehicle movements etc.	N	Upon approach to Pegwell Bay, the draft Order Limits have been widened in order to accommodate temporary construction activities. The introduction of the new access route via the former Ramsgate International Hoverport for any operation and maintenance activities now avoids the saltmarsh habitat at Pegwell Bay. However, temporary disturbance to the surrounding mudflats is anticipated between the cable and hoverport if access is required to the cable during operation. Therefore, impacts to intertidal mudflat habitats during operation are scoped back into the ES. Therefore, based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** all data to support the baseline and impact assessment is presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Offshore Physical Environment	**Baseline Characterisation Document(s) Used: Part 1: Chapter 4, Part 4: Chapters 2 & 3** **Survey Data Acquisition** 4.2.4.10 The geophysical survey data does not cover the full extent of the offshore scheme and zone of direct impact. Therefore, there are no bathymetric data for either landfall, Goodwin Sands MCZ, or the northern section of the offshore cable route. Other sandbanks, sandwaves or other significant bedforms along the cable route have not been identified along the cable route. Whilst we note that further surveys were planned for Summer 2023, including sampling of the areas that may require pre-sweeping, the current baseline is incomplete.	These data are vital for informing the impact assessment and should be provided in the ES.	N	Using the results from recent bathymetric surveys, the baseline is assessed in more detail within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The ES baseline identifies and provides more information on key bathymetric features including, sandbanks, sandwaves and the Goodwin Sands MCZ.
		Offshore Physical Environment	**Data Gaps** 4.2.7.25, 4.2.7.264, 2.7.46, 4.2.7.47 & 4.2.17 In Table 4.2.17, long-term	Beach and seabed profile data should be provided for both landfalls. Coastal recession/accretion rates for	N	Beach profile and LiDAR datasets were obtained and used to provide an informed understanding of short and long-term changes in coastal morphology. Further details on coastal morphology are

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			erosive/accretive changes are described at landfall, based on beach profile data from 2003-2020 and available LiDAR survey data, however, these data have not been provided.	the landfall locations should also be provided.		included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** for both landfalls.
		Offshore Physical Environment	4.2.7 Coastal sediment cells, nearshore and regional sediment transport pathways are an important part of the baseline but have not been provided.	Coastal sediment cells, nearshore and regional sediment transport pathways should be considered and identified on a map.	N	Coastal morphology is included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** for both landfalls.
		Offshore Physical Environment and Design	Figure 1.4.22 & 1.4.5.138 Whilst Figure 1.4.22 identifies the indicative rock placement locations along the Offshore Scheme draft Order Limits, it is unclear if there is any overlap with sensitive habitats or physical environment receptors (e.g., sandwave fields, sandbanks etc).	A map showing the indicative rock placement locations along the offshore cable corridor relative to designated areas, marine processes and physical environment receptors would be useful in the ES.	N	A map showing the rock placement locations along the offshore cable corridor relative to designated areas and physical environment receptors are included within **Application Document 6.2.1.4 ES Description of the Proposed Project**.
		Offshore Physical Environment	Figures 4.2.1 & 4.2.4 Whilst Figure 1.4.22 identifies the indicative rock placement locations along the Offshore Scheme draft Order Limits, it is unclear if there is any overlap with sensitive habitats or physical environment receptors (e.g., sandwave fields, sandbanks etc).	A map showing the spring tidal excursion ellipses across the full study area should be provided in the ES.	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** contains a map showing spring tidal excursion ellipses across the full study area.
		Geology and Hydrogeology	Image 4.2.1 A photograph of the Suffolk Landfall coastline has been provided, which is useful. However, there is no equivalent photograph for the Kent Landfall.	Please include a photograph of the Kent Landfall coastline in the ES.	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** contains an aerial photograph of the Kent landfall site.
		Offshore Physical Environment	4.2.7.9, 4.2.7.33, 4.2.7.68 Peak spring and neap tidal flow speeds near The Haven coastline and Kent landfall have been provided, but there are no values for the wider study area.	A map showing peak spring tidal flow speeds along the length of the offshore cable route and across the wider study area should be provided.	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** contains figures showing spring tidal flow rates along the cable corridor.
		Offshore Physical Environment	4.2.7.23 & 4.2.7.43 Sediment transport and seabed mobility needs to be considered not just within the coastal zone, but also the offshore, particularly at/near sensitive seabed areas, significant bedforms and MPAs. This is important because it will provide an indication of the potential extent and magnitude of the effect of the Project	Assess sediment transport pathways and potential seabed mobility in the vicinity of the cable route.	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** considers areas of medium and high sediment mobility along the cable corridor, relative to significant/sensitive seabed features.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			and likely fate of any material resuspended by installation activities or the presence of seabed infrastructure.			
		Offshore Physical Environment	Figures 4.2.7 & 4.2.9 Although Figures 4.2.7 and 4.2.9 provide a large-scale overview of the bathymetry for the southern section of the offshore cable corridor, there is no map identifying all significant Physical Environment seabed features and receptors.	A map identifying all significant seabed features and other physical environment receptors should be provided in the ES.	N	A map identifying significant seabed features and other physical environment receptors where available is included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Offshore Physical Environment	**Data Analysis, Modelling and Reporting** Table 4.2.16 KP numbers are referenced from the MMT benthic report, however, there is no map to show their location relative to the cable route. Reference could be made to Figure 4.3.2 (Part 4: Chapter 3 Figures).	Include the KP numbers on the map.	N	KP numbers are included within the relevant maps across Volume 6 where applicable.
		Offshore Physical Environment and Design	Table 4.2.17 It is stated that despite the use of trenchless techniques in the nearshore zone, some trenching would still be likely to be required. Where is it anticipated that trenching will be needed? We note that in the benthic chapter this issue is not presented.	In all relevant chapters please provide the location, water depth, distance offshore of trenching in the nearshore zone and ensure consistency across thematic areas.	N	At both the Suffolk and Kent landfalls, a trenchless construction solution at landfall is possible. Due to the large extent of the intertidal area at Pegwell Bay, the HVDC cable will need to be buried in the soft sediment habitats on approach to landfall to the exit pit locations. Additional information on this has now been within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment and Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Offshore Physical Environment	4.2.6.1 It is stated that the study area for the Physical Environment extends beyond the Offshore Scheme to account for the potentially wider Zone of Influence (ZoI). However, the ZoI has not been defined.	The anticipated maximum ZoI of the Project needs to be defined. Spring tidal excursion ellipse extent will help determine the spatial extent of sediment plumes, whilst littoral sub-cells can be used to inform assessment of changes to sediment transport processes and morphological change at the coast.	N	The ZOI is defined within **Application Document Part 4 Marine Chapter 1 Physical Environment**, based on a sediment transport model developed for the assessment.
		Inter-Project Cumulative Effects and Offshore Physical Environment	**Environmental Impact Assessment - Document Used: Part 1: Chapter 4 Description of the Proposed Project, Part 4: Chapter 2 Physical Environment** **Identified impacts** We are concerned that there is the potential for overlapping impacts due to the Project and a number of other plans	We advise that a cumulative effect assessment needs to be carried out for marine processes/physical environment to assess their impacts on protected sites, species and habitats of importance, significant bedforms and the coastal morphology at landfall.	N	A cumulative impact assessment for Physical Processes is presented in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			or projects. However, cumulative impacts have not been considered.			
		Offshore Physical Environment	Table 4.2.17 Receptors are discussed in Table 4.2.17, however, it would be useful if these could be summarised following Section 4.2.7 Baseline Conditions along with assessed impact pathways for each phase of the Project (i.e., construction, operation and decommissioning). There are also a number of receptors that have not been considered, including all designated sites, sandbanks, sandwave fields seabed features within the Zone of Influence (ZoI).	Provide a summary of assessed impact pathways and marine processes and physical environment receptors for each project phase. Affected MPAs and significant bedforms along the cable route and the coastline at landfall should be considered individually i.e., Goodwin Sands MCZ.	N	A full impact assessment relating to the construction, operation and decommissioning phases of the project is included within **Application Document 6.2.4.1 Part 4 Introduction Chapter 1 Physical Environment**, with consideration of designated sites, sandbanks, sandwave fields and seabed features within the ZoI.
		Agriculture and Soils	1.4.5.68 It is stated that pilot drilling cuttings will be disposed of appropriately off site, but it is not stated where this disposal site may be.	Spoil disposal locations should be identified, and any potential impacts considered and assessed.	N	Noted, as described within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, a Site Waste Management Plan will be developed prior to construction. The Plan will set out, in an auditable manner, how waste will be reduced, reused, managed and disposed of in accordance with the waste hierarchy. Dedicated areas will be identified on the construction plans to allow materials and wastes to be segregated at source, reducing the risk of damage or contamination. Disposal locations will be identified at the stage that these are produced.
		Offshore Physical Environment and Benthic Ecology	4.2.2.10 It is stated that "…as both landfalls will be achieved using trenchless techniques, there are no activities occurring at the surface in the intertidal area." However, in Table 4.2.17, it is also stated that "…some trenching would still be likely to be required" [in the nearshore]. This could lead to increased suspended sediment loads in the intertidal or nearshore during installation at both landfalls.	If there is the potential for increased suspended sediment loads in the intertidal zone during installation at both landfalls, this should be assessed. Details need to be provided of the location, total area of impact (both direct and indirect) of trenching in the intertidal or nearshore. Plume extent, concentration and persistence should be assessed. Subsequent sediment deposition should also be assessed. The presence of any sensitive habitats that may be impacted should also be identified. Potential impacts on receptors along the coast at landfall should also be considered. Predicted recovery rates of the intertidal or nearshore zone from temporary disturbance should be assessed.	N	**Application Document 6.2.4.1 Part 4 Chapter 1 Physical Environment** assesses the impact of sediment disturbance within the intertidal zone; however, this assessment is not based on results from local modelling of sediment plume dispersion where wave-induced currents are likely to be an important factor. Potential impacts will therefore be interpreted by considering local tidal conditions and the further enhanced dispersion due to wave effects. Ground investigations have confirmed the use of trenchless techniques at both landfalls. In Kent, this technique will avoid the sensitive saltmarsh habitats in the upper intertidal area. However, due to the extent of the intertidal area at Pegwell Bay, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats such as mudflats including temporary increased suspended sediment concentrations during construction, operation and decommissioning are to be scoped back into the ES. Therefore, based on updates to **Application Document Part 1 Chapter 4 Description of the Proposed Project**, all data to support the baseline and impact assessment, including consideration of recovery rates, is presented in **Application Document Part 4 Marine Chapter 2 Benthic Ecology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Landfall location, Design and Benthic Ecology	4.2.2.10 Whilst it is stated that '…both landfalls will be achieved using trenchless techniques,' we are concerned that trenchless methods may not be feasible. This in turn, could lead to intertidal environmental damage and disturbance due to cable installation (e.g., saltmarsh and mudflats at Pegwell Bay).	We note that once landfall surveys are completed, the Landfall Feasibility Technical Report is to be updated. This should be included in the ES. Please see comments on the benthic chapter and landfall chapters for further information on the feasibility study and comments relating to the use of HDD.	N	Ground investigations have confirmed the use of trenchless techniques at both landfalls. In Kent, this technique will avoid the sensitive saltmarsh habitats in the upper intertidal area. However, due to the extent of the intertidal area at Pegwell Bay, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats such as mudflats including temporary and physical disturbance, temporary increased suspended sediment concentrations during construction, operation and decommissioning are to be scoped back into the ES. Additionally, the introduction of the new access route via the former Ramsgate International Hoverport for any operation and maintenance activities now avoids the saltmarsh habitat at Pegwell Bay. However, temporary disturbance to the surrounding mudflats is anticipated between the cable and hoverport if access is required to the cable during operation. Therefore, impacts to intertidal mudflat habitats during operation are to be scoped back into the ES. The Landfall Feasibility Technical Report has been updated to reflect this update. Further details are contained in Appendix A of **Application Document 7.3 Design Development Report**.
		Inter-Project Cumulative Effects	1.4.5.2 Potential cumulative impacts at the Suffolk and Kent Landfall due to multiple cables coming onshore at the same location could lead to overlapping effects through the different phases of the Project.	These potential impacts should be considered in a Cumulative Effect Assessment.	N	These potential impacts have been considered in the following: • **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects;** • **Application Document 6.2.3.12 Part 3 Kent Chapter 12 Intra-Project Cumulative Effects;** • **Application Document 6.2.4.10 Part 4 Marine Chapter 10 Intra-Project Cumulative Effects;** • **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects;** • **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects; and** • **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects.**
		Offshore Physical Environment	4.2.7.79 - 4.2.7.83/Table 4.2.17 Aldeburgh Ridge, Aldeburgh Napes, offshore sandbanks and sandwave fields have not been identified in the Preliminary Assessment of Physical Environment effects.	Nearshore morphological bedforms and other significant bedforms offshore are physical environment receptors and should be included in the impact assessment.	N	The potential impact on nearshore morphological bedforms are assessed within **Application Document 6.2.4.1 Part 4 Marine Chapter 2 Physical Environment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Offshore Physical Environment	Table 4.2.17 Several of the impacts considered in the Preliminary Assessment are too broad, generic. The different project phases have also been considered together in the same impact assessment. Receptors identified are also too broad e.g., water column.	The assessed impact pathways and receptors need to be more specific for the preliminary impact assessment to be meaningful. For example: Impact Pathway: Sediment disturbance caused by activities that may lead to increased SSCs (e.g., cable installation) Receptor: Goodwin Sands MCZ	N	The assessed impact pathways and receptors are more clearly defined in **Application Document 6.2.4.1 Part 4 Marine Chapter 2 Physical Environment** as in the example provided. The updates to **Application Document Part 1 Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys),** have also informed updates to specific impact pathways and receptors in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Offshore Physical Environment	Table 4.2.17 Preliminary sensitivity to sediment plumes and sediment deposition has only been considered for the water column. Yet, there are a number of MPAs that overlap or are in the vicinity of the offshore cable route, for example: Margate and Long Sands SAC (2km) Goodwin Sands MCZ (0km) Kentish Knock East MCZ (1km) Thanet Coast MCZ (<1km) Thanet Coast SAC (<1km) Sandwich Bay SAC (0km) Thanet Coast and Sandwich SPA (0km) We are concerned that the creation of sediment plumes may lead to settling of material onto benthic habitats, thus impacting sensitive receptors. The plumes themselves may also affect WFD water body status and impact ecological receptors through issues related to light attenuation.	The WCS should be determined in terms of maximum sediment plume concentration, extent and persistence, as well as associated changes in bed level for those cable route locations that overlap MPAs or are within proximity to them. Plume dispersal and subsequent sediment deposition predictions should be provided for specific locations along the cable route, for example, nearshore, near Margate and Long Sands SAC, Kentish Knock East MCZ, Thanet Coast MCZ, Goodwin Sands MCZ.	N	Based on a sediment transport model developed for the assessment, the ZOI is defined within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The impact of increased suspended sediment suspension and deposition on the sensitive aspects of the physical environment are also assessed within this Chapter. The ZoI overlaps with some MPAs along the offshore cable route. The impact of increased SSC on ecological receptors and the relevant designated sites within the ZoI are assessed in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology, Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology** and **Application Document 6.11 Marine Conservation Zone Assessment**.
		Offshore Physical Environment and Design	Table 4.2.17 Receptor: Seabed Morphology, including Seabed Features such as Bedforms and Sandbanks (Construction and Decommissioning) It is suggested that the sensitivity of sandwaves and sandwave fields (e.g., Goodwin Sands, Aldeburgh Napes, Aldeburgh Ridge) to cable installation and decommissioning is low, as	We advise that potential changes to sandwaves, sandbanks, and other significant bedforms (including Aldeburgh Napes, Aldeburgh Ridge and Goodwin MCZ) along the offshore cable route, due to cable installation activities and decommissioning need to be fully assessed. The updated geophysical	N	Sandwaves, sandbanks and other significant bedforms (including Aldeburgh Napes, Aldeburgh Ridge and Goodwin MCZ) are considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The updated geophysical survey is used to support the assessment.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			sandwave recovery is expected. How has bedform recovery been assessed? What are the expected timescales for bedform recovery? The magnitude of seabed disturbance is also considered low. However, we are concerned that significant changes in sandwave sandbank topography and habitat loss, for example, due to sandwave clearance, could affect the condition of Annex I sandbank. Sediment transport patterns could also be affected, resulting in morphological change. Currently, there is insufficient evidence to support these conclusions.	survey data should be used to inform identification of seabed morphological features, with particular regard to features within designated sites and/or sensitive areas of coastline. All possible efforts should be made to avoid these areas of sandwaves/minimise the need for clearance by micro-routing. Any evidence of sandwave recovery in affected MPAs should be used to inform the assessment of sensitivity and significance of effect. Cleared material should remain in the system and be 'intelligently' placed.		
		Offshore Physical Environment	Table 4.2.17 and Chapter 4/Figure 1.4.22 Receptor: Seabed Morphology, including Seabed Features such as Bedforms and Sandbanks (Construction and Decommissioning) Rock protection (10 rock bags per trenchless exit) will be required at landfall. The duration that these will be in place is unclear. However, their presence in shallow nearshore areas could affect the nearshore hydrodynamic regime or sediment transport pathways.	Potential impacts to the nearshore hydrodynamic regime and sediment transport pathways at the Suffolk and Kent coastal landfalls need to be considered and assessed.	N	To support the impact assessment of the nearshore seabed morphology, beach and seabed profile data is analysed and included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** for both landfalls, with analysis of coastal recession/accretion rates. Coastal sediment cells, nearshore and regional sediment transport pathways are also considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** and identified via maps/figures.
		Offshore Physical Environment	Table 4.2.17 Receptor: Suffolk and Kent coastline morphology, including Sandwich Bay to Hacklinge Marshes SSSI and The Haven LNR (Construction and Decommissioning) Whilst we acknowledge the Project's efforts to avoid designated sites at landfall and minimise the impact of sediment disturbance in the intertidal zone during cable installation, we are unable to agree that the sensitivity is Low-Medium until further evidence and a fuller conceptual understanding of the coastal processes at landfall, is provided.	A feasibility study utilising geotechnical data should be prioritised. More detailed information needs to be provided regarding the nature of the landfall area in order to understand how the coast may alter through the lifetime of the Project and whether the integrity of the buried assets may be maintained. For example, survey data covering the intertidal area down to MLWS and the nearshore zone should be provided. Any installation and post-construction evidence on burial success, saltmarsh recovery, lessons learned from the Nemo Link and Thanet OWF projects in Pegwell	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** considers the coastal processes operating at the landfall, and how they may alter through the lifetime of the Project taking into account the influence of climate change. Reference is made to the lessons learned from the Nemo Link and Thanet OWF projects in Pegwell Bay where appropriate.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				Bay, should be included in the ES. Further consideration should be given to the coastal processes operating at landfall, and how they may alter through the lifetime of the Project taking into account the influence of climate change.		
		Water Environment and Geology and Hydrogeology	4.2.7.45, Table 4.2.17 Receptor: Water Quality (Construction and Decommissioning) There is the potential for cable installation to remobilise contaminants from the disused hoverport to the east of the Kent landfall site, and leached contaminants from the landfill site to the west.	This needs to be considered in the appropriate section of the ES.	N	The disused hoverport is included within the updated **Application Document 6.3.3.5.A ES Appendix 3.5.A Preliminary Contamination Risk Assessment** that will support the ES. The release of contaminants associated with water/intertidal construction activities are considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The Chapter considers what type of contaminants may be released, while ecology and water environment chapters will consider the impact on biological receptors.
		Offshore Physical Environment and Design	1.4.5.139-1.4.5.140 We note that cable and pipeline crossing locations have been provided in Tables 1.4.16 and 1.4.17, however, there is no map to accompany this information. This is important for evaluating potential effects on sensitive areas of seabed and/or designated sites.	Provide a map showing the location of cable and pipeline crossings, including designated areas, sensitive areas of seabed, other physical environment receptors.	N	A map showing the indicative rock placement and cable locations along the offshore cable corridor relative to designated areas is presented in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. No pipeline crossings are anticipated as part of the Offshore Scheme.
		Geology and Hydrogeology	Table 4.2.17 Receptor: Coralline Crag Ridges (Construction, Operation, Decommissioning) To what extent is it anticipated the Coralline Crag Ridges at the Suffolk landfall will be impacted by the Project?	Can this be clarified? Please be advised that all other projects to date have avoided this formation including Sizewell C and East Anglia 1N and 2.	N	The Coralline Crag formation is considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The cable corridor route passes over a small section of the Crag therefore, the potential impacts associated with suspended sediment deposition onto the Crag, cable installation burial and rock armouring are assessed in this Chapter. Furthermore, the potential for permanent damage to the Crag occurring and having a knock on impact on sediment transport in the region and potentially altering coastal geomorphology is also assessed.
		Offshore Physical Environment	Table 4.2.17 Receptor: Seabed (Operation) – Scouring impact of the seabed to sediment disturbance due to scouring are both considered Low. However, 'seabed' is a very broad receptor group which does not consider scour potential at specific areas of sensitive seabed, bedforms or designated areas (e.g.Goodwin Sands MCZ). We are also concerned that successful cable burial may not be	We advise that the potential for cable exposure and/or protection measures to lead to scour (or secondary scour) and removal of seabed sediments needs to be assessed for specific locations along the cable route (e.g., designated sites, at landfall, significant bedforms). Scour potential and seabed mobility need to be	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** assesses the impact on the seabed in relation to specific sensitive areas and seabed mobility. The impact associated with cable exposure is also assessed.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			achieved through the lifetime of the Project. Therefore, we are unable to agree with these conclusions.	adequately assessed for these receptors.		
		Onshore Mitigation	Table 4.2.17 Receptor: Suffolk and Kent Coastal Morphology , including Sandwich Bay to Hacklinge Marshes SSSI and The Haven LNR (Operational). It is stated that cable protection at landfall will be constructed in the nearshore during the operational phase of the Project. The sensitivity of both Suffolk and Kent landfall coastlines to this impact is considered Low-Medium. The magnitude of change due to the presence of nearshore cable protection is also considered Low. However, without detailed information on the landfall/nearshore bathymetry, coastal processes and morphology, we are unable to agree with these conclusions at present.	We advise that the mitigation hierarchy to avoid-reduce-mitigate should be followed to minimise environmental impacts along the proposed route. Cable protection should be avoided in MPAs. The potential for impacts to physical (and biological) processes within nearshore and intertidal habitats at landfall should be fully considered and assessed in the ES. Please refer to JNCC/NE best practice guidance: Environmental considerations for offshore wind and cable projects - 52965454Nature conservation considerations and environmental best practice for subsea cables for English Inshore and UK offshore waters, Sept 22.pdf - All Documents (sharepoint.com)	Y	The potential impacts to physical processes within nearshore and intertidal setting is fully considered and assessed in the **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The ES assesses the impact of cable installation processes and the presence of the cable on nearshore/coastal hydrodynamics and sediment transport, and morphology. Since the PEIR, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ.
		Offshore Physical Environment and Landfall location	4.2.7.26 Atkinson and Esteves (2019) [Ref 2.50] observed the presence of a sediment convergence that benefits the ness (gravel foreland) north of Thorpeness, by influencing its stability and growth. The position of this sediment convergence is in turn influenced by nearshore conditions. This complex inter-relationship between the ness and adjacent coastline needs to be considered. It is suggested in 4.2.7.26 that the Thorpeness to Aldeburgh Bay is 'naturally stabilised.' However, Atkinson and Esteves suggest that there are 'considerable variability alongshore in the way beaches respond to the same offshore wave conditions' due to interaction with the complex nearshore bathymetry. Therefore, we are concerned that cable installation activities and the presence of cable protection measures in shallow nearshore areas could cause morphological change through	We advise that the potential for morphological change at landfall due to cable installation activities and presence of cable protection and vulnerability of the Project assets, need to be fully investigated for the lifetime of the Project.	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** provides a detailed baseline assessment that considers the complex interrelationship between the Ness and the adjacent coastlines associated with the complex nearshore bathymetry and wave processes. The ES assesses the impact of cable installation processes and the presence of the cable on nearshore/coastal hydrodynamics and sediment transport, and morphology.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			modification of nearshore hydrodynamic and sediment transport regimes.			
		Geology and Hydrogeology and Onshore Route location	Impacts to geological features of SSSIs have not been assessed.	Potential impacts to geological features should be assessed within the marine and coastal physical processes EIA.	N	Within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** the Sandwich Bay to Hacklinge Marshes SSSI and the Leiston-Aldeburgh SSSI are assessed in association with potential erosion/ geomorphological alteration of these sections of coastline, including changes to sediment transport patterns and hydrodynamics. The impact on ecological receptors at the SSSI sites are assessed in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology and Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. The Coralline Crag is considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. The cable corridor route passes over a small section of the Southern extent of the Coralline Crag. Therefore, the potential impacts associated with suspended sediment deposition, cable installation burial are assessed in this Chapter. Further, the potential for permanent damage to the Coralline Crag has been considered in this Chapter.
		Offshore Route location and Shipping and Navigation	Are any seabed impacts anticipated due to anchoring, jack-up barge or other seabed penetrating foundations?	Please clarify what is meant here.	N	Any seabed impacts associated with anchoring, jack-up barge or other seabed penetrating foundations are considered in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. No significant adverse effects have been identified as a result of the Proposed Project on seabed features during any phase.
		Offshore Route location and Design	General Comment: The fate of cleared material, for example, due to pre-sweeping, has not been included in the assessment.	Disposal site information needs to be provided including specific locations, total area of impact (direct and indirect), volume of dredged material, habitats impacted, presence of sensitive habitats, nature of dredged material, impacts from disposal.	N	Any excavated material will be side cast within the Order Limits and not deposited away from the Offshore Scheme. Further details are available within **Application Document 6.2.4.1 Part 4 Chapter 1 Physical Processed** and **Application Document 6.2.1.4 Part 1 Chapter 4 Description of the Proposed Development**.
		Offshore Physical Environment	**Methodology** General Comment: A sufficiently robust conceptual understanding of coastal processes at the landfall sites has not been established. This is important to help understand how the proposed project may change or influence coastal and nearshore processes and morphology. For example, the relationship between	A more robust conceptual understanding of the coastal and nearshore system at landfall needs to be established.	N	Beach and seabed profile data is included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** for both landfalls, with analysis of coastal recession/accretion rates. Coastal nearshore sediment cells and sediment transport pathways (and associated hydrodynamics) are considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** and identified via maps/figures.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			beach erosion at the Suffolk landfall longshore sediment transport processes, nearshore wave climate and bathymetry, the ness to the north of landfall.			
		Offshore Physical Environment	General Comment: A source-pathway-receptor map for marine and coastal processes and physical environment receptors has not been provided.	A source-pathway-receptor map should be provided identifying all marine and coastal processes and physical environment receptors (and any other dependent environmental receptors).	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** contains figures showing areas of medium and high sediment mobility along the cable corridor, relative to significant/sensitive seabed features, conservation areas, sediment transport pathways, and rock placements locations.
		Inter-Project Cumulative Effects	4.2.4 There is no cumulative impact assessment.	All potential cumulative impacts should be assessed in the EIA.	N	A full inter-project and intra-project effects assessment has been carried out for the Proposed Project. The inter-project cumulative effects assessments have assessed the combined environmental impacts resulting from proposed Developments due to come forward within the cumulative zone of influence. The full assessment is available within the following ES Chapters: • **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects;** • **Application Document 6.2.3.12 Part 3 Kent Chapter 12 Intra-Project Cumulative Effects;** • **Application Document 6.2.4.10 Part 4 Marine Chapter 10 Intra-Project Cumulative Effects;** • **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects;** • **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects; and** • **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects.**
		Offshore Physical Environment	Chapter 5/Image 1.5.2 Basis of assigning significance We note that within the matrix presented in Image 1.5.2, it is possible for an effect to span two different criteria ratings, for example, a small magnitude impact but very high value/sensitivity could lead to an effect being judged moderate or minor. Given that the identification of effect significance typically requires professional judgement, this can make	Please note that CIEEM advise against the use of a matrix-based approach to effect significance determination. The distinction between evidence-based and professional judgement-based assessments of effect significance, should be made clear. Furthermore, as a precautionary measure, we would advise that where the multiplying criteria (value/significance and magnitude of impact) span two	N	The assessment within the PEIR used professional judgement to estimate significance which is supported by the use of the matrix approach. Within the ES it is now made clearer that professional judgment has been used as the main determinator of significance. Where this differs from the results defined by the matrix approach, it is clearly explained/justified. Where appropriate, a precautionary approach has been used.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			the process of determining effect significance, rather subjective. In turn, this could lead to an effect being deemed not significant in EIA terms.	different ratings, the higher (worst case) criteria should be selected.		
		Offshore Physical Environment	4.2.4.9 General approach taken to determining the significance of effect in this preliminary assessment is only to state whether effects are likely or unlikely to be significant, rather than assigning significance levels.	If the baseline characterisation and conceptual understanding were more robust, this would enable a more detailed assessment of effect significance. Moreover, if the baseline and impact assessment were at a more detailed stage, this would allow a more detailed response to be provided which, in turn, would better inform the Project design and EIA and reduce the need for a more precautionary approach.	N	Noted, the technical environmental assessments contained within the ES are supported by a robust baseline and associated assessment which categorises the residual effect, including whether the effect is considered significant or not. Each technical environmental assessment follows the general EIA methodology outlined within **Application Document 6.2.1.5 Part 1 Chapter 5 EIA Approach and Methodology** and where a different approach is taken this is detailed within the relevant ES Chapter.
		Offshore Physical Environment and Landfall location	**HRA - Document Used: Chapter 3: Habitat Regulations Screening Report & Figures** **Screening** Chapter 3/Table 4.3.1.1 We note that because no activities are anticipated in the intertidal zone at both Leiston-Aldeburgh SSSI (Suffolk Landfall) and Sandwich Bay Hacklinge Marshes SSSI (Kent Landfall), that these sites have not been considered in the impact assessment. However, given the landfall and geophysical surveys have yet to be reported and the coastal process/physical environment baseline and conceptual understanding are not yet complete, we would advise that these sites should be included in the assessment.	Include in the EIA.	N	There will be a jack up barge in the intertidal zone in Kent and this is reflected in **Application Document 6.6 Habitats Regulations Assessment Report**. Impacts on SSSIs are considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Coordination with other Projects	**MCZ Assessment. Document Used: Part 5: Chapter 4 Marine Conservation Zone Assessment & Figures** **Cumulative / In- combination Assessment** 5.4.9.11-5.4.9.12 The information on the North Falls OWF needs to be updated	North Falls OWF red line boundary has been revised. The northern array has been removed and the southern array no longer overlaps Kentish Knock East MCZ.	N	The Red Line Boundary for North Falls has now been updated to reflect the current design of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			as the proposed scheme design has been revised.			
		Intra-Project Cumulative Effects	5.4.9 There is no map to show the location of the relevant plans and project for the in-combination effect assessment.	Map should be provided in the ES to show the location of the relevant plans and projects included in the in combination effect assessment.	N	A map showing the relevant plans and project is presented in **Application Document Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Marine Conservation Zone Assessment and Benthic Ecology	**MCZ Assessment Conclusion** The baseline characterisation is incomplete therefore, Natural England is unable to agree with the outcome of the Stage 1 Assessment at present.	A robust baseline characterisation should be provided to inform the MCZA. Lessons learned and post-construction evidence from other projects (e.g., Nemo Link) should be drawn upon to inform the MCZA for Goodwin Sands MCZ. Please see the benthic response for further information on the MCZ assessment.	Y	A more thorough overview of the designated features and conservation objectives has been written as part of **Application Document 6.11 Marine Conservation Zone Assessment**. Additionally, a section has been included summarising the available information regarding lessons learned from previous developments. Furthermore, the re-routing of the Offshore Scheme to avoid the Goodwin Sands MCZ will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area. Details are contained in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Onshore Mitigation	**Further Receptor Points** Siting of the cable route through Goodwin Sands MCZ and in proximity to KKE MCZ and Thanet Coast MCZ.	Best practice dictates that as the process of method selection and final route refinement within the cable corridor is undertaken using the avoid, reduce, mitigate hierarchy.	Y	The Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. Details are contained in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Consultation	**Annex 5_PEIR Specialist Advice_Benthic Ecology** **Preliminary Environmental Information Report (PEIR) Review** **Annex 5 – Benthic Ecology** In formulating these comments, the following documents have been considered: Part 1 Introduction; Chapter 3 Main Alternative Considerations Part 1 Introduction; Chapter 4 Description of Project Part 1 Introduction; Chapter 5 PEIR Approach and Methodology Part 4 Offshore; Chapter 3 Benthic Ecology Part 4 Offshore; Chapter 11 Intra-project cumulative effects Part 4 Offshore; Chapter 12 Inter-project cumulative effects Part 5 Project Wide Effects; Chapter 2 Combined effects of onshore and offshore elements Part 5 Project Wide Effects; Chapter 3 Habitat Regulations Screening Part 5 Project Wide Effects; Chapter 4 Marine Conservation Zone Assessment		N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Natural England's Advice and Recommendations A summary of Natural England's advice in relation to Offshore Ornithology is set out in Table 1. Our key concerns along with recommendations are presented in further detail in Table 2.			
		Benthic Ecology and Geology and Hydrogeology	**Summary of Key Concerns** **Table 1 Summary of Key Issues - Benthic Ecology** Intertidal impacts on benthic receptors have been scoped out.	**Natural England's Recommendations to Resolve Issues.** Natural England doesn't agree with the scoping out of impacts on intertidal receptors. No feasibility studies have been presented to confirm the ability for the Applicant to use trenchless techniques at landfall locations. As previously advised by Natural England for Horizontal Directional Drilling (HDD) to be considered as viable, pre-consent geotechnical investigations are required to confirm what is achievable. Furthermore, lessons learnt from other plans and projects (Triton Knoll and Hornsea Project 2) where HDD has had unforeseen impacts due to the limitations of drilling in unconsolidated sediment and the occurrence of sink holes should be explored. Additionally, even if HDD is feasible, it is not void of any risk. Potential impacts on intertidal/subtidal benthic receptors have not been assessed for trenchless techniques including impacts at the exit pits.	N	Ground investigations have confirmed the use of trenchless techniques at both landfalls. In Kent, this technique will avoid the sensitive saltmarsh habitats in the upper intertidal area. However, due to the extent of the intertidal area at Pegwell Bay, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats such as mudflats including temporary and physical disturbance, temporary increased suspended sediment concentrations during construction, operation and decommissioning are scoped back into the ES in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. The Landfall Feasibility Technical Report has been updated to reflect this update. Further details are contained in Appendix A of **Application Document 7.3 Design Development Report**.
		Onshore Route location and Design	In addition to NE Ref 1, no other methodology has been assessed as an alternative if HDD is not a viable option.	With no alternative methodology having been assessed, a variation to the Development Consent Order (DCO), should HDD be found post consent to technically not viable. In this instance, alternative approaches could be considered a material change, noting the implications for any HRA determination.	N	Trenchless techniques have been confirmed as the viable option and have been assessed in the ES, as described in **Application Document 6.2.1.4 Part 1 Introduction Chapter 1 Description of the Proposed Project**. No other methods have been assessed. It is noted that an alternative approach could be considered a material change. However, there are no alternative approaches being considered at this stage.
		Benthic Ecology	Evidence: Benthic survey data is incomplete. 2023 data has not been included. Areas of the offshore scheme	The PEIR would have benefited from being submitted with completed surveys from 2023 and/or further	N	For the January DCO submission the ES uses the full benthic data (PSA, Macrofauna and DDV) from the 2021 Benthic Characterisation Survey for the marine route as of Environmental

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			boundary wider than 500m do not include survey data. Locations identified in 2021 data with ephemeral features have not been resurveyed (for example, Sabellaria spinulosa, Mytilus edulis), and data has been presented on why NERC Section 41 habitats cannot be avoided.	empirical evidence to support characterisation survey conclusions. We highlight that we have not been consulted on survey methodology, and currently can't comprehend the level of risk to sensitive receptors. Natural England is therefore unable to agree that the approach presented is sufficient and whether further surveys are advised. We advise that the Evidence Plan process is fully engaged with to determine if further information and mitigation measures are required for protected habitats and species. Under the NERC Act 2006, the Applicant has a duty to avoid, reduce, mitigate impacts on priority habitats. Natural England advises that an updated baseline is presented, and where appropriate repeated survey data across a wider area is included to enable conceptual understanding of the Worst-Case Scenario and potential mitigation measures.		Scoping boundary. As previously discussed, an additional survey campaign has been underway to target five discrete areas along the revised Offshore Scheme currently being taken forward to ES and subsequent DCO submission. The results from the comprehensive geophysical survey, preliminary imagery and survey logs are being integrated with our existing 2021 data and supplemented with existing environmental information from available sources such as One Benthic to provide confidence in the assessment. The final results of the most recent survey campaign will be provided prior to examination as supplementary information in order to provide an additional confidence in the conclusions. Assessment of impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Marine Conservation Zone Assessment, Benthic Ecology and Offshore Mitigation	The proposed cable route passes through Goodwin Sands Marine Conservation Zone (MCZ) and the 2021 benthic surveys indicate the presence of blue mussel (Mytilus edulis) the MCZ overlapping with the proposed cable route.	Evidence has not been provided by the Applicant to justify why Goodwin Sands MCZ cannot be avoided. Natural England is unable to agree with the MCZ Assessment conclusions. Natural England advises that a robust MCZ Assessment and supporting evidence similar to those provided for Sheringham and Dudgeon Extension Projects will be required due to the risk of the conservation objectives being hindered. Based on the information provided to date, further mitigation such as, avoidance of the site or a commitment of no rock armouring in the MCZ, appears to be the only option that would avoid the need for the decision-maker to proceed to the subsequent steps of a Stage 2 MCZ assessment.	Y	The re-routing of the Offshore Scheme will reduce impacts to the known and potential benthic receptors located within Goodwin Sands MCZ. This follows the mitigation hierarchy, avoiding impacts to the features and conservation objectives of Goodwin Sands MCZ. Additionally, the impacts of the Proposed Project on the blue mussel have now been detailed further in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology and Application Document 6.11 Marine Conservation Zone Assessment**, as well as within **Application Document Part 4 Chapter 3 Fish and Shellfish Ecology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				Natural England advises that the mitigation hierarchy is followed and that the Applicant thoroughly considers all benthic mitigation options provided in Appendix 1. We advise that the Applicant gives due consideration to the conservation objectives of the MCZ's designated features. Mytilus edulis beds are a designated feature in the site with a recover objective and an ephemeral species. The presence of juvenile Mytilus edulis indicates that the location of the proposed cable route has the potential to support the recovery of this designated feature. We advise that further information is provided along the section of the proposed cable route that overlaps with Goodwin Sands MCZ as well as survey data of a wider area to present options to avoid features. We highlight that Mytilus edulis reef is associated with the life cycle of Sabellaria spinulosa reef another interest feature of Goodwin Sands MCZ and both are priority habitats under NERC 2006 and therefore should also be avoided where possible outside of the designated site.		
		Benthic Ecology, Offshore Route location and Design	Natural England doesn't agree with the preliminary sensitivity assessment blue mussel (Mytilus edulis) beds, English Channel outburst flood features. Moderate energy circalittoral rock, Ross worm (Sabellaria spinulosa) reefs, Subtidal coarse sediment and Subtidal sand (including sandbanks) and therefore we therefore don't agree with the conclusions.	"The assessment provided for impacts from cable laying activities and placement of external rock protection on protected habitats and species is insufficient. Further information is required on the following to fully assess impacts and conceptualise Worst Case Scenarios: Specific locations of activities Total area of impact (direct and indirect, including impact from sediment plumes) Habitats impacted	N	Based on updates to **Application Document 6.2.4.1 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys**), all data to support the baseline and fully assess impact pathways is now presented within presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. Further information on the location and area of activities and the habitats to be affected is provided in **Application Document 6.2.4.1 Part 1 Introduction Chapter 4 Description of the Proposed Project** and **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				Presence of sensitive habitats		
		Marine Conservation Zone Assessment	**Table 2 Natural England's Key Advice and Recommendations – Benthic Ecology** **Project Parameters. Document(s) Used: Part 1: Chapter 3 Main Alternative Considerations, Chapter 4 Description of Project, Chapter 5 PEIR Approach and Methodology, Part 4: Chapter 3 Benthic Ecology** **Project Description** 1.3.4.32, 1.3.5.55-page 22 Offshore Environment section states that both offshore MCZs are avoidable.	This statement appears to contradict the proposed cable route, as the proposed cable route overlaps with Goodwin Sands MCZ. Data has not been presented to indicate whether the MCZ can be avoided.	Y	The Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ.
		Offshore Route location and Design	1.4.5.67 pages 42 to 45 Multiple trenchless landfall techniques are described.	Feasibility studies have not been presented to provide assurance that trenchless techniques are able to be used, and the potential impacts they may present to protected sites. We recommend that a figure showing the route and proposed length of HDD is presented. Depending on the yet to be determined (from pre consent geotechnical investigations), ground conditions, there are limitations to the use of HDD. The feasibility of HDD therefore requires further consideration at the time of consent. Natural England is particularly concerned in relation to the potential impacts from exit pit works both directly from habitat loss and indirectly from disruption of marine processes. We advise that no exit pits are located within a designated site and/or impact on designated site features and priority habitats.	N	National Grid confirm that a trenchless construction solution will be employed for both the Suffolk and Kent landfalls from the transition joint bays eastwards. An initial ground investigation survey has been undertaken to confirm the viability of this solution. Details are contained in The Landfall Feasibility Technical Report which has been updated to reflect this update. Further details are contained in Appendix A of **Application Document 7.3 Design Development Report**. The commitment to trenchless solutions is secured in Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project description, design drawings and work plans are presented in **Application Document 2.5.3 Work Plans - Offshore, Application Document 2.13.4 Design and Layout Plans - Offshore, Application Document 2.14.3 Indicative General Arrangement Plans - Offshore and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Marine Conservation Zone Assessment	Table 1.4.F.7 offshore scheme mitigation No mitigation measures are considered for benthic impacts.	The proposed cable route will enter Goodwin Sands MCZ. We advise that the Applicant adheres to the mitigation hierarchy. Please see further detail in our comments below	N	The Offshore Scheme has now been re-routed to avoid the Goodwin Sands MCZ. This has now been re-assessed in **Application Document 6.11 Marine Conservation Zone Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		and Onshore Mitigation		regarding the MCZ Assessment. Please also refer to Appendix 1 for a list of benthic mitigation measures to be considered by the Applicant.		
		Benthic Ecology	Chapter 5 PEIR Approach and Methodology overall statement	Natural England acknowledge the Applicant's statement that there is no prescribed format as to what a PEIR should comprise. However, it should allow consultees to understand the likely environmental effects of the Project. Therefore, NE would expect complete datasets to be presented to understand the potential impacts of the Project and allow an informed view of the impact assessments.	N	Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Inter-Project Cumulative Effects and Coordination with other Projects	Appendix 1.5B Inter project cumulative effects initial long list doesn't consider Nemo Link interconnector.	We advise that Nemo Link is included due to potential cumulative impacts at, Sandwich Bay to Hacklinge Marshes SSSI, Thanet Coast to Sandwich Bay SPA and Ramsar and Sandwich Bay SAC from landfall. We have previously advised that Sea Link reviews monitoring reports from Nemo Link and Thanet Offshore cables to consider the lessons learnt from projects landing in the same area, to better understand how potential impacts can be mitigated.	N	The Nemo Link has been added to the list of other proposed developments included within **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. Potential cumulative impacts with designated sites have been considered in **Application Document 6.6 Habitat Regulations Assessment Report**.
		Benthic Ecology, Offshore Route location and Design	**Natural England's Position on Worst Case Scenario** Part 4 Chapter 3 Table 4.3.6 ID 5.2.6 and 4.3.6 Disturbance to intertidal benthic receptors is scoped out on the basis that trenchless techniques will be used intertidally. Therefore, the worst-case scenario does not account for a scenario where trenchless techniques are not possible intertidally.	Natural England advise that for certainty on the use of trenchless techniques, feasibility studies are carried out and used to inform the ES. The WCS should be assumed for the purpose of the assessment unless the Applicant can provide evidence, beyond scientific doubt, that the exit pits will not be within the designated sites.	N	Ground investigations have confirmed the use of a trenchless solution at both landfalls. In Kent, this technique will avoid the sensitive saltmarsh habitats in the upper intertidal area. However, due to the extent of the intertidal area at Pegwell Bay, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats such as mudflats including temporary and physical disturbance, temporary increased suspended sediment concentrations during construction, operation and decommissioning are scoped back into the ES, using a worst-case scenario (**Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**). This has also been considered in **Application Document 6.6 Habitat Regulations Assessment Report**. The Landfall Feasibility Technical Report has been updated to reflect this update. Please refer to Appendix A of **Application Document 7.3 Design Development Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Benthic Ecology	**Baseline Characterisation – Document(s) Used: Part 4 Chapter 3 Benthic Ecology** 4.3.4.7 - 4.3.4.13 Data from benthic surveys conducted in 2021 is presented: 37 subtidal sampling locations. Grab sampling for PSA and infauna analysis, 5 DDV transects where grab sampling not possible (hard bottom and sensitive areas)"	Natural England is unable to comment on whether the acquired subtidal data from 2023 is of sufficient quality. We recommend that through the Evidence Plan process this data is provided as early as possible to ensure that the data gathered is sufficient. It is not possible for Natural England to agree to the survey approach at this stage. It would have been valuable to wait until the necessary information has been gathered to inform the PEIR.	N	Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
		Benthic Ecology	**Data Gaps** Figure 4.3.2 Subtidal benthic surveys were conducted across the 500m wide Offshore Scheme Boundary.	There are sections of the Offshore Scheme Boundary which are wider than 500m and where biotope data is not presented. As a pre-construction requirement, we advise that surveys are carried out across a wider boundary which allows for avoidance of sensitive features and buffer, to assess the possibility of micro-siting. We advise that within the In Principle Monitoring Plan to be submitted with the application there is a requirement for preconstruction surveys to map feature extent.	N	For the DCO submission the ES uses the full benthic data (PSA, Macrofauna and DDV) from the 2021 Benthic Characterisation Survey for the Proposed Project marine route as of the Environmental Scoping boundary. As previously discussed, an additional survey campaign has been underway to target five discrete areas along the revised Offshore Scheme currently being taken forward to ES and subsequent DCO submission. The results from the comprehensive geophysical survey, preliminary imagery and survey logs are being integrated with existing 2021 data and supplemented with existing environmental information from available sources such as One Benthic to provide confidence in our assessment. Assessment of impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. Pre- installation survey requirements are outlined in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Offshore Physical Environment, Design and Benthic Ecology	Figure 4.3.2 The figure shows areas of Sandbanks with high ecological functionality present at multiple locations along the 500m wide Offshore Scheme Boundary, including between KP114 and 110, where the route approximately overlaps with Goodwin Sands MCZ.	It is important that the ecological function of dynamic sandbanks is maintained. Therefore, we advise that bathymetric surveys are used to consider the ability for the cable to remain buried along the entirety of the cable route, and in particular where it may cross a designated site, due to the possibility of external cable protection being required at a later stage.	N	The Offshore Scheme has been rerouted to avoid Goodwin Sands MCZ. The nearest site designated for Annex I sandbanks is the Margate and Long Sands SAC, located 3 km to the west of the Offshore Scheme. Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**, including the rerouting of the Offshore Scheme, and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This includes assessment of impacts on sandbanks. A Cable Burial Risk Assessment has also been completed, using data from project specific geophysical surveys. This has assessed where

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
						pre-sweeping is required to prevent cable exposure at sandbank features. Several embedded and control measures for mitigation of benthic ecology have been included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions (REAC) and Commitments** and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, in addition to the sensitive routing and siting of infrastructure and temporary works.
		Offshore Physical Environment, Design and Benthic Ecology	**Data Analysis, Modelling and Reporting** 4.3.7.11-4.3.7.12, Figure 4.3.2 and Table 4.3.9 Subtidal mixed sediments with patches of Sabellaria spinulosa were identified at locations KP 13.9 and 19.3 and Mytilus edulis beds at KP 15.4. It is stated that no reef formations of Sabellaria spinulosa or Mytilus edulis beds were present. However, in Figure 4.3.2 and Table 4.3.9 Sabellaria spinulosa and Mytilus edulis beds at the aforementioned locations are labelled as 'Sublittoral biogenic reef'.	Clarity of these statements would be welcomed for Sabellaria spinulosa and Mytilus edulis. Natural England advises further explanation about how refines has been assessed should be provided. Natural England advises that surveys are repeated preconstruction to map any reef extent and where found to be present a 50m buffer area applied as mitigation.	N	Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. Further consideration has been given to potential receptors located within the area, including *Mytilus edulis* beds and *Sabellaria spinulosa* has been included.
		Benthic Ecology and Offshore Mitigation	**Environmental Impact Assessment - Document Used: Part 4 Chapter 3 Benthic Ecology** **Identified impacts** 4.3.7.11-4.3.7.12, Figure 4.3.2 and Table 4.3.9 Sabellaria spinulosa and Mytilus edulis beds have been recorded as present within the Offshore Scheme Boundary and potential impacts have not been taken forward for assessment.	There is an assumption that avoiding areas of reef is sufficient mitigation. This is inadequate mitigation and undermines the conclusion reached by the assessment itself. Sabellaria spinulosa and Mytilus edulis reef naturally develop and erode over time. Therefore, in order to maintain its extent, protection needs to be afforded to areas where reef is currently (i.e. at the time of survey), but also areas within Goodwin Sands MCZ where there is sufficient evidence to demonstrate that Annex I biogenic reef has previously been present and could therefore re establish and/or where juvenile reef may be developing. As well as the direct impact on Sabellaria spinulosa and Mytilus edulis, other impacts which need to be considered are temporary/localised increases in suspended sediment, disruption of	Y	The re-routing of the Offshore Scheme will reduce direct impacts to the known and potential benthic receptors located within Goodwin Sands MCZ, including *Sabellaria spinulosa* and *Mytilus edulis reef* which are present in pre-construction (**Application Document 6.11 Marine Conservation Zone Assessment**). Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** including consideration of all features of conservation interest such as *Sabellaria spinulosa* and *Mytilus edulis* pre-construction. Furthermore, the benthic characterisation surveys did an analysis of 'reefiness,' to assess the structure of aggregations of *S. spinulosa* present, which did not indicate large aggregations of tubes, and therefore no presence of reef formations was identified. Pre-installation surveys will be carried out and will include drop down video and remotely operated vehicles to confirm locations of sensitive benthic habitats and features. Several embedded and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				marine processes, permanent loss of natural substrate for biogenic reef habitats as well as impairment of the potential for reefs to develop in the future. Noting that reef may be present preconstruction, mitigation measures should be adopted as part of the consenting phase to ensure that impacts can be mitigated.		control measures for mitigation of benthic ecology have been included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, in addition to the sensitive routing and siting of infrastructure and temporary works.
		Benthic Ecology and Offshore Mitigation	Five grab samples were undertaken in the Goodwin Sands MCZ and juvenile Mytilus edulis were identified in four of the grab samples, but no beds were identified.	80% of grab samples in Goodwin Sands MCZ contained juvenile Mytilus edulis. Therefore, this indicates potential for reef to be present or to establish. Mytilus edulis beds are a feature of Goodwin Sands MCZ with a recover objective. In addition to our comment above, where extent needs to be recovered it is even more critical to afford protection to areas where reef could re-establish. By failing to afford any protection to areas where reef could re-establish, reef extent may not be adequately maintained and likely would not be restored. Natural England advises as a preconstruction requirement, that preconstruction biogenic reefs surveys are required to inform the deployment of mitigation measures. We advise that micro-siting is used as mitigation with a 50m buffer for this ephemeral species. As Mytilus edulis were identified within the boundary of the MCZ, we advise that a precautionary approach is applied here and this feature needs further consideration (loss of suitable habitat for reef formation, impairment of the potential for bed/reef to develop in future). The greater the confidence that can be achieved in defining these features, the less precautionary an assessment will need to be when assessing the potential impact of any development.	Y	The re-routing of the Offshore Scheme to avoid the Goodwin Sands MCZ will reduce direct impacts to the known and potential benthic receptors located within this designated site, including *Mytilus edulis* reef which are present in pre-construction (**Application Document 6.11 Marine Conservation Zone Assessment**). Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** including consideration of all features of conservation interest such as *Mytilus edulis* during pre-construction. Pre-installation surveys will be carried out and will include drop down video and remotely operated vehicles (ROV) to confirm locations of sensitive benthic habitats and features. Several embedded and control measures for mitigation of benthic ecology have been included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, in addition to the sensitive routing and siting of infrastructure and temporary works.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Benthic Ecology and Offshore Mitigation	No additional mitigation measures have been identified beyond the embedded, control and management measures and no mitigation measures are stated for Goodwin Sands MCZ nor priority habitats outside of designated sites. .	The Offshore Scheme has the potential to impact the benthic receptors identified in Tables 4.3.10 and 4.3.12. We advise that the following may be impacted: blue mussel (Mytilus edulis) beds, Moderate energy circalittoral rock, Ross worm (Sabellaria spinulosa) reefs, Subtidal coarse sediment and Subtidal sand (including sandbanks). The recoverability of the identified benthic receptors has not been referred to, to establish the potential impact of the proposed activities and whether mitigation measures are required. Further assessment is required. In addition, the benthic receptors Sabellaria spinulosa and Mytilus edulis may have the potential to develop to form reefs and data from repeat surveys has not been presented to show temporal variation. Further assessment preconstruction and adoption of mitigation measures at the time of consenting are required. Please see Annex 2.	Y	Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This includes the consideration of all features of conservation interest such as circalittoral rock, subtidal coarse sediment, subtidal sand, *Sabellaria spinulosa* and *Mytilus edulis*, as well as the consideration of any mitigation measures where appropriate. As part of the sensitivity assessment of such features, recoverability was a factor that was considered. The Offshore Scheme has also been rerouted to completely avoid Goodwin Sands MCZ. An Intertidal Characterisation Survey was undertaken in 2023, and Subtidal Characterisation Surveys were undertaken in 2021 and 2024. The data from these surveys have been used in the assessment of impacts on benthic ecology. This included analysis of 'reefiness,' to assess the structure of the aggregations of *S. spinulosa* present, which did not indicate large aggregations of tubes, and therefore no presence of reef formations was identified. Pre-installation surveys will be carried out and will include drop down video and remotely operated vehicles to confirm locations of sensitive benthic habitats and features. Several embedded and control measures for mitigation of benthic ecology have been included in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** and **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, in addition to the sensitive routing and siting of infrastructure and temporary works. No additional mitigation measures have been proposed, as no likely significant effects to benthic ecology have been identified during the assessment.
		Offshore Route location, Design and Benthic Ecology	Table 4.3.11 Benthic receptors for Leiston to Aldeburgh SSSI, Sandwich Bay to Hacklinge Marshes SSSI and Thanet Coast and Sandwich Bay SPA are not considered to have potential impacts.	This assumption is based on the ability to use a trenchless technique at landfall, which has not been verified by feasibility studies. additionally, potential interactions of trenchless techniques with benthic receptors have not been assessed. We advise that further detail is provided on the locations of entry and exit pits in relation to designated sites and their features. If the entry and exit pits are in the vicinity of designated sites, the potential	N	Ground investigations have confirmed the use of a trenchless solution at both landfalls. In Kent, this technique will avoid the sensitive saltmarsh habitats in the upper intertidal area. However, due to the extent of the intertidal area at Pegwell Bay, impacts during cable trenching will affect both intertidal and subtidal habitats until it reaches the exit pit. Therefore, impacts to intertidal habitats such as mudflats including temporary and physical disturbance, temporary increased suspended sediment concentrations during construction, operation and decommissioning are scoped back into the ES (**Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**). This has also been considered in **Application Document 6.6 Habitat Regulations Assessment Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				impacts will require assessment. Likewise, if cable protection is required at the exit pits any disruption to coastal processes which may have secondary impacts to designated sites must be considered.		
		Offshore Route location, Design and Benthic Ecology	Table 4.3.12 and 4.3.13. Table 4.3.13 states "The only Annex I habitat observed within the Offshore Scheme, was 'sandbanks which are slightly covered by sea water all the time' (Ref 3.2), but it is not specifically protected under any designated site," however Table 4.3.12 states Annex I habitat does not overlap with offshore scheme.	There are contradictions within the chapter of the presence of Annex 1 habitat. We advise that this is rectified. We advise that the proposed route does overlap with sandbanks which have high ecological functionality to the wider marine environment, which could qualify as Annex I sandbanks (1110).	N	The highlighted contradictions have been rectified. Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This will include the consideration of all features of conservation interest such as sandbanks as well their potential to qualify as Annex I features.
		Offshore Route location, Design and Benthic Ecology	Table 4.3.13. Table 4.3.13 states "The Offshore Scheme passes through the Goodwin Sands MCZ. The only feature of this designated site identified within the Offshore Scheme was 'subtidal sands. This habitat is considered to be of medium value and grab samples from within the MCZ were found to have sparse fauna. Thus, the sensitivity of this habitat is considered to be low."	These habitats (including sandbank habitats) are often found in high medium energy environments and have the potential to recover from cable activities relatively quickly with low to medium sensitivity to extraction, penetration, abrasion and smothering pressures. However, where features are dynamic, the introduction of hard substrate (such as external cable protection) is often required causing physical change to another seabed or sediment type and therefore likely loss of extent of the existing habitat, form and function. It is particularly important in MPAs designated for sandbank features to consider these pressures in the context of other operations within the site, as many sandbank MPAs are already impacted by these pressures therefore reducing their capacity to withstand further impacts. External cable protection has been considered in the chapter, exact locations should be identified, as if external cable protection is required (likely in this dynamic environment) on sub-tidal sands then additional	N	The exact locations for cable protection have now been identified, an overview of the expected areas of rock backfill are presented in **Application Document 6.4.1.4 Part 1 Introduction Chapter 1 Description of the Proposed Project**. Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This will include the consideration of any sandbank features.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				pressures/impacts on this feature need to be considered too.		
		Benthic Ecology	Table 4.3.10 and 4.3.12 The Summary of Subtidal Habitats of Conservation Importance and Summary of Receptors includes the following habitats: Sandbanks which are slightly covered by seawater all the time. Communities of circalittoral rock Subtidal sands and gravels.	It is not clear from these tables or the sections above how these three receptors have been chosen to be assessed further in the Benthic Ecology Chapter and other benthic receptors identified, which will be sensitive to the proposed activities have not. Subtidal biogenic reefs including mussel beds and Sabellaria spp, whilst tolerant to a certain amount of smothering, biogenic reefs are highly sensitive to damage by abrasion and penetration (although if the area of impact is limited there is potential for the reef to reform over time). We advise that these tables are reconsidered	N	These tables have been reconsidered based on **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)** These determined the potential interactions between benthic receptors and the project activities. All data to support the baseline and fully assess impact pathways is now presented within in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This includes the consideration of all features of conservation interest such as circalittoral rock, subtidal coarse sediment, subtidal sand, *Sabellaria spinulosa* and *Mytilus edulis*, as well as the consideration of any mitigation measures where appropriate.
		Benthic Ecology and Design	Table 4.3.13 The preliminary assessment of benthic ecology effects has identified multiple potential impacts from cable installation activities.	The following information is required for Natural England to advise on potential impacts: Specific locations of activities Total area of impact (direct and indirect, including impact from sediment plumes) Habitats impacted. Presence of sensitive habitats For example, we request reference to these activities in relation to their proximity to MPAs, Annex 1 habitats and habitats of principle importance under Section 41 of the NERC Act 2006. Natural England advises that no external cable protection is placed within Goodwin Sands MCZ and should be secured through condition of consent.	N	Further detail regarding the locations of activities and areas of impact have now been identified. Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This includes the consideration of allocations in relation to designated sites and features of conservation interest. Additionally, the re-routing of the Offshore Scheme will reduce direct impacts to the known and potential benthic receptors located within Goodwin Sands MCZ, including *Sabellaria* reef, subtidal sand and subtidal coarse sediment.
		Benthic Ecology	Table 4.3.13 The impact, temporary physical disturbance to subtidal benthic habitats and species, has been	Natural England requires further information to be able to agree with the conclusion on no significant	N	Natural England's advice has now been taken into consideration and recoverability of features has been considered within the assessment (**Application Document 6.2.4.2 Part 4 Marine**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			identified due to a number of project activities that have been grouped together and will result in temporary physical disturbance to intertidal and subtidal benthic habitats and species. The preliminary sensitivity assessment includes Annex 1 sandbanks which are slightly covered by seawater all the time, communities of circalittoral rock and subtidal sands and gravels. The overall effect is considered not significant.	overall effect from temporary physical disturbance. Additionally, temporary disturbance assumes that habitats are able to recover from the project activities. However, the assessment does not consider the varying ability of benthic habitats to recover. Natural England welcome that Annex 1 sandbanks within Margate and Long Sands SAC will be avoided. However, sandbanks with high ecological functionality have been identified outside of MPAs within the Offshore Scheme Boundary and statements referring to the sensitivity of Annex 1 sandbanks should be referenced. For example, evidence to indicate the 'often low biodiversity' and 'high capacity to tolerate physical disturbance' which is used to conclude the low sensitivity of this habitat to temporary disturbance. Communities on circalittoral rock and subtidal sands and gravels are referred to together as 'medium importance' with 'medium sensitivity' to temporary disturbance. This statement is not referenced and does not consider the recoverability of habitats to disturbance from the various activities included in this assessment. For example, cable trenching on circalittoral rock will likely result in a permanent impact as the soft chalk and clay exposures identified within this habitat are irreplaceable and will have a different ability to recover from abrasion and disturbance to subtidal sand and gravels. Natural England advises recoverability evidence for habitats is presented in the assessment, that the total area of impact on habitats of principle importance is determined and that mitigation measures may be required.		**Chapter 2 Benthic Ecology and Application Document 6.6 Habitats Regulations Assessment Report**). The impact of the Proposed Project on the blue mussel and *Sabellaria spinulosa* reef have now been detailed further within the MCZ assessment (**Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**), as well as within fish and shellfish impact assessment (**Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**). The impact of the Proposed Project on the *Sabellaria spinulosa* reef has also been detailed further within the MCZ assessment (**Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				Mytilus edulis recorded in the Offshore Scheme Boundary in Goodwin Sands MCZ are not included within this assessment. Please see our comments above advising that impacts on juvenile Mytilus edulis within Goodwin Sands MCZ are assessed. Similarly, we advise that Mytilus edulis beds and Sabellaria spinulosa located outside of a protected site are assessed and avoided where possible.		
		Benthic Ecology, Offshore Mitigation and Design	Table 4.3.13 The impact, direct loss of subtidal benthic habitats and species due to placement of hard substrates on the seabed, has been identified due to: Rock placement Concrete mattresses Rock/gravel/sand/grout bags Protection sleeves/cast-iron shells The overall effect is considered not significant.	It is stated that 0.01km2 of habitat in Goodwin Sands MCZ will be lost. We wish to remind the Applicant to adhere to the mitigation hierarchy, this needs to be fully justified and assessed in the ES. In addition, further information on and amounts of external rock protection placed within MPAs is required. Clarity is required on the potential for cable crossings in Goodwin Sands MCZ. Natural England advises further clarification on whether this habitat loss includes designated features of the site is required to enable conclusions to be drawn on significance of effect. Noting that the Mytilus edulis identified in Goodwin Sands MCZ have not been included within this assessment. We advise that further information is provided on the recoverability of habitats after external rock protection is removed. Please see comments below regarding the MCZ Assessment relating to the need for Measures of Equivalent Environmental Benefit (MEEB).	Y	The Offshore Scheme has been updated to avoid Goodwin Sands MCZ entirely and it no longer overlaps with the Order Limits. This follows the mitigation hierarchy, avoiding impacts to the features and conservation objectives of Goodwin Sands MCZ. The re-routing of the Offshore Scheme will reduce impacts to the known and potential benthic receptors located within the area, including avoiding any permanent loss of benthic habitat. The Offshore Scheme now avoids the Goodwin Sands MCZ, and so no rock protection will be required within this designated site. The total area of rock protection required for the Offshore Scheme is presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. The locations of rock protection are shown in **Figure 6.2.4.3.3**.
		Design	Table 4.3.13 External cable protection options presented: Rock placement	As part of the proposed works, we advise that decommissioning plans are clearly explained and that any external cable protection proposed is completely removed from the	N	Additional information and clarity regarding the Proposed Project's decommissioning plans have now been outlined in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and within each of the marine technical chapters. As this work is planned decades into the future, it is

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Concrete mattresses Rock/gravel/sand/grout bags Protection sleeves/cast-iron shells	seabed. External cable protection other than rock placement, such as mattresses, rock bags, would be easier to remove at decommissioning and result in better environmental outcomes. In addition, we advise that a monitoring plan for post decommissioning is committed to, to assess the recovery of any impacted features.		unknown what the exact methodology will be for decommissioning, as this will be based on the best available technology available at the time of decommissioning. An initial decommissioning plan would be written once the final route and installation methodology is engineered by the contractor post submission. This would be in accordance with all applicable legislation, best practice guidance and Shoreline Management Policies at the time of compilation. However, as decommissioning of the cable would be many decades into the future, regulatory requirements and industry best practice may change. Sediment transport studies have been commissioned and undertaken by National Grid which outline the short to long term nearshore beach variance and stability at both landfalls. These studies would be used to inform the initial decommissioning plan. A written scheme of decommissioning will be submitted for approval to the relevant planning authority at least six months prior to any decommissioning works. This would follow National Grid's processes at that point in time, for assessing and mitigating any environmental impacts.
		Marine Conservation Zone Assessment	**MCZ Assessment. Document Used: Part 5 Chapter 4 Marine Conservation Zone Assessment** **Screening** 4.5.3 The following impact pathways have been scoped in for subtidal and benthic habitats and species: Temporary disturbance Permanent loss Increase in suspended sediment. Introduction of invasive non-native species (INNS) Electromagnetic fields (EMF)	Natural England agrees with the impact pathways that have been scoped in	N	National Grid notes your comment.
		Marine Conservation Zone Assessment	Figure 5.4.1 The Swale Estuary MCZ and Blackwater, Crouch, Roach and Colne Estuaries MCZ are not depicted or assessed despite the overlap of both MCZs with the 30km buffer zone.	Both MCZs should be appropriately scoped in to the MCZ assessment, if not, justification should be given as to why these MCZs have not been assessed.	N	There has been further consideration of MCZs scoped into the assessment as part of **Application Document 6.11 Marine Conservation Zone Assessment**, with detailed justification provided where appropriate. The screening distance has been refined to 17 km, in line with the precautionary approach encouraged by the MMO. Therefore, MCZs which lie outside of this screening distance, including the Swale Estuary MCZ and Blackwater, Crouch, Roach and Colne Estuaries MCZ, have not been included.
		Marine Conservation	**Assessment**	Natural England disagrees with this conclusion and advise that, as presented, the proposed works have the potential to cause significant	Y	Natural England's advice has been taken into consideration in **Application Document 6.11 Marine Conservation Zone Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Zone Assessment	The MCZ assessment concluded that the conservation objectives of Goodwin Sands MCZ will not be hindered. impacts on the designated features of Goodwin Sands MCZ, notably from temporary physical disturbance and permanent loss. Further mitigation measures are required at Stage 1 to determine that the conservation objectives will not be hindered, and a Stage 2 assessment is not needed. Natural England advises that a robust MCZ Assessment will be required due to the risk of the conservation objectives being hindered. The MCZ Stage 1 Assessment process (as stipulated in the MMO Guidance) should determine whether: there is no significant risk of the activity hindering the achievement of the conservation objectives stated for the MCZ. If this point cannot be met, then the Stage 1 Assessment should determine whether: there is no other means of proceeding with the act which would create a substantially lower risk of hindering the achievement of the conservation objectives stated for the MCZ. This should include proceeding with it (a) in another manner, or (b) at another location. Natural England advises that based on the information provided to date, the avoidance of the site or a commitment of no rock armouring in the MCZ (which must be secured through licence condition) appears to be the only option that would avoid the need for the decision-maker to proceed to the subsequent steps of the MCZ assessment process i.e. a Stage 2 Assessment.		Notably, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ and will therefore reduce impacts to the known and potential receptors located within the area.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Marine Conservation Zone Assessment, Design and Offshore Mitigation	Stage 1 assessed impacts on Kentish Knock East MCZ and Thanet Coast MCZ from temporary increase in suspended sediment and concluded that conservation objectives will not be hindered.	Natural England is unable to agree with this conclusion without further information. The final methodology for landfall has not been determined or backed up by feasibility studies. This activity has the potential to release significant amounts of suspended sediment which could impact Thanet Coast MCZ. Locations of cable preparation and installation activities, such as pre sweeping, have not been presented and have the potential to impact Kentish Knock East MCZ.	N	The latest methodology regarding the landfall is detailed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. These methods have been carefully considered as part of **Application Document 6.11 Marine Conservation Zone Assessment**, including the potential effects that may occur to the designated features of Thanet Coast and Kentish Knock East MCZs. Additional consideration has been given to the advice provided by Natural England in the above comments, regarding the PEIR MCZ assessment. Notably, cable installation activities will not pass directly through the either of these MCZs, avoiding direct impacts, and reducing the impacts to the known and potential receptors located within the area. Both MCZs have been assessed in **Application Document 6.11 Marine Conservation Zone Assessment** for indirect impacts as a result of temporary increase in SSC. The temporary increase in SSC was concluded as unlikely to affect the conservation objectives of both sites.
		Inter-Project Cumulative Effects and Benthic Ecology	Cumulative / In- combination Assessment Part 4 Chapter 12 Offshore Scheme has included the following project for cumulative effects on benthic ecology: Lion Link Nautilus Neuconnect Gridlink Five Estuaries OFW North Falls OFW East Anglia One, Two and Three OFW Aggregate area 528 Nemo Link and Thanet Offshore have not been included in the inter-project cumulative effects.	Natural England advises that the Nemo Link interconnector cable and Thanet Offshore wind farm and cables are included within the cumulative effects and assessed appropriately for benthic impacts. Natural England also note that active nearby telecoms cables have not been depicted in any figures when considering cumulative impacts despite being present within the study area. These include the cables Atlantic Crossing 1, Mercator, Pan European Crossing and Tangerine. All telecoms' cables should be scoped in for cumulative impact assessment or justification should be provided as to why these cables have not been considered.	N	Natural England's advice has been considered and the recommended Nemo Link interconnector cables and Thanet Offshore wind farm cables have been considered within the cumulative effects assessment. Further information is provided within **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Marine Conservation Zone Assessment and Benthic Ecology	**MCZ Assessment Conclusion**	We agree with the MCZs scoped in for a stage 1 assessment. However, we disagree with the conclusion for Goodwin Sands MCZ that conservation objectives will not be hindered. Natural England	Y	Natural England's advice has been taken into consideration in **Application Document 6.11 Marine Conservation Zone Assessment**. Notably, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ and will avoiding direct impacts, reducing the impacts to the known and potential receptors located within the area.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				advises that the conservation objectives of the designated features are revisited, for example Mytilus edulis have a recover objective, and further mitigation applied. This requires further discussion about the development of an in principle MEEB plan using the evidence plan process. See previous comments.		Therefore, the development of an in-principle MEEB plan is not considered necessary.
		Benthic Ecology and Offshore Mitigation	**Priority Habitats and Species listed under Section 41 list of the Natural Environmental and Rural Communities (NERC) Act, 2006.** **Potential impact pathways where further info/assessment required.** 4.3.7.3 2 – 4.3.7.3 8 and Table 4.3.10 There is reference made to Mytilus edulis beds and Sabellaria spinulosa being recorded along the Offshore Scheme Boundary outside of a designated site. However, they are not included in Table 4.3.10 as subtidal habitats of Conservation Importance and assessed further within the chapter.	Sabellaria spinulosa reef and Mytilus edulis beds on sediment are protected under the Section 41 of the NERC Act 2006 and are UK BAP priority habitats. As set out in previous points further assessment and adoption of mitigation measures are required for biogenic reef.	N	These tables have been reconsidered, based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is now presented within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This will include the consideration of all features of conservation interest such as *Sabellaria spinulosa* reef and *Mytilus edulis* beds.
		Marine Conservation Zone Assessment and Benthic Ecology	4.3.7.3 2 – 4.3.7.3 8 and Table 4.3.10 Juvenile Mytilus edulis have been recorded within Goodwin Sands MCZ along the proposed cable route, where Mytilus edulis beds are a designated feature. However, they are not included in Table 4.3.10 as subtidal habitats of Conservation Importance and assessed further within the chapter.	In addition, to our previous comment, we advise that Mytilus edulis recorded within Goodwin Sands MCZ are given further assessment and mitigation measures due to their potential interaction with project activities, and their recover objective, as it is even more critical to afford protection to areas where reef could re-establish.	Y	The Offshore Scheme has been rerouted to completely avoid the Goodwin Sands MCZ. This avoids direct impacts to the MCZ and reducing the impacts to the known and potential benthic receptors located within the area, including *Mytilus edulis*.
		Marine Conservation Zone Assessment and Benthic Ecology	4.3.7.5 2 – 4.3.8.1 and Appendix 1.4F Sandbanks which are slightly covered by seawater all the time, Communities on circalittoral rock and subtidal sands and gravels and identified as benthic ecology receptors, however no mitigation measures for benthic ecology are applied in the referenced Appendix 1.4F	Natural England advises that designated site features and NERC 2006 priority habitats are thoroughly assessed. In addition, clay outcrops and soft chalk have been identified in the communities on circalittoral rock. These are rare and irreplaceable habitats that we advise are given a robust assessment of potential impacts and consideration of	N	The designated features of the MCZs screened into assessment, including clay and soft chalk communities, have been carefully considered as part of **Application Document 6.11 Marine Conservation Zone Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			mitigation measures following the mitigation hierarchy.		
		Offshore Mitigation and Benthic Ecology	**Appendix 1** **Benthic mitigation measures** We note that the proposed Measure of Equivalent Environmental Benefit Assessment needs to be defined as mitigation measures have not been fully explored. Natural England advises that the impacts on benthic ecology could be avoided, reduced and mitigated by implementing (but not exclusively) the following mitigation measures: - Avoid SAC/MCZ Reduce number of cables though use of HV/DC system or coordinated approach with other projects. Micro siting cables around reef and other features of ecological importance – All projects post Lincs OWF consent 2008. Sandwave levelling to reduce risk of free spanning cables and requirement for external cable protection – though this has own issues in relation to ensuring sediment remains in the system, disposal in like for like habitat/sediment, demonstrating full recoverability etc. – All projects since 2016 have included an element of this Adoption of the reburial hierarchy with external cable protection being last resort – all projects Pre consent undertake a cable burial risk assessment using geotechnical data to focus cable protection requirements to areas where cables are likely to be sub-optimally buried e.g., mixed sediment - to apply for a realistic worse-case scenario – All projects since Vanguard. Use of guard vessels and/or advance mapping to avoid sub-optimally buried/surface laid cables negating the need for physical cable protection e.g., Lincs cable in the Wash. Requirement to install cable protection with the minimal footprint e.g., pinning – TWT cable corridors. Requirement to install cable protection with the greatest likely of removal e.g., rock bags. See decommissioning paper. Example Norfolk Projects No use of jack up barges along export cable routes through benthic SACs – Norfolk OWF projects No cable protection in fisheries byelaw areas to avoid hindering reef recovery, noting that cable may still go through the outskirts of these areas - Norfolk Projects Designing rock armouring to mirror the structure and function of geogenic reef – advised for Viking Link interconnector. Bundle Cables to reduce impact footprint – Dogger Bank A & B	N	Natural England's advice has been taken into consideration and all relevant mitigation measures have been considered in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** and **Application Document 6.11 Marine Conservation Zone Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Consultation	**Annex 6_PEIR Specialist Advice_Fish & Shellfish** **Preliminary Environmental Information Report (PEIR) Review** **Annex 6 – Fish and Shellfish Ecology** In formulating these comments, the following documents have been considered: Part 1 Introduction; Chapter 1 Introduction Part 1 Introduction; Chapter 2 Regulatory and Planning Policy Context Part 1 Introduction; Chapter 3 Main Alternative Considerations Part 1 Introduction; Chapter 4 Description of Proposed Project Part 4 Offshore; Chapter 4 Fish & Shellfish Part 5 Project Wide Effects; Chapter 3 Habitat Regulations Screening Part 5 Project Wide Effects; Chapter 4 Marine Conservation Zone Assessment **Natural England's Advice and Recommendations** A summary of Natural England's advice in relation to Offshore Ornithology is set out in Table 1. Our key concerns along with recommendations are presented in further detail in Table 2.	N	National Grid acknowledges your comment.
		Fish and Shellfish Ecology and Consultation	**Summary of Key Concerns** **Table 1 Summary of Key Issues - Fish & Shellfish Ecology** Natural England defers to the expertise of Cefas in relation to fish and shellfish, where they are not features of designated sites or a prey species associated with the feature of a designated site. The absence of comment on aspects such as underwater noise, adequate baseline characterisation, and the impact assessment etc., should not be assumed to mean the absence of any concerns.	Natural England's Recommendations to Resolve Issues. We advise the Project seeks the advice of Cefas on the sensitivity of particular species, and the appropriateness of the sensitivity assigned in the assessment. We advise that Natural England's comments are read in conjunction with the advice of Cefas. It should be noted that Natural England's remit differs to that of Cefas. Natural England's role is to advise on features of designated sites in the context of the conservation objectives, to ensure that the sites fulfil their function and make their due contribution to the Marine Protected Areas network. Cefas' role is to advise on how the development might interact with the fish populations as a whole. This context should be considered when reading the advice of both organisations and	N	National Grid has had early engagement with Cefas regarding a range of issues, including underwater sound, herring and sandeel spawning, and UXO assessments. This included meetings held on 31 May 2023 and 08 February 2024. National Grid has considered the context of both regulators advice and have addressed them in unison.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				is likely to be the reason for any perceived differences. Natural England's RAG rating relates to our remit, and therefore this may not fully reflect the significance of an issue when considered under Cefas' remit.		
		Fish and Shellfish Ecology, Consultation and Offshore Mitigation	We defer to Cefas in relation to the appropriate mitigation but note that, based on the overlap/proximity of herring and nursery areas, the proposal cable route interacts with sandeel spawning areas and both herring and sandeel preferred/marginal habitat (Figures 4.4.4 to 4.4.8). As the Project will also interact with the Outer Thames Estuary Special Protection Area (OTE SPA) and Southern North Sea Special Area of Conservation (SNS SAC) it is possible that mitigation measures will need to be further explored. Any mitigation proposed will need to be accompanied by suitable evidence to demonstrate it efficacy.	We recommend the Project take on board advice received from Cefas regarding mitigation measures for the herring and sandeel spawning and nursery habitats. Natural England advises that a map showing locations for external cable protection are provided with layers for sandeel and herring suitable habitat and in OTE SPA and SNS SAC. We advise the Applicant that impacts on prey availability in these sites, including suitable habitat availability and recoverability, will need thorough assessment and consideration at Appropriate Assessment and appropriate mitigation measures are applied.	N	National Grid has had early engagement with Cefas on the approach to the herring and sandeel spawning assessment. This included meetings held on 31 May 2023 and 08 February 2024. This approach has been approved by Cefas. Cable protection areas have been plotted with layers of suitable habitat and have been assessed as part of the herring and sandeel assessment within the fish and shellfish impact assessment (**Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**). The potential effects to prey items have been considered within **Application Document 6.6 Habitats Regulations Assessment Report**.
		Fish and Shellfish Ecology	The Worst-Case Scenario (WCS) refers permanent habitat loss of all suitable habitat for herring and sandeel due to external cable protection and concludes that the impact of this is not significant.	In addition to NE Ref 3, we recommend that robust assessment is carried out in relation to the WCS of all suitable herring and sandeel habitat lost where the proposed cable route interacts with OTE SPA and SNS SAC.	N	Consideration of the potential indirect prey effects to the features of these designated sites from loss of potential herring and sandeel spawning habitat, has been considered with **Application Document 6.6 Habitats Regulations Assessment Report** which concludes that the Proposed Project will not result in an adverse effect on the integrity of any European sites either alone or in combination with other plans or projects.
		Fish and Shellfish Ecology, Marine Conservation Zone Assessment and Onshore Mitigation	Mytilus edulis has been recorded along the proposed cable route and within Goodwin Sands MCZ.	Natural England disagree with the conclusions of the MCZ Assessment, that the conservation objectives of Goodwin Sands MCZ will not be hindered. We advise that further information regarding impacts and mitigation measures to reduce the level of risk to acceptable levels are required. Please see our comments in Annex 5 Benthic Ecology. Evidence has not been provided by the Applicant to justify why Goodwin Sands MCZ cannot be avoided. Natural England is unable to agree	Y	The re-routing of the Offshore Scheme will reduce direct impacts to the known and potential benthic receptors located within Goodwin Sands MCZ, including *Mytilus edulis* reef (**Application Document 6.11 Marine Conservation Zone Assessment**). This follows the mitigation hierarchy, avoiding impacts to the features and conservation objectives of Goodwin Sands MCZ. Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** including consideration of all features of

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			with the MCZ Assessment conclusions. Natural England advises that a robust MCZ Assessment and supporting evidence similar to those provided for Sheringham and Dudgeon Extension Projects will be required due to the risk of the conservation objectives being hindered. Based on the information provided to date, further mitigation such as, avoidance of the site or a commitment of no rock armouring in the MCZ, appears to be the only option that would avoid the need for the decision-maker to proceed to the subsequent steps of a Stage 2 MCZ assessment. Natural England advises that the mitigation hierarchy is followed and that the Applicant thoroughly considers all benthic mitigation options provided in Annex 5. We advise that the Applicant gives due consideration to the conservation objectives of the MCZ's designated features. Mytilus edulis beds are a designated feature in the site with a recover objective and an ephemeral species. The presence of juvenile Mytilus edulis indicates that the location of the proposed cable route has the potential to support the recovery of this designated feature. We advise that further information is provided along the section of the proposed cable route that overlaps with Goodwin Sands MCZ as well as survey data of a wider area to present options to avoid features. We highlight that Mytilus edulis reef is associated with the life cycle of Sabellaria spinulosa reef another interest feature of Goodwin Sands MCZ and both are priority habitats under NERC 2006 and therefore should also be avoided where possible outside of the designated site.		conservation interest such as *Mytilus edulis* and *Sabellaria spinulosa reef*.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Fish and Shellfish Ecology	**Table 2 Natural England's Key Advice and Recommendations – Fish and Shellfish Ecology** **Baseline Characterisation – Document(s) Used: Part 4 Chapter 4 Fish and Shellfish ecology** 4.4.7.15 Results and academic papers from a project called Salmonid Management around the Channel (SAMARCH) may have more information on swimming depths for Brown Trout.	Consider searching for published information/ contacting Game and Wildlife Conservation Trust (GWCT) for more information on this.	N	A range of academic sources have been considered for information on the swimming depths for brown trout. This now includes academic papers from the Salmonid Management around the Channel project. National Grid has also searched for published information/ contacting Game and Wildlife Conservation Trust.
		Fish and Shellfish Ecology	Table 4.4.10; 4.4.11; 4.4.15; 4.4.16	Natural England are satisfied with the data sources which have been provided in these tables.	N	National Grid acknowledges your comment.
		Fish and Shellfish Ecology, Noise and Vibration and Offshore Mitigation	Table 4.4.18 Within "preliminary likely significance of effect" relating to underwater sound (excluding UXO), the Applicant states that soft start procedures to any works will ensure sound levels only gradually increase to allow fish to move away from the noise source and reduce risk of injury. Natural England do not agree with soft start procedure being applicable to fish, as there is very little evidence to support any assertion that fish flee consistently and coherently away from noise sources.	Ensure consistency across the submitted assessment to ensure that this method is not incorrectly portrayed as an appropriate mitigation measure for underwater noise impacts on fish.	N	National Grid has considered the guidance on UXO detonation mitigation measures from the JNCC (2010), noting that this guidance is specific to marine mammals. It has considered the requirement for additional mitigation for fish, noting that soft-starts are not an appropriate form of mitigation.
		Fish and Shellfish Ecology and Consultation	Figures 4.4.4 to 4.4.8 Herring and sandeel spawning and nursery grounds have been mapped, along with preferred/marginal habitat along the cable route and a contour map showing International Herring Larvae Surveys (IHLS) from 2008 and 2017. It is unclear why the most up to date IHLS data has not been used.	We defer to Cefas to comment on the appropriateness of the data presented and sufficiency of surveys mapping the preferred/marginal habitat for assessing impacts of the proposed cable route on herring and sandeel species. We therefore recommend discussing the most appropriate dataset to use with Cefas.	N	A meeting was held with Cefas on 08 February 2024 which outlined the approach to the herring and sandeel spawning assessment, including the data to be presented and the data sources used. This approach was approved by Cefas.
		Fish and Shellfish Ecology	**Data Analysis, Modelling and Reporting** Figures 4.4.4 to 4.4.5. Figure 4.4.4 indicates the known locations of herring spawning and nursery grounds in	The data presented in the figures suggests that the proposed cable route overlap with spawning habitat and low intensity nursery habitat for	N	Indirect effects from prey items on the features of these designated sites, has been considered in **Application Document 6.6 Habitats Regulations Assessment Report**. This includes presentation of these designated sites in a figure.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			relation to the proposed cable route from Coull et al 1998 and Ellis et al 2012. Figure 4.4.5 indicates the known spawning and nursery grounds for sandeel from the same data sources. Both figures use Ellis et al 2012 to show estimated intensity of nursery grounds.	sandeel, as well as high intensity nursery habitat for herring. Natural England advises that the Figures also include the designated SPAs and SACs that the proposed project will interact with, as there is potential for impacts to occur on the prey species of designated features within OTE SPA and SNS SAC.		However, the herring and sandeel spawning assessment figures (**Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**) also include these designated sites, for greater context.
		Fish and Shellfish Ecology	Figure 4.4.6 shows the results of IHLS in the North Sea as a contour map. The results presented in the contour map show that the proposed cable route includes a large portion of amber/medium abundance of herring larvae ranging from 200-600 eggs and larvae found per m2.	Although, no portion of the proposed cable route overlaps with high abundance of herring eggs and larvae (600-46600m2), a medium abundance indicates suitable conditions for eggs and larvae and requires sufficient assessment for potential impacts from the project on loss of prey availability for the OTE SPA and SNS SAC.	N	A full herring and sandeel spawning assessment, including potential effects to these receptors has been undertaken in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. Indirect effects from prey items on the features of these designated sites, has been considered in **Application Document 6.6 Habitats Regulations Assessment Report** which concludes that the Proposed Project will not result in an adverse effect on the integrity of any European sites either alone or in combination with other plans or projects.
		Fish and Shellfish Ecology	Figures 4.4.7 and 4.4.8 Coull et al (1998) and benthic characterisation surveys have been used to map preferred/marginal habitat for herring and sandeel.	See comment on Figures 4.4.4 to 4.4.5 above, which also applies here.	N	Indirect effects from prey items on the features of these designated sites, has been considered in **Application Document 6.6 Habitats Regulations Assessment Report**. This includes presentation of these designated sites in a figure. However, the herring and sandeel spawning assessment figures (**Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**) also include these designated sites, for greater context.
		Fish and Shellfish Ecology and Consultation	**Environmental Impact Assessment - Document Used: Part 4 Chapter 4 Fish and shellfish ecology; Part 1 Chapter 6 Scoping Opinion and EIA Consultation; Part 1 Chapter 5 PEIR Approach and Methodology** Outer Thames Estuary Special Protection Area (OTE SPA) – as recognised in Natural England's supplementary advice on the conservation objectives for the site, species such as herring and sandeels are key prey species of red-throated diver (RTD). Impacts to these key fish species therefore have the potential to reduce prey availability for RTD. Impacts to the mortality, fitness or distribution of these species have the	We advise that providing an adequate baseline, utilising the best available evidence for herring and sandeel, is key to the assessment of impacts on these species. Such evidence is also required to inform the assessment of impacts on prey availability for RTD in the Ornithology Chapter and through the Habitats Regulations Assessment (HRA). We advise that Natural England's comments are read in conjunction with the advice of Cefas. It should be noted that Natural England's remit differs to that of Cefas. Natural England's role is to advise on features of designated sites in the context of the conservation objectives, to ensure that the sites	N	National Grid has had early engagement with Cefas on the approach to the herring and sandeel spawning assessment. This included meetings held on 31 May 2023 and 08 August 2024. This approach has been approved by Cefas. A full herring and sandeel spawning assessment, including potential effects to these receptors has been undertaken in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. Indirect effects from prey items on the features of these designated sites, has been considered in **Application Document 6.6 Habitats Regulations Assessment Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			potential to add to existing pressures on RTD due to anthropogenic disturbance. Natural England defers to the expertise of Cefas in relation to fish and shellfish, where they are not features of designated sites or a prey species associated with the feature of a designated site. The absence of comment on aspects such as underwater noise, adequate baseline characterisation, and the impact assessment etc., should not be assumed to mean the absence of any concerns.	fulfil their function and make their due contribution to the Marine Protected Areas network. Cefas' role is to advise on how the development might interact with the fish populations as a whole. This context should be considered when reading the advice of both organisations and is likely to be the reason for any perceived differences. Natural England's RAG rating relates to our remit, and therefore this may not fully reflect the severity significance of an issue when considered under Cefas' remit.		
		Fish and Shellfish Ecology, Consultation and Design	Table 4.4.17 and 4.4.18 Figures 4.4.4 to 4.4.8 It is important that the ecology of each individual species is taken into account when determining potential impacts upon them. This includes aspects such as their lifecycle (and sensitive stages within this, such as spawning, when fish can be in poor body condition), physiology, habitat requirement for spawning etc. It is key to note that both herring and sandeel are substrate specific demersal spawners. This makes them particularly sensitive to temporary or permanent changes in the particular substrate types that they use for spawning. Temporary increase Suspended Sediment Concentration (SSC) and subsequent sediment deposition. has the potential to impact negatively on spawning, which particularly needs to be considered in relation to the herring spawning areas as modelling of sediment dispersion has not been presented. As presented in Figures 4.4.4 to 4.4.8, there is overlap with the Project and herring high intensity nursery grounds, and sandeel spawning and nursery grounds and preferred/marginal habitat for both species. Therefore, we do not agree that habitat loss will be temporary, and the seabed will quickly recover to its	We advise the Project seeks the advice of Cefas on the sensitivity of particular species, and the appropriateness of the sensitivity assigned in the assessment. Natural England advises the Applicant that recoverability of habitat is thoroughly assessed and referenced, and that a commitment is made to monitor recovery of herring and sandeel habitat post-construction, to ensure that any potential impacts on OTE SPA and SNS SAC designated features are not permanent. In addition, to reduce permanent impacts, we advise that no external cable protection is laid at locations where Cefas determine high sensitivity for herring and sandeel, where the proposed cable route interacts with OTE SPA and SNS SAC, wherever possible. Natural England advise that the Applicant shares further detail on the exact locations of proposed external cable protection in relations to OTE SPA and SNS SAC.	N	A meeting was held with Cefas on 08 February 2024 which outlined the approach to the herring and sandeel spawning assessment, including the data to be presented and the data sources used. This approach was approved by Cefas. The exact locations of the proposed cable protection required have been presented within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. Consideration will also be given to the recoverability of herring and sandeel spawning habitat, following temporary disturbance.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			original condition where external cable protection has been placed. This is because the habitat type will have changed. In relation to long-term habitat loss, we advise this is permanent rather than long term. This is due to the lack of certainty of methods of external rock protection and recovery after decommissioning. In addition, we do not agree that a WCS of permanent habitat loss of all suitable habitat for herring and sandeel due to external cable protection is not significant. Outer Thames Estuary Special Protection Area (OTE SPA) – as recognised in Natural England's supplementary advice on the conservation objectives for the site, species such as herring and sandeels are key prey species of red-throated diver (RTD).			
		Fish and Shellfish Ecology, Consultation and Design	4.4.8.4 We defer to Cefas in relation to the appropriate mitigation but note that, based on the overlap/proximity of herring high intensity nursery areas, sandeel spawning and nursery areas and herring and sandeel preferred/marginal habitat, it is possible mitigation measures will need to be further explored. Any mitigation proposed will need to be accompanied by suitable evidence to demonstrate its efficacy.	The submitted ES should fully reflect any advice received from CEFAS regarding mitigation measures for herring and sandeel spawning and nursery habitat. Natural England advises that any proposed mitigation measures to seasonally restrict the proposed works outside of herring and/or sandeel spawning periods would also be appropriate to reduce impacts on OTE SPA and SNS SAC. In addition, to reduce permanent impacts, we advise that no external cable protection is laid at locations where Cefas determine high sensitivity for herring and sandeel, where this interacts with OTE SPA and SNS SAC wherever feasible.	N	The cable route is not considered to go through important spawning grounds for sandeel and herring (**Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**). A full seasonal restriction (1st November – 31st March) in the Outer Thames Estuary SPA will be implemented for all offshore cable installation activities, excluding the PLGR, for red-throated diver. A reduced seasonal restriction (1st January – 31st March) is also in place for landfall cable installation activities at the Suffolk landfall in Aldeburgh. Therefore, the Proposed Project will also avoid the seasonal period for spawning herring and sandeel of November – January and November – February (respectively) within the Outer Thames Estuary SPA with regards to cable burial activities (excluding PLGR).
		Benthic Ecology	4.4.7.8 Mytilus edulis was recorded as one of the top ten most abundance species in the Offshore Scheme's survey area and was recorded within grab samples in Goodwin Sands MCZ.	Please refer to our comments in Annex 5 Benthic Ecology regarding Mytilus edulis identified within the Offshore Scheme and within Goodwin Sands MCZ.	Y	The re-routing of the Offshore Scheme will reduce direct impacts to the known and potential benthic receptors located within Goodwin Sands MCZ, including *Mytilus edulis* reef (**Application Document 6.11 Marine Conservation Zone Assessment**). This follows the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
						mitigation hierarchy, avoiding impacts to the features and conservation objectives of Goodwin Sands MCZ. Based on updates to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and additional survey data (**Application Document 6.3.4.2.A ES Appendix 4.2.A Benthic Characterisation Report (Original Report) and Application Document 6.3.4.2.B ES Appendix 4.2.B Geophysical Survey Interpretation (Additional Surveys)**, all data to support the baseline and fully assess impact pathways is presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** including consideration of all features of conservation interest such as *Mytilus edulis* and *Sabellaria spinulosa reef*.
		Habitat Regulations Screening	**HRA - Document Used: Part 5 Chapter 3 Habitats Regulations Screening** **Screening** Overall Relevant sites and features have been identified and screened in/ out with justification.	Natural England agree with the sites and designated features screened in for the HRA.	N	National Grid acknowledges your comment.
		Fish and Shellfish Ecology and Offshore Mitigation	Table 5.3.3 The Appropriate Assessment for Outer Thames Estuary Special Protection Area has concluded that there will be permanent loss of subtidal offshore areas including foraging ground and increase in Suspended Sediment Concentration including foraging ground.	The submitted ES should fully reflect any advice received from CEFAS regarding mitigation measures for herring and sandeel spawning and nursery areas. We recommend that the herring and sandeel spawning and nursery grounds and priority/marginal habitat maps in Figures 4.4.4 and 4.4.8 are overlain on OTE SPA.	N	National Grid acknowledges your comment. A full seasonal restriction (1st November – 31st March) in the Outer Thames Estuary SPA will be implemented for all offshore cable installation activities, excluding the PLGR, for red-throated diver. A reduced seasonal restriction (1st January – 31st March) is also in place for landfall cable installation activities at the Suffolk landfall in Aldeburgh. Therefore, the Proposed Project will also avoid the seasonal period for spawning herring and sandeel of November – January and November – February (respectively) within the Outer Thames Estuary SPA with regards to cable burial activities (excluding PLGR).
		Fish and Shellfish Ecology and Offshore Mitigation	Table 5.3.16 The Appropriate Assessment for Southern North Sea Special Area of Conservation has concluded that there will be permanent loss of subtidal offshore areas including foraging ground and increase in Suspended Sediment Concentration including foraging ground.	The submitted ES should fully reflect any advice received from CEFAS regarding mitigation measures for herring and sandeel spawning and nursery areas. We recommend that the herring and sandeel spawning and nursery grounds and priority/marginal habitat maps in Figures 4.4.4 and 4.4.8 are overlain on OTE SPASNS SAC.	N	National Grid acknowledges your comment. A full seasonal restriction (1st November – 31st March) in the Outer Thames Estuary SPA will be implemented for all offshore cable installation activities, excluding the PLGR. A reduced seasonal restriction (1st January – 31st March) is also in place for landfall cable installation activities at the Suffolk landfall in Aldeburgh. Therefore, the Proposed Project will also avoid the seasonal period for spawning herring and sandeel of November – January and November – February (respectively) within the Outer Thames Estuary SPA with regards to cable burial activities (excluding PLGR). Seasonal restrictions will not be implemented in the Southern North Sea SAC.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Fish and Shellfish Ecology and Offshore Mitigation	Table 5.3.16 The Appropriate Assessment for Southern North Sea Special Area of Conservation has concluded that there will be permanent loss of subtidal offshore areas including foraging ground and increase in Suspended Sediment Concentration including foraging ground.	The submitted ES should fully reflect any advice received from CEFAS regarding mitigation measures for herring and sandeel spawning and nursery areas. We recommend that the herring and sandeel spawning and nursery grounds and priority/marginal habitat maps in Figures 4.4.4 and 4.4.8 are overlain on SNS SAC.	N	National Grid acknowledges your comment.
		Marine Conservation Zone Assessment, Benthic Ecology and Offshore Mitigation	**MCZ Assessment. Document Used: Part 5 Chapter 4 Marine Conservation Zone Assessment** **Screening** Figure 5.4.1 The Blackwater, Crouch, Roach and Colne Estuaries MCZ, which is designated for native oyster (Ostrea edulis) and native oyster beds, is not depicted or assessed despite the overlap of the MCZs with the 30km buffer zone. The MCZ assessment concluded the conservation objectives of Goodwin Sands MCZ will not be hindered. All relevant sites/ features have been screened in.	Natural England advises that the MCZ is scoped in to the MCZ Assessment. Natural England disagree with this conclusion and advise that, as presented, the proposed works have the potential to cause significant impacts on the designated features of Goodwin Sands MCZ, such as Mytilus edulis beds, notably from temporary physical disturbance and permanent loss. Please refer to comments in Annex 5 Benthic Ecology. We advise that a further information regarding impacts and mitigation measures to reduce the level of risk to acceptable levels are required. Natural England agree with the sites and designated features screened in for the MCZ assessment	Y	There has been further consideration of MCZs scoped into assessment as part of **Application Document 6.11 Marine Conservation Zone Assessment**, with detailed justification provided where appropriate. The screening distance has been refined to 17 km, in line with the precautionary approach encouraged by the MMO. Therefore, the Blackwater, Crouch, Roach and Colne Estuaries MCZ has not been screened in as it lies outside of the refined 17 km screening distance. Notably, the Offshore Scheme has been rerouted to completely avoid the Goodwin Sands MCZ, avoiding direct impacts and reducing the impacts to the known and potential receptors located within the area.
		Marine Conservation Zone Assessment, Benthic Ecology and Offshore Mitigation	**MCZ Assessment Conclusion** Overall: The MCZ assessment concluded the conservation objectives of Goodwin Sands MCZ will not be hindered.	Natural England disagree with this conclusion and advise that, as presented, the proposed works have the potential to cause significant impacts on the designated features of Goodwin Sands MCZ, such as Mytilus edulis beds, notably from temporary physical disturbance and permanent loss. Please refer to comments in Annex 5 Benthic Ecology regarding our advised approach to the MCZ Assessment. We advise that further information regarding impacts and mitigation measures to reduce the level of risk to acceptable levels are required.	Y	The assessment of temporary physical disturbance and permanent loss to benthic designated features has been carefully considered within **Application Document 6.11 Marine Conservation Zone Assessment**. Notably, the re-routing of the Offshore Scheme to avoid the Goodwin Sands MCZ avoiding direct impacts, and reducing the impacts to the known and potential receptors located within the area.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Fish and Shellfish Ecology and Legislation and Policy inc. Permits	**Priority Habitats and Species listed under Section 41 list of the Natural Environmental and Rural Communities (NERC) Act, 2006.** Overall: Natural England would like to highlight that lesser sandeel (Clupea harengus) and herring (Clupea harengus) are protected species as listed on Section 42 of the Natural Environmental and Rural Communities (NERC) Act 2006.	The Applicant should have due regard for species listed on Section 42 of the NERC Act 2006 and provide a robust assessment of impacts both direct and indirect, prior to concluding no significant effect.	N	Section 42 Species of Principal Importance have been considered within **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**, including the assessment of direct and indirect impacts. No likely significant effects were identified.
			Annex 7_PEIR Specialist Advice_Marine Mammals **Preliminary Environmental Information Report (PEIR) Review** **Annex 7 – Marine Mammals** In formulating these comments, the following documents have been considered: Part 4 Offshore; Chapter 5 Marine Mammals Part 4 Offshore; Chapter 11 Intra-Project Cumulative Impacts Part 4 Offshore; Chapter 12 Inter-Project Cumulative Impacts Part 4 Offshore; Chapter 12 Inter-Project Cumulative Impacts; Appendix 4.12.A Description of Other Projects Part 5 Project Wide Effects; Chapter 3 HRA Screening Report **Natural England's Advice and Recommendations** A summary of Natural England's advice in relation to Marine Mammals is set out in Table 1. Our key concerns along with recommendations are presented in further detail in Table 2.		N	National Grid acknowledges this feedback.
		Inter-Project Cumulative Effects	**Summary of Key Concerns** **Table 1 Summary of Key Issues - Marine Mammals** Nemo interconnector is not scoped into the inter-project cumulative impacts assessment. Nemo comprises subsea cables connected to a converter station running from Pegwell Bay, it is likely that both Nemo and Sea Link may overlap and have cumulative impacts.	**Natural England's Recommendations to Resolve Issues.** Nemo interconnector should be considered in the inter-project cumulative impacts assessment and any potential for cumulative or in-combination effects identified and addressed through careful application of the mitigation hierarchy.	N	The Nemo interconnector is considered further in the inter-project cumulative impacts assessment for any potential of cumulative or in-combination effects in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Marine Mammals	**Table 2 Natural England's Key Advice and Recommendations – Marine Mammals** **Baseline Characterisation – Document(s) Used: Chapter 4 Part 5 Marine Mammals** **Survey Data Acquisition** 4.5.4.5 Natural England note at the time of assessment the SCANS IV were not available and SCANS III were used as the most recent, available surveys. SCANS IV are now available and should be considered and assessed appropriately to reflect any cetacean abundance and distribution updates.	Consider the latest SCANS IV report and update the density and abundance figures in the submitted ES as required.	N	SCANS IV data has been considered in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine Mammals	4.5.6.4 The Management Unit (MU) named for Minke whale is European North Atlantic, however in section 4.5.7.15 describes Minke whale in the Celtic and Greater North Sea MU.	Correct the name of the MU for minke whale in the submitted ES.	N	The corrected name for the Minke Whale MU has been applied in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine Mammals	4.5.7.53 The PEIR states Berwick and North Northumberland Coast SAC is designated for harbour seal. This is incorrect, this SAC is designated for grey seal.	The ES should be corrected as per our comment. submitted	N	This comment has been addressed in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine Mammals	4.5.7 Baseline Conditions - For abundance estimates it is advised that precautionary densities are used.	The submitted ES should use the most precautionary densities or provide justification if such an approach was not applied.	N	Precautionary densities have been applied again in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine Mammals	4.5.7 Baseline Conditions - SCOS 2022 report should be included as the most recent surveys available for matters relating to management of seal populations	The submitted ES should include consideration of the latest SCOS report (2022).	N	The most recent SCOS report has been considered in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine Mammals and Inter-Project Cumulative Effects	**Data Gaps** 4.12.2 Telecommunications cables have not been considered for CEA, including Atlantic Crossing 1, Mercator, Pan European Crossing and Tangerine. Telecommunications cables should be scoped in for CEA. If not, justification	The major developments 'Long List' should be re-considered in the inter project cumulative effects assessment presented in the submitted ES.	N	The major developments long list has been carefully considered as part of **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. For other fully operational projects, i.e. those developments that will be completed prior to the Proposed Project construction activities and where little to no operation and maintenance activities are expected, these have been considered as part of the future baseline conditions reported in Volume 6, Part 4 of the ES. These projects therefore are not considered as part of the inter-project cumulative

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			should be provided as to why these cables have been scoped out.			appraisal reported by this chapter. This includes the following developments: • Atlantic Crossing 1; • Mercator; • Pan European Crossing; and • Tangerine.
		Marine Mammals and Inter-Project Cumulative Effects	4.12.2 Nemo Interconnector should be scoped in for CEA. Nemo comprises subsea cables connected to a converter station running from Pegwell Bay, it is likely that both Nemo and Sea Link may overlap and have cumulative impacts.	Nemo interconnector should be considered in the inter-project cumulative impacts assessment and any potential for cumulative or in combination effects identified and addressed through careful application of the mitigation hierarchy.	N	The Nemo Interconnector is considered as part of **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects** including the implementation of embedded mitigation and any need for additional mitigation.
		Marine Mammals	5.3.4 European Sites: HRA Screening Report - Although the HRA identifies connectivity of seal populations in Humber Estuary SAC, Berwickshire and North Northumberland Coast SAC and the Wash and North Norfolk Coast SAC, these populations are not included in EIA and, therefore, there may be discrepancies in population abundance.	The submitted ES should apply a consistent approach to marine mammal populations across EIA and HRA.	N	Care has been taken to ensure there is consistency between **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals** and **Application Document 6.6 Habitats Regulations Assessment Report**.
		Marine Mammals	**Data Analysis, Modelling and Reporting** 4.5.17 Preliminary assessment of effects on marine mammals - Further explanation on which JNCC guidelines to minimise auditory injury are being followed."	The submitted ES should specify which JNCC guidelines documents will be followed.	N	JNCC guideline documents followed are specified in the **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Offshore Mitigation	4.5.17 Control and Management Measures -GM03 has been described but mitigation is not specified in the preliminary assessment (i.e., what is this measure mitigating against?)	Please provide clarification in the submitted ES.	N	GM03 is an embedded mitigation or control measure which applies across the Proposed Project. It is considered industry best practice and does not relate to any specific Proposed Project activity impact.
		Offshore Mitigation	4.5.17 Control and Management Measures - Mitigation measures LVS03 and LVS05 are described however it is not clear which impacts there are implemented for. we advise it to be made clear what impacts this mitigation measure is addressing.	Please provide clarification in the submitted ES.	N	LVS03 and LVS05 are embedded mitigation or control measures which apply across the Proposed Project. They are considered industry best practices and do not relate to any specific Proposed Project activity impact.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Offshore Mitigation	4.5.17 Preliminary assessment – potential for indirect effects through impacts to prey species - GM01 stated as mitigation for potential indirect effects through impacts to prey species, but there is no description of what GM01 defines under control and management measures section.	Please provide clarification in the submitted ES.	N	GM01 has been defined within the Control and Management measures of the **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
		Marine Mammals and Inter-Project Cumulative Effects	**Environmental Impact Assessment - Document Used: Part 4 Chapter 12 Inter-Project Cumulative Impacts** **Identified Impacts** 4.12.17 Marine Mammals Cumulative Impacts Assessment - We advise the implementation of a tiered system approach for cumulative impacts assessment for marine mammals, as agreed between NE and JNCC (please see Annex 9)).	We recommend the submitted ES adopt the tiered system approach as per NE and JNCC advice.	N	National Infrastructure Planning Advice Notes have been utilised as part of the assessment and reference to these where applicable has been made within the ES in Parts 2, 3 and 4 of the technical specialist assessments. National Grid has reviewed this additional guidance and taken the guidance into consideration where required. However, for a consistent approach across all schemes, National Grid has followed the guidance from the planning inspectorate provided in National Significant Infrastructure Projects: Advice on Cumulative Effects Assessment. Therefore, the tier system provided in Nationally Significant Infrastructure Projects: Advice on Cumulative Effects Assessment has been adopted in the inter-project cumulative effects assessment. This adopts a 3-tier approach when identifying the 'other developments' considered in the inter-project cumulative effects assessment as opposed to 6 tiers. It should be noted that although there are fewer tiers, the suggested criteria set out in the 6 tiers is also captured within the 3-tier approach set out within the Planning Inspectorate's guidance 'National Significant Infrastructure Projects: Advice on Cumulative Effects Assessment'. The categories of other developments within Tier 1 in Annex 9 are considered within the future baseline, Tier 2, 3 and 4 outlined in Annex 9 are covered in Tier 1 of the PINS guidance, Tier 5 within Tier 2 and Tier 6 within Tier 3. It should also be noted that for each shortlisted project that has been assigned a Tier number using the Planning Inspectorate's Guidance (Nationally Significant Infrastructure Projects: Advice on Cumulative Effects Assessment), further details such as application status and date of application have been included within **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**. Further detail on the approach applied to the cumulative effects assessment is contained in **Application Document 6.3.1.5.A ES Appendix 1.5.A Cumulative Effects Assessment Methodology**.
		Consultation	**Annex 8_PEIR Specialist Advice_Ornithology** **Preliminary Environmental Information Report (PEIR) Review** **Annex 8 – Offshore Ornithology In formulating these comments, the following documents have been considered:** Part 1 Introduction; Chapter 3 Main Alternative Considerations		N	These comments have been noted by National Grid.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Part 1 Introduction; Chapter 4 Description of Project Part 1 Introduction; Chapter 5 PEIR Approach and Methodology Part 4 Offshore; Chapter 4 Fish and Shellfish Part 4 Offshore; Chapter 6 Ornithology • Part 4 Offshore; Chapter 11 Intra-project cumulative effects Part 4 Offshore; Chapter 12 Inter-project cumulative effects Part 5 Project Wide Effects; Chapter 2 Combined effects of onshore and offshore elements Part 5 Project Wide Effects; Chapter 3 Habitat Regulations Screening **Natural England's Advice and Recommendations** A summary of Natural England's advice in relation to Offshore Ornithology is set out in Table 1. Our key concerns along with recommendations are presented in further detail in Table 2.			
		Ornithology	**Summary of Key Concerns** **Table 1 Summary of Key Issues - Offshore Ornithology** The seasonal restrictions suggested for Red Throated Diver as mitigation measures are January to March.	**Natural England's Recommendations to Resolve Issues.** Natural England advice for Red Throated Diver (RTD) has been updated for the core over-wintering period. We advise that 1st November to 31st March is applied as a seasonal restriction for works in the Outer Thames Estuary (OTE) Special Protection Area (SPA). This condition should be secured through condition within the Development Consent Order.	N	As discussed with Natural England, National Grid has committed to a seasonal restriction of 01 November to 31 March for offshore cable installation activities and a seasonal restriction of 01 January to 31 March for cable installation activities at the landfall. This is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, which is secured by Requirement 6 in Schedule 3 of the draft DCO (**Application Document 3.1**).
		Ornithology	Coastal Sites of Special Scientific Interest (SSSI), Ramsar sites and SPAs which overlap with intertidal works have not been thoroughly assessed for impacts on breeding and over-wintering ornithological features. It is noted that findings from all breeding and over wintering bird surveys have not been presented.	Natural England is of the opinion that the PEIR would have been more valuable to be presented with complete over-wintering and breeding bird data to create a robust assessment of potential impacts. We are unable to advise on the most appropriate mitigation and agree with conclusions. We request that the Applicant engage with us once the findings from all the breeding and over-wintering surveys are available. Natural England advise that intertidal works will result in Likely Significant Effects from noise and visual disturbance at Thanet Coast to	N	Bird surveys were still being conducted at the time of PEIR submission and therefore it was not possible to include a full dataset. However, a full dataset is available for the ES, which has informed the further assessment of potential impacts in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology** for the Offshore Scheme and **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** for the Kent Onshore Scheme. Appropriate mitigation measures, informed by bird surveys conducted, have also been provided, including the consideration of seasonal restrictions and avoiding severe weather conditions, and the provision of mitigation land for wintering golden plover in the form of enhancement of off-site arable land. Natural England's advice on seasonality has also been considered.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
				Sandwich Bay SPA, Ramsar and Sandwich Bay to Hacklinge Marshes SSSI and Leiston to Aldeburgh SSSI, Alde-Ore Estuary SPA, Ramsar and SSSI. We advise that mitigation is considered to reduce these impacts, such as seasonal restrictions on intertidal works and avoiding construction work severe weather restrictions. We would like to refer the Applicant to Natural England's advice on seasonality Site Search (naturalengland.org.uk).		
		Fish and Shellfish Ecology and Ornithology	The Offshore Scheme passes through preferred/marginal herring and sandeel spawning habitat and herring and sandeel nursery habitat.	Natural England advise that adequate baselines to determine priority spawning and nursery grounds for herring and sandeel should be presented in the submitted ES. We defer to Cefas in relation to the appropriate mitigation, based on the overlap/proximity of sandeel and herring spawning and nursery areas. We recommend that the Outer Thames Estuary SPA boundary is overlain on the herring and sandeel spawning and nursery habitat maps in the submitted ES, and an assessment of potential implications for red-throated diver presented.	N	A full herring and sandeel spawning assessment, including potential effects to these receptors has been undertaken in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. This has also informed **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**.
		Ornithology and Offshore Mitigation	Construction works in the intertidal area during freezing conditions have the potential to exacerbate impacts to breeding bird features that use the intertidal area of the Alde-Ore Estuary SPA.	Natural England would welcome a cold weather protocol: 'If freezing conditions persist for five consecutive days work should cease until there has been three consecutive days of thaw'. This should be secured through condition/requirement in any Development Consent Order submitted with the application. However, Natural England notes our comment above regarding the need for a seasonal restriction, which may override any need for a cold weather protocol.	N	The inclusion of a cold weather protocol for the Pegwell Bay area of the Thanet Coast and Sandwich Bay SPA is provided in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. National Grid do not consider it necessary to implement any similar protocol at the Suffolk landfall, due to the absence of intertidal areas used by qualifying features of the Alde-Ore Estuary SPA.
		Ornithology	**Table 2 Natural England's Key Advice and Recommendations – Offshore Ornithology**	Update the table in the submitted assessment to reflect the correct features.	N	Noted. The designated features of Alde-Ore Estuary Ramsar have been reviewed as part of **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Baseline Characterisation – Document(s) Used: Part 4 Chapter 6 Ornithology **Survey Data Acquisition** 4.6.10 Sites Designated for Marine Ornithology – Alde-Ore Estuary Ramsar is also designated for winter waterbird assemblages, this is not noted in the table.			
		Ornithology	4.6.6 Study Area – Natural England would welcome reference to how the study area was calculated as the maximum zone of influence for ornithological features.	Please provide clarification in the submitted assessment.	N	A more detailed description of the study area and justification for its extent has been provided in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**.
		Ornithology and Noise and Vibration	**Data Gaps** Chapter 6 and 5.3.9.3 Over-wintering bird surveys have not been presented within the PEIR.	Natural England advise that it would have been valuable for this information to be available for the PEIR. Without the data presented, we are unable to agree with the conclusions of the HRA and determine the appropriateness of scoping out intertidal impacts on ornithological features due to noise and visual disturbance.	N	The overwintering bird survey had not been completed prior to submission of the PEIR and therefore the results could not be presented. Over-wintering bird surveys have now been completed and the results are presented in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**.
		Ornithology and Noise and Vibration	**Environmental Impact Assessment - Document Used: Part 4 Chapter 6 - Ornithology** **Identified Impacts** Table 4.6.10 Impacts from the Offshore Scheme on overwintering ornithological features of Thanet Coast to Sandwich Bay SPA and Ramsar site, Sandwich Bay to Hacklinge Marshes SSSI and Sandwich and Pegwell Bay National Nature Reserve (NNR) have not been considered in the assessment.	Natural England advise that intertidal works have the potential to cause noise and visual disturbance to overwintering features within the SSSI, Ramsar site and SPA, as works pass through 2km of the sites. Further assessment and mitigation may be required. For example, avoidance on intertidal works during the overwintering period (November to February inclusive) and severe weather restrictions.	N	Further assessment of noise and visual disturbance to overwintering features within the SSSI, Ramsar sites and SPAs is provided in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**, and further mitigation is recommended where appropriate. Likely Significant Effects from noise and visual disturbance at Thanet Coast to Sandwich Bay SPA, Ramsar and Sandwich Bay to Hacklinge Marshes SSSI and Leiston to Aldeburgh SSSI, Alde-Ore Estuary SPA, Ramsar and SSSI have been considered in **Application Document 6.6 Habitat Regulations Assessment Report**. The use of best practicable methods to reduce noise is commitment B106 in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Ornithology and Noise and Vibration	Table 4.6.10 Impacts from the Offshore Scheme on overwintering ornithological features of Leiston to Aldeburgh SSSI, Alde-Ore Estuary SPA, Ramsar site and SSSI and Minsmere-Walberswick SPA,	Natural England advise that intertidal works have the potential to cause noise and visual disturbance to overwintering features within the SSSIs, SPAs and Ramsar sites, as the works are being carried out	N	Where appropriate, further assessment of noise and visual disturbance to overwintering features in intertidal habitats within the SSSI, Ramsar sites and SPAs is provided in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**, and further mitigation is recommended. Likely Significant Effects from noise and visual disturbance at Thanet Coast to Sandwich Bay SPA,

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Ramsar site and SSSI have not been considered in the assessment.	adjacent to the sites. Further assessment and mitigation may be required. For example, avoidance on intertidal works during the overwintering period (November to February inclusive) and severe weather restrictions.		Ramsar and Sandwich Bay to Hacklinge Marshes SSSI and Leiston to Aldeburgh SSSI, Alde-Ore Estuary SPA, Ramsar and SSSI have been considered in **Application Document 6.6 Habitat Regulations Assessment Report**. The use of best practicable methods to reduce noise is commitment B106 in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Ornithology	4.6.8.4 Mitigation measures – all works with the exception of trenchless installation at landfall will avoid the overwintering period for RTD, which is defined as January to March.	Natural England advice for RTD has been updated for the core over-wintering period. We advise that 1st November to 31st March is applied as a seasonal restriction for works in the OTE SPA. This restriction should be secured through condition within the Development Consent Order.	N	As discussed with Natural England, National Grid has committed to a seasonal restriction of 01 November to 31 March for offshore cable installation activities and a seasonal restriction of 01 January to 31 March for cable installation activities at landfall. This is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Ornithology, Fish and Shellfish Ecology and Benthic Ecology	Table 4.6.14 Direct loss and disturbance of seabed habitat (including associated prey) used by seabirds and waterbirds.	Natural England advise that adequate baselines to determine priority spawning and nursery grounds for herring and sandeel should be presented in the submitted ES. We defer to Cefas in relation to the appropriate mitigation, based on the overlap/proximity of sandeel spawning and herring nursery areas. This evidence is also required to inform the assessment of impacts on prey availability for RTD in the Ornithology Chapter and through the Habitats Regulations Assessment (HRA). We advise that our comments in Annex 6 Fish and Shellfish are referred to, to determine the extent of impact from the proposed works on prey fish spawning habitat in Outer Thames Estuary SPA and for designated breeding seabirds in Alde Ore Estuary SPA, Ramsar site and SSSI and Minsmere-Walberswick SPA and Ramsar site and Minsmere-Walberswick Heaths and Marshes SSSI	N	Further assessment on the impacts of prey availability for all bird species considered is provided in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**.
		Ornithology and Habitat	Table 4.6.12 and Table 4.6.14 Figures 4.6.3, 4.6.4, 4.6.5 Table 4.6.14	We advise that further information, such as the completed over-wintering and breeding bird survey	N	Over-wintering and breeding bird survey data have been included **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology** to further inform the assessment of impacts. This

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Regulations Screening	Breeding seabirds designated in Alde-Ore Estuary SPA, Ramsar site and SSSI and Minsmere Walberswick SPA and Ramsar site and Minsmere-Walberswick Heaths and Marshes SSSI have the potential to interact with the Offshore Scheme. Combined, the sites are designated for the following breeding seabirds: Little tern Sandwich tern Arctic tern Common tern Lesser black-backed gull Common gull Black-headed gull Herring gull All designated breeding seabirds, with the exception of common gull, arctic tern and sandwich tern, have been identified as likely to be present in the Study Area of the Offshore Scheme. Heat maps have been presented in January and July for the following species: Lesser black backed gull Herring gull Razorbill Potential impacts from direct disturbance and displacement of birds from noise and visual impacts have been assessed for breeding seabirds as ranging from low to medium sensitivities to displacement by vessels (MMO data, Fliessbach et al, Garthe and Huppop) and sensitivities due to impacts on prey availability have been determined as not significant.	data, is required to determine that impacts on breeding seabirds will be not significant. However, we note contradiction in the Applicant's assessment approach, as in the Habitat Regulations Assessment, these features have been taken to Appropriate Assessment.		Chapter and **Application Document 6.6 Habitats Regulations Assessment Report** have now been aligned.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Ornithology and Habitat Regulations Screening	4.6.7.22 Alde-Ore Estuary SPA, Ramsar and SSSI and Minsmere-Walberswick SPA, Ramsar and SSSI are also designated for breeding waders including avocet, oystercatcher, redshank, ringed plover.	These features may have the potential to interact with the proposed intertidal works. Natural England advise that breeding bird surveys are presented to provide a robust assessment of the potential impact of the works on functional habitat, and noise and visual disturbance.	N	Breeding bird survey data have been included in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology** to further inform the baseline and assessment of impacts.
		Ornithology	4.6.15 The preliminary assessment of impacts concluded all impact pathways to be non-significant for ornithological features	Please see Natural England's RTD advice above for recommended seasonal restrictions. We advise that intertidal impacts on breeding and over-wintering ornithological features are given robust consideration, please see our comments above.	N	Intertidal impacts on breeding and over-wintering ornithological features have been considered further in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. The inclusion of a full seasonal restriction (1 November – 31 March) for offshore cable installation activities in the Outer Thames Estuary SPA and a reduced seasonal restriction (1 January – 31 March) for landfall cable installation activities at the Suffolk landfall in Aldeburgh is provided in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Ornithology and Offshore Mitigation	4.6.8.4 The following mitigation measures have been suggested for ornithological receptors in the Offshore Scheme: There will be Health, Safety and Environment (HSE) procedures implemented, with strict limits on weather conditions, equipment maintenance and personnel to further reduce the risk of any accidental spills/releases. Furthermore, in the event of a spill, a response will be made swiftly. Existing shipping lanes will be utilised for vessel transiting routes to avoid additional disturbance where practicable. Vessel operators will be made aware of the importance and sensitivity of the species to disturbance. Vessels will avoid rafting birds and areas with high densities of birds where practicable.	Natural England are pleased to see the suggested mitigation measures. However, we advise that further mitigation may also be required to reduce potential impacts on breeding and overwintering features designated in the coastal SPAs, Ramsars and SSSIs. We advise that the Applicant engage with us during the Evidence Plan Process once all breeding and over-wintering bird surveys are complete to ensure that seasonal restrictions are applied wherever necessary. In addition, we recommend that the following wording is used for severe weather restrictions: "If freezing conditions persist for five consecutive days work should cease until there has been three consecutive days of thaw". This mitigation should be secured through condition/requirement within the development Consent Order. However, Natural England notes our comment above regarding the need	N	Further consideration of mitigation measures and recommended wording has been included in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. The inclusion of a cold weather protocol for the Pegwell Bay area of the Thanet Coast and Sandwich Bay SPA is provided in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
			Artificial lighting on vessels will be directional and only used when necessary, noting that health and safety requirements will need to be met for safe working practices; and To avoid cumulative effects with other projects, with the exception of trenchless installation techniques at landfall, all other construction works will be timed to ensure the overwintering period of the red-throated diver is avoided (in the months of January – March).	for a seasonal restriction, which may override any need for a cold weather protocol.		
		Ornithology, Offshore Mitigation and Habitat Regulations Screening	**HRA - Document Used: Part 5 Chapter 3 Habitat Regulations Screening** **Screening** 5.3.9.4 For landfall at Kent, Likely Significant Effect (LSE) has been concluded for Thanet Coast and Sandwich Bay SPA due to loss of functionally linked land for golden plover (non-breeding) and will be taken forward to Appropriate Assessment.	Mitigation measures have not been proposed and over-wintering bird surveys have not been presented. As the proposed works have the potential to lead to loss of functionally linked land of a non breeding bird feature, over-wintering bird restrictions may also be required. The proposed intertidal works have the potential to produce noise and visual disturbance, however no LSE has been concluded. We advise that this is reviewed with the over-wintering bird surveys.	N	National Grid acknowledges this feedback. Wintering bird reports have now been shared with Natural England along with the results of noise modelling and proposals for mitigating losses of functionally linked land.
		Ornithology, Offshore Mitigation and Habitat Regulations Screening	5.3.9.3 For landfall at Suffolk, LSE has been concluded for Minsmere-Walberswick SPA due to loss of functionally linked land for white fronted geese (non-breeding) and will be taken forward to Appropriate Assessment.	Mitigation measures have not been proposed and over-wintering bird surveys have not been presented. As the proposed works have the potential to lead to loss of functionally linked land of a non-breeding bird feature, over-wintering bird restrictions may also be required. The proposed intertidal works have the potential to produce noise and visual disturbance, however no LSE has been concluded. We advise that this is reviewed with the over-wintering bird surveys.	N	National Grid acknowledges this feedback. Wintering bird reports have now been shared with Natural England along with the results of noise modelling. No significant populations of non-breeding SPA birds (including white fronted goose) have been recorded in locations to be subject to surface works.
		Ornithology and Fish and	5.3.9.5 For the Offshore Scheme, LSE has been concluded for RTD in OTE SPA due to temporary physical disturbance, permanent loss, increase in	Natural England agrees with this conclusion. Please see our comments above on seasonal restrictions for RTD for the	N	Further consideration of seasonal restrictions and prey availability have been included in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation		Change Y/N?	Regard had to response (s49)
		Shellfish Ecology	suspended sediment and airborne sounds and visual disturbance, and will be taken forward to Appropriate Assessment.	construction phase for the appropriate mitigation measures, and Annex 6 Fish and Shellfish for impacts on prey availability.		
		Ornithology and Fish and Shellfish Ecology	5.3.9.5 For the Offshore Scheme, impact pathways for Alde-Ore Estuary SPA and Minsmere-Walberswick SPA have been scoped in due to: Temporary physical disturbance Permanent loss of habitat Temporary increase in suspended sediment Airbourne sounds and visual disturbance	Natural England agree with the conclusion that these impact pathways are taken to appropriate assessment for the designated breeding seabird features in these sites. Natural England welcome the Applicant to engage with us during the Evidence Plan Process to ensure that the appropriate mitigation measures are applied and that surveys are sufficient.	N	All appropriate mitigation measures and survey data have been included in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**.
		Ornithology and Inter-Project Cumulative Effects	**In- combination** 5.3.8 London Array Offshore Wind Farm (OWF) has not been scoped in for in combination effects in the Offshore Scheme	Natural England advise that London Array OWF is assessed for in-combination effects on RTD in OTE SPA.	N	London Array OWF has now been included in the in-combination effects at the ES stage and is assessed within **Application Document 6.6 Habitats Regulations Assessment Report**.
		Inter-Project Cumulative Effects	**Annex 9_Suggested Tiers for Cumulative Impact Assessment_JNCC x N** **JNCC and Natural England Suggested Tiers for Cumulative Impact Assessment** Cumulative assessment is required within any environmental impact assessment (EIA) that is undertaken for development projects and the outcomes are presented in an environmental statement (ES). However, there is often considerable deliberation over which projects should be included in a cumulative assessment, i.e. what projects are considered reasonably foreseeable (which guidance1 recommends should be the basis for inclusion). Although this framework has been outlined in the context of cumulative impact assessment it can also be used for the purposes of in-combination assessment within Habitats Regulations Assessment (HRA). To assist with providing a framework for cumulative assessment in some recent ESs a system of tiers has been used. JNCC and NE believe that this staged approach could potentially be helpful in resolving the deliberations regarding what projects should be included in cumulative assessments. The structured approach allows the level of uncertainty associated with the assessment tiers (and the data used in the assessment) to be highlighted according to the consenting stage of the cumulative projects. The more preliminary the projects, the greater the uncertainty associated with assessment as the data used are less comprehensive/recent (so the higher the tier, the greater the uncertainty). Once you reach Tier 5 then data is less likely to be publicly available therefore the assessment from this stage is more		N	National Infrastructure Planning Advice Notes have been utilised as part of the assessment and reference to these where applicable has been made within the Environmental Statement in Part 2, 3 & 4 of the technical specialist assessments. National Grid have reviewed this additional guidance and taken the guidance into consideration where required. However, for a consistent approach across all schemes, National Grid have followed the guidance from the planning inspectorate provided in National Significant Infrastructure Projects: Advice on Cumulative Effects Assessment. Therefore, the tier system provided in Nationally Significant Infrastructure Projects: Advice on Cumulative Effects Assessment has been adopted in the inter-project cumulative effects assessment. This adopts a 3-tier approach when identifying the 'other developments' considered in the inter-project cumulative effects assessment as opposed to 6 tiers. It should be noted that although there are fewer tiers the suggested criteria set out in the 6 tiers is also captured within the 3 tier approach set out within the Pins guidance 'National Significant Infrastructure Projects: Advice on Cumulative Effects Assessment'. The categories of other developments within Tier 1 in Annex 9 are considered within the future baseline, Tier 2, 3 and 4 outlined in Annex 9 are covered in Tier 1 of the PINS guidance, Tier 5 within Tier 2 and Tier 6 within Tier 3. It should also be noted that for each shortlisted project that has been assigned a Tier number using PINS Guidance (Nationally Significant Infrastructure Projects: Advice on Cumulative Effects Assessment),

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			likely to be qualitative rather than quantitative. However, for projects included from outside the UK, data availability may be more restricted at a lower tier so qualitative assessment may be introduced at a lower tier. 1 European Commission, 1999, Guidelines for the Assessment of Indirect and Cumulative Impacts as well as Impact Interactions, Luxembourg: Office for Official Publications of the European Communities. ISBN 92-894-1337-9.		further details such as application status and date of application that been included within **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List.** Further detail on the approach applied to the cumulative effects assessment is contained within **Application Document 6.3.1.5.A ES Appendix 1.5.A Cumulative Effects Assessment Methodologies**.
		Inter-Project Cumulative Effects	**Table 1: Suggested tiers for undertaking a staged cumulative impact assessment** **Consenting or construction stage** / **Data availability** **Tier 1:** Built and operational projects should be included within the cumulative assessment where they have not been included within the environmental Pre-construction (and possibly post construction) survey data from the built project(s) and environmental characterisation survey data from proposed project (including data	N	National Infrastructure Planning Advice Notes have been utilised as part of the assessment and reference to these where applicable has been made within the Environmental Statement in Part 2, 3 & 4 of the technical specialist assessments. National Grid have reviewed this additional guidance and taken the guidance into consideration where required. However, for a consistent approach across all schemes, National Grid have followed the guidance from the planning inspectorate provided in National Significant Infrastructure Projects: Advice on Cumulative Effects Assessment. Table 1.22 Network Rail Property (Anglia Route)

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy, land rights and CPO, design	Network Rail is a statutory undertaker responsible for maintaining and operating the railway infrastructure and associated estate. It owns, operates, maintains and develops the main rail network. Network Rail aims to protect and enhance the railway infrastructure therefore any proposed development which is in close proximity to the railway line or could potentially affect Network Rail's specific land interests, will need to be carefully considered. Impact on Network Rail Infrastructure The Sea Link project could have a potential impact on the operational railway land and / or assets. The proposed scheme may affect Network Rail level crossings in the surrounding area of the onshore cable route. The Applicant must engage with Network Rail to discuss potential impacts. Therefore, we advise that level crossing use to be avoided if possible, or crossings to be used with our approval if unavoidable. An Asset Protection Agreement is required to be signed before proceeding with any design or construction work alongside, above or below Network Rail's Infrastructure. The trenching project and tunnelling works beneath the railway will be overseen by ASPRO to safeguard railway assets. Network Rail Infrastructure Limited Registered Office: Network Rail, One Eversholt Street, London, NW1 2DN Registered in England and Wales No. 2904587 www.networkrail.co.uk Prior to any development/construction or alterations to the site by National Grid on behalf of the Sea Link project further site-specific safety requirements, engineering technical approval and detailed conditions will need to be sought from Network Rail's Anglia Asset Protection team (angliaasprotownplanningnotices@networkrail.co.uk). The process for obtaining approval is outlined on Network Rail's web page https://www.networkrail.co.uk/running-the-railway/looking-after-the-railway/assetprotection-and-optimisation/. Network Rail have standard protective provisions which will need to be included in the DCO as a minimum. National Grid should therefore contact Tony Ridley, email: [redacted] to request a copy of these and to discuss any other agreements that will need to be entered into with Network Rail. A number of legal and commercial agreements will need to be entered into, for example, asset protection agreements, method statements, connection agreements, property agreements and all other relevant legal and commercial agreements. This list is not	N	National Grid acknowledges this feedback and is seeking further engagement with Network Rail to identify asset interfaces, discuss potential impacts and agree appropriate mechanisms for safeguarding during the Proposed Project's construction programme – including an Asset Protection Agreement and Protective Provisions.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			exhaustive and will need to be reviewed once more scheme details are discussed between the parties. Thank you again for allowing Network Rail to comment on this consultation. I trust that the comments above are clear, but if you require any further information or have any queries, do not hesitate to contact me.		

Table 1.23 National Rail Property (Southern)

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy, land rights and CPO	Network Rail would like to make the following comments. Network Rail is a statutory undertaker responsible for maintaining and operating the railway infrastructure and associated estate. It owns, operates, maintains and develops the main rail network. Network Rail aims to protect and enhance the railway infrastructure therefore any proposed development which is in close proximity to the railway line or could potentially affect Network Rail's specific land interests, will need to be carefully considered. Given the proximity of the proposal to the operational railway, an Asset Protection Agreement with Network Rail will be required before proceeding with any design or construction work alongside, above or below Network Rail's Infrastructure to ensure that the works do not have any adverse impacts on the operational railway. Prior to any development / construction or alterations to the site, further site-specific safety requirements, engineering technical approval and detailed conditions will need to be sought from our Asset Protection London South East team (AssetProtectionSouthEast@NetworkRail.co.uk) & Asset Protection Anglia team (AssetProtectionAnglia@networkrail.co.uk). The process for obtaining approval is outlined on Network Rail's web page https://www.networkrail.co.uk/runningtherailway/looking-after-the-railway/asset-protection-and-optimisation/. As well as an Asset Protection Agreement, a number of legal and commercial agreements will need to be entered into. In addition, if Network Rail has any existing rights over / under any of the land within the Order these must be retained. Network Rail have standard protective provisions which will need to be included in the DCO as a minimum. Should you wish to discuss the protective provision please contact Damian Hajnus via [redacted] I trust that the comments above are clear, should you require any further information please do not hesitate to contact me.	N	National Grid acknowledges this feedback and is seeking further engagement with Network Rail to identify asset interfaces, discuss potential impacts and agree appropriate mechanisms for safeguarding during the Proposed Project's construction programme – including an Asset Protection Agreement and Protective Provisions.

Table 1.24 Port of London Authority

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy, construction, socio-economic, recreation and tourism	Thank you for consulting the PLA about the PEIR that has been produced in relation to the Sea Link Project by National Grid. As you would expect the PLA's comments are limited to the marine proposals/offshore scheme: the proposed approximately 130km of subsea HVDC cable, running between the Suffolk landfall location and the Kent landfall location. The PLA is the statutory harbour authority for the tidal River Thames between Teddington and the outer Thames Estuary. Governed by the Port of London Act 1968 its statutory functions include responsibility for conservancy, hydrographic surveying, dredging, managing the public navigation and controlling vessel movements. The offshore scheme would be located wholly outside of the PLA's Statutory Limits under the 1968 Act. However, the PLA's functions include the promotion of the use of the River for freight and passengers as an important and sustainable transport corridor for London. The Port of London is the country's biggest port – 55m tonnes of goods were handled in the Port in 2022 - and its contribution to international trade is critical. Over 48,000 jobs depend on the Port, which generates more than £4.5 billion in economic value added annually, and there is significant ongoing investment taking place within the Port. It is therefore imperative that the existing and future capacity and operation of the Port of London are not compromised during construction and operation of the project.	N	This comment has been noted. There are not anticipated to be any socio-economic effects on the Port of London as a result of the Proposed Project and the facility will not be compromised during construction and operation.
		Offshore route location, design, consultation	The information provided is very high level, making it difficult to comment on and to properly assess potential impacts on the Port. There is not enough detail on the route due to the wide draft Order Limits corridor and the PLA would expect this corridor to be reduced as the project is refined in order for a full assessment of impacts to be undertaken. At the Sunk the route goes east of the pilot diamond in water deeper than 20m. The route then crosses the Long Sand Head two way route, again in deeper water. The PLA has no in principle concerns about this. The PLA does however have concerns about the crossing of Gridlink on the inshore side of the Thanet Windfarm. The charts used in the figures are not at a scale where it can be assessed if a 5% reduction in water depth would impact the 12.5m the PLA needs to safeguard in this area for southern access to the port. It is therefore not clear whether the PLA's previously raised concerns have been fully addressed.	N	The comment refers to the Order Limits defined in the Statutory consultation stage of the Proposed Project, rather than the current Order Limits, with regard to the width of the Order Limits. The route in the vicinity of the GridLink crossing has a greater width to allow further engineering of the crossing with GridLink in order to optimise the crossing to address the 12.5 m water depth and 5% reduction in water depth. This is an ongoing area of engineering review and design, with additional survey data collected in 2024 to assess the crossing. National Grid is also engaging with GridLink. Outcomes of this ongoing dialogue will help to address PLA's concerns.
		Inter-project cumulative effects,	The PLA is also concerned about cumulative impacts, and the multiple cables that are proposed in this area, sterilising significant areas of riverbed. As the documents demonstrate,	N	A cumulative impact assessment for Shipping and Navigation is presented in **Application Document Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. The Proposed Project will enter into crossing agreements and/or

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		coordination with other projects, benthic ecology	crossings involve the placing of rock protection on the riverbed and the more cables that are proposed the more crossings that will inevitably be required. Parties need to work together wherever possible to minimise impacts and to maximise the potential for other projects to come forward in the future.		proximity agreements with the third-party asset owners of any subsea infrastructure installed and/or planned along the corridor. Additional information regarding compass deviations is presented in **Application Document 6.3.4.7.B ES Appendix 4.7.B Electromagnetic Deviation Study**.
		Offshore route location, design, consultation	Any cable crossings should be avoided in the vicinity of the NE Spit Pilot Station to avoid disruption to this crucial service when laying the cable and there should be no reduction in water depths in this area. The Option Selection and Design Evolution Report lists the factors considered in determining the corridor in Section 4.5.5 the PLA is broadly content with the criteria but would suggest that they should also consider port facilities such as pilot stations which play a crucial role in the successful operation of a port. The PEIR Non-technical Summary states a minimum DOL to the top of the cable of 0.5m in areas of bedrock and a target DOL of approximately a minimum 1.5m. It is assumed this is burial depth, but it was not clear from the document. The is further reference to depths of drilling being unknown at this stage.	N	Clarification is sought on the location of the 'NE Spit Pilot Station' and the associated limits of the area of interest referred to. National Grid's routing development has considered the requirements of Port Facilities and pilot stations. For example, the Proposed Project currently routes south of the Sunk Deepwater Anchorage and north of the Sunk Pilot station in accordance with engagement and requirements of HHA. A Cable Burial Risk Assessment has been undertaken which defines the target DOL. The 1.5 m target DOL, is lowering relative to the seabed and/or a Non-Mobile Reference Level and not burial; 0.5 m is lowering in bedrock areas. the actual DOL is between 1.5 m to 2.5 m where geological conditions allow in sediment areas.
		Shipping and navigation, design, consultation	Paragraph 7.7.5 of the PEIR non technical summary states that all risks to shipping and navigation are acceptable or tolerable. Whilst in broad terms the project seems to have considered the avoidance of crossings in shipping lanes and there is direct reference to cable crossings being outside the navigation channel and the need to maintain 20m depth in DW routes, the PLA cannot be fully re-assured until more detail is provided on the route. The PLA would strongly urge the applicant to continue to engage with the PLA, including when further surveys have been completed, before the route is finalised.	N	Engagement and communication with key stakeholders including harbour authorities such as the Port of London Authority is established in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment** as a crucial recommendation for shipping and navigation.

Table 1.25 Ramsgate Port

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	**Feedback form question 1:** Do you support the principle of reinforcing the network in this location? **Response:** Yes.	N	National Grid acknowledges this feedback.
		Shipping and navigation, offshore route location, design	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are broadly positive but still need some refinement **Further comments:** Please see my comments in Section 11 Marine Proposal	N	National Grid acknowledges this feedback and has provided regard to question 11 below.
		Shipping and navigation, offshore route location, design	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** 1. Will the cable pass to the east of RA buoy in the Ramsgate compulsory pilotage area? 2. When is crosses the Thanet offshore windfarm will mats be used? If so will it lessen the depth of water there? Currently about 5.7m - 7.2 above Datam. 3. Currently Ramsgate has not commercial ferry operator. Please be aware that this might change. 4. Will the cable laying effect the passage of ferries in & out of Ramsgate?	N	1. As described in **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7 A Navigational Risk Assessment**, the Offshore Scheme is planned to route to the east and south of the RA buoy. The planned route crosses through the southern section of the Ramsgate pilotage area. 2. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** should be referred to for details on cable protection. Recommendations regarding cable protections where necessary, and matters of under keel clearance, are considered within **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation and Application Document 6.3.4.7.A ES Appendix 4.7 A Navigational Risk Assessment**. 3. Any potential risk of disruption to passenger vessels is considered in **Application Document 6.3.4.7.A ES Appendix 4.7 A Navigational Risk Assessment**.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** From a mariner's point of view, I need lat & longs of where cable will cross Port Boundaries	N	The cable route corridor does not cross the limits of the Port of Ramsgate Boundary and is 1.1 km to the south of the port breakwaters (**Application Document 6.3.4.7.A ES Appendix 4.7 A Navigational Risk Assessment**). The final full corridor design and coordinates will be available in the DCO application and can be provided on request.

Table 1.26 River Stour Internal Drainage Board

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Design and onshore route location	**Feedback form question 2:** What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? **Response:** I think the changes are neither positive nor negative. **Further comment:** We appreciate the requirement for overhead cables in Kent and have been liaising directly with your consultants on the need for Land Drainage Consent for various permanent and temporary works.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 3:** What do you think about our proposal to connect into the existing network via the proposed Friston substation? **Response:** I have no preference either way.	N	National Grid has engaged with the River Stour Internal Drainage Board regarding consenting and permanent works and has defined a consenting strategy which is secured within the DCO application.
		Onshore route location	**Feedback form question 4:** What do you think about our proposed HVAC cable route in Suffolk? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Converter station location	**Feedback form question 5:** What do you think about our proposed converter station, including its proposed location? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Onshore route location	**Feedback form question 7:** What do you think about our proposed HVDC cable route in Suffolk? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landfall location	**Feedback form question 8:** What do you think about our proposed landfall between Aldeburgh and Thorpeness? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects and Onshore route location	**Feedback form question 9:** Constructing additional ducts within the underground cable corridor to accommodate cables for up to two other projects? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects and Converter station location	**Feedback form question 9:** Co-locating up to three converter stations at a single location near Saxmundham? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Coordination with other Projects and Landfall location	**Feedback form question 9:** Co-locating the landfall point of up to three projects at a location between Aldeburgh and Thorpeness? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Offshore route location	**Feedback form question 11:** Do you have any comments or issues you would like us to take into consideration regarding our marine proposals? **Response:** No, thank you.	N	National Grid acknowledges this feedback.
		Landfall location	**Feedback form question 12:** What do you think about our proposed landfall at Pegwell Bay? **Response:** I have no preference either way.	N	National Grid acknowledges this feedback.
		Offshore route location, Onshore route location, Onshore	**Feedback form question 13:** What do you think about our proposed HVDC cable route in Kent?	N	Cables will be installed at sufficient depth to protect them from heavy plant crossing. If for any reason the cables need to be installed at a shallower depth then they will be protected.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		mitigation and Design	**Response:** I think this is the best cable route. **Further comment:** The trenchless installation should minimise the impact on the area. Where the cable crosses below watercourses or watercourse maintenance tracks, it must be ensured that there is sufficient cover to provide protection from heavy tracked machinery. If sufficient cover can't be provided, specific protective measures should be used to ensure maintenance activities will not damage the cable.		
		Converter station location, Water environment and terrestrial Ecology	**Feedback form question 14:** What do you think about our proposed converter station and adjacent substation near Minster? **Response:** I have no preference either way. **Further comment:** We have held preliminary discussions with your consultants on the proposed location and nature of the facility. Provided we are kept informed of any developments or amendments and that Land Drainage Consent is obtained for those aspects where it is required, we have no objection. However, it must be ensured that flood risk and drainage is appropriately considered and that suitable ecological mitigation is provided for any lost habitat.	N	National Grid notes this feedback. National Grid has continued to engage regularly with the River Stour Internal Drainage Board as the Proposed Project design has developed and is pleased to note that they have no objection to the proposals.
		Design and Converter station location	**Feedback form question 15:** We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages? **Response:** Green roof, Colour and curve **Further comment:** Green roofs can provide benefits from a flood risk and drainage perspective, provide habitat and reduce the need for heating and cooling. They will lessen the visual impact too.	N	National Grid acknowledges this feedback. Design principles are being established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. They are seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The effects arising from the Kent Onshore Scheme relating to visual amenity is detailed within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Onshore route location	**Feedback form question 16:** What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line?	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Response: I have no preference either way.		
		Construction - general	**Feedback form question 18:** Do you have any key concerns regarding the construction stage of Sea Link? **Response:** Ecology and biodiversity, Archaeology, Public access to rights of way (such as bridleways), Disruption to land use and Drainage.	N	National Grid has engaged with the River Stour Internal Drainage Board to agree surface water drainage principles and principles for the crossings of their drains. This has shaped the preliminary design of the construction and operational drainage proposals, which will continue to be developed by the appointed contractor, in line with the commitments set out in **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan and Application Document 6.8 Flood Risk Assessment**. Environmental assessments have been carried out for the Proposed Project and where appropriate mitigation measures have been set out to minimise and reduce any adverse environmental impacts. Further details relating to ecology are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Further details relating to archaeology are contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage and Application Document Part 3 Kent Chapter 3 Cultural Heritage**. Further details relating to the PRoW assessment are contained in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism and Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**.
		Onshore mitigation and Consultation	**Feedback form question 19:** Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals? **Response:** We will be keen to be involved with any plans you may produce.	N	National Grid acknowledges this feedback.
		Consultation	**Feedback form question 22:** What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand? **Response:** Very good.	N	National Grid acknowledges this feedback.

Table 1.27 Royal Mail

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy inc. permits, Traffic and transport	**Royal Mail – relevant information** Under section 35 of the Postal Services Act 2011, Royal Mail has been designated by Ofcom as a provider of the Universal Postal Service. Royal Mail is the only such provider in the United Kingdom. The Act provides that Ofcom's primary regulatory duty is to secure the provision of the Universal Postal Service. Ofcom discharges this duty by imposing regulatory conditions on Royal Mail, requiring it to provide the Universal Postal Service. Royal Mail is under some of the highest specification performance obligations for quality of service in Europe. Its performance of the Universal Service Provider obligations is in the public interest and this should not be affected detrimentally by any statutorily authorised project. Royal Mail's postal sorting and delivery operations rely heavily on road communications. Royal Mail's ability to provide efficient mail collection, sorting and delivery to the public is sensitive to changes in the capacity of the highway network. Royal Mail is a major road user nationally. Disruption to the highway network and traffic delays can have direct consequences on Royal Mail's operations, its ability to meet the Universal Service Obligation and comply with the regulatory regime for postal services thereby presenting a significant risk to Royal Mail's business.	N	National Grid acknowledges this feedback.
		Onshore route location, Traffic and Transport	**Royal Mail position as at December 2023** Royal Mail and its advisor BNP Paribas Real Estate have reviewed the relevant sections of the PEIR for Sea Link dated October 2023 plus the draft CTMPs for the Suffolk and Kent onshore schemes. Reference the lists and indicative plans below, Royal Mail has 8 operational properties within approximately c.10 km of the proposed DCO boundary: **Suffolk:** BE 1627 Leiston Delivery Office, 14 Sizewell Road, Leiston, IP16 4AA (c. 0.5km) BE 1632 Saxmundham DO/RET/PAR, 48 High Street, Saxmundham, IP17 1AA (c. 0.5km) BE 2117 Wickham Market PAR, 36 High Street, Wickham Market, IP13 0QS (c. 10km)	N	National Grid acknowledges this feedback.
		Onshore route location,	**Kent:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Traffic and Transport	BE 1430 Sandwich DO, 34 King Street, Sandwich, CT13 9AA (c. 1km) BE 1426 Ramsgate DO, 42 Wilfred Road, Ramsgate, CT11 7RA (c. 3.7km) BE 1407 Broadstairs DO, 20 The Broadway, Broadstairs, CT10 2AA (c. 5.7km) BE 4154 Broadstairs PAR, St Peters Park Road, Broadstairs, CT10 2BQ (c. 5.7km) BE 1424 Margate DO, 12-18 Addington Road, Margate CT9 1NQ (c. 7km)		
		Inter-Project cumulative effects, Traffic and transport	There are other DCOs neighbouring both the Suffolk and Kent onshore elements. The relevant DCOs in the Suffolk area are: The Sizewell C Project East Anglia Two Offshore Wind Farm LionLink Multi-Purpose Interconnector Nautilus Interconnector The relevant DCOs in the Kent area are: Manston Airport	N	National Grid acknowledges this feedback. Consideration of relevant DCO schemes within the local area that have the potential to result in cumulative effects have been identified and assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**.
		Construction – general, Traffic and transport Socio-economic. recreation and tourism	Every day, in exercising its statutory duties Royal Mail vehicles use all of the main roads that may potentially be affected by the construction of Sea Link. Any periods of road disruption / closure, night or day, on or to the roads immediately connected to the scheme or the surrounding highway network will have the potential to impact operations and may consequently disrupt Royal Mail's ability to meet its Universal Obligation service delivery targets.	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** demonstrate that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**.
		Intra-Project cumulative effects	Royal Mail's performance of the Universal Service Provider obligations is in the public interest and should not be affected detrimentally by any statutorily authorised project. Accordingly, Royal Mail seeks to take all reasonable steps to protect its assets and operational interests from any potentially adverse impacts of proposed development.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Onshore mitigation	Royal Mail does not wish to stop or delay Sea Link from being consented and constructed. However, Royal Mail does wish to ensure the protection of its future ability to provide an efficient mail sorting and delivering service to the public from and to the above identified operational facilities in accordance with its statutory obligations.	N	National Grid acknowledges this feedback.
		Construction – general, Traffic and transport	Despite the preliminary information and draft CTMPs referred to above, Royal Mail is of the view that the construction phase of this infrastructure proposal has potential to impact on its operational interests.	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** demonstrate that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**.
		Traffic and transport, Onshore Mitigation, Construction - general	In order to protect Royal Mail's position, it is requested that wording is added to the Suffolk and Kent scheme CTMPs to secure the following mitigations: the CTMPs should include specific requirements that during the construction phase Royal Mail is notified by National Grid Energy Transmission or its contractors at least one month in advance on any proposed road closures / diversions / alternative access arrangements, hours of working;	N	National grid acknowledges this feedback. A commitment is now included within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** that where practicable, National Grid will inform the relevant Local Authority and other relevant stakeholders (e.g. Royal Mail) of any road closures, diversions or access arrangements that are considered to impact their operations at the earliest possible opportunity. This is also contained within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Traffic and transport, Onshore Mitigation, Construction - general	where road closures / diversions are proposed, National Grid Energy Transmission or its contractors liaise with Royal Mail at least one month in advance to identify and make available alternative highway routes for operational use, where possible; and	N	National grid acknowledges this feedback. A commitment is now included within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** that where practicable, National Grid will inform the relevant Local Authority and other relevant stakeholders (e.g. Royal Mail) of any road closures, diversions or access arrangements that are considered to impact their operations at the earliest possible opportunity. This is also contained within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Inter-Project cumulative	cumulative highways impact from other major developments in the Suffolk and Kent onshore areas (including those	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		effects, Traffic and transport, DCO process	identified above) is fully addressed by National Grid Energy Transmission. Royal Mail also wishes to reserve its position to submit representations to the future Public Examination, if required.		**Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including traffic and transport. Mitigation has been identified where necessary. However, it is not the responsibility for National Grid to mitigate the impacts of other developments and this wording has not been included within the **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**. These Plans are secured through Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). Diversions and road closures will be coordinated through the Local Authority road space booking procedure and National Grid will continue to liaise with other developers throughout planning and delivery of the Proposed Project.
		Converter station location, Onshore route location, Design	Royal Mail NSIP & MIP Screening Pro-forma Scheme: Sea Link Promoter: National Grid Electricity Transmission Consultation/s: Statutory Consultation – Section 48 Date: 18th December 2023 Classification: Medium / Cat 2 Notes: National Grid is proposing to reinforce the network between Suffolk and Kent via a new, primarily offshore, 2 GW high voltage direct current (HVDC) link. Additionally onshore infrastructure required to deliver the Proposed Project, including converter stations, substations and new underground and overhead electricity lines, will also be installed. The project is required to accommodate additional power flows generated from renewable and low carbon energy generation and consists of: Constructing a new converter station within 5km of the proposed Friston substation then HVAC underground cables between the substation and a converter station and then HVDC underground cables between the converter station and the coast. Constructing a new offshore HVDC cable between Suffolk and Kent Constructing a new converter station within 5km of the existing Richborough substation with HVDC underground	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			cables between the converter station and the coast at Pegwell Bay		
		Construction - General, Design, Timescales / programme	All onshore parts of the project would be located within England and offshore parts within the English Territorial Waters. Subject to gaining development consent, construction works would be expected to start in 2026 and be functionally completed by the end of 2030 with reinstatement potentially continuing into 2031. The construction phases will include various temporary construction activities.	N	National Grid acknowledges this feedback.
		Traffic and transport, Construction - general	The Section 48 consultation includes a draft PEIR and a traffic management plan for the Suffolk and Kent onshore elements. The PEIR indicates overall there will be a maximum of 473 vehicles associated with the proposed Suffolk Onshore Scheme per day during the peak of the construction phase (planned for 2029) with an average number of 302 vehicles accessing construction site per day. This includes a maximum of 276 site-based staff vehicles as well as 68 LGVs and 129 HGVs per day.	N	National Grid acknowledges this feedback. These forecasts have been updated and re-assessed as part of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**. Further details are available within these chapters.
		Traffic and transport, Onshore route location	It appears from the PEIR that the most significant onshore effects will be in the Suffolk area. The proposed works may affect the following routes on the highway network:	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Traffic and transport, Onshore route location	**Suffolk Onshore** A12 B1121 to the north & south of Saxundham A1094 Saxmundham Road between Church Common and Aldeburgh B1119 Church Hill/Saxmundham Road/Waterloo Avenue B1122 Abbey Road B1069 Snape Road Brook Lane B1353 Aldringham Lane Jutes Lane B1122 Aldeburgh Road/Leiston Road Marsh Farm Road All roads within and connected to the village of Leiston	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Road links to Sizewell nuclear power stations and the Beach View Holiday Park All roads within and connected to the village of Thorpeness including Thorpe Road All roads within the west portion of Aldeburgh, from the roundabout junction of A1094 Saxmundham Road with B1122 Leiston Road All roads within and connected to the village of Friston including B1121 Saxmundham Road Grove Road from Friston to the western edge of Saxmundham		
		Traffic and transport, Onshore route location	**Kent Onshore** Sandwich Road A256 Richborough Way A299 Hengist Way Cottington Road and Cottington Lane Ebbsfleet Lane and Ebbsfleet Lane North Brook Lane Jutes Lane Marsh Farm Road	N	**Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent**. This Plan is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Onshore route location	The nearest Royal Mail operational properties are listed below and are identified on the plan at Figure 2. Distances are from the nearest boundaries of the relevant Onshore sites. **Suffolk Onshore** BE 1627 Leiston Delivery Office, 14 Sizewell Road, Leiston, IP16 4AA (c. 0.5km) BE 1632 Saxmundham DO/RET/PAR, 48 High Street, Saxmundham, IP17 1AA (c. 0.5km) BE 2117 Wickham Market PAR, 36 High Street, Wickham Market, IP13 0QS (c. 10km)	N	National Grid acknowledges this feedback.
		Onshore route location	**Kent Onshore** BE 1430 Sandwich DO, 34 King Street, Sandwich, CT13 9AA (c. 1km) BE 1426 Ramsgate DO, 42 Wilfred Road, Ramsgate, CT11 7RA (c. 3.7km)	N	National Grid acknowledges this feedback.

			BE 1407 Broadstairs DO, 20 The Broadway, Broadstairs, CT10 2AA (c. 5.7km) BE 4154 Broadstairs PAR, St Peters Park Road, Broadstairs, CT10 2BQ (c. 5.7km) BE 1424 Margate DO, 12-18 Addington Road, Margate CT9 1NQ (c. 7km)		
		Traffic and transport, Inter-Project cumulative effects	There are other DCOs neighbouring both the Suffolk and Kent onshore elements. Suffolk has a greater density of DCOs in the area and this should be taken into account when determining Royal Mail routes. The nearby DCOs in the Suffolk area are: The Sizewell C Project East Anglia Two Offshore Wind Farm LionLink Multi-Purpose Interconnector Nautilus Interconnector The nearby DCOs in the Kent area are: Manston Airport	N	National Grid acknowledges this feedback. Consideration of relevant DCO schemes within the local area that have the potential to result in cumulative effects have been identified and assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. Please refer to these chapters for further details.
		Construction – general, Traffic and transport, Inter-Project cumulative effects	The scheme is considered to have some potential for impact on Royal Mail assets or operations during its construction phase. Draft CTMPs have been prepared as part of the PEIR that is out for consultation at Section 42 stage. The proximity of on-shore scheme areas to a number of other DCOs raises potential for cumulative construction phase impacts. It is therefore advised that a standard Section 42 consultation response is submitted by 18th December setting out a request for advanced notification by addition of words to the CTMP.	N	The requests to include additional wording within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** with regard to the advanced notification of works are acknowledged. Responses have been provided against these comments as appropriate. These Plans are secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		DCO process, Land rights and CPO	Screening undertaken by: Grace Russell Date 14th December 2023 Screening classifications: Category 1 Potential for Direct Affect Undertake Risk assessment based on information available and with SEP consultation Category 2 Low Potential for Direct Affect Standard response to non-statutory consultations, s42 consultations and ES scoping, based on lack of information to enable RM to assess risk. No SEP involvement until risk assessment at Pre-exam stage Category 3 No Potential for Direct Affect Sense check with SEPs then add to LOW risk on Tracker Direct Affect = Property/part property is to be acquired or access is to be directly affected	N	National Grid acknowledges this feedback.

24 October 2023	18 December 2023	Consultation, DCO process	Galloper windfarm unfortunately missed the consultation period for the Proposed Sea Link Project. Our only comment is to request that Galloper Control Room is included in the Notice to Mariners distribution list, for all works that would be in the area of the transit route from Harwich to the Windfarm. srv_galcontrolroom.service@rwe.com and srv_galmcc.service@rwe.com If you could please confirm receipt and acceptance of this request. Thank you	N	National Grid acknowledges these comments and will seek to engage with the developer.

Table 1.29 Southern Gas Networks

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore mitigation, DCO process, protective provisions	SGN have a medium pressure gas main within the proposed Order boundary and are concerned that works associated with the Order may adversely affect the integrity of and/or access it. Please see enclosed infrastructure plan. The gas main is subject to specific working practices that must be followed by any third party working in the vicinity of it. To ensure that these working practices are observed and all reasonable measures are taken prior to any works taking place, SGN will require a legally binding Protective Provisions agreement to be entered into. SGN will draft the agreement at the cost of National Grid Electricity Transmission plc. Yours sincerely	N	National Grid acknowledges this feedback. National Grid acknowledges the presence of Southern Gas Network's assets within the Order Limits of the Proposed Project and will seek to maintain a dialogue to address the matters of concern with the DCO application. National Grid is maintaining ongoing dialogue with Southern Gas Networks regarding asset interfaces and the standard protective provisions within the DCO or if further bespoke provisions are required and draft agreement required.

Table 1.30 Southern Water

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	Good Morning Thank you for your letter in relation to the proposed sea link project. Your correspondence has now been assessed. Please find the attached response letter, Apparatus detail spreadsheet and GIS extract.	N	National Grid acknowledges this feedback.
		Land rights and CPO, onshore mitigation, design	**Statutory consultation for the proposed sea link project (the "proposed project").** **Protection of Southern Water Assets.** SWS is the statutory sewerage undertaker for the area of the proposed development. SWS has apparatus and interests in land which is the subject of the proposed application. I enclose a spreadsheet listing the SWS's assets/easements in proximity to the proposed works, including approximate Grid references. You will need to obtain copies of SWS's records to ascertain the full extent of plant affected. Please note: This is sensitive data and should not be placed on the public record. The information and data contained on these drawings are copyright to SWS and are provided as a guide to the approximate position and details of the assets listed in the documents accompanying this letter. SWS accepts no responsibility in the event of inaccuracy. The actual positions and details will need to be determined on site in all cases. Appropriate protective provisions will be required to ensure the protection of SWS's assets and ensure that necessary provisions are in place to ensure that the apparatus can be maintained in perpetuity. Without such provisions the proposed application will have an unacceptable impact on SWS's assets. We look forward to hearing from you in due course, ideally to agree protective provisions in advance of the submission of your application for a Compulsory Purchase Order. Correspondence relating to this response should be sent to the address shown in the footer of this document.	N	National Grid thanks the statutory sewerage undertaker for the information and is aware of the requirements and acknowledges the presence of apparatus and land interests. It therefore intends to include protective provisions for the benefit of statutory undertakers in Schedule 14 of the DCO application. National Grid is engaging with Southern Water and has identified asset interfaces with the Proposed Project and Southern Water assets. Protective Provisions have been requested and are under discussion. An MOU has been issued and SoCG is being prepared.
		Design, water environment, legislation and policy	The information and data contained on these drawings or supplied by any other means are copyright to Southern Water Services Ltd. and are provided as a guide to the approximated position and details of Southern Water Assets as listed above, but Southern Water Services Ltd. accepts no responsibility in the event of inaccuracy. This information must be treated with caution and the actual positions and details should be determined on site, in all cases.	N	The following assets have been identified from the records supplied by Southern Water: Interface with Trenchless Cable K/UT/FW/0002 – 600 mm Rising Main – Ductile Iron - Estimated Depth 2.3 m K/UT/FW/0005 – 600 mm Rising Main – Ductile Iron K/UT/W/0011 – 300 mm Clean Water – Cast Iron

Southern Water Services Ltd. records will not necessarily record the location or show information associated with private sewers which may have become public sewers under the transfer of private sewers.

Please note the proposed development is located near to the WEATHERLEES HILL and MINSTER IOT Wastewater Treatment Works. Please contact Southern Water to discuss and agree the Scope of the Odour assessment.

Southern Water requires existing access arrangements to the Wastewater Treatment Works and wastewater pumping station to be maintained with regards to unhindered 24 hour / 7 days a week access. Southern Water operates a closed gate policy during maintenance works for Health and Safety reasons.

It is possible that a sewer now deemed to be public could be crossing the development site. Therefore, should any sewer be found during construction works, an investigation of the sewer will be required to ascertain its ownership before any further works commence on site. For further advice, please contact Southern Water, Southern House, Yeoman Road, Worthing, West Sussex, BN13 3NX (Tel: 0330 303 0119).

Website: southernwater.co.uk or by email at: SouthernWaterPlanning@southernwater.co.uk

Interfaces with HVDC trenchless crossing

K/UT/W/0020 – 500 mm Clean Water Trunk Main– Ductile Iron

K/UT/FW/0021 – 800 mm Foul Water Rising Main – PE – Estimated Depth 2.2m

K/UT/FW/0022 – 800 mm Foul Water Rising Main – Ductile Iron

Interfaces with Temporary Construction Haul Road

K/UT/W/0023 – 500 mm Clean Water Trunk Main– Ductile Iron

K/UT/FW/0024 – 800 mm Foul Water Rising Main – PE – Estimated Depth 2.2m

K/UT/FW/0025 – 800 mm Foul Water Rising Main – Ductile Iron

Interfaces with Temporary Drainage Outfall Pipe (Subject to Change)

K/UT/W/0026.1 – 500 mm Clean Water Trunk Main– Ductile Iron

K/UT/FW/0026.2 – 800 mm Foul Water Rising Main – PE – Estimated Depth 2.2m

K/UT/FW/0026.3 – 800 mm Foul Water Rising Main – Ductile Iron

National Grid recognises the limitations of the information provided and will plan and undertake trial holes on utility crossings once a contractor is appointed to inform detailed design. Southern Water will be notified prior to undertaking the trail holes and will be offered a watching brief.

Southern Water and National Grid has agreed a 1 m minimum separation between the assets once installed.

Southern Water have identified that due to the topography of the site a new foul water connection will not be available so the site will need to be serviced via septic tank or similar.

A Section 45 new connection request will be raised for the new potable water connection for the site, routing for the connection is to be agreed but is currently considered likely to originate from Jutes Lane.

National Grid will maintain discussions with Southern Water with a view to arranging an Odour Assessment.

There is no current plan for any works to effect Weatherlees sewage treatment plant.

Table 1.31 Suffolk & Essex Coast & Heaths AONB Partnership

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy inc. permits	In Nov 2023 AONBs rebranded to National Landscapes, but references to the designation in law and policy remain as AONB, hence this response uses the AONB nomenclature.	N	National Grid notes this feedback.
		Coordination with other Projects, DCO process, Inter-Project Cumulative Effects	The AONB Partnership considers that the proposals need to be considered in combination with other energy projects in the area. This includes consideration of dual consenting processes with other projects such as Lion Link, coordinating construction works such as cable routes and required infrastructure, construction timings and assessment of cumulative effects in a coordinated fashion of the multiple energy projects impacting east Suffolk and the AONB.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects have been considered appropriately and have been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. When considering the total potential cumulative effect of all the other developments combined with the Suffolk Onshore Scheme, there is the potential for significant cumulative effects for a short term and temporary period on the Suffolk Coast and Heaths AONB as a result of the potential simultaneous or sequential construction of the Suffolk Onshore Scheme, East Anglia ONE and TWO Offshore Windfarms and LionLink Offshore Interconnector. The concentration of construction activity associated with the landfalls and HVDC cable corridors within part of the Suffolk Coast and Heaths AONB has the potential to alter the perception of the AONB with construction of major energy projects becoming a temporary characteristic feature of the landscape. These total cumulative effects are unlikely to remain once all projects are operational, particularly once the cable corridors are reinstated and mitigation plantings become established over time.
		Landscape and visual	It considers that there is a risk of public perception of the AONB to be associated with major energy projects and not its statutory purpose, to conserve and enhance natural beauty.	N	The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. It is concluded that there would be no significant adverse effects on the AONB at any Proposed Project stage. As landscaping proposals have responded to the design of the Proposed Project

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					throughout its development, the embedded mitigation within the design has addressed visual effects wherever possible. As such no additional mitigation measures have been identified in addition to the embedded measures.
		Needs case, Design, Landscape and visual	The AONB Partnership understands that the proposals have been designed to increase the capability of the network to carry electricity form where it is generated to homes and businesses across the country. And that the proposals are made up of three elements: The Suffolk onshore scheme. The offshore scheme. The Kent onshore scheme. It understands the Suffolk onshore element will include the following that is likely to have an impact on the nationally designated landscape: A landfall between Aldeburgh and Thorpeness. An HVDC underground cable between landfall and a proposed convertor station near Saxmundham, including a transition joint bay approximately 900m inshore from a landfall point where the cable transitions from onshore to offshore technology. It understands the offshore element will include a 130km subsea HVDC cable that land between Aldeburgh and Thorpeness that will pass through the Suffolk Heritage Coast, which extends 3km seaward from Mean High Water.	N	National Grid notes this feedback. The respondent's comments are correct, **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** contains the latest design information.
		Landfall location, Onshore route location, Offshore route location	The AONB Partnership recognised that the proposed substation at Friston and convertor station near Saxmundham are both located outside the nationally designated AONB.	N	National Grid notes this feedback, and confirms that the proposed substation at Friston and Saxmundham Convertor Station are both located outside the AONB.
		Landfall location, Onshore route location, Offshore route location, Landscape and visual	However, it considers that the landfall and underground cable has the potential to have a negative impact on the AONB and that the subsea cable has the potential to have a negative impact on the defined Suffolk Heritage Coast.	N	The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. The effects on the Suffolk Heritage Coast are also outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. It is concluded that there would be no significant adverse effects on the Suffolk Heritage Coast or AONB at any Proposed Project stage.
		Legislation and policy inc.	The AONB Partnership:	N	National Grid notes this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		permits, Consultation	The Partnership was formed in 1993, it comprises public, private and voluntary organisations who are committed to conserving and enhancing the Natural Beauty of the AONB. The Partnership's role is to act as an advocate for the AONB and oversee the delivery of the AONB Management Plan. The AONB Partnership consists of: Babergh Mid Suffolk District Council, East Suffolk Council, Essex County Council, Ipswich Borough Council, Suffolk County Council, Tendring District Council, Community Action Suffolk, Country Land and Business Association, The Crown Estate, Defra, Environment Agency, Forestry Commission, Historic England, National Farmers' Union, Natural England, National Trust, Royal Society for the Protection of Birds, Suffolk Association of Local Councils, Suffolk Coast Acting for Resilience, Suffolk Coast Ltd, Suffolk Farming & Wildlife Advisory Group, Suffolk Preservation Society, Suffolk Wildlife Trust. It should be noted that: Many of these partners are public bodies or statutory undertakers which have the duties to conserve and enhance the Natural Beauty of the AONB as set out in section 85 of the Countryside and Rights of Way Act (2000), as amended in the Levelling Up and Regeneration Bill (2023). It is anticipated that these partners, and other members of the Partnership, will provide separate consultation responses that reflect these and other interests and responsibilities.		
		Consultation	Suffolk Coast & Heaths AONB Partnership response National Grid Sea Link Statutory Consultation Oct to Dec 2023: The AONB Partnership will restrict itself to commenting on proposals that impact its area of interest, ie those proposals that impact the Suffolk Coast & Heaths Area of Outstanding Natural Beauty and associated Suffolk Heritage Coast. The AONB Partnership has formed its view on these proposals from information provided by National Grid from: The project's website. Information shared by project proposer at working group meetings. Site visits. Discussion with AONB partners and others with knowledge of the proposals	N	National Grid notes this feedback.
		Legislation and policy inc. permits	Summary of the Suffolk Coast & Heaths AONB Partnership response to National Grid Sea Link Statutory Consultation Oct to Dec 2023. It considers that: All proposals should adhere to all relevant policy.	N	The routeing and siting of the Suffolk Onshore Scheme has taken into consideration designations, including the Suffolk Coast and Heaths AONB and Suffolk Heritage Coast. The Converter Station site is not located within either of the designated landscapes. The effects arising from the Suffolk Onshore Scheme on the AONB and Heritage Coast are outlined within **Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Major new electricity transmission infrastructure should avoid nationally designated landscapes such as the Suffolk Coast & Heaths AONB. Major new electricity transmission infrastructure should avoid the defined Suffolk Heritage Coast.		**Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The assessment of effects on the AONB and Heritage Coast is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. It is concluded that there would be no significant adverse effects on the AONB and Heritage Coast at any Proposed Project stage. As landscaping proposals have responded to the design of the Proposed Project throughout its development, the embedded mitigation within the design has addressed visual effects wherever possible. As such no additional mitigation measures have been identified in addition to the embedded measures. A robust alternatives assessment has been undertaken for the Proposed Project. Further information is contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design Development Report and Application Document 7.2 Strategic Options Back Check Report**. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report (October 2023)**.
		Landfall location, Onshore route location, landscape and visual	The Suffolk Coast & Heaths AONB has a very high sensitivity to development.	N	The sensitivity of the AONB is noted and is reflected in the assessment of effects, as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The sensitivity of the AONB is identified as being ‘very high’. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases.
		Landfall location, Onshore route location, landscape and visual, ecology and biodiversity	The proposed cable routes across the AONB may not be fully reinstated due to restrictions on vegetation and impacts on soil structures and drainage patterns.	N	The challenges relating to reinstatement following construction are set out within the assessment of effects on the AONB, landscape character and visual amenity within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes consideration that heathland and acid grassland will take longer to be reinstated than other habitat types and this has been acknowledged within the assessment. Details around reinstatement are set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. This Plan is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases.
		Construction – general, Onshore route location, Design	The installation of underground cables through the AONB should be undertaken by Horizontal Directional Drilling (or similar) rather than trenching technology to avoid negative impacts on the nationally designated landscape.	N	The effects of installing the cables as part of the Proposed Project has been assessed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and impacts have been mitigated via reinstatement. Details around reinstatement are set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. This Plan is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). The assessment concludes no likely significant

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. There would be direct effects in localised areas of the AONB associated with the HVDC cable laying, including vegetation removal, temporary displacement of agricultural land and acid grassland, temporary infiltration ponds and pipes along the cable route and at the landfall, temporary drilling rig at the landfall, a construction compound to the east of Leiston Road (B1122) and construction access along the cable route. For further details relating to the installation methodology for the HVDC cables are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Construction – general, Landscape and visual	The construction phase will have a negative impact on the ability of the AONB to deliver its statutory purpose such as from the construction of a transition joint bay within the AONB.	N	The anticipated construction effects arising from the Suffolk Onshore Scheme on the AONB and its statutory purpose are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The assessment concludes no significant adverse effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases.
		Coordination with other projects, Inter-Project cumulative effects, timescales / programme	The proposed scheme needs to be considered in combination with other energy projects in the area. This includes consideration of dual consenting processes with other projects such as Lion Link, coordinating construction works such as cable routes and required infrastructure, construction timings and assessment of cumulative effects in a coordinated fashion of the multiple energy projects impacting east Suffolk and the AONB. A collaborative approach should be taken to minimise negative impacts and to consider the public perception of the AONB, which may be related to energy projects rather than its statutory purpose of conserving and enhancing natural beauty.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects have been considered appropriately and have been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is considered in the ES within **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. When considering the total potential cumulative effect of all the other developments combined with the Suffolk Onshore Scheme, there is the potential for significant cumulative effects for a short term and temporary period on the Suffolk Coast and Heaths AONB as a result of the potential simultaneous or sequential construction of the Suffolk Onshore Scheme, East Anglia ONE and TWO Offshore Windfarms and LionLink Offshore Interconnector. The concentration of construction activity associated with the landfalls and HVDC cable corridors within part of the Suffolk Coast and Heaths AONB has the potential to alter the perception of the AONB with construction of major energy

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					projects becoming a temporary characteristic feature of the landscape. These total cumulative effects are unlikely to remain once all projects are operational, particularly once the cable corridors are reinstated and mitigation plantings become established over time.
		Landscape and visual, Construction - general	The AONB Partnership consider that infrastructure of this magnitude does not contribute to the delivery of statutory purpose of the AONB. Furthermore, it does not concur with the assessment in table 2.2.41 of the Preliminary Environmental Information Report Volume 1 Part 2 Chapter 2 starting on page 129. This section refers to 'small areas', 'removal of small sections of boundary features', 'expected to be localised', 'temporary period of time', 'localised tranquillity'. The AONB Partnership consider that these phrases underplay the impacts on the nationally designated landscape from major construction activity. It considers that impact on part of the AONB is an impact on the AONB which it considers to be a single entity and that that impacts that are planned to happen for a 'short time' do not preclude the impacts impacting the AONB and by those experiencing the AONB.	N	The comment is acknowledged that the AONB Partnership do not agree with statements made in the PEIR about effects to the AONB arising from the Suffolk Onshore Scheme. The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** which describes in further detail the potential effects on the AONB. The assessment of effects identifies that construction effects are considered to be temporary, acknowledges that reinstatement would take longer for some habitats and focuses on each of the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. The assessment continues to refer to where 'small sections of boundary features' are to be removed and provides further explanation as to how this relates to the functions of the AONB, including openness and enclosure. The assessment also continues to refer to 'small' areas where appropriate to describe parts of the Proposed Project and then relates this to understanding how this effects the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases.
		Onshore route location, Construction – general, Onshore environmental impact, Landscape and visual	The AONB Partnership consider that table 2.2.65 of Preliminary Environmental Information Report Volume 1 Part 2 Chapter 2 starting on page 182 section on Natural Heritage Features and Scenic Quality underplays the impacts from the installation of underground cables due to the likely impacts on vegetation from disruption to soil structure, drainage patterns and surface vegetation. The AONB Partnership acknowledges that the project's proposer adheres to the draft EN-5 to underground cables through the AONB but considers there will still be a negative impact on the AONB during construction and operation.	N	The comment is acknowledged that the AONB Partnership do not agree with statements made in the PEIR about effects to the AONB arising from the Suffolk Onshore Scheme. The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** which describes in further detail the potential effects on the AONB. The assessment of effects identifies that construction effects are considered to be temporary, acknowledges that reinstatement would take longer for some habitats and focuses on each of the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. Relating to Natural Heritage features, this includes reference to the removal of boundary vegetation within the AONB and refers to **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** for further information. Relating to Scenic Quality, this includes reference to the unaffected long distance and panoramic views across the AONB and the open landscape between Aldeburgh and Thorpeness due to the proposed trenchless technique at the landfall and the extent of change experienced onshore is often limited due to an intervening layered network of vegetation, landform and built form. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases.
		Legislation and policy inc. permits,	The AONB Partnership considers that the proposals need to be determined against the relevant National Policy Statements, Legislation and other relevant policy, plans and guidelines. The AONB Partnership notes that:	N	The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. It is concluded that there would be no significant adverse effects on the AONB at any Proposed Project stage.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landscape and visual	A) The Overarching National Policy Statement for Energy (EN1), paragraph 5.9.9, states: Development proposed within nationally designated landscapes “National Parks, the Broads and AONBs have been confirmed by the Government as having the highest status of protection in relation to landscape and scenic beauty. Each of these designated areas has specific statutory purposes which help ensure their continued protection and which the IPC [Now Planning Inspectorate] should have regard to in its decisions. The conservation of the natural beauty of the landscape and countryside should be given substantial weight by the IPC [Now Planning Inspectorate] in deciding on applications for development consent in these areas”. The AONB Partnership considers that to conform to EN1 that the proposed developments should not significantly negatively impact nationally designated landscape.		The Partnership's response refers to the 2011 version of the energy NPSs, which have been withdrawn. It is the November 2023 versions of the Energy NPSs that are in force. **Application Document 7.1 Planning Statement** sets out a comprehensive appraisal of the Proposed Project in relation to the relevant energy NPSs, including EN-3, and other policy that may be considered important and relevant to the Secretary of States decision. Regarding the Secretary of State's decision making, National Grid does not agree with the Partnership's interpretation of the out-of-date policy and draws its attention to paragraphs 4.2.15 to 4.2.17 of the November 2023 NPS EN-1 that is in force. Paragraph 4.2.15 sets out that the urgent need for critical national priority (CNP) infrastructure, which includes the Proposed Project, will outweigh residual impacts "in all but the most exceptional circumstances". Paragraph 4.2.16 goes on to explain that the starting point for the Secretary of State's decision making is therefore that CNP infrastructure "is to be treated as if it has met any tests which are set out within the NPSs, or any other planning policy, which requires a clear outweighing of harm, exceptionality or very special circumstances." Paragraph 4.2.17 confirms that this includes policy tests associated with nationally designated landscapes: "...the Secretary of State will take as a starting point that CNP Infrastructure will meet the following, non-exhaustive, list of tests: ... ...-where development in nationally designated landscapes requires exceptional circumstances to be demonstrated..."
		Legislation and policy inc. permits, Landscape and visual	B) The National Policy Statement for Renewable Energy Infrastructure (EN-3), paragraph 2.5.33 states: “In sites with nationally recognised designations (Sites of Special Scientific Interest, National Nature Reserves, National Parks, the Broads, Areas of Outstanding Natural Beauty and Registered Parks and Gardens), consent for renewable energy projects should only be granted where it can be demonstrated that the objectives of designation of the area will not be compromised by the development, and any significant adverse effects on the qualities for which the area has been designated are clearly outweighed by the environmental, social and economic benefits”. The AONB Partnership considers that to conform to EN3 that the proposed developments should not have significantly negatively impact nationally designated landscape.	N	The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. It is concluded that there would be no significant adverse effects on the AONB at any Proposed Project stage. The Partnership's response refers to the 2011 version of the energy NPSs, which have been withdrawn. It is the November 2023 versions of the Energy NPSs that are in force. **Application Document 7.1 Planning Statement** sets out a comprehensive appraisal of the project in relation to the relevant energy NPSs and other policy that may be considered important and relevant to the Secretary of States decision. Regarding the Secretary of State's decision making, National Grid does not agree with the Partnership's interpretation of the out-of-date policy and draws its attention to paragraphs 4.2.15 to 4.2.17 of the November 2023 NPS EN-1 that is in force. Paragraph 4.2.15 sets out that the urgent need for critical national priority (CNP) infrastructure, which includes the Proposed Project, will outweigh residual impacts "in all but the most exceptional circumstances". Paragraphs 4.2.16 goes on to explain that the starting point for the Secretary of State's decision making is therefore that CNP infrastructure "is to be treated as if it has met any tests which are set out within the NPSs, or any other planning policy, which requires a clear outweighing of harm, exceptionality or very special circumstances." Paragraph 4.2.17 confirms that this includes policy tests associated with nationally designated landscapes: "...the Secretary

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					of State will take as a starting point that CNP Infrastructure will meet the following, non-exhaustive, list of tests: ... ...-where development in nationally designated landscapes requires exceptional circumstances to be demonstrated..."
		Legislation and policy inc. permits, Landscape and visual	C) The draft National Policy Statement EN-5 on Electricity Networks Infrastructure States in para 2.11.11: “The Horlock Rules – guidelines for the design and siting of substations were established by National Grid in 2009 in pursuance of its duties under Schedule 9 of the Electricity Act 1989. These principles should be embodied in Applicants’ proposals for the infrastructure associated with new overhead lines”. It then briefly references the Horlock rules including: “seek to avoid altogether internationally and nationally designated areas of the highest amenity, cultural or scientific value by the overall planning of the system connections” The AONB Partnership considers that to conform to the draft EN-5 that the proposed development should pay regard to AONB purpose.	N	The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. It is considered that there would be no significant adverse effects on the AONB at any Proposed Project stage. The Partnership's response refers to the 2011 version of the energy NPSs, which have been withdrawn. It is the November 2023 versions of the Energy NPSs that are in force. **Application Document 7.1 Planning Statement** sets out a comprehensive appraisal of the project in relation to the relevant energy NPSs, including EN-5, and other policy that may be considered important and relevant to the Secretary of States decision. Regarding the Secretary of State's decision making, National Grid does not agree with the Partnership's interpretation of the out-of-date policy and draws its attention to paragraphs 4.2.15 to 4.2.17 of the November 2023 NPS EN-1 that is in force. Paragraph 4.2.15 sets out that the urgent need for critical national priority (CNP) infrastructure, which includes the Proposed Project, will outweigh residual impacts "in all but the most exceptional circumstances". Paragraphs 4.2.16 goes on to explain that the starting point for the Secretary of State's decision making is therefore that CNP infrastructure "is to be treated as if it has met any tests which are set out within the NPSs, or any other planning policy, which requires a clear outweighing of harm, exceptionality or very special circumstances." Paragraph 4.2.17 confirms that this includes policy tests associated with nationally designated landscapes: "...the Secretary of State will take as a starting point that CNP Infrastructure will meet the following, non-exhaustive, list of tests: ... ...-where development in nationally designated landscapes requires exceptional circumstances to be demonstrated..."
		Legislation and policy inc. permits, landscape and visual	D) Section 85 of the Countryside and Rights of Way Act (2000), as amended to reflect the Levelling Up and Regeneration Bill (2023), that states: *General duty of public bodies etc* *(1) In exercising or performing any functions in relation to, or so as to affect, land in an area of outstanding natural beauty, a relevant authority must seek to further the purpose of conserving and enhancing the natural beauty [our emphasis] of the area of outstanding natural beauty.* *(2) The following are relevant authorities for the purposes of this section—* *(a) any Minister of the Crown,*	N	Paragraph 2.2.11 of NPS EN-5 reminds transmission and distribution licence holders of their statutory duty, under Schedule 9 to the Electricity Act 1989, to “*have regard to the desirability of preserving natural beauty”*. Paragraph 2.2.11 adds: “*Depending on the location of the proposed development, statutory duties under Section 85 of the Countryside and Rights of Way Act 2000, Section 11A of the National Parks and Access to the Countryside Act 1949 (as amended by Section 62 of the Environment Act 1995), and Section 17A of the Norfolk and Suffolk Broads Act 1988 may be relevant. Applicants should note amendments to each of these provisions contained in Section 245 of the Levelling Up and Regeneration Act 2023”.* The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			(b) any public body, *(c) any statutory undertaker [our emphasis]* *(d) any person holding public office.* The AONB Partnership considers that National Grid is a statutory undertaker and must seek to further the purpose of conserving and enhancing the natural beauty AONB when undertaking its operations and decision making.		assessment concludes no significant adverse effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. Details regarding how National Grid have sought to further the purpose of conserving and enhancing the AONB are set out within **Application Document 7.1 Planning Statement**.
		Legislation and policy inc. permits, landscape and visual	E) The statutory Suffolk Coast & Heaths AONB Management Plan 2023-28 outlines within its 25 year vision for the area, it includes: *Development contributes to the statutory AONB purpose and is designed to be an environmental exemplar. Nationally Significant Infrastructure Projects such as energy production and its associated infrastructure should seek to avoid damage to the natural beauty of the AONB. Where residual damage cannot be avoided this should be minimised, mitigated, and compensated for in so far as Development Consent Orders require.* The AONB Partnership considers that National Grid's Sea Link proposals for development are required to meet the aims of the AONB Management Plan.	N	National Grid is cognisant of these requirements and has given careful consideration to minimising the impacts of the Proposed Project on the AONB. The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The assessment concludes no significant adverse effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. **Application Document 7.1 Planning Statement** sets out a comprehensive appraisal of the Proposed Project in relation to the relevant energy NPSs and other policy that may be considered important and relevant to the Secretary of States decision. Consideration is also given to the 2023-28 management plan.
		Legislation and policy inc. permits, landscape and visual	The AONB Partnership note that it published its 2023-28 management plan on 8 Dec 2023. This plan should be a material consideration in decision making on proposals that impact the nationally designated landscape. The AONB Partnership recognise six elements of interest in the proposals from the consultation that it will comment on: **I) Landfall** **ii) HVDC cable routes** **iii) Convertor stations** **iv) HVAC cable routes** **v) Substation** **vi) Socio-economic impacts**	N	The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. **Application Document 7.1 Planning Statement** sets out a comprehensive appraisal of the Proposed Project in relation to the relevant energy NPSs and other policy that may be considered important and relevant to the Secretary of States decision. Consideration is also given to the 2023-28 management plan.
		Landfall location, landscape and visual	**I) Landfall** The AONB Partnership note the landfall site in the proposals is in the nationally designated landscape. Major development, such as outlined in the proposals, does not contribute to the natural beauty or the ability of AONBs to meet its statutory purpose to conserve and enhance natural beauty. Landfall	N	The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. It is not considered that there would be significant adverse effects on the AONB at any Proposed Project stage. The construction activity associated with the landfall would be in a small part of the AONB and the extent of this change experienced onshore is often limited due to an intervening layered network of vegetation, landform and built form.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			within the AONB will have a negative impact on its statutory purpose and natural beauty during construction.		
		Onshore route location, alternative solutions, design	**ii) HVDC cable routes** The AONB Partnership notes that the proposed cable routes, where they cross the nationally designated landscape will be put underground as presumed in the draft National Policy Statement EN-5. It considers that there will be negative impacts on the AONB during construction. It therefore considers that undergrounding cables through the AONB should be undertaken using Horizontal Directional Drilling (or similar) and not trenching technology to minimise negative impacts on the nationally designated landscape.	N	The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. The construction effects of the cable laying would be localised, including temporarily displacing small areas of acid grassland and removal of small sections of boundary features. Should a trenchless construction solution be used within the full boundary of the AONB, a wider swathe would be required. National Grid has assessed the habitats within the AONB and it has used a trenchless methodology through the most sensitive habitats. The impact of the trenchless solution throughout the AONB would have a greater adverse impact than the use of a trenched solution. The assessment of potential impacts on ecology are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Further details relating to the Proposed Project design are contained within **Application Document 6.2.1.4 Part 1 Chapter 4 Description of the Proposed Project**. A robust alternatives assessment has been undertaken for the Proposed Project. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design Development Report and Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project.
		Terrestrial ecology, agriculture and soils, water environment	The AONB Partnership further considers that the impacts on surface vegetation and sub surface soil structures and drainage patterns during operation will potentially have a negative impact on the character of the AONB.	N	The assessment of effects on the AONB is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The assessment concludes no likely significant effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. It is acknowledged that the re-instatement of localised areas of acid grassland would be in their early period of re-establishment at year 1 of operation. The assessment of effects on soils is contained in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. The assessment concludes that impacts on agriculture and soil receptors may result from the temporary disturbance of soils and temporary removal of BMV land from agricultural production, and from the permanent land take required for the Proposed Project's infrastructure. Whilst the temporary effects during construction are significant, the majority of the land required would be reinstated to the pre-construction condition by the end of the construction phase in accordance with the measures set out in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. In addition, soil resources from the footprint of the permanent infrastructure would be re-used within the Proposed Project where practicable, enabling an associated range of soil functions to continue.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Design, converter station location	**iii) Convertor stations** The AONB Partnership note that the proposers of the scheme have applied the Horlock Rules and other policy drivers to considerations in identifying a site for the convertor station outside the AONB. It recognises the concerns of others that that will be significantly impacted by the location chosen and would urge the scheme proposer to address those concerns.	N	The comment is acknowledged and it should be noted that National Grid has engaged with stakeholders throughout the process as well as internal collaboration between disciplines. This is outlined within **Application Document 5.1 Consultation Report**. NPS EN-5 gives consideration to the Horlock Rules, devised by National Grid in 2003 and updated in 2009. The Horlock Rules provide guidelines for the siting and design of new substations and substation extensions to avoid or reduce the environmental effects of such developments. In summary, they facilitate consideration of environmental and amenity factors within the design and siting of new substation infrastructure. These were considered during the identification of potential locations for the proposed Saxmundham Converter Station and the proposed Minster 400 kV Substation and Minster Converter Station, acknowledging the absence of similar guidance specific to converter stations. Further details on how the project has considered the Horlock Rules can be found in **Application Document 7.1 Planning Statement**. Further details of the options assessed for the location of the converter station can be found in **Application Document 6.2.1.3. Part 1 Chapter 3 Main Alternatives Considered**.
		Onshore route location, design	**iv) HVAC cable routes** The AONB Partnership considers that the use of a HVAC cable link between the convertor station and substation should not be an issue for the AONB Partnership as this infrastructure is not located within the nationally designated landscape.	N	National Grid acknowledges this feedback.
		Onshore route location, landscape and visual	**v) Substation** While recognising the legitimate concerns of those impacted by the proposed Friston substation the AONB Partnership's remit relates to the designated AONB and its setting. As such it welcomes the proposals to use the site of the proposed Friston sub station rather than a site within the nationally designated landscape.	N	National Grid acknowledges this feedback.
		Cultural heritage	**vi) Socio-economic impacts** In addition to landscape and wildlife impacts the proposers should consider the impact on the AONB's cultural heritage. The AONB has significant cultural significance including those relating to the works of composers, such as Benjamin Britten, artists such as Maggi Hambling, M W Turner and Walter Crane, poets such as George Crabbe and numerous photographers including the contemporary Gill Moon.	N	The potential effects on the Suffolk Coast and Heaths AONB in relation to the natural beauty indicators, including reference to cultural heritage, is included within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment concludes no significant adverse effects on the landscape character of the Suffolk Coast and Heaths AONB during construction, operation or maintenance phases. The effects on the statutory purpose of the Suffolk Coast and Heaths AONB are considered within **Application Document 7.1 Planning Statement**. The assessment concludes that with the provision of acid grassland enhancement within the AONB (circa 6 ha), this enhancement targets the Natural Beauty and some of the Special Qualities indicators of the AONB and contributes to aspirations set out in its Management Plan, and will therefore further the statutory purposes of the AONB. A full assessment of impacts to cultural heritage receptors is covered in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** which acknowledges that

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					most works in this area will be undertaken using a trenchless construction solution, with open-cut works temporary in nature.
		Socio-economic, recreation and tourism, health and wellbeing	The AONB Partnership considers that the proposer of the project considers the economic impacts of its project and on the tourism industry and residents' quality of life. Whilst it is not the role of the AONB Partnership to promote the visitor economy, that economy is a vital part of the functioning of a thriving protected landscape The AONB, as a designation, has an important role to play in the tourism industry, that supports over 4,000 jobs and is worth over £250M pa.	N	National Grid acknowledges this feedback. The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and experience from the construction of the Suffolk Onshore Scheme.
		Landscape and visual, socio-economic, recreation and tourism, Health and Wellbeing	The natural beauty and special qualities of the AONB are a key driver for the tourism industry, in particular its landscape quality, tranquillity, and natural cultural heritage features. Furthermore, residents in the AONB enjoy benefits associated with AONB natural beauty and special quality indicators. Resident's quality of life is enhanced by the statutory purpose of the AONB.	N	The assessment of effects on the AONB is within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** which highlights that construction effects are considered to be temporary, acknowledges that reinstatement would take longer for some habitats and focuses on each of the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and experience from the construction of the Suffolk Onshore Scheme. A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project, including on residents within the AONB.

Table 1.32 Suffolk Constabulary

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, legislation and policy	I refer to the above consultation being undertaken by National Grid Electricity Transmissions plc (NGET) and the letter received by the Office of the Police and Crime Commissioner (PCC) for Suffolk dated 19 October 2023 regarding this matter. NPS Property Consultants is commissioned by Norfolk and Suffolk Constabulary to prepare representations in response to planning consultations on certain infrastructure matters. Therefore, on behalf of the Office for the PCC, the following initial comment is made regarding the possible impact on policing resources which would result from this proposal. The consultation is supported by the Preliminary Environmental Information Report (PEIR). Amongst its provisions, it identifies key planning policy considerations and indicates that local planning policies (notably the Suffolk Coastal Local Plan - adopted in September 2020) have been considered alongside national policy (including adopted and emerging / draft Energy National Policy Statements, the National Planning Policy Framework (NPPF) - updated in September 2023 and the Levelling Up and Regeneration Act – enacted in October 2023). In relation to the function of emergency services, Central Government places great emphasis on the role of the Police and this has been reinforced in the Levelling Up and Regeneration Act (enacted in October 2023) which contains specific provision for the emergency services in the definition of ‘infrastructure’ as well as clarifying that this type of infrastructure encompasses equipment and facilities, recognising directly for the first time the emergency services role in primary legislation governing the English planning system.	N	National Grid acknowledges this feedback.
		Legislation and policy, onshore mitigation, safety	The Suffolk Coastal Local Plan (adopted in September 2020) contains several policies and provisions linked to major development proposals and recognise the importance of the provision of police infrastructure (which include new floor space, staff, equipment and police vehicles). Local Plan Policy SCLP3.5 (Infrastructure Provision) further outlines the importance of such infrastructure being delivered in a timely manner and that ‘developers must consider the infrastructure requirements needed to support and service the proposed development. All development will be expected to contribute as necessary towards infrastructure provision to meet the needs generated’. Major new development can result in extra pressure being placed on existing police infrastructure. Therefore, the impact on policing of this proposed development (and the associated infrastructure needs of Suffolk Constabulary) should be fully addressed in the PEIR, consistent with the provision of Local Plan policy SCLP3.5.	N	There are no likely significant effects identified on police resources as a result of the Proposed Project, and therefore the impact on police resources is not a topic which has been scoped into the EIA.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Whilst Local Plan policy identifies the need for specific police infrastructure requirements associated with several major developments identified in its provisions, as the Sea Link Project is not such a major project allocated in the Plan, its implications / impact on existing police resources has not been included in any site-specific plan provisions.		
		Traffic and transport, construction, major accidents and disasters	Suffolk Constabulary consider this proposal, in view of its nature and importance as a nationally significant infrastructure project, could place additional pressure on police resources unless suitable measures are detailed and put in place to mitigate the impact. The impact on police resources for a major infrastructure project such as the Sea Link Project may relate to (but not be limited to) policing the following. • Numerous (wide / heavy) additional commercial traffic loads on the county roads (initially during the construction phase). • The impact of temporary labour at the development sites. • The security of a nationally / regional important energy site. • Additional anti-social behaviour and / or public demonstrations relating to a development. • Any terrorist or serious and organised crime threats.	N	There are no likely significant effects identified on police resources as a result of the Proposed Project, and therefore impact on police resources is not a topic that has been scoped into the EIA. However, **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** considers the impact of the Proposed Project on community facilities, including police stations. The baseline conditions outline that there are no police stations within 500 m of the Suffolk Onshore Scheme Order Limits. The nearest police station is Saxmundham Police Station, located approximately 770 m to the west of the Suffolk Onshore Scheme Order Limits. As 500 m is the distance threshold beyond which it is considered that changes to accessibility and severance on community assets would be unlikely, based on the Design Manual for Roads and Bridges (DMRB) LA 112, the Proposed Project is not anticipated to impact police stations. National Grid is continuing to seek to engage with the Suffolk Constabulary and other relevant blue light services in order to discuss and understand any matters of concern that they may have as a result of the construction or operational phases of the Proposed Project. Furthermore, National Grid will seek to establish an ongoing dialogue to discuss the terms that will be necessary to develop actions to be implemented to secure mutually acceptable outcomes. It should also be noted that the construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place.
		Onshore mitigation, finance, consultation	Having reviewed the supporting PEIR, it is noted that this appears silent on the impact of the proposal on police resources and any potential additional pressure that may be placed on Suffolk Constabulary. In addition, the PEIR fails to outline any additional fund / finance that may be required towards police infrastructure to safeguard this nationally significant development. In this case, given the significant nationally significant scale of the proposal, it is considered that the above matters need to be fully addressed in PEIR so that Suffolk Constabulary can properly assess the mitigation proposed and whether the proposal will add pressure to Suffolk Constabulary resources. The PCC looks	N	There are no likely significant effects identified on police resources as a result of the Proposed Project, and therefore impact on police resources is not a topic that has been scoped into the EIA. As an operator of national infrastructure, National Grid commit significant resources and investment into maintaining the security of their sites and assets. National Grid is engaging with the local authorities on an ongoing basis and will seek to discuss and identify security measures that may be necessary at each stage of development and operation. National Grid will ensure that its contractors provide the relevant levels of security and where gates are installed these shall be locked out of hours and

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			forward to further information on this matter to allow a more detailed response to be provided to this consultation. Copy to – Duncan Potter (Norfolk and Suffolk Constabulary - Head of Estates)		mobile and static security patrols or CCTV will be installed where it is deemed required. However, **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** considers the impact of the Proposed Project on community facilities, including police stations. The baseline conditions outline that there are no police stations within 500 m of the Suffolk Onshore Scheme Order Limits. The nearest police station is Saxmundham Police Station, located approximately 770 m to the west of the Suffolk Onshore Scheme Order Limits. As 500 m is the distance threshold beyond which it is considered that changes to accessibility and severance on community assets would be unlikely, based on the Design Manual for Roads and Bridges (DMRB) LA 112, the Proposed Project is not anticipated to impact police stations. National Grid will continue to engage with the Suffolk Constabulary and other relevant blue light services in order to discuss and understand any matters of concern that they may have as a result of the construction or operational phases of the Proposed Project. Furthermore, National Grid will seek to establish an ongoing dialogue to discuss the terms that will be necessary to develop actions to be implemented to secure mutually acceptable outcomes. It should also be noted, that the construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place.

Table 1.33 Suffolk Local Access Forum

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore route location, Walking, cycling and horse riding, landscape and visual, Construction - general	SLAF is a statutory body appointed by Suffolk County Council under the Countryside and Rights of Way Act 2000 to advise various bodies on matters affecting countryside access and the public rights of way (PRoW) network. We have been consulted and responded to proposals by bodies such as Network Rail, Highways England, Natural England and EDF. There are two main issues that SLAF wish to comment on. First, is that as with other energy schemes that they have been involved with, there is a line on the map showing the draft order limits from Saxmundham to the Suffolk landfall of the offshore cable just north of Aldeburgh adjacent to the old railway line. Within the line would be a trench for cable ducts from there to the Friston substation and then on to Saxmundham. However, there is a lack of information on the width and depth of the cable trenches and the visual impact of the proposed cable joint bay and link boxes. We would expect that in the construction phase there would be continuation of public access within this area. Any temporary closures would be kept to a minimum, and alternative routes provided where necessary.	N	For further details on the design of the Proposed Project including the details relating to the indicative Proposed Project Cable Trench widths and depths. Further details are contained in **Application 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The visual impact assessment associated with the Proposed Project is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and has used the design parameters set out within **Application Document 6.2.1.4 Part 1 Chapter 4 Description of the Proposed Project** as the basis for the assessment on receptors within the study area. This includes reference to link boxes, referred to as kiosks, and the cable joint bay. The assessment concludes a range of significant and non-significant effects for visual amenity across the study area during construction, operation or maintenance phases. In Suffolk, there are 21 locations where the proposed works would impact the existing PRoW network and these are identified within **Application Document 6.3.1.4.A ES Appendix 1.4.A Crossing Schedules** and presented in **Application Document 6.4.1.4 Crossing Schedules**. The intention is to provide a permissive right of way along the permanent access subject to agreement with stakeholders to enhance the east west connectivity of the PRoW network in the area. Further details are contained in **Application Document 2.7.1 Access, Rights of Way and Public Rights of Navigation Plans - Suffolk**. National Grid fully appreciates the importance of PRoW and maintaining safe public access to them and it is the overall intention to keep the majority of PRoW effectively open via management and diversions where necessary. The proposed management measures seek to retain access to PRoW during all phases of the Proposed Project, with temporary diversions only being proposed where these are required to bypass any temporary closures during the construction phase where necessary. Two PRoW are proposed to be permanently stopped up (with permanent diversions) as a result of the Suffolk Onshore Scheme which comprise PRoW E-354/006/0 due to the location of the Friston Substation and PRoW E-491/005/0 due to the location of the Saxmundham Converter Station. Further details of the PRoW provisions and diversions are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project and Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been prepared which provides further details of PRoW closures and diversions.
		Landscape and visual, Walking, cycling and horse riding,Design	Second, at the Converter Station site, which will have the greatest impact on the landscape and PRoWs, this is very open with little tree cover and at present has several rights of way on it or close by including Saxmundham 23, Sternfield 5, 6 & 10 and Knodishall 15,16,17 & 18 which all provide green access routes from Saxmundham to the wider countryside to the east. SLAF would expect a PRoW management plan agreed with Suffolk	N	The open nature of the converter station site is noted and the PRoW in close proximity are acknowledged. The effects on the visual amenity of PRoW users as a result of the Suffolk Onshore Scheme are detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			County Council to be in place prior to any construction work. This would include showing how the loss of these routes would be mitigated against or diverted to allow new alternative routes and additional landscaping which would enable robust and attractive links between Saxmundham, Sternfield and Knodishall. The height and footprint of the proposed converter station(s) would also have a serious landscape and visual impact leaving Saxmundham on the B1119 which would be difficult to disguise.		The outline PRoW Management Plan is included for Suffolk (**Application Document 7.5.9.1 Outline Public Rights of Way Management Plan for Suffolk**). This Management Plan is submitted as a supporting document to the Development Consent Order (DCO) application (**Application Document 3.1**) and would be implemented by Schedule 3 Requirement 6 of the Draft DCO, and will be in place prior to any construction works commencing. The permanent PRoW diversion on the Converter Station site has been designed so that recreational users have a variety of visual amenity experiences with some sections more open and others more contained within areas of woodland planting designed to aid screening of views towards the Converter Station. This has also included the provision of open access areas, as requested through stakeholder feedback. The indicative landscape strategy is contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** and details the permanent PRoW diversion across the site. There would be localised significant effects for visual receptors, including those travelling along the B1119, as expected for the nature of this type of development. Mitigation design has been incorporated to reduce effects where possible, including hedgerow and tree planting along the B1119 close to the receptor to maximise the screening capabilities.
		Coordination with other Projects, Socio-economic. recreation and tourism, Consultation, Traffic and Transport, Ecology and Biodiversity	Other issues which SLAF have with the proposals includes, the seeming lack of co-ordination between energy schemes on the Suffolk Coast with its numerous conservation and environmental designations, the impact this proposal would have on the local economy in terms of the loss of socio-economic, tourism and recreation potential, and the possible impact of construction traffic in the area conflicting with that likely to arise from Sizewell C if both end up going ahead at the same time. SLAF would also request that they are formally consulted at the next stage of consultation.	N	National Grid is coordinating with other developers of large scale infrastructure projects where possible, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. Environmental designations have been assessed within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. It is concluded that there are no significant adverse effects in relation to the Suffolk Onshore Scheme on environmental designations, following the implementation of additional mitigation measures as outlined within the chapter. Cumulative effects associated with environmental designations are considered within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**. The impact of the Proposed Project on the local economy including socio-economics, recreation and tourism considerations is included within **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. It is concluded that there are no significant adverse effects in relation to the Suffolk Onshore Scheme on socioeconomics, recreation and tourism receptors during construction, operation and maintenance and decommissioning with the proposed mitigation in place. The proposed mitigation includes sensitive routing and siting of infrastructure and temporary works to avoid or reduce impacts on socio-economics, recreation and tourism receptors, with further commitments made within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Cumulative effects associated with socio-economies and recreation and tourism are considered within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**.Construction phase

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					transport effects are assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** which considers the baseline traffic flows. No significant adverse effects have been identified as a result of the Proposed Project on transport and access during any phase with the proposed mitigation in place. The proposed mitigation includes embedded measures set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** and potential carriageway widening works, vegetation clearance and street furniture removal at the locations identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** to accommodate construction vehicles (including Abnormal Indivisible Loads). Further measures relevant to the control and management of impacts during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. These Plans are secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). Cumulative effects are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** which includes consideration of Sizewell C.

Table 1.34 Suffolk Resilience Forum

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	Please see attached response to the Sea Link Consultation from the Suffolk Resilience Forum The SRF held a virtual meeting on Wednesday 29th November 2023 to consider the consultation documents and determine the risks to Suffolk in line with the national and community risk registers. This process allows any agency (Environment Agency (EA), emergency services, including Police Counter Terrorism Security Advisors (CTSA's) and local authority emergency planners) to highlight issues or concerns within the competence of the organisation over the development of the site, although they will not state the development is safe or that any risk mitigation measures, are adequate.	N	National Grid acknowledges this feedback.
		Water environment, climate change, safety	In considering the proposed project it is the opinion of the SRF that on viewing the Consultation pack and relevant legislation the following aspects should be considered by the National Grid's Project delivery team • Flood. There is no information in the documentation explaining what flood mitigation provisions are envisaged. All sources of flood risk need to be considered as part of the project and, in particular, the site selection and options for the routing of the cable corridors. This decision making needs to include consideration of the current and future impacts of climate change. Plans also need to consider the risks associated with the construction phases of the project and safety of the workforce and local communities.	N	**Application Document 6.8 Flood Risk Assessment** assesses all relevant sources of flood risk to and arising from the Proposed Project during its construction and operation. The assessment includes consideration of the effects of climate change on flood risk over the Proposed Project lifetime, in accordance with current best practice guidance and describes the measures proposed to mitigate the risks of flooding for the Proposed Project, local communities and surrounding existing infrastructure. Decisions behind the detailed routing and siting of Proposed Project components are provided in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 8.1 Corridor Preliminary Routeing and Substation siting Study (October 2022) and Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**.
		Geology and hydrogeology	• Coastal Erosion. There is no information on the implications for coastal erosion, particularly the vulnerable areas around Aldeburgh and Thorpeness.	N	Beach and seabed profile data is included within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Physical Environment** for both landfalls, with analysis of coastal recession/accretion rates. Coastal nearshore sediment cells and sediment transport pathways (and associated hydrodynamics) are considered within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Physical Environment** and identified via maps/figures. The impact assessment included within **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Physical Environment** considers the potential implications relating to coastal erosion for each phase of the Proposed Project. This assessment concludes there will be no significant adverse effects associated with physical processes effects resulting from the Proposed Project. Mitigation including embedded measures such as sensitive routeing and siting of infrastructure are integral in reducing the physical processes effects of the Proposed Project, with further commitments made within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Traffic and transport, consultation, coordination with other projects	• Traffic Management. There is no information in the documents provided on traffic management and the impacts to the road infrastructure and community during construction. All works and traffic movement will require close coordination with Suffolk Highways to mitigate the impacts on the community and cooperation with other significant national infrastructure projects, including Sizewell C.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** has been updated to include details on Temporary Traffic Management (TTM) where this is known at the time of DCO submission, as well as any improvements to road infrastructure to accommodate construction vehicles. Further details of TTM will become available once a contractor is appointed and a Detailed Construction Traffic Management and Travel Plan is prepared post-consent. The mitigation identified within the aforementioned document has been reviewed in consultation with Suffolk County Council. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. National Grid is maintaining ongoing dialogue with Sizewell C and other developers in the area to coordinate works and will continue to do so as all parties construction programmes become clearer. Opportunities to further mitigate the impact of construction traffic will be considered including the potential of sharing facilities such as park and rides. Cumulative effects are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** which includes consideration of Sizewell C.
		Coordination with other projects, traffic and transport, safety	• Sizewell B. The response to an Off-Site Nuclear Emergency (OSNE) at Sizewell B must be considered and suitable plans developed to ensure that the B1119 Saxmundham Road can be used by the emergency services at all times. • Security systems. (Highlighted by CTSA's) - Integrated built in security systems are included.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the B1119 Saxmundham Road, which will remain open to the emergency services at all times. Access from the B1119 uses existing accesses only, works within the B1119 will be limited to new utility connections, environmental mitigation works along the B1119 will be undertaken off line from the carriageway of the B1119 including the planting of a new hedgerow. National Grid is maintaining ongoing dialogue with EDF regarding the relationship between the Proposed Project and Sizewell C.

Table 1.35 Thanet OFTO

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Legislation and policy, offshore route location, onshore route location	I am writing to you in my capacity as a director of the Thanet OFTO Limited. Thanet OFTO Limited ('the OFTO') is in receipt of a notification of the above consultation which runs from 24 October to 18 December 2023. In response to the consultation the OFTO would like to make you aware that the proposed cable route for the Sea Link project appears to show the SE Link cables crossing the OFTO's two 132kV export cables at two locations, one offshore and one onshore. The OFTO expects that the parties (the OFTO and Sea Link / NGET) will need to be put in place formal Crossing Agreements to document the requirements for construction of the crossings and ongoing operation of OFTO and Sea Link cables. The OFTO would urge Sea Link to ensure that the Crossing Agreements are drafted and accepted by the parties well in advance of construction starting. The OFTO's experience with other Crossing Agreements indicate it will take at least 12 months to put such an agreement in place. The OFTO has previously written to Sea Link's consultants, Mott Macdonald (MM), to provide initial views on the Sea Link project. Please find attached a copy of the letter that the OFTO sent to MM, dated 20 March 2023. Please can you acknowledge receipt of this e-mail. Please do not hesitate to contact me should you require any further information about the Thanet OFTO.	N	National Grid welcomes these comments from the respondent and is progressing discussions regarding a Crossing Agreement.
Onshore route location, offshore route location, consultation			Sea Link - Stakeholder Engagement Thanet OFTO Thank you for your e-mail dated 13 March 2023 and the attached document, SEA Link on-shore HVDC cable link – Tender and DCO Interface with Thanet OFTO ('the document'). The Thanet OFTO Limited ('the OFTO') provides in this letter a response to the questions raised under section 2.3 in the document. The Mott Macdonald question is shown in bold font followed by the OFTO's response in regular font. **1) Seek confirmation that all affected assets have been identified (and undertake additional review of further assets where required). Currently one crossing point identified.** The document only shows the onshore section of the route. The OFTO has seen a plan from National Grid (see attachment 1) which shows the Sea Link cables crossing the OFTO's export cables offshore. Figure 2.1 in the document shows the OFTO's 132kV export cables located within the boundary of Sandwich Road, this aligns	N	National Grid welcomes these comments from the respondent and is progressing discussions regarding a Crossing Agreement.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			with the OFTO's cable records provided by the developer dated 15/09/08 – see attachment 2.		
		Onshore route location, offshore route location, design	**2) Confirm that the crossing location is acceptable in principle and obtain information relating to any constraints in the near vicinity that would prevent moving the crossing from its current positions.** In principle the OFTO has no objection to the onshore crossing location shown in Figure 2.1 in the document, however in order to confirm acceptance of this or any other crossing location the OFTO would request a detailed proposal describing how the crossing is to be installed below the OFTO's cables and what precautions will be taken to avoid damaging the OFTO's cables and confirmation that the OFTO will be compensated in full for repair of damage and loss of revenue should the OFTO's cables be damaged; these details would normally be contained within a bespoke crossing agreement. The OFTO would add that it is for National Grid (not the OFTO) to obtain the necessary permissions from the landowner(s), and / or any other relevant parties, for installation of the Sea Link cables below the OFTO's cables.	N	National Grid acknowledges this feedback. National Grid is progressing discussions regarding a Crossing Agreement which will clarify the approach towards addressing the matters outlined.
		Design, onshore route location	**3) Confirm cover to existing buried infrastructure (based on record data or scoping of surveys).** The construction records provided by the developer to the OFTO show that the OFTO's 132kV export cables are buried at depth of 1270mm from the top of the tarmac road to the bottom of the cable duct – see attachment 3, Trench Sections 134 - 481. There are three single core 132kV cables and one fibre optic cable per each of the two export circuits. The single core cables are each installed in a 160mm diameter duct and the fibre optic cable is installed in 96mm duct.	N	National Grid acknowledges this feedback. National Grid is maintaining dialogue with the stakeholder which will clarify the approach towards addressing the matters outlined.
		Design, onshore route location	**4) Identify requirements (if any) for protection, diversion or undergrounding of existing infrastructure at each cable crossing point.** Prior to entering into agreement with National Grid for the Sea Link cables to cross under the OFTO's cables, the OFTO would expect, as a minimum, to be provided with the information describe in 2 above. The OFTO would expect there to be at least 1m of vertical separation between the OFTO's cables and the uppermost point of the Sea Link cable ducts, assuming that these will be crossing under the OFTO's cables.	N	National Grid acknowledges this feedback. National Grid is maintaining dialogue with the stakeholder which will clarify the approach towards addressing the matters outlined.
		Design, onshore route location	**5) Determine any changes to the cable alignments that may be required as a result of the proposed interface with Thanet OFTO assets.**	N	National Grid acknowledges this feedback. National Grid is maintaining dialogue with the stakeholder which, amongst other issues, includes a crossing agreement.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			At this time the OFTO has no objection to the proposed alignment of the Sea Link cable ducts with respect to the OFTO's cables as shown in Figure 2.1 in the document. The point of contact for all enquiries related to the Thanet OFTO Limited should, in the first instance, be addressed to: [redacted - see original copy] The information provided above is provided in good faith and the OFTO reserves its position to provide further comments on the Sea Link crossing proposal as the project develops.		

Table 1.36 The Coal Authority

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case and consultation	Thank you for your notification of 19 October 2023 seeking the views of the Coal Authority on the above. I have checked the site location plan against our coal mining information and can confirm that, whilst the proposed development site falls within the coalfield, it is located outside the Development High Risk Area as defined by the Coal Authority. On this basis, the Planning team at the Coal Authority have no comments to make. Please do not hesitate to contact us if you would like to discuss this matter further.	N	National Grid acknowledges this feedback.

Table 1.1 Aldeburgh Town Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case, alternative solutions, coordination with other projects	Aldeburgh Town Council's response to SeaLink statutory consultation Aldeburgh Town Council's interest in the SeaLink project is as a landowner, and representative body for our residents, visitors, businesses, groups and organisations. ATC is supportive of wind generated renewable energy however it remains strongly opposed to these proposals to provide a network upgrade via an interconnector to/from Kent. We remain opposed to the proposed locations for each the onshore infrastructure believing that other solutions exist where the energy generated off our coast would be connected out at sea and/or use made of UK brownfield sites closer to where the power is needed. These options are more sustainable and would avoid highly damaging impacts. We also do not support co-location here of up to three projects due to potential increased frequency and/or magnitude of harm. ATC request an immediate pause and urgent review be undertaken of this project, along with all other proposed energy projects and consented energy NSIP (Nationally Strategic Infrastructure Projects) DCOs (Development Consent Orders).	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure for the Proposed Project whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. As such, where there is a need for mitigation measures to ensure the conservation of sensitive ecological receptors the Environmental Impact Assessment (EIA) process has identified opportunities to enhance biodiversity interests and these are reported in the **Application Document 7.1 Planning Statement** and **Application Document 6.12 Biodiversity Net Gain Feasibility Report** submitted with the application for development consent. Furthermore, the Proposed Project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. The rationale behind colocation is to reduce the impact of up to three converter stations located in this area, resulting in more significant impacts to the Area of Outstanding Natural Beauty (AONB) and other sensitive receptors. Further details are contained in **Application**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects. It is a condition of National Grid's license to deliver the Proposed Project following OFGEM's decision to award the Accelerated Strategic Transmission Investment (ASTI) suite of projects by 2030. Any decision to change the Proposed Project delivery timescales now sits outside of National Grid. National Grid has taken account of local planning policy in its development of the Proposed Project and an appraisal of important and relevant planning policy is set out within **Application Document 7.1 Planning Statement**. Whilst the second paragraph of the comment noted in this row would be correct of planning applications to be decided under the Town and Country Planning Act 1990, the position is different for DCO applications under the Planning Act 2008. Under Section 104 of the Planning Act 2008, the Secretary of State is required to decide the application having regard to, amongst other things, any relevant national policy statement. The Secretary of State may also have regard to local planning policy if they consider it to be important and relevant to its decision. Regarding local planning policy, Paragraph 4.1.12 of NPS EN-1 states: "*Other matters that the Secretary of State may consider both important and relevant to their decision-making may include Development Plan documents or other documents in the Local Development Framework*." Regarding emerging Development Plan Documents, paragraph 4.1.13 of NPS EN-1 states: "*Where the project conflicts with a proposal in a draft Development Plan, the Secretary of State should take account of the stage which the Development Plan document in England or Local Development Plan in Wales has reached in deciding what weight to give to the plan for the purposes of determining the planning significance of what is replaced, prevented, or precluded*." Paragraph 4.1.15 of NPS EN-1 clarifies that where there is a conflict between local policy documents and a NPS, the NPS prevails for the purpose of Secretary of State decision making given the national significance of the infrastructure.
		Inter-project cumulative effects	**Specifically** The cumulative impact with other projects (both energy and general construction) has not been fully considered.	N	The cumulative effects assessment has been developed since publication of the Preliminary Environmental Information Report as part of Statutory consultation. A full inter-project and intra-project effects assessment has been carried out for the Proposed Project. For the Suffolk Onshore Scheme, the full assessment is available within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. For the Offshore

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Scheme, the full assessment is available within **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
		Socio-economic, recreation and tourism	This is a rural area, and 'the Heritage Coast' where our economy is dependent on year-round tourism which would be negatively impacted by noise, dust, vibration & light pollution. In the PIER these have been rated as 'not significant' which we contest.	N	National Grid acknowledges this feedback. A complete assessment of health and wellbeing effects has been undertaken available within **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. Amenity effects arising as a result of changes to air quality, noise, vibration, visuals, tourism and transport are set out and assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The assessment concludes that there are no anticipated significant effects as a result of the Proposed Project.
		Traffic and transport	The very limited road infrastructure in and out of the area does not have the capacity/ suitability for the volumes of heavy vehicles needed to support the construction elements. The area is constrained to the east by the North Sea and the South by the River Alde.	N	**Application Document 6.2.2.7 Part 2 Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during any phase is not expected to result in any significant impacts on the surrounding highway network with the mitigation in place. Mitigation has been identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**, secured by Requirement 6 of Schedule 3 the draft DCO (**Application Document 3.1**). Mitigation within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** includes but is not limited to the following: • Construction staff will be made aware of sustainable travel information including maps of walking and cycling routes and links with public transport. • HGV arrival and departure times will be managed to minimise the number of HGVs travelling to the Site during the network peak hours for the local highway network; identified within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. • Staff movements will be managed through: ○ limited car parking; ○ car sharing; ○ walking and cycling; ○ public transport information; ○ staff arrival and departure times; and • a minibus service transferring staff across site.
		Offshore route locations, landfall location, onshore environmental impact	The route from out at sea to the Landfall is proposed to pass under the RSPB reserve North Warren (this SSSI/AONB land – now renamed 'Suffolk and Essex Coast & Heaths National Landscape between Aldeburgh & Thorpeness which should receive the highest protection.	N	National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding this crossing and the high importance of the RSPB reserve is noted. This is a major reason why the reserve would be traversed using trenchless methods as committed to throughout **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, secured by

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Requirement 6 of Schedule 3 the draft DCO (**Application Document 3.1**).
		Needs case, design, alternative solutions	The method proposed for drilling under the marshland at North Warren is not fully costed or technologically proven to be possible here and we believe other potential (and brown field) sites without protected marshland have not been fully evaluated. If there is no capacity to take the energy onto the high voltage grid, the power from other projects (such as windfarms and the Sizewell Group) should not be sent to and then from the proposed substation at Friston and then out to Kent via SeaLink or to Suffolk from Kent. The original NG offer to connect here should be rejected along with the current plans (approved but subject to JR) to construct a substation at Friston.	N	An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. Information is contained in Appendix A of **Application Document 7.3 Design Development Report**. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. The needs case for the Proposed Project has identified that a connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. As set out in the needs case, the Proposed Project will send power either from Suffolk to Kent or from Kent to Suffolk depending on system conditions and faults that occur in either Suffolk or Kent. Therefore, power is not being sent in one direction all the time and therefore locating generation elsewhere in the system would not solve the entire needs case. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Socio-economic, recreation and tourism, traffic and transport, alternative solutions	There will not be the accommodation available for workers, and rat running/parking will destroy adjacent villages. This project is ill-conceived and misguided when other solutions exist where the energy generated off our coast can	N	National Grid will consider ways of minimising the impacts of an influx of workers during the construction phase of the Proposed Project. Potential measures may include car sharing and it is noted that Sizewell C is looking to utilise a park and ride scheme. Nonetheless, **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			be connected out at sea to other countries in EU or to areas of the UK where the power is most needed.		the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within **Application Document 7.5.7.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Assessment of accommodation needs for construction workers has been undertaken within the ES. In a worst-case scenario where all 327 peak workers need accommodation, there is still approximately 18.9% spare capacity within a 60-minute drive from the Suffolk Onshore Scheme at peak occupancy (July). There would still be 1,331 remaining rooms within a 60-minute drive time radius from the Suffolk Onshore Scheme. It is anticipated that accommodation providers would be able to accommodate employees working on the Suffolk Onshore Scheme without any adverse effects on the sector. This would lead to a **negligible effect**, which is not considered significant. The assessment of effects on tourism and recreation assets is included within **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. It is concluded that there are no anticipated significant socio-economic effects. The existing high voltage electricity network in East Anglia does not have the capability needed to reliably and securely transport all the energy that will be connected while meeting the Security and Quality of Supply Standard and therefore several network reinforcement projects are planned to address the shortfall of which the Proposed Project is one. In addition, by connecting the Proposed Project into the transmission system at the proposed Friston Substation it also reinforces the Bramford-Sizewell radial circuits, which are due to carry additional power from offshore wind, new nuclear and interconnectors, so offering additional constraint savings to the consumer. Further details are set out in **Application Document 6.2.1.1 Part 1 Introduction Chapter 1 Introduction** and **Application Document 7.1 Planning Statement**.
		Socio-economic, recreation and tourism, landscape and visual, terrestrial ecology	**Background** Aldeburgh is a small town situated on the Suffolk Heritage Coast between Lowestoft and Felixstowe, accessed by one single carriageway road the A12. The town and surrounding area lie within the Suffolk Coast and Heaths AONB (now known as Suffolk and Essex Coast & Heaths National Landscapes) with other areas of special interest (RAMSAR, SSSIs) and is constrained by RSPB owned and maintained marshland to the north and the River Alde (RAMSAR, SSI site 692) to the south and the North Sea to the east. There are only three minor 'B' roads into/out of the town from the direction of Thorpeness, Aldringham/Leiston, and Knodishall/Snape/Friston. Over many years it has developed into a well-known, all-year-round 'destination' town, heavily associated with the arts, music, historic and cultural heritage of the area, and its economy relies on tourism, leisure and retail following the	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			demise of the raditional fishing, boatbuilding and brickmaking industries. This economic uplift also benefits the surrounding villages and towns and provides extensive employment. The town attracts many day and longer-stay visitors through the year and its regular population of just over 3,000 regularly increases to well over 15,000. Recent footfall reports by East Suffolk Council state over 1M visits per year. The town has recently gained another hotel/restaurant to add to the existing provision of three large hotels and several estaurants, cafes, bed and breakfast, Airbnb and thriving holiday let businesses. There are many major festivals (documentary, literary, poetry, theatre) throughout the year, as well as the internationally important Aldeburgh Festival now at nearby Snape Maltings. Aldeburgh is known as the home of British composer Benjamin Britten, Britain's first female doctor and mayor Elizabeth Garrett Anderson. EM Forster, Susan Hill, Laurens van de Post and many other famous authors have written of the inspiration of the town. Facilities include a Community Hospital, GP surgery, Lifeboat & Coastguard service, Fire Brigade house, Library, Primary school, two award-winning Golf courses, two yacht/sailing clubs, several community halls and entertainment/performance spaces, and a vibrant High Street, with an independent Cinema, bookshops, pharmacy, and variety of retail outlets (boutique & chain). Aldeburgh has a long, attractive but narrow shingle beach, with a Martello tower and a range of protected and unique flora and fauna. It also has the Garrett Anderson Era conservation area, with many important architectural buildings, the church of St Peter & St Paul, the Church of our Lady & St Peter, a Baptist Chapel, and a Grade I Moot Hall once the seat of local government, which is still used for council meetings and now hosts the town's museum. Public amenities include two large sports fields, two children's play areas, a large area of allotments, tennis courts and bowls pitches		
		Needs case	**Further evidence of specific concerns** NGV claim this project will enable the UK to meet zero carbon targets, yet driver appears to be cost and the failure of investment into the existing grid to enable the excess energy to be created off the east coast to be transmitted to where it is needed in the South of England.	N	The Proposed Project is part of National Grid's Great Grid Upgrade programme, which comprises 17 major infrastructure projects that will both scale up the grid and update their existing networks. Over 80% of UK electricity demand is outside of London, therefore it is vital that new infrastructure is provided for the whole country and the electricity generated is distributed accordingly. Alongside the Proposed Project, the Great Grid Upgrade includes proposals for infrastructure all over the country, including a new high voltage transmission line between East Yorkshire and Nottinghamshire and an overhead line in Lincolnshire. The Proposed Project and the reinforcements within East Anglia are part of the National Grid. The grid operates by sending power to where it is needed from where it is generated. Therefore, the power will not

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					necessarily flow to London but could flow anywhere in the country. Power generated in the North Sea and along the east coast will be used in cities, towns and villages across the country. National Grid has a license condition to maintain the network for the generation and demand required and agrees with OFGEM, the regulator, the spend to ensure the network is fit for the future. The new generation and interconnectors connecting both in Suffolk and Kent are driving the need for additional infrastructure. Prior to their applications and subsequent connection in the future there was no requirement for additional infrastructure in these areas. Therefore, additional infrastructure would have been unnecessary ahead of need.
		Coordination with other projects, alternative solutions, combined effect of the proposed project	We do not understand why Central Government and NG would now advocate that SeaLink and up to two other projects should coordination here rather than onto brownfield sites or via an off-shore grid system? The level of destruction and damage to our tourism industry, environment/wildlife is too high a price to pay, especially with brown field sites available. We understand that supply chain issues (including for HV cables and HV circuit breakers) mean that some target deadlines would not be met if an off-shore grid connection was progressed, but believe this would be of more significant benefit as it would enable other projects to connect and target for 2030 still to be met.	N	While the comments stating a preference for use of previously developed land are acknowledged, it remains imperative that alternative options address the overarching needs case for the Proposed Project by providing additional network capacity where it is needed. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure whether singly located or colocated. The criteria for the selected areas of search including the size of the site are explained in **Application Document 8.1 Corridor Preliminary Routing and Substation Siting Study (October 2022)**. National Grid's plans in Suffolk have been developed for the Proposed Project as a standalone project but have been designed in a coordinated way with other projects, including two potential NGV projects. As development work on the Proposed Project and these other projects has progressed, National Grid's approach to coordination has evolved. A key part of its coordination strategy is to continue to explore opportunities to co-locate infrastructure where feasible and beneficial. At Statutory consultation, National Grid presented a design which showed the NGV works themselves at the landfall and along the cable sections. It also included the entire wider site at Saxmundham, to show how they could be flexible if constructing around one or two additional converter stations. This assumed a scenario where the NGV projects, whose routeing and siting work is at an earlier stage, identified the same cable and converter station sites as the Proposed Project. In March 2024, NGV's LionLink project announced that it had down selected its potential landfall at Aldeburgh and would be removing it from the LionLink proposals. LionLink is still proposing to co-locate its converter station alongside the Proposed Project's near Saxmundham. As National Grid's design work and their engagement with the NGV projects has progressed, they have evolved their approach to coordinating with NGV. They are considering further ways that they could coordinate their construction activities and other projects and developers, including NGV, EDF Energy and SPR. As the Proposed Project has developed, National Grid has rigorously assessed the impact on designated sites and the wider environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring,

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					and offsetting impacts. In addition, the Proposed Project in the format of this consultation is considered to be deliverable by 2030. In addition, a fully offshore grid does not represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Even with the provision of offshore converter stations and substation(s), onshore infrastructure would still be needed to transmit to the onshore national electricity network. Cables would still need to run onshore from an offshore grid and onshore converter stations would still be needed to convert the electricity from direct to alternate current, along with a substation to transform electricity into the required voltages. National Grid are working with all of the relevant suppliers in the HVDC supply chain to use the most up-to-date technology for all of their projects. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Furthermore, coordination of all proposed transmission infrastructure seeking to make landfall on the East Anglian coast is not feasible due to each project being promoted by different companies, with different project teams covering several different geographical locations and on different timelines for delivery. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design Development Report and Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 (Strategic Options Report 2023)**.
		Onshore route location, design, needs case	The assumption to connect to a substation in the ‘Leiston area; or ‘Friston’ is flawed. This is still subject to JR and was consented only on the basis of SPR EA1N and EA2, the cumulative impact of additional projects was not included. There are issues outstanding with this project including flood risk which has increased recently. ATC wish to challenge how NG ESO can make a connection point offer to another part of NG NGV when the truth is overhead powerlines cannot take the capacity generated (due to lack of ongoing investment and planning by NGET) and an additional interconnector is now needed to take the power back out to sea and down south to Kent/London (SeaLink). Surely this proves it is a false offer, and should have been rejected. When the appraisal was completed the extent of the problems with pylons was not understood. We would request you reconsider this project as it	N	ScottishPower Renewables (SPR) East Anglia One North and East Anglia Two offshore windfarms both secured development consent for the proposed new substation at Friston. The Court of Appeal has rejected the appeal from local campaign groups against the decision, stating that the developer did not need to show that there were no other areas with a lower risk of surface water flooding where the development could take place, while also stating that there was insufficient information about the other projects in order to make a cumulative impact assessment. In complying with its statutory duties and fulfilling connection agreements (including the proposed connection of the Proposed Project to this substation), National Grid will seek to limit disruption to the local community where practicable and ensure that development does not exacerbate any identified existing issues.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			is not deliverable as originally planned (to connect to the KV lines)		National Grid has no control over the connection offer process. This was carried out previously by the National Grid Electrical System Operator and is now carried out by the National Electrical System Operator. There are no known issues regarding the connection points for the Proposed Project. Due to the extent and linear nature of the Proposed Project, some parts of the Project must necessarily be located in areas with a medium or high likelihood of flooding from rivers and surface water. The Flood Risk Assessment (**Application Document 6.8 Flood Risk Assessment)** demonstrated that with a range of control measures in place, including construction and operational drainage and watercourse crossing designs, the residual risk of flooding would be low and flood risk to neighbouring land would not be increased.
		Socio-economic, recreation and tourism, health and wellbeing	Claims that this project will be good value for consumers is false. It will not be financially viable because of the high level of compensation and mitigation required to resolve the harm caused. During the consultation stages local people have already suffered blight on their house value, and stress from approaches from the developer even before the DCO stage. Research indicates that other business development in the area has halted also as a result just due to speculation.	N	The Government and the Regulator (Ofgem) expect National Grid to find a balance when developing proposals, taking account of the duties set out in the Electricity Act 1989 to be efficient, coordinated and economical and to have regard to the desirability of preserving amenity. When looking at the costs of a new connection, National Grid is guided by the laws, policies and regulations that have been set by Government on behalf of electricity consumers and society. National Grid is required through those to balance affordability to the electricity bill payer with the impact of the proposals on the environment. National Grid considers that the Proposed Project strikes an appropriate balance in the context of national policy and National Grid's statutory duties, which include the need to be economic and efficient. It is for the Government, through the planning process, to confirm whether this balance is right. National Grid recognises that the development, construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on people's mental health, recognising the impact that other projects may have had upon local residents. Throughout the development phase of the Proposed Project it therefore tried to clearly communicate the proposals, including through the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid has sought to provide certainty on the plans wherever possible. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.
		Combined effect of the proposed project, walking, cycling and horse-riders, socio-	Reputational damage to the area from traffic congestion and increased movements, light pollution, dust, noise, vibration and disruption to wildlife will be significantly damaging, especially set against our benchmark our dark skies, quiet lanes and extremely peaceful tranquillity. Proposed drilling and	N	The variety of environmental impacts that are set out in this feedback are captured and assessed within the ES which supports the DCO application.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		economic, recreation and tourism	trenching would lead to closures of footpaths heavily used by tourists and residents year-round, and you are unable to confirm the technical feasibility of detailed methods so the level of harm is also unknown/uncertain.		An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. Details are contained in Appendix A of **Application Document 7.3 Design Development Report**. The following chapters deal with the issues raised: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**; • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**; • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**; • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality; and** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Please note that effects on the landscape character as a result of the Suffolk Onshore Scheme have been assessed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This assessment includes reference to changes to key characteristics of the landscape which are integral to its distinctive character, changes to aesthetic or perceptual aspects of the landscape altered either by removal of existing components of the landscape or by the addition of new components and the contribution of lost landscape elements to the character of the landscape. For details relating to the construction methodology and Proposed Project design that have been used to inform the assessments contained within the ES. Further details are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Consultation, DCO process, design	**Quality of consultation** Town and Parish councils are not provided with any additional resources to study and respond to consultations or to engage in the NSIP process, however we have done so because this is so important. Our experience of the consultation was that it was inadequate at best and deliberately vague at worst. Documentation and webinars lacked detail, (how drilling will be possible under fragile marshes for long lengths where HDD may not be possible and the public exhibition days which were attended by record numbers included inaccurate maps (historic features and listed buildings missing) and misleading information (not being honest about the total hectares required or location of the SSSI/AONB) and were sadly staffed by individuals who were not always able to answer questions.	N	Respondents to the consultation are welcome to use the feedback form to help steer their responses or to structure their own narrative as they see fit. The questions on the response form are intended to cover as much of the project detail and background as is possible. While the complexity of the Proposed Project is recognised, National Grid has endeavoured to provide accessible information that explains the detail and the rationale behind the Proposed Project. Furthermore, the Statutory consultation programme offered meetings in a range of formats that gave individuals and community groups the opportunity to explore and develop their understanding of matters of concern. National Grid acknowledges the criticisms of the consultation materials. National Grid has carefully considered all feedback submitted in response to its pre-application public consultations when developing its plans. Throughout the development of the proposals, it has sought to show how feedback has informed the development of the plans. For

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Consultations should be hosted not by Developers but by independent bodies. Stating you have listened to our feedback at previous stages and then to carry on with the same plans you put forward in previous stages is disingenuous. The level of trust that our community has in the potential development and the developer is extremely low, because you have not demonstrated real regard to our concerns or to the protected internationally important habitats, or our impacted community. The PEIR states impacts are "not significant" and this is false, considering the background levels and thresholds of harm. ATC objects to your consultation feedback form. Asking respondents to answer general statements is not effective consultation and is misleading. Of course, everyone will say they agree that delivering net zero should be a priority, and that the UK needs to improve its energy security, and we should keep energy prices down - but this project specifically in these locations will not be the only way to achieve this. We believe you are attempting to gain support for the project falsely.		example, the Project Overview Document published as part of the Statutory consultation specifically addresses how feedback had informed changes to its plans, whilst the Non-Statutory Consultation Report considers in further detail feedback received to the Non-statutory consultation. **Application Document 5.1 Consultation Report** provides a detailed analysis of feedback received to National Grid's pre-application public consultations on the Proposed Project, along with how this feedback informed the development of its plans. A consultation summary report of the Non-statutory consultation was produced and details of that consultation and the feedback received is set out in Section 5 of **Application Document 5.1 Consultation Report**, this report. The documentation published for Statutory consultation outlines the changes made to the Proposed Project since Non-statutory consultation, while National Grid's publicly documented needs case explains the requirements for the Proposed Project to reinforce the network between the Sizewell area and the Kent area. The PEIR is intended to give consultees an understanding of the potential likely significant effects to enable them to prepare well informed responses to the Statutory consultation. All conclusions and assessments are by their nature preliminary and are based on the Proposed Project design and assumptions described within the PEIR. This PEIR identifies which effects may be potentially significant. These potential effects will be taken forward as part of the EIA and additional mitigation may be identified as the design develops further. Therefore, likely significant effects provisionally identified at this preliminary stage may later be found to be not significant following completion of the mitigation strategy when reported in the ES.
		Consultation, coordination with other projects, community benefits/enhancements	ATC is very concerned that you have introduced the idea of potential co-location which does not reduce footprint and only coordinates potential siting or timelines. This would mean either more disruption to the same area over a longer time frame or of a greater magnitude for a shorter time frame, which neither is preferred. It is natural that respondents would favour some co-location and will answer this question without understanding the negative impact this will have. This is misleading, unfair, divisive and harms community cohesion. We are aware of the OCSS proposal to co-locate the Northfalls and Five Estuaries wind-farm projects here with SeaLink which we reject. There was no information on benefits to communities, residents or visitors for hosting onshore infrastructure, in addition to the cost of mitigation/compensation.	N	Project coordination, including colocation of infrastructure, is encouraged through the National Policy Statements that underpin the primary legislation that provides the framework for decision-making on DCO applications. National Grid's plans in Suffolk have been developed for the Proposed Project as a standalone project but have been designed in a coordinated way with other projects, including two potential NGV projects. As development work on the Proposed Project and these other projects has progressed, National Grid's approach to coordination has evolved. A key part of its coordination strategy is to continue to explore opportunities to co-locate infrastructure where feasible and beneficial. At Statutory consultation, National Grid presented a design which showed the NGV works themselves at the landfall and along the cable sections. It also included the entire wider site at Saxmundham, to show how they could be flexible if constructing around one or two additional converter stations. This assumed a scenario where the NGV projects, whose routeing and siting work is at an earlier stage, identified the same cable and converter station sites as the Proposed Project. In March 2024, NGV's LionLink project announced that it had down selected its potential landfall at Aldeburgh and would be removing it from the LionLink proposals. LionLink is still proposing to co-locate its converter station alongside the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Proposed Project's near Saxmundham. As National Grid's design work and their engagement with the NGV projects has progressed, they have evolved their approach to coordinating with NGV. They are considering further ways that they could coordinate their construction activities and other projects and developers, including NGV, EDF Energy and SPR. Further details are contained in **Application Document 7.10 Coordination Document**. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routeing and Substation siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 (Strategic Options Report 2023)**. The assessment of inter-cumulative effects with these other proposed developments is also considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. National Grid welcomes the ongoing Government review of community benefit options associated with transmission infrastructure. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. National Grid is committed to creating a positive impact in communities through infrastructure projects, emphasising social responsibility and equity via our Community Benefit Plan that aims to provide social, economic, and environmental benefits to local communities, ensuring they leave behind a positive legacy. National Grid Electricity Transmission plc (National Grid) Community Benefit Plan aligns with National Grid's Responsible Business Charter, emphasising impact in environment, communities, people, economy, and governance, shaping their strategic priorities with a focus on responsibility.
		Alternative solutions	**Conclusion** We respectfully request that NGV consider a much broader and more creative approach to landfall sites, cable runs, convertor sites and sub-station construction than its current set of proposals, which all fall within and/or threaten green field, AONB, SSSI protected reserve locations. Either brown field or offshore connecter stations should be used along with an offshore grid option. We understand the you do not like to choose brownfield sites as they are often more constrained by structures which causes additional cost and time delays - but we would encourage you to look at the wider longer-term gains if you did locate onto a brown field site further north or south, and/or developed offshore hub/grid options. ATC believes that NGV has not	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure for the Proposed alone. Further details on how the design has evolved and the consideration of alternatives are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023), Application Document 8.3 Strategic Options Report October (2023) and Application Document 7.2 Strategic Options Back Check Report**. Alternative options, such as an offshore grid do not represent a feasible solution to the network reinforcement that the Proposed Project is

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			properly considered alternative sites away from the Suffolk coast. Building large-scale industrial buildings in rural villages/hamlets should be avoided. Many millions of public and private investments have created this as a year-round 'destination' and protected its wildlife, dark skies and tranquillity. The Suffolk Heritage coast is a unique and delicate coastal environment, with a truly special biodiversity that justifies the highest levels of protection in planning legislation. Only in exceptional circumstances should an area with internationally important protected designations be used, and this is not justified.		seeking to provide. As part of the DCO submission, National Grid has prepared **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. Lighting impacts are included within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. The Suffolk Heritage Coast is considered to be of very high landscape value within **Application Document 6.3.2.1.B ES Appendix 2.1.B Landscape Baseline** due to its recognition for heritage value. The effect of the Proposed Project on the Suffolk Heritage Coast is assessed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** considered to be minor adverse (not significant) at construction and year 1 of operation and a negligible adverse (not significant) effect at year 15 of operation.

Table 1.2 Benhall & Sternfield Parish Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	**Introduction** Whilst the consultation acknowledges that the proposals will impact on communities and mitigation will be necessary, it was disturbing to find out during the exhibitions that some of National Grid Sea Link's (NGSL) representatives had either not heard of Benhall or Sternfield, or had no idea of the nature of the communities. Therefore, the Parish Council (PC) would like to start this response with an introduction to Benhall and Sternfield. The villages of Benhall and Sternfield lie immediately south of Saxmundham, and whilst, historically, were two separate villages, today operate with a joint Parish Council, whilst still retaining their individual characters. Benhall is the larger village, and straddles the A12. The current line of the A12 was opened in 1987, and was designed to relieve Benhall, Saxmundham and Kelsale of through traffic, particularly HGVs. The original settlement was to the west of the A12, but more recently has developed to the east, and is known as Benhall Green. The housing is quite diverse, with a high percentage of social housing and very few large houses, giving a balanced community. Facilities include a primary school, community hall, and a large and much used village green, which is also used by the primary school for outdoor teaching in the summer. The principal access to Benhall Green is from the former A12, now B1121, Main Road. The most recent housing accesses directly onto Main Road, and this development is soon to be expanded by a further 40 – 50 houses. Sternfield is the smaller village. Most of the housing is along the B1121, Church Hill and The Street, and along Sandy Lane, linking to Benhall Green. It is classified as countryside, and as such has little recent housing. Of the more scattered housing, it is worth noting that Hill Farm House (sold away from Hill Farm), is only 250m from the indicative location of the proposed converter station. Some years ago, improvements to the B1121 through Sternfield were curtailed to avoid demolition of listed buildings, leaving the length to the east of Start Farm, The Street, more akin to a country lane. There are two significant agricultural holdings at Hill Farm and Redhouse Farm, both accessed from the B1121 at Baldry's Corner, that generate a significant amount of HGV movements. The former operates as a produce chilling and packing station for seven months a year, and the latter is mostly arable, but also has four large duck rearing sheds (mistakenly identified by one of NGSL's representatives as an	N	National Grid acknowledges this feedback. Thank you for providing the additional information in relation to Benhall and Sternfield. The assessment in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality** shows there would be no significant impacts on the highway network in terms of air quality. The portion of the B1121 in the vicinity of Start Farm, Church Hill and The Street within Sternfield will not experience HGV construction traffic as vehicles will instead use the B1121 Main Road to the south of Saxmundham. The proposed routing and access arrangements are identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			industrial estate), as well as some farm diversification. Recent development at these holdings have shown the inability of the B1121 east of Start Farm to cope with HGVs, in terms of inability to pass other traffic, and consequential damage to the highway.		
		Consultation, alternative solutions, coordination with other projects	**Overarching consideration of proposal** The PC contends that the consultation documents fail to produce a convincing argument for not developing off shore infrastructure, to limit on shore works. Countries on the other side of the North Sea consider off shore infrastructure as the environmentally and socially acceptable way to proceed. It is appreciated that the four divisions of National Grid are separate legal identities, but despite assurances to the contrary, this appears to be a restriction to full coordination. Submitting separate applications for DCOs does not allow the communities to adequately consider the accumulated impact and mitigations. National Grid Group plc must take a role here and find a way for meaningful coordination. In the 'Non-statutory Consultation Report (Version A October 2023)', 6.2.8, NGSL's dismissal of the semi-brownfield disused Leiston airfield is far from convincing. It is said that it is too far from the Friston substation, yet both Nautilus and LionLink have identified it as a viable option. Whilst the report tells of the increased cost of cabling, it says nothing about the increased cost of mitigation by building so close to Saxmundham, nor the savings that wouldresult from being close to the Sizewell access road.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The needs case for the Proposed Project has identified that a connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. In the Non-Statutory Consultation Report, National Grid dismissed the use of the Leiston Airfield. Further details are contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. Other options proved preferable, while this location posed greater likelihood of cumulative effects with Sizewell C.
		Traffic and transport, consultation	The PC's response to NGSL's non-statutory consultation commented that the appropriateness of the Wood Farm site would depend, inter alia, on the access. NGSL has shown options for accesses, but not how they will link to the principal road network, and suggested that they will select the option and impose mitigation later. Whilst the PC will comment further below, it is hoped that when the access option is finalised a supplementary consultation will be carried out.	N	National Grid acknowledges this feedback. Further rounds of targeted engagement with stakeholders including the Parish Council was undertaken to reach the final design including with respect to access.
		Traffic and transport	**Converter site access** The PC will restrict comments to those accesses which directly impact on Benhall and Sternfield, namely S-BM09 (from the B1121 south of Saxmundham), and S-BM13 (from the B1121 along the track to Redhouse Farm. The comments below relate only to NGSL's proposals. If further converter stations are constructed using the same accesses, the PC will respond further in due course. **Access S-BM109, leaving B1121 south of Saxmundham** It is assumed that NGSL intend to route traffic from the A12, along the B1121, Main Road, through Benhall to the access point north of Bigsby's Corner. The PC's concerns regarding the significant increase in traffic in relation to the safety of existing road users are tabulated below:	N	National Grid acknowledges this feedback. Responses have been provided against each comment below.
		Traffic and transport, safety	Concern: Safety at A12 / B1121 junction - confllict between turning traffic and overtaking traffic northbound. This concern is compounded by Sizewell C traffic on same timescale.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes a review of the collision records (based on full collision data obtained from Benhall & Sternfield Parish Council) and an assessment of road safety for the study area, which includes the A12/ B1121 junction. This demonstrates that the additional construction traffic

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Suggested Mitigation: Suffolk County Council to review junction safetyand appropriate measures identified.		to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the road safety of this junction, with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Further consultation was held with Benhall & Sternfield Parish Council as the ES was prepared.
		Traffic and transport, walking, cycling and horse-riders	Concern: The footway from Benhall to Saxmundham is along the west side of Main Road, whilst all but a few houses are to the east. There needs to be safe crossing points. Some school pupils walk between Benhall and Saxmundham, along Main Road. Suggested Mitigation: Provide safe crossing points at the following principal points: • Whitearch Park (by railway bridge), • Forge Close / Shotts Meadow / Kiln Lane, and • School Lane / Gray's Lane. The significant increase in traffic, coupled with inadequate visibility, warrants that these crossing points have halfway refuges, with local road widening to accommodate them as necessary.	Y	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** sets out the management measures for the control of construction traffic. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the part of the network identified (B1121 Main Road). Therefore, it is not considered that any additional mitigation is required. It is apparent that the existing crossing points and footways in this area have not been maintained adequately, leading to pedestrians walking in the carriageway. This is a matter for Suffolk County Council Highways, as it is not the responsibility of the Proposed Project to maintain these assets, nor will it necessarily exacerbate these issues. These concerns are acknowledged and may be discussed in the course of National Grid's ongoing discussions with the Council.
		Safety, walking, cycling and horse-riders, onshore mitigation	Concern: Potentially fatal conflict between lorries and vulnerable road users (cyclists and equestrians) The significant increase in HGVs from the proposal makes it imperative that vulnerable road users are separated from the main carriageway. Benhall is little more than a mile from Saxmundham, and non-motorised travel is encouraged. Further, a cycle route to Saxmundham and beyond issigned from the A12, south of Benhall Green. Suggested Mitigation: A segregated cycleway should be provided from the A12 to Saxmundham. The length from Forge Close to Gray's Lane could be substituted with suitable traffic management in School Lane.	Y	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** sets out the management measures for the control of construction traffic. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the part of the network identified (B1121 Main Road). Therefore, it is not considered that any additional mitigation is required. Notwithstanding the above, there is insufficient land available within the public highway for an offline cycle track to be provided along the length of the B1121. CPO of land adjacent could not be justified by the traffic figures associated with this scheme. Community benefit funding is available should alternative routes for a cycle track wish to be explored.
		Nosie and vibration, air quality, health and wellbeing	Concern: Noise and emissions (nitrogen dioxide and fine particulates) pollution – health concerns. Suggested Mitigation: Only HGVs complying with the latest environmental standards should be permitted. A 30 mph speed restriction should be imposed between the A12 and the access.	N	Construction traffic noise has been assessed within **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Impacts of construction traffic on air quality have been assessed within **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**. The effect of construction vehicle emissions as a result of the Proposed Project has been determined as negligible (not significant).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Further information on the assessments and mitigation is available in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality** and **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**.
		Traffic and transport, landscape and visual	Concern: Impaired visibility at junctions Suggested Mitigation: Cut back vegetation: • North of Forge Close to assist traffic turning right out of Forge Close • Opposite B1121 Sternfield Road, so that traffic turning right into Sternfield Road can readily see approaching traffic	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Construction traffic associated with the Proposed Project will not use Forge Close or Sternfield Road and therefore no mitigation is required. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including along the B1121 Main Road. Therefore, it is not considered that any additional mitigation is required. Further to the above, **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes an assessment of road safety and hazardous/large loads during the construction phase, based on personal injury accident data obtained from Suffolk County Council. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network (including for road safety or as a result of hazardous/large loads) during the construction phase with the proposed embedded mitigation and control and management measures in place.
		Traffic and transport, walking, cycling and horse-riders, onshore mitigation	**Access S-BM 13, leaving B1131 along track to Redhouse Farm** The presumption is that NGSL intend to direct traffic along the B1121 from Bigsby's Corner through Sternfield. It is noted that the traffic count was taken in Friston, and so missed the significant traffic generated at Hill Farm and Redhouse Farm, the majority of which passes through Sternfield, not Friston. It should be noted that the HGV traffic from the packing station at Hill Farm currently operates April to October, concurrent with holiday traffic. Further, it must not be overlooked that this road is not just for cars and lorries, but is also regularly used by pedestrians (particularly dog walkers), cyclists and equestrians. There is no footway east of Start Farm. The width of the road by Start Farm has been measured by SCC highways to be 5.0m, and insufficient for a centre marking. Further, the visibility eastwards from Start Farm is impaired by the curvature and hump in the road alignment. The centre marking creates a false sense of security to car	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. It is not intended to route construction traffic along the B1121 from Bigsby's Corner through Sternfield. The accesses off the B1121 near Sternfield are for monitoring and maintenance access and would only be required for use by LGVs on an ad hoc infrequent basis to monitor the cable installation and drainage assets. Minimal construction traffic to access the existing overhead lines will be routed from the south through Friston hence the monitoring in that location. It is recognised that a suggestion has been made to adopt the proposed minor access at the A1121 as public highway. The suggestion is considered by the consultee as a benefit, but would not be a mitigation resulting from the Proposed Project. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. However, community benefit is separate to compensation and mitigation. The former Government consulted on community benefit options associated

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			drivers, who, all too often, are confronted by HGVs, which have no choice but to travel along the centre of the road. SCC have admitted that the centre line should not be there, and have suggested that it be removed and replaced with edge markings to avoid the false sense of security and alert drivers to the narrowing. The PC is currently pursuing this safety measure with SCC. This part of the B1121 does not feature on the SCC Lorry Route Map, even for the lowest classification, and the attached photographs illustrate the current conflict experienced on a regular basis. Scottish Power has accepted that this road is unsuitable for the routing of HGVs, and any proposal by NGSL to route any HGVs along the B1121 through Sternfield is strongly opposed. **Opportunity for enhancement to the highway network** Whichever access NGSL pursues, consideration should be given to the opportunity for, with appropriate modification / extension, the access to be adopted as a public highway, enhancing the network, and leaving a beneficial legacy to the local community.		with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Walking, cycling and horse-riders, converter station location, onshore mitigation	**Rights of Way** The Parish Council accepts that the footpaths across the converter station site will need to be diverted. This is the only footpath route from Sternfield to Saxmundham, and even temporary closures should be resisted. The preference would be to divert the paths before any work commences through landscaping swathes, so that within just a few years the substation(s) is largely hidden from view. Whilst this may not be entirely achievable, it should be the aim, andonly if not feasible should a temporary route be provided. The PC will welcome any enhancement to the Rights of Way network, and upgrading to bridleway where possible.	N	National Grid acknowledges this feedback. PRoW will be kept open wherever possible during the construction phase through the management measures identified. Diversion routes have been identified where any temporary PRoW closures will be required. These details are set out in **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk**. The outline landscape plan is shown at **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** and visual effects on receptors on the local PRoW network is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Enhancement of the PRoW within the area will be discussed and agreed with the PRoW officer to ensure any improvements that can be offered are in keeping with the Local Authorities' requirements.
		Landscape and visual, converter station location, onshore mitigation	**Visual impact** The PC notes the visual impact assessment presented in the documentation, but is concerned that no viewpoints have been considered from the rising land to the south of the B1121 through Sternfield. From Red Lane / Kiln Lane, the new buildings at Hill Farm and Redhouse Farm sit below the treeline, and do make a significant visual impact. The converter station(s) are expected to rise above the trees, and the PC asks that this additional viewpoint be adopted in considering impact. It is noted that the red line to the south of the indicative converter station site would put the row of trees along the field	N	Five new viewpoints have been included following the production of the Preliminary Environmental Information Report, which include a range of different receptors and distances from the Proposed Project. Following stakeholder comment, this includes Viewpoint 19 on rising land to the south of the B1121 as requested. This is shown in **Application Document 6.4.2.1 Landscape and Visual** and effects detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The indicative landscape strategy for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed to ensure appropriate screening including to the southwest of the converter station

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			boundary within your control. This row is of utmost importance in providing a degree of screening from the south, and it hoped that the inclusion within the red line is to ensure their survival, rather than create the opportunity to fell. There are several ash trees in the row, which have questionable longevity, so the PC strongly advocates that this row is enhanced at the earliest opportunity. Clearly there is the need for early preocular planting at key viewpoints, and the PC would strongly support such a policy. There is concern relating to the converter station proximity in relation to Hill Farm House and Sternfield House. The PC asks that this be considered when finalising the position of the buildings to give as much clearance as possible.		site and key visual receptors. The landscape strategy seeks to retain and enhance the existing band of planting referred to in the comment. Hill Farm Grade II listed building would not experience a significant impact with the proposed mitigation in place as noted in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Sternfield House Grade II listed building is noted in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and is not expected to experience any significant impacts.
		Water environment, converter station location, geology and hydrogeology	**Surface water run-offs – flood risk** The proposal will create a considerable impervious area and the PC notes that some consideration has been given to the impact on the natural drainage system. However, we would wish to make some observations. The area identified for the converter station drains to the east and south into the watercourse from north of the B1119 to Redhouse Farm, past Glebe Farm and into the River Fromus. Only the length from the Fromus to Baldry's Cottages is under the jurisdiction of the Internal Drainage Board. However, there is little maintenance carried out by the IDB, and the condition of the watercourse is largely in the hands of the riparian owners, and is maintained to variable standards. It is noted that some run-off will be pumped to agricultural reservoirs, and beyond this there will be some attenuation measures. Hill Farm and Redhouse Farm also have considerable impervious areas and discharge, with some attenuation, into this watercourse. The recent Storm Babet in Suffolk clearly flagged up that reliance on unmaintained watercourses to carry run-off from vast areas of development is not a sound approach. The PC is concerned about the impact on the natural drainage system through Sternfield and Benhall, and seeks assurance that a full hydrological study will be carried out, including the accumulated impact of further converter stations at Wood Farm and the run-offs from Hill Farm and Redhouse Farm, together with a watercourse maintenance review, to ensure that there is no increase in flood risk.	N	Surface water flows generated within the Proposed Project's Order Limits both during construction and operation would be managed in accordance with drainage strategies that provide suitable sustainable drainage systems (SuDS) to capture, where necessary treat, and attenuate runoff prior to its discharge to the water environment (be that to ground, to a surface watercourse, or a combination). The drainage strategies have been developed in consultation with drainage authorities and the DCO commits the appointed contractor to further enhance these strategies to reflect the detailed designs of the Proposed Project, for approval by the relevant statutory bodies. This ensures a robust approach to surface water runoff and land drainage management. A full flood risk assessment is detailed in **Application Document 6.8 Flood Risk Assessment** and further details in relation to the water environment are included within **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. **Application Document 6.8 Flood Risk Assessment** concludes that the FRA has demonstrated that with a range of control measures in place, including construction and operational drainage and watercourse crossing designs, the residual risk of flooding would be low and flood risk to neighbouring land would not be increased.
		Onshore mitigation, community	**Concluding comments** Whilst the PC cannot welcome the proposals for development at Wood Farm, we equally understand that it is likely to be	N	National Grid regards community benefit as being separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		benefits/enhancements, consultation	granted DCO. Therefore, the PC would prefer to work with NGSL to agree suitable mitigation and community enhancements, such as improvements to the community hall, or the wildlife site. Whilst it is acknowledged that the major negotiations will be through East Suffolk Council and Suffolk County Council, we would ask that NGSL also communicate directly with the PC where appropriate for the unique local insight that can only come from the community. [Images/captions attached]		example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. National Grid is engaging with statutory technical stakeholders including local planning authorities, Natural England, Historic England and the Environment Agency to inform the approach to mitigation. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believes it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the current Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. National Grid welcome the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders including parish councils and local communities to further inform this. National Grid acknowledges the images/captions provided by Benhall & Sternfield Parish Council.

Table 1.3 Dover District Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, onshore route location	**Statutory Consultation** Thank you for consulting Dover District Council in respect of the Sea Link proposals for the construction of a 2GW High Voltage Direct Current (HVDC) undersea electricity link between Suffolk and Kent. The onshore infrastructure in Kent would consist of a converter station, substation and connection to the Richborough to Canterbury overhead line (which serves the nearby NEMO Link to the east). These comments relate primarily to the onshore aspects of the proposals which fall within the Dover district, which include the proposed overhead line connection and associated pylons. However due to the close proximity of the proposed works to the district's boundary, other comments are also offered on other aspects of the proposals.	N	National Grid welcomes the Council's comments.
		Legislation and policy, needs case	**Relevant Planning Policies and Guidance** National Planning Policy Statements EN-1 and EN-5 set out the Government's strategy for energy and electricity network infrastructure, setting out principles to be applied in the assessment of applications. In respect of local planning policy, Dover District Council Local Plan to 2040 (Regulation 19 Submission) was submitted for examination in March 2023 and is a material consideration. The hearing sessions of the examination took place between 14th November to 13th December 2023 and the response from the Planning Inspectorate is expected to be received in the first quarter of 2024. At this stage, the weight to be attributed to the draft policies will depend on their compliance with the National Planning Policy Framework and the level of unresolved objections and following the examination, there may be modifications required to the wording of the policies. The draft plan and evidence can be found at the following website address: https://www.doverdistrictlocalplan.co.uk/get-involved The following Policies are considered to be relevant: • SP1 - Planning for Climate Change • SP2 - Planning for Healthy and Inclusive Communities • SP6 - Economic Growth • SP11 - Infrastructure and Developer Contributions • SP12 - Strategic Transport Infrastructure	N	National Grid has taken account of local planning policy in its development of the Proposed Project and an appraisal of important and relevant planning policy is set out within **Application Document 7.1 Planning Statement**. National Grid is aware that Dover District Council's Local Plan to 2040 was adopted in October 2024. National Grid has taken account of local planning policy and this is set out in **Application Document 6.2.1.2 Part 1 Introduction Chapter 2 Regulatory and Planning Context**. Further information on Dover District Council's Local Plan to 2040 can be found in **Application Document 7.1 Planning Statement**. Whilst the second paragraph of the comment noted in this row would be correct of planning applications to be decided under the Town and Country Planning Act 1990, the position is different for DCO applications under the Planning Act 2008. Under Section 104 of the Planning Act 2008, the Secretary of State is required to decide the application having regard to, amongst other things, any relevant national policy statement. The Secretary of State may also have regard to local planning policy if they consider it to be important and relevant to its decision. Regarding local planning policy, Paragraph 4.1.12 of NPS EN-1 states: "*Other matters that the Secretary of State may consider both important and relevant to their decision-making may include Development Plan documents or other documents in the Local Development Framework*." Regarding emerging Development Plan Documents, paragraph 4.1.13 of NPS EN-1 states: "*Where the project conflicts with a proposal in a draft Development Plan, the Secretary of State should take account of the stage which the Development Plan document in England or Local Development Plan in*

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• SP13 - Protecting the District's Hierarchy of Designated Environmental Sites and Biodiversity Assets • SP14 - Enhancing Green Infrastructure and Biodiversity • SP15 - Protecting the District's Historic Environment • CC1 - Reducing Carbon Emissions • CC2 - Sustainable Design and Construction • CC3 - Renewable and Low Carbon Energy Development • CC4 - Water Efficiency • CC5 - Flood Risk • CC6 - Surface Water Management • CC7 - Coastal Change Management Areas • CC8 - Tree Planting and Protection • PM1 – Achieving High Quality Design, Place Making and the provision of Design Codes • TI1 – Sustainable Transport and Travel • TI2 – Transport Statements, Assessments and Travel Plans • NE1 – Biodiversity Net Gain • NE2 – Landscape Character and the Kent Downs AONB • NE3 – Thanet Coast and Sandwich Bay SPA Mitigation and Monitoring Strategy • NE4 – Air Quality • NE5 – Water Supply and Quality • HE1 – Designated and Non-designated Heritage Assets • HE3 – Archaeology Also of relevance are the Saved Policies of the Local Plan 2002, Dover District Local Development Framework Core Strategy 2010 and Dover District Land Allocations Local Plan 2015. The Council is generally supportive of the overall principal of the proposal, which will improve energy security, provided that the		*Wales has reached in deciding what weight to give to the plan for the purposes of determining the planning significance of what is replaced, prevented, or precluded*." Paragraph 4.1.15 of NPS EN-1 clarifies that where there is a conflict between local policy documents and a NPS, the NPS prevails for the purpose of Secretary of State decision making given the national significance of the infrastructure.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			impacts of the project are adequately assessed, appropriately mitigated and compensated as required.		
		Needs case, alternatives	**Need and Consideration of Alternatives** National Grid has provided information setting out the need for the development; to reinforce the network between the South East and East Anglia. The main reasons include that the existing transmission network was not designed to transport electricity from where it is increasingly now generated (largely offshore); that the growth in offshore wind, interconnectors and nuclear power means that more electricity will be generated in the years ahead than the current network is able to securely and reliably transport; that electricity demand is forecast to at least double by 2050, increasing the amount of energy needing to be transported; and that upgrading the existing network as it is today (replacing cables to carry more power) will not be enough to carry the amount of future power whilst operating to required standards. The Option Selection and Design Evolution Report sets out the rationale for the site location, considering the constraints of other options and local and national designations.	N	National Grid notes the Council's summary of this information that they presented at its Statutory consultation. National Grid also notes that NPS EN-1 paragraphs 3.2.6 to 3.2.7 set out that the Secretary of State should assess all applications for types of infrastructure covered by the NPS (which includes the Proposed Project) on the basis that the need for the infrastructure has been established and should be afforded substantial weight, and the specific contribution of an individual project to the overall established need is not required to be separately considered. These paragraphs are in bold typeface in the NPS.
		Converter station location, design, landscape and visual	**Landscape and Visual** Converter station design – background to potential architectural approaches (version A) provides six options for the design of the two proposed converter stations, informed by a toolkit. Whilst the converter stations for the Kent proposals would be located within the Thanet District, due to their height (up to 26m high), the stations will be seen from the Dover district in views across the Ash Levels and from the scheduled monument at Richborough. In terms of the design approach for the proposed converter stations, concepts that seek to reduce the visual impact of the structures would be desirable. Whilst planting and landscaping could be used to soften and screen views of the structures, due to the position and direction of the proposed overhead line and pylons, it is considered likely that views from the southeast of the substation and converter station are unlikely to be fully screened by any new or existing vegetation. Of the six developed options, the Council considers that a combination of the Colour and Curve (Section 2.2) and Colour (section 2.3) options would be most effective. It is noted that the converter station to the southeast of the site (at Richborough Energy Park) uses the colour approach, with the building finished in a green base, ranging to a light beige colour at roof level. It is however noted that these buildings are positioned closer to the A256 and are seen within the context of the wider Richborough Energy Park and other buildings to the north, south and on the opposite side of the highway. Notwithstanding this, it is not considered this is particularly	N	The assessment of effects arising from the Kent Onshore Scheme on landscape character and visual amenity is set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. To clarify that the Kent Onshore Scheme includes one converter station (and one substation). The indicative landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** including screening in the form of proposed woodland, hedgerow and hedgerow tree planting. Screening has been included to the south of the converter station and substation specifically to target views from the south. This is shown on **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent** and has been designed in collaboration with relevant stakeholders including Dover District Council as communicated through various thematic meetings (first introduced on 16 April 2024). National Grid welcomes the Council's comments on the Converter Station design. The ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. The design of this structure, in terms of the building form and the external materials, has been developed alongside consultation and stakeholder feedback. Although colour will not be secured within the DCO application, colour has been considered and is detailed within the Design Principles for the building which have been provided with the application for development consent (**Application Document 7.12.2 Design Principles - Kent**. The Design Principles provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			effective in reducing the visual impact of the building due to the limited graduation and colours used. A combination of the Colour and Curve (Section 2.2) and Colour (section 2.3) options could soften the appearance of the development and visual impact of the scale of the buildings (through the use of the curved roof line and bunding), whilst the colour option, if using similar colours to the nearby converter station (albeit with more graduation and care being taken with choice of colours), could reduce the perceived scale of the building in views from the south. Of the other options suggested, it is considered the agricultural barns (section 2.5) could, subject to their materials, increase the prominence of the buildings, with the nearest barns of a similar scale being further east, positioned on the west side of the A256/Jutes Lane/Sandwich Road roundabout, some distance from the site. The Kinetic approach (section 2.7) would draw attention to the upper half of the buildings and subject to its finish, could result in the buildings appearing taller in distanced views than other options suggested. In respect of Section 2.4, the green roof option would provide additional landscaping to soften views of the development. However, there are concerns that this could be more dominant in the relatively flat landscape, given the proximity to the Ash Levels.		Design Principles have been established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. It is seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles.
		Landscape and visual, onshore mitigation, consultation	The Council considers that the development of the final design and landscaping proposals should provide an opportunity to engage with local communities who will be impacted by the development and should be suitably informed by the landscape and visual impact assessment, also considering views from public rights of way. A landscape masterplan should be developed for the whole site, to minimise harm to the landscape and considering additional planting to screen and mitigate the visual impact of the development.	N	The indicative landscape strategy has been developed to minimise effects on landscape and visual receptors (including those on PRoW), as set out within the embedded mitigation within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** including screening in the form of proposed woodland, hedgerow and hedgerow tree planting. This is shown on **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan Kent** and has been designed in collaboration with stakeholders as communicated through various thematic meetings (first introduced on 16 April 2024).
		Terrestrial ecology, onshore mitigation	**Ecology and Biodiversity** The Senior Natural Environment Officer has been consulted on the proposals; their comments are included in full at the end of this consultation response. At this stage, they advise that most of the species surveys identified as necessary to inform the project have not yet commenced, with the Phase 1 habitat survey partially completed. The PEIR presents broad, preliminary conclusions regarding the potential mitigation options available, however without the detailed survey work it is not possible to reach conclusions regarding the significance of likely effects of all the ecological receptors. Although it is stated in the PEIR that "Embedded measures have been integral in reducing the ecology and biodiversity effects of the Proposed Project", these largely	N	Detailed survey work has taken place during 2024, and Dover District Council has been kept informed of survey progress through thematic meetings. Survey reports have also been shared as they became available. Mitigation proposals were also shared with Dover District Council, such as for addressing noise disturbance impacts and for mitigating for loss of Golden Plover habitat. Further information is contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and the associated appendices. The mitigation hierarchy is used throughout the ES and the approach is outlined within **Application Document 6.2.1.5 Part 1 Introduction Chapter 5 EIA Approach and Methodology**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			relate to designated sites and broad habitat types as the species surveys have not yet been completed. The mitigation hierarchy should be adequately applied and should be adequately demonstrated in the Environmental Statement, particularly with regards to avoiding significant impacts, before mitigation and compensation measures are considered.		Examples of using the mitigation hierarchy in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** include but are not limited to the following: • sensitive routeing and siting of infrastructure and temporary works; • vegetation clearance would be undertaken during September to February inclusive, wherever possible. If any works become necessary during the breeding bird season, works will be supervised by an Environmental Clerk of Works. Appropriate protection measures will be put in place should active nests be found. These will include exclusion zones around active nests until chicks fledge or nests become inactive as determined by monitoring by the Environmental Clerk of Works (B02); • to avoid disturbance of nesting woodlark, works close to known nesting areas would be commenced during the winter so there is already activity before the nesting season, the birds would then choose alternative nesting locations (B69); • there would be no lighting near any badger setts and a 40m setback between the identified badger sett and construction compounds S04 and S08 (B62); and • to avoid killing and injury of reptiles a two-phase strimming displacement technique would be used in key areas that may harbour reptiles (B05).
		Ornithology, terrestrial ecology, onshore environmental impact	The potential loss of functionally linked land due to significant numbers of golden plover is of particular concern, as is the potential for impacts to designated sites, including SSSI and Local Wildlife Sites (LWS). There is minimal consideration in the preliminary assessment of effects in respect to the Ash Level and South Richborough Pasture LWS, and the impact of habitat loss within the LWS as a result of the proposed pylons south of the River Stour is omitted from *Table 3.3.13: Preliminary assessment of direct loss of habitats during construction or decommissioning and Table 3.3.14: Preliminary assessment of direct loss of designated sites during construction or decommissioning.*	N	As discussed in thematic meetings, proposals for mitigating the loss of habitat for wintering golden plover consist of enhancing approximately 10 ha of arable land off-site, but adjacent to the South Richborough Pasture Local Wildlife Site. This approach has been discussed with Natural England. Further details, including a full assessment of impacts on the Local Wildlife Site including riverside scrape creation to offset habitat loss due to the pylon bases are contained in **Application Document 6.2.3.2 Part 3 Chapter 2 Ecology and Biodiversity**.
		Terrestrial ecology, design, onshore route location	It is considered that the PEIR lacks some clarity with regards to the proposed cabling locations and impacts in respect to the intertidal zone of Pegwell Bay. Figure 1.1.3 shows the Kent Onshore Scheme Boundary at its eastern extent, which includes the intertidal zone of Pegwell Bay, but the information presented in the Kent Onshore Scheme sections of the PEIR does not include the details for the full extent of the Boundary. Figure 3.3.3 shows survey parcels 379 and 391 in the intertidal zone, but no reference to survey parcel 391 is made in Appendix 3.3.A, and the habitat classification for survey parcel 379 presented in Table 3.3.A.5 does not include any mudflats. From reviewing Figure	N	The Phase 1 mapping has been completed and is presented within the DCO application. Having undertaken geotechnical investigation it can be confirmed that trenchless solutions are a viable option for traversing the Thanet Coast & Sandwich Bay SPA and there will be no surface cable trenching through any saltmarsh or through the intertidal area. The commitment to trenchless methods through the landfall is cited throughout **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The cable will emerge in the intertidal area and therefore there will be a jack up barge or similar present to make the connection, but the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			3.3.2, it appears that the phase 1 habitat work, undertaken using aerial photographs taken at high tide, means that the phase 1 survey for the Kent Onshore Scheme has omitted all of the intertidal habitat. There are discrepancies and a lack of clarity in the PEIR with regards to the Kent Landfall and trenchless solution. In paragraph 1.4.3.9 states that *"there is a commitment to make landfall using a trenchless crossing technique beneath the saltmarsh habitat within the Pegwell Bay. The location of the TJB and the exit of the trenchless crossing seaward of the mean highwater springs mark (MHWS) would be located outside of the sensitive saltmarsh habitat". In paragraph 4.3.2.16 it is stated that "as both landfalls will be achieved using trenchless techniques, there are no activities occurring at the surface in the intertidal area."* Furthermore, in paragraph 4.3.6.3 it is stated that *""The Offshore Scheme will use a trenchless solution at both landfall locations, avoiding any work in the intertidal area. The trenchless solution entry/exit pits, where the cable will be pulled for subsequent submarine installation, will be entirely in the subtidal environment (Figure 4.3.4 Habitats present at, and location of, trenchless solution entry/exit entry/exit pits). Indicative water depths at lowest astronomical tide for the entry/exit pit locations are 5-6 m at Aldeburgh and ~ 4 m at Pegwell Bay."* However, figure 4.3.4 indicates that the 'potential trenchless solution' line starts only just off the coast and does not traverse the mudflats.		trenchless solution will be driven from inland, west of the golf course. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.3.3.2.A ES Appendix 3.2.A Extended Phase 1 Habitat Survey Report**.
		Terrestrial ecology, marine mammals, noise and vibration	It is concluded in the PEIR that by using the trenchless solution, impacts to intertidal habitats and species will be avoided, so no detailed assessment of the habitats and species has been undertaken. The PEIR does not clearly show that the whole of the intertidal area of Pegwell Bay will be avoided, with no exit/entry point identified in the figures. It is requested that clarification on this point is provided. In addition, while the trenchless solution may ensure that direct impacts to subtidal ecology can be avoided, it is questioned whether there could be indirect impacts as a result of noise and vibrations, including the seal population that hauls out the mouth of the River Stour.	N	The trenchless location and any potential impacts to seals have been considered in the **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**. The indicative exit/entry points are described in **Application Document 6.2.1.4 Part 1 Introduction Chapter 1 Description of the Proposed Project**. The exact locations of the exit/entry pits have not yet been defined. Bore exit pits at the Suffolk Landfall would be positioned wholly within the subtidal area, avoiding impacts to the intertidal at this location. The use of a jack up barge would be required to support the creation of the exit pits in advance of breakout. Due to the extent of the intertidal zone at Kent, bore exit points would be located approximately 105 m to 140 m seaward from the edge of the saltmarsh. Pits would be excavated and potentially a small cofferdam would be installed either before or immediately after punch out of the pilotbore to contain drilling fluids (four punch outs in total) as a reasonable worst case scenario. The equipment would include up to four small excavators (15-20 t), two tractors, hovercraft and ancillary equipment such as drilling pipes, pumps and generators. Excavators would remain within a maximum area of 120 m x 180 m around the exit pits. As the exit pits are in the upper intertidal area, access would be via the corridor from the former hoverport rather than transportation by sea at the top of the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					tide. Depending on ground conditions, either excavators would tow sledges of equipment or tractors would tow trailers with equipment to the exit.
		Cultural heritage, landscape and visual, onshore route location	**Cultural Heritage** The Principal Heritage Officer has been consulted on the proposals and it is considered the principal concern is the potential for impact on the setting of the scheduled monument at Richborough. Works have recently been undertaken by English Heritage to enhance the visitor experience; including the erection of a tower within the walls (the Claudian Gateway) to aid interpretation and understanding both of the phases of the fort itself and its relationship to the surrounding countryside. It is considered that the proposal could be visible from this viewpoint, although it is noted this would be considered further in the landscape and visual impact assessment, which would assist in the assessment of the impact on the heritage asset. The approach to the overhead line is considered to be appropriate in this respect. In respect of archaeology, this would be subject to consideration by KCC Archaeology.	N	An assessment of the potential for impacts on the setting of heritage assets has been included as part of **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. This includes assessing the impacts on the setting of Richborough Fort, with viewpoints agreed with Historic England and the Kent County Council Archaeological Advisor. The results of the assessment are included within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and associated appendices. The indicative landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** including screening in the form of proposed woodland, hedgerow and hedgerow tree planting. Screening has been included to the south of the Converter Station and Substation specifically to target views from the south. This is shown on **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent** and has been designed in collaboration with stakeholders as communicated through various thematic meetings (first introduced on 16 April 2024). National Grid acknowledges the Council's design preferences and considers that the Kent design review panels will provide a forum for further discussion. The design principles consider that the proposed Converter Station should appear more as background development than as a landmark structure (**Application Document 7.1.2.2 Design Principles – Kent**). The impacts on specific heritage assets, including the scheduled monument at Richborough, are acknowledged. National Grid will seek to identify solutions to these issues through ongoing dialogue with the Council in thematic meetings. These discussions will inform the iterative approach to the design of permanent infrastructure.
		Air quality, health and wellbeing, traffic and transport	**Air Quality, Noise and Vibration and Health and Wellbeing** The Environmental Protection Team have been consulted on the proposals, advising that the primary concern would be any possible effect that construction traffic and construction sites set within the Dover district may have on nearby residences. The construction of any new pylon system within the Dover district may require access points via local roads or temporary compounds within nearby road networks and it is expected that further details of this will be provided as the proposals progress.	N	National Grid acknowledges this feedback. **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality** and **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration** assess the construction phase impacts to residential receptors. Please refer to the complete assessment for details of the assessment and any mitigation measures. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** also includes details and locations of access points and temporary construction compounds required to facilitate the works.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Water environment, traffic and transport, cultural heritage	**Other Matters** It is noted that a number of other matters will be relevant to the assessment of the impacts of the proposals, including in respect of flood risk and drainage, traffic and transport and archaeology. It is considered that these matters will be addressed in any representations from KCC.	N	National Grid acknowledges this feedback. For reference, the topics mentioned are assessed within the ES as follows: • Flood risk is assessed within **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment and Application Document 6.8 Flood Risk Assessment**; • Traffic and Transport is assessed within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**; and • Archaeology is assessed within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Terrestrial ecology, onshore mitigation	**Consultee Responses:** **Senior Natural Environment Officer:** Most of the species surveys identified as necessary to inform this project have not yet commenced, with only the Phase 1 habitat survey partially completed (much of it has been undertaken using only aerial photographs). Although it is stated in the PEIR that the Phase 1 habitat survey will "assist with assessing which Phase 2 surveys would be deemed necessary", the extent and locations are not provided for the ongoing and proposed species surveys. The PEIR presents broad, preliminary conclusions regarding the potential mitigation options available, but without the detailed survey work it is not possible to reach conclusions regarding the significance of likely effects of all the ecological receptors. Given the wellprogressed proposals, including the locations of the Minster Substation and Minster Converter Station, I have some concern that the mitigation hierarchy may not be adequately applied, particularly with regards to avoiding significant impacts before mitigation and compensation measures are considered.	N	Detailed survey work has been carried out during 2024 and Dover District Council were kept informed of survey progress through thematic meetings. Survey reports were also shared as they emerged. Mitigation proposals were also being shared with Dover District Council, for example, the mitigation proposals for addressing noise disturbance impacts and for mitigating for loss of golden plover habitat. The mitigation hierarchy has been applied and discussion of the application of the hierarchy is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.
		Ornithology, terrestrial ecology	The potential loss of functionally linked land due to significant numbers of golden plover is of particular concern, as is the potential for impacts to designated sites, including SSSI and Local Wildlife Sites (LWS), though there is minimal consideration in the preliminary assessment of effects in respect to the Ash Level and South Richborough Pasture LWS, and the impact of habitat loss within the LWS as a result of the proposed pylons south of the River Stour is omitted from Table 3.3.13: Preliminary assessment of direct loss of habitats during construction or decommissioning and Table 3.3.14: Preliminary assessment of direct loss of designated sites during construction or decommissioning.	N	As discussed in thematic meetings, proposals for mitigating the loss of habitat for wintering golden plover consist of enhancing approximately 10 ha of arable land off-site, but adjacent to the South Richborough Pasture Local Wildlife Site. This approach has been discussed with Natural England. Further details, including a full assessment of impacts on the Local Wildlife Site including riverside scrape creation to offset habitat loss due to the pylon bases are contained in **Application Document 6.2.3.2 Part 3 Chapter 2 Ecology and Biodiversity**.
		Terrestrial ecology, onshore mitigation	Although it is stated in the PEIR that "Embedded measures have been integral in reducing the ecology and biodiversity effects of the Proposed Project", these largely relate to designated sites and broad habitat types as the species surveys have not yet	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			been completed. The application of the mitigation hierarchy will have to be adequately demonstrated in the Environmental Statement.		
		Terrestrial ecology, design, onshore route location	The PEIR lacks some clarity with regards to the proposed cabling locations and impacts in respect to the intertidal zone of Pegwell Bay. Figure 1.1.3 shows the Kent Onshore Scheme Boundary at its eastern extent, which includes the intertidal zone of Pegwell Bay, but the information presented in the Kent Onshore Scheme sections of the PEIR does not include the details for the full extent of the Boundary; Figure 3.3.3 shows survey parcels 379 and 391 in the intertidal zone, but no reference to survey parcel 391 is made in Appendix 3.3.A, and the habitat classification for survey parcel 379 presented in Table 3.3.A.5 does not include any mudflats. From reviewing Figure 3.3.2, it appears that the phase 1 habitat work, undertaken using aerial photographs taken at high tide, means that the phase 1 survey for the Kent Onshore Scheme has omitted all of the intertidal habitat. There are discrepancies and a lack of clarity in the PEIR with regards to the Kent Landfall and trenchless solution. In paragraph 1.4.3.9 states that “there is a commitment to make landfall using a trenchless crossing technique beneath the saltmarsh habitat within the Pegwell Bay. The location of the TJB and the exit of the trenchless crossing seaward of the mean highwater springs mark (MHWS) would be located outside of the sensitive saltmarsh habitat”. In paragraph 4.3.2.16 it is stated that “as both landfalls will be achieved using trenchless techniques, there are no activities occurring at the surface in the intertidal area.” In paragraph 4.3.6.3 it is stated that ““The Offshore Scheme will use a trenchless solution at both landfall locations, avoiding any work in the intertidal area. The trenchless solution entry/exit pits, where the cable will be pulled for subsequent submarine installation, will be entirely in the subtidal environment (Figure 4.3.4 Habitats present at, and location of, trenchless solution entry/exit entry/exit pits). Indicative water depths at lowest astronomical tide for the entry/exit pit locations are 5-6 m at Aldeburgh and ~ 4 m at Pegwell Bay.” However, figure 4.3.4 indicates that the ‘potential trenchless solution’ line starts only just off the coast and does not traverse the mudflats.	N	The Phase 1 mapping has been completed for the DCO application and is part of **Application Document 6.3.3.2.A ES Appendix 3.2.A Extended Phase 1 Habitat Survey Report**. Having undertaken geotechnical investigation it can be confirmed that trenchless solutions are a viable option for traversing the Thanet Coast & Sandwich Bay SPA and there will be no surface cable trenching through any saltmarsh or through the intertidal area The commitment to trenchless methods through the landfall is cited in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**, which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The cable will emerge in the intertidal area and therefore there will be a jack up barge or similar present to make the connection, but the trenchless solution will be driven from inland, west of the golf course.
		Terrestrial ecology, marine mammals, noise and vibration	It is concluded in the PEIR that by using the trenchless solution, impacts to intertidal habitats and species will be avoided, so no detailed assessment of the habitats and species has been undertaken. The PEIR does not clearly show that the whole of the intertidal area of Pegwell Bay will be avoided, with no exit/entry point identified in the figures, and I advise that clarification on this point is necessary. In addition, while the trenchless solution may ensure that direct impacts to subtidal ecology can be avoided, I query whether	N	The trenchless location and any potential impacts to seals have been considered within **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			there could be indirect impacts as a result of noise and vibrations and particularly highlight the seal population that hauls out the mouth of the River Stour.		
		Coordination with other projects, benthic ecology	I query whether any of the surveys and monitoring conducted in respect to the NEMO link have been used to inform the assessments and suggest that this may be useful. With regards to the Offshore Scheme, this link on the document library page is not correct PEIR Volume 2 Appendix 4.3.A Benthic Characterisation Report – it just opens the same document as the link above it (PEIR Volume 1 Part 4 Chapter 3 Benthic Ecology).	N	A summary of available information and lessons learned from previous developments is provided in **Application Document 6.2.4.3 Part 4 Chapter 3 Fish and Shellfish Ecology**.
		Cultural heritage, landscape and visual, design	**Principal Heritage Officer:** Our principal concern is the potential for impact on the setting of the scheduled monument at Richborough. English Heritage have recently carried out works to improve the visitor experience at Richborough, including the erection of a tower within the walls (the Claudian Gateway) to aid interpretation and understanding both of the phases of the fort itself and its relationship to the surrounding countryside. We consider the overhead line approach to be appropriate in this respect. In terms of the design approach for the proposed converter stations, concepts that seek to reduce the visual impact of the structures will be desirable. Of those illustrated in fig 2.1 of the background document we are particularly interested in the use of colour and form to reduce their massing.	N	An assessment of the potential for impacts on the setting of heritage assets has been included as part of **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. This includes assessing the impacts on the setting of Richborough Fort, with viewpoints agreed with Historic England and the Kent County Council Archaeological Advisor.
		Traffic and transport, construction, health and wellbeing	**Environmental Protection Officer:** Environmental Protection have been invited to comment on the above consultation. Our primary concern is any possible effect that construction traffic and construction sites set within the Dover district may have on nearby residences. The construction of any new pylon system within the Dover district may require access points via local roads or temporary compounds within nearby road networks. If it is applicable to the application type we request a condition to cover this process.	N	National Grid acknowledges this feedback. **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality** and **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration** assess the construction phase impacts to residential receptors. Please refer to the complete assessment for details of the assessment and any mitigation measures. **Application Document 7.5.1.2 Construction Traffic Management and Travel Plan - Kent** also includes details and locations of access points and temporary construction compounds required to facilitate the works.
		Traffic and transport, construction	A suitable condition could be: • 1. A Construction Management Plan shall be submitted before the commencement of any development within the Dover district to include the following: • Routing of construction and delivery vehicles to / from any proposed construction process within the Dover district.	N	**Application Document 7.5.1.2 Construction Traffic Management and Travel Plan - Kent** has been prepared as part of the DCO application and includes the details requested by Dover District Council.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• Parking/turning areas for construction and delivery vehicles and site personnel. • Timing and number of HGV movements. • Provision of wheel washing facilities. • Temporary traffic management / signage. • Access / egress arrangements • Duration of construction • Time of construction operations The development shall be carried out in accordance with the approved details. Other than this request we have no other comments currently. I am happy to discuss our request with the applicant if required. Dover District Council appreciates the opportunity to make the above comments and trust that they will be of assistance and will be taken into account as the project progresses.		

Table 1.4 East Suffolk Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	5 January 2023	Consultation	Thank you for giving the Council the opportunity to respond to the statutory consultation. The Council's response comprises of the following: a) Cabinet Report for the 2 January 2024 meeting b) Appendix A associated with a) – Response to Sea Link by ESC c) Appendix B associated with a) – Drawings d) Notes of the meeting held between representatives of East Suffolk Council & the relevant Town & Parish Councils On 3 January 2024 we will confirm the resolution of Cabinet and provide any necessary updates to our response by 5 January 2024.	N	National Grid acknowledges this feedback and has responded to the specific points raised below.
		Consultation	**APPENDIX A** **1. Introduction** 1.1 East Suffolk Council (ESC) welcomes the opportunity to provide comments on the proposals for the Sea Link project. The Council's comments have been set out below. 1.1 During your consultation ESC held a meeting with the directly affected town and parish councils to seek their views on the project. The views expressed have been included in ESCs response. It was clear during the meeting that there is no town or parish council support for the proposal currently being consulted upon. A copy of the notes from the meeting held with directly affected town and parish council representatives has been provided at the end of this report. **2. Engagement on the Sea Link Project** 2.1 ESC wishes to highlight at an early stage in this response concerns in relation to the engagement on the project. Whilst the higher-level project overview meetings on Sea Link have been scheduled regularly throughout the pre-application period, the detailed engagement on a technical level has been extremely limited and inadequate. Ahead of the statutory consultation ESC would have expected technical officers to be regularly engaged in all the thematic areas but this has not been the case. Whilst a limited number of meetings have been held with technical officers, these have been insufficient in number and depth and there has not been the appropriate opportunity to feed into the assessments and preliminary environmental information. In relation to some vitally important topic areas, there has been no engagement at	N	Statutory consultation was undertaken in accordance with the SoCC which itself was subject to extensive consultation with the host LPAs and prepared in accordance with all applicable statutory requirements pursuant to the Planning Act 2008 and the Infrastructure Planning (EIA) Regulations 2017 as well as other relevant guidance. The material published for Statutory consultation was based on the information available at that time and was of sufficient detail to enable informed feedback to be provided on the emerging scheme proposals. National Grid had regard to all such feedback as part of the continuing development of the Proposed Project up to the time of submitting the DCO application. All views expressed in response to the Statutory consultation (and indeed all other consultation and engagement activities undertaken by National Grid as part of the National Grid acknowledges the Council's concerns) have been considered and taken into account as set out within **Application Document 5.1 Consultation Report**. Following Statutory consultation, National Grid committed to ongoing engagement with stakeholders, including East Suffolk Council. This comprised a programme of thematic meetings running through to submission, addressing specific aspects of the Proposed Project design and potential impacts arising during construction and operation.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			all, these include coastal processes, ecology, surface water drainage and flood risk and air quality. The engagement with ESC in relation to the technical details of the project must be improved going forwards. In addition to this, engagement with the local communities is also essential and should be a key feature of the pre-application phase.		
		Legislation and policy, coordination with other projects, needs case	**3. National Policy** 3.1 The Energy National Policy Statements (NPSs) were updated in November 2023 with the publication of revised NPSs EN-1 to EN-5. ESC notes that EN-1 identifies that "there is an urgent need for new electricity network infrastructure to be brought forward at pace to meet our energy objectives" (paragraph 3.3.65), in addition to this it is noted that the "volume of onshore reinforcement works needed to meet decarbonisation targets is substantial", specifically noting the need for "substantial reinforcement in East Anglia to handle increased power flows from offshore wind generation" (paragraph 3.3.68). Distribution Network Operators are required under Section 9 of the Electricity Act 1989 to bring forward efficient and economic proposals in terms of network design. However national policy is clear that "in considering the 'economic and efficient' approach the network project needs to follow good design, avoidance and mitigation principles as reference in EN-5" (paragraph 3.3.78). 1.1 Paragraph 3.3.80 of EN-1 goes on to state "…considering the potential or unwarranted and avoidable disruption, inefficient, and visual impacts along the onshore-offshore boundary, coordination of onshore transmission, offshore transmission, and offshore generation and interconnector developments should be considered at both the strategic and more detailed project design levels. This coordinated approach is likely to provide the highest degree of consumer, environmental, and community benefits." 2.1 Therefore, whilst EN-1 recognises the need for new electricity networks in order to meet the future energy demands, the importance of good design and need for coordination to reduce the adverse impacts on the local communities and environment is acknowledged. The revised NPS EN-5 supports need for coordination stating that "The coordinated solutions assessed should seek to be ambitious in the degree of co-ordination, wherever possible".	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Coordination with other projects,	**4. Offshore Transmission Network Review and Coordination**	N	National Grid acknowledges the District Council's concerns about the current approach towards planning for new development on the electricity network, but nevertheless must comply with Section 9 of the Electricity Act and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		alternative solutions, consultation	4.1 The Council has been engaging with the Government regarding the unstructured and non-collaborative approach to energy development which the revised NPSs seek to address1. ESC would like to be supportive of well-developed and designed coordinated projects that enable the goal of Net Zero and the interim targets, as set out in the revised NPSs. This however is not currently the case with projects delivered in a piecemeal fashion with little regard for the cumulative impacts, this cannot continue to occur at the expense of Suffolk's environment and communities. The succession of individual proposals impacting our communities without visible strategic over-sight, or collaboration to minimise impacts, creates a very challenging and unsustainable situation. The Offshore Transmission Network Review (OTNR) was announced in 2020 following recognition by Government that the current un-coordinated approach to offshore transmission lacked any strategic vision and was causing significant environmental and local impacts from the associated onshore infrastructure. It was recognised that point to point connections do not always provide the most efficient approach and could become a major barrier to delivery. This is a matter which ESC has been highlighting and calling for action on from the Government since 2018.		Standard Condition D3 (transmission system security standard and quality of service) of its Transmission Licence. This means that where the boundary capacity of the Main Interconnected Transmission System is exceeded against the standards, National Grid must resolve the capacity shortfall under the terms of its Transmission Licence. A fully offshore grid does not represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid will continue to monitor Government's response to this ongoing debate, but can clarify that even with the provision of offshore converter stations and substation(s), onshore infrastructure would still be needed to transmit to the onshore national electricity network. Cables would still need to run onshore from an offshore grid and onshore converter stations would still be needed to convert the electricity from direct to alternate current, along with a substation to transform electricity into the required voltages. At present, co-ordination of all proposed transmission infrastructure seeking to make landfall on the East Anglian coast is not feasible due to each project being promoted by different companies, with different project teams covering several different geographical locations and on different timelines for delivery. National Grid is therefore listening to community feedback in order to understand concerns about the impact of the Proposed Project, both as a standalone project and in combination with other projects in the area, to minimise these impacts onshore and offshore. It should also be noted that the effects of interactions between the Proposed Project and other proposed developments in Suffolk within the cumulative zone of influence have been identified and assessed within the ES and are reported within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. For further details of these effect interactions and any additional mitigation proposed are set out in this Chapter.
			4.2 ESC has previously requested National Grid PLC comprehensively and robustly explore every opportunity for coordination of the Sea Link, EuroLink and Nautilus projects at all stages of the development consent process2. It is also imperative given the pressures this area of east Suffolk is facing, that in-combination effects with other proposed and consented projects are considered and opportunities for coordination maximised. This is necessary to reduce the adverse impacts of the developments on east Suffolk's sensitive and valued environment and the local communities, who have been hit by a constant barrage of energy projects and will be subject to years of disruption from associated construction works, if they are consented and implemented.		National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application (**Application Document 7.10 Coordination Report**). While efforts are being made to engage with other projects and identify appropriate ways of co-ordinating with different projects, covering several different geographical locations and on different timelines for delivery, it is not always possible to co-ordinate with all projects.
			4.3 ESC requests that consideration be given to an offshore grid solution and the use of brownfield solutions for the onshore infrastructure. The principle of subsea interconnectors is an important part of an offshore focused approach, but it needs to be ensured the connections are made in the right locations.		The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
			4.4 On 5 December 2023 it was announced that North Falls, Five Estuaries and Sea Link had been successful in receiving grant funding from the OCSS. The purpose of the funding from the OCSS was to enable the exploration of coordination between the two offshore wind farms and Sea		With regard to the Offshore Coordination Support Scheme (OCSS), grant funding was awarded to North Falls, Five Estuaries and Sea Link in order to explore the coordination of two offshore wind farms and a bootstrap reinforcement to the GB grid. A feasibility study was undertaken which

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Link. Given the association between Sea Link, LionLink and Nautilus, the opportunity for co-ordination created by the funding has been significantly limited. It is unknown whether there will be further funding granted for other projects as part of the OCSS, but at present the outcomes of the OTNR more generally, and the limitations on the potential benefits from the OCSS, has been extremely disappointing for east Suffolk. Put simply, the Sea Link project will receive funding to explore coordination with two offshore wind projects which had revised grid connections in Essex and therefore whilst there will be a potential reduction in the infrastructure overall the benefits will primarily be felt in Essex, it is not evident that there would be any reduction in the onshore infrastructure within east Suffolk. 4.5 ESC would like to understand the proposals put forward by Sea Link as part of the OCSS bid and to understand the implications for the current proposals put forward in the consultation. ESC would also like to be fully engaged and kept up to date on the work proposed to be undertaken as part of the OCSS funding, seeks further details on timescales for this work, implications for the consenting timeframe and details of anticipated further consultations on the proposals as a result.		focused on defining the necessary building blocks, capital costs, construction and commissioning methodologies and overall programme. This study concluded that a technical solution was feasible, but drawbacks were identified in this particular application such as an increase in capital costs over the baseline, additional constraint costs driven by the need for further network outages and up to five years delay to the delivery of North Falls and Five Estuaries. The Electricity System Operator also undertook a study associated with the resultant change in power flows that arose from this OCSS proposal and the changes in connection location of the North Falls and Five Estuaries offshore windfarms. The Secretary of State for Energy Security and Net Zero reviewed the study amongst other information and decided not to grant further funding. All OCSS related work ceased and no further work is being undertaken on this OCSS proposal. The need for the Proposed Project, as a point-to-point 2 GW HVDC network reinforcement between East Anglia and Kent, remains and is being progressed solely as such. There is no requirement for offshore platforms, converter upgrades or additional OCSS interrelated network reinforcements. Any identified modifications and enhancements to the Proposed Project needed to facilitate OCSS have been shelved and do not form part of the Proposed Project DCO.
		Coordination with other projects, alternatives, design	4.6 ESC also notes that following the outcomes of the OCSS, National Grid Electricity System Operator made a commitment to review the connections in East Anglia, this work is yet to be undertaken and therefore increases the amount of uncertainty. 4.7 Notwithstanding the above, ESC acknowledges that National Grid Electricity Transmission (NGET) has endeavoured to plan for a degree of co-location, whist this is a step in the right direction, this has however not been reciprocated by the other projects. LionLink for example continues to promote a number of different landfall, cable route and converter station location options, the converter station site east of Saxmundham is just one of these options and no indication of a preferred site has been given. The degree of coordination 'buy in' from the various scheme promotors is very unclear. National Grid Ventures (NGV) has also not provided any further details of the siting and routeing options for Nautilus since their non-statutory consultation and therefore the siting and routeing options in relation to this project are unknown. It is noted that NGV are exploring a potential alternative connection for the Nautilus project at the Isle of Grain which ESC fully supports, however the feasibility of this has not been confirmed and the uncertainty surrounding the connection location for this project is very challenging.	N	The results of the ESO East Anglia Network Study were published in March 2024. The conclusions highlight that the ESO holistically assessed ten network configuration options in East Anglia, using the OCSS outcome as the baseline. Six of these options were developed by the ESO/NGET and four proposed by community representatives, ranging from onshore network configurations to a network involving no new overhead lines within East Anglia. However, from this assessment, it is evident is there is no single option that minimises impacts across all the metrics. Critical trade-offs will need to be made between the cost borne by consumers, communities hosting this nationally significant infrastructure as well as environmental considerations. National Grid is coordinating with other developers of large-scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid will set out details of how it has coordinated with other projects as part of its DCO application (**Application Document 7.10 Coordination Report**). National Grid's plans in Suffolk have been developed for the Proposed Project as a standalone project but have been designed in a coordinated way with other projects, including two potential NGV projects. As development work on the Proposed Project and these other projects has progressed, National Grid's approach to coordination has evolved. A key part of its coordination strategy is to continue to explore opportunities to co-locate infrastructure where feasible and beneficial. At Statutory consultation, National Grid presented a design which showed the NGV works themselves at the landfall and along the cable sections. It also included the entire wider

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			4.8 The lack of coordination evident between Sea Link and other proposed NSIPs connecting in the same locality is a significant concern. Should the Sea Link project continue to be progressed, maximum coordination should be inherent within the design and ambitious solutions delivered as the revised NPSs state. Coordination is considered to be more than just co-location, it is essential that there is a reduction in the disruption and environmental impacts as a result. 4.9 As stated above, coordination should be sought during all phases of the developments, not just at the siting and routeing stage, although the co-location and sharing or infrastructure/corridors at the siting and routeing stage is important. The various NSIPs are currently being proposed on the basis of multiple different timescales. In order to deliver a genuinely coordinated approach, ESC considers that National Grid PLC should seek to align their projects (Sea Link and Lionlink with the addition of Nautilus only in the event it connects in east Suffolk) both spatially but also temporally in terms of consenting and delivery. The alignment of timescales would allow a shared or conjoined examination with the appointment of the same the examining panel to consider the projects. This would not only help to reduce the huge burden on local communities and statutory consultees imposed by the consenting process, but it would also allow the robust consideration of the coordinated design and cumulative impacts of the projects. 4.10 In order to reduce the degree of disruption experienced by local communities and the adverse impacts on the environment, the delivery of Sea Link should be coordinated with other projects being delivered in the locality. As stated above, coordination should reduce the adverse impacts of the project, so in the event the projects all receive consent, we avoid the situation where each project is being delivery one after the other, with the construction effects being elongated and experienced over many years.		site at Saxmundham, to show how they could be flexible if constructing around one or two additional converter stations. This assumed a scenario where the NGV projects, whose routeing and siting work is at an earlier stage, identified the same cable and converter station sites as the Proposed Project. In March 2024, NGV's LionLink project announced that it had down selected its potential landfall at Aldeburgh and would be removing it from the LionLink proposals. LionLink is still proposing to co-locate its converter station alongside the Proposed Project's near Saxmundham. As National Grid's design work and their engagement with the NGV projects has progressed, they have evolved their approach to coordinating with NGV. They are considering further ways that they could coordinate their construction activities and other projects and developers, including NGV, EDF Energy and SPR. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Whilst there are physical similarities between the infrastructure that would comprise the Proposed Project and the Lion Link and Nautilus interconnector projects, it differs from the interconnectors in terms of the type, purpose, need and geographical location outside of Suffolk. The Proposed Project will seek consent for its own works only. However, an illustrative coordinated masterplan showing one way in which converter stations for up to three projects could be accommodated on land near Saxmundham will be include with the DCO application, for information purposes only. National Grid's approach to coordination with other projects operating in this area remains subject to ongoing dialogue. This approach has been discussed with the Suffolk Host Authorities. National Grid must also maintain its obligation to facilitate network connection agreements by providing the required network reinforcement by 2030. NGV still have a connection offer for a connection at Friston Substation for the Nautilus project. Until this offer is terminated, National Grid still needs to consider that the Nautilus project may still connect at Friston.
	Needs case	**5. Need** 5.1 The project is said to be required in order to be able to transfer energy to and from Suffolk and to and from Kent. However, in respect of exporting energy from Suffolk and Suffolk grid reinforcement, the need for the project only arises once Sizewell C, LionLink and Nautilus are all operational (the latter two are not yet consented). Therefore, the reinforcement is not yet required, and should the identified projects not become operational at the times anticipated or not be delivered at all, then presumably this changes the need for Sea Link. If Sea Link is consented; its implementation should be conditional on the other three	N	National Grid notes the Council's acknowledgement of the urgent need for new electricity transmission infrastructure and that the Proposed Project will be considered against the relevant Energy National Policy Statements (NPSs) that were published in November 2023 and came into for force in January 2024. NPS EN-1 sets out at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. The need case for the project is outlined in **Application Document 7.1 Planning Statement** and is not contingent on any other particular project going ahead.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			projects all being committed. With regard to the Kent perspective, Sea Link serves to reinforce the south coast grid but it is not considered that it has adequately been demonstrated that reinforcement by a means other than Sea Link is not possible.		In addition, National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the overriding requirement for this Proposed Project.
		Alternative solutions, needs case, community benefits/ enhancements	**6. Overview of ESC's Position on Sea Link** 6.1 ESC currently objects to the Sea Link project as it would result in further unacceptable harm to the communities, environment and economy of East Suffolk and it is not yet considered that the timing of the need for the project is currently proven, and with Sizewell C potentially at least 10 years away from generation, it is requested further consideration of alternative offshore solutions is undertaken and consider that the project does not currently include sufficient levels of coordination in all areas of the NSIP process. In reaching this position the submitted plans showing the possible siting of converter stations adjacent to the proposed converter station for this project amplify the coordination/cumulative impact concerns.	N	National Grid's plans in Suffolk have been developed for the Proposed Project as a standalone project but have been designed in a coordinated way with other projects, including two potential NGV projects. As development work on the Proposed Project and these other projects has progressed, National Grid's approach to coordination has evolved. A key part of their coordination strategy is to continue to explore opportunities to co-locate infrastructure where feasible and beneficial. At Statutory consultation, National Grid presented a design which showed the NGV works themselves at the landfall and along the cable sections. It also included the entire wider site at Saxmundham, to show how they could be flexible if constructing around one or two additional converter stations. This assumed a scenario where the NGV projects, whose routeing and siting work is at an earlier stage, identified the same cable and converter station sites as the Proposed Project. In March 2024, NGV's LionLink project announced that it had down selected its potential landfall at Aldeburgh and would be removing it from the LionLink proposals. LionLink is still proposing to co-locate its converter station alongside the Proposed Project's near Saxmundham. As National Grid's design work and their engagement with the NGV projects has progressed, they have evolved their approach to coordinating with NGV. They are considering further ways that they could coordinate their construction activities and other projects and developers, including NGV, EDF Energy and SPR. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The need case for the Proposed Project is outlined in **Application Document 7.1 Planning Statement** and is not contingent on any other particular project going ahead. The Proposed Project is needed to meet the Government's Clean Power Action Plan. Notwithstanding this, NPS EN-1 sets out at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. The Proposed Project is of a type defined by NPS EN-1 as a critical national priority (CNP). National Grid has carefully sited and developed its Proposed Project following the principles of the mitigation hierarchy and have robustly considered alternatives. NPS EN-1 acknowledges that even after the application of the mitigation hierarchy, it is likely that some significant residual effects will remain, including at paragraphs 3.1.2 and 4.1.7, the latter of which states: "Where this NPS or the relevant technology specific NPSs require an applicant to mitigate a particular impact as far as possible, but the Secretary of State considers that there would still be residual adverse effects after the implementation of such mitigation measures, the Secretary of State should weigh those residual effects against the benefits of the proposed development. For projects which qualify as CNP Infrastructure, it is likely that the need case will outweigh the residual effects in all but the most exceptional cases..." Paragraph 4.2.16 of NPS EN-1 also states that for CNP infrastructure, such as the Proposed Project: "...the Secretary of State will take as the starting point for decision-making that such infrastructure is to be treated as if it has met any tests which are set out within the NPSs, or any other planning policy, which requires a clear outweighing of harm, exceptionality or very special circumstances."
		Inter-project cumulative effects, coordination with other projects	**7. Master Planning and Good Design** 7.1 Notwithstanding the Council's position, should Sea Link alongside other NSIPs (LionLink and potentially Nautilus) be progressed within east Suffolk this should be on the basis of a coordinated approach. ESC remains significantly concerns about the cumulative impacts of multiple projects. In order to ensure the delivery of good design, it is imperative that the converter station site is appropriately master planned. Without the strategic oversight of a master plan, it will be impossible to understand whether the site can accommodate multiple projects and demonstrate the achievement of long-term good design. The masterplan should be developed collaboratively with not only the other affected NSIP promotors but also with statutory consultees, which includes the relevant town and parish councils. 7.2 The provision of an inclusive and collaborative master planning process is an important component of the delivery of good design. This collaborative process must however	N	National Grid's plans in Suffolk have been developed for the Proposed Project as a standalone project but have been designed in a coordinated way with other projects, including two potential NGV projects. As development work on the Proposed Project and these other projects has progressed, National Grid's approach to coordination has evolved. A key part of their coordination strategy is to continue to explore opportunities to co-locate infrastructure where feasible and beneficial. At Statutory consultation, National Grid presented a design which showed the NGV works themselves at the landfall and along the cable sections. It also included the entire wider site at Saxmundham, to show how they could be flexible if constructing around one or two additional converter stations. This assumed a scenario where the NGV projects, whose routeing and siting work is at an earlier stage, identified the same cable and converter station sites as the Proposed Project. In March 2024, NGV's LionLink project announced that it had down selected its potential landfall at Aldeburgh and would be removing it from the LionLink proposals. LionLink is still proposing to co-locate its converter station alongside the Proposed Project's near Saxmundham. As National Grid's design work and their engagement with the NGV projects has progressed, they have evolved their approach to coordinating with NGV.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			extend into the more detailed design phases and include genuine engagement with the local authorities, parish and town councils and local communities. It is important that the site is designed to minimise the adverse impacts through innovation and embedded mitigation and maximise any opportunities for benefits through the delivery of enhancements. Recent NSIPs consented within east Suffolk have also included an independent design review process which should be included as a commitment within any application. 7.3 Further commentary regarding the design of the project has been provided by the Design and Heritage Team within the technical comments section of the report. ESC would welcome engagement on the design approach to the converter and substations in addition to the overall master planning. It is noted that currently the design proposals appear to be limited to that of the converter station, similar consideration should be given to the design of the substation at Friston.		They are considering further ways that they could coordinate their construction activities and other projects and developers, including NGV, EDF Energy and SPR. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Design Principles are being established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. They are seeking input from independent design review panels, as recommended by the Host Authorities. The Design Principles will also be the subject of discussion with an independent Design Review Panel comprising local architects and sustainability experts, and the meetings are attended by East Suffolk Council. Friston Substation's design will be carried out in accordance with SPR's made DCOs The Design Principles are contained in **Application Document 7.12.1 Design Principles – Suffolk**. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles.
		Landfall location, construction, socio-economic, recreation and tourism	**8. Landfall** 8.1 The landfall identified is located at the seaside town of Aldeburgh, just across the road from the well-known sand and shingle beach. The site is within the Suffolk Coast and Heaths Area of Outstanding Natural Beauty (AONB) and defined Heritage Coast, Leiston-Aldeburgh Site of Special Scientific Interest (SSSI), RSPB North Warren Reserve and close to the Sandlings Special Protection Area. The town is a hugely popular tourist and visitor destination with the area heavily used year-round as a walking route between Aldeburgh and Thorpeness. In addition to the high	N	This comment and the information within have been noted. **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** assesses the impact of the Proposed Project on the Suffolk Coast and Heaths AONB. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality** assess the impact of the Proposed Project on the Leiston-Aldeburgh SSSI and the Sandlings Special Protection Area. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** assesses the impact of the Proposed Project on RSPB North Warren Reserve assess the impacts to the receptors mentioned in the response. The impact of the Proposed Project on tourism is assessed in **Application Document 6.2.2.10 Part 2**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			landscape importance of the area, Aldeburgh is also considered of great cultural significance. Further details in relation to ESC concerns regarding the impact on the tourist economy from this project in combination with other NSIP projects has been provided in the project wide section later in the report.		**Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** which includes information on Aldeburgh, RSPB North Warren Reserve and walking routes. **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** considers information related to the RSPB North Warren reserve, walking routes and tourism when assessing the impacts of the Proposed Project on Health and Wellbeing. Impacts of the Proposed Project on cultural heritage assets associated with Aldeburgh are set out in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.
		Onshore route location, design	8.2 The Preliminary Environmental Information Report (PEIR) makes the assumption that the Leiston-Aldeburgh SSSI which is part of RSPB North Warren Reserve will be crossed using trenchless techniques and therefore direct impacts on the designated sites will be largely avoided. No evidence has however been provided to demonstrate that this technique is feasible in engineering terms and therefore deliverable. Without this certainty there is potential for greater impacts to occur. Greater information, evidence and justification must be provided to demonstrate the deliverability of the trenchless technique chosen and then this technique would need to be secured within the Development Consent Order (DCO).	N	In thematic meetings it has been confirmed that geotechnical investigation has established that trenchless methods are appropriate for traversing RSPB North Warren and the SSSI, and these confirm the depth of the of bore. Details of the confirmation that trenchless technology is viable are contained in Appendix A of **Application Document 7.3 Design Development Report**. Information on the trenchless method for traversing the RSPB North Warren is within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The DCO will therefore not include an option for surface trenching in the SSSI. The detail within this Chapter has subsequently informed the assessment of the Leiston-Aldeburgh SSSI. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Construction – general, traffic and transport, landfall location	8.3 Horizontal Directional Drilling (HDD) is one of the trenchless techniques which could be adopted, but the PEIR has not considered the potential risk of 'frack out' associated with this technique and the impacts this could have. ESC has experience of other NSIP projects utilising HDD techniques and, on each occasion, 'frack outs' have occurred. The potential hydrological impact from the trenchless construction works on the designated sites has also not been assessed, it is therefore unclear what measures could be implemented to address potential impacts which could arise.	N	Commitment GH02 in the outline CoCP (**Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**) includes for the provision of a Foundation Works Risk Assessment, where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid loss. Mitigation against frac outs is also included within **Application Document 7.5.2 Outline Offshore Construction Environmental Management Plan**.
		Traffic and transport	8.4 Access to the landfall area by large vehicles is limited. The site is served by narrow roads which either travel through Aldeburgh or Thorpeness, two popular seaside destinations. The difficulties of large vehicles using the roundabout at the entrance to Aldeburgh was explored as part of the East Anglia One North and East Anglia Two projects and therefore ESC recommends that NGET revisit this information and the challenges faced.	N	The strategy for access and construction vehicle routing has been reviewed as part of the ES, and details are set out in **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Following feedback, traffic through Aldeburgh has been restricted to less than 10 HGVs daily, the majority of construction traffic will access the landfall location via the new haul road being constructed. Access to the foreshore is limited to light vehicles for monitoring purposes.
		Geology and hydrogeology, landfall location	8.5 ESC could not find any landfall impact assessments, material or reference to any consideration of coastal change or impacts on/from existing planned coastal structures within the consultation documents. If NGET has scoped coastal change from this stage of the process this is a significant oversight which should be rectified moving forwards. The	N	Chapter 2 (Physical Environment) in Table 4.2.17 of the PEIR assessed the impact of construction, operation and decommissioning on the Suffolk and Kent coastline morphology, including Sandwich Bay to Hacklinge Marshes SSSI and The Haven SSSI.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			section of the coast proposed for the landfall is managed by the Environment Agency and so the applicant should ensure they are consulted on this matter. ESC has responsibility for managing coastal frontages to the north (Thorpeness) and south (Aldeburgh) of the proposed landfall and so would have an interest in the findings of the coastal change/management impact assessment.		A more detailed assessment at each of the Suffolk and Kent Landfalls is presented within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. Coastal sediment cells, nearshore and regional sediment transport pathways are considered within **Application Document Part 4 Marine Chapter 1 Physical Environment** and identified via maps/figures where appropriate. The most recent details from the SMP, including coastal management plans for specific management units are now included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Construction - general	8.6 The impacts on residential properties must also be taken fully into consideration. The western end of the landfall and cabling corridor are in close proximity to residential properties. Construction activities taking place at the landfall site, from previous experience, will necessitate some 24-hour working which could cause significant noise and disturbance to local residents.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided at all nearby properties. Further detailed assessments will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**.
		Water environment	8.7 Flood risk is also a significant concern. The low lying Hundred River valley has the potential for surface water and tidal inundation and lies within Flood Zone 3. Flood risk from all sources of flooding must be very carefully considered.	N	Flood risk from all relevant sources has been assessed within **Application Document 6.8 Flood Risk Assessment**. The assessment considers flood risk to the Proposed Project in the present day and over its lifetime, accounting for the predicted effects of climate change, and describes the measures proposed to ensure a flood resilient design that does not cause any increase in offsite flood risk.
		Landfall location, inter-project cumulative effects, coordination with other projects	8.8 Finally, given the sensitivities of the landfall site significant further detail is required in relation to the impacts of the works at the landfall from both one project alone and cumulatively, in addition to the provision of required mitigation. ESC request that spatial and temporal coordination is fully explored as this could deliver a significant reduction in the adverse impacts socially, environmentally and economically.	N	Effect interactions between the Proposed Project and other proposed developments in Suffolk within the cumulative zone of influence have been identified and assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Further details of these effect interactions and any additional mitigation proposed are contained in this Chapter. National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
		Onshore route location, design, onshore mitigation	**9. Cable Corridor** 9.1 The cable corridor associated with the Aldeburgh landfall is heavily constrained on the eastern end by ecological and landscape designations in addition to other matters as previously highlighted. If this can be navigated, there is then a significant pinch point at the crossing of Leiston Road close to Aldeburgh Golf Club. At this narrow point the construction works would not only be near residential properties, but also have the potential to cause significant disruption to one of the main routes into the town from Leiston. Once across Aldeburgh Road the cabling would be to the north of the current golf club layout but through an area of land granted planning consent (DC/22/2697/FUL) to facilitate the expansion of the golf course and the creation of new holes. The corridor also remains within the designated AONB for the majority of its length. 9.2 The cable route continues to pass close to residential properties as it travels across to the converter station site, it is proposed the cabling will enter the Friston site from the north which involves running near residential properties and tourist businesses. The route would involve interaction with the East Anglia One North and East Anglia Two Order Limits and cable corridors which are entering the Friston site from the south. The construction works in combination with the offshore wind projects will need to be carefully considered to avoid compromising the mitigation measures already secured under the consented DCOs. 9.3 From the converter site there is a need for a High Voltage Alternating Current (HVAC) cable corridor back to the proposed Friston substation. This would result in a cable corridor entering the Friston site from the western side. The proposals in addition to the construction works associated with the East Anglia One North and East Anglia Two projects, should they be constructed, would encircle the village with construction works. 9.4 ESC requests that NGET seek to minimise disruption to both residential properties and businesses through micro siting of the route and also by providing appropriate mitigation for the works proposed. Should multiple projects be required to cable through this area, coordination both spatially and temporally will be essential. 9.5 There has been no consideration of narrowing of the cable route swathes in particular sensitive locations to reduce the impact of the cable construction works. This embedded mitigation technique was utilised on the East Anglia One	N	9.1 National Grid notes this comment. 9.2 National Grid is liaising closely with SPR on the proposed works at Friston. 9.3 Routing has looked to keep works to the east and north of Friston village, National Grid will continue to liaise with other developers to coordinate works as the Proposed Project progress. 9.4 National Grid notes this comment. 9.5 Typical construction swathes are shown within the Statutory consultation typical design details that show the requirements for the swathes, including stockpiling of materials, drainage, fencing, access and trenches. Further details are contained in **Application Document 2.13.1 Design and Layout Plans – Suffolk**. Narrowing of the swathes at sensitive areas has been applied and will continue to be developed as environmental surveys and stakeholder feedback progresses. This will include narrowing the swathe to avoid trees and hedgerows where possible or minimise impacts. Noting that where swathes are narrowed, additional space is generally needed either side of the narrow point to accommodate the additional stockpiling of materials that would be displaced. National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid will set out details of how it has coordinated with other projects as part of its DCO application (**Application Document 7.10 Coordination Document**). While efforts are being made to engage with other projects and identify appropriate ways of co-ordinating with different projects, covering several different geographical locations and on different timelines for delivery, it is not always possible to co-ordinate with all projects.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			North and East Anglia Two projects and ESC considers that such an approach should be fully considered as part of this project. In addition to this further justification is required as to why the cable corridors within the swathes cannot be reduced in width and need to be the widths specified.		
		Converter station location, cultural heritage, landscape and visual	**10. Converter Station** 10.1 Saxmundham is an historic market town set in the valley of the River Fromas, a tributary of the River Alde. The converter site lies to the east of the town and is detached from the setting of the AONB. The site is bounded to the north by the Leiston-Saxmundham Road (B1119) and to the south by a woodland block and occupies an elevated position in the landscape. The land to the north and east of Bloomfield's covert is open arable land. Modern commercial farming practice since the mid-20th Century has stripped the landscape of most key features such as field boundary hedgerows, hedgerow trees and small woodland blocks, Prior to agricultural improvement works after 1945, this area had a locally characteristic field pattern and included a substantial Ancient Woodland known as Great Wood, as well as ponds and a small plantation typical of the Ancient Estate Claylands landscape type, of which this area is part. The visual impact of the development is hard to mitigate during construction or in the early years after construction, due to the open nature of the landscape.	N	The location of the site is noted. The historic features of the Saxmundham Converter Station site, including the woodland and ponds, have been taken into consideration within the iterative design process and the indicative landscape strategy (**Application Document 7.5.7.1. Outline Landscape and Ecological Management Plan - Suffolk**). There would be localised significant effects for visual receptors, including those travelling along the B1119, as expected for the nature of this type of development. Mitigation design has been incorporated to reduce effects where possible, including hedgerow with hedgerow tree planting along the B1119 close to the receptor to maximise the screening capabilities. Landscape and visual impacts are contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 2 Landscape and Visual**.
		Construction, traffic and transport, landscape and visual	10.2 Access to the site is constrained due to the road network serving the area and the desire not to route traffic through either Saxmundham or Leiston. Multiple access routes to the converter station have been identified within the consultation. The benefits and disbenefits of each option will need to be carefully considered. For example, the access proposed to the southeast at Red House Farm would seem to cause the least landscape impact, although it would include the loss of hedgerows and landscape character, this would however involve the inappropriate utilisation of narrow rural roads for potentially large vehicles. The northern access of the B1121 would allow the centre of Saxmundham to be bypassed, however it would also result in direct impact on Carlton Park which is a locally listed historic parkland, affect trees subject of Tree Preservation Orders, roadside hedgerows and the setting of Saxmundham Conservation Area. The southern access of B1121 would similarly allow Saxmundham centre to be avoid but as a consequence have direct impacts on the Fromus valley landscape, willow woodland belt and roadside hedgerows. ESC would welcome further engagement on the access options to fully understand the	N	The southern access on the B1121 has been taken forward, which will avoid construction vehicles passing through Saxmundham. ESC has been invited to transport thematic meetings since February 2024. ESC is also invited to ecology thematic meetings where loss of ecological features are discussed. Further details regarding assessment of impacts including on the Fromus valley landscape, woodland and hedgerows are contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			proposals and level of permanence associated with each one.		
		Water environment, walking, cycling and horse riders	10.3 It is important that surface water drainage and flood risk at the site is appropriately assessed and managed given the contours and potential poor infiltration properties at the site. The Order Limits must be sized appropriately to accommodate the drainage solution for the site during both construction and operation.	N	The infiltration properties of the soils have been characterised by conducting compliant testing as part of the Proposed Project's Ground Investigations. The data has been used to inform the proposed surface water drainage designs of operational above ground infrastructure. Details of the drainage measures proposed are provided within **Application Document 6.8 Flood Risk Assessment** and space within the Order Limits has been included to accommodate surface water treatment and attenuation measures for both construction and operational stages of the Proposed Project.
		Walking, cycling and horse riders	10.4 The site is crossed by Footpaths 5 and 6 which would require diversion, it is essential that any new route provides appropriate amenity for the users. This will feed into the master planning of the site as it is important that any permanent diversion is established with the long-term future of the site fully considered, to avoid the need for subsequent diversions.	N	**Application Document 7.5.9.1 Outline Public Rights of Way Management Plan - Suffolk** has been developed in consultation with SCC and ESC. The proposed diversion routes will be designed to be of equivalent nature and connectivity to the existing sections of the routes to be closed, whilst minimising the additional journey length as far as practical. The proposed diversion routes are subject to agreement with Suffolk County Council. The opportunities for recreation have been developed in collaboration with other key disciplines including traffic and transport and socio-economics (further details are within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** and **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This has included a permanent PRoW diversion on the Converter Station site which has been designed to have a variety of experiences with some sections more open and others adjacent to woodland planting to aid screening of views towards the Suffolk Onshore Scheme. This has also included the provision of open access areas, as requested through stakeholder feedback. The existing footpath connecting southwards is shown on **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**.
		Landscape and visual, cultural heritage, converter station location	10.5 As the surrounding landscape is largely undeveloped and open, this needs to be considered alongside the setting of Wood Farmhouse and Hill Farmhouse, Grade II listed buildings. The combination of agricultural land alongside the patches of woodland strongly contribute to the setting of the listed buildings and other surrounding heritage assets. The consideration of setting has been incorrectly based solely on intervisibility and we refer the applicant to Historic England's 'The Setting of Heritage Assets: Historic Environment Good Practice Advice in Planning Note 3 (Second Edition)' (2017) which states that setting may also be understood through 'our understanding of the historic relationship between places.	N	Noted, the impact assessment examining setting impacts relating to listed buildings can be found in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Where there was potential for significant impacts on the setting of heritage assets, discussions were held with stakeholders and with viewpoint photography agreed. The assessment of impacts on the setting of the asset considered changes to the landscape/landscape character in which the assets are located, as well as aspects such as designed views.
		Cultural heritage,	10.6 A list of assets which ESC considers should be included within the assessment has been provided within the detailed technical comments. For example, no justification	N	Viewpoint photography locations, as well as assets to be taken forward to full detailed assessment, were agreed with stakeholders including the East Suffolk Council Conservation Officer following submission of the PEIR, and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		landscape and visual	has been given for scoping out the churches of St John the Baptists (Saxmundham) or Mary Magdalene (Friston). The Church of John the Baptist (Grade II*) stands on the eastern edge of the Saxmundham Conservation Area, on lower ground. While the church is some distance from the site, as medieval structures, churches have a complex relationship with the surrounding landscape, as historic religious centres, and therefore their setting is likely extensive. Further information is required if they are to be screened out. 10.7ESC would like to have further discussions with the applicant in relation to the conclusions reached on the significance of the impact on heritage assets to ensure that the harm is not being underplayed.		discussions were held regarding assets where there was the potential for significant impacts on setting. The full assessment can be found in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.
		Noise and vibration, onshore mitigation	10.8In relation to operational noise, the starting point for ESC is to seek a below background sound rating level. The acoustic character of the area is quiet and rural, and the Sea Link project will introduce a potential persistent industrial noise into this area. Projects of this scale have the responsibility and means to ensure they achieve the best possible outcome, and this begins within a thorough assessment considering all aspects of an introduced sound or noise and not simply rely on calculated levels where there is an inherent uncertainty. A robust subjective assessment which considers the character of the area and character of that noise must be undertaken. Noise creep is a concern for ESC particularly in the co-location scenario. 10.9It is noted that the assessment has indicated that with mitigation the sound levels at nearby noise sensitive receptors will be below background, this is welcomed and aligns with ESC asks. It is important that we work collaboratively to ensure that this is the best level which can be achieved, and no further reasonable improvements can be made.	N	An indicative assessment of operational noise from the proposed Converter Station is included in the ES, based on available design information and includes consideration of the existing acoustic character and context, as required by BS 4142:2014+A1:2019. The assessment has also considered guidance from the Association of Noise Consultant's Technical Note on BS 4142. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Noise creep is a justifiable concern, and this would need to be considered by any future schemes as part of their assessment, through consultation with East Suffolk Council.
		Noise and vibration, ornithology, converter station location	10.10 ESC does not currently agree with the scoping out of noise effects from new overhead lines, it is considered further assessment is necessary to justify the assumption of unlikely significant adverse effects.	N	An assessment of noise impacts due changes to the overhead lines has been conducted as part of the ES. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**.
		Noise and vibration, ornithology	10.11 In addition to the project wide ecology comments provided below, there is concern that the PEIR does not properly consider the operational impacts from noise on birds and other fauna. The current assessment limits its consideration of impacts to maintenance visits and does not consider the operational noise of the converter station.	N	Discussion of this issue are included within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. However, as discussed at thematic meetings, the Converter Station will not be a significant source of noise of a type to disturb wildlife, being comparable to that produced by other substations for which there is no evidence of wildlife disturbance.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			This should be addressed within the future Environmental Statement (ES).		
		Landscape and visual, onshore mitigation	10.12 The PEIR is not clear in relation to the role of mitigation planting in moderating the magnitude of effects overtime. In the future ES this needs to be made much clearer and should include a realistic understanding of growth rates for new planting in east Suffolk. The erratic and unpredictable rainfall patterns, notwithstanding the late summer and early Autumn of this year, can be a very limiting factor in successfully establishing new tree and shrub growth. This should be identified in consultation with ESC and once established, further photomontages should be provided to illustrate year 1, year 5 and year 15 post planting. It is essential that a master plan for the site is created to ensure that mitigation planting relied upon for one project is not compromised by subsequent projects.	N	The PEIR set out the stages of the Suffolk Onshore Scheme to be included within the assessment, including operation year 15 which is intended "to help demonstrate how proposed mitigation planting will influence effects once established". The assessment of effects during operation at both year 1 and year 15 are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Growth rates have been discussed with stakeholders in various thematic meetings, including the February and April 2024 meetings. Arboricultural specialists have prepared a report to evidence the growth rates and information has been supplied by East Suffolk Council, which has informed the height of mitigation planting shown in the year 15 visualisations, included in **Application Document 6.4.2.1 Landscape and Visual**. The request to prepare year 5 photomontages has been discussed with stakeholders at the thematic meetings and it was decided that as these do not relate to the operational assessment phases considered in the LVIA, such that they will not be prepared. The co-location illustrative masterplan information can be found within **Application Document 7.10 Coordination Document**.
		Design, inter-& intra-project cumulative effects	10.13 Further information is required in relation to the cumulative parameters of the collective development and the extent of the infrastructure sharing which would be possible. Good design must be an essential component of the project. The importance of design has also been reflected within the revised NPS EN--1 which encourages the seeking of professional advice on design aspects of the scheme. Design input should be sought at an early stage and continue throughout the consenting and post consent phases. Good design can help to lessen the visual impacts of the development which is vital given the scale of infrastructure proposed for the Sea Link project alone, and in a coordinated scenario.	N	The Proposed Project has been designed in response to National Policy Statements including in accordance with NPS EN-1 section 4.7 Criteria for good design for Energy Infrastructure. The Proposed Project also responds to local planning policy and guidance along with other design guidance, such as The National Design Guide and National Model Design Code, and will be demonstrated within **Application Document 7.11.1 Design Approach Document – Suffolk**. Volume 1, Part 2, Chapter 1, Evolution of the Suffolk Onshore Scheme identifies the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Saxmundham Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. **Application Document 7.12.1 Design Principles - Suffolk** will be provided with the application for development consent. The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid is cognisant of the requirements of national policy and has given careful consideration to how it will approach infrastructure design at a project and strategic level across all Great Grid Upgrade projects. This will be reflected in the emerging Design Principles for the Proposed Project, with further consideration of how National Grid will approach design in the consenting process at a strategic level. Design Principles are being established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. They are seeking input from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting,

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles.
		Cultural heritage, walking, cycling & horse riders, intra-project cumulative effects	**11. Connection Substation at Friston** 11.1 The proposed National Grid substation location is a sensitive site, with its historic character, proximity of listed buildings, proximity to residential properties and the settlement of Friston, flood risk, public rights of way and quiet rural positioning. Significant amounts of information were submitted as part of the East Anglia One North and East Anglia Two DCO examinations which should be carefully reviewed and taken into consideration.	N	The location and sensitivity of the substation site is acknowledged and is referred to within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Relevant information submitted within the East Anglia One North and East Anglia Two DCO examinations has been reviewed and has informed the production of the ES where relevant. This has included the review and adoption of several of the representative viewpoint locations to inform the assessment on visual amenity of the Suffolk Onshore Scheme. This is shown in **Application Document 6.4.2.1 Landscape and Visual**. The effects on landscape character and visual amenity has taken into consideration two different scenarios at Friston (Friston Scenario 1 and Friston Scenario 2) which should be referred to within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. Outline landscape mitigation which is shown on **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** which has been prepared with reference to the East Anglia ONE North and East Anglia TWO landscape plans. Impacts on the setting of heritage assets have also been assessed and are detailed in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. This included a review of the East Anglia ONE North and East Anglia TWO assessments and viewpoints considered as part of their assessment.
		Cultural heritage, converter station location, consultation	11.2 The impact of the National Grid substation on the surrounding heritage assets at Friston has been discussed at length by ESC and other stakeholders during the East Anglia One North and East Anglia Two examinations. At the scale that the substation has already been considered, there will be adverse impacts of various magnitudes on Little Moor Farm (Grade II), High House Farm (Grade II), Woodside Farm (Grade II), Friston House (Grade II), Church of St Mary (Grade II*) and the War Memorial (Grade II), and it will cause the loss of a historic track which is considered a non-designated heritage asset. Should the National Grid substation at Friston need to be extended, this would likely worsen the impacts on these heritage assets. Some of the assets have however been scoped out of the assessment which ESC disagrees with. 11.3 As previously stated in relation to the converter station site, no justification has been provided for scoping out the church of Mary Magdalene. A full list of the assets which should be assessed has been included within the technical comments provided later within this report.	N	Impact assessment examining setting impacts can be found in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. All assets where there was the potential for significant impacts on the setting of heritage assets were discussed with stakeholders at thematic meetings and viewpoint photography locations agreed with East Suffolk Council Conservation Officer and Historic England. Impacts on the setting of Saxmundham, including the Church of St Mary, are assessed as part of **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			11.3In addition to the above assets, Friston Hall is a Grade II listed building located within the village, development within the curtilage is likely to impact its setting and significance, this is not currently acknowledged within the consultation material. More information is required on the loss of a formal landscape historically to better understand impact on the setting of the listed building.		
		Water environment, legislation and policy	11.4 It is noted that the PEIR chapter on existing flood risk and drainage fails to acknowledge historical surface water flooding which has been experienced downstream in Friston. The village has been subject of surface water flooding on multiple occasions. Suffolk County Council as the Lead Local Flood Authority has undertaken s19 investigations under the Flood and Water Management Act 2010 which should be taken into account within the documents. This omission should be addressed within the ES. 11.5 It is vitally important that there is sufficient space on site to accommodate an acceptable construction drainage design in addition to understanding the implications of the operational drainage design and its interaction with the drainage proposals consented under the East Anglia One North and East Anglia Two projects.	N	Since preparation of the PEIR, National Grid has liaised regularly with Suffolk County Council in its role as LLFA to gather information on flood risk sensitivities at Friston, including review of all relevant S19 Reports and data from the Friston Surface Water Management Plan. This information has informed **Application Document 6.8 Flood Risk Assessment** that has been prepared for the Proposed Project and has guided the measures embedded within the design of the Proposed Project to manage surface water runoff and land drainage. The Proposed Project has also engaged robustly with the East Anglia ONE and TWO project teams to provide for holistic and complementary drainage solutions.
		Noise and vibration, ornithology, onshore environmental impact	11.6 In relational to operational noise, ESC does not agree with the scoping out of the substation at Friston on the basis that the switchgear noise emissions would be impulsive in character and operation would be infrequent. Insufficient justification has been provided to support this decision. This substation is subject of a site rating level imposed by East Anglia One North and East Anglia Two DCOs, therefore NGET needs to be very confident that the introduction of a further or different equipment will not impact that constraint. 11.7 As identified above, it is important that the impact of the operational noise of the substation is considered in relation to birds and other fauna.	N	An assessment of noise impacts from the proposed Friston Substation has been conducted as part of the ES. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The proposals for Friston substation as part of this Project are no different in noise terms to those proposed as part of the East Anglia One North and East Anglia Two projects. As such, no further or different equipment is proposed which would impact the constraints. Discussion of this issue is included within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. However, as discussed at thematic meetings with ESC, the Saxmundham Converter Station will not be a significant source of noise of a type to disturb wildlife, being comparable to that produced by other substations for which there is no evidence of wildlife disturbance.
		Coordination with other projects, health and wellbeing, consultation	11.8 The proposals in relation to the overhead works differ considerably from that proposed under the east Anglia One North and East Anglia Two projects. It is important that NGET and Scottish Power Renewables work together to communicate any changes and reasons for these, so it is understood whether these have been identified collaboratively. Further detail is required in relation to the interactions of the projects in this regard. 11.9 The local community has been subjected to a number of years of uncertainty as a result of the East Anglia One North	N	11.8 The proposed overhead works for the scenario where Friston Substation is built as part of the Proposed Project are those required to meet the specific requirements of the Proposed Project and therefore may differ from the proposals set out by the East Anglia ONE North and East Anglia TWO projects. Further details relating to the design for the Proposed Project, are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. 11.9 This comment is noted. National Grid has engaged with the key stakeholders and the local community throughout the design development stages in advance of submitting the planning application through specific

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			and East Anglia Two DCOs, the current consultation proposes to increase the amount of infrastructure in the area. NGET should be aware of the detrimental impact this will be having on the affected local community. It is essential that NGET appropriately engages with the local communities and parish and town councils. The issue of the impact on wellbeing will be felt across this area of the district but will be intensified in communities which have been subject of previous NSIPs proposals.		thematic meetings, Non-statutory consultation, Statutory consultation and Targeted consultation. This process was undertaken in accordance with the SoCC which itself was subject to extensive consultation with the host LPAs and prepared in accordance with all applicable statutory requirements pursuant to the Planning Act 2008 and the Infrastructure Planning (EIA) Regulations 2017 as well as other relevant guidance. National Grid has taken note of all views expressed in response to Statutory consultation (and indeed all other consultation and engagement activities undertaken). Further details on the consultation process and feedback received are contained in **Application Document 5.1 Consultation Report**.
		Terrestrial ecology, onshore environmental impact, consultation	**12. Project Wide Comments** 12.1 Ecology 12.1.1 A significant amount of ecological survey work remains outstanding, in addition to some survey work which has been undertaken not being provided for review, the combination of this has limited the ability for ESC to provide detailed comments on the ecological impacts and also the avoidance, mitigation and compensation measures which would be suitable to address these. 12.1.2 The use of terms such as 'where feasible and necessary' within the consultation documents is unhelpful and provides a significant degree of uncertainty in relation to the deliverability of the commitments made. If an assumption is made within the PEIR or future ES and that assumption is utilised for the basis of the assessments, then this must be secured within the DCO and form a firm commitment. Alternatively, the assessment should be based on the worst-case scenario.	N	Where the PEIR previously contained levels of ambiguity, these areas have been further clarified with more firm commitments including installing visual and noise disturbance screening. These commitments are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of **Application Document 3.1 draft Development Consent Order**. Further ecological surveys have been conducted and ecological reports have been shared with East Suffolk Council as they were completed and their findings discussed in thematic meetings. Further information and ecological assessment is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and the associated appendices.
		Landscape and visual, terrestrial ecology	12.1.3 In previous examinations there has been significant discussion in relation to growth rates and the agreed period of time planting would take to grow or be restored. It is important that growth rates are agreed with ESC prior to the ES assessments being undertaken on the basis of assumptions made. It is noted that in the PEIR for example, it is stated that the hedgerows will be restored within 1-2 years, there is no justification of this statement and in the Council's experience this is not likely to be achievable. 12.1.4 The provision of 10% Biodiversity Net Gain (BNG) is welcomed, ESC would however want to raise at this early stage that it is expected that 10% BNG will be delivered in both geographical locations independently (i.e. Suffolk and Kent).	N	National Grid acknowledges this feedback. Growth rates were discussed with East Suffolk Council at the thematic meeting in February 2024. Further information on growth rates is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Two Biodiversity Net Gain assessments have been undertaken for each LPA, one for Suffolk and one for Kent. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Noise and vibration, construction, design	**12.2 Construction Noise** 12.2.1 The use of BS5228 – Code of practice for noise and vibration control on construction and open sites along with the ABC methodology within that code, is accepted. The working	N	12.2.1 Acceptance of the BS 5228 ABC methodology is noted. Since publication of the PEIR within Statutory consultation, the proposed construction working hours have changed, although Saturday working hours remain the same. Shortening working hours would potentially extend the

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			hours however set out in the Outline Code of Construction Practice (OCoCP) identify Saturday working at 07:00-17:00. ESC does not currently consider that Saturday afternoon working is acceptable. Saturday working hours of 07:00-13:00 were set as part of the East Anglia One North and East Anglia Two projects and should be complied with on the Sea Link project. 12.2.2 ESC has concerns about the magnitude of impact which has been determined by the Design Manual for Roads and Bridges (DMRB). There is a concern that the levels set provide a false representative of the scale of magnitude and downplay the actual magnitude of impact, a medium impact being the highest theoretically achievable level of impact. Further details are provided in the technical comments later in the report, but ESC would welcome further discussions on the magnitude of impact methodology. ESC has similar concerns in relation to the use of DMRB and the inclusion of above SOAEL magnitude levels in the magnitude impact thresholds, SOAEL being a level to be avoided. 12.2.3 ESC notes that Best Practicable Means (BPM) will be implemented which is welcomed, this should be committed to at all times with work and any noise mitigation carried out to BPM to ensure noise and vibration are kept to a reasonable minimum and not just below the relevant thresholds. BPM is a critical control point for a project of this scale.		working programme and put at risk delivery of the Proposed Project by 2030. The change in working hours has been consulted on, including with East Suffolk Council, as part of the Targeted consultation. Details relating to the proposed construction working hours and any associated restrictions are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. 12.2.2 The DMRB magnitude scale clearly indicates the criteria for a large magnitude impact and therefore the statement that 'a medium impact being the highest theoretically achievable level of impact' is incorrect. A medium magnitude impact is defined as an average construction noise level between the SOAEL and 5dB above the SOAEL, while a large magnitude impact is defined as an average construction noise level greater than 5dB above the SOAEL. The SOAEL is defined as the relevant 'A' criteria from the ABC method for the relevant time period. Medium and large magnitude impacts (i.e. those above the SOAEL) are considered to be a potential significant adverse effect at sensitive receptors where they are of sufficient duration and would therefore be sought to be avoided through best practicable means. The methodology and assessment criteria is therefore in line with the suggestion in the comment. 12.2.3 The contractor will be required to implement best practicable means to reduce the impacts of noise and vibration during construction for all works. However, any mitigation measures employed will be proportionate to the level of risk, with a greater focus on activities which are likely to cause the greatest impact. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**.
		Water environment, consultation	**12.3 Private Water Supplies** 12.3.1 The district has a number of private water supplies that could be sensitive to construction works and therefore ESC would invite NGET to engage with us to ensure that there supplied are protected.	N	Private water supply information has been obtained from the Local Authorities and included within **Application Document 6.3.2.5.B ES Appendix 2.5.B Groundwater Risk Assessment** as a receptor where available. National Grid is maintaining ongoing discussions with affected landowners. Where interfaces with assets such as private water supplies are identified, appropriate mechanisms for safeguarding these will be identified.
		Climate change, air quality	**12.4 Air Quality** 12.4.1 ESC notes that a detailed air quality assessment will be carried out at the ES stage once further data is available. It is understood that at this stage Non Road Mobile Machinery (NRMM) will be considered further, however the Council would like to see a commitment to reduce emissions from this source which should include commitments to use renewable energy sources alongside Stage 4 NRMM as a minimum and Stage 5 where possible.	N	NRMM emissions have been considered in the air quality assessment as detailed in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**. Several control measures relating to NRMM emissions have been included in the CEMP (**Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**) including; AQ04 - Avoid the use of diesel or petrol powered generators and use mains electricity or battery powered equipment where practicable. Impose and signpost a maximum speed limit on unsurfaced haul roads and work areas; AQ09 - Ensure all equipment complies with the appropriate Non-Road Mobile Machinery standards. Use stage 4 NRMM as a minimum and stage 5

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					where possible. Additionally, where possible, use alternative / renewable energy to power NRMM; and GG10 - Any activity carried out or equipment located within a construction compound that may produce a noticeable nuisance, including but not limited to dust, noise, vibration, and lighting, will be located away from sensitive receptors such as residential properties or ecological sites where practicable.
		Geology and hydrogeology, agriculture and soils	**12.5 Land Contamination** 12.5.1 In terms of land contamination, whilst ESC accepts the risk of contamination may be low, this does not preclude the possibility of unknown contamination and therefore a management plan which provides a robust strategy and procedures for managing contamination should be provided and agreed with ESC.	N	A commitment to provide a protocol for dealing with unexpected contamination is included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which will be developed prior to construction.
		Landscape and visual	**12.6 Landscape** 12.6.1 In addition to the comments previously provided within the response, ESC has concerns regarding some of the value assessments given to selected viewpoints, further justification is required in relation to these judgements, and this discussed further with the Council. 12.6.2 ESC would also expect tree and hedgerow surveys to be carried out to identify the most important landscape features and details provided of how to protect them.	N	The value judgements and the reasoning for the representative viewpoints are presented within **Application Document 6.3.2.1.B ES Appendix 2.1.B Landscape Baseline**. The value judgements were issued to stakeholders on 16 September 2024 for comment; however, no response was received upon the finalisation of this response in December 2024. Tree and hedgerow surveys have been undertaken to inform the ES and important hedgerows which consider both ecological and heritage factors are set out within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document ES 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Further details on the control and management measures that relate to hedgerows are outlined within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**. The Important Hedgerows under the Regulations have been considered within the landscape and visual impact assessment. Further details are contained in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.
		Socio-economic, recreation and tourism, community benefits/ enhancements	**12.7 Socio-economic** 12.7.1 The visitor economy is one of the largest sectors in east Suffolk accounting for 15% for all employment in the district. The continued success of this sector of the economy is dependent on the areas reputation as a holiday destination and the overall experience offered to visitors. ESC is concerned that the impact of Sea Link in combination with other significant infrastructure projects proposed and consented in the locality will negatively affect the visitor experience, damaging the reputation and perception of the district as a holiday designation, ultimately adversely affecting the visitor economy. It is essential that this impact is appropriately considered and assessed, and appropriate mitigation provided to support the success of the sector.	N	A complete assessment of socio-economics effects has been undertaken which includes assessment of receptors typically used by visitors. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-economics, Recreation and Tourism**. The Chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. With regard to employment on the Proposed Project, the Chapter estimates around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes. Further information can be supplied regarding employment opportunities following the appointment of a Main Contractor.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			12.7.2 The potential benefits of the direct and indirect temporary employment are welcomed but it is essential that these opportunities are accessible to the resident population of east Suffolk.		
		Inter-project cumulative impacts, onshore mitigation combined effect of the proposed project	**12.8 Cumulative Impacts** 12.8.1 The PEIR considers the list of projects to be taken forward as part of the cumulative impacts assessment. It is noted that only projects and impacts considered to crossover with the anticipated peak construction period (2029) of the Sea Link project have been included for final assessment. Cumulative impacts with other projects, particularly NSIPs should not be scoped out on the basis of uncertain construction programme forecasts. For several reasons including legal and funding challenges a number of the consented NSIPs including East Anglia One North, East Anglia Two and Sizewell C, have not been able to follow the construction timescales they predicted during their examinations. It is therefore essential that NGET do not arbitrarily scope out projects which are known to be delayed based on their originally predicted timeframes. Similarly, it is important that Sea Link consider the implications of delays to their own project. ESC is significantly concerned about the cumulative impacts of the Sea Link project alongside other significant infrastructure projects; it is essential that the assessment undertaken is robust to ensure the full extent of the impacts are understood and appropriate mitigation measures are provided. This includes the consideration of cumulative impacts outside the identified peak construction year.	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in the Inter-Project Cumulative Effects chapter of the ES for each discipline, including traffic and transport. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** is based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**, which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, Nautilus, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. A conservative approach was adopted when identifying other projects which could have an overlap with the construction programme of the Proposed Project. The traffic and transport cumulative assessment considers the additional traffic to be generated across the highway network (within the study area) by the Proposed Project and other cumulative schemes, based on the same assessment criteria assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Robust assumptions have been made with respect to adopting peak construction traffic flows associated with Sizewell C and the SPR schemes, as well as with other committed developments where necessary. Construction/ operational traffic has been included as part of the assessment for committed developments where there is the potential for this traffic to overlap with the construction phase for the Proposed Project, i.e. during the five year period, not just the peak construction year.
		Onshore mitigation, community benefits/ enhancements, consultation	**12.9 Community Compensation** 12.9.1 If the scheme is consented by the Secretary of State, there needs to be adequate compensation for the communities that will be adversely affected. The Council would welcome early engagement with the applicant on this matter. 12.9.2 It is important that community benefits remain distinctly separate from the need to adhere to the mitigation hierarchy, firstly to avoid, then to mitigate and only if mitigation is not adequate to compensate. As part of this process, it is important that consideration of long term enhancement and legacy opportunities are maximised.	N	Community benefit is separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Converter station location, design,	**13. Detailed Comments from Technical Officers** **13.1 Design and Conservation Comments** **13.1.1 Convertor Station Design**	N	The description of the Suffolk Onshore Scheme is located within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The maximum parameters of the Proposed Project have been used as a reasonable worst case scenario to inform the assessment of

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		landscape and visual	1.1.5: It is unclear how the completed convertor station will appear, as it is noted that it could be 'up to 26 metres high, plus roof mounted equipment, which may include lightning protection, aerials and walkways. These factors are important in considering visual impact. Likewise, regarding the perimeter fencing to enclose and era of approximately 6.5 hectares. 1.1.6: Positive consideration of design is welcome; however, this would need to take account of the surrounding landscape and the setting of heritage assets in the vicinity. 2.1.4: As the surrounding landscape is largely undeveloped ('unspoilt') this needs to be taken into account, as well as the setting of Wood Farmhouse and Hill Farmhouse, Grade II Listed Buildings. It needs to be stressed that the combination of agricultural land as well as the patches of woodland which define the area strongly contribute to the setting of the above listed buildings, as well as other surrounding heritage assets, in terms of both their character as well as understanding their context and historical development. It is suggested that colour be considered in light of the surrounding landscape. 2.2: It is not considered that the enhanced elevations approach would be appropriate. While acknowledging the deliberate choice of colours in regard to the surrounding landscape, the structure will likely still remain conspicuous and visually impactful. This approach may also result in harm to the setting of surrounding heritage assets. It would be useful to have existing examples displayed to better understand the potential visual impact. 2.2.3: It is noted that the convertor station will likely be visible from the B1119, increasing its visual impact. 2.3: It is unclear how the use of coloured horizontal banding can be applied successfully. While the illustration provided shows a relatively seamless integration with both land and sky, in reality that would depend on being in a specific location and looking at a specific angle. The change of seasons, as acknowledged in 2.2.2, would invalidate the colour scheme chosen for at least part of the year, making the structure more visually intrusive. It would be useful to have existing examples demonstrated to better understand the potential visual impact. It is not considered that the use of coloured banding would therefore be appropriate, as it may result in harm to the setting of surrounding heritage assets. 2.4: The green roof approach may offer the best approach in terms of mitigating visual impact and minimising harm to the setting of the surrounding heritage assets. It appears to allow the structure to be incorporated into the landscape unobtrusively. It would be useful though to have existing		effects on landscape character and visual amenity, presented within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and is shown on the visualisations within **Application Document 6.4.2.1 Landscape and Visual**. The outline landscape mitigation for the Suffolk Onshore Scheme (**Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**) has been developed to consider the surrounding landscape and setting of heritage assets where relevant to landscape character. Although colour will not be secured within the DCO application, colour has been considered and is detailed within the design principles within **Application Document 7.12.1 Design Principles - Suffolk**. There would be localised significant effects for visual receptors, including those travelling along the B1119, as expected for the nature of this type of development. Mitigation design has been incorporated to reduce effects where possible, including hedgerow with hedgerow tree planting along the B1119 close to the receptor to maximise the screening capabilities. The impacts on specific heritage assets are acknowledged. National Grid will seek to identify solutions to these issues through ongoing dialogue with East Suffolk Council in thematic meetings. These discussions will inform the iterative approach to the design of permanent infrastructure. With regard to the potential impacts, the LVIA assumes a worst case scenario and the design principles are intended to create a better scenario that reduces the impacts identified. Many of the specific comments about the design approaches that were put forward during Statutory Consultation will be the subject of Design Panel Review discussions.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			examples displayed to better understand the potential visual impact. 2.5: While acknowledging that the agricultural barn approach seeks to evoke the district's existing rural architecture, it is considered that the scale of the structure will greatly exceed the size of most local farm buildings. It is noted that while the gabled roofs also appear to have been chosen to reflect local agricultural architecture, their repetition as illustrated would likely be overly conspicuous, increasing the building's visual impact. It would be useful though to have existing examples displayed to better understand the potential visual impact. It is considered that the agricultural barn approach would be appropriate, as it may result in harm to the setting of surrounding heritage assets. 2.6: The colour and curve approach may be acceptable, though it would likely need to be carefully designed to be successful. However, there is still the potential that this design may result in harm to the setting of surrounding heritage assets. It would be useful though to have existing examples displayed to better understand the potential visual impact. 2.7: The kinetic approach is unlikely to be appropriate due to its conspicuousness and distinctive alienness in the surrounding landscape. This is noted in 2.7.3, which acknowledges that this design choice would likely be better suited to the Kent site.		
		Cultural heritage, landscape and visual	**13.1.2 Preliminary Environmental Information Report** 5.3.5: Setting erroneously only considered in terms of intervisibility, whereas it also includes the historic relationship between heritage assets and the wider landscape. PEIR: Vol. 1, Part 2, Chapter 4 (Cultural Heritage) 2.4.1.4 - 2.4.1.5: These should be included as appendices in the document. 2.4.4.5: Limited understanding of setting has been incorrectly based solely on intervisibility. Historic England's 'The Setting of Heritage Assets: Historic Environment Good Practice Advice in Planning Note 3 (Second Edition)' (2017) states that setting may also be understood through 'our understanding of the historic relationship between places. For example, buildings that are in close proximity but are not visible from each other may have a historic or aesthetic connection that amplifies the experience of the significance of each'. 2.4.6.2: Figure 1.1.2 not included in document. 2.4.6.3: Figure 2.4.2 not included in document. 2.4.7.3: Is a full list of listed buildings available?	N	Comments relating to the PEIR are noted. **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** contains the full impact assessment which includes a full assessment examining setting.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			2.4.8.3 – H02: East Suffolk Council should always be informed of any discovery. MSF23092: Friston Hall a Grade II Listed Building, therefore development in its curtilage is likely to impact its setting and significance (not acknowledged in the preliminary assessment). More information required on the loss of a formal landscape historically to better understand impact on the setting of the listed building. MSF43589: No comment (archaeology)		
		Landscape and visual, cultural heritage	2.4.9.14: No justification has been given for the scoping out of the churches of St John the Baptist or Mary Magdalene. As medieval structures, these churches have a complex relationship with the surrounding landscape, as historic religious centres, and therefore their setting is likely extensive. Further information is required if they are to be screened out. 2.4.9.14: Blank third bullet point. 2.4.9.14: Disagree that Sternfield House, Little Moor Farmhouse, High House Farmhouse and Hill Farmhouse merit scoping out. 2.4.9.14: Agree with conclusion regarding Friston Post Mill. LB1231179: Disagree that existing outbuildings will provide screening, as there are extensive views east from the east elevation of the farmhouse. Likewise, regarding vegetation, for though there are trees surrounding the house, these are largely directly south and will provide limited screening looking south-east. Unclear what statement 'farmhouse was not designed to have long ranging views over the surrounding landscape' means. The wider agriculture landscape contributes to the setting of the farmhouse by reinforcing an understanding and appreciation of its historic function, which continues to the present. Similarly, while not designed as a landmark, the farmhouse nonetheless provides a prominent visual marker in the landscape. Agree with the statement 'it is, however, acknowledged that the agricultural fields that surround the farm represent a component of the farms setting, and the loss of some of these fields will erode the agricultural setting of Wood Farm'. Likely significance of effect given as 'not significant'; however, this does not appear to comply with table 2.4.7.	N	Comments relating to the PEIR are noted. **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** contains the full impact assessment which includes a full assessment examining setting which is based on further baseline data that was collected since production of the PEIR, as well as additional site visits, the production of visualisations and design alteration.
		Landscape and visual	LB1268178: Whilst the description of significance is largely agreed with, it should be noted that Wood Farm historically formed part of the Hurts Hall estate, and therefore is considered to form part of its setting.	N	The effects on the setting of heritage assets are assessed within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Representative Viewpoint 1 is located in close proximity to Wood

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Whilst the conclusion on impacts are largely agreed with, it should be noted that Wood Farm is considered to form part of the setting of Hurts Hall and hence should also be taken into consideration. Similarly, views from the former track leading to Wood Farm should be taken into consideration. Likely significance of effect given as 'not significant'; however, this does not appear to comply with table 2.4.7.		Farm and the anticipated effects are detailed within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Wood Farm Grade II listed building has been assessed within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** and is not expected to experience any significant impacts. Methodology tables have been updated in accordance with those agreed at scoping.
		Landscape and visual, design	LB1215749: The description of significance is largely agreed with. However, we would disagree with the assertion that 'it does not appear to have been designed to be a prominent feature in the wider landscape'. Buxlow Manor appears to have been designed as a high-status dwelling, apparently dating from 1678 according to the listing description. Built to an E-shape plan with three prominent Dutch gables, the building is clearly intended to advertise its status, and as such may be considered a prominent feature, regardless of current vegetation and screening. It is unclear how well screened the house would be from the proposed converter station, though it is acknowledged that the existing hedgerows would provide some mitigation. However, it does appear that there are clear views across the valley looking west and south-west. It is possible that the proposed converter station could be even more visible from the first and second stories of Buxlow Manor. I also disagree with the statement: "the house does not appear to have been designed to be a prominent feature in the wider landscape and was rather built to occupy a key location on the north side of the green of the settlement of Knodishall Green". for the reasons given above. The significance of effect given is 'not significant', however this does not appear to comply with table 2.4.7.	N	Further assessment of the potential for impacts on the setting of Buxlow Manor was undertaken in consultation with East Suffolk Council and Historic England as part of the process of agreeing viewpoint photography. As part of this process, it was agreed that viewpoint photography would not be required from Buxlow Manor in January 2024. The full assessment of potential impacts on the setting of heritage assets is contained in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**.
		Cultural heritage, converter station location	LB1287864: The description of significance is largely agreed with but note that no consideration has been given to the church's wider setting. As a medieval religious structure, Friston Church likely has a complex relationship with the surrounding landscape, being a local religious centre. It is agreed that views of the convertor station from the church would likely be limited due to existing vegetation and screening. However, it is less certain if the proposed structure would affect the church's visual dominance in the landscape, especially from further views. Likely significance of effect given as 'not significant'; however, this does not appear to comply with table 2.4.7.	N	Viewpoint photography locations have been agreed with stakeholders including East Suffolk Council, and discussions have been held regarding assets where there was the potential for significant impacts on setting. Church of St Mary in Friston (NHLE 1287864) was not identified as a heritage asset that would result in impacts from the Proposed Project and is therefore not assessed. For further details on the effects on the setting of heritage assets please refer to **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. The results of the East Anglia ONE North and East Anglia TWO schemes (which were consented, with construction works started in the form of archaeological mitigation) have also been cross-referenced, and form part of the Proposed Project assessment. Methodology tables have been updated and in accordance with those agreed at scoping.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The following heritage assets be considered in regard to both the Saxmundham and Friston sites: • Saxmundham Conservation Area • Church of St John the Baptist, Saxmundham (Grade II* LB) • Oak Tree Farmhouse (Grade II LB) • Hill Farmhouse (Grade II LB) • The Limes (Grade II LB) • Garden Cottage (Grade II LB) • Church of St Mary Magdalene, Sternfield (Grade II*) • Sternfield War Memorial (Grade II LB) • Sternfield House (Grade II LB) • High House Farm (Grade II LB) • Little Moor Farm (Grade II LB) • Woodside Farm (Grade II LB) • Friston House (Grade II LB) • Friston War Memorial (Grade II LB) • Nos. 1 and 2 (Church Walls) and 3 and 4 (Church Walls Cottage) (Grade II LB) • Track previously identified as an Non Designated Heritage Asset		
		Terrestrial ecology, design, onshore mitigation	**13.2 Ecology Comments** It is noted that there is a significant amount of ecological survey work that remains to be undertaken and therefore it is not possible to provide detailed comment on all potential impacts at this time. 13.2.1 Statutory Designated Sites The PEIR identifies that the landfall location for the cable limit of Deviation (LoD) crossPart of the Leiston-Aldeburgh Site of Special Scientific Interest (SSSI) and RSPB North Warren Reserve. The assessment assumes that this site will be crossed using a trenchless technique (e.g., at section 2.3.5.55 and Table 2.3.14) and therefore direct impacts on the designated site will be largely avoided, resulting in a Negligible Adverse, Not Significant effect on the SSSI. However, it is unclear whether the assumption that this type of construction method is deliverable in this location is justified. In the absence of adequate demonstration that trenchless installation is achievable, the selection of this landfall area means that the	N	Full ecological surveys have been undertaken and their results and an impact assessment including assessment of frac out risk and measures to avoid frac out are set out in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. In thematic meetings it has been confirmed that geotechnical investigation has established that trenchless methods are appropriate for traversing RSPB North Warren and the SSSI, and these confirm the depth of the of bore. They have also confirmed that frac out is only a risk for the final stretch of trenchless crossing beyond the RSPB reserve. The commitment to trenchless methods through the landfall and measures to address frac out are cited in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC),** secured Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Commitment GH02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** includes for the provision of a Foundation Works Risk Assessment, where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid loss. The Proposed Project is therefore not including an option for surface trenching in the SSSI.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			project has the potential to result in a much greater impact on the designated site than is set out in the PEIR. The use of a trenchless technique (such as horizontal directional drilling) comes with its own potential construction impacts, such as the risk of 'frack out' of the drilling compound/material (e.g., bentonite), the risk of such impacts occurring and assessment of the impacts which they may have on the designated sites and the species which it supports must be assessed and addressed as part of the proposal. Justification of the selected landfall location and adequate demonstration that the proposal can be delivered without result in adverse impacts on the designated site are essential. It is also noted that assessment of the potential hydrological impacts from trenchless construction on the designated site remain unassessed at this time, although Table 3.2.22 states that the project will "Implement measures to ensure no significant hydrological impact on water levels in North Warren RSPB Reserve". In the absence of such assessment, it is unclear what measures could be implemented to address this potential impact. This must be adequately assessed and addressed as part of the project. 13.2.2 Non-Statutory Designated Sites: The selection of the route to avoid County Wildlife Sites (CWSs) is welcomed.		
		Terrestrial ecology	13.2.3 Protected Species – Bats: As recognised in section 2.3.5.32 and Table 2.3.7, new bat survey guidelines1 have recently been released. It must be ensured that bat surveys programmed for 2024 are undertaken in accordance with these guidelines, and that where necessary surveys undertaken in 2023 that significantly deviate from the new guidelines are either updated or their validity justified as part of the Environmental Statement. Section 2.3.5.34 makes reference to bat activity transect surveys which have been, and which are being, undertaken. However, it is not clear which transect routes have been selected. Further information on this is required so that it can be ensured that all necessary areas have been adequately covered by these surveys. Section 2.3.5.39 identifies that bat activity static detector surveys are yet to be undertaken but are programmed for 2024. It must be ensured that such surveys have sufficient seasonal coverage to meet the best practice guidelines and appropriate inform the Table 2.3.8 sets out the ecological significance categories proposed to be used as part of the Environmental Statement. The applicant's attention is drawn to the guidance	N	National Grid acknowledges this feedback. Detailed bat activity surveys have been undertaken, informed by the latest guidance, and the survey transects, results and an impact assessment are set out in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and associated survey appendices.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			on this matter for assessing impacts on bats which is set out in the newly published Bat Mitigation Guidelines 2. It is requested that the Environmental Statement takes account of this guidance in relation to assessing potential impacts on bats. assessment within the Environmental Statement.		
		Terrestrial ecology	13.2.4 Protected Species - Hazel Dormouse: In addition to the use of nest boxes/nest tubes to survey for hazel dormouse (sections 2.3.5.40 and 41), it is strongly recommended that footprint tunnels are used in conjunction with the nest boxes/tubes. Whilst it is acknowledged that this method alone is not currently accepted as demonstration of absence of this species from a site, it is known to increase the likelihood of detection of dormice if they are present. It is therefore considered to be a good companion technique, alongside nest boxes/nest tubes, for establishing presence of this species.	N	This was discussed at the thematic meeting in February 2024 and it was confirmed that since they are not part of current survey guidelines, footprint tubes would not be used in the survey.
		Ornithology, terrestrial ecology	13.2.5 Breeding and Wintering Birds: It is noted from sections 2.3.5.22 and 2.3.5.25 that the wintering and breeding bird surveys undertaken to date have predominantly been carried out from public rights of way. Whilst the report states that this “enabled good coverage”, no plans of this coverage are provided and therefore it is impossible to confirm whether this statement is correct. Given the high value of many habitats in the potential cable corridor for wintering and/or breeding birds, and the need to collect at least two seasons of survey data (as per section 2.3.5.55), it is essential that it is ensured that sufficient survey coverage has been achieved, otherwise there will be insufficient information available to allow full assessment of the likely impacts of the proposals on wintering and breeding birds. Many of these bird species are also features of the statutory designated sites in the area, and although the project seeks to avoid any direct impacts on such sites, given the potential for disturbance impacts as a result of construction it is also essential that adequate survey information is available to assess such impacts.	N	The breeding and non-breeding bird reports have been provided to East Suffolk Council, which includes maps of survey coverage. National Grid is seeking to ensure survey coverage is maximised for the second season of surveys so that sufficient information is obtained.
		Onshore environmental impact, onshore mitigation	13.2.6 Assessment of Potential Ecological Impacts: As set out in the PEIR and above, there is a considerable amount of ecological survey information which is still to be gathered, as well as a considerable amount which has been gathered but not made available to consideration. It is therefore not possible to provide detailed comments on all of the likely ecological impacts, or avoidance, mitigation or compensation measures which may be suitable to address these. However,	N	National Grid acknowledges the comments. Further ecological surveys have been undertaken and assessment of impacts and proposed mitigation is contained within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			based on the information provided in the PEIR I have the following initial comments.		
		Onshore mitigation	13.2.7 General approach to avoidance and mitigation measures: Whilst it is acknowledged that the project seeks to embed a number of ecological avoidance and mitigation measures within it, it is concerning that many of these, such as the use of trenchless construction techniques or deployment of physical noise mitigation measures, are caveated with the phrase “where feasible and necessary”. It is unclear how this test will be determined or what will happen if it is decided that a particular measure is necessary but not feasible? Many of these potential measures are related to avoiding or mitigating impacts on areas of high biodiversity importance, including nationally and internationally important nature conservation sites, and if such measures are deemed to be unfeasible then significant adverse impacts are likely to occur. If adequate measures following the mitigation hierarchy (avoid, mitigate, compensate) cannot be identified and implemented then unacceptably harmful ecological impacts will occur. In addition to the embedded measures described in the report, it is noted that no reference to the use of narrowed cable construction working widths near particularly sensitive habitats is included. This is a measure which has been secured as part of other similar projects in the district, and it should form part of this proposal unless it is adequately justified why it is not necessary. Finally, Table 2.3.13 (Preliminary assessment of direct loss of habitats during construction or decommissioning) should identify that the first step is to seeks to avoid direct habitat loss, particularly permanent loss at the converter station and substation sites, through the design of the infrastructure. Only if it is appropriately justified that full avoidance is not possible should mitigation measures be pursued.	N	The feasibility of mitigation generally relates to technical feasibility. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** outlines the mitigation to be deployed (including trenchless methods for the Suffolk landfall) and this does include narrowing the cable corridor wherever hedgerows are to be traversed to 20 m (39 m where the HVAC and HVDC cables are both required). **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** also explains that avoidance of hedgerow removal (through for example the use of trenchless construction solutions) was considered but deemed not feasible or appropriate. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** also sets out the habitat creation work to be undertaken around the Saxmundham Converter Station. The Converter Station is situated within an arable field so there is considerable potential for ecological enhancement and this has been realised. The mitigation above, is also set out within **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Terrestrial ecology, onshore mitigation	13.2.8 Assessment of specific ecological impacts, Leiston-Aldeburgh SSSI: Table 2.3.17 (Preliminary assessment of disturbance of designated sites during construction or decommissioning) states that “Leiston-Aldeburgh SSSI is in the same location as Sandlings SPA and will therefore be similarly affected”. However, not only does the SSSI boundary not overlap with the SPA boundary at the landfall location, the SSSI also has a significantly larger suite of features for which it is designated. The assessment must take account of this, it cannot be assumed that measures potentially suitable for avoiding or mitigating impacts on SPA qualifying features are also suitable for SSSI features.	N	Separate assessments of Sandlings SPA and Leiston-Aldeburgh SSSI as well as details of the necessary mitigation is included within Application **Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Noise contour maps for both the SSSI and SPA have been made available to East Suffolk Council.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Landscape and visual, onshore mitigation	13.2.9 Assessment of specific ecological impacts, Hedgerow loss: The assessment presented in the PEIR (e.g., Table 2.3.16) suggests that the applicant considers that hedgerow loss can be restored in 1-2 years. No justification for this timescale is provided, nor is it clarified what is meant by restored. It is considered highly unlikely that new hedgerow planting to either infill created gaps or replace lost hedgerow lengths will be sufficiently mature in 1-2 years to mitigate for that which is lost. Whilst the Environmental Statement (ES) may consider such an impact to be temporary, it is essential that is clearly defines over what length of time such a temporary impact is likely to occur. This is to ensure that the assessment within the ES realistically considers such impacts and the time that it will take for mitigation measures to take functional effect.	N	National Grid acknowledges this feedback. Growth rates were discussed with East Suffolk Council at the thematic meeting in February 2024. Further information on growth rates is contained in **Application Document 6.2.2.2 Part 2 Chapter 2 Ecology and Biodiversity**.
		Terrestrial ecology, onshore mitigation, noise and vibration	13.2.10 Assessment of specific ecological impacts - Operational Noise: Table 2.3.24 (Preliminary assessment of disturbance of birds and other fauna during Operation) concludes that disturbance of birds and other fauna during operation of the project would be at worst Minor Adverse, Not Significant in the absence of any mitigation measures. However, the justification provided only relates to maintenance visits during operation and does not address whether the operation of the equipment at the converter station and substation sites may give rise to disturbance impacts such as through the generation of increased noise (including high frequency noise). This should be assessed as part of the ES to determine whether any significant impacts from such sources may arise and whether any avoidance or mitigation measures are required to address these.	N	Discussion of this issue are included within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. However, as discussed at thematic meetings the Converter Station will not be a significant source of noise of a type to disturb wildlife, being comparable to that produced by other substations for which there is no evidence of wildlife disturbance.
		Terrestrial ecology, onshore mitigation	13.2.11 Assessment of specific ecological impacts - Shading of riparian habitats: Table 2.3.36 (Preliminary assessment of shading impacts on riparian habitats during Operation) concludes that with mitigation the impact from shading on the River Fromus from a new crossing would be Minor Adverse to Negligible, Not Significant. However, the mitigation identified (bridge designed to a height:width ration of 0.7) feasible and necessary" discussed in section 3.1 above, it is queried what will be concluded if the necessary mitigation is determined not to be practicable. The conclusions presented in the ES should only be based on deliverable mitigation measures. If it is unknown whether a particular mitigation measure is deliverable, then the	N	Matter such as bridge design and height are detailed within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** and ecological receptors are assessed within **Application Document 6.2.2.2 Part 2 Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			assessment must be made on a worst-case basis (i.e., that the mitigation measure is not deliverable). Please also note in Table 2.3.36 that the receptor is the River Fromus not the River Frome.		
		Coordination with other projects, design	13.2.12 Co-location Options: Whilst in principle the exploration to co-locate infrastructure for other projects as part of this project is supported, this is only if it can be demonstrated that to do so would significantly reduce the cumulative ecological impacts from all of the relevant projects. This must include not only physical interactions, but also temporal ones. Co-location should not result in the lengthening of impacts (particularly disturbance type impacts) as a result of requiring significantly increased construction timeframes or requiring project sequencing which significantly extends or overlaps construction periods. It is also noted that co-location could result in this project installing cable ducts for use by projects. Whilst again in principle this may have merit, experience from other projects in the district where a similar approach has been taken has identified that risks such as duct failure ahead of following projects commencing must be considered as part of the overall assessment of the option.	N	National Grid acknowledges the feedback.
		Terrestrial ecology	13.2.13 Biodiversity Net Gain Whilst the commitment to deliver Biodiversity Net Gain as part of this project is welcomed, as the project has two distinct geographic locations (Suffolk and Kent) it must be ensured that a minimum of 10% BNG is delivered in both areas. Delivery of greater BNG should not be proposed in one location at the expense of the other.	N	Two Biodiversity Net Gain assessments have been undertaken for each LPA, one for Kent and one for Suffolk. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Noise and vibration, onshore mitigation, construction	**13.3 Noise and Vibration Comments** The Applicant has provided a variety of assessments and information which will continue to be scrutinised and assessed and will form the basis of ongoing discussions throughout this process. This response should be read in conjunction with ESC's scoping consultation response much of which is still relevant in terms of our expectations and That response below for completeness. 13.3 Operational Noise and Vibration 13.3.1 Opening Matters In terms of Operational Noise and Vibration it is important to note our fundamental requirements which have been	N	The ES includes an indicative assessment of operational noise based on available design information. The parameters used for the assessment are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment has been conducted in accordance with BS 4142:2014+A1:2019. The assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			communicated to the applicant both verbally and in witing and appear in their assessment documents. Our current stance on noise from developments of this nature in this district may be summed up by the following condition used in Town and Country Planning Act applications but is equally relevant here and has been stated for this and other DCO projects we are involved with: Noise from fixed plant or machinery (e.g., heat pumps, compressors, extractor systems, fans, pumps, air conditioning plant or refrigeration plant) can be annoying and disruptive. This is particularly the case when noise is impulsive or has tonal characteristics. A noise assessment should therefore be submitted to include all plant and machinery and be based on BS4142:2014. A rating level (LAeq) of at least 5dB below the typical background (LA90) should be achieved. Where the rating level cannot be achieved, the noise mitigation measures considered should be explained and the achievable noise level should be identified and justified.		
		Noise and vibration	Due to the size of these types of projects the 5dB below background is an aspirational target and one ESC ask developers to consider as the appropriate limit, deviation from this level will require robust justification and the aim in all cases should be to achieve the lowest possible sound level which will also require robust justification, this should be in line with all relevant standards, guidance and policy. The developer is reminded of the overarching principles of NPS EN-1 in terms of noise and vibration and particularly the requirement to mitigate and minimise adverse noise impact and avoid significant adverse impact. The Applicant has previously stated that it is their intention that the development, if consented, will have a rating level below background sound levels which broadly accords with our expectations in this regard subject to those levels being agreed. The council recognises that an initial assessment has been undertaken and a relatively conservative approach adopted in the determination of representative background sound levels has been taken, further assessment of the relevant documents is required before agreement can be made but the representative backgrounds currently suggested appear to be reasonable and the applicants adoption of the night time levels as those of most significance in terms of impact is accepted as the correct determinant to base future targets on in respect to suitable rating levels. Due to the low background sound levels in this area, particularly at night, it is extremely important that noise levels from the development are avoided, mitigated or minimised to ensure these background sound levels are not subject to “noise	N	The ES includes an indicative assessment of operational noise based on available design information. The parameters used for the assessment are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment has been conducted in accordance with BS 4142:2014+A1:2019 and includes consideration of the existing acoustic character and context, as required by BS 4142:2014+A1:2019. The assessment has also considered guidance from the Association of Noise Consultant’s. Technical Note on BS 4142. The assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			creep". This is particularly important given this sites potential as a co-location site for at least one other similar project making the reduction of individual project impact key to the prevention of cumulative impact. It is not enough to say that future impact is the responsibility of future projects, and it must be taken account of now, the adoption of below background rating levels will effectively aid the prevent of cumulative noise impact by preventing the increase in background sound level that future projects would adopt for their assessment.		
		Noise and vibration	As stated above due to the likelihood that there will be future projects using this site background noise creep is a significant issue. The applicant mentions absolute levels in their documents and assessment, and this is assumed to mean that a site noise level of 35db may be considered. If this is the case, it will be resisted in the strongest terms in favour of a below background rating level. Whilst it is accepted that BS4142 allows for consideration of absolute levels in certain circumstances the cumulative potential for this site and the current character of the area means that all efforts should be made to prevent background sound level creep which the adoption of a 35dB site level would not. An absolute level would also not take account of any acoustic penalties that a rating would, given the types of plant to be used tonality, impulsivity and intermittency are all likely to be considerations. If this is to be considered in line with section 11 1) of BS4142 we will require a robust assessment to show that adoption of absolute levels is as or more protective than rating levels and would require consideration of acoustic character of those levels in line with section 11 2). The Acoustic character of the area is quiet rural residential in nature and this application and development has the potential to introduce a persistent commercial and industrial noise into that character, this should hold considerable weight in terms of contextual the considerations required by BS4142 when assessing the significance of impact in addition to assessed and modelled noise levels. Projects of this scale have the responsibility and means to ensure that they achieve the best possible outcome, and this begins with a thorough assessment considering all aspects of an introduced sound or noise and not simply relying on calculated levels where there is an inherent uncertainty but also undertaking a robust subjective assessment considering the character of the area and the character of the noise. It is essential that any changes in design and location of substations must be considered in terms of noise assessment, this must be in terms of Sea link in isolation and cumulatively at the site with future projects dependant on the information available.	N	The ES includes an indicative assessment of operational noise based on available design information. The parameters used for the assessment are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment has been conducted in accordance with BS 4142:2014+A1:2019 and includes consideration of the existing acoustic character and context, as required by BS 4142:2014+A1:2019. The assessment has also considered guidance from the Association of Noise Consultant's Technical Note on BS 4142. The assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process. Noise creep is a justifiable concern, and this would need to be considered by any future schemes as part of their assessment, through consultation with ESC. The assessment considers absolute noise levels as part of the consideration of context, as required by BS 4142, and requested by ESC. A level of 35 dBA is recognised as a Lowest Observed Adverse Effect Level (LOAEL) and is therefore considered as part of the assessment of context. The Proposed Project aims to achieve the requested noise levels of ESC where this is feasible, or otherwise as low as reasonably possible. Further operational noise assessments will be conducted as part of the detailed design process, during which specific noise mitigation measures will be determined.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Noise and vibration, onshore mitigation, intra-project cumulative effects	In terms of cumulative assessment and impact whilst the Saxmundham substation site is an area of particular concern should further projects co-locate there the applicant must be extremely mindful of cumulative impacts in relation to the numerous other projects in the area particularly in terms of construction noise, whilst there may be some assumed deconfliction to construction dates at this time these may change and as such review and re-assessment should be embedded in this process and project. The following comments are made on the assessment and what has been scoped for assessment. a) Firstly, in terms of overhead lines, Significant adverse effects from noise from new overhead lines has been deemed unlikely and has been scoped out of further assessment. Further assessment needs to be undertaken to quantify the expected unlikely significant adverse effect and to quantify whether there are adverse effects and cannot be assumed. b) Secondly, the impacts from the connector substation at Friston have been scoped out on the basis that switchgear noise emissions would be impulsive in character and operation would be infrequent, there is no indication as to sound levels, how impulsive or how infrequent, neither is there consideration of the impact of this matter cumulatively with other projects and whether there is a point where the number of projects and the increase in equipment will cause an impact. It is very important to note that the Friston connection substation is part of the site rating levels and therefore it is a site constraint, the applicant needs to be very confident that introduction of further or different equipment will not impact that constraint. Whilst considering the above comments the applicant's assessment has indicated that with mitigation the sound levels at all nearby Noise Sensitive Receptors will be below background sound levels except for one location where background is achievable. This is welcomed by ESC and aligns with the expectations previously stated. We look forward to working with the developer going forward to exhaustively assess whether further reasonable improvements can be made to ensure this project is the best it can be in respect to noise and vibration.	N	The assessment of inter-cumulative effects with other proposed developments is considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The assessment is based on the latest available programme information for other projects and considers cumulative noise impacts. The ES includes an indicative assessment of operational noise based on available design information. The parameters used for the assessment are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment has been conducted in accordance with BS 4142:2014+A1:2019 and includes consideration of the existing acoustic character and context, as required by BS 4142:2014+A1:2019. The assessment has also considered guidance from the Association of Noise Consultant's Technical Note on BS 4142. The assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process. An assessment of noise impacts due changes to the overhead lines has been conducted as part of the ES. An assessment of noise impacts from the proposed Friston Substation has been conducted as part of the ES.
		Noise and vibration, inter-project cumulative effects	13.3.2 The operational noise scoping response has been included below. Operational noise and vibration scoping: The proposed study area of 1000m from the proposed substation sites and the Friston Site is accepted along with the developer's emphasis on closer proximity Noise Sensitive Receptors. In respect to location the developer is advised that	N	The ES includes an indicative assessment of operational noise based on available design information. The parameters used for the assessment are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment has been conducted in accordance with BS 4142:2014+A1:2019 and includes consideration of the existing acoustic character and context, as required by BS 4142:2014+A1:2019. The assessment has also considered guidance from the Association of Noise Consultant's Technical Note on BS 4142. The

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			the National Grid Connector Sub Station at Friston is included in the EA1N and 2 Rating level for the site and as such this is a site wide constraint that they will have to meet. The developer has proposed BS 4142:2014+A1:2019 Methods for rating and assessing industrial and commercial sound (BS4142) in respect of operational noise assessment and this is accepted. The developer has also stated that the DCO will contain a requirement with an appropriate noise level, and this will need to be determined as a rating level using BS4142 in order to take account of any acoustic character to sound emissions and importantly to take account of the local context. In respect of that context the developer has correctly stated that the majority of the area is quiet rural and residential in nature, the potential for the introduction of a 24 hour a day 7 days a week industrial noise source to have significant adverse impact exists and this is to be avoided along with adverse impact mitigated and minimised in line with NPS EN-1 and the Noise Policy Statement for England. The developer is also required to consider cumulative effects with other committed or consented major projects, principally, but not necessarily limited to, Sizewell C and Scottish Power Renewables EA1N, EA2 and EA3 as well as other proposed major projects such as Euro link and Nautilus where there is information available to consider. “Noise creep” is a significant issue with the number of projects both potential and consented and needs to be considered, minimised and where possible prevented entirely.		assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process. An assessment of cumulative effects has been undertaken and no significant adverse effects have been identified. The assessment is contained in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Noise creep is a justifiable concern, and this would need to be considered by any future schemes as part of their assessment, through consultation with ESC, together with an assessment of cumulative effects.
		Noise and vibration, onshore mitigation	The developer ascribes significance criteria to operational noise in line with NPS EN-1 and states that a significant adverse effect is considered to occur at large, or medium magnitudes of impact which Table 2.10.9 describes as a rating level between 5 and 9dB above background and more than 10dB above background respectively. As Significant Adverse Effects are to be avoided it is therefore assumed the developer is expecting to achieve 4dB above background or less as a rating level. Our current stance on noise from developments of this nature in this district may be summed up by the following condition used in Town and Country Planning Act applications but is equally relevant here and has been stated for other DCO projects we are involved with. Noise from fixed plant or machinery (e.g., heat pumps, compressors, extractor systems, fans, pumps, air conditioning plant or refrigeration plant) can be annoying and disruptive. This is particularly the case when noise is impulsive or has tonal characteristics. A noise assessment should therefore be submitted to include all plant and machinery and be based on BS4142:2014. A rating level (LAeq) of at least 5dB below the	N	The ES includes an indicative assessment of operational noise based on available design information. The parameters used for the assessment are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment has been conducted in accordance with BS 4142:2014+A1:2019 and includes consideration of the existing acoustic character and context, as required by BS 4142:2014+A1:2019. The assessment has also considered guidance from the Association of Noise Consultant’s Technical Note on BS 4142. The assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			typical background (LA90) should be achieved. Where the rating level cannot be achieved, the noise mitigation measures considered should be explained and the achievable noise level should be identified and justified. Due to the size of these types of projects the 5dB below background is an aspirational target and one we ask developers to consider as the appropriate limit, deviation from this level will require robust justification and the aim in all cases should be to achieve the lowest possible sound level which we will also require robust justification for, this should be in line with all relevant standards, guidance and policy. The developer is reminded of the overarching principles of NPS EN-1 in terms of noise and vibration and particularly the requirement to mitigate and minimise noise impact although they appear very familiar with these principles which is comforting at this stage. Section 2.10.7.20 also Implies that adverse effects will be avoided, and the rating level will be set below background so that the impact is negligible as is "standard practice", if this is the case it is to be welcomed. The overall expectation for operational noise is that a robust assessment will be undertaken using BS4142, that an appropriate rating level will be proposed relative to an appropriate representative background sound level and that it will inform design and mitigation so as to reduce noise impact to an absolute minimum. There will be a need for a requirement in the DCO and dependent on the rating level that is proposed there may be a need for a further requirement with a commitment to reduce that rating level further should it be possible to do so at a later detailed design and implementation stage, the need to keep impact from operational noise to an absolute minimum cannot be understated and we will require robust justification in reaching agreement. In terms of scoping operational vibration has been scoped out and this is accepted, all areas that have been scoped in are agreed. The developer has however stated that noise from switchgear and emergency equipment such as generators and compressors should be scoped out, this is currently not agreed as it will be dependent on the likely frequency, duration and mitigation for these events and therefore further justification should be provided.		
		Construction, noise and vibration, traffic and transport	**13.3.3 Construction Noise and Vibration** The Applicant has committed to using BS5228 - Code of practice for noise and vibration control on construction and open sites along with the ABC methodology within that code, this accords with other similar projects in the area and is accepted. Thresholds have been set relative to the lower noise thresholds (Category A) as detailed in Section E.3.2 of BS	N	Acceptance of the BS 5228 ABC methodology is noted. Correct, the reference to effect threshold levels during other time periods are provided for works that may occur outside of normal working hours. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Since publication of the PEIR within Statutory consultation, the proposed construction working hours have changed, although Saturday working hours

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			5228-1 (the 'ABC' method) and are proposed to be used throughout as a worst-case, this is also accepted. Construction noise LOAEL and SOAEL have been set in accordance with these thresholds and in terms of Weekdays 7:00am to 7:00pm, and Saturdays 7:00am to 1:00pm this appears reasonable, Table 2.10.8 also contains thresholds for other periods, and it is assumed that these are present to govern either emergency works or where the local planning authority has granted permission to work beyond the consented working hours. In terms of working hours, the outline code of construction practice (OCoCP) states the following. The proposed construction working hours are: • Monday – Friday: 07:00am–19:00pm. • Saturday: 07:00am–17:00pm. • Sundays/Bank Holidays: non-working. We do not currently consider Saturday afternoon to be acceptable and precedent has been set in respect to a similar project (requirement 23 for EA1N and 2) for Saturday to be 07:00-1300 and this should be applied here. Work outside these hours should be agreed with the Local Planning Authority and be of the type listed for this purpose in the Coop.		remain the same. Shortening working hours would potentially extend the working programme and put at risk delivery of the Proposed Project by 2030. The change in working hours has been consulted on as part of the Targeted consultation. Details relating to the proposed construction working hours and any associated restrictions are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Design, noise and vibration, traffic and transport	The magnitude of impact has been determined in line with The Design Manual for Roads and Bridges (DMRB) which is designed as the title suggests for the construction of roads and bridges, ESC is not therefore convinced of its appropriateness here. The magnitude of impact assessment uses LOAEL and SOAEL in the determination of magnitudes. It is a concern that the highest level of magnitude, Large, is above +5dB above SOAEL and Medium being equal to or above SOAEL and below +5dB, given that SOAEL is a barrier to consent and must be avoided levels beyond SOAEL should not form any part of a scale for assessment as it should never occur, to include such a criteria provides a false representation of the scale of magnitude and downplays the actual magnitude of impact, a medium impact being the highest theoretically achievable level of impact. Construction Vibration has been determined in line with BS5228-2 and this is accepted, LOAEL has been set a 0.3 mm/s PPV and SOAEL a 1.0 mm/s PPV which appears to be reasonable. In terms of vibration, ESC has similar comments in respect to the use of DMRB and the inclusion of above SOAEL magnitude	N	The DMRB magnitude scale clearly indicates the criteria for a large magnitude impact and therefore the statement that 'a medium impact being the highest theoretically achievable level of impact' is incorrect. A medium magnitude impact is defined as an average construction noise level between the SOAEL and 5dB above the SOAEL, while a large magnitude impact is defined as an average construction noise level greater than 5dB above the SOAEL. The SOAEL is defined as the relevant 'A' criteria from the ABC method for the relevant time period. Medium and large magnitude impacts (i.e. those above the SOAEL) are considered to be a potential significant adverse effect at sensitive receptors where they are of sufficient duration and would therefore be sought to be avoided through best practicable means. The methodology and assessment criteria are therefore in line with the suggestion in the comment. The contractor will be required to implement best practicable means to reduce the impacts of noise and vibration during construction for all works. However, the measures will be proportionate to the level of risk, with a greater focus on activities which are likely to cause the greatest impact.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			levels in the magnitude of impact thresholds, SOAEL being a level to be avoided. As the report acknowledges that Best Practicable Means (BPM and taken to be as defined by section 72 of the Control of Pollution Act 1974 and further described in BS5228) will be implemented, this should be committed to at all times with work and any noise mitigation carried out to BPM to ensure noise and vibration are kept to a reasonable minimum and not just below the relevant thresholds. BPM is a critical control point for a project of this scale. A road Traffic Noise Assessment has been carried out, this is a highways authority matter which in this case is Suffolk County Council and we will defer to them in that regard. The Construction Noise and Vibration response for the scoping exercise is copied below for completeness.		
		Noise and vibration, construction, design	**13.3.4 Construction noise and vibration scoping response** The proposed study area of 300m from construction areas is accepted, although this will not prejudice complaints from Noise Sensitive Receptors from further afield in the event the project is consented and implemented. The developer has stated that BS 5228-1:2009+A1:2014 Code of practice for noise and vibration control on construction and open sites – Noise and BS 5228-2:2009+A1:2014 Code of practice for noise and vibration control on construction and open sites – Vibration (BS5228), and specifically the “ABC” methodology of those standards, are to be used in relation to impact from construction noise and vibration and this is accepted as suitable. The developer had committed to Best Practicable Means (BPM), as defined in the Control of Pollution Act 1974 and expanded upon in BS5228: 2009+A1: 2014 in respect of site operations and mitigation for noise and vibration and this is welcomed. It is important that all relevant sections of BS5228 are considered and implemented including particularly section 8 – Control of Noise. The developer has provided an Outline Code of Construction Practice (Coop) which includes noise and vibration management as is expected for this type of development and should be secured in a requirement in terms of compliance. The Coop provides a relatively high-level view of noise and vibration management and mitigation and provides for Construction Environmental Management Plans (CEMPs) to provide the detail in respect of specific works. The Local Planning Authority should have some input into construction activities in terms of mitigation and monitoring for noise and vibration and therefore	N	**Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk** has been prepared and included with the DCO application. Construction phase measures relevant to noise and vibration are secured within **Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk**. For other environmental topics, construction phase measures are secured by one of the following: • **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** contains general construction measures to avoid or reduce potential noise effects of the Proposed Project. The CEMP also includes the Code of Construction Practice containing a list of the control and management measures that will be implemented on the Proposed Project as Appendix A (**Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**) • a register of all mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 in Schedule 3 of the draft DCO (**Application Document 3.1**); • **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** measures to manage construction traffic and impacts on the wider traffic network; and • **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** measures to manage construction impacts on landscape and ecology. The above plans are referenced in the **Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan - Suffolk** where appropriate.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			should be included in approving the CEMPs, if this is not possible and that position is justified there may be a need for a more detailed Noise Management Plan (NMP) as an appendix to the Coc and consideration of adopting a Control of Pollution Act 1974 Section 61 approvals process.		**Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan - Suffolk** includes processes for liaison with the local planning authority, including the Control of Pollution Act 1974 Section 61 approvals process which may be beneficial for some construction activities. The Local Planning Authorities will approve the CEMPs as required by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Construction, traffic and transport	The developer should produce a detailed complaints and monitoring plan including when and how they intend to inform the Local Planning Authority, this should form part of the Coop, CEMP, NMP or S.61 as appropriate. The developer has considered noise and vibration from construction traffic, it is assumed this is in respect of highway noise and vibration which is a Highways Authority matter, and that site construction traffic noise and vibration will be consider in respect of the overarching construction noise and vibration requirements under BS5228 and in the Coop. The developer has ascribed significance in respect of construction noise and vibration, and this should be in line with the BS5228 "ABC" methodology as proposed.	N	**Application Document 7.5.8.1 Outline Noise and Vibration Management Plan – Suffolk** has been prepared and included with the DCO application. The assessment of construction noise includes consideration of construction traffic on the public highway and site traffic. Initial information of the complaints procedure is set out in **Application Document 7.5.3.1 CEMP Appendix A Outline Construction Code of Practice, Application Document 7.5.8.1 Outline Noise and Vibration Management Plan – Suffolk** and **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which are secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). The detailed complaints procedure will be developed by the contractor at a later date.
		Onshore mitigation, design, construction	**13.3.5 coop:** The coop as an outline document is accepted and it is noted that there are further opportunities to assist in its development. The Council which the applicant to note the following examples: a) Working Hours – Saturday working after 13.00 is not currently acceptable without robust justification. A comparable project has Saturday 07:00 – 13:00 as a requirement. Work can be undertaken outside of these hours as stated in the coop, but this should be with Local Authority agreement to ensure that the works are indeed necessary. Necessity to carry out works out of hours is a key principle of BPM, if you don't need to do it at a sensitive time then you shouldn't. s61 agreements could be considered by the applicant as required. b) Complaints – the coop describes an internal complaints procedure but this does not require engagement or notification with East Suffolk Council. We would expect to be informed of complaints received and in a timely manner, along with any action taken. c) Emergency Action Plan – ESC should be informed of any incidents identified under the Emergency Action Plan so that we can consider if we need to be involved, and so that we have information should the public come to us for assistance. d) Contamination – There may be something in the relevant documents but the Coop should contain full reference to a discovery strategy should unexpected contamination be	N	a) Since publication of the PEIR within Statutory consultation, the proposed construction working hours have changed. The change of these hours has been consulted on as part of the Targeted consultation. For details relating to the proposed construction working hours and any associated restrictions, please refer to **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. **Application Document 7.5.8.1 Outline Noise and Vibration Management Plan – Suffolk** has been prepared and included with the DCO application. The NVMP states the requirement for the contractor to implement best practicable means to reduce the impact construction noise and vibration. b) Noted, National Grid is committed to maintaining a register of complaints received under the coop and is happy to make a copy of this register that will be made available to Host Authorities for review on request. The wording in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** has been updated. This is secured through Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). c) Noted, National Grid will inform ESC of what are considered large scale incidents under the Incident Response Plan. Smaller scale issues will be recorded in a register that will be made available to Host Authorities for review on request. The wording in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** has been updated. This is secured through Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**). d) A protocol for dealing with unexpected contamination is included within **Application Document 7.5.3 Onshore Construction Environmental**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			encountered along with a plan to resolve the situation and a commitment to seek agreement with us and the Environment Agency in any matter relating to the investigation and remediation of contamination discovered. This should broadly accord with the steps of our unexpected contamination TCPA condition. a. Best Practicable Means – This is a critical control point for this and all NSIPs in terms of mitigation of Noise and Vibration, and a principle that should spread across all areas of the project, doing the best they can to prevent impact. In terms of the principle of BPM as defined by Section 72 of the Control of Pollution Act 1974 and further defined in documents such as BS5228 it is noted that the relevant BPM for each work stream will be in the CEMPs. Presumably we will have sight of these and if not, we will need to be provided with at least the BPM work and mitigation should a problem arise to ensure the relevant BPM is actually in place. Internally there should be a principle of reviewing BPM in the event of a complaint to ensure that the work is being carried out to those principles, this is a precedent with other comparable projects. e) Health and Safety should be separated out from Environmental Considerations to avoid confusion. f) Construction Method Statements; CEMPs; Managements Plans – we need to be clear with the document hierarchy and where detail of mitigation (noise, dust, water, vibration and soil) will be found. The documents should be submitted and approved to ESC. g) It is not clear where the LOAELs in Table 2.10.8 have originated from. h) Table 1.4.A.2: Control and management measures – NV03 – we are a little concerned that this paragraph is not committing to the same rating levels (or absolute if more appropriate) as are discussed elsewhere (below or at worst matching background). I) Table 1.4.A.2: Control and management measures – GG13 – this paragraph refers to ‘plant’ and vehicles but only has commitment to vehicle standards and not plant. Please see comments in the air quality section of this response from more detail on this subject. Whilst it is expected that there will be numerous management plans that exist below the coop this document should contain sufficient information and commitments to prevention, minimisation and mitigation of impacts associated with construction to provide confidence that Best Practicable Means in its wider context across all topics will be applied.		**Management Plan** in accordance with Commitment GH08 of **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. e) As outlined within **Application Document 7.5.3.2 CEMP Appendix A Register of Environmental Commitments and Action (REAC)** which is secured through **Application Document 3.1 draft Development Consent Order**, a Safety, Health and Environment Plan will be submitted and approved by the relevant planning authorities in advance of the works commencing. f) **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** contains a comprehensive list of the mitigation required following the environmental assessments. g) The LOAEL values originate from guidance values for the achievement of suitable external and internal (with open windows) noise levels from BS 8233:2014 Guidance on sound insulation and noise reduction for buildings and World Health Organisation guidance. h) Control Management measure NV03 appropriately captures the design aims for the proposed converter station to incorporate noise mitigation measures into the design such that the aims of the local authority or met, or otherwise as low as reasonably possible. I) This feedback is noted. Specific responses to these points are contained in the air quality section of **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Inter-project cumulative effects, traffic and transport	**13.3.6 Inter Project Cumulative Effects:** Table 2.14.4 – Matrix summarising Stage 1 + 2 of the Inter Project Cumulative Effects: ESC is concerned that the peak year has been used as a basis for assessment and not progressing to the next stage. For example - A12 bypass; traffic, transport and air quality – not taking to stage 3 assessment due to peak year not occurring until after the bypass is operational. It is the same for many of the Sizewell C associated developments. The concern is that firstly, there may be impacts from this project (Sea Link) prior to peak year which should be considered; and secondly, timelines slip and change – sometimes significantly – potentially on all projects. Regarding air quality – ESC may have more comments after the Highways Authority has had a chance to comment as they may identify areas of concern or impact that have not been considered. It is suggested that if any project is carried through for stage 3 assessment for traffic and transport, then this should automatically also be put through for consideration of the impact on air quality if congestion related. All areas of impact including air quality, dust and noise and vibration should be robustly assessed for inter project cumulative effects, the developer should be mindful that a review and re-assessment process should be implemented to ensure any changes to various project timelines are taken account of and addressed to avoid unexpected cumulative impact where previously impacts were low or scoped out on the basis of deconfliction between projects.	N	As above, construction/ operational traffic has been included as part of the assessment for committed developments where there is the potential for this traffic to overlap with the construction phase for the Proposed Project, i.e. during the five-year period, not just the peak construction year. Robust assumptions have also been made with respect to adopting peak construction traffic flows associated with Sizewell C and the SPR schemes, as well as with other committed developments where necessary. Traffic and transport data has been provided to the air quality, noise and vibration and ecology teams to inform their Inter-project Cumulative Effects Assessments accordingly. Further detail is provided within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Water environment, construction	**13.4 Private Water Supplies Comments** 13.4.1 The district has numerous Private Water Supplies that could be sensitive to some of the construction methods likely to be employed by the project (such as trenchless ducting and dewatering if required), the developer should engage with ESC to ensure that these Private Water Supplies are considered and where necessary measures are taken to ensure that the supplies are not affected by works associated with Sea link.	N	Private water supply information has been obtained from the Local Authorities and included within **Application Document 6.3.2.5.B ES Appendix 2.5.B Groundwater Risk Assessment** as a receptor where available. National Grid is maintaining ongoing discussions with affected landowners. Where interfaces with assets such as private water supplies are identified, appropriate mechanisms for safeguarding these will be identified.
		Air quality, construction, onshore mitigation	**13.5 Air Quality Comments** 13.5.1 We acknowledge that a detailed air quality assessment will be carried out at the ES stage once further data is available. This is to include, but not limited to, emissions from construction site vehicle emissions; Non Road Mobile Machinery (NRMM); emissions from use of the back-up generator; and monitoring of air quality pollutants/dust. As has	N	13.5.1 Construction vehicle emissions, NRMM emissions, backup generator emissions and construction dust emissions have been assessed as outlined in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**. Monitoring During the construction phase mitigation measures will be adopted to control emissions as detailed in **Application Document 7.5.6.1 Air Quality Management Plan - Suffolk**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			been recognised it is essential that cumulative effects with other projects, with consideration of the impact of this project on traffic flows potentially some distance away, is included in the detailed assessment. Sensitivity tests for slippage of timelines should also be considered – both slippage within this project and for other projects. 13.5.2 We agree that air quality impacts associated with the operational phase vehicle emissions can be scoped out for further assessment. 13.5.3 Emissions from Construction Site dust – we acknowledge that the assessment for dust has concluded that a high level of mitigation is required. It is agreed that a Dust Management Plan for the project should be developed, submitted to and agreed with ESC. 13.5.4 There is some consideration of NRMM within the current documents and we acknowledge that this is to be considered further in an air quality assessment at the ES stage. In line with some other projects and given the potential impact on local air quality from the numerous additional NRMM in use within the surrounding area local to this project, we would like to see a commitment to reducing emissions from this source as much as possible. This should involve a commitment to use of renewable energy sources such as solar banks for charging batteries where possible, use of electricity or batteries, with use of diesel as a last resort. A commitment to use of Stage 4 NRMM as a minimum, and stage 5 where possible should be made. 13.5.5 The commitment to Euro standards made in the Coc for vehicles associated with the site is positive. This will require monitoring for compliance.		The other proposed developments that have the potential to overlap temporally with the Proposed Project have been identified and any potential inter-project cumulative effects resulting from the interaction between the other developments and the Proposed Project have been assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**, this includes consideration of inter-cumulative air quality impacts. 13.5.2 Noted, no further comment. 13.5.3 An Air Quality Management Plan has been developed which outlines the mitigation measures required and proposed monitoring during the construction phase (**Application Document 7.5.6.1 Air Quality Management Plan - Suffolk**). Monitoring locations have been agreed with ESC. 13.5.4 NRMM emissions have been assessed as outlined in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**. Several control measures relating to NRMM emissions have been included in the CEMP (**Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**) including: AQ04 - Avoid the use of diesel or petrol powered generators and use mains electricity or battery powered equipment where practicable. Impose and signpost a maximum speed limit on unsurfaced haul roads and work areas; AQ09 - Ensure all equipment complies with the appropriate Non-Road Mobile Machinery standards. Use stage 4 NRMM as a minimum and stage 5 where possible. Additionally, where possible, use alternative / renewable energy to power NRMM; and GG10 - Any activity carried out or equipment located within a construction compound that may produce a noticeable nuisance, including but not limited to dust, noise, vibration, and lighting, will be located away from sensitive receptors such as residential properties or ecological sites where practicable. Monitoring will be undertaken during construction as outlined in **Application Document 7.5.6.1 Outline Air Quality Management Plan - Suffolk**.
		Agriculture and soils, geology and hydrogeology	**13.6 Land Contamination Comments** 13.6.1 The developer has undertaken a preliminary contaminated land risk assessment which has not indicated any locations where contamination is likely to exist beyond a low risk. This Assessment has been carried out in line with the principles of the Environment Agency's Land Contamination Risk Management (LCRM), this is the applicable guidance in this respect. This is clearly based on current knowledge and locations should be reassessed on a case-by-case basis should further information come to light.	N	**Application Document 6.3.2.5.A ES Appendix 2.5.A Contamination Risk Assessment** has been revisited following updates to the design. A protocol for dealing with unexpected contamination is included within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** in accordance with Commitment GH08 of **Application Document 7.5.3.1 Appendix A Outline Code of Construction Practice**. This will be completed by the contractor.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			13.6.2 Whilst the current risk of contamination is low and it is accepted that much of the route is isolated and agricultural or wild in nature this does not preclude the possibility of unknown contamination that may be encountered during the development given the amount of excavation required. The developer should provide contaminated land management plan which covers a robust discovery strategy and procedures for managing contamination should it be found unexpectedly; this must include consultation and agreement with the Local authority in respect of investigation and remediation required in the event this scenario occurs.		
		Landscape and visual	**13.7 Landscape Comments** 13.7.1 Non-Technical Summary Para 5.1.5 and later contains a potentially misleading reference to a landscape character area (Froms Valley, Heven Ingham and Knodishall Estate Claylands coastal landscapes) from Suffolk Coastal Landscape Character Assessment. The main name is correct but also includes reference to coastal landscapes. It may that this is a reference to the eastern and therefore coastal side of the Landscape Character Area but this should be clarified for the avoidance of doubt.	N	Noted, this has been considered and amended in **Application Document 6.1 Environmental Statement Non Technical Summary**.
		Onshore environmental impact, onshore mitigation	13.7.2 PEIR The setting out of the policy framework is comprehensive and considered fully inclusive. The consideration of the AONB Special Qualities is appropriate and welcomed. 3.1.1 It is agreed operational lighting should be scoped in given the rural location of converter station. 3.1.6 Although the current PEIR study area has been agreed with ESC, we welcome the proposal to keep it under review as the project evolves. 2.2.8.32 Visual receptors - Noted but the Council has concerns about some of the Value assessments given to the selected viewpoints in section 2.2.8.32 Table 2.2.17. The rationale for attributing Medium value to some PROWs and High and Very High to others is not wholly clear. We recommend that the developer discuss these issues with the Council before the LVIA is progressed any further. 2.2.9 Mitigation Measures - Draft Mitigation Measures Figures 1.4.3 and 1.4.7 in PEIR Vol 3 Part 1 Chapter 4 and Table 1.4.F.6 are noted and the Council welcomes ongoing dialogue to achieve the optimum outcome for the Saxmundham site. N.B. the reference to the Richborough Energy Park and the wider marsh landscape would seem to be incorrect in respect of	N	Comments noted regarding the policy framework, AONB Special Qualities, operational lighting and PEIR study area. The value judgements and the reasoning for the representative viewpoints are presented within **Application Document 6.3.2.1.B ES Appendix 2.1.B Landscape Baseline**. The value judgements were issued to stakeholders on 16 September 2024 and ESC agreed the value judgements via email on 23 January 2025. The indicative landscape strategy is presented within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. This has been an iterative process and the Council has been involved. This included the presentation of the initial concepts in a thematic meeting held on 23 April 2024. Tree and hedgerow surveys have been undertaken to inform the ES and important hedgerows which consider both ecological and heritage factors are set out within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Further detail on the control and management measures that relate to hedgerows are outlined within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**. The Important Hedgerows under the Regulations have been considered within the landscape and visual impact assessment, refer to **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment.**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			the Saxmundham site and probably refer to the Kent converter station site. In respect of Control and Management Measures (2.2.9.3), where retention and protection of existing vegetation (trees and hedgerows) is a key component of the mitigation strategy, and indeed as a general principle of the project as a whole, the Council will expect pre-commencement tree and hedgerow surveys to be carried out to identify the most important landscape components and how to protect them during construction.		Arboricultural information is located within **Application Document 6.10 Arboricultural Impact Assessment** and BS5837:2012 tree surveys form the basis of this report.
		Landscape and visual	It is recommended that cleared hedgerows should be chipped and re-used as mulch for new planting areas. 2.2.9.4 - Noted but the Council will need to understand how wider landscape mitigation measures can reliably be delivered on land outside Order limits, e.g., along B1119 out of Saxmundham. In respect of other matters relating to mitigation related issues: Table 1.4.A.2 CoCP Control and Management Measures ref: GG03 - The later production of a Landscape and Ecological Management Plan (LEMP) is noted but the Council recommends that the developer engages with its technical officers at the earliest opportunity to ensure a collaborative ongoing dialogue in respect of landscape mitigation matters. GG08 and GG09 - The outline proposed measures are noted, but given their very highlevel outline nature, further comment is unrealistic at this stage. The Council would welcome closer dialogue with the developer as more detailed proposals emerge. LV01 and LV02 - The intention to retain vegetation where practicable is noted and the Council will expect retained vegetation to be fully protected according to recommendations contained in BS5837:2012 Trees in Relation to Construction (LV02 refers to this and is noted). Further, the Council will expect all proposed hedgerow crossings along the cable route and hedgerows affected by the converter station proposals to be assessed against the criteria for 'Importance' laid out in the 1997 Hedgerow Regulations. Where hedgerows meet the criteria for 'Importance' under the Regulations, the Council will have an expectation that these should be retained at least along the cable route and alternative solutions to open trenching put forward. LV03 The proposed five-year aftercare period for reinstatement and mitigation planting is noted, but it should be understood	N	The comment on cleared hedgerows to be used as mulch has been included within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. The hedgerow and tree planting along the B1119 is within the Order Limits. This Plan outlines how mitigation will be delivered and managed and the format of which has been discussed with stakeholders within thematic meetings (including meeting held on 25 June 2024) and other contributing disciplines, namely ecology. The five-year establishment maintenance period will include replacing failed or defective plants with matching species of the same size during the next planting season after failure. The aftercare will also include an adaptive management programme for the landscape planting. It will allow flexibility to adapt to future climate changes and trends with regard to species selection and maintenance requirements. Monitoring will be undertaken throughout the implementation and maintenance and management periods to ascertain progress of tree growth to inform the subsequent steps to be taken as part of the adaptive management programme. Tree and hedgerow surveys have been undertaken to inform the ES and important hedgerows which consider both ecological and heritage factors are set out within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Further detail on the control and management measures that relate to hedgerows are outlined within **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan**. The Important Hedgerows under the Regulations have been considered within the landscape and visual impact assessment, refer to **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment** and **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			that the Council will be requiring this five-year period to also apply to all replacement planting that covers any plant failures. i.e., it should be a rolling five-year period for all planting from the time of planting. The limitations of replacing removed trees in a like for like basis in the vicinity of installed electrical cables is understood. LV04 and LV05 Soil management proposals noted.		
		Landscape and visual, onshore mitigation	13.7.3 Preliminary Assessment of Effects The assessment of anticipated Landscape Character effects at construction, maintenance (assumed to mean 'operation') and decommissioning seems acceptable and realistic at this stage, but issues emerging from finer details may form topics for further discussion. As above, the preliminary assessment of visual amenity effects at construction, maintenance (assumed to mean 'operation') and decommissioning for the various viewpoints is noted. The preliminary assessment is less clear on the role of mitigation planting in moderating the magnitude of effects over time. This needs to be made much clearer and once incorporated in the assessment, should include a realistic understanding of growth rates for new planting in the East of Suffolk. It needs to be understood that erratic and unpredictable rain fall patterns, notwithstanding the late summer and autumn of 2023, can be a very limiting factor in successfully establishing new tree and shrub planting. We expect to be advised of the anticipated growth rates as the LVIA progresses. Once understood and agreed, it is expected that photomontages/wireframes will include depictions of mitigation planting at Year 1, Year 5 and Year 15 post planting. Issues surrounding the question of colocation at the converter station site and possible loss of mitigation planting relied on to moderate adverse visual effects arising from a single converter station need to be more clearly presented. A lack of project coordination could lead to unforeseen adverse effects on visual amenity through removal of previously relied upon mitigation. Any acceptability of the proposed landfall option (S2) is wholly dependent on the use of trenchless technology to pass under the Leiston to Aldeburgh SSSI and North Warren RSPB bird reserve.	N	The maintenance assessment refers to the maintenance activities associated with the Proposed Project, rather than the scheme at operation which is assessed separately. This is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The PEIR set out the stages of the Suffolk Onshore Scheme to be included within the assessment, including operation year 15 which is intended "to help demonstrate how proposed mitigation planting will influence effects once established". The assessment of effects during operation at both year 1 and year 15 are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Growth rates have been discussed with stakeholders in various thematic meetings, including the February and April 2024 meetings. Arboricultural specialists have prepared a report to evidence the growth rates and information has been supplied by East Suffolk Council, which has informed the height of mitigation planting shown in the year 15 visualisations, included at **Application Document 6.4.2.1 Landscape and Visual**. The requirement to prepare year 5 photomontages has been discussed with stakeholders at the thematic meetings and it was decided that as these do not relate to the operational assessment phases considered in the LVIA, that they will not be prepared. The co-location illustrative masterplan information can be found within **Application Document 7.10 Coordination Document**. **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Development** confirms the use of trenchless technology under the Leiston to Aldeburgh SSSI and the North Warren RSPB reserve.
		Landscape and visual, traffic and transport, DCO process	In respect of the potential impact of the proposed options for access road routes to the converter station: South Eastern Access 1 Redhouse Farm - This option would seem likely to be of least landscape impact, but it still carries	N	The South Eastern Access 1 Redhouse Farm and the Northern Saxmundham Access 2 off B1121 are no longer being pursued, as the Southern Saxmundham Access 3 off the B1121 has been adopted. Details relating to the Southern Saxmundham Access 3 off the B1121 including

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			risk to hedgerows and landscape character. Northern Saxmundham Access 2 off B1121 - This option will have direct impacts on Carlton Park which is a locally listed historic parkland, on TPOs, roadside hedgerows and the setting of the Saxmundham Conservation Area. Southern Saxmundham Access 3 off B1121 - This option will have direct impact on the Fromus valley landscape, willow woodland block, and roadside hedgerows. With regard to any proposed accesses onto the highway, these will need to be presented with accurate and realistic visibility splay requirements. It will not be acceptable for the Council to be forced to accept a whole string of post consent requirements for additional roadside hedgerow and tree removal needed to achieve splays that should have been properly assessed and presented as part of the DCO submission process.		visibility splay requirements are provided within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan**. The landscape planting proposals associated with the permanent access route are shown on **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. The effects of the access route are taken into account in the assessment of effects arising from the Suffolk Onshore Scheme on landscape character and visual amenity. This is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to vegetation removal and the impact on the Fromus Valley landscape. It is understood that some trees within the plantation woodland to the west of the River Fromus will be felled prior to construction of the Suffolk Onshore Scheme. This has been considered as part of the future baseline and has informed the landscape and visual assessment as well as the development of mitigation options around the River Fromus.
		Landfall location, combined effect of the proposed project, geology and hydrogeology	**13.8 Coastal Management Comments** 13.8.1 The many consultation documents that appeared to me to have potential to include a reference to landfall impact assessments have been reviewed. Also key word searches undertaken including landfall, coastal and erosion. No reference to any consideration of coastal change or impacts on/from existing or planned coastal control structures within the consultation documents have been found. 13.8.2 The Strategic Options Report includes the following text: 1.3 Assessment Principles Applied by Decision Maker 1.3.1 Part 4 of EN-1 sets out the general policies that are applied in determining DCO applications relating to new energy infrastructure. Paragraphs 2.3-2.5 of EN-5 set out the general assessment principles in the specific context of electricity networks infrastructure. Those impacts identified in EN-1 include air quality and emissions, biodiversity and geological conservation, civil and military aviation and defence interests, coastal change (to the extent in or proximate to a coastal area), dust, odour, artificial light, smoke, steam and insect infestation, flood risk, historic environment, landscape and visual, land use, noise and vibration, socio-economic effects, traffic and transport, waste management and water quality and resources. The extent to which these impacts are relevant to a particular stage of a project,or are a relevant differentiator at a particular stage of the options appraisal process, will vary. In particular, some of these impacts are scoped out of this stage of the options appraisal process for this project. 13.8.3 It is therefore assumed that the developer has scoped out coastal change from this stage of the process. If that is the case, it is a significant oversight.	N	Chapter 2 (Physical Environment) in Table 4.2.17 of the PEIR assessed the impact of construction, operation and decommissioning on the Suffolk and Kent coastline morphology, including Sandwich Bay to Hacklinge Marshes SSSI and The Haven SSSI. A more detailed assessment at each of the Suffolk and Kent landfalls is presented within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. Coastal sediment cells, nearshore and regional sediment transport pathways are considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** and identified via maps/figures where appropriate. The most recent details from the SMP, including coastal management plans for specific management units are now included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			13.8.4 The section of coast proposed for the landfall is managed by the Environment Agency and so they should lead on responding to the developer. 13.8.5 ESC has responsibility for managing coastal frontages to north (Thorpeness) and south (Aldeburgh) of the proposed landfall and so would have an interest in the findings of a coastal change / management impact assessment.		
		Socio-economic, recreation and tourism, construction, community benefits/ism, construction, community benefits/ enhancements	**13.9 Tourism & Economy Comments** 13.9.1 The Sea Link project has the potential to adversely affect the east Suffolk economy throughout its lifecycle. The construction works at the landfall and along the cable corridor in addition to the construction works and permanent infrastructure at the converter station site and connection site will have an alone and cumulative effects 13.9.2 The visitor economy is one of largest sectors in east Suffolk, contributing c. £700m to the local economy annually and supporting around 11,000 (FTE) jobs. This accounts for 15% of all employment in the district. The continued success of the visitor economy is dependent on its reputation as a holiday destination, and the overall experience offered to visitors. The East Suffolk Visitor Economy Strategy identifies that together, the coastline, towns and places, natural landscape, and cultural offer present a compelling experiential proposition for the visitor.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The Chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.
		Inter-project cumulative effects, onshore mitigation, community benefits/ enhancements	13.9.3 ESC is concerned that the cumulative impact of Sea Link in addition to the other proposed energy projects will negatively affect the visitor experience, damaging the reputation and perception of the district as a holiday destination, therefore negatively affecting the visitor economy throughout the lifetime of the project(s) 13.9.4 The impact of the Sea Link scheme will not be limited to the immediate vicinity of the proposed landfall, converter station, connection infrastructure and cable corridor locations. There is a high degree of interdependency between visitor destinations, employment, and supply chains within east Suffolk. Visitors move from destination to destination, employees need to access their employment, and the potential for the displacement of visitors during construction should not be ignored. 13.9.5 Should this project proceed, it is essential that this impact is appropriately considered, and sufficient mitigation is provided to support the continued success of the visitor economy. 13.9.6 ESC notes and welcomes the potential opportunity that Sea Link presents in generating ‘direct and indirect temporary	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The Chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. This Chapter estimates around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes. Further information can be supplied regarding employment opportunities following the appointment of a Main Contractor. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. However, community benefit is separate to compensation and mitigation. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			employment, training, and apprenticeship opportunities both on site and in the supply chain during the construction, maintenance, and decommissioning phases of the scheme.' However, the Council would like to be reassured that any direct or indirect employment opportunities are accessible to the resident population of East Suffolk, and that any potentially negative effects on employment within the visitor economy and wider business population are suitably assessed and mitigated. 13.9.7 The Council notes the opportunities to improve awareness of the wider energy sector across east Suffolk and the high value/high skill employment and apprenticeship opportunities available. Greater information about workforce planning for the Sea Link project is required. 13.9.8 The decision maker needs to be able to balance the potential benefits which may result from the temporary employment, training and apprenticeship opportunities created against the disbenefits of the project.		delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Socio-economic, recreation and tourism, community benefits/ enhancements, onshore mitigation	**13.10 Economic Development and Regeneration (EDR) Comments** 13.10.1 In October 2022, EDR responded to the Sea Link non-statutory consultation expressing concern over the scheme's potential for negative socio-economic impacts affecting businesses, employment, and the wider economy. Especially the potential for cumulative adverse socio-economic effects resulting from multiple energy infrastructure projects scheduled for development in east Suffolk over the next decade. 13.10.2 Tourism is one of the largest economic sectors in East Suffolk and is dependent upon its perception and reputation as a visitor destination providing a high-quality experience to visitors. EDR continues to consider the visitor economy to be particularly sensitive to the cumulative effects described above. 13.10.3 EDR are somewhat reassured to note that within the Sea Link statutory consultation, concerns about the cumulative impact of multiple infrastructure projects in east Suffolk are being addressed, and that opportunities for the co-ordination of multiple infrastructure projects and the co-location of infrastructure elements are being explored. However, 'Table 2.14.38 Socio-Economics, Recreation and Tourism CEA' states that there is insufficient information to determine any cumulative effects at this stage. Therefore, EDR will continue to monitor and review the progress made in evaluating cumulative effects once the Environmental Statement is published in due course. 13.10.4 EDR expressed a concern during the non-statutory consultation about baseline data methodology, recognising a need for caution when relying on purely desk-based research and digital modelling to establish the socio-economic baseline,	N	Other proposed developments that have the potential to overlap temporally with the Proposed Project have been identified and any potential inter-project cumulative effects resulting from the interaction between these other developments and the Proposed Project have been assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. In terms of socio-economics, recreation and tourism, the chapter concludes that there are no anticipated significant cumulative effects on socio-economic, recreation and tourism receptors as a result of the Proposed Project in combination with the cumulative schemes. Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the statutory consultation. The meetings have run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			and ongoing monitoring and assessment of socio-economic impacts. 13.10.5 EDR recognises the limitations of certain 'standard' datasets and believes that additional field base assessments including visitor, business, and resident surveys should be conducted to establish baseline information for some of the more qualitative or intangible impacts of the scheme. Especially, the perception of business owners and visitors towards the scheme, the impact on the visitor experience and reputation throughout the project life cycle, and the impact on the movement of residents, and visitors during the construction phase. 13.10.6 This approach could create a more dynamic reporting methodology, allowing real time understanding of the socio-economic impact of the Suffolk Onshore Scheme. This is congruent with the PEIR, paragraphs 2.11.4.26 and 2.11.4.27. 13.10.7 EDR notes that within the Preliminary Assessment Effects, paragraph 2.11.9.4 that the Suffolk Onshore Scheme might create 105 net additional jobs during the construction period. The significance of energy generation and transmission to east Suffolk means that EDR would welcome the opportunity to discuss the possibility of a 'NGET outreach' programme, like NGET's 'Connect Partnership', providing a series of in-person workshops, seminars, and Q&A sessions for local students.		
		Socio-economic, recreation and tourism, construction	13.10.8 In terms of the PEIR, the following comments are made: a)EDR acknowledges the use of NPS EN-1 (2011) in determining the socioeconomic considerations for the PEIR and welcomes inclusion of the additional requirements identified within the published draft NPS EN-1 (2023). b) EDR concur with the potential socio-economic impacts identified within Table 2.11.1. c) EDR confirms that it was able to engage with NGET through the non statutory consultation in November 2022, and again through the online thematic meeting in August 2023. Table 2.11.2. d) The NPPF requirements relevant to socio-economic requirements are welcome, especially those where potential project impacts could adversely affect economic growth and productivity across local economic centres and key industrial sectors such as tourism. Table 2.11.3. e)EDR appreciates the inclusion of, and reference to key economic development strategies (East Suffolk Economic	N	These comments have been noted. Please refer to the assessment of socio-economics effects that is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Strategy 2022-202, East Suffolk Visitor Economy Strategy 2022-2027 and East Suffolk Cultural Strategy 2023-2028. f) ID 3.10.1 refers to the creation of permanent operational phase employment, training, and apprenticeship opportunities, both directly and indirectly in East Suffolk. EDR accepts that the scale of operational employment is likely to be very limited and that this matter should be scoped out of the assessment. g) ID 3.10.2 scopes out an assessment of the generation of GVA in East Suffolk during the operational phase. EDR accepts that during the operational phase, any effect on GVA will be small. h) ID 3.10.3 EDR welcomes the introduction of routes connected via the road network as well as recreational routes and public rights of way when assessing impacts on local communities. EDR welcomes the additional assessment of the impact of the changing influx of the construction workforce on local accommodation facilities and their effect on the local tourism industry. Paragraph 2.11.3.3. j) EDR are satisfied with the overarching approach described in paragraph 2.11.41 which 'determine the baseline conditions, sensitivity of the receptors and magnitude of effects and sets out the significance criteria that have been used for the preliminary socio-economics, recreation and tourism assessment'. However, where the assessment aims to adopt an objective and quantifiable approach, EDR recognises that some effects can only be evaluated on a qualitative basis and is supportive of the PEIR definition of effects described in 2.11.4.8.		
		Socio-economic, recreation and tourism, walking, cycling and horse-riders, construction	k) DR is supportive of the adopted methodology described in 2.11.4.10 for assessing the significance of project effects on the defined receptors. l)The economic additionality assumptions described in Table 2.11.6 and the economic impact criteria described in paragraph 2.11.4.14 including the sensitivity and magnitude criteria in 2.11.4.5 and tabulated in tables 2.11.7 and 2.11.8 are considered appropriate for the assessment of the socioeconomic receptors relating to employment and GVA. m) Likewise, the magnitude and sensitivity criteria adopted to assess the direct and severance effects on public rights of way and private, community, recreation and tourism assets described in tables 2.11.9 through to 2.11.12 are considered appropriate.	N	These comments have been noted. Please refer to the assessment of socio-economics effects that is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			n) The basis of assigning significance of effects in image 2.11.1 is appropriate. o) EDR supports the requirement for built in design flexibility and the need to consider alternative scenarios outlined in paragraph 2.11.5.1, Table 2.11.13 and Table 2.11.14. p) The option for co-location with National Grid Ventures proposed Nautilus and LionLink (formerly known as EuroLink) interconnector projects is welcome. Especially where it has the potential to reduce the potential for adverse socio-economic impacts, especially during the construction phase of each project. Paragraph 2.11.5.7 and Table 2.11.15. q) The different components of the socio-economics recreation and tourism effects assessment presented in Table 2.11.16, describing the geographic scale at which each component is assessed, and the rationale behind the geographic scales need to be considered. r) When considering the 60-minute travel area for employment generation and GVA during the construction phase, the use of CIPD national commute data may not reflect the true geographical area of impact, particularly for those direct, highly specialised, and technical trades required for construction of electricity transmission infrastructure.		
		Socio-economic, recreation and tourism, construction	s) When considering the 1km and 500m radii, especially for local communities, business premises and visitor attractions, EDR believes that it is important to recognise the degree of interdependency between visitor destinations, employment, and supply chains throughout east Suffolk. Professional judgement and experience should be used to consider the potential for direct and indirect impacts that fall outside of the proposed geographical areas of impact. t) EDR recognises the limitations of certain datasets, especially the time lag additional field base assessments including visitor, business, and resident surveys should be conducted to establish a baseline for some of the more qualitative or intangible impacts of the scheme. u) In addition, the appropriate frequency of data sampling should be considered. However, EDR agrees with the benchmarked standard in paragraph 2.11.7.2 v) Paragraph 2.11.7.30 and Table 2.11.20 identifies 27 business premises within 500m of the Suffolk Onshore Scheme Order Limits. Within the list of premises, it is notable that 12 can be described as closely linked to recreation and tourism and it could be argued that these could be more sensitive to the construction phase of the Suffolk Onshore Scheme than other business premises. The list includes a golf club, holiday lets,	N	These comments have been noted. Please refer to the assessment of socio-economics effects that is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			campsite, and a café. EDR would like to know more about the methodology planned for assessing the impact of the scheme during the construction phase of the project. w) In addition, the visitor attractions listed in 2.11.7.31 could be more sensitive to environmental impacts during the construction phase due to their status as visitor destinations. x) The categories of mitigation measures describedin 2.11.8.2 and 2.11.8.3; whether embedded measures; control and management measures; and mitigation are as expected and EDR welcome active measures such as 'keeping the community and local businesses informed' providing that they are comprehensive and maintained throughout the construction phase. y) EDR notes that in Table 2.11.38, the preliminary assessment considers the preliminary project effects on construction employment within the Economic Study Area, and employment to have a small beneficial effect which is not considered significant. z) EDR notes that in Table 2.11.39, the preliminary assessment of socio-economics, recreation, and tourism effects of the project on construction employment within the Economic Study Area, and employment to have a small beneficial effect which is not considered significant. END		
		Design	**Appendix B** Proposed Friston Substation And Proposed Saxmundham Converter Station With Underground Cable Route Between (image) Route Of Underground Cable From Saxmundham to North Warren via Friston (image) Route of Underground Cable from North Warren To The Coast (image)	N	National Grid acknowledges this feedback.
		Consultation, DCO process	**CABINET - Tues 02 January 2024** **Purpose and high-level overview** Purpose of Report: To provide a response to the statutory consultation for this nationally significant infrastructure project (NSIP). To get agreement that the Head of Planning & Coastal Management be given delegated authority, in consultation with the relevant Cabinet	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Member(s) to undertake all further activities in relation to the Sea Link project during the pre-application, examination and post examination/consent phases including the signing of any legal agreements/memorandum of understandings. Options: To not agree the consultation response. To not agree to provide the requested delegated authority. Recommendation/s: 1. Agree the consultation response as set out in Appendix A. 2. Agree that the Head of Planning & Coastal Management, in Consultation with the relevant Cabinet Member(s) be given delegated authority to act on behalf of the Council in all activities associated with the pre-application, examination and post examination/consent phases of the project including the signing of any legal agreements/memorandum of understandings.		
		Socio-economic, recreation and tourism, community benefits/ enhancements, DCO process	**Corporate Impact Assessment** **Governance:** The constitution is such that a response to the statutory consultation is made via Cabinet. However, for NSIPs such as Sea Link, the consultation deadlines are short and can be frequent such that it is not considered feasible in the future to provide timely responses and engage appropriately with the project in addition to meeting the timelines associated with Cabinet meetings. It is essential that the Council can respond in an agile way to the project, to enable the views and position of East Suffolk Council (ESC) to be represented, therefore additional delegation is being sought. **ESC policies and strategies that directly apply to the proposal:** The applicant has stated that the project is required to reinforce the national grid network and in part to accommodate the additional anticipated generation coming to the region, some of which includes renewable energy. The potential benefits of grid reinforcement alongside some temporary economic benefits must be considered against the disbenefits involving the impact on the ecology, landscape, heritage, coastal management, amenity and quality of life in the district and well as tourism. **Environmental:** The impacts of the proposal are considered in the report. **Equalities and Diversity:**	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Currently there is insufficient information to determine if the proposal impacts disproportionately on any groups in the district. **Financial:** Engagement with the project during the pre-application, examination and post consent phases will have implications for the Council's resources. Negotiations are currently taking place with the applicant to secure a Planning Performance Agreement. **Human Resources:** ESC officers will be engaged in future consultations on the project, at the examination and during the post consent phases with the implementation of the project, if consented. **ICT:** None **Legal:** The Council will require legal representation when the project reaches examination stage. The project may result in the Council being party to a legal agreement in respect of securing adequate mitigation or compensation for the impacts of the proposal. **Risk:** None		
		Design, consultation	Background and Justification for Recommendation 1.1 The Council has received a statutory eight week consultation (24 October to 18 December 2023) from National Grid Electricity Transmission (NGET) for the Sea Link NSIP. The project proposes: 1. An above ground connection from the overhead electricity lines near Friston to a proposed new substation near Friston (if the substation already consented under the East Anglia One North and East Anglia Two projects is constructed then this can also serve Sea Link). 2. Below ground HVAC connection from the substation to a proposed converter station near Saxmundham. 3. Below ground HVDC connection from the converter station to the coast near Aldeburgh. 4. Undersea cable to Kent The project is said to be required in order to be able to transfer energy to and from Suffolk and to and from Kent.	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			It should be noted that the submitted consultation material indicates the potential to site/co-locate converter stations for the Lionlink and Nautilus interconnectors adjoining the site to the east of Saxmundham See Appendix B for a more detailed map of the proposals. 1.2 As an NSIP, the Council is a statutory consultee in the process. The Secretary of State for the Department of Energy Security and Net Zero is the decision maker following an examination and the consideration of a report from an appointed Examining Authority which is provided and managed by the Planning Inspectorate. 1.3 This consultation is the opportunity to make the applicant aware of the Council's views on the proposal and the work undertaken by the applicant so far on the Environmental Impact Assessment. 1.4 The Council had to provide a response to the eight-week consultation by 18 December 2023 due to that being the close of the consultation period. A draft response (see Appendix A) was prepared by officers, having been agreed by Councillor Tom Daly, as the relevant Cabinet Member and submitted. This report is seeking the confirmation of Cabinet that response submitted is acceptable or to be agreed with amendments. The applicant has agreed that the final response can be provided by 5 January 2024 to allow for consideration at this Cabinet meeting.		
		Coordination with other projects, needs case, timescales/ programme	2 Current position **National Plan for / Co-ordination of Energy Projects** 2.1 Members will be aware that there are a number of energy projects, either consented (Sizewell C, East Anglia One North, East Anglia Two, East Anglia Three), or proposed (Nautilus, Lion Link – both interconnector schemes, North Falls and Five Estuaries) as well as Sea Link, being considered/delivered in this part of East Suffolk. The Council has previously stated following the Motion to Full Council in September 2023 that the government should seek :- • To intervene to bring long-term stability and security for future plans for all off and on-shore energy generation • To carry out a full cost-benefit analysis of options for connecting all electricity generation to users in the UK rather than the current piecemeal approach 2.2 The Secretary of State has not yet responded to that letter sent following Full Council but this proposal amplifies again that there is the need for better national planning and co-ordination of all these energy projects such that the best possible decision	N	National Grid's plans in Suffolk have been developed for the Proposed Project as a standalone project but have been designed in a coordinated way with other projects, including two potential NGV projects. As development work on the Proposed Project and these other projects has progressed, National Grid's approach to coordination has evolved. A key part of their coordination strategy is to continue to explore opportunities to co-locate infrastructure where feasible and beneficial. At Statutory consultation, National Grid presented a design which showed the NGV works themselves at the landfall and along the cable sections. It also included the entire wider site at Saxmundham, to show how they could be flexible if constructing around one or two additional converter stations. This assumed a scenario where the NGV projects, whose routeing and siting work is at an earlier stage, identified the same cable and converter station sites as the Proposed Project. In March 2024, NGV's LionLink project announced that it had down selected its potential landfall at Aldeburgh and would be removing it from the LionLink proposals. LionLink is still proposing to co-locate its converter station alongside the Proposed Project's near Saxmundham. As National Grid's design work and their engagement with the NGV projects has progressed, they have evolved their approach to coordinating with NGV. They are considering further ways that they could coordinate their construction activities and other projects and developers, including NGV, EDF Energy and SPR.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			and outcome for communities, and the environment, can be achieved having regard to the need to upgrade our energy infrastructure. 2.3 It is acknowledged that the principle of subsea interconnectors is a key part of an offshore focused approach. However, the full outcomes of the Offshore Coordination Support Scheme (OCSS), and the review of connections in East Anglia, which is to be undertaken by National Grid Electricity System Operator, are unknown. Therefore, the proposals related to this project could be subject of significant change. 2.4 On 5 December 2023 it was announced that North Falls, Five Estuaries and Sea Link had been successful in receiving grant funding from the OCSS. The purpose of the funding from the OCSS is to enable the exploration of coordination between the two offshore wind farms and Sea Link. Given the association between Sea Link, LionLink and Nautilus, the opportunity for co-ordination created by the funding has been significantly limited. Whilst the Sea Link proposal has endeavoured to plan for a degree of co-location, there remains the concern regarding the lack of co-ordination and strategic planning, not least as each of the projects is being proposed by different organisations on the basis of different timetables. The Council's objections and disappointment on these issues therefore remains.		Further details are contained in **Application Document 7.10 Coordination Document**. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Needs case	**Need For The Project** 2.5 The project is said to be required in order to be able to transfer energy to and from Suffolk and to and from Kent. However, in respect of exporting energy from Suffolk and Suffolk grid reinforcement, the need for the project only arises once Sizewell C, LionLink and Nautilus all come online (the latter two are not yet consented). Therefore, and notwithstanding the concerns the Council raises if Sea Link is consented, its implementation should be conditional on the other three projects all being committed for implementation. With regard to the Kent perspective, Sea Link serves to reinforce the south coast grid but it is not considered that it has been adequately demonstrated that reinforcement by a means other than Sea Link is not possible. It is also considered that alternatives to the project, such as an offshore grid and use of brownfield sites, have not been considered. Again, the Council remains disappointed that there has been no real demonstrable approach by the government or the energy companies to address the many issues highlighted affecting the east Suffolk communities.	N	The needs case for the Proposed Project is outlined in **Application Document 7.1 Planning Statement** and is not contingent on any other particular project going ahead. Notwithstanding this, NPS EN-1 sets out at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. The preference for use of previously developed land is recognised, however, it remains imperative that alternative options address the overarching needs case for the Proposed Project by providing additional network capacity where it is needed. As a national infrastructure provider, National Grid is seeking to deliver the Government's policies regarding net zero by 2050. Its publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for the Proposed Project. While comments relating to Government policy are not within the remit of the Proposed Project, National Grid is coordinating with other large scale infrastructure projects in Suffolk, noting that those other projects are also

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					outside of its control. Details of how it is coordinating with other projects will be set out in the DCO application. Alternative solutions to the Proposed Project have been considered by National Grid. Details are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Needs case, intra-project cumulative effects, alternative solutions	**Overview of ESC's position on Sea Link** 2.6 ESC currently objects to the Sea Link project as it would result in further unacceptable harm to the communities , environment and economy of East Suffolk and it is not yet considered that the timing of the need for the project is currently proven, and with Sizewell C potentially at least 10 years away from generation, it is requested further consideration of alternative offshore solutions is undertaken and consider that the project does not currently include sufficient levels of coordination in all areas of the NSIP process. In reaching this position the submitted plans showing the possible siting of converter stations adjacent to the proposed converter station for this project amplify the coordination/cumulative impact concerns.	N	National Grid is coordinating with other developers of large-scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The needs case for the Proposed Project is outlined in **Application Document 7.1 Planning Statement** and is not contingent on any other particular project going ahead. Notwithstanding this, NPS EN-1 sets out at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. The project is of a type defined by NPS EN-1 as a critical national priority. National Grid has carefully sited and developed the Proposed Project following the principles of the mitigation hierarchy and has robustly considered alternatives. NPS EN-1 acknowledges that even after the application of the mitigation hierarchy, it is likely that some significant residual effects will remain, including at paragraphs 3.1.2 and 4.1.7, the latter of which states: "Where this NPS or the relevant technology specific NPSs require an applicant to mitigate a particular impact as far as possible, but the Secretary of State considers that there would still be residual adverse effects after the implementation of such mitigation measures, the Secretary of State should weigh those residual effects against the benefits of the proposed development. For projects which qualify as CNP Infrastructure, it is likely that the need case will outweigh the residual effects in all but the most exceptional cases..." Paragraph 4.2.16 of NPS EN-1 also states that for CNP infrastructure, such as the project: "...the Secretary of State will take as the starting point for decision-making that such infrastructure is to be treated as if it has met any tests which are set out within the NPSs, or any other planning policy, which requires a clear outweighing of harm, exceptionality or very special circumstances."

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Alternative solutions to the Proposed Project have been considered by National Grid. Details are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
		Onshore environmental impact, offshore environmental impact	**Preliminary Environmental Information Report (PEIR)** 2.7 Notwithstanding the concerns with the principle of the proposal as already stated, there is the need for the Council to consider the technical aspects of the scheme. PEIR's are often included in the first statutory consultation document on an NSIP proposal. It is usual for the assessments to have some gaps within them. This has been the case here. As such officers have not been able to form a full and final opinion on whether the various environmental impacts of the proposal are within acceptable limits or not. Below are the main points that officers wish to make in relation to the PEIR. A very high level summary of the comments on the project has been provided in the following paragraphs, full details are available in Appendix A of this report.	N	National Grid acknowledges this feedback.
		Landfall location, geology and hydrogeology, offshore physical environment	**Coastal processes** 2.8 The impact of the cables arriving to shore have not been assessed. This is a significant omission within the environmental information provided. This is hugely disappointing, especially given the sensitivities of the East Suffolk coastline and the erosion rates that have been seen recently. This section of coast is managed by the Environment Agency but as ESC has responsibility for managing the coastal frontages to the north and south of the landfall, it is essential that we are informed of the findings of coastal change/management impact assessment.	N	Chapter 2 (Physical Environment) in Table 4.2.17 of the PEIR assessed the impact of construction, operation and decommissioning on the Suffolk and Kent coastline morphology, including Sandwich Bay to Hacklinge Marshes SSSI and The Haven SSSI. A more detailed assessment at each of the Suffolk and Kent landfalls is presented within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. Coastal sediment cells, nearshore and regional sediment transport pathways are considered within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** and identified via maps/figures where appropriate. The most recent details from the SMP, including coastal management plans for specific management units are now included within **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**.
		Noise and vibration, construction, consultation	**Operational Noise & Vibration** 2.9 Officers are working with the applicant to ensure that the impacts are appropriately assessed. The starting point for ESC at the converter site is to seek a below background sound rating level, it is welcomed that the applicant has stated that it is their intention for the development to achieve this. Due to the low background sound levels in this area, particularly at night, it is extremely important that noise levels from the development are prevented, mitigated or minimised to ensure these background sound levels are not subject to "noise creep". 2.10 ESC does not agree with the scoping out of the substation at Friston on the basis that the switchgear noise emissions would be impulsive in character and operation would be	N	The ES includes an indicative assessment of operational noise based on available design information. The parameters used for the assessment are contained within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment has been conducted in accordance with BS 4142:2014+A1:2019 and includes consideration of the existing acoustic character and context, as required by BS 4142:2014+A1:2019. The assessment has also considered guidance from the Association of Noise Consultant's Technical Note on BS 4142. The assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			infrequent. Insufficient justification has been provided to support this decision. This substation is subject of a site rating level imposed by East Anglia One North and East Anglia Two DCOs, therefore NGET needs to be very confident that the introduction of a further or different equipment will not impact that constraint. 2.1 1 ESC will be engaging further with the applicant on operational noise to ensure the amenity of the area and local residents is protected. Significant more technical detail has also been provided in Appendix A.		An assessment of noise impacts from the proposed Friston Substation has been conducted as part of the ES.
		Noise and vibration, construction	**Construction Noise & Vibration** 2.12 The use of BS5228 – Code of practice for noise and vibration control on construction and open sites along with the ABC methodology within that code, is accepted. The working hours however set out in the Outline Code of Construction Practice (OCoCP) identify Saturday working at 07:00-17:00. ESC does not currently consider that Saturday afternoon working is acceptable. Saturday working hours of 07:00-13:00 were set as part of the East Anglia One North and East Anglia Two projects and should be complied with on the Sea Link project. It is welcomed that the applicant intends to use Best Practicable Means (BPM) which is a critical control point and therefore any noise mitigation carried out with BPM will ensure noise and vibration is kept to a reasonable minimum. ESC would however welcome further discussions with the applicant on the impact methodology utilised in the environmental assessments.	N	Acceptance of the BS 5228 ABC methodology is noted. Since publication of the PEIR within Statutory consultation, the proposed construction working hours have changed, although Saturday working hours remain the same. Shortening working hours would potentially extend the working programme and put at risk delivery of the Proposed Project by 2030. The change in working hours has been consulted on as part of the Targeted consultation. Details relating to the proposed construction working hours and any associated restrictions are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Intra-project cumulative effects, inter-project cumulative effects, timescales/ programme	**Interproject cumulative effects** 2.13 ESC is concerned that only the peak year has been used as a basis for assessment and so there may be impacts from Sea Link prior to the cumulative peak predicted year which should be considered and also the impact of timeline slips in regard to the project's overlap with other NSIPs. It is already evident that some of the dates provided for the commencement of NSIPs in the cumulative assessment are not accurate. The methodology utilised for the scope of the projects included within the cumulative impacts assessment needs to be reconsidered.	N	As above, construction/ operational traffic has been included as part of the assessment for committed developments where there is the potential for this traffic to overlap with the construction phase for the Proposed Project, i.e. during the five year period, not just the peak construction year. Robust assumptions have also been made with respect to adopting peak construction traffic flows associated with Sizewell C and the SPR schemes, as well as with other committed developments where necessary. Traffic and transport data has been provided to the air quality, noise and vibration and ecology teams to inform their Inter-project Cumulative Effects Assessments accordingly. Further detail is provided within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Air quality, construction	**Air Quality** 2.14 ESC notes that a detailed air quality assessment will be carried out at the Environmental Statement (ES) stage once further data is available. It is understood that at this stage Non Road Mobile Machinery (NRMM) will be considered further, however the Council would like to see a commitment to reduce	N	NRMM emissions have been considered in the air quality assessment as detailed in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			emissions from this source which should include commitments to use renewable energy sources alongside Stage 4 NRMM as a minimum and Stage 5 where possible. Further specific details are provided within the Council's response in Appendix A.		Several control measures relating to NRMM emissions have been included in the CEMP (**Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**) including: AQ04 - Avoid the use of diesel or petrol powered generators and use mains electricity or battery powered equipment where practicable. Impose and signpost a maximum speed limit on unsurfaced haul roads and work areas; AQ09 - Ensure all equipment complies with the appropriate Non-Road Mobile Machinery standards. Use stage 4 NRMM as a minimum and stage 5 where possible. Additionally, where possible, use alternative / renewable energy to power NRMM; and GG10 - Any activity carried out or equipment located within a construction compound that may produce a noticeable nuisance, including but not limited to dust, noise, vibration, and lighting, will be located away from sensitive receptors such as residential properties or ecological sites where practicable.
		Landscape and visual	**Landscape** 2.15 There are clear concerns in relation to the potential landscape impacts of the converter station site to the east of Saxmundham. Regarding the identified visual receptors, the Council has concerns about some of the value assessments given to some of the selected viewpoints as the rationale for attributing 'medium value' to some public rights of way and 'high' and 'very high' to others is not wholly clear. It is recommended that the developer discusses these issues with the Council before the Landscape and Visual and Impact Assessment is progressed any further. The applicant should engage with officers to ensure a collaborative ongoing dialogue in respect of landscape mitigation matters. The preliminary assessment is not clear on the role of mitigation planting in moderating the magnitude of effects over time. Photomontages/wireframes will need to include depictions of mitigation planting at Year 1, Year 5 and Year 15 post planting. Multiple different access options have been set out in the consultation material. In term of the proposed accesses and their impact on landscape: • Southeastern Access 1 Redhouse Farm - This option would seem likely to be of least landscape impact, but it still carries risk to hedgerows and landscape character. • Northern Saxmundham Access 2 off B1121 - This option will have direct impacts on Carlton Park which is a locally listed historic parkland, on Tree Preservation Orders, roadside hedgerows and the setting of the Saxmundham Conservation Area.	N	The value judgements and the reasoning for the representative viewpoints are presented within **Application Document 6.3.2.1.B ES Appendix 2.1.B Landscape Baseline**. The value judgements were issued to stakeholders on 16 September 2024 for comment. The PEIR set out the stages of the Suffolk Onshore Scheme to be included within the assessment, including operation year 15 which is intended "to help demonstrate how proposed mitigation planting will influence effects once established". The assessment of effects during operation at both year 1 and year 15 are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Growth rates have been discussed with stakeholders in various thematic meetings, including the February and April 2024 meetings. Arboricultural specialists have prepared a report to evidence the growth rates and information has been supplied by East Suffolk Council, which has informed the height of mitigation planting shown in the year 15 visualisations, included in **Application Document 6.4.2.1 Landscape and Visual**. The requirement to prepare year 5 photomontages has been discussed with stakeholders at the thematic meetings and it was decided that as these do not relate to the operational assessment phases considered in the LVIA, that they will not be prepared. The co-location illustrative masterplan information can be found within **Application Document 7.10 Coordination Document**. The landscape planting proposals associated with the permanent access route are shown in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**. The effects of the access route are taken into account in the assessment of effects arising from the Suffolk Onshore Scheme on landscape character and visual amenity, this is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to vegetation removal and the impact on the Fromus Valley landscape. The South Eastern Access 1 Redhouse Farm and the Northern Saxmundham Access 2 off B1121 are no longer being pursued, as the Southern Saxmundham Access 3 off the B1121 has been adopted. Details relating to the Southern Saxmundham Access 3 off the B1121 including

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• Southern Saxmundham Access 3 off B1121 - This option will have direct impact on the Fromus valley landscape, willow woodland block, and roadside hedgerows. With regard to any proposed accesses onto the highway, these will need to be presented with accurate and realistic visibility splay requirements.		visibility splay requirements are provided within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan**.
		Cultural heritage	**Design & Heritage** 2.16 The heritage assessment is considered incomplete as several heritage assets have not been considered or assessed. Notwithstanding this, there are clear concerns regarding the potential impact of the converter station in relation to the setting and appreciation of a number of heritage assets. Where assets have been assessed it is considered that in a number of cases the setting of heritage assets has been underplayed.	N	Comments relating to the PEIR are noted, The full impact assessment includes a full assessment examining setting and is contained within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. Viewpoint photography, as well as the list of assets taken forward to full assessment were agreed with the East Suffolk Council Conservation Officer in early 2024. Note only summer photography is included as access issues prevented winter photography being completed. Winter photography will be submitted post-DCO submission.
		Terrestrial ecology, construction	**Ecology** 2.17 There is still a great deal of survey and assessment to be undertaken by the applicant. A trenchless technique for laying the cable at the Leiston-Aldeburgh Site of Special Scientific Interest (SSSI) and RSPB North Warren Reserve is proposed but there are doubts over the deliverability of this given the nature of the environment. If it is deliverable, the risk of 'frack out' of the drilling compound/material (e.g., bentonite) and the associated impacts need to be assessed. It has been stated that the Leiston-Aldeburgh SSSI is in the same location as Sandlings SPA which is not the case, and it cannot be assumed that measures potentially suitable for avoiding or mitigating impacts on SPA qualifying features are also suitable for SSSI features. ESC is also concerned about the applicant's assumption that replanted hedges will deliver their mitigation within a 2-year timeframe and therefore consider the operational impacts of the development on ecology have potentially been underplayed.	N	In thematic meetings it has been confirmed that geotechnical investigation has established that trenchless methods are appropriate for traversing RSPB North Warren and the SSSI, and these confirm the depth of the of bore. National Grid has can confirm that frac out is only a risk for the final stretch of tunnelling beyond the RSPB reserve. Commitment GH02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** includes for the provision of a Foundation Works Risk Assessment, where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid loss. The Proposed Project is therefore not including an option for surface trenching in the SSSI. This is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Socio-economic, recreation and tourism, community benefits/ enhancements	**Tourism & Economy** 2.18 The proposal has the potential to significantly impact on the tourism economy of the district as an individual project but also in combination with proposed and consented schemes promoting energy infrastructure. Equally, the project has the potential to provide jobs and skills advancement for residents. More information needs to be provided so that the Council can consider the issue appropriately.	N	Other proposed developments that have the potential to overlap temporally with the Proposed Project have been identified and any potential inter-project cumulative effects resulting from the interaction between these other developments and the Proposed Project have been assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. In terms of socio-economics, recreation and tourism, the chapter concludes that there are no anticipated significant cumulative effects on socio-economic, recreation and tourism receptors as a result of the Proposed Project in combination with the cumulative schemes. Thematic Meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					meetings have run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES.
		Onshore mitigation, consultation	**Community Compensation** 2.19 In the event that the development is consented by the Secretary of State, then it is important that the communities impacted are appropriately compensated. The Council would welcome an early discussion with the applicant on this matter. It is important to stress that whilst the Government is looking at putting in place a formal system for providing community compensation this does not excuse the need for projects to be both environmentally acceptable and have the impacts adequately mitigated in the first instance.	N	Community benefit is separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, they operate a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst they await clarity on the government's position, they are working to understand local and regional aspirations and priorities in relation to community benefits. They welcome the suggestions for delivering community benefits and as the Proposed Project progresses, they will work with stakeholders and local communities to further inform this.
		Consultation, DCO process, combined effect of the proposed project	**3 How to address current situation** 3.1 The Council has been formally consulted by the applicant on the Sea Link proposal as part of the NSIP process. The Council should, and needs, to respond to the consultation especially given its status as a “host authority”. Given the deadline for submitting comments (18 December 2023) being prior to the Cabinet meeting (2 January 2024), officers have sent the response in Appendix A, in consultation with Councillor Daly as a preliminary response pending confirmation by Cabinet. 3.2 Officers will seek to engage the applicant in relation to the concerns which have been identified within the PEIR and seek to ensure that these are addressed within the development consent application if it is subsequently submitted. 3.3 Due to the short timeframes and frequency of deadlines provided for NSIP consultations and responses during the consenting process, the recommendation includes a request for full delegation going forwards during the pre-application, examination and post consent phases of the project for the Head of Planning and Coastal Management to make decisions in consultation with the relevant cabinet member. This will ensure that the Council is able to fully engage with the applicant and project in order to minimise the disbenefits of the project and seek the best outcomes for east Suffolk.	N	National Grid acknowledges your feedback.
		Needs case, coordination with	**4 Reason/s for recommendation**	N	National Grid is coordinating with other developers of large-scale infrastructure projects in Suffolk, noting that those other projects are outside

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		other projects, DCO process	4.1 The Council objects to the proposed grid reinforcement proposals because: • There are concerns in respect of the principle of the proposal in that there continues to be a piecemeal approach to what is a nationally important issue. Whilst the proposal includes some elements of co-location, a greater degree and certainty of coordination is necessary. • It is not satisfied that there is not a technically deliverable solution for establishing reinforcement opportunities through better offshore coordination, and notwithstanding this the proposal of itself and in combination with other projects would have a detrimental impact on the communities, environment and economy of this part of the district. The need for the Sea Link scheme is triggered when three other schemes are implemented (two of these do not actually have consent). The project is predicated on the delivery of Sizewell C and other works which would not be generating/transmitting collectively for at least 10 years. In this regard, and notwithstanding the objections to the proposal if Sea Link is consented, the implementation should be conditional on the other projects being committed. In this way there is a greater chance that Sea Link is implemented at the same time as the other projects so that the communities and environment are disrupted a single time rather than on three separate occasions.		the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within the **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The need case for the Proposed Project is outlined in **Application Document 7.1 Planning Statement** and is not contingent on any other particular project going ahead. Notwithstanding this, NPS EN-1 sets out at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. The project is of a type defined by NPS EN-1 as a critical national priority (CNP). National Grid has carefully sited and developed the Proposed Project following the principles of the mitigation hierarchy and has robustly considered alternatives. NPS EN-1 acknowledges that even after the application of the mitigation hierarchy, it is likely that some significant residual effects will remain, including at paragraphs 3.1.2 and 4.1.7, the latter of which states: "Where this NPS or the relevant technology specific NPSs require an applicant to mitigate a particular impact as far as possible, but the Secretary of State considers that there would still be residual adverse effects after the implementation of such mitigation measures, the Secretary of State should weigh those residual effects against the benefits of the proposed development. For projects which qualify as CNP Infrastructure, it is likely that the need case will outweigh the residual effects in all but the most exceptional cases..." Paragraph 4.2.16 of NPS EN-1 also states that for CNP infrastructure, such as the project: "...the Secretary of State will take as the starting point for decision-making that such infrastructure is to be treated as if it has met any tests which are set out within the NPSs, or any other planning policy, which

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					requires a clear outweighing of harm, exceptionality or very special circumstances."
		Alternative solutions, onshore mitigation	Another reason why Sea Link is needed is to reinforce the grid on the South Coast. It is not considered that alternative options for reinforcement have been considered. 4.2 The consultation material published by the applicant has been reviewed by the relevant specialist teams within the authority and the comments that were forthcoming have formed the basis of the technical elements of the proposed response. As the project progresses through the consenting process, it is appropriate for the Council to engage with the applicant to ensure that in the event the scheme is consented by the Secretary of State, the impacts of the project are appropriate mitigated and if appropriate compensation provided in addition to ensuring the community is appropriately compensated. 4.3 There will be a future time for comments in the form of Relevant Representations on the proposal when it is submitted to the Planning Inspectorate for examination. In addition to this during the examination there will be multiple unrelenting deadlines to meet and if consented, requirements to discharge during the post -consent phase. By virtue of the number and frequency of deadlines it is not possible to present reports to Cabinet seeking agreement on each occasion. Delegated authority is therefore being sought to allow the Head of Planning & Coastal Management to respond and fully engage in the pre-application, examination, and post consent phases of the process, including the signing of any legal agreements/memorandums of understandings in consultation with the relevant portfolio holder on behalf of Cabinet.	N	Noted, continued engagement with East Suffolk Council has taken place since Statutory consultation. Further details on this engagement are contained in **Application Document 5.1 Consultation Report**. Alternative solutions to the Proposed Project have been considered by National Grid. Details are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.

Table 1.5 East Sussex County Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Walking, cycling and horse-riders, cultural heritage	**Sea Link – Statutory Consultation** Thank you for the opportunity to comment on the above consultation. As the National Trail Officer (NTO) for the South East section of the King Charles III England Coast Path (KCIIIECP), it is my responsibility to ensure the path is maintained to a high standard and seek opportunities to enhance the trail where possible. The KCIIIECP is a national asset that links iconic places and heritage sites along the coast, enabling people to experience, recognise and value the benefits of our environment. When it is completed, the KCIIIECP will be the longest managed coastal walking route in the world (approx. 2,700 mile).	N	National Grid acknowledges this feedback.
		Walking, cycling and horse-riders, health and wellbeing, socio economic, recreation and tourism	The Trail brings significant health and wellbeing benefits, in addition to boosting local economies and coastal communities. Research has shown that when local coastal resident expenditure is excluded, an additional £334 million was spent in local economies by people walking on English coastal paths. (The economic and health impacts of walking on English coastal paths: a baseline study for future evaluation - NECR283 (naturalengland.org.uk)). Taking this evidence into consideration, it is imperative that potential impacts of the Sea Link proposals on the KCIIIECP are fully considered.	N	National Grid acknowledges this feedback.
		Onshore route location, walking, cycling and horse-riders, design	With reference to the attached plan, the KCIIIECP passes directly through the Draft Order Limits for the Sea Link project and would be affected by the proposals. Concerns are raised with the potential impacts of the proposed high voltage direct current (HVDC) cables that would cross under the Trail, near the proposed landfall site in Kent. While it is understood that the cable route will traverse the route of the KCIIIECP using a trenchless method, the specific details of this method and its potential impacts are not clear.	N	As part of thematic meetings, the assessment approach to PRoW has been discussed and agreed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** concludes that there are no anticipated significant effects on PRoW/recreational routes as a result of the Proposed Project. Further details on the proposed trenchless methodology is contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Walking, cycling and horse-riders, construction, onshore mitigation	One of the principal features of the KCIIIECP is that the Trail provides a continuous walking route around the coastline of England. It is therefore essential that public access is maintained along the trail for path users, at all stages of the project. Should the path need to be temporarily closed during the construction, operation or decommissioning phase, a diversion route should be provided and managed by the applicant for the duration of the closure. Naturally, the duration of the temporary closure should be minimised to reduce disruption for path users. It is understood that an Outline PRoW Management Plan will be prepared, which will identify the management and mitigation	N	National Grid acknowledges this feedback. Whilst **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** only concerns PRoW, the King Charles III England Coast Path (KCIIIECP) has also been considered where any management and mitigation measures are required given its significance. Nonetheless, no impacts are expected given that trenchless techniques will be employed at landfall. The KCIIIECP is to be managed during trenchless works, although no crossing points or diversions are expected during the construction phase. There should be no requirement to close the KCIIIECP during the construction, operation or decommissioning phase.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			measures to be implemented, to avoid any significant effects on PRoW during all phases of the Proposed Project. Given the shared interests of the KCIIIECP and PRoW network, it is suggested that management and mitigation measures for the KCIIIECP are included within this same document. This should include details of any temporary closures and diversions proposed for the KCIIIECP.		
		Walking, cycling and horse-riders, DCO process	The full management plan must be agreed prior to the submission of the DCO application. All specific points of KCIIIECP management covering pre-construction, construction, operation and any decommissioning must be agreed with and approved by myself prior to the DCO application being submitted, not as part of the submission.	N	**Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** only concerns PRoW, although the KCIIIECP has also been considered where any management and mitigation measures are required given its significance. As set out within this document, trenchless methods will be undertaken at landfall and no crossing points or diversions of the KCIIIECP are therefore expected. Further detail on the measures which will be implemented to ensure that there is no impact on the KCIIIECP and its users will be set out within the detailed version of this document. Matters relating to PRoW and the KCIIIECP have been discussed at thematic meetings with Kent County Council PRoW officers. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** will be submitted to and approved by the relevant local planning authority.
		Walking, cycling and horse-riders, legislation and poilcy	You should also be aware of the coastal margin, located adjacent to the KCIIIECP. This margin includes all the land seaward of the Trail and may extend inland, providing access rights for the public to enjoy the coastline. Most of the coastal margin is open access land under the Countryside and Rights of Way Act 2000 (CROW Act), though some areas do not have these access rights, due to the nature of the land and its use. Further details can be found here: https://www.gov.uk/guidance/manage-your-land on-the-england-coast-path	N	National Grid acknowledges this feedback.
		Onshore mitigation, walking, cycling and horse-riders, design	Finally, please note the following development principles regarding the KCIIIECP: • No furniture, fence, barrier or other structure may be erected on or across the KCIIIECP without the express consent of the NTO. • There must be no disturbance of the surface of the KCIIIECP, or obstruction of its use, either during or following any approved development without the express consent of the NTO. • No hedging or shrubs should be planted within 1 metre of the edge of the KCIIIECP. • Please also make sure that the applicant is made aware that any planning consent given confers no consent or right to close or divert any section of the KCIIIECP at any time without the express permission of the NTO.	N	There will be no requirement to temporarily close/divert the KCIIIECP as a trenchless HVDC crossing will be implemented at depth below ground level. Access along the HVDC alignment will be required by foot/quad bike for monitoring purposes during construction and operation. Further details are set out within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Comments are made in reference to the following planning policy; • **National Planning Policy Framework** o Paragraph 100 - Planning policies and decisions should protect and enhance public rights of way and access, including taking opportunities to provide better facilities for users, for example by adding links to o **Paragraph 174** - Planning policies and decisions should contribute to and enhance the natural and local environment by: • c) maintaining the character of the undeveloped coast, while improving public access to it where appropriate; • **Thanet District Council Local Plan (Adopted 2020)** o Policy SP27 - Green Infrastructure o Policy SP32 - Protection of Open Space and Allotments o Policy SP33 - Local Green Space o Policy SP38 - Healthy and Inclusive Communities o Policy SP43 - Safe and Sustainable Travel o Policy SP45 - Transport Infrastructure o Policy TP02 – Walking **This response is made on behalf of the King Charles III England Coast Path National Trail. The views expressed should be considered only as the response of the National Trail officer in respect of King Charles III England Coast Path matters relating to the proposal.**	N	Under Section 104 of the Planning Act 2008, the Secretary of State is required to decide the application having regard to, amongst other things, any relevant National Policy Statement. The Secretary of State may also have regard to local planning policy or the NPPF if they consider it to be important and relevant to their decision. Regarding the NPPF, Paragraph 4.1.11 of NPS EN-1 states: "The energy NPSs have taken account of the National Planning Policy Framework (NPPF), the Planning Practice Guidance for England, and Planning Policy Wales and Technical Advice Notes (TANs) for Wales, where appropriate." Regarding local planning policy Paragraph 4.1.12 of NPS EN-1 states: "Other matters that the Secretary of State may consider both important and relevant to their decision-making may include Development Plan documents or other documents in the Local Development Framework." Paragraph 4.1.15 of NPS EN-1 clarifies that where there is a conflict between a relevant NPS and local policy or the NPPF, the NPS prevails for the purpose of Secretary of State decision making given the national significance of the infrastructure. **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** sets out the relevant policy, guidance and legislation relating to the socio-economics discipline at the national, regional and local level.

Table 1.6 Essex County Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	Thank you for the opportunity for Essex County Council (ECC) to comment on the second statutory round of public consultations, in advance of the submission of an application of a Development Consent Order (DCO) anticipated for Quarter 3 or 4 of 2024. The Sea Link project, presented by National Grid Electricity Transmission (NGET) is an electricity grid reinforcement scheme, consisting of the construction of 2GW High Voltage Direct Current (HVDC) undersea electricity link between Suffolk and Kent and includes onshore infrastructure, underground cabling from Aldeburgh to a converter station to the southeast of Saxmundham, then further underground cabling to the consented, but as yet unbuilt, substation at Friston. In Kent, the landfall location would be at Pegwell Bay.	N	National Grid acknowledges this feedback.
		Socio-economic. recreation and Tourism, traffic and transport, Inter-Project cumulative effects	The proposed development would constitute a Nationally Significant Infrastructure Project (NSIP) under the Planning Act 2008, therefore the Secretary of State at the Department of Energy Security & Net Zero (DESNZ) would decide on this scheme, on the advice of the Planning Inspectorate (PINS). ECC's interest, considerations and comments on the scheme reflects ECC's wider leadership role in protecting and promoting the interests of the county's communities, businesses and environment. Having reviewed the proposals, it is noted that there would be no direct, physical impact as a consequence of the proposed development. However, having reviewed the proposals, we consider that there could be residual impacts from the development during construction and operation and we believe that these principally relate to employment, education and skills, procurement and highways impact. It is noted that the proposal could also have implications for cumulative projects that do directly impact Essex and ECC would like to ensure that there is some coordination between various developers to maximise project opportunities and benefits whilst minimising detrimental impacts. As per the consultation documents, ECC would like to comment on six key areas: 1. Proposed offshore route of the HVDC cable from landfall to landfall 2. Potential for coordination and co-location of infrastructure with other forthcoming infrastructure projects 3. Construction methodology	N	National Grid acknowledges this feedback. **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** notes that there are no likely significant residual effects. Impacts to employment, education and skills, procurement and highways are assessed within the ES. Within Suffolk notably within **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** For Kent, within **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism and Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**. With respect to cumulative impacts, this is assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. The listed key areas that Essex County Council wish to provide specific comments on are responded to below. 1) The evolution of the proposed offshore route is addressed in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and the final proposed offshore route of the HVDC cable from landfall to landfall is addressed in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. 2) National Grid is coordinating with other developers of large scale infrastructure projects in the area, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			4. Likely environmental affects arising from the proposed project 5. Sustainability 6. Community Benefits		routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is considered within **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. 3) A construction programme and methodology is outlined in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. 4) Environmental effects are outlined in each specialist topic chapter. Intra-project cumulative effects and inter-project cumulative effects within Suffolk are addressed in: • **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects;** • **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects;** • **Application Document 6.2.3.12 Part 3 Kent Chapter 12 Kent Onshore Scheme Intra-Project Cumulative Effects; and** • **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects.** 5) Sustainability is embedded within each topic chapter. 6) Community benefits are outlined and assessed within **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism and Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**.
		Offshore route location, Coordination with other Projects, Norwich to Tilbury	1. Proposed offshore route of the HVDC cable from landfall to landfall The consultation documentation indicates that the proposal would involve the installation of approximately 130km of subsea high voltage direct cable, running between the Suffolk landfall location (between Aldeburgh and Thorpeness) and the Kent landfall location at Pegwell Bay.	N	National Grid acknowledges comments in relation to the Offshore Scheme. Additional information around the needs case of the Proposed Project is presented in **Application Document 6.2.1.1 Part 1 Introduction Chapter 1 Introduction and Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. The needs cases underlying the Proposed Project addresses a specific network reinforcement need that differs to those needs being met by other

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			We understand that NGET has considered and assessed a number of options for the marine route corridor and raise no objection to the offshore route proposed. ECC welcomes the use of subsea cabling, which has a significantly lower impact on visual amenity and long-term impacts for surrounding communities. ECC is therefore supportive of the principle of subsea cabling. We would like to better understand the opportunities that exist for the expansion of this project to enable the cabling to meet the needs of proposed offshore wind, thereby negating the need for onshore connections in Essex for projects such as Five Estuaries and North Falls Offshore Wind Farms. We welcome the indication that discussions between these projects has already commenced and would welcome these projects being incorporated into the subsea route. Alongside this, ECC are also keen to understand if opportunities exist to utilise this project to remove the requirement for the Norwich to Tilbury scheme. ECC is keen to ensure that the potential expansion of this project should not be viewed as a 'missed opportunity' at a later date. ECC's view is that comments within the consultation documents about the limited opportunity for co-ordination and co-location of projects because of different business timescales is not sufficient justification for the long-term harm that projects could place on the communities that live in close proximity to them. This is addressed further below.		projects, such as Norwich to Tilbury. While efforts are being made to engage with other projects and identify appropriate ways of co-ordinating and co-locating infrastructure with different project teams, covering several different geographical locations and on different timelines for delivery, it is not possible to co-ordinate simultaneous delivery of all of the network reinforcements coming forward under the Great Grid Upgrade programme. As National Grid has developed the Proposed Project, it has considered a number of strategic options that could provide the reinforcement required and have engaged with the Government on the Offshore Co-ordination Support Scheme (OCSS), which is understood to be considering connecting North Falls and Five Estuaries windfarms to an offshore platform in the middle of the Proposed Project route, thereby removing the need to connect those generators to the onshore East Anglia Connection Node (EACN) substation. However, this would not affect the Proposed Project's onshore connections and any benefits anticipated from reducing connections at EACN are likely to be more than offset by the need for additional onshore infrastructure. Cables would still need to run onshore from an offshore grid and onshore converter stations would still be needed to convert the electricity from direct to alternate current, with a substation to transform electricity into the required voltages and other infrastructure to facilitate the onward transmission. As such, at present, an offshore grid (or similar solutions) does not represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. With an offshore grid not representing a feasible solution at present, this would not align with the UK Government's commitment to net zero by 2050.
		Inter-Project cumulative effects, Needs case, Health and wellbeing	2. Potential for coordination and co-location of infrastructure with other forthcoming infrastructure projects Whilst ECC acknowledges that the Government's net zero objectives are the key driver for schemes such as this, as NGET may be aware, there are numerous energy NSIPS within Essex and Suffolk and the effect of the cumulative impact of multiple developments must be carefully considered. ECC understands and supports the justification for the Sea Link project, namely that the existing transmission network was not designed to transport electricity from where we increasingly now generate it (largely offshore). The solution to this should represent the most sustainable option, with the least impact on nearby communities.	N	National Grid is cognisant of the potential cumulative effects arising from other energy projects across Suffolk and Essex. This is therefore reflected in their approach to design and mitigation. Coordination amongst the several energy projects planned for Suffolk in the years ahead features as a significant theme of Statutory consultation feedback. Coordination is a key consideration. National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with other projects where it is feasible. The assessment of inter-cumulative effects with other proposed developments is also considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. More widely, a lot of work has taken place in recent years to consider the potential for further coordinated offshore infrastructure, such as the Government's Offshore transmission network review and the Electricity System Operator's Holistic network design. The Proposed Project is identified in the ESO's Network Options Assessment as an 'essential' project in order to deliver on offshore wind generation targets, so it is right that National Grid continue to develop their proposals in tandem with these other processes.
		Coordination with other Projects, Norwich to Tilbury, Health and wellbeing	It is consequently essential that NGET fully explores the potential for offshore coordination as part of the Offshore Transmission Network Review 'Early Opportunities' workstream and ECC very much welcome the indication that NGET Sea Link, North Falls (Offshore Wind Farm) and Five Estuaries (Offshore Wind Farm) have been working together to explore the potential for offshore coordination and would very much welcome being part of these discussions. ECC also requests that consideration of how this project could integrate the needs of the Norwich to Tilbury project should be carefully considered. ECC recommends that projects with the opportunity to interconnect should seek to coordinate consenting, construction, and operation, and Essex considers that it is the responsibility of the National Grid Group to manage the operation of its subsidiaries and to work with other Developers in order to achieve this, to effectively minimise the harm to the environment and the communities that will be impacted, including during the construction phase.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2GW are not available yet. As such, in Belgium, the 3.5GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100km of new overhead lines and around 20km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. The Proposed Project is a separate project to Norwich to Tilbury. Each project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. Since the connecting projects are being promoted by different companies, with different project teams, covering several different geographical locations and on different timelines for delivery, it is not possible to co-ordinate simultaneous delivery of all of the network reinforcements coming forward under the Great Grid Upgrade programme. As National Grid has developed the Proposed Project, it has considered a number of strategic options that could provide the reinforcement required. It assessed a variety of potential areas for infrastructure, including brownfield sites. However, in accordance with National Grid's regulatory obligation to find more efficient ways to work, a connection between East Anglia and Richborough in Kent has been identified as the most efficient the most efficient means of resolving the capacity requirements within the electricity

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					network, while the brownfield sites within the areas of search are too small to accommodate the required infrastructure. National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts.
		Construction – general, Traffic and transport, Health and wellbeing	3. Construction methodology It has been noted through the submission documents that the A12 would provide a key route during the four-year construction phase of the project and ECC would be keen to ensure that there would be minimal detrimental impact on surrounding communities. Although the project would not involve any construction within Essex, it is likely that construction materials would be transported through Essex. The Environmental Statement notes that Management Plans would be submitted once a DCO is granted but ECC would welcome discussions and provision of information such as construction management and construction logistics plans prior to the commencement of any DCO submission, to help mitigate any negative impacts of the development.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk** and **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** are provided to help mitigate any potential impacts. The associated traffic and transport chapters demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified within the **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. This includes the A12 (Suffolk County Council Highways) within and to the south of the study area. Details relating to construction traffic movements at a strategic level, including towards the A12/A14 Interchange (and therefore further south towards Essex albeit located some 45 km to the southwest of the Order Limits), are also provided within the Transport Assessment Note which has been prepared for Suffolk (**Application Document 6.3.2.7.A ES Appendix 2.7.A Transport Assessment Note**).
		Onshore mitigation, Landscape and visual, Terrestrial ecology	4. Likely environmental affects arising from the proposed project ECC strongly support the consultation documents' suggestion of the enhancement of landscaping and planting mitigation, compensation and enhancement, including biodiversity net gain and delivering an increase in habitat value for wildlife after the project is completed. Such measures can have a significant long term, positive project legacy.	N	National Grid acknowledges and agrees with the comments.
		Air quality, Onshore mitigation	5. Sustainability For the proposal, A Whole Life Carbon (WLC) assessment should be carried out, and mitigation measures to reduce the emissions put forward and evaluated. A WLC assessment would cover both operational and embodied carbon emissions.	N	A lifecycle greenhouse gas assessment is included in **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This is an assessment of the greenhouse gas emissions (also known as 'carbon' for shorthand) associated with the Proposed Project over its whole life, including operational emissions and embodied carbon. This assessment considers the mitigation measures embedded in the Proposed Project to reduce greenhouse gas emissions, as well as puts forward additional mitigation measures where applicable. This assessment has been conducted in accordance with the Institute of Environmental Management and Assessment (IEMA) good practice guidance for greenhouse gas assessments in Environmental Impact Assessments. **Application Document 7.5.13 Greenhouse Gas Reduction Strategy** has been developed alongside the climate change chapter. This document sets out how greenhouse gas emissions will be managed across the Proposed Project lifecycle.
		Community benefits /	6. Community Benefits	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		enhancements, Socio-economic. recreation and tourism, Coordination with other Projects	NSIPs are an excellent opportunity to provide a variety of community and economic benefits. ECC encourage NGET to undertake comprehensive and effective engagement with developers and their supply chain partners to maximise the local business opportunities, skills aspirations, and employment benefits and where appropriate, would hope for these to expand into Essex. As noted earlier in this letter, coordination of projects should be explored and this should be expanded into community benefits, procurement and employment in order to enhance these benefits, deliver growth, and attract inward investment. ECC's Economic Development Officers would be keen to be involved in any discussions in relation to the preparation of an agreement for use of locally sourced materials and employment. Thank you for taking the time to review our comments and we look forward to further discussions with NGET in the future.		programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, they it work with stakeholders and local communities to further inform this.

Table 1.7 Friston Parish Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	• Needs **case**	**Introduction** FPC supports the energy infrastructure necessary to address climate change, to increase energy security and to reduce cost to consumers, but not the highly damaging onshore impacts which could be avoided through offshore solutions and/or using brownfield sites. Fundamentally FPC opposes this project, the National Grid connection hub at Friston, EA1N, EA2, Lionlink, Nautilus and any other projects National Grid proposes to connect at the highly unsuitable site at Friston. The comments below are made subject to that fundamental opposition.	N	In developing the Proposed Project proposals National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Similarly, coordination of a fully offshore grid does not represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide, while onshore infrastructure would still be needed in order to transmit to the onshore national electricity network. Cables would still need to run onshore from an offshore grid and onshore converter stations would still be needed to convert the electricity from direct to alternate current, along with a substation to transform electricity into the required voltages. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
		Needs case, Coordination with other Projects, Alternative solutions	The recent announcement concerning OCSS highlights yet again the missed opportunities in the transmission of offshore energy. The use of Sealink for the North Falls and Five Estuaries windfarms indicates that the energy from North Falls and Five Estuaries does not need to come to East Suffolk. Therefore the “Suffolk end” of Sealink should be eliminated. Likewise there should be a “Sealink 2” which should connect EA1N and EA2 to London and the Southeast, again without a “Suffolk end”. These comments should not be considered to be a definitive or exhaustive view of the problems with these projects, but those which were most immediately apparent. As you should be aware parish councils have very limited resources.	N	While National Grid recognises the Parish Council's concerns, it is not within the scope of the Proposed Project to provide solutions for other projects. Removing the need to connect North Falls and Five Estuaries windfarms to the onshore East Anglia Connection Node (EACN) substation would not affect the Proposed Project’s onshore connections, since any benefits anticipated from reducing connections at EACN are likely to be more than offset by the need for additional onshore infrastructure. National Grid will continue to monitor Government’s response to this ongoing debate, but can clarify that the Proposed Project is nonetheless required to provide network capacity in this area. National Grid is listening to community feedback in order to understand concerns about the impact of the Proposed Project, both as a standalone project and in combination with other projects in the area, to minimise these impacts onshore and offshore.
		Inter-Project cumulative	The community is struggling under the burden of multiple projects with multiple consultations and uncoordinated	N	National Grid recognises that the development, construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		effects, Coordination with other Projects, Health and wellbeing	application processes. This renders the entire process unfair. This is damaging the well-being of the community.		that may impact on people's mental health. Throughout the development phase it has therefore tried to clearly communicate the proposals, including through the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid has sought to provide certainty on the plans wherever possible.
		Consultation, Inter-Project cumulative effects, Water environment	**Quality (Lack of) of Consultation** This consultation is deeply flawed. It is clear National Grid has: ignored the results of the non-statutory consultation – FPC held a meeting with National Grid. Seven members of the National Grid project team attended the meeting yet not one of them had read the consultation response submitted by Friston Parish Council which is a statutory consultee. This response is attached as many if not all of the points remain relevant showing the ineffectiveness of the non-statutory consultation; ignored the findings of the Scottish Power examinations – a clear example is the absence of any consideration of the Examining Authorities' comments concerning "utmost care"; ignored the terms of the Scottish Power DCOs – the proposal to work all day Saturday clearly contradicts these DCOs as is the proposal to use Friston village as a construction route; relied upon information which it knows to be incorrect as an excuse for not assessing cumulative impacts - National Grid states that construction period for Scottish Power projects will be 2023-2026. National Grid know this to be false (it is a matter of public record that the Scottish Power projects have been delayed by two years). Further it is obvious that no construction work has taken place in 2023. Also National Grid is working closely with Scottish Power in relation to the National Grid substation/connection hub. The construction periods will clearly overlap with multiple damaging cumulative impacts; ignored the flood risk to the north of the village – the flood risk to the north of the village and in the village is well documented. However National Grid has ignored this. Given this National Grid has not met the legal standards required for consultations.	N	National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. At the time of the option identification and selection, the proposed Friston Substation was advanced in the consenting process. A DCO application had been submitted and was progressing through examination and determination, this was subsequently granted in March 2022, prior to non-statutory consultation on the Proposed Project. It was therefore reasonable for the Proposed Project to select a connection point that, whilst not yet implemented was reasonably foreseeable by virtue of it having been granted development consent. **Application Document 6.3.2.14.A ES Appendix 2.14.A Descriptions of Other Developments** contains updated information regarding other project timescales which have been used in the updated cumulative impact assessment in the ES. East Anglia ONE North and East Anglia TWO construction is expected to commence in 2024/2025 and energisation to commence in 2027 (Scottish Power Renewables, 2024). The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Flooding concerns have been acknowledged by National Grid. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Inter-Project cumulative effects	**Overarching issues**	N	A full inter-project effects assessment has been carried out for the Proposed Project. This assessment has assessed the combined environmental impacts resulting from proposed developments due to come forward within the cumulative zone of influence and have considered the need for

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			As this community has argued for many years the unassessed cumulative impacts of all these projects will have a permanent damaging effect on this area.		additional mitigation (where applicable) to the standalone mitigation recommended by the technical environmental assessments to reduce and minimise the adverse inter-project effects associated with the Proposed Project when combined with other developments in the surrounding area. The full assessment is available within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Inter-Project cumulative effects	This latest consultation demonstrates yet again the unsuitability of Friston as the connection hub for multiple energy projects. The site is next to a quiet rural village on productive agricultural land, surrounded by listed buildings and which has a serious surface water flood risk and which poses a flood risk to the village.	N	The ES has assessed the impact of the Proposed Project on heritage assets, landscape character, visual amenity and agricultural land, proposing mitigation where necessary to minimise and reduce any adverse effects. The ongoing assessments have helped inform the evolving design to ensure that the Proposed Project has had regard for sensitive environmental receptors. Further details on the assessment of the aspects mentioned are contained in the following Chapters of the ES: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage; and** • **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils.** With regard to flood risk, it should be noted that since preparation of the PEIR, National Grid has liaised regularly with Suffolk County Council in its role as LLFA to gather information on flood risk sensitivities at Friston, including review of all relevant S19 Reports and data from the Friston Surface Water Management Plan. This information has informed **Application Document 6.8 Flood Risk Assessment** and has guided the measures embedded within the design of the Proposed Project to manage surface water runoff and land drainage in order to achieve no increased flood risk to lands within and neighbouring the Proposed Project boundary.
		DCO process, Design	National Grid has not used “utmost care” as recommended by the Examining Authorities for the Scottish Power and National Grid connection hub projects who recognised the unsuitability of the Friston site.	N	Friston Substation received Development Consent under the SPR East Anglia One North and East Anglia Two schemes and is expected to be constructed under these consents. The Proposed Project has included Friston within the project submission for completeness should SPR choose not to proceed with their project. Given the development consent granted for the Friston Substation the site is considered suitable for the Proposed Project.
		Coordination with other Projects	In principle FPC supports “coordination” provided it reduces environmental impacts and also the duration of the construction period. Coordination and co-location are different concepts and the two should not be confused.	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with other projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Inter-Project cumulative effects, Timescales / programme	Cumulative effects – There is no evidence that the comments of the Examining Authorities concerning "utmost care" have been addressed. Given the years National Grid have had to conduct environmental assessments, it is not acceptable that so many significant impacts are "to be assessed" particularly when considered in the context of the "utmost care" comments. This approach negates the effectiveness of consultation. Temporal issues - National Grid has completely misinformed itself as to the timing of the EA1N and EA2 projects. It has been in the public domain for over a year that the EA1N and EA2 projects are delayed by at least two years. Referring to construction as being between 2023 and 2026 is woefully out of date. This failure renders the cumulative impact assessment in a number of key areas including air quality, water, noise and traffic almost useless and has undermined the consultation process.	N	A full inter-project effects assessment has been carried out for the Proposed Project. This assessment has assessed the combined environmental impacts resulting from proposed developments due to come forward within the cumulative zone of influence and have considered the need for additional mitigation (where applicable) to the standalone mitigation recommended by the technical environmental assessments to reduce and minimise the adverse inter-project effects associated with the Proposed Project when combined with other developments in the surrounding area. The full assessment is available within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. **Application Document 6.3.2.13.A ES Appendix 2.13.A Descriptions of Other Developments** includes an updated description of other developments, outlining the changes to construction timeframes of other projects. East Anglia One North and Two construction is expected to commence in 2024/2025 and energisation to commence in 2027 (SPR, 2024) although construction timeframes are subject to change.
		Alternative solutions	**Specific Comments arising from PEIR** There follows a number of specific comments which arise from the subject matter and/or content of specific chapters of the PEIR. For obvious reasons these are focused on Part 1 (Introduction) and Part 2 (Suffolk onshore scheme). Part 1 – Introduction Chapter 3 Main Alternatives Considered In terms of the Sizewell location this chapter demonstrates that no alternatives have been considered. An obvious alternative would be for EA1N and EA2 connect offshore and the power taken direct to Kent (see paragraph 2 above) or an alternative location in the Southeast/London where the power is required. There are similar considerations for Lionlink and Nautilus. It is	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that In Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2GW are not available yet. As such, in Belgium, the 3.5GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100km of new overhead lines and around 20km of new underground cables.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			notable that this is the approach being adopted for the North Falls and Five Estuaries projects.		Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Consultation, Design	Chapter 4 Description of the Proposed Project National Grid Connection Hub - Pylon Realignment and Cable Sealing Ends - clearly a different approach is being taken compared to the Scottish Power EA1N and EA2 DCOs, but there is no explanation of this in the consultation materials including the PEIR. There needs to be a clear explanation of the differences, why they have been made and what infrastructure will be necessary not just for Sealink but for EA1N, EA2, Sealink, Lionlink and Nautilus to connect to the Grid.	N	It is expected that Friston Substation and the connection to the existing overhead lines would be undertaken under SPRs DCO, and would progress ahead of the Proposed Project. National Grid has included Friston Substation within the Proposed Project so that the substation can be constructed by them should SPR choose not to proceed. In the eventuality that the Proposed Project delivers Friston Substation then connection to the existing overhead lines would be via a double turn-in of the southern line. The double turn-in would require the construction of temporary overhead line structures to the south of the existing overhead line and the realignment of conductors onto these temporary structures. In addition, the removal of one existing tower and the construction of two new towers on the alignment of the existing overhead line, the restringing of the conductors onto the new towers and the removal of the temporary structures would be undertaken. A typical arrangement for Friston Substation has been provided in the Statutory consultation documentation and is available in **Application Document 2.13.1 Design and Layout Plan – Suffolk**. National Grid will not

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					be looking for rights to construct a substation for connecting any other projects.
		Construction – general, Combined effect of the proposed Project	Construction Impacts - Key concerns are road traffic, construction noise, air pollution, light pollution, multiple cable swathes close to residential buildings, ecology and flood risk. In effect there will be a vast construction site stretching from Friston all the way to Saxmundham. These impacts will be greatly exacerbated by multiple projects – see paragraph 6 below. The scale of the construction impacts is difficult to comprehend as the area stretching from Friston to Saxmundham will become one vast construction site for many years, with the associated noise, pollution, traffic congestion, flood risk, loss of amenity, loss of habitat and other damaging environmental impacts. It will be truly unpleasant to live here. Yet this statutory consultation barely scratches the surface of these issues.	N	A full intra-project cumulative effects assessment has been carried out for the Proposed Project and is contained within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**. The assessment considers impacts from the Proposed Project on noise and vibration, traffic and transport, flood risk, loss of amenity, loss of habitats and other environmental impacts. A full inter-project cumulative effects assessment has been carried out for the Proposed Project. The inter-project cumulative effects assessments have assessed the combined environmental impacts resulting from other proposed developments due to come forward within the cumulative zone of influence alongside the identified effects for the Proposed Project for the construction and operational phase of the Proposed Project, where necessary additional mitigation has been considered in addition to the standalone mitigation recommended by the technical environmental assessments is identified. The full assessment is available within **Application Document 6.2.2.13 Part 2 Chapter 13 Inter-Project Cumulative Effects**.
		Construction – general, Intra-Project cumulative effects	Working Hours - working at the weekend will disrupt many people's free time when they are looking forward to enjoying the countryside. This is unacceptable. Saturday working should not be permitted. National Grid has completely ignored the position in the Scottish Power DCOs where working on a Saturday is limited to the mornings. Any Saturday morning working needs to be revisited in any event given the multiplicity of projects and the cumulative construction impacts - see further below.	N	To give National Grid the flexibility to deliver the construction programme on time and incorporate standard industry working patterns, it has identified a need to include 7am to 5pm working on Saturdays, Sundays and bank holidays within the core working hours. The proposed construction core working hours (unless otherwise approved by the relevant Local Planning Authority) for all terrestrial works in Suffolk and Kent are: • Monday – Friday: 0700 to 1900; and • Saturday, Sunday and Bank Holidays: 0700 to 1700. Whilst this change gives National Grid the flexibility to carry out works when and where needed, it does not expect construction activity to take place on every Sunday or bank holiday. There will be restrictions on the type of activity that can occur on these days. The restrictions include limiting HGV and percussive piling activities. Details relating to the proposed construction working hours and any associated restrictions are contained in **Application Document 6.2.1.4 Part 1 Chapter 4 Description of the Proposed Project**. The working hours are secured by Requirement 7 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Landscape and visual, Design, Onshore mitigation	Part 2 - Suffolk Onshore Scheme Chapter 2 Landscape and Visual National Grid Substation Design - architectural solutions sympathetic to the rural and historic environment should be used for the substation and other National Grid infrastructure. National Grid has suggested a number of architectural	N	Friston Substation will be designed to be sympathetic to is surroundings and in accordance with either SPR's planning consent or that which is sought by National Grid under the Proposed Project's DCO. In the event that the SPR projects do not come forward, National Grid would adopt the approved substation design. The GIS substation will be designed to be the smallest footprint and size that it can be to house the required equipment. National Grid is proposing a

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			approaches for the converter stations and yet completely ignored the substation at Friston. A GIS substation is far too tall relative to AIS (16m v 6m) and its landscape impact cannot be effectively mitigated. No information has been provided as to gases in the GIS substation. Are alternatives to SF6 being proposed if so what are they?		SF6 free substation but at this time a manufacturer has not been selected therefore they do not know the exact gas that will be use, it will however not be SF6. This commitment is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). An outline landscape mitigation plan is contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**. This would include woodland planting, native hedgerow planting and grassland planting.
		Construction – general, Terrestrial ecology	Chapter 3 Ecology and Biodiversity Construction in particular will have a very damaging impact on the diverse wildlife in this area. These projects will result in the elimination during the construction period of a vast area of habitat stretching from Friston all the way to Saxmundham.	N	A full suite of ecological surveys (and other environmental surveys) has been undertaken and a rigorous impact assessment has been produced in line with guidance and legislation. Extensive consultation with key stakeholders such as Suffolk County Council, East Suffolk Council, Natural England, RSPB and Suffolk Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain in Suffolk even though this is not a legal requirement at present. Further details relating to the ecology assessment are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Cultural Heritage	Chapter 4 Cultural Heritage Not all assets been identified, both designated and undesignated – see EA1N and EA2 examinations. 2Study areas have been identified at 500m and 2km however this has the effect of underrepresenting the impact on key heritage assets in and around Friston in particular the Grade II* assets of Friston Parish Church and the Post Mill which lie just outside the 500m line.	N	All assets within the prescribed study areas adopted for informing the baseline/archaeological potential, and assessing impacts on setting, were cropped from national datasets, as well as the Suffolk Historic Environment Record, with the study areas agreed with stakeholders. A revised data search was also undertaken once the final Order Limits (DF4) were agreed, and this data search was also in line with the agreed study areas.
		Water Environment, Onshore Mitigation	Chapter 5 Water Environment 23. National Grid seems unaware of the water environment in the catchment to the north of Friston. The baseline plans are wrong. The surface water flood risk to the north and above the village and in the village has been ignored when National Grid knows there is a problem. Clearly it has chosen to pretend this issue does not exist. 24. If these projects are to go ahead then FPC remains concerned that the mitigation proposed will not be adequate and the proposals for a discharge pipe under Church Road are not workable.	N	The flood risk sensitivity of Friston is recognised by National Grid. The concerns raised during examination of the East Anglia ONE North and East Anglia TWO projects have been reviewed and data from the Friston Surface Water Management Plan has been collected and appraised to inform the Water Environment ES assessments and **Application Document 6.8 Flood Risk Assessment** that has been prepared. Mitigation for the management of surface water runoff generated from the Proposed Project, both during its construction and operation, has been shaped in consultation with Suffolk County Council, as the Lead Local Flood Authority, and key drainage design principles and standards have been agreed. **Application Document 6.8 Flood Risk Assessment** states that the Proposed Project would not be an increase in flood risk during construction from rivers, sea and surface water. The Proposed Project is at low risk of

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			25. Flood risk during construction is an even greater concern given the large area of land which will be rendered impermeable. Flood risk during construction is an even greater concern given the large area of land which will be rendered impermeable. 26. National Grid is advised to review the submissions made during the examinations for and the Examining Authorities' report for EA1N and EA2. The ExA was very concerned about future development at Friston and highlighted drainage in particular.		groundwater flooding and construction activities would have no increased impact on this source of flooding.
		Agriculture and Soils, Inter-Project Cumulative Effects, Socio-Economic. Recreation and Tourism	Chapter 7 Agriculture and Soils 27. Loss of BMV land – as noted this is significant but there needs to be greater analysis. 28. Loss of BMV land needs to be broken down, both for Sealink and cumulatively for all projects, between: I. loss during construction and duration of loss ii. loss during operation iii. loss of land used for the infrastructure itself iv. loss of land required for mitigation. 29. This needs to be expressed both in absolute terms acres/hectares and as a percentage of BMV land in East Suffolk. 30. Further as agriculture is a key part of the local economy there needs to be an economic analysis in terms of the loss of productive land and the impact on food security.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Any economic effects on landowners due to fragmentation or loss of land will be noted in the assessment and any that arise would be addressed through landowner discussions and through the compensation payments undertaken through the National Grid Lands Team; such agreements lie outside the scope of the ES.
		Traffic and Transport, Construction - General	**Chapter 8 Traffic and Transport** 31. It is unacceptable for the B1121, the road through the middle of the village, is to be used for construction traffic and for there to be accesses off the B1121 to the construction sites.	N	The construction vehicle routeing has been designed to minimise impacts across the highway network (including the B1121) as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Whilst a B road, the B1121 is narrow and twisty and in places there is not even a white line. 32. In terms of HGVs National Grid is proposing 84 a day which is 7 per working hour which equates to one less than every 10 minutes. The road passes the village green where there is a children's playground. Also there are bus stops either side of the road where pedestrians cross without the benefit of a pedestrian crossing. Given the north of the village will be a no-go area for walking and recreation all village residents will need to walk south which means much more pedestrian traffic across the B1121. 33. The operational access road was discarded as a construction access road due to its unsuitability during the EA1N and EA2 examinations. 34. The B1121 should not be used for HGV traffic, LGV traffic or construction workers travelling to site.		**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the part of the network identified (B1121). Responses to Statutory consultation, including these responses have been taken into account and, in the scenario where fit out of additional bays is required at Friston Substation, that work will be completed via the haul road access from Snape Road rather than from the permanent access to Friston Substation. The B1121 through Friston is now only to be used to access the existing overhead line. Rights of access to this overhead line already exist, however, the works have been included for completeness. The works will be limited in nature requiring the climbing of existing towers and the installation of protective scaffolding at the road crossing.
		Air Quality	**Chapter 9 Air Quality** 35. See comments on the construction and cumulative construction impacts	N	National Grid acknowledges this feedback. The issues raised are responded to in the relevant sections of this document.
		Noise and Vibration, Construction - General	**Chapter 10 Noise and Vibration** 36. Construction - National Grid needs to demonstrate it can achieve the noise requirements. For example will it be able to achieve the required noise level through BPM (Best Practicable Means) where there are multiple projects conducting construction at the same time? See further comments on the construction and cumulative construction impacts. 37. Operation - all noise at the substations and convertor stations needs to be assessed including the impulsive noise from switchgear. The site is close to a quiet village with very low background noise. There was clear evidence in the Scottish Power examinations that the switchgear, when operated at night, will wake people up. In terms of continuous noise National Grid should take the noise limit of 31dB as a starting point for all infrastructure a combined basis	N	There are no specific limits for construction noise or vibration. There are, however, guideline levels for the threshold of potential significant effects. The contractor would be required to employ best practicable means to reduce levels of noise and vibration from construction activities. A list of mitigation measures is set out in **Application Document 7.5.3.2 CEMP Appendix A Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The assessment of construction noise and vibration indicates that with the provision of best practicable means, significant adverse effects from construction activities would be avoided. A further detailed assessment would be conducted by the contractor based on their specific construction methodologies and proposed mitigation. Noise from switchgear has been considered within **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration** and **Application Document 6.3.2.9.E ES Appendix 2.9.E Friston Substation and OHL Operational Noise Information (Informative)**. The assessment concludes that the impact of noise from the operation switchgear would be negligible magnitude at nearby noise sensitive receptors and not significant.
		Socio-Economic. Recreation and Tourism, Community Benefits / enhancements	**Chapter 11 Socio- economic Recreation and Tourism** 38. The damage which these projects will cause to this area's key tourism sector is understated. 39. These projects will provide no long-term jobs locally. Therefore these projects offer only economic damage with no economic benefits locally.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** states that although the construction jobs are medium-term temporary in nature, they represent a positive

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					economic effect for a substantial period of time. Additionally, it is expected the temporary jobs would be taken up by residents in the study area.
		Health and Wellbeing, Intra-Project Cumulative Effects, Inter-Project Cumulative Effects	**Chapter 12 Health and Wellbeing** 40. These projects are already damaging the health and well-being of the community. The construction impacts of Sealink in isolation and cumulatively with the other projects will have a very serious effect on the well-being of all local residents many of whom are elderly or vulnerable. These projects do and will continue to blight the last productive lives of many residents. There needs to be a proper assessment of well-being impacts.	N	National Grid recognise that the construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on people's mental health. Throughout the development phase of the Proposed Project, National Grid have therefore tried to clearly communicate the proposals including the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid have sought to provide certainty on the plans wherever possible. A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project. This is in combination with **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** which assesses the impact of the Proposed Project in combination with a number of major infrastructure projects in the study area and concludes no significant effects.
		Safety, Major Accidents and Disasters	41. Fire Safety - substations and convertor stations can and do catch fire. When they do they emit toxic gases. This infrastructure will be surrounded by vegetation which will be very dry in the summer. Such a risk is unacceptable next to a village. A full fire safety assessment needs to be conducted including the impact of a serious fire upon the village of Friston in the summer months, when prevailing winds could drive the fire and smoke/gases towards the village across very dry vegetation. A similar assessment should be conducted for Saxmundham.	N	National Grid's standard processes require consideration of the impact of all constructed assets with regard to fire risk as part of our duties under the Construction (Design and Management) Regulations. Therefore, National Grid will ensure that suitable liaison with local fire services is carried out at appropriate stages of the design and build process. **Application Document 6.14 Environmental Scoping Report 2022** scoped out Major Accidents and Disasters.
		Intra-Project Cumulative Effects, Inter-Project Cumulative Effects	**Chapter 14 Inter-project Cumulative Effects** 42. The weakness of the analysis in specific environmental impacts (e.g. landscape, noise, water environment, traffic and transport etc) flows through into the cumulative assessment. 43. The description of other projects is poorly organised. There are serious factual errors in respect of the projects which may significantly affect Sealink. A key example is the construction timetable. 44. This has led to cumulative effects being underestimated. The plans particularly in relation to the other offshore projects are unhelpful both in terms of detail and overall cumulative effect.	N	Both the environmental assessment and cumulative effects assessment has been developed further since publication of the PEIR for Statutory consultation. A full inter-project and intra-project effects assessment has been carried out for the Proposed Project and is now available within the following ES Chapters: • **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects;** • **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects;** • **Application Document 6.2.2.13 Part 3 Kent Chapter 12 Intra-Project Cumulative Effects;** • **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects;**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					• **Application Document 6.2.3.13 Part 4 Marine Chapter 10 Intra-Project Cumulative Effects; and** • **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects.** **Application Document 6.3.2.13.A ES Appendix 2.13.A Descriptions of Other Developments** includes an updated description of other developments, outlining the changes to construction timeframes of other projects. East Anglia ONE North and TWO construction is expected to commence in 2024/2025 and energisation to commence in 2027 (SPR, 2024) although construction timeframes are subject to change.
		Inter-Project Cumulative Effects, Construction – General, Combined Effect of the Proposed Project	45. The length and complexity of this chapter is proof of the excessive burden of at least four other projects (in addition to Sealink and the National Grid connection hub) being developed in the same small area and connecting in the same place where the temporal construction duration of the projects overlap. It is self evident that National Grid has chosen the wrong development and the connection location for these six projects. This is significantly exacerbated by the Sizewell C project. 46. In particular cumulative construction impacts have not been properly assessed which undermines the consultation process. National Grid has included incorrect information on the construction period for the Scottish Power projects (2023 - 2026). These are already running two years late which is a matter of public knowledge and obviously no construction activity has been going on this year. There will be overlapping construction periods for all six projects. It is unacceptable that cumulative impacts are not being assessed and consulted upon based on information that National Grid knows to be incorrect. The cumulative impact of potentially six projects (EA1N, EA2, the National Grid connection hub, Sealink, Lionlink and Nautilus) across a vast construction site will be severe and unsustainable. Key concerns are: I. the capacity of the local road network ii. flood risk during construction when there will be far more impermeable areas created than will exist in the operational phase iii. the combined construction noise from all these projects iv. the combined air pollution from plant emissions and dust v. light pollution from multiple construction sites vi. multiple cable swathes. National Grid estimate the multiple cable swathes between Friston and the converter stations site at Saxmundham will be 180m wide vii. ecology – this vast	N	Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. **Application Document 6.3.2.13.A ES Appendix 2.13.A Descriptions of Other Developments** contains updated information regarding other project timescales which are used in the cumulative impact assessment. Capacity of the local road network are assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Flood risks are assessed within **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment**. The combined construction noise with other projects are assessed within **Application Document 6.2.2.13 Part 2 Chapter 13 Inter-Project Cumulative Effects**. The combined air pollution with other projects will be assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The combined light pollution from multiple construction sites within the Proposed Project will be assessed within the **Application Document 6.2.2.12 Part 2 Suffolk Chapter Suffolk Onshore Scheme 12 Intra-Project Cumulative Effects** and combined light pollution with other projects will be assessed within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Ecological effects and mitigation will be addressed within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Landscape and Heritage effects and mitigation will be addressed within the **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**, **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			construction site will disrupt a very large area and effectively eliminate habitat where there is a great deal of wildlife activity viii. landscape & heritage - this multiplicity of projects will impact the deliverability of landscape and heritage mitigation which will significantly increase the landscape harm. 47. Overall cumulative effects have been severely understated.		A full inter-project and intra-project cumulative effects assessment has been carried out for the Proposed Project.

Table 1.8 Ipswich Borough Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Alternative solutions	Although the line of the upgraded pylon routes do not form part of the current consultation, I am writing to you to say that the route of the existing pylons which will be upgraded as part of this overall national grid upgrade project will pass over the only permanent gypsy and traveller site in Ipswich. If possible, this needs to be rerouted to avoid this site, particularly as the cable route is going to be upgraded to a higher capacity which is not suitable to pass over these people's homes.	N	The area of concern is not located within the vicinity of the Proposed Project.

Table 1.9 Kelsale-cum-Carlton Parish Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 december 2023	Needs case, traffic and transport, inter-project cumulative effects	**Kelsale-cum-Carlton Parish Council Response to Sea Link Statutory Consultation** Kelsale-cum-Carlton Parish Council strongly opposes the Sea Link proposal. In addition to the gross industrialisation of the tranquil rural landscape in Saxmundham bringing no jobs and most certainly resulting in loss of tourism, the primary serious detrimental effect to Kelsale-cum-Carlton would be the additional construction traffic from Sea Link exacerbated by the substantial amount of traffic generated by Sizewell C and the Sizewell Link Road construction and other energy projects.	Y	The northern access route no longer forms part of the Proposed Project. Therefore, no construction vehicles will travel along the B1121 Main Road in the vicinity of Kelsale. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network, with the mitigation identified **within Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. It is acknowledged that the Proposed Project will be under construction alongside other projects in the area which has been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List** includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, Nautilus, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. However, this demonstrates that the proposals are not expected to contribute towards any cumulative effects on the parts of the highway network near Kelsale. Please also note that **Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment** set out an assessment of landscape and visual effects for construction, operation and maintenance. Landscape mitigation proposals are identified in Proposed Project Design and Embedded Mitigation section of **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** and within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** which has been developed in collaboration between the landscape and heritage teams as well as stakeholder consultation to minimise effects as far as possible. The landscape mitigation proposals are considered within the operational assessment of effects. **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** presents a full socio-economic assessment of effects, including economic impacts and direct and severance effects on sensitive local businesses, visitor attractions and tourism assets.
		Traffic and transport, intra-project cumulative effects, health and wellbeing	Because Saxmundham is one of the primary service centres for Kelsale-cum-Carlton, both the proposed ‘Southern’ and ‘Northern’ access routes would have significant negative effects on KcC residents. The proposed ‘Northern’ access route, however, poses the most direct impact on KcC, although both would have the consequential negative effects of increased pollution, decrease in biodiversity, flood risk and damage to historic buildings as well as making it extremely difficult for residents to carry on with daily living.	Y	The southern access route has been adopted for the Proposed Project. The northern access route no longer forms part of the proposals. Therefore no construction vehicles will travel along the B1121 Main Road in the vicinity of Kelsale. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic associated with the southern access route are not expected to result in any significant impacts on the surrounding highway network.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Needs case, coordination with other projects, health and wellbeing	We recognise the need for additional electricity and support the coordinated development of alternative energy sources such as offshore wind power, but the failure of NGET and other energy companies to engage with each other or to consider options to minimise disruption to our community will seriously diminish the quality of life for our residents. We, therefore, strongly oppose the Sea Link project on behalf of our 1100 residents, Parish-based businesses, and its significant farming community.	N	National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the Parish Council's concerns about the potential impacts of the Proposed Project and is committed to developing a project that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases.
		Consultation	**Description of KcC Parish** Prior to 1885 Kelsale and Carlton were separate Parishes, but were combined in March during that year under the divided Parishes Act. The Parish now comprises Kelsale, Carlton, and the hamlets of East Green, North Green, Curlew Green and Dorley's Corner. The B1121/Main Road cuts through the Parish and is the primary access road to Saxmundham. Kelsale Village is to the east of Main Road, the hamlet of North Green is to the north east and the hamlet of East Green is to the east. Carlton Village and the hamlet of Curlew Green are on the west side of the road. Dorley's Corner is near the junction of the A12. The Sizewell Link Road will be built to the north of the Parish beginning at North Green and 'travelling' via Theberton and Middleton to Sizewell. To the west of the Main Road/B1121 on Rosemary Lane is the Poachers Pocket pub used by KcC residents. Further down Main Road/B1121, on the west side is Carlton Park Industrial Estate housing several businesses, Saxmundham Sports Club, Carlton Park Camping and Caravan site and the Kelsale Primary School. At the end of Carlton Road, is Carlton Village. Carlton Village is home to the historic Carlton Church. On the east side of Main Road/B1121, is Kelsale Village which hosts a post office, historic Village Hall, Social Club, the 1000-year-old Church of St Mary's and St Peter's and a recreation ground with play equipment and football pitches. The Village Hall and Social Club are the social hubs of the Parish hosting Parish Council meetings, annual events such Remembrance Day, live music, quizzes, and various other seasonal events. The recreation ground is bordered by Main Road/B1121 and is used for football matches with visiting teams from neighbouring villages, children from all over the parish, dog walkers and Parish events such as Bonfire Night which is attended by over 500 people. Saxmundham acts as the primary 'service centre' to KcC with shops and two large grocery stores and many other useful	N	National Grid acknowledges the Parish Council's comments the nature of the area in which its Proposed Project will be located and seeks to minimise and mitigate against adverse effects upon the local community and the built and natural environment. While surveys of the local environment and analysis of other contextual evidence is an important part of informing our understanding of the potential impacts, so too is the feedback received during consultation. National Grid is committed to creating a positive impact in communities through infrastructure projects, emphasising social responsibility and equity via our Community Benefit Plan that aims to provide social, economic, and environmental benefits to local communities, ensuring it leaves behind a positive legacy. National Grid's Community Benefit Plan aligns with National Grid's Responsible Business Charter, emphasising impact in environment, communities, people, economy, and governance, shaping its strategic priorities with a focus on responsibility.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			services. Leiston also provides services including a doctors' surgery, vet and grocery store especially to North Green and East Green residents in the north east of the Parish. The Saxmundham doctors' surgery is located to the south of Clay Hills Road on the east side of the B1121 just north of Saxmundham.		
		Traffic and transport, converter station location	**<u>Traffic and Cumulative Impact</u>** The proposed 'Northern' access route will come off the A12 onto Main Road/ B1121 at Dorley's Corner past Carlton Industrial Estate, Carlton Park Camping and Caravan site, the Sports and Recreation Club and the Kelsale Primary School towards Saxmundham where it will join the newly constructed 'haul road' just before Saxmundham Surgery. It will then cross the railway line over a newly constructed bridge and continue behind the housing estate (behind Waitrose) across good farmland and into the Wood Farm converter site. An estimated 458 vehicles per day, including 65 HGV and associated AILs, will travel from the A12 down Main Road/B1121 to the newly constructed 'haul road'. Work on the construction of Sea Link will begin at 7 am and end at 7 pm Monday to Saturday which will exacerbate the impact. The cumulative impact of traffic generated from the construction of Sea Link in addition to the traffic from the construction of Sizewell C and other projects will effectively turn KcC into an island and will have the following adverse effects:	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the B1121 Main Road in the vicinity of Dorley's Corner, Carlton Industrial Estate, Carlton Park Camping and Caravan site, the Sports and Recreation Club and the Kelsale Primary School, as the southern access route will be used.
		Traffic and transport, inter-project cumulative effects	**– The Parish of KcC will be cut in half by traffic on Main Road if the proposed 'Northern Access' route is adopted.** Residents of Kelsale, East Green and North Green on the east side of Main Road/B1121 will find it very difficult to get across Main Road to access the Sports and Recreation Club, Kelsale Primary School, the Carlton Park Industrial Estate and the Poacher's Pocket pub. Whilst they can turn left onto Main Road, turning right to reach the A12 or these amenities on the west side of the road will be nearly impossible. On the west side of Main Road/B1121, residents of Curlew Green will struggle to turn right onto Main Road to reach the Kelsale Village Hall, Social Club, Post Office, St Mary's and St Peter's Church and the Kelsale Recreation Ground or Saxmundham to access services.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the B1121 Main Road in the vicinity of Kelsale, North Green or East Green, as the southern access route will be used.
		Traffic and transport, inter-project cumulative effects	**– Hamlet residents will not be able to access essential services without significant challenges severely affecting their quality of life if the proposed 'Northern Access' route is adopted.** **North and East Green** – North Green is to the north east of the Parish and East Green is to the east of Kelsale Village. With the	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the B1121 Main Road in the vicinity of Kelsale, North Green or East Green, as the southern access route will be used.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Sizewell Link Road beginning around North Green, residents of both hamlets will find it extremely difficult to access basic services in Leiston or Saxmundham. To reach Leiston, residents will need to travel down to the Saxmundham Road/B1119 and then onto the B1122 which is severely affected by Sizewell traffic. Fordley Road, another possible route, will be closed whilst the Sizewell Link Road is built so that is not an option for a few years. Other minor routes, Pretty Road and Moat Road, are also affected. East Green residents will face the additional challenge posed by the proposal to put a converter near Peakhill Farm. Since residents of other villages will also be trying to move around at the same time to carry on with their daily lives, access to Leiston will be significantly impacted. To get to Saxmundham, residents can go through Kelsale Village and onto Main Road which will be carrying Sea Link construction traffic. Or, if they really want a challenge, can head out to the A12 which will be carrying the estimated 10,000 extra Sizewell vehicles and either turn left across the A12 onto Main Road/B1121 carrying the Sea Link traffic or further south onto B1119. Quality of life will most certainly diminish and it will be nearly impossible for these residents to get around.		
		Traffic and transport, inter-project cumulative effects	**Curlew Green** - Curlew Green is to the west of the Main Road/B1121. To reach Leiston, residents will need to turn right onto Main Road which will be very difficult with the 458 additional vehicles a day from Sea Link. Curlew Green has the further challenge of the dangerous brow of the hill and its proximity to the lane entrance. Residents will then either turn left into Kelsale where they will begin to encounter Sizewell traffic or turn left onto Clay Hills where there the new 'haul road' for Sea Link is proposed to go as well as Sizewell's changes to the rail way and green rail route. They then will begin to run into Sizewell traffic again. The Curlew Green to Leiston journey will be nearly impossible. To access Saxmundham, residents would need to turn right onto Main Road braving the 458 vehicles or give up and go back out to the A12 where they will again encounter the estimated 10,000 extra Sizewell vehicles, turn left and approach Saxmundham from the B1119.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the B1121 Main Road via Curlew Green, as the southern access route will be used.
		Traffic and transport, inter-project cumulative effects	**Dorley's Corner** – Dorley's Corner is at the junction of the A12 and Main Road/B1121. Residents will directly suffer both from the increased traffic from Sizewell on the A12 and on Main Road/1121. Every day will be a challenge. Turning right to reach the A12 will be very difficult and getting to Leiston will be nearly impossible.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will turn from the A12 to the B1121 via Dodley's Corner, as the southern access route will be used.
		Traffic and transport	**– Lack of public transport means residents use cars.** With little in the way of public transport available in the Parish, a high	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			proportion of residents use private cars, and therefore access to services on Main Road, Leiston, Saxmundham, emergency services and support networks are critical.		**Outline Construction Traffic Management and Travel Plan - Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including the routes through Leiston and Saxmundham. For example, construction traffic travelling to/ from the B1119 and through Saxmundham will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than five HGVs per day).
		Traffic and transport	**– Danger to school children and vulnerable persons living on the west side of Main Road using the bus stop on the east side of Main Road.** Although a high proportion of residents use private cars, some do take the bus, especially secondary school-aged children. The bus stop is located on the east side of Main Road. If these persons live on the west side of Main Road, with the increased traffic, it will dangerous to cross Main Road to get to the bus stop.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along this section of the B1121 Main Road (to the north of Saxmundham). The proposals are therefore not expected to affect severance (ability for pedestrians to cross Main Road) or road safety on this part of the network.
		Traffic and transport, socio-economic, recreation and tourism	**– No shops in KcC so residents must access Saxmundham or Leiston which will be very challenging due to the increase in traffic.** It is important to note that there is no shop or convenience stores in KcC, excepting a Farm shop at Maple Farm and one nearby at Peakhill Farm and several homebased specialist food producers.	Y	The northern access route no longer forms part of the proposals. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the key routes between Kelsale and Saxmundham (via the B1121 Main Road to the north of Saxmundham) or between Kelsale and Leiston (via the B1119 Church Hill/ Saxmundham Road).
		Traffic and transport, walking, cycling and horse-riders	**– Risks of collision.** The risk of collision with vehicles including HGVs and other road users such as cyclists and pedestrians will be significantly increased all hours of the day. With an additional 458 vehicles using Main Road from 7 am to 7 pm, Monday to Saturday, risk of collision will be significantly increased at all times during the day. This is especially important for Curlew Green residents due to the dangerous brow of the hill and its proximity to the lane entrance.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along this section of the B1121 Main Road (north of Saxmundham), including near Curlew Green. The proposals are therefore not expected to affect road safety on this part of the network. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals on the southern access road (B1121 Main Road) during the peak construction phase are not expected to result in any significant impacts, including with regard to road safety.
		Traffic and transport, walking, cycling and horse-riders	**– Crossing Main Road.** It will be unsafe to walk, cycle or ride horses across Main Road, this is especially critical for vulnerable people including children at Kelsale Primary School and those who participate in sports and the elderly who may use mobility scooters. Main Road is already very busy and the addition of 458 vehicles will make it extremely dangerous.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along this section of the B1121 Main Road (north of Saxmundham), including near Kelsale Primary School. The proposals are therefore not expected to affect road safety on this part of the network. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals on the southern access road (B1121 Main Road) during the peak construction phase are not expected to result in any significant impacts, including with regard to road safety.
		Traffic and transport,	**– Emergency service response times will increase due to the significant traffic on Main Road.** Access to emergency services is critical to KcC which has a high proportion of elderly.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the section of the B1121 Main Road to the north of Saxmundham and the proposals are not expected to increase

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		health and wellbeing			journey times on this part of the network. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network (including the B1121 Main Road), with the mitigation identified within **Application Document 7.5.1.1. Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Traffic and transport, inter-project cumulative effects	**– Rat-running on KcC narrow country lanes due to cumulative impact of traffic from the numerous energy project specifically Sizewell C.** Government statistics show "60% of people killed on Britain's roads die on rural roads, and new research shows many more drivers are needlessly putting themselves at risk of an accident. A shocking 25% of drivers report having had a near miss on a country road, while 40% have been surprised by an unexpected hazard, such as an animal. A third also confess to taking a bend too fast." Our roads are at risk of being turned into rat runs with no control exercised over workers. NGET has failed to take a robust analysis of cumulative impact into consideration.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the section of the B1121 Main Road to the north of Saxmundham and the proposals are not expected to result in any rat running along KcC narrow country lanes. It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. This demonstrates that the proposals are also not expected to contribute towards any cumulative effects on these parts of the network as a result of other schemes in the area such as Sizewell C.
		Traffic and transport, construction	**– Loss of Quiet Lanes.** Rat-running will put KcC's Quiet Lanes in jeopardy as people will 'self-route' to avoid delays and gridlock or construction traffic will divert onto them. This is wholly inappropriate and could put people in real danger. The Parish Council nominated Butchers Road, Curlew Green, Dorleys Corner, East Green, Theberton Road, Lowes Hill, North Green, Town Farm Road, Rendham Road, Tiggins Lane and Rosemary Lane as part of a Quiet Lanes network. The Quiet Lanes network also works with public rights of way, of which there are over 40 in the Parish. Quiet Lanes are single track, unpaved winding lanes on which (dog) walkers, riders (horse or cycle), joggers etc. co-exist with a very small quantity of motorised traffic which is highly respectful of these users. Construction traffic, either from self-routing or diversion, will put these vulnerable users in danger of grave harm and will destroy the tranquility of country life.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the section of the B1121 Main Road to the north of Saxmundham and the proposals are not expected to result in any rat running along KcC narrow country lanes. In addition, no construction vehicles will use KcC's Quiet Lanes which will be a requirement of **Application Document 7.5.1.1. Outline Construction Traffic Management and Travel Plan - Suffolk**. As such, the proposals are not expected to have any impacts on KcC's Quiet Lanes.
		Traffic and transport, health and wellbeing	**– Access to medical services impeded.** The Saxmundham surgery is located on Main Road near Clay Hills and will be very difficult to access with the increased traffic and new 'haul road'. Many residents use the Leiston surgery but, with the cumulative impact of traffic from the construction of Sizewell C, this too will be difficult to reach. Carer visits will also be impacted. The closest A & E is in Ipswich. We have grave concerns about the disruption and delays to reach this service as there is no viable alternative route to Ipswich hospital other than the A12.	Y	The northern access route no longer forms part of the proposals. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the key routes between Kelsale and Saxmundham (via the B1121 Main Road to the north of Saxmundham) or between Kelsale and Leiston (via the B1119 Saxmundham Road). For example, construction traffic travelling to/ from the B1119 and through Saxmundham will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than five HGVs per day). The proposals are also not expected

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					to contribute towards any cumulative effects on these parts of the network as a result of other schemes in the area such as Sizewell C, as demonstrated by **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** which is based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List** and considers more than 25 developments including Sizewell C Nuclear Power Station, LionLink, Nautilus, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm.
		Traffic and transport, safety	**– Evacuation in the event of a nuclear accident.** In the event of a nuclear emergency at Sizewell, with the well over 10,000 individual vehicle movements a day from Sizewell construction as well as the 458 additional vehicles a day associated with construction of Sea Link, we have very real concerns as to how would the area could be safely evacuated.	Y	The northern access route no longer forms part of the proposals. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the B1121 Main Road to the north of Saxmundham. In addition, no construction vehicles will pass through Kelsale. Therefore, the proposals are not expected to contribute towards any cumulative effects on these parts of the network as a result of other schemes in the area such as Sizewell C, as demonstrated by **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Terrestrial ecology, traffic and transport	**– Damage to verges and roadside nature reserves.** On Main Road, there is a protected area for the nationally rare and protected Sandy Stiltball Fungus (Battarrea phalloides). Tiggins Lane has boulder clay flora such as sulphur clover as well as a diverse range of habitats including species-rich grassland on former arable and privately owned and managed for nature conservation. The pollution from the increased traffic as well as the road grit and sand thrown on the verges from HGVs will destroy these protected species.	N	Any increase in traffic will be temporary and a relatively small increase in overall vehicle flows on these roads.
		Traffic and transport, terrestrial ecology	**– Increase in road kill accidents and deaths of wildlife as well as connectivity severance.** The substantial increase in traffic would further fragment wildlife connectivity, as well as having an adverse effect on more mobile species such as Badger (a protected species), Brown Hare (a BAP species) as well as hedgehog and deer species, leading to an increase in road kill deaths and accidents, already all too familiar on the A12.	Y	The northern access route no longer forms part of the proposals. Therefore no construction vehicles will travel along the B1121 Main Road in the vicinity of Kelsale. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant traffic or transport impacts on the surrounding highway network (including B1121 Main Road and the A12), with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Impacts of the Suffolk Onshore Scheme on habitat connectivity for wildlife (both during construction and operation) is considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and measures required to ensure continued connectivity (e.g. passage of badger) across the haul road and permanent access have been considered.
		Terrestrial ecology	**Decrease in Biodiversity** The KcC Biodiversity Group has considerable expertise. The group study all areas of the Parish, logging their findings periodically with the Suffolk Biodiversity Information Service and	N	Noted, National Grid has used Suffolk Biodiversity Information Service as a source of data.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			updating their own Parish inventory, an example of which can be found on the Parish Council website at www.kelsalecarltonpc.org.uk in the Environment section.		
		Terrestrial ecology	**– KcC Parish is rich in biodiversity and has numerous legally protected species which will be put in danger as a result of the Sea Link project construction and the significantly detrimental cumulative impact of other energy projects.** **Simpsons Fromus Valley Reserve:** a significant nature reserve comprising over 27 acres of ancient woodland, ponds and meadows once part of a medieval deer park. It is one of the few semi natural stretches of the River Fromus in the Parish showing riffles and meanders absent elsewhere. It is located to the west of the A12 at Mile Hill, in close proximity to the proposed SLR roundabout. It is under the custodianship of a Charitable Trust chaired by the 5th Earl of Cranbrook. He is probably most remembered for bringing to the attention of the public that “The survival of habitats must not be left to chance".	N	National Grid acknowledges the feedback.
		Ornithology, landscape and visual	**Fromus Valley Reserve** supports over 50 bird species including endangered species such as bullfinch, yellowhammer and skylark. The site also provides a wildlife haven attracting significant numbers of migrant birds in the winter, including fieldfares and redwings and acts as a refuge for resident bird species. It also supports a rich invertebrate fauna associated with grazing livestock. The Reserve is also notable for a number of books having been written by respected authors about the ecology and archaeology preserved in the Reserve.	N	National Grid acknowledges the feedback.
		Terrestrial ecology, landscape and visual	**Roadside Nature Reserves** Tiggins Lane: Area protected for boulder clay flora such as sulphur clover. (Please note, this road merges into Fordley Road which also has another Roadside Nature Reserve) Coe Wood: Area protected for boulder clay flora such as sulphur clover Main Road, Kelsale: Area protected for the nationally rare and protected Sandy Stiltball Fungus (Battarrea phalloides)	N	National Grid acknowledges this feedback. Impacts on non-statutory wildlife sites such as these are considered in the Environmental Statement where they will be directly affected by the Proposed Project or where traffic flows will materially change in line with National Highways guidance. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Note: Privately owned Tiggins Lane assets: Tiggins Meadow contains a diverse range of habitats including species-rich grassland on former arable, privately owned and managed primarily for nature conservation, directly adjoining Tiggins lane, and contiguous with Mabels Wood (privately owned) and managed as planted mixed deciduous woodland on former arable land as a family memorial and wildlife conservation area.		
		Terrestrial ecology, ornithology	**County Wildlife sites:** In Suffolk there are approximately 900 County wildlife sites, 3 of which are in, or immediately adjacent to the Parish. a] Clay Hills known as the Kelsale Morio Meadow is a rare surviving traditionally managed unimproved meadow with the largest population of Anacamptis morio (green winged orchid) in Suffolk, together with its associated plant and invertebrate community. b] Lonely Wood: an Ancient Woodland designated for its typical woodland flora including Early Purple Orchid and Wood Anemone. Also important for saproxylic (decayed Wood) and other Invertebrates, Birds and Bats. c] Coe Wood: southern boundary (of Sibton) along KcC's northern boundar Priority species for Suffolk which have been recorded in KcC by our biodiversity group are as follows: 1] Mammals: 1.1 Bats: Common Pipistrelle, Soprano Pipistrelle, Noctule, Brandt's bat, Natterer's Bat, and Brown-long-eared bat 1.2 Brown Hares 1.3 Harvest Mouse 1.4 Hedgehog 1.5 Water Vole 1.6 Badger 1.7 Otter *In comparison Bats recorded at Minsmere include: Common Pipistrelle, Soprano Pipistrelle, Nathusius' Pipistrelle, Noctual bat, Serotine bat, Natterer's bat, Daubenton's bat, Natter's bat. 2] Birds: 1.1 Barn Owl (breeding at two or more sites) 1.2 Cuckoo 1.3 Bullfinch (locations in scrub/dense hedgerows 1.4 Lapwing	N	National Grid acknowledges this feedback. Impacts on non-statutory wildlife sites such as these are considered in the Environmental Statement where they will be directly affected by the Proposed Project or where traffic flows will materially change in line with National Highways guidance. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			1.5 House Sparrow (breeding at two or more sites) 1.6 Linnet 1.7 Marsh Tit 1.8 Mistle Thrush 1.9 Nightingale 1.10 Skylark 1.11 Spotted Flycatcher 1.12 Swift, Swallow 1.13 Song Thrush 1.14 Starling 1.15 Red Kite 1.16 Turtle Dove 1.17 Buzzard 1.18 Yellowhammer All species above are on the UK Red List - most vulnerable bird species of conservation concern apart from red kite, buzzard, swift and swallow which are not currently on the list 3] Reptiles: Common Lizard, Slow worm, Grass Snake 4] Amphibians: Common Toad, Great Crested Newt, Smooth Newt, 5] Invertebrates: 1.1 Grayling butterfly 1.2 White Admiral butterfly 1.3 White-letter Hairstreak butterfly 1.4 Horehound Longhorn Moth 1.5 Longitarsus quadriguttatus Hound’s tongue leaf beetle Nationally Rare (1 site) 1.6 Oedemera femoralis a thick-kneed flower beetle Nationally Scarce (3 sites) 1.7 Gorytes laticinctus a solitary wasp (RDB3) species (the 8th Suffolk record) 6] Plants Achillea ptarmica Sneezewort (1 site) Allium ursinum Ramsons, Wild Garlic (3 sites) Anacamptis pyramidalis Pyramidal orchid (3 sites), Anacamptis morio Green winged orchid The Reserve is a legacy of Francis Simpson, MBE who for 60 years chronicled and grieved over – the price paid for progress by Suffolk's wildlife, especially its wild flowers. He was Suffolk’s Botanical Recorder for more than 50 years and died in 2003. He was the author of the Flora of Suffolk published in 1982. Cardamine pratensis Lady’s Smock, Cuckoo Flower, Milkmaids (4+ sites), Clinopodium vulgare Wild Basil (2 sites),		

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Cynoglossum officinale Houndstongue (1 site) Dactylorhiza fuchsii Common Spotted Orchid (3 sites), Dactylorhiza praetermissa Southern Marsh Orchid (1 sites), Daphne laureola Spurge Laurel (3 sites), Fritillaria meleagridis Snakeshead Fritillary (1 site*), Galaeobdolon luteum Yellow Archangel (1 site), Knautia arvensis Field Scabious (3 sites), Lathyrus nissolia Grass Vetchling (1 site), Lepidium heterophyllum Smith's pepperwort (1 site) Lithospermum officinale Common Gromwell (1 site), Odontites verna Red Bartsia (5 sites), Ophioglossum vulgare Adders Tongue Fern (1 site), Ophrys apifera Bee Orchid (2 sites), Orchis mascula Early Purple Orchid (2 Sites) Orobanche minor Common Broomrape (1 site) Palanthera Chlorantha Greater Butterfly Orchid (1 site) Ranunculus auricomus Goldilocks Buttercup (2 sites), Rhinanthus minor Yellow Rattle (3 sites +1*), Scrophularia aquatica Water Figwort (1 site), Trifolium fragiferum Strawberry Clover (1 site), 7] Fungus Sandy Stiltball. (Battarrea phalloides) In addition to public 'space', the Biodiversity Group also survey particular areas of private land in the Parish (by invitation or with the owner's permission) and have surveyed 2 areas near the proposed SLR; Fir Tree Farm & Kelsale Lodge. Fir Tree Farm was surveyed in 2019, and extracts of the report are below: a] Description of area: Scrub is a poorly represented habitat within the Parish, and this area is one of the most extensive present. The area has potential to support a wide range of biodiversity and act as a reservoir of wildlife for the wider countryside. If managed sensitively it could develop an even richer flora and fauna over time. Ponds elsewhere on site and on adjacent land are an important addition to the habitat mosaic present. The scrub field is important for protected species such as great-crested newt (terrestrial phase) and also for foraging bats, birds, reptiles and invertebrates. b] Notable species Great-crested newt (Triturus cristatus) is known to be present in ponds in the vicinity (see earlier ecological survey) and the scrub		

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			area will be very important for the terrestrial phase of the lifecycle of this protected species. In addition, the habitat appears to be eminently suitable for protected reptiles such as Common Lizard (Zootoca vivipara) and Slow-worm (Anguis fragilis) as well as Grass snake (Natrix natrix). Weather conditions were not suitable for these species to be observable, but their presence could easily be confirmed by survey, utilising tin or felt refugia. The habitat mosaic would certainly be expected to support many species of insects such as butterflies, bees, beetles, grasshoppers etc. as well as other invertebrates. Evidence of the immature stages of a picture-winged fly Myopites inulaedyssenteriae were abundant on fleabane (Pulicaria dyssenterica). This nationally rare species is accorded Red Data Book 3 (RDB3) status. However, this may be revised in the light of further studies. Further survey under more favourable conditions would doubtless add substantially to both floral and faunal species lists.		
		Terrestrial ecology, traffic and transport, inter-project cumulative effects	**– Connectivity between species will be further fragmented and damaged by the construction of Sea Link and the cumulative impact of other energy projects.** As mentioned earlier, individual habitats cannot thrive in isolation, and, for example, fields by the Fir Tree Farm are linked to the wider countryside and other semi-natural habitats by hedgerows of varying quality, with the A12 forming a considerable barrier to the west. Another busy, traffic congested road would further fragment this connectivity, as well as having an adverse effect on more mobile species such as Badger (a protected species), Brown Hare (a BAP species) as well as hedgehog and deer species, leading to an increase in road kill deaths and accidents, already all too familiar on the A12.	Y	The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the B1121 Main Road in the vicinity of Kelsale. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant traffic or transport impacts on the surrounding highway network (including B1121 Main Road and the A12), with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. Impacts of the Suffolk Onshore Scheme on habitat connectivity for wildlife (both during construction and operation) is considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** and measures required to ensure continued connectivity (e.g. passage of badger) across the haul road and permanent access have been considered.
		Ornithology	**– NGET has stated in its list of ongoing surveys that it is surveying migrating birds in November and December of 2023. This survey will be inaccurate as local birds would have migrated by this time.**	N	It is unclear what documentation is being referenced but standard bird surveys have been undertaken for the Proposed Project, including 2 seasons of non-breeding bird surveys (covering October to March in 2022-23 and 2023-24 and breeding bird surveys in both 2023 and 2024).
		Landscape and visual, air quality, health and wellbeing	**Pollution - Light, Noise and Air** **– Light pollution from incresed traffic and the converter station(s) will adversely affect KcC residents' health and well-being.** There is little street lighjting in the Parish and as can be seen form the screenshot below the dark skies the Parish enjoys are amongst the darkest measured at -0.25, 0.25-0.5 and 0.5-1.	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project. The assessment of health and wellbeing effects also draws on other technical chapters, such as **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual** which includes reference to the effect of lighting on landscape character and visual amenity.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Dark skies have a significant well-being aspect, humans evolved to the rhythms of the natural light-dark cycle of day and night. Research suggests that artificial light at night can negatively affect human health.		
		Landscape and visual, noise and vibration, terrestrial ecology	**– Light and noise pollution will also harm wildlife.** Light pollution is known to adversely affect foraging in some bat species as well as interfering with bird reproductive cycles and migration patterns. Nocturnal invertebrates can also suffer negative impacts from intense illumination sources. Whilst wildlife can in some cases adapt to some background noise, more sensitive species are likely to be repelled or otherwise negatively affected and suffer disturbance from such pollution. The A12 is already a source of noise and light pollution and additional traffic will further compound such pollution.	N	Noise and lighting impacts on wildlife are considered as part of the Environmental Statement. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Traffic and transport, air quality, noise and vibration	**– Increased traffic noise and air pollution from both the A12 and B1121 will negatively affect the health and well-being of residents.** With 458 additional vehicles, 65 of which are estimated to be HGVs from the construction of Sea Link along with the traffic from construction of Sizewell C and the SLR, there will be a significant increase in noise and air pollution. Air pollution is now recognised as having a significant detrimental impact on the UK population; shortening lives, impairing health, causing lung disease and other chronic conditions. This will affect the health and well-being of residents who live close to the road, use the sports facility or the recreation ground in Kelsale and children who attend Kelsale Primary School. A number of residents with asthma and other breathing impairments chose Coastal Suffolk as the place to live due to the air quality and the low levels of traffic pollution.	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing** and concludes that there are no anticipated significant effects as a result of the Proposed Project.
		Water environment, traffic and transport, inter-project cumulative effects	**Flood Risk** **– As seen by recent events, with the increased traffic it will be difficult to find alternative routes to avoid flooding**. Bridge Street in Kelsale has seen significant flooding from the Fromus recently resulting in the closure of the road. Residents on the east side of the road were cut off from Main Road and had to find alternative routes which will be made more difficult with the increase in traffic both from the construction of Sea Link and Sizewell C and SLR. NGET has failed to assess this.	Y	**Application Document 6.8 Flood Risk Assessment** has been prepared to inform the DCO application has considered flood risk to the routes of access and egress to and from construction working areas, and the contractor, when working in flood risk sensitive locations would operate under the protocols set out in a Flood Warning and Evacuation Plan. The northern access route no longer forms part of the proposals. Therefore, no construction vehicles will travel along the section of the B1121 Main Road to the north of Saxmundham and the proposals are not expected to increase journey times on this part of the network. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network (including the B1121 Main Road), with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**.
		Water environment,	**– Uncertainty of flood risk due to climate change has not been assessed.** The recent flooding was unexpected and our	N	The Proposed Project design has been informed by **Application Document 6.8 Flood Risk Assessment** which factors in the predicted effects of climate

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		climate change	communities were not prepared for the significant effects of flooding. This must be modelled and assessed properly by NGET especially given its significant alteration to the landscape both in the construction of the converter(s) and the new 'haul roads'.		change in line with current best practice guidance. The surface water drainage design and design of watercourse crossings factor in uplifts in rainfall intensity and river flows, to ensure the Proposed Project is resilient to climate change and land drainage and flood risk mitigation measures also include for climate change allowances.
		Cultural heritage	**Risk to Heritage Assets from Increased Pollution Due to the Rise in Traffic** Kelsale Conservation Area contains a cluster of nationally designated buildings which were designed or altered by nationally significant late Victorian architects such as Norman Shaw and Edward Prior. The village also retains a number of high-status timber framed buildings including the sixteenth century Guildhall. The grade one listed medieval parish church is a prominent local landmark and dominates the northern part of the Conservation Area. The Conservation Area retains numerous unlisted buildings which make a strong positive contribution to its character and significance; many of these also possess considerable intrinsic interest. The Conservation Area is of considerable character and historic interest, including nineteenth century cottages, farm buildings, a former smithy, and a charming classical Methodist Chapel. In addition to their own intrinsic value, they contribute considerably to the setting of nearby listed buildings. In common with several villages in the Suffolk Coastal district, pavements are largely lacking from Kelsale, as are concrete kerbs and street lighting, which helps retain a rural and largely unaltered streetscape. To the north-east of the village, along Tiggins Lane, is a dense belt of trees which visually separates the grounds of Kelsale Court and Kelsale Manor. These tree belts give Tiggins Lane an enclosed woodland character and form a critical part of the setting of the listed buildings in the immediate (Conservation) area. Map of Conservation Area attached.	Y	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England, and as part of this procedure, a list of assets to fully assessed was agreed. Furthermore, the Proposed Project will no longer use the north access option which was the closest element of works to Kelsale. The final assessment within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** has been informed by the Proposed Project design and construction methodology outlined within **Application Document 6.2.1.1 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment is also informed by the Zone of Theoretical Visibility (ZTV) produced to accompany the Landscape and Visual Impact Assessment which has been informed through consultation with Historic England and East Suffolk Council. Effects arising from the Suffolk Onshore Scheme on landscape character is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Cultural heritage	To put this in context there are 37 listed buildings in the Parish. In addition, Carlton Park has an area of historic parkland which is a non-designated heritage asset and there is a signpost at the junction of East Green and Theberton Road which has the same designation.	Y	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England, and as part of this procedure, a list of assets to fully assessed was agreed. Furthermore, the Proposed Project will no longer use the north access option which was the closest element of works to Kelsale. The final assessment within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** has been informed by the Proposed Project design and construction methodology outlined within **Application Document 6.2.1.1 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The assessment is also informed by the Zone of Theoretical Visibility (ZTV) produced by the Landscape and Visual Impact Assessment which has

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					been informed through consultation with Historic England and East Suffolk Council.
		Traffic and transport, air quality, noise and vibration	The increase in pollution – light, air and noise – as well as vibration resulting from the significant rise in traffic will have a detrimental impact on these important heritage assets.	Y	The potential for impacts on the setting of heritage assets was discussed with key stakeholders including East Suffolk Council and Historic England, and as part of this procedure, a list of assets to fully assessed was agreed. Furthermore, the Proposed Project will no longer use the north access option which was the closest element of works to Kelsale. The final assessment within **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage** has been informed by the Proposed Project design and construction methodology outlined within **Application Document 6.2.1.1 Part 1 Introduction Chapter 4 Description of the Proposed Project**, and is also informed by the Zone of Theoretical Visibility (ZTV) produced by the Landscape and Visual Impact Assessment which has been informed through consultation with Historic England and East Suffolk Council.
		Alternative solutions, inter-project cumulative effects, coordination with other projects	**Conclusion** NGET has not done its work and properly assessed alternative options and adverse impacts of the Sea Link project on our rural community of Kelsale-cum-Carlton. Further, it has only given the cumulative impact of Sizewell C and other energy projects on this small area a cursory analysis. Alternatives to Sea Link's proposal exist, but have not been given serious consideration by National Grid Electricity Transmission (NGET). An integrated offshore grid with converter stations on brownfield sites or where there is existing infrastructure has not been assessed properly by NGET even though it was raised in the non-statutory consultation by Kelsale-cum-Carlton PC. There would be no need for Sea Link if pilot tests like East Anglia One North and East Anglia Two pooled their energy to Lion Link and took the power to Bradwell. We vigorously support a pause and review which aims for a co-coordinated review of all proposed transmission infrastructure that makes landfall on the East Anglian coast, an objective assessment of landing points at both ends of Sea Link, specifically brownfield and where there is existing infrastructure, and a fully costed scenario for an integrated offshore grid. KcC Parish Council supports renewable energy and understands the need for a reinforced grid, but urges NGET to think carefully about the consequences of proceeding too quickly to the wrong solution. We have been burdened with consultations for a decade which means a decade of not being able to work to improve our community and enjoy what it offers. We deserve better!	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Full details on how the design has evolved and the consideration of alternatives are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Effect interactions between the Proposed Project and other proposed developments in Suffolk within the cumulative zone of influence have been identified and assessed within the ES and are reported within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Further details of these effect interactions and any additional mitigation proposed is contained in this Chapter. National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Table 1.10 Kent County Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation, Traffic and transport	Thank you for consulting Kent County Council (the County Council) on the Statutory Consultation for the National Grid Sea Link Project. The County Council has reviewed the consultation documents and would like to raise the following comments for consideration. **Highways and Transportation** Preliminary Environment Impact Assessment (PEIR) Part 3 - Chapter 8 Traffic and Transport Assessment The County Council, as Local Highway Authority, provides the following comments in respect of the Preliminary Environment Impact Assessment (PEIR) Part 3 - Chapter 8 Traffic and Transport Assessment. The County Council also acknowledges that further assessments will be considered as part of the Environmental Statement (ES) and would welcome continued engagement with National Grid on these matters.	N	National Grid welcomes all consultation feedback which has been acknowledged and responded to in the relevant areas. Kent County Council has been engaged as part of a series of transport thematic meetings and engagement will continue throughout the DCO process.
		Traffic and transport, Construction – general, Onshore mitigation	It is noted and accepted by the County Council, as Local Highway Authority, that the operation and maintenance phase of the works will have an inconsequential impact on the highway network. Therefore, these phases do not require any further assessment or comment. It is the construction phase that is the area of focus as this is the only time when vehicle trips generated by the construction of the various elements of the project will potentially cause impacts for assessment and the need for potential mitigation. If the site is decommissioned, this will have a lesser impact than the construction stage so again is not under consideration at this time.	N	**Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** follows the approach taken in the PEIR by including an assessment of the construction and decommissioning phases. An assessment of the operational and maintenance phase has been scoped out on the basis that vehicle movements associated with the operation of the site and maintenance requirements are anticipated to be infrequent and low.
		Traffic and transport, Construction - general	The County Council requests that at this pre-application stage, further details are provided in respect of construction vehicles using secondary routes such as Marsh Farm Road, Hill Court Road, Cooper Street Drove, Richborough Road and Whitehouse Drove. Whilst it is anticipated that only Light Goods Vehicles (LGVs) will be used, this could still be vehicles of up to 3,500kg using single track country lanes only wide enough for one vehicle, with very few passing places over considerable lengths. Condition surveys will be required on these routes as outlined in the Transport Assessment (TA) and some temporary passing places may be required dependent on the anticipated number of trips and vehicle types.	N	National Grid is aware of the limited capacity of the secondary accesses, notably Jutes Lane, Tothill Street, High Street, Marsh Farm Road, A257, The Causeway (Ash Road) and Richborough Road. The proposed use of secondary accesses is set out in detail within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**. By nature of the works that will be undertaken using these routes, the flow of construction vehicles on these accesses will be limited, for example, Marsh Farm Road will be used only for the construction of a temporary pylon, scaffolding erection and works to the existing pylon within the Order Limits, and Jutes Lane will only be used to undertake utility connection works which originate from Jutes Lane. The number of HGVs will be <10 per day at the peak of the works. LGVs are largely vans and 4x4 vehicles for staff movements and again have been limited to a maximum of 25 per day at the peak. Condition surveys of all secondary accesses will be undertaken, committed as a measure within **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Traffic and transport	When considering future year forecasts, it is noted that TEMPro v 7.2 is used. The County Council recognises that this is not the latest version. However, TEMPro v 8 is heavily caveated due to COVID19, and the County Council is therefore satisfied that TEMPro v 7.2 gives a more robust output. The County Council will therefore not be requesting the use of TEMPro v 8 in this instance.	N	**Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** follows the approach taken in the PEIR by adopting TEMPro v 7.2 to derive future traffic growth.
		Traffic and transport, Design	The County Council, as Local Highway Authority, does raise concerns over the new permanent bell-mouth access onto the A256 in the location shown due to its close proximity to Ebbsfleet Lane North. The County Council is aware that motorcyclists already cross the grassed verge from the A256 to gain access onto the (now stopped up) Ebbsfleet Lane North. The County Council requests provision of necessary evidence and drawings to demonstrate that no access can be gained for motor vehicles onto this former connection due to the impact on the unmanned level crossing to the north. In addition, it is noted that the submitted drawings only show a standard bellmouth without acceleration and deceleration lanes. The construction of this access must be Design Manual for Roads and Bridges (DMRB) compliant and will be subject to the County Council's technical approval and safety audit process.	N	The FEED team has conducted additional consultation with Kent County Council and has prepared a Memorandum of Understanding (MoU) as part of this process. The MoU covers additional items relating to the A256 access and road safety audits for example. In terms of the A256 access, the Stage 1 RSA has been shared with Kent County Council. The proposed design/ layout of the A256 access will be revised to consider any recommendations where necessary. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** has been updated accordingly.
		Traffic and transport	3.8.7 Baseline Traffic Data The County Council notes in paragraph 3.8.7.10 that the Sandwich Road data is from 2010 and has been factored up as later data was not available. It should be recognised that this is not representative - this data would have been collected prior to the opening of the East Kent Access (Richborough Way A256/Hengist Way A299) when Sandwich Road was the primary route into Thanet from the south. Therefore, the Average Annual Daily Traffic (AADT) data would be far higher after the opening of the new route. Sandwich Road was downgraded in 2012 and now includes traffic calming features and single way working resulting in it being a relatively lightly trafficked route now, generally only serving those properties in the immediate area and not acting as a rat run. Subsequently, the reporting figures within paragraph 3.8.7.4 for Ebbsfleet Lane would also be much higher based on the same reasons as Sandwich Road since prior to the opening of the East Kent Access, Ebbsfleet Lane was a through road and a well-used local route. It is now a dead end serving Stonelees Golf Course and a limited number of dwellings. Sandwich Road considerations would also be based on the higher numbers and as such these figures are considerably overestimated. It is recommended that National Grid has consideration of this. Table 3.8.22 - Sensitivity of road links and junctions for driver delay In respect of this table, the road links K-RL7 and K-RJ6 may fall into a lower sensitivity banding due to the overestimation of flows on Sandwich Road. Table 3.8.24 - Collision rates (road links)	N	National Grid acknowledges this feedback. The study area and traffic survey specification for the PEIR was agreed with Kent County Council in June 2023. Whilst the PEIR was based on the agreed study area, it was not possible to accommodate the traffic surveys prior to the PEIR submission and the baseline data was therefore based on available Department for Transport traffic counts. Traffic surveys have since been carried out (in January 2024) based on the agreed survey specification. The baseline data within the **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** has been based on these traffic surveys, and collision rates and receptor sensitivity levels have been updated accordingly.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Similarly, to the above, the AADT flows will be inaccurate in the formula so the collision rates for Sandwich Road will be much lower than those shown.		
		Traffic and transport, Construction - general	Volume 3 - Figure 1.4.20 Kent Onshore Scheme Traffic Routes during Construction and Operation The County Council notes in Figure 1.4.20 that office based/supervisor and management staff are being assessed as single car occupancy rather than the 1.5 per vehicle for other staff. However, there is no indication of what number of staff fall into the aforementioned categories. For completeness, clarity should be provided on this point as this will determine daily trips for staff.	N	The PEIR assumed that office based/supervisor and management staff would travel in single occupancy vehicles for robustness. These staff movements were included as part of the LGV movements. Further details have been provided within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** for completeness as requested.
		Traffic and transport, Construction – general, Onshore mitigation	Paragraph 3.8.8.3 – Control and Management Measures The County Council requests that wheel washing facilities should be provided at all access points to prevent mud/debris from coming out onto the public highway, particularly when egressing onto high-speed roads.	N	National Grid acknowledges this feedback. The requirement to provide wheel washing has been included as commitment GG18 in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured by Requirement 6 in Schedule 3 of the draft DCO (**Application Document 3.1**).
		Traffic and transport	Paragraph 3.8.9.2 – Proposed access arrangements In the absence of knowing where construction staff will actually be travelling from, the distribution across the network is accepted and considered robust to assume all will be travelling by motor vehicle.	N	National Grid acknowledges this feedback. This approach has similarly been adopted within the Environmental Statement. Further details are contained in **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.
		Traffic and transport, Construction – general, Consultation	County Council Conclusion Overall, the transport evidence submitted appears to be robust, however, there remains a number of queries which the County Council requests consideration of by National Grid at this pre-application stage. This includes clarity sought with respect to the use of smaller rural lanes by construction vehicles and to the detail of the in/out access onto the A256 preventing access and egress onto Ebbsfleet Lane North for all motor vehicles from the A256. The County Council, as Local Highway Authority, would welcome continued engagement on this project as it progresses.	N	National Grid acknowledges this feedback. These queries have been reviewed above. Kent County Council was engaged in a series of transport thematic meetings prior to submission.
		Traffic and transport, Consultation	**Highways and Transportation – Structures** The County Council notes that there are two County Council owned/maintained highway structures which will be affected by the works. There are also several County Council owned and/or maintained highway structures which are likely to be affected by the works dependent upon the final route. There are also other structures which the County Council hold a record for that are likely to be affected. These are as detailed below: County Council Structures that will be affected by the proposed development:	N	The FEED team has conducted additional consultation with Kent County Council and has prepared a MoU as part of this process. The MoU covers additional items relating to the protection of structures/ assets for example. National Grid will maintain ongoing dialogue with the County Council throughout preparation of the DCO application, including thematic meetings with the Highways team.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Cottington Outfall (8589) – Owned by the County Council (highways drain run) Weatherlees Drain & Outfall (8590) – Owned by the County Council (highways drain run) County Council Structures that are likely to be affected by the proposed development: Cottington Interceptor PI-D1, PI-D2, PI-D3 (8587, 8603, 8604) – Owned by the County Council Cottington Road Bridge (9427) – Owned by the County Council Cottington Road Drain crossing (8588) – Owned by the County Council Cottington Environmental Barrier (8601) – Owned by the County Council (non-structure management) Weatherlees Interceptor PI-C1, C2, C3 (8591, 8602, 8605) – Owned by the County Council Ebbsfleet/Richborough Roundabouts Outfall (8592) - Owned by the County Council A256 Richborough Power Station PI (8385) – Owned by the County Council Salt Water Sluice (680B) - Owned by the Environment Agency, inspected by the County Council Structures that are not completely under the County Council remit: Cottington (1392) – Owned and inspected by National Rail Ebbsfleet Farm (681) – Owned and inspected by Environment Agency Marsh Farm Road (241) – Owned by Environment Agency, inspected by the County Council TE 26 (7362), EE 42 (7363) - Owned by National Rail, inspected by the County Council Public Rights of Way and Access Service The County Council has a technical approval process in place for any works by statutory undertakers that affect County Council structures and therefore would welcome engagement with National Grid to ensure proposals do not have any adverse effect on the structures1.		
	Walking, cycling and horse-riders, Intra-Project cumulative effects	**Public Rights of Way (PRoW)** The County Council is keen to ensure that its interests are represented with respect to the statutory duty to protect and improve Public Rights of Way (PRoW) in the County. The County Council is committed to working in partnership with all parties to achieve the aims contained within the County Council Rights of Way Improvement Plan (ROWIP) and Framing Kent's Future, a strategic policy for Kent. Specifically, these relate to	N	National Grid acknowledges this feedback. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to mitigate PRoW impacts.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			quality of life, supporting the rural economy, tackling disadvantage and safety issues, and providing sustainable transport choices. PRoW is the generic term for Public Footpaths, Public Bridleways, Restricted Byways, and Byways Open to All Traffic. The value of the PRoW network is in providing the means for residents and visitors to access and appreciate landscapes for personal health and wellbeing, enhancing community connectivity and cohesion, reducing local traffic congestion for economic benefit and improvement in air quality, and much more. The existence of the Rights of Way is a material consideration.		The PRoW impacts have been assessed within **Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**.
		Walking, cycling and horse-riders, Socio-economic. recreation and tourism, Onshore mitigation	Public Footpaths TE39, TE40, TE37, TE32, TE26, EE42 and TR32, Restricted Byways TE35 and TE36 would be affected by the proposed development. A Public Footpath carries pedestrian rights only, a Restricted Byway has pedestrian, equestrian and all non-mechanical vehicle rights. The King Charles III Coast Path National Trail will also be affected by the proposed development. The substantial size and timescale of this project will have an adverse impact on the PRoW network, both visually and through loss of amenity, which leads to an impact on public use over a significant period of time. Appropriate measures will need to be taken by National Grid to help mitigate this impact. Sustainable active travel - as well as recreational activity across both the proposed site and the wider area connectivity - must be future-proofed and appropriately delivered.	N	As part of thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. **Application Document 6.3.2.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** concludes that there are no anticipated significant effects on PRoW/recreational routes as a result of the Proposed Project. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** sets out measures to manage PRoW through the construction and operational phases of the Proposed Project. An assessment of PRoW diversions and closures is contained in **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.
		Walking, cycling and horse-riders, Onshore mitigation	In respect of PRoW, the County Council has significant concerns regarding the proposed project for the following reasons: Insufficient weight given throughout documents as to the impact on the PRoW network and National Trail and the lack of understanding as to the benefits they bring to the area. Inappropriate mitigation is proposed. The County Council has at all points of previous engagement advised that a form of legacy fund would be appropriate, as per the Richborough scheme.	N	As part of thematic meetings, the assessment approach to PRoW has been discussed and agreed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. **Application Document 6.2.310 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** concludes that there are no anticipated significant effects on PRoW/recreational routes as a result of the Proposed Project. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to mitigate PRoW impacts. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this.
		Walking, cycling and horse-riders, DCO process, Consultation	All specific points of PRoW management covering pre-construction, construction, operation, and any decommissioning must be agreed with and approved by the County Council prior to the Development Consent Order (DCO) application being submitted, not as part of the submission. A full and detailed PRoW Management Scheme is to be progressed and then approved by the County Council at this pre-application stage. This	N	As part of thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** provides an assessment of the impact of the Proposed Project on PRoW.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Scheme must also be referenced within any future Statement of Common Ground between KCC and the applicant. The County Council strongly advises that the views of other local stakeholders are represented and considered holistically in the process in developing the Management Scheme. Negotiations and responses between all parties should therefore be seen as ongoing and evolving.		**Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases.
		Walking, cycling and horse-riders, Consultation, Intra-Project cumulative effects	There is little detail presented within the consultation material regarding both the PRoW alignment (if diversions are necessary due to the pylon locations Chapter 4 1.4.9) and the PRoW specification within the proposed development area. The impact on landscape, the visual amenity and the experience of the user requires greater consideration – a negative impact will have adverse impact on the use of the PRoW network. There is also the cumulative effect of this development together with developed area of Minster, all leading to wide and long-term disruption to the PRoW network and community use.	N	Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The meetings have run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. Other proposed developments that have the potential to overlap temporally with the Proposed Project have been identified and any potential inter-project cumulative effects resulting from the interaction between these other developments and the Proposed Project have been assessed within **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. The potential effects arising from the Proposed Project on users of PRoW and visual amenity in general in the study area is detailed within **Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment**. The potential effects arising from the Proposed Project on landscape character is detailed within **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. A range of likely significant and non-significant effects are reported during construction, operation or maintenance phases. Any impacts to PRoW have been discussed throughout the ES, across **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** and **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.
		Landscape and visual, Walking, cycling and horse-riders, Onshore mitigation	The County Council is in discussion with Thanet District Council regarding the Landscape and Visual Assessment, considering opportunities to address the impact on the area. There are also further stakeholders to be engaged within the local area. The public benefits of such work would help to compensate for the level of disruption caused by the construction and long-term operation of the proposed development and the negative effects on the PRoW network. To support this, Appendix A provides evidence of public use together with the socio-economic value of the path network of the area.	N	As part of thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. An assessment of impacts on PRoW is set out in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** sets out measures to manage PRoW through the construction and operational phases of the Proposed Project. An assessment of PRoW diversions and closures is contained within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Walking, cycling and horse-riders, DCO process, Onshore mitigation	PEIR Volume 1 Part 3 Kent Onshore Scheme - Chapter 2 Landscape and Visual In respect of the Control and Management Measure referred to as TT03, as considered in paragraph 3.2.8.3, all PRoW matters must be approved by and agreed with the County Council prior to the submission of the DCO application. The County Council requests further mitigation, including a legacy fund for the PRoW network.	N	**Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. The potential to provide a contribution towards a community/ legacy fund for PRoW improvements will be investigated. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations when projects are in construction. However, community benefit is separate to compensation and mitigation. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Walking, cycling and horse-riders, DCO process	Section 3.2.9 - Preliminary Assessment of Effects In this section, reference is made to the PRoW Management Scheme being submitted as part of the ES within the DCO application, which as considered above, is not considered acceptable to the County Council, as Local Highway Authority. A full management scheme must be agreed prior to submission of the DCO application.	N	**Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. Following grant of the DCO, a full, or Detailed PRoW Management Plan will be prepared in order to discharge the relevant condition.
		Walking, cycling and horse-riders, Legislation and policy inc. permits, Landscape and visual	Table 3.2.6 - Local Planning Policies relevant to landscape and visual Reference to the Dover Green and Blue Infrastructure Strategy should also acknowledge that the PRoW network is part of the Local Plan and that the County Council continues to engage with the District Council accordingly.	N	The reference to the Dover Green and Blue Infrastructure Strategy has been updated in line with the Kent County Council comment. This is set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**.
		Walking, cycling and horse-riders, Landscape and visual	Table 3.2.17 - the Representative viewpoint locations The photomontages should be amended to specifically reference the PRoW for clarity, rather than “Public Footpath east of Minster”.	N	The visualisations have been labelled to reference specific PRoW. This is shown at **Application Document 6.4.3.1 Landscape and Visual**.
		Walking, cycling and	Overall, the County Council considers that the proposed development would result in a significant impact on the network in the area across all	N	Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		horse-riders, Intra-Project cumulative effects, Consultation	criteria. In respect of PRoW, the County Council was not involved in early-stage discussions on this subject and is now engaging with Thanet District Council. The County Council recommends that further holistic engagement is carried out by National Grid to ensure all relevant stakeholders are engaged in discussion as may be relevant.		thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The meetings have been run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. Other proposed developments that have the potential to overlap temporally with the Proposed Project have been identified and any potential inter-project cumulative effects resulting from the interaction between these other developments and the Proposed Project have been assessed within **Application Document 6.2.3.13 Part 3 Chapter 13 Inter-Project Cumulative Effects**.
		Walking, cycling and horse-riders, Combined effect of the proposed Project, Health and wellbeing	PEIR Volume 1 Part 3 Kent Onshore Scheme - Chapter 12 Health and Wellbeing Transport Modes Table 3.12.25, Preliminary assessment of Transport modes, access, connections, and physical activity (active travel) The overall impact of the development appears to be predicted as low or medium/not significant across all criteria. In respect of PRoW, the County Council disagrees with this conclusion and recommends greater weight is given to the impact of the proposed development. This is due to the long-term scale of the impact on user experience from all receptors that should be regarded as high (including impact on the Saxon Shore Way and the King Charles III Coast Path), due to the impact on recreational walks within open countryside.	N	**Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing** provides an assessment of the health and wellbeing effects on PRoW/recreational routes as a result of the Proposed Project. These conclusions are based on best practice guidance from the Institute of Environmental Management and Assessment, London Healthy Urban Development Unit, the World Health Organisation and Dahlgreen and Whitehead's model of the main determinants of health. Health and Wellbeing conclusions are also based on assessments in other technical chapters.
		Walking, cycling and horse-riders, Design, Socio-economic. recreation and tourism	PEIR Volume 1 Part 3 Kent Onshore Scheme - Chapter 11 Socio-Economics, Recreation and Tourism The County Council refers National Grid to Appendix A for evidence supporting the statements within this chapter. Paragraph 3.11.3.4 – Consultation and Project Engagement This paragraph states - "a number of PROWs recently renamed." - the County Council is concerned with this point and requests clarity of the matter. Paragraph 3.11.4.17 – Direct and Severance Effects, Public Rights of Way In respect of this paragraph regarding 'Direct and Severance Effects on the PRoW network', the list of PRoW within the boundaries and within 500m is correct. However, the County Council considers that 500m is not far enough for PRoW use as the majority of use is across a longer distance.	N	Consultation with Kent County Council revealed that the England Coast Path has recently been renamed the King Charles Path. Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The meetings have been run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. Where deemed relevant, impacts on PRoW beyond 500 m have been included in the assessment. Further details are contained in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**.
		Walking, cycling and horse-riders, Onshore Mitigation,	Section 3.11.8 - Mitigation The mitigation referred to as TT03 requires all PRoW details to be agreed with the County Council. There is omission of the permanent diversion referred to in other documents which requires clarification.	N	As part of thematic meetings, the assessment approach to PRoW has been discussed with stakeholders. National Grid is confident that its desk based approach is sufficiently robust and incorporates best practice methodology used on comparable DCO schemes. An assessment of impacts on PRoW is set out in **Application Document**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Construction - General	Measure GG26, as referred to within paragraph 3.11.8.3, Control and Management Measures – information regarding site works should also take into account provision of this information to PRoW users by local means and also through Explore Kent. Paragraph 3.11.9.7 – Public Rights of Way – Table 3.11.23 Preliminary Assessment of Footpath TE39 The potential diversion referred to (which requires clarification due to conflicting information) of TE39 and reference to a temporary closure is lacking in detail and this should be provided accordingly. A four-year construction period is not considered to be temporary, and the County Council would not accept such an impact. An alternative, safe and attractive to use route would be required to be approved by the County Council as part of the PRoW Management scheme. This cannot be left undetermined prior to any DCO submission. Paragraph 3.11.9.8– Public Rights of Way – Table 3.11.27 Preliminary Assessment of Footpath EE42 Public Footpath EE42 and Saxon Shore Way (a County promoted route) is, as above, proposed for a short-term diversion or closure. Again, insufficient detail is provided, and the impact is again not considered by the County Council to be only short term. Any proposal for a permanent or long-term closure is not a “small adverse” impact as suggested, it is considered significant and negative. Far greater detail is therefore requested by the County Council. Paragraph 3.11.9.9 - Public Rights of Way – Table 3.11.28 Preliminary Assessment of Footpath TE26 Public Footpath TE26 would be impacted by the location of the overhead cables area, as well as during the long construction period. Again, this cannot be considered “not significant” given the timescale of construction and the permanence of the infrastructure. Recreational use does not lessen the impact on the network. Paragraph 3.11.9.10 - Public Rights of Way – Table 3.11.29 Preliminary Assessment of Footpath TE35 Restricted Byway TE35, the comments for TE26 apply. Even if this route is not severed, diverted, or closed, there will still be major impact on use. Section 3.11.10 – Summary The County Council cannot agree with the overall view there will not be a significant impact on the PRoW network for the reasons above and requests that the evidence sought is provided. The County Council also requests that much greater detail on the impact of the proposed development on the PRoW network is considered and the mitigation required is made clear.		**6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** sets out measures to manage PRoW through the construction and operational phases of the Proposed Project. An assessment of PRoW diversions and closures is contained within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**. Mitigation for impacts to PRoW are set out within **Application Document 7.5.3.1 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured via Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Traffic and transport, Construction –	PEIR Volume 1 Part 3 Kent Onshore Scheme - Chapter 8 Traffic and Transport	N	**Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council, which includes further details of PRoW

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		general, Walking, cycling and horse-riders	The County Council requests that PRoW considerations must be included in the proposed Construction Traffic Management Plan as referenced in Volume 2 Part 1 Appendix 1.4C. Table 3.8.14 - Categorising the overall magnitude of effect of a PRoW diversion and/or closure In respect of this table - the County Council queries the use and origin of the basic categories and definitions used. For example, there cannot be a diversion of a route without a closure. The definition of what is considered long term and short term is also required.		diversions, closures and durations. This is separate to the **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent**. It is acknowledged that there cannot be a PRoW diversion without a closure. Further clarity in terms of definitions has been provided within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.
		Walking, cycling and horse-riders, Traffic and transport, DCO process	Section 3.8.8 – Mitigation The mitigation measure referred to as TT03, this does not go far enough and as stated, the County Council requires a full PRoW Management Scheme approval prior to DCO submission. Paragraphs 3.8.8.6 to 3.8.8.8 – Mitigation Measures The County Council notes that all PRoW issues are still unconfirmed and require further detail regarding diversion, closure and management. The County Council is therefore unable to fully comment on what is being proposed as part of this development. The PRoW Management Scheme must not be considered outline; full details must be provided as required by the County Council for each PRoW route affected across all the construction, operation and decommissioning phases. Again, this must be agreed prior to DCO submission.	N	National Grid acknowledges this feedback. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. The scope of the document was agreed with Kent County Council PRoW Officers during the transport thematic meetings. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent** is secured by Requirement 6 of Schedule 3 in the draft DCO (**Application Document 3.1**).
		Walking, cycling and horse-riders, Traffic and transport, Construction - General	Paragraphs 3.8.9.4 to3.8.9.7 - Construction vehicle routes The County Council still maintains its significant concern regarding the impact on both the PRoW network and the rural roads of the area given the traffic numbers (including HGV) quoted. Paragraph 3.8.9.7 quotes secondary access as Tothill Street, Minster High Street, Marsh Farm Road etc. which are unsuitable for this use. This would give rise to conflict with Non-Motorised User (NMU) groups. Paragraph 3.8.9.8 – Construction programme, working hours and associated parameters. The Construction Programme is quoted as 50 months. The construction phase is across a significant timeframe and will impact on the PRoW network in the area. In respect of decommissioning, further detail around what this is expected to include is requested.	N	As above, **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** has been prepared as part of the ES. Works have been planned to make use of the primary accesses as far as possible, minimising use of the secondary accesses to those activities that are strictly necessary. Using the secondary accesses for limited works helps keep overall construction activities down reducing traffic impacts and the construction programme, it also derisks elements of the work. The secondary accesses chosen are already identified as maintenance accesses for National Grid infrastructure or 3rd party infrastructure that is being worked upon as part of the Proposed Project. **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent** and **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan - Kent** are secured by Requirement 6 of Schedule 3 in the draft DCO **(Application Document 3.1**).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Walking, cycling and horse-riders, Traffic and transport	Paragraphs 3.8.9.38 to 3.8.9.41- non-motorised user amenity An overall low assessment of impact is given in respect of NMU amenity. The County Council disagrees with this conclusion given the evidence, experience, and overall impact of development in the area.	N	The assessment of Non-Motorised User Amenity within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** has been reviewed based on the feedback received from Kent County Council. The likely impact of the Proposed Project on Non-Motorised User Amenity for all receptors within the study area is considered to be not significant.
		Walking, cycling and horse-riders, Traffic and transport, DCO process	Paragraphs 3.8.9.61 to 3.8.9.64 - PRoW Diversions and Closures The County Council does not consider that the levels of medium/low given are sufficient from its professional experience as the Local Highway Authority for PRoW. There are only references given here to construction and decommissioning, both over 5 years i.e. not taking into consideration the impact over the operational period. Therefore, a medium/low level underestimates the impact over a substantial time period. The County Council requests further detail and clarity regarding diversions as any permanent diversion would include the operational period of the project – with reference to commentary for TE26 and EE42 regarding the Pylon Options. This section is lacking clarity and detail, without which the County Council is unable to comment fully. This gives rise to serious concerns as to the overall intentions and for the management of the PRoW network. In respect of paragraph 3.8.9.64, the reference to “not significant” impacts shows the underestimated impact on, and benefits of, the PRoW network throughout and across all criteria – public health, socio-economic, tourism, access to greenspace. The County Council has considerable concerns with the current information and requires the PRoW Management Scheme to be prepared and agreed prior to the DCO submission and would urge National Grid to engage accordingly on this matter.	N	As above, **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases, as well as details on the roles and responsibilities of the contractor and National Grid relating to PRoW. The assessment of PRoW diversions and closures within **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** has been reviewed based on the feedback received from Kent County Council. The traffic and transport assessment does not identify any significant impacts on PRoW in terms of diversions and closures, with the proposed embedded mitigation and control and management measures in place.
		Onshore mitigation, Traffic and transport, Community benefits / enhancements	Paragraph 3.8.9.65 to 3.8.9.66 - Operation and Maintenance The PRoW Management Scheme must be agreed and approved by the County Council, as Local Highway Authority, prior to the DCO submission to mitigate the concerns of the impact of the proposed development on the PRoW network. With regards to section 3.8.10, Summary - the County Council refers to commentary within this response. There is no mention of mitigation in terms of a Legacy Fund to enable high quality routes for all and this requires consideration from National Grid. The current proposed mitigation is unsatisfactory, as it offers only very limited mitigation, which is insufficient given the impact of the proposed development of the PRoW network during all the stages of this project. There is no reference to the ROWIP as previously advised, or detail of community engagement or information regarding benefit to the area.	N	As above, **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan - Kent** has been prepared in consultation with Kent County Council to provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. The potential to provide a contribution towards a community/ legacy fund for PRoW improvements will be investigated. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. However, community benefit is separate to compensation and mitigation. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					position, it are working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Onshore mitigation, Agriculture and soils, Onshore Environmental Impact	**Minerals and Waste** The County Council, as Minerals and Waste Planning Authority, requests that more detailed location maps are provided as part of future engagement to allow for clear assessment of the impact of the proposed development. The County Council notes that there appears to be no safeguarded waste management or minerals infrastructure that would be potentially affected by the preferred option for the route. With regard to safeguarded land-won minerals, it appears that where the proposed development makes landfall in the Richborough area, there is a safeguarded land-won mineral, Storm Beach sand and gravels, as shown on the Mineral Safeguarding Area Maps for Thanet District and Canterbury City Council Proposals Maps from the Kent Minerals and Waste Local Plan 2013-30 (Early Partial Review 2020) [KMWLP], as shown below: [Image][Image] The issue of how the proposed development will affect these safeguarded land-won minerals is not addressed within the consultation. The proposed development is unlikely to cause significant sterilisation of these deposits. However, the Environmental Statement must include consideration of the KMWLP's policy provision that allows non-mineral development to be assessed against the presumption to safeguard exemption criteria (Policy DM 7: Safeguarding Mineral Resources).	N	National Grid acknowledges this feedback. It has been agreed through thematic meetings undertaken with Kent County Council that the mineral being safeguarded within the area of the Proposed Project is the Storm Beach Gravels and that the Proposed Project does not interact with this strata. A copy of the geological map with the Order Limits overlayed to show that the Proposed Project doesn't interact with this strata is presented within **Application Document 6.4.3.5 Geology and Hydrogeology**. Therefore, safeguarded minerals within Kent have not been assessed further.
		Agriculture and soils, Design, Consultation	**Waste Management** The County Council notes that the material published as part of this Statutory Consultation indicates that the project does not bisect the Pegwell Bay closed landfill site. Should this change as the project progresses, National Grid must engage with the County Council accordingly.	N	National Grid acknowledges this feedback.
		Water environment, Climate change, Onshore mitigation	**Sustainable Urban Drainage Systems (SuDS)** The County Council, as Lead Local Flood Authority, understands from the Preliminary Environmental Information Report, Part 3, Chapter 5 that the siting of infrastructure and temporary works are proposed to be in areas that are not at risk of flooding from rivers and the sea i.e. Flood Zones 2 or 3. The County Council also accepts that a Flood Risk Assessment and Drainage Strategy is to be provided as part of the Environmental Statement which will further consider surface water management and any mitigation required and the County Council. The County Council would highlight that as part of any future Flood Risk Assessment or Drainage Strategy, consideration must be applied to	N	**Application Document 6.8 Flood Risk Assessment** has been prepared to inform the DCO application and has assessed flood risk from a range of sources including surface water, considering flood risk to the Proposed Project and effects on neighbouring lands, properties and infrastructure arising from the Proposed Project during its construction and operation at the local catchment scale. Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Proposed Project's lifetime).

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			property, roads, and drainage features outside areas to being identified as being at risk. This is to minimise impact on access/egress and allow the drainage features to function as intended. Whilst the County Council has no preference as to whether a Flood Risk Assessment forms part of an Environmental Statement or is submitted as a standalone document, any identified flood risk or surface water management issues should be appropriately considered within the application documentation (with appropriate mitigation recommended wherever necessary). The County Council will expect the Drainage Strategy to encompass a detailed drainage impact assessment or surface water management strategy and consider the latest climate change guidance for peak rainfall allowances.		In addition, where the Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a Project commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised. **Application Document 6.8 Flood Risk Assessment** has been prepared as a standalone document, which has informed the ES and recommends appropriate mitigation strategies wherever necessary. A commitment is secured within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** for the appointed contractor to prepare a detailed drainage impact assessment for the construction phase.
		Cultural heritage, Marine archaeology	**Heritage Conservation** The County Council's Principal Archaeological Officer has had prior input to this project and inputted into the response to the Scoping Report (October 2022). The County Council has been in continuing dialogue with the applicant's archaeological team with respect to the assessment, survey and evaluation work that is needed to understand the impact of the scheme on archaeological remains and the significance of those remains. This continued engagement is welcomed. The County Council leads on providing archaeological advice to both Thanet and Dover District Councils. Impacts on the setting of Built Heritage will be led on by the District Conservation Officers and Historic England. Historic England will generally lead on advice with respect to offshore archaeology below the Mean Low Water mark. The County Council comments are provided with respect to the relevant sections of the PEIR relating to the onshore archaeology within Kent.	N	National Grid acknowledges this feedback. Consultation has continued with both the Kent County Council's Principal Archaeological Officer and Historic England. This has included general project updates and thematic group meetings, as well as focused discussions relating to aspects such as geophysical survey and evaluation trenching. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching.
		Landfall location, Alternative solutions, Cultural heritage	PEIR Volume 1 Part 3 Kent Onshore Scheme – Chapter 1 Evolution of the Kent Onshore Scheme As noted in the County Council's response to the Scoping Report, due to the rich archaeological landscapes of Thanet, a preference was expressed for a land fall in the Sandwich Bay area and connection into the Richborough substation. The landfall in Pegwell Bay may have more intertidal impacts on archaeological assets - though that is preferred to the options between Broadstairs and Margate and on the north Thanet / Kent coast as these would have required extensive connection runs through rich archaeological landscapes. The option for the convertor site closest to Richborough substation was preferred, though the high archaeological and historic landscape value of this area has been highlighted. The County Council noted that the Scoping Report had only flagged the location of Scheduled Monuments and asked that the way in which heritage has influenced the overall selection of options be set out in more detail in the future study.	N	A review of the route and site selection and development has been included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and heritage was one of a number of elements considered as part of the route and siting work. Routeing and siting work also continued to be developed throughout the assessment stage as new data was collected.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage, Landscape and visual	Paragraph 3.1.4.5 – Historic environment This paragraph correctly identifies that the overhead line option would have more setting impacts than underground; and in terms of archaeology, the impacts on the setting of the Scheduled Monument at Richborough and how they are reduced through routing needs to be clearly set out. Viewpoints from Richborough are being agreed with Historic England. The County Council highlights the impact of the proposed development on the setting of the important (non-designated) enclosure at Ebbsfleet; and the potential historic landscape effects, highlighting the significance of the Wantsum Sea Channel in which the pylons and converter station are proposed to lie. As noted within the PEIR, the underground option will have more impact on buried archaeology.	N	A full assessment of the potential for impacts on setting is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. Viewpoints required were agreed with the Kent County Council's Principal Archaeological Officer and Historic England.
		Cultural heritage, Design, Onshore route location	Paragraph 3.1.4.20 – Proposed HVAC connection The paragraph refers to the setting impacts on designated assets in Minster and at Richborough as being considerations when reaching a preferred option. However, it is not clear as to whether the impact on the setting of the Ebbsfleet enclosure and the historic landscape have also been taken into account. The County Council notes and welcomes that further heritage surveys are to be undertaken which will determine the pylon selection and encourage that these include the impacts on non-designated heritage such as at Ebbsfleet and the Wantsum sea Channel.	N	A full assessment of the potential for impacts on setting is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. This includes an assessment of both physical impacts and the impacts on the setting of the Ebbsfleet Lane enclosures.
		Landscape and visual, Design	Paragraph 3.1.4.26 – Proposed Minster 400kV Substation and Minster Converter Station. The paragraph explains that the Minster Convertor Station has been located as close as possible to the infrastructure of the Richborough Energy Park to reduce the impact on views from Richborough. The relationship with views from the Ebbsfleet enclosure should also be considered in future studies and detailed design.	N	A full assessment of the potential for impacts on setting is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. This includes an assessment of both physical impacts and the impacts on the setting of the Ebbsfleet Lane enclosures.
		Cultural heritage, Design	Paragraphs 3.1.4.31 to 3.1.4.38 – Proposed underground HVDC Cables and Kent Landfall The County Council welcomes that the draft Order limits are left wide to the west of the A256 Richborough Way (with reference to paragraph 3.1.4.34). This area is particularly rich in archaeology, including archaeology that is of very high significance and potentially of national importance. The surveys that are presently under way will enable further consideration on the routing and approach to cabling with respect to archaeology and ways in which to reduce the effects of the proposals. It is also appropriate that the limits are set wide to the east of the A256 (3.1.4.35) where archaeological remains should also influence the routing and cabling options. The County Council notes that the trenchless options across the salt marsh and golf courses will help to reduce impacts on archaeology in those areas.	N	Since the submission of the PEIR, additional works have been undertaken throughout the Draft Order Limits including geophysical survey and evaluation trenching. This included the land to the west of the A256. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. The result of this work has been used to characterise the archaeology, and assess impacts, as well as inform the design in this area. The results of this are covered in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, as well as supporting appendices.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Cultural heritage, Onshore mitigation	PEIR Volume 1 Part 3 Kent Onshore Scheme – Chapter 4 Cultural Heritage The County Council notes that Chapter 4 of the PEIR provides a preliminary assessment of the archaeological baseline and its significance. The County Council has previously highlighted that the development is proposed within an area that is highly sensitive for archaeology; and that a thorough study is needed to establish a detailed baseline and understand the high significance of the archaeology of the area. Such a study would need to be supported by survey and evaluation targeted at the potential impacts of the scheme. The survey work is presently ongoing, and liaison is continuing between the County Council's Principal Archaeological Officer and the applicant's archaeologists, who are agreeing the scope of the survey and evaluation works that are needed. The results of the ongoing work should be used to update the baseline, inform significance, assessments of impact and potential mitigation approaches in due course.	N	The baseline and impact assessment have been based on information collected through various sources and methods including previously recorded heritage assets, historic mapping, and aerial photography, as well as a geophysical survey and evaluation trenching undertaken for the Order Limits. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. These works have been agreed through consultation with stakeholders including the Kent County Council's Principal Archaeological Officer, and results are included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, as well as supporting appendices.
		Cultural heritage, Landscape and visual, Consultation	Section 3.4.2 Regulatory and Planning Context / 3.4.3 Scoping Opinion and Consultation The PEIR recognises in a number of places that the Environmental Statement will be informed by further survey and evaluation (Tables 3.4.1 to 3.4.5) and that more detailed information is needed to address impacts (Table 3.4.6 Comments raised in the Scoping Opinion). The County Council agrees that a draft Written Scheme of Investigation (WSI) should be agreed and provided with the ES and welcomes the assessment of the Wantsum Sea Channel and associated features will be included within the ES as referred to in Table 3.4.6. Paragraphs 3.4.3.3 to 3.4.3.6 - Consultation and Project Engagement The County Council can confirm that the County Council's Principal Archaeological Officer has been involved in the consultation process as described in these paragraphs. In addition to views from Richborough, the viewpoints from Ebbsfleet Lane have been discussed and agreed. Consultations on the ongoing survey and evaluation programme is continuing and this is welcomed by the County Council. Paragraph 3.4.4.10 – Baseline Data Gathering and Forecasting Methods This paragraph provides a summary of further data gathering exercises that will inform the ES. In addition to those listed, archaeological evaluation trenching and test pit works will also be needed to understand the buried archaeology and its significance.	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, and evaluation trenching. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England who had approved Written Schemes of Investigation and the scope of works, as well as aspects such as locations for visualisations, where required. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, and is also contained in the supporting appendices.
		Cultural heritage, Landscape and visual	3.4.7 Baseline conditions The County Council notes that the 500m study area has been used to gather Historic Environment Record (HER) data and that 427 non-designated heritage assets have been recognised and listed. The period-based summary for each reflects the range of the archaeological assets listed. It should be noted that in the supporting figure 3.4.1, the mapping	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, evaluation trenching, and a geo-archaeological assessment. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England who had approved Written Schemes of Investigation and the scope of works

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			is HER events (i.e. investigations) and not heritage assets which may provide a better impression of the archaeology resource. It is important that the wider significance of the archaeology of Thanet is recognised, which is particularly rich, and being at a gateway into Britain, is often unique in character. A number of nationally significant events have taken place within the landscape of the proposed scheme - including the arrival and departure of the Romans, the tradition of the landing of the Saxons Hengist and Horsa, and the arrival of the mission of St Augustine. The enclosure at Ebbsfleet Lane may be associated with the landings by Julius Caesar and also has later Claudian elements. In presenting the archaeological data, it will be important to ensure that the findings are properly modelled, with known features within the Order limits set out clearly against topography. This will allow for impacts to be considered in detail. The geophysics, results of previous investigation, aerial photography and LiDAR should help to readily facilitate this.		where required. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, as well as supporting appendices, with data mapped in appropriate ways to show the distribution of known heritage assets. This has also been used to assess the archaeological potential of the area.
		Cultural heritage, Onshore mitigation	3.4.8 Mitigation – Control and Management Measures The County Council supports the control and management measures that have been outlined in paragraph 3.4.8.3. The undertaking of thorough survey and evaluation to inform the ES should help to reduce the potential for unexpected discoveries. 3.4.9 Preliminary Assessment of Effects It will be important to consider the context of findspots, such as the coins, in relation with other remains and what their distribution suggests may be present. This can provide a useful contribution to the over model of the archaeology. The preliminary assessment of the grouped archaeological assets is noted for which the further survey and evaluation will review and set out in more detail.	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, evaluation trenching, and a geo-archaeological assessment. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England who had approved Written Schemes of Investigation and the scope of works where required. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, with information (such as findspots, etc) used to assess both the archaeological potential and as well as impacts.
		Cultural heritage, Construction - general	Table 3.4.12 - Preliminary assessment of direct physical impacts on non-designated assets straddling the A256 during construction. The table considers direct physical impacts on the archaeology straddling the A256. This is a highly complex multi-period settlement site which extends some considerable distance east and west of the A256. Its full significance is not understood from the road investigations which represented a section through the wider site. The geophysical survey works, in particular, are helping to define the extent of the site. In its late Iron Age and Roman phases, the location related to the arrival of the Romans, the establishment of the enclosure and the establishment of the roman port of entry at Richborough - these will be particularly important in considering significance. The scheme flexibility will need to limit impacts on this group of assets. The County Council would suggest their sensitivity is greater than medium and if they cannot be avoided, then significant.	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, evaluation trenching. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England who had approved Written Schemes of Investigation and the scope of works where required. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and supporting appendices, and has also been used to inform design as well as when assigning value/significance.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Table 3.4.13 - Preliminary assessment of direct physical impacts during construction on non-designated assets near Ebbsfleet Farm. The County Council agrees with the assessment as currently understood.		
		Cultural heritage	Table 3.4.14, Preliminary assessment of direct physical impacts during construction on non-designated (possible Roman port) near Ebbsfleet Farm It is not clear what is covered by this table. If this is the enclosure site which incorporates Ebbsfleet Farm and Wood, and the potential for an area of waterside activity (potentially associated with the Roman landings or as a port), then the significance would be very high and potentially of national importance. The scheme limits should enable flexibility to ensure much of the core and the enclosure itself is avoided. However, the marshland edge may be a focus of the Roman waterside activity and be vulnerable. Further survey and evaluation will need to establish the archaeological potential and significance of that area. The County Council agrees that the effects are likely to be significant.	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, and evaluation trenching. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, and has been used to attempt to define areas of the Ebbsfleet Land complex. The results of the geophysical survey and trenching have also been used to inform design, with areas of significant remains (such as a concentration of Bronze Age barrows) avoided. The large enclosure at the southern end of the Ebbsfleet Peninsula also now falls outside of the Order Limits.
		Cultural heritage, Construction - general	Table 3.4.15 - Preliminary assessment of direct physical impacts during construction on non-designated assets at Weatherlees Hill The extent of the archaeology at Weatherlees Hill and how it may have survived is not fully understood. Burials have been found and removed but the activity on the hill and its surroundings may still survive, and if associated with the Roman archaeology at Ebbsfleet, which seems likely, then could be of high sensitivity	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, and evaluation trenching. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and supporting appendices. The data has also been used to attempt to define areas of the Ebbsfleet Land complex as well as Weatherlees Hill, while the Draft Order Limits have been reduced in this area, therefore, reducing the potential for physical impacts.
		Construction – general, Cultural heritage, Landscape and visual	Table 3.4.16, Preliminary assessment of direct physical impacts during construction on non-designated cropmarks The low sensitivity outlined is based on assumption that may be of local significance. Appearance on aerial photographs depends on site conditions and not necessarily that they have been eroded away. The cropmarks should be considered in conjunction with other features found during the surveys and further detailed assessment. Table 3.4.17, Preliminary assessment of direct physical impacts during construction on the non-designated site of Richborough Port and sidings	N	National Grid notes your comment. All assets that fell within the Order Limits were re-assessed based on any updated information gained through works such as geophysical survey and evaluation trenching. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** with the heritage value/significance assigned based on the results of the various surveys and documentary research, and the level of impacts based on the Proposed Project

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The County Council notes that the significance of Richborough Port in WW1 is high, but the remains in this area may be more limited in their significance and of local importance as described.		design as outlined within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Cultural heritage, Construction – general, Onshore mitigation	Table 3.4.18 - Preliminary assessment of direct physical impacts during construction on non-designated ditches and banks in Minster Marshes / Table 3.4.19 - Preliminary assessment of direct physical impacts during construction on non-designated sea defences possibly dating to the medieval period The drainage ditches and banks noted are a representation of the process of 'inning', reclamation of salt marsh for agriculture that was initiated by the religious houses at Canterbury and principal landowners in the area during medieval times. Features such as the Boarded Groyne and the Abbots Wall are significant heritage assets of medieval date that contribute to the regionally significant landscape of the Wantsum Sea Channel. Careful mapping and avoidance should limit effects.	N	National Grid notes your comment. All assets that fell within the Order Limits were re-assessed based on any updated information gained through works such as geophysical survey and evaluation trenching. The Order Limits have also been refined to reduce impacts. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**, as well as supporting appendices. Where possible, works have been designed to avoid assets/assets have been removed from the Order Limits. Impacts have been assessed where assets cannot be avoided, and mitigation is being developed with stakeholders with proposed mitigation provided in **Application Document 7.5.4.2 Outline Onshore Overarching Written Scheme of Investigation (OWSI)**. .
		Cultural heritage, Construction – general	Table 3.4.20, Preliminary assessment of direct physical impacts during construction on a non-designated possible Second World War stop-line It should be noted that anti-invasion defences on Pegwell Bay have been considered of national significance and listed. A Walkover survey should be carried out to establish if any remains of the stop line are extant and vulnerable to impacts. Tables 3.4.21, Preliminary assessment of direct physical impacts during construction on a number of non-designated haystack stances / Table 3.4.22, Preliminary assessment of direct physical impacts during construction on a possible non designated bomb crater The County Council notes the information set out in these tables.	N	National Grid acknowledges this feedback. All assets that fell within the Order Limits were re-assessed based on updated information gained through works such as walkover surveys, geophysical survey and evaluation trenching. The Order Limits have also been refined to reduce impacts, while sections of work will be installed using trenchless construction solutions to reduce impacts. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
		Cultural heritage, Geology and hydrogeology, Construction - general	Table 3.4.23 - Preliminary assessment of direct physical impacts during construction on the former Wantsum Channel It is noted by the County Council that impacts may include the foundation arrangements for the sub-station and converter station. Direct physical impacts from the foundations on deposits within the former sea channel and impacts on the hydrology and hence preservation of nearby deposits. The County Council agree this can be reviewed in light of green infrastructure works. In respect of paragraph 3.4.9.11 and the tables referred to above, these are noted as tables selected on presently known archaeology. There is potential for a substantial greater amount of archaeology to be present in the study area and the further assessment, survey and evaluation works	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, evaluation trenching, and a geo-archaeological assessment. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England who had approved Written Schemes of Investigation and the scope of works where required. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and supporting appendices. The archaeological potential of the Wantsum Channel has been assessed based on works including the evaluation trenching and the geo-archaeological assessment.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			will provide additional evidence. The unrecorded archaeology may include remains of national importance.		**Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching.
		Cultural heritage, Landscape and visual, Converter station location	Table 3.4.24 - Preliminary assessment of impacts on the setting of Richborough Castle The County Council notes that the assessment includes the relationship of the view from Richborough to the enclosure site and possible port at Ebbsfleet. Consideration is also needed of the view from the enclosure which is likely to have more immediate views of the convertor station.	N	A full assessment of the potential for impacts on setting is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**. This includes an assessment of both physical impacts, and the impacts on the setting of the Ebbsfleet Lane enclosures.
		Design, Geology and hydrogeology, Onshore mitigation	**County Council Conclusion** To conclude, in respect of heritage conservation matters, the County Council considers that careful design can help to avoid impact on archaeological assets. Further work is required, including a geophysical survey plus the LiDAR, aerial photography, walk over survey, green infrastructure monitoring and evaluation trenching to inform the baseline and mitigation. The setting of the Ebbsfleet site also needs to be considered alongside the impact on the Historic landscape of the Wantsum Sea Channel.	N	Since submission of the PEIR, data collection has continued including a review of aerial photography and LiDAR data, geophysical survey, evaluation trenching, and geo-archaeological assessment. This has been undertaken through consultation with the Kent County Council's Principal Archaeological Officer and Historic England who had approved Written Schemes of Investigation and the scope of works where required. **Application Document 6.3.2.3.F ES Appendix 2.3.F Phase 1 Archaeological Trial Trenching Report (Draft)** contains further information on the trenching. This data has been used to produce the baseline and impact assessment and is included in **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage** and supporting appendices, with information used to assess both the archaeological potential and as well as impacts (both physical and on the setting of assets).
		Terrestrial ecology, Consultation, Onshore mitigation	Biodiversity The County Council notes that in consideration of biodiversity matters, the Preliminary Environmental Information Report states that "Survey work is ongoing or has yet to commence for most receptors." The County Council would welcome engagement once the survey work is complete, and the outcomes are understood. However, in addition to the proposed survey work, the County Council would also advise that National Grid reviews the survey results from the Richborough Connection Project and the NEMO link. Both projects would have made recommendations for ecological mitigation/enhancements and a review of the surveys/reports would help them demonstrate if proposed mitigation is likely to be successful. The proposed development will be adjacent or within the Special Protection Area / Ramsar and Site of Special Scientific Interest (SSSI). Therefore, there is a need to ensure that any mitigation or compensation proposed is acceptable and achievable.	N	National Grid has been meeting with Kent County Council during 2024 to discuss ecological matters and is sharing reports as they emerge. This includes measures to avoid significant effects on nearby SSSIs or SACs/SPAs through noise disturbance, loss of functionally linked habitat, direct land take and other issues. Reference has been made to ecological reports for Nemo Link and Richborough Connection. However, the data informing those assessments is quite old and in the case of Nemo Link the fact that the Proposed Project will be making landfall using trenchless methods limits the relevance of that work since Nemo Link made landfall by open cut methods.
		Terrestrial ecology, Community benefits /	County Parks The County Council notes that material published as part of this Statutory Consultation indicates that the project does not impact the County Park – with the proposed development outside of the boundary of the County	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		enhancements, Consultation	Park. The County Council would welcome engagement with National Grid regarding opportunities for biodiversity and community projects to create a positive legacy for the project.		However, community benefit is separate to compensation and mitigation. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
		Walking, cycling and horse-riders	Context: See Recreational Access Map The proposed project directly affects several paths, which intersect the project area, which also has knock-on effects to the wider path network. The Sutrans Regional Route 15 (The Viking Coastal Trail) passes around the Thanet peninsula before continuing down the coast towards Sandwich. There are two long distance promoted routes in the area: The Saxon Shore Way (running along the southern bank of the river Stour) and the King Charles III England Coast Path National Trail. The Pegwell Bay Country Park site is also a key greenspace attraction located immediately to the south of the proposed cable landfall. The section of the KCIIIECP in this area also coincides with a key promoted route from Ramsgate to Pegwell Bay country park, encouraging the local populous to be become more active and access nearby greenspace without a car journey. There is a people counter located on this section of path and the chart, below, shows that this has consistently recorded high use over the past seven and a half years:	N	In **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation, and Tourism**, the baseline conditions reports existing PRoW network and recreational routes within the study area. The study area for PRoW and recreational routes is within, and up to 500 m radius from the Kent Onshore Boundary as 500 m is the distance threshold beyond which it is considered that people are likely to be deterred from making trips to an extent that they would change their habits, based on the Design Manuel for Roads and Bridges (DMRB) LA 112. The King Charles III Coastal Path crosses the Kent Onshore Scheme draft Order Limits as it passes along Sandwich Road and is therefore identified as a sensitive receptor.
		Walking, cycling and horse-riders	Pegwell Bay: People Counts Note: 2016 shows lower figures than subsequent year, as the counter was installed half-way through the year. The lockdowns through 2020, most likely account for the elevated use.	N	National Grid acknowledges this feedback.
		Walking, cycling and horse-riders	The PRoW service compliments use of people counters with the Strava Metro platform. This is a free tool offered to Local Authority's, to aid with Active Travel planning, through which Strava data has been made available for analysis. Currently, publishing graphics and extracts from the platform is closely controlled and so, at this point, no graphics can be included here. However, the interactive heat maps on the Strava platform show high use of the routes in and around the Sealink project area. The Pegwell Bay Country Park site also shows particularly high use. It is noted that, as it is an app, Strava will have a self-selecting demographic and, therefore, the figures recorded on it will only be reflective of a small portion of the actual overall use of a route, and only by part of society. Nonetheless, it is a good indicator, and it is also likely that the use of a route will be higher. This anecdotal assertion is supported by analysis where actual recorded counts, from people	N	National Grid acknowledges this feedback.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			counters, have been compared to Strava data. The PRoW service has found that the Strava use accounts for a median of between 4% to 9% of actual recorded use.		
			Socio-economic value of the path network The Outdoor Recreation Valuation (ORVal) tool was developed by the University of Exeter to calculate the health and wellbeing benefits of green and blue space, as well as path networks. The tool is endorsed by HM Treasury and DEFRA, as an accurate estimate of the welfare benefits delivered to local communities by recreational access in an area. The table, below, shows the estimated benefit of some of the nearby path networks which intersect the indicative project site. The tool can provide further demographic segmentation to show how much each social group will benefit from these networks.	N	National Grid acknowledges this feedback. National Grid is confident that its desk-based analysis combined with stakeholder engagement is sufficiently robust and comprehensive as an assessment of the health and wellbeing benefits of green and blue space and path networks. National Grid has not used the described tools because this tool is helpful if a study is undertaken quantifying the benefits associated with green and blue space. As an EIA has been undertaken, National Grid has applied the recommended guidance from the Institute of Environmental Management and Assessment.

Description	Network Length (m)	Estimated Visits per annum	Walfare Values (£) per annum
Small network of routes leading out of Minster to the east.	1810.50	9,732	£23,434.38
Small network east of Minster (between Richborough Way and railway line)	2136.58	16,701	£58,363.89
More extensive network of routes to the north of the river Stour and to the west of Minster	15422.10	79,221	£262,912.66
More extensive network of routes south of the river Stour	42634.83	151,084	£558,725.42
Pegwell Bay Country Park: site immediately south of the cable landfall, which crosses a small section of the park.	N/A	74,372	£273,382.40

Table 1.11 London Borough of Bexley

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case and consultation	I write to you following receipt of your letter dated 19th October 2023 which invites the London Borough of Bexley to comment on a Preliminary Environmental Information Report (PIER) relating to the above referenced Nationally Significant Infrastructure Planning application. Having reviewed the documentation published, due to the location of the development the Council have no comment to make on this proposal.	N	These comments have been noted by National Grid.

Table 1.12 Medway Council

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case and consultation	I refer to your letter of consultation regarding the above and would inform you that the Council RAISES NO OBJECTION to it. 1 Medway Council raises no objection following the statutory consultation under section 48 of the Planning Act 2008 (as amended) regulation 4 the Infrastructure Planning (Applications: Prescribed Forms and Procedures) Regulations 2009 -Statutory Consultation for the Proposed Sea Link Project. Your attention is drawn to the following informative(s) :- 1 This response is based on the email correspondence, section 48 notice, sea link feedback form and sea link community newsletter received 24 October 2023.	N	National Grid thanks the Council for its feedback and notes the comments.

Table 1.13 Minster Parish Council

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Onshore mitigation, socio-economic, recreation and tourism	Please see attached the response from Minster Parish Council following their attendance at the consultation event and subsequent meeting. The administrative area of Thanet District is facing an unprecedented level of housing growth, with significant strategic housing allocations being delivered on agricultural land. The Parish of Minster is not immune from this, with an allocation of 250 houses now under process alongside a smaller allocation of 35 units yet to commence. The effects and consequence of the housing growth are such that it places immense pressures on the communities in which it is situated and strengthens the importance of maintaining and enhancing the remaining environment.	N	National Grid thanks the Council for its comments. Please refer to the responses provided below.
		Onshore environmental impact, terrestrial ecology, landfall location	MPC considers that Minster Marshes is one the most environmentally sensitive locations remaining in the Thanet area. Consequently, the value of this location cannot and should not be underestimated given the ecology, landscape, biodiversity and wildlife situated in the locality	N	These comments have been noted by National Grid. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. During the design of the Proposed Project these surveys have fed into design amendments and extensive discussions with Natural England, the Environment Agency, Thanet Council, Dover Council, Kent Council, the RSPB and Kent Wildlife Trust among others. Detailed assessment and mitigation measures has been developed and is presented within **Application Document 6.2.3.3 Part 3 Kent Chapter 3 Ecology and Biodiversity**.
		Onshore environmental impact, alternative solutions, needs case	The Sea Link proposals have generated a groundswell of objection relating to environmental impact on Minster Marshes which MPC recognises. MPC therefore OBJECTS to the proposals. In recognising the need for strategic electricity network enhancement, it is felt that a sequential analysis of all other land based options needs to be undertaken with cost benefits being balanced against environmental impacts. The site at Minster Marshes should not be progressed simply because it appears to be the most effective location through cost and operational expediency.	N	Environmental impacts were a key part of the consideration of the route and siting work that has been undertaken for the Proposed Project. Further detail can be found in **Application Document 8.2 Option Selection and Design Evolution Report (October 2023), Application Document 8.3 Strategic Options Report (October 2023) and Application Document 7.2 Strategic Options Back Check Report**. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** also demonstrates the alternative design options considered and the environmental considerations that were factored into the decision-making process.
		Water environment, needs case	It is also noted that Minster Marshes are situated in an area that is subject to significant future flooding risk associated with Climate change indicators illustrating that the locality will be under water by 2050. The recent National Audit Office Report issued in November 2023 highlighted that the government acknowledges that building new flood defences and maintaining existing ones is no longer enough and that a wider range of interventions is now needed to build resilience against increasing	N	**Application Document 6.8 Flood Risk Assessment** assesses future flood risks to the Proposed Project over its operational lifetime. Best practice guidance, published by the Environment Agency, has been applied with regard to increases in future river flows, sea level rise and rainfall intensities, and this has informed the design of the Proposed Project, which embeds future flood resilience measures.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			flood risk. MPC suggest that one such intervention is not to build in locations subject to future flood risk such as Minster Marshes; water and electricity are not good bedfellows…..		
		Land rights and CPO, onshore mitigation	MPC understands that the DCO process, if agreed, includes a Compulsory Purchase regime which will secure the land and rights needed to implement the development. MPC is concerned that the possible loss of agricultural land will inevitably impact on the viability of the remaining agricultural holding. Consequently, MPC wish to be assured that full compensatory arrangements would be enacted for any party affected by the proposals.	N	Where the Proposed Project intends to build permanent above ground infrastructure, National Grid will seek to acquire the land by way of a voluntary agreement at market value accompanied by the appropriate sums of compensation relevant to the normal heads of claim. This is both a Company preference and a requirement of the CPO process. Where the infrastructure is buried cable or overhead line the land will be returned to agricultural use alongside a payment for the depreciation in the value of the land and again any payments for loss defined by the compensation code.
		Construction, onshore mitigation, walking, cycling and horse riders	In the event that Sea Link proceeds on Minster Marshes, MPC also wish to see a fully detailed scheme of operations outlining how the construction, operation and subsequent maintenance of the facility will be conducted. It is inevitable that there will be a range of disruptions to Minster and on Minster MarshParticularly. Significant assurance will be needed to mitigate the impacts of the project and to protect the locality while works are being carried out.	N	A full construction methodology is provided within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The works directly affecting Minster will be the routing of construction traffic through Minster to access Marsh Farm Road. This has been limited to a daily peak of <10 HGVs and <20 LGVs/Cars/Vans and is only to access the existing overhead line towers to undertake temporary diversion works. The diversion works accesses from Marsh Farm Road will include the construction of a temporary overhead line structure and protection scaffolds, the diversion of conductors onto the temporary structure, the return of conductors to the original tower with the inclusion of arching horns on the existing tower's insulators, removal of the temporary tower and scaffolds. The works in this area will be limited in nature with works being undertaken in two phases for the installation and then later removal of the temporary structures, each phase is likely to take a couple of months to complete. During the operational phase, the overhead line will continue to be accessed in the same manner as is currently undertaken, with no increased impacts. Construction works on Minster Marshes would be as detailed within the ES, with the use of a new permanent access off the A256 and proposed upgrade of an existing agricultural level crossing and temporary bridge crossing of the River Stour proposed to limit construction access from the local road network. Construction works on Minster Marsh are expected to take 4-5 years and include the construction of temporary compounds and access roads, water course crossings, raised platforms for the Converter and Substation, foundation construction, drainage installation including attenuation and outfalls to local water courses, the construction of new buildings and electrical infrastructure, new overhead line towers and conductors. During the operational phase the site would be staffed 24 hours with minimum staffing levels, routine maintenance activities would be undertaken on all assets.
			MPC considers that, in offsetting the harm to the locality, a Community Infrastructure Fund should be provided by the applicant. This should be provided for the benefit of MPC and used for projects that provide compensatory environmental benefit in the parish. One such measure could relate to the provision and retention of a footbridge across the River Stour for	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, they operate a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			walkers linking Richborough to Minster Marshes and through to Minster and Thanet generally.		this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst they await clarity on the government's position, they are working to understand local and regional aspirations and priorities in relation to community benefits. They welcome the suggestions for delivering community benefits and as the project progresses, they will work with stakeholders and local communities to further inform this.
		Consultation	In conclusion, MPC, requests that our comments are recorded as a formal response to the current consultation and are formally recorded in the Consultation Report.	N	These comments have been noted by National Grid. The feedback provided and the responses provided are captured within this document which is part of the consultation report submitted with the DCO application.

Table 1.14 Saxmundham Town Council

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Needs case	Summary Saxmundham Town Council is opposed to the development of Sealink as presented by National Grid Electricity Transmission (NGET) in this statutory consultation.	N	National Grid acknowledges the Town Council's objections to the proposals.
		Landscape and visual	Saxmundham is a historic market town and parish, whose current population is 5,000, having grown significantly in recent decades. Unlike our close neighbour Leiston, with its proud engineering heritage, Saxmundham is a service centre for the surrounding rural district and has never had a significant industrial base nor character.	N	The comment is acknowledged. The landscape and visual baseline that has informed the assessment of effects arising from the Suffolk Onshore Scheme can be found within **Application Document 6.3.2.1.B ES Appendix 2.1.B Landscape Baseline**.
		Community benefits / enhancements, Socio-economic. recreation and tourism, Landscape and visual	If the current Sealink proposals proceed, the whole character and landscape of our town will change forever. We risk facing a giant set of industrial structures that will overshadow and dominate our town. But whereas in previous industrial revolutions, new industry has brought jobs and prosperity to the towns affected, we know that this will not be the case here. We will have all the impacts of random, unplanned industrialisation but without any of the economic benefits accruing to us. Our town faces a fundamental, externally imposed overturning of its character and heritage.	N	The effects on the landscape character and visual receptors as a result of the Suffolk Onshore Scheme is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to residual significant adverse effects primarily due to the scale of the infrastructure proposed. The design of the Suffolk Onshore Scheme has involved an iterative design process focused on minimising effects, including on landscape character and visual amenity. The indicative landscape strategy for the Suffolk Onshore Scheme is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**, which illustrates the proposed mitigation measures such as woodland planting to reinstate historic woodland found on the site and other measures including hedgerow and hedgerow tree planting.
		Needs case, Alternative solutions, Onshore mitigation	We understand the need to reinforce the country's electricity transmission network, but National Grid has not clearly demonstrated that the industrialisation of the rural countryside is necessary to achieve this. If it is shown, objectively, and after proper analysis of all alternative options, that locating Sealink in East Suffolk is in the national interest, then Saxmundham will surely play its part. Until this has been evidenced, then it is our duty to test and vigorously oppose the proposals as currently put forward. And, at the very least, to ensure that compensation and mitigation are commensurate with the scale of disruption and damage, both in the short and long term.	N	NPS EN-1 sets out (in bold text) at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. Further details relating to the need for the Proposed Project are contained in **Application Document 6.2.1.1 Part 1 Introduction Chapter 1 Introduction and Application Document 7.1 Planning Statement**. Please note that the ES has assessed the impact of the Proposed Project on the environment and taken measures to minimise and reduce any adverse effects. The assessments have helped inform the evolving design to ensure that the Proposed Project has had regard for sensitive environmental receptors. Further details on the assessment and proposed mitigation are contained in the relevant technical chapters of the ES. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure. Full details on how the design has evolved and the consideration of alternatives please are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Alternative solutions	The Sealink project is stated to be more about improving security and resilience in our national electricity transmission network than about 'decarbonising' the energy system to meet the UK's net zero targets. We are aware of the diversity of views as to whether this project, requiring such major disturbance in an extremely ecologically fragile as well as beautiful environment is necessary, and whether the location here (and not in a brownfield site) of onshore infrastructure is the optimal and necessary outcome in the national interest. The argument has been put forcefully by others that offshore solutions, plus landfall to brownfield sites are possible which would avoid the worst of the disadvantages for Suffolk. What is needed, on the issue of the merits of the proposal, is a rapid independent enquiry, established by the government, to assess the validity or otherwise of the alternatives and to determine a strategic and holistic way forward which meets the UK's net zero targets but is considerate to those affected by the necessary onshore infrastructure. If that does not occur, the already-prevalent sense of alienation, of having a serious disruption imposed by non-public enterprises in a non-transparent manner, will be many times magnified.	N	NPS EN-1 sets out (in bold text) at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. The Secretary of State has directed that the Proposed Project be consented via the DCO process under the Planning Act 2008. It is therefore required to follow all of the relevant procedures and processes under the Planning Act 2008. National Grid has consulted the community in accordance with the requirements of the Planning Act 2008. Notwithstanding the above NPS considerations, the Proposed Project is one of 17 projects within National Grid's Great Grid Upgrade programme. The overarching aspiration of this programme is to scale up the grid and update existing networks. This will support the transmission of more clean, secure energy from where it's generated to where it is needed it, boosting energy security, affordability and helping the nation become more self-sufficient. Furthermore, the Proposed Project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030.
		Inter-Project cumulative effects, Traffic and transport	**Cumulative Impacts** National Grid and its associated companies are not the only players looking to develop Nationally Significant Infrastructure Projects in this area, so our concern is that even three converter stations may turn out to be an underestimate of what will occur in the near future. Saxmundham is also identified in East Suffolk Council's Local Plan as a growth node, with proposals for a 'Garden Neighbourhood' of 800 new dwellings, to be located between the railway line and A12. This development is due to be rolled out over the coming decade, including a new roundabout to connect to a service station, lorry park and a new employment zone to be created on the west of the A12. We have argued, in the Local Plan process, that future growth of the town should be mainly located to the east since the proposed 'Garden Neighbourhood' development is badly connected to the town. If the converter stations are indeed located as planned, this will block the only sensible, viable location for future expansion, since siting future housing adjacent to several giant converter stations is simply not acceptable. On top of all these other development challenges, in the south and west of the town, we confront Sealink's vast scale industrialisation to the east, with access roads to be constructed to the north or south. Saxmundham will be a town under siege.	N	As part of the inter-project cumulative effects assessment, a thorough search of proposed development in the surrounding area has been carried out. This has included consideration of local authority planning portals, local plan allocations and any development consent order planning applications which fall within the cumulative zone of influence. Once the list of other proposed developments was identified a judgement based on their potential to interact with the Proposed Project has been made and assessed where appropriate. **Application Document 6.3.2.13.A ES Appendix 2.13.A Descriptions of Other Developments** contains updated information regarding other project timescales which are used in the assessment. South Saxmundham Garden Neighbourhood is on the short list of developments taken through to stage 4 of the inter-project assessment. The Order Limits are adjacent to this allocation. Further details of the inter-project cumulative assessment are contained in **Application Document 6.2.2.13 Part 2 Chapter 13 Inter-Project Cumulative Effects**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Socio-economic. recreation and tourism, Community benefits / enhancements, Intra-Project cumulative effects	**Economic Aspects** The economy of Saxmundham is based on services which serve a wide catchment area. It is not itself a tourist town but serves many of the needs of the crucial tourist sector. We consider that the industrialisation of Saxmundham's landscape, with constant roadworks and construction traffic, and the environmental and ecological impacts will lead to a grave loss of confidence by tourists themselves and businesses based on the 'visitor economy'. This will feed into Saxmundham's own local economy in a negative way. In short, from an economic perspective, the local economy of the area, and that of our town, is almost certain to take a hit in the short and longer term. And as noted already, the new industrialisation of our town will be a largely jobless one so local people will not benefit in any way from the wages that have normally accrued from new jobs in new local industries.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that there are no anticipated significant effects as a result of the Proposed Project. There is likely to be a minor beneficial impact on employment generation and local spending as a result of the construction phase of the Suffolk Onshore Scheme. Severance impacts on businesses, recreation and tourism assets are not anticipated to be significant in line with impacts on the highway network assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Inter-Project cumulative effects, Needs case	**Environmental Impacts** Other respondents will have drawn attention to the dangers to our much-loved local environment and ecology in the Suffolk coastal area from the multiple energy projects. We agree and underline that government needs to take on its responsibility to assess the overall impact of these projects on our area, weighing the perceived advantages and disadvantages in a transparent and unbiased way.	N	A full inter-project and intra-project effects assessment has been carried out for the Proposed Project. The inter-project cumulative effects assessments have assessed the combined environmental impacts resulting from other proposed developments due to come forward within the cumulative zone of influence. The full assessment is available within **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects** and **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Landscape and visual, Noise and vibration, Cultural heritage	The proposal to locate not just one converter station, but three, immediately adjacent to the eastern edge of the settlement boundary, will have profound and negative impacts on our town and its residents, whose choices to live here are, for many, based on the historic character of the town and its surrounds. The industrialisation of eastern Saxmundham will have a particularly negative impact on local people. Converter stations are huge in footprint and height, hard to screen, invasive visually, noisy and cause light pollution. The intention is to locate them within a very short distance of an existing residential area. Visually, NGET's own consultants show that they will also intrude into our protected landscape views from the south of town.	N	The cumulative assessment for effects on landscape character and visual amenity is set out within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The co-location illustrative masterplan can be found within **Application Document 7.10 Coordination Document**. Referring to the comment regarding industrialisation of eastern Saxmundham, the effects on the landscape character and visual receptors as a result of the Suffolk Onshore Scheme is set out within **Application Document 6.2.2.1 Part 2 Chapter 1 Landscape and Visual**. This includes reference to residual significant adverse effects primarily due to the scale of the infrastructure proposed. The design of the Suffolk Onshore Scheme has involved an iterative design process focused on minimising effects, including on landscape character and visual amenity. The indicative landscape strategy for the Suffolk Onshore Scheme is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk** which illustrates the proposed mitigation measures such as woodland planting to reinstate historic woodland found on the site and other measures including hedgerow and hedgerow tree planting. The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations and the assessment. Details are contained in **Application Document 6.4.2.1 Landscape and Visual** and **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. These are Viewpoint 2 (Important View

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					1a and 1b) and Viewpoint 20 (Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham.
		Converter station location, Needs case, Coordination with other projects	**If Sealink Is Consented - Mitigation and Compensation** For all the above reasons, we consider that the selection of eastern Saxmundham and Sternfield for the location of multiple converter stations is wrong, and certainly premature ahead of any overall assessment, organised by government, of the case for Sealink and related projects and the locational issues concerned if one takes a holistic, transparent approach to the issue of infrastructure to meet the needs of the Great Grid Upgrade. Sealink should not proceed until this assessment has been undertaken.	N	The Proposed Project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. Since the connecting projects are being promoted by different companies, with different project teams, covering several different geographical locations and on different timelines for delivery, it is not possible to co-ordinate simultaneous delivery of all of the network reinforcements coming forward under the Great Grid Upgrade programme. The rationale underlying the decision-making process that identified the Saxmundham converter station site as the preferred option emerged as a result of many respondents to the Non-statutory consultation expressing the view that all major energy projects currently proposed in East Suffolk should be coordinated, thus reducing the perceived spread of industrialisation and reducing impacts on the area.
		Converter station location, Design	If after consideration, eastern Saxmundham is decided upon as an appropriate location, we must insist that only one, and certainly no more than two, converter stations should be located in the vicinity.	N	National Grid acknowledges the feedback.
		Onshore mitigation, Socio-economic. recreation and tourism, Community benefits / enhancements	Moreover, it is self-evident that our town and parish will suffer from the near-jobless industrialization process which brings no local benefits. It is therefore of paramount importance that both central government as well as the developer agree on an appropriate compensation and mitigation package – both physical (improved local infrastructure), social (improved public and community services) and financial (reduced energy bills for the lifetime of the projected lifespan of the converter stations), as compensation for local loss of amenity and disruption. This package needs to be agreed with the different local authorities concerned – county, district but also town council as the very local voice of Saxmundham. In our detailed evidence below, we give many ideas for the types of mitigation that we need to achieve. But we also call on central government to play its role in planning holistically for the energy transition. Without proper leadership, transparency and equity at all levels, failure will follow.	N	Community benefit is separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, they operate a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst they await clarity on the government's position, they are working to understand local and regional aspirations and priorities in relation to community benefits. They welcome the suggestions for delivering community benefits and as the Proposed Project progresses, they will work with stakeholders and local communities to further inform this.
		Socio-economic. Recreation and tourism, Cultural heritage, Terrestrial ecology	**About Saxmundham** The parish of Saxmundham is roughly equidistant from Ipswich and Lowestoft, the two principal economic centres of East Suffolk district. It is served both by the A12 and the East Suffolk line of Greater Anglia railways. It acts as a ‘gateway’ to the Suffolk Heritage Coast, the tourist resorts of Aldeburgh and Thorpeness, and the international music venue at Snape Maltings.	N	National Grid acknowledges the comments.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The town originally grew up to the west of the River Fromus and developed in a linear form along the turnpike, which was the main road from London to Lowestoft. The town was granted a market charter in 1272, signifying its importance as a market town serving the surrounding agricultural and rural area, a function which it still fulfils. Saxmundham Conservation Area covers the historic heart of the town and includes most of the land between the River Fromus and the railway and extends north of the railway bridge. The buildings in the centre of town are mainly 16th, 17th and 18th century. With the coming of the railway, the town expanded westwards largely in the form of typical Victorian brick-built terraces. The construction of the by-pass in the 1980s led to large scale residential development between the existing town and the by-pass. More recent development has extended the town eastwards. The population of Saxmundham in 2020 was estimated by the Office of National Statistics at 4,723. The town sits in the Fromus valley below the rising land to the east. The approach from the south is spacious, it is flanked by The Layers to the west and Hurts Hall Park to the east with views across to Hurts Hall itself and St John's Church, both of which are listed grade II. Saxmundham boasts 50 listed buildings, most of which are in the town centre. The approach from the north is wooded and enclosed and opens out on arrival at the built-up area. Approaching from the east, the town is not visible until the boundary when the road dips down towards the Fromus, and there are glimpses of the roofs of the town ahead. There are no designated nature conservation sites within Saxmundham, however the parish is relatively close to the extremely sensitive Sandlings, Alde-Ore and Minsmere-Walberswick Special Protection Areas and the Suffolk and Essex Coast and Heaths National Landscape. Saxmundham is situated in an area which has several road links to areas of open countryside and the coast. However, it only has a few open green spaces in the town centre and several smaller green spaces that create an open setting within the more recently developed housing estates. Saxmundham has also recently adopted a Neighbourhood plan, which acknowledges the potential for modest and sustainable growth of the Town for housing and business whilst protecting the 'green gateways' to the Town.		
		Needs case, Coordination with other Projects, Inter-	**East Suffolk Energy Projects – General Observations** We understand the national need to expand renewable and sustainable green energy sources, and the desire to improve the	N	NPS EN-1 sets out (in bold text) at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Project cumulative effects	interconnections between the UK and Europe, however, we are concerned that the determination of connection points and the coordination of onshore infrastructure is not being determined strategically and holistically by the government especially when so large a proportion of our electricity requirements, whether through offshore wind generation or importation through interconnectors, is expected to make landfall on the east coast and in East Suffolk in particular. The government has recognised that the lack of transmission capacity is a major contributor to delays in the development of offshore wind generation projects. National Grid Energy Transmission (NGET) is under increasing pressure to increase network capacity more quickly to facilitate connection of generation in meeting the UK target of up to 50GW of offshore wind by 2030. However, given the uncertainty of the volume and speed of development of generation from all the existing proposed projects in the East Anglia area, there remains significant uncertainty with regard to the need and timing for this proposed reinforcement. The impact of new energy infrastructure and construction on the Suffolk coast for transport, tourism, the local environmental, housing and social and community facilities has already been put into sharp focus by Sizewell C proposals – so consideration needs to be given to cumulative impact. Delaying the decision to commit to an expansion of the East Anglia network whilst additional reviews are undertaken would ensure the risk of unnecessary investment is reduced.3.		the specific contribution of an individual project to satisfying the need established in the NPS. Consistent with the Government's Net Zero target, there has been, and continues to be, growth in the volume of renewable and zero carbon generation that is seeking to connect to the electricity transmission system in the East Anglia and South East regions. UK Government policy clearly sets out the critical requirement for significant reinforcement of the transmission system to facilitate the connection of renewable energy sources and to transport electricity to where it is used. In particular, the British Energy Security Strategy sets targets for the connection of up to 50 GW of offshore wind by 2030 as a key part of a strategy for secure, clean and affordable British energy for the long term. Without reinforcement, the capacity of the existing network in East Anglia and the South East is insufficient to accommodate the connection of proposed new power sources connecting in the area. National Grid has therefore been assessing the reinforcement options available for providing the additional capability required.
		Alternative solutions, Climate change	Given the government's commitment to achieving net zero by 2050, the future growth of offshore wind and electricity interconnectors will require innovative and potential offshore solutions to minimise the onshore impact of the associated infrastructure. One possible solution is for offshore wind and interconnectors to be connected via a modular offshore grid using offshore platforms and artificial islands connected to onshore brownfield sites. We note that East Suffolk Council has been urging investigation of alternative options to Sealink and has commented on the regrettable lack of holistic planning regarding energy infrastructure and the sensitivity and value of the East Suffolk environment. We support several of the key stakeholders including the Rt Hon Therese Coffey MP in calling for: a government review of all onshore energy connections along the Suffolk coast, a commitment to carry out a comparative study, including already suggested brownfield sites such as Bradwell, Tilbury and the Isle of Grain, and	N	Alternative options do not represent feasible solutions to the network reinforcement that the Proposed Project is seeking to provide within the agreed timescales of National Grid's statutory obligations. National Grid will continue to monitor Government's response to this ongoing debate, but can clarify that even with the provision of offshore converter stations and substation(s), onshore infrastructure would still be needed to transmit to the onshore national electricity network. In developing the Proposed Project National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Where there is a need for mitigation measures to ensure the conservation of sensitive ecological receptors the EIA process will identify opportunities to enhance biodiversity interests and these will be reported in the Planning Statement submitted with the application for development consent and a biodiversity net gain assessment. The potential interaction between the Suffolk Onshore Scheme and human health will also be assessed in the EIA. While the PEIR concluded that effects would be not significant in relation to human health and wellbeing, a Construction Code of Practice will help control and manage aspects of the Proposed Project that could affect health and wellbeing.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			a proper assessment of the environmental impact of these connections before proceeding any further. The government's emerging National Policy Statements make clear that transmission operators are expected to be able to demonstrate how the optimum onshore connection locations have been identified, and how environmental, community and other impacts have been considered but this cannot be achieved without a full assessment of brownfield alternatives. There is still time for the National Grid Electricity Systems Operator and the Department of Energy Security and Net Zero to reevaluate the merits of an alternative offshore strategy that would transmit power direct to brownfield sites much closer to the larger scale populations that these energy projects will serve. However, this review needs to be undertaken swiftly with a moratorium imposed on existing, and any future approvals, for grid connectors and consequential landfall and onshore infrastructure to ensure it is not too late to have any impact on projects that are already planned for East Suffolk.		
		Coordination with other projects, Alternative solutions, Inter-Project cumulative effects	We are concerned that the process for determining the connection point of the three emerging energy projects in East Suffolk - Sealink, Lion Link and Nautilus - is within the overarching responsibility of National Grid, a single commercial entity, offering no means of reasonable challenge by individuals, groups, communities, and local authorities. As each project is brought forward, it is assigned a connection point individually therefore no holistic assessment of impacts can be undertaken. Should the Nautilus, Five Estuaries and North Falls projects be granted a combined connection at the Isle of Grain, potentially from an offshore modular grid, the coordination between these projects and Sealink and Lion Link should be reviewed once more to ensure an appropriate coordination solution is achieved. Under no circumstances should these projects be allowed to progress individually to inflict sequential and geographically separate solutions for their connections into the Sizewell to Bramford overhead power lines, whether or not the Scottish Power Renewables substation at Friston is finally approved following the decision of two Judicial Reviews. The lack of forward planning for the associated onshore infrastructure will result in unnecessary and repeated levels of disruption for the local population, harm to its tourist industry, and considerable damage to the coast and countryside to the detriment of the general amenity of this area for many years.	N	The Proposed Project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. A single solution for each of these projects is not considered feasible, due to the varying nature of the underlying needs cases. Since the connecting projects are being promoted by different companies, with different project teams, covering several different geographical locations and on different timelines for delivery, it is not possible to co-ordinate simultaneous delivery. National Grid is coordinating with developers of other large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with other projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is considered in the ES within

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					Application Document 6.2.13 Part 2 Suffolk Chapter 13 Inter-Project Cumulative Effects. Appropriate mitigation is identified where necessary.
		Needs case	**Sealink Proposals – General Observations** Saxmundham Town Council is opposed to the development of Sealink as presently proposed. Growth in offshore wind generation, along with potential new interconnectors to Europe, and nuclear generation development in East Suffolk, will make a significant contribution to reaching the government's net zero targets. The generation in this area could potentially meet some 25%-50% of UK demand at any given time depending on the prevailing wind conditions. Peak demand in the East Anglia area is circa 1.5GW and is anticipated to grow to circa 2GW by 2035.5 Sizewell B nuclear power station will continue to generate 1.2GW, Sizewell C will generate 3.3GW, the cumulative offshore windfarms will generate 1.7GW, and the two interconnectors will transfer 3.1GW, which is a potential total of 9.3GW transmitted in East Suffolk alone. The connection to the Sizewell to Bramford overhead power lines, provided by the proposed substation at Friston, will have the capacity to transmit in the region of 6GW to the network. It is therefore clear that the Sealink project is only necessary to take excess electricity from Suffolk to Kent and brings no benefits to the immediate area.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. The need case for the Proposed Project has identified that connection is required within the Sizewell area to address electricity transmission faults that cause overloads specific to that area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide.
		Design	The proposed Sealink landfall locations, cable corridors and convertor station site are based upon the assumption that the substation north of Friston will be approved and constructed. The Development Consent Orders granted to Scottish Power Renewables to build the substation for the EA1N and EA2 windfarms are still subject to legal challenge by means of two Judicial Reviews. In our opinion, the greenfield site at Friston is entirely unsuitable for a substation on the scale proposed by Scottish Power Renewables and we note that it will require expansion to accommodate the cable sealing ends and additional pylons for the three converter stations. Given that there is no existing grid connection at Friston, which is an enabling project, it is wrong for multiple projects to seek connection at this location. We would like to see a review take place including an exploration of alternatives. Our comments are premised on this starting point. However, should the infrastructure development be consented along the lines of current proposals, we would put forward the case for mitigations, some of which we cover in this response.	N	The East Anglia ONE North and East Anglian TWO windfarms have extant DCOs, which give established connection agreements at Friston, along with consented schemes to build the new substation at Friston. The Proposed Project DCO includes powers to build a substation at Friston and is therefore not reliant on the outcome of legal challenges to the East Anglia ONE North and TWO windfarms. In developing the Proposed Project, National Grid assessed a variety of other options, including other potential areas for new infrastructure. However, brownfield sites within the areas of search were considered too small to accommodate the required infrastructure, while the options of offshore infrastructure does not represent a feasible solution with some of the required technology not being commercially available, especially the requirement for HVDC circuit breakers. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.
		Consultation	**Community Engagement** Local authorities are key to representing community interests and helping negotiate community benefits with infrastructure developers. Our ability to do so is not only dependant on strategic negotiation, but also on whether developers are willing to engage at an early and formative stage of the process. Throughout the consultation process, NGET held a series of face-to-face events including public information exhibitions, 'ask the expert' sessions, and webinars. They have also provided paper copies of the project proposal documents by post to all local households, at deposit points, on request, and by electronic download from the project website. However, feedback from our community has shown that people have found it challenging to gain a meaningful understanding of the Sealink proposals. This has curtailed their ability to properly engage with the local authorities who represent them and, in turn, enable us to influence the strategic planning of the infrastructure to avoid potential impacts and, where impacts cannot be avoided, to ensure they are reduced, mitigated or compensated against. A rushed consultation with responses to be submitted pre-Christmas is also not appropriate; this consultation needs more time. Feedback from the public information exhibitions included observations that NGET personnel gave conflicting answers to questions posed, the maps were shaded in such a way as to obliterate any detail of the proximity of the nearby residential areas to the converter station site, the trees on the 3D model were inaccurately shown as higher than the converter station and, again, the proximity of the residential area was not included, and the attenuation pond at the converter station site assumed that water would run uphill.	N	Statutory consultation was undertaken in accordance with the SoCC, which itself was subject to extensive consultation with the host Local Planning Authorities and prepared in accordance with all applicable Planning Act 2008 statutory requirements and the Infrastructure Planning (EIA) Regulations 2017 as well as other relevant guidance. The material published for Statutory consultation was based on the information available at that time and was of sufficient detail to enable informed feedback to be provided on the emerging scheme proposals, while National Grid's approach to public consultation accommodated 'Ask the Expert' sessions in addition to face-to-face consultation events, allowing small groups or individuals to speak to members of the project team about specific issues and seek clarification. National Grid had regard to all such feedback as part of the continuing development of the Proposed Project to the time of submitting the DCO application. All views expressed in response to the Statutory consultation (and indeed all other consultation and engagement activities undertaken by National Grid as part of the development of the Proposed Project) have been considered and taken into account as set out in **Application Document 5.1 Consultation Report**. There will also be further opportunities for consultees, stakeholders and other members of the public to make representations as part of the DCO examination.
		Consultation, DCO process, Coordination with other Projects	The complexity of the Sealink project and volume of information means communities and local authorities also face challenges in resourcing and keeping up with the consenting process, particularly during the examination stage. With reference to the Sealink and Lion Link consultation deadlines, the Planning Inspectorate (PINS), at a meeting held on 20 June 2022, advised 'The Inspectorate responded that considering the amount of consultation in the East Anglia region, the application should be aware of what procedures can be taken forward in a combined matter to minimise resourcing pressures.' Should the three projects proceed, we request that NGET and NGV combine consultations and the DCO examination process as the onshore	N	While National Grid recognises the Town Council's concerns, all consultation has been undertaken in accordance with the SoCC, with regular updates issued to the community and interested parties throughout the pre-application stages of the Proposed Project. The Proposed Project and LionLink are separate projects, being promoted by different companies, with different project teams and on different timelines. Notwithstanding the potential to give rise to conflicting messaging around each project's needs case, it is not considered feasible or beneficial to co-ordinate simultaneous community engagement.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			impacts for all three projects are similar and may become identical.		
		Consultation, DCO process, Onshore mitigation	We welcome the government reforms to incentivise early, constructive engagement with infrastructure developers to address impacts early to reduce the burden on local authorities and communities at the later stages of the consenting process. We also support the government's intentions to increase funding to local authorities to provide tangible improvements to securing benefits to improve project outcomes and to build capability and capacity across authorities, share learning, and encourage more efficient and effective local engagement with NSIPs and infrastructure developers. We ask that this funding is extended to Town and Parish Councils affected by Nationally Significant Infrastructure Projects. Furthermore, we approve the government's recent reforms to expect infrastructure developers to demonstrate how the views of affected communities have been considered and what measures have been taken as a result as part of the Development Consent Order application.	N	National Grid acknowledges the comments.
		Traffic and transport, Onshore Mitigation	**Traffic Impacts** **General Observations** We are concerned about the lack of clarification and lack of data at this statutory consultation stage which makes it difficult to comment on the likely traffic impacts in the town and parish. We exhort NGET to undertake a full Traffic Impact Survey and Assessment, to be included at the Environmental Statement (ES) stage and agree necessary mitigation prior to the submission of the application for a Development Consent Order.	N	The baseline traffic data within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** is based on recent traffic surveys which were carried out in accordance with the agreed survey methodology as reviewed and agreed with Suffolk County Council. The assessment work within the ES Traffic and Transport chapter has been based on these recent traffic surveys, as well as full collision data obtained from Suffolk County Council. Mitigation has been identified where necessary, as set out within the supporting management plans.
		Traffic and transport, Inter-Project cumulative effects	There are likely to be impacts to traffic volumes and highway safety due to the cumulative effects of numerous major infrastructure projects in the area and the development of the Saxmundham Garden Neighbourhood which NGET, whilst acknowledging existence of, have not considered in their modelling of assumed increases in traffic flows. Whilst agreeing to review the Garden Neighbourhood as part of the ES, NGET noted that this would be subject to more information being available.10	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** is based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects**, which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, Nautilus, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. The traffic and transport cumulative assessment considers the additional traffic to be generated across the highway network (within the study area) by the Proposed Project and other cumulative schemes, based on the same assessment criteria assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Traffic and transport, Construction – general, Intra-Project cumulative effects	The effect of construction works on the preliminary infrastructure and at the converter station site will increase traffic congestion and create intra-project cumulative effects which may: deter shoppers from visiting the town centre and impact the economic viability of the independent High Street shops; deter residents and visitors from visiting the town's many amenities; deter tourists from using the town's holiday accommodation, and; devalue and reduce demand for properties adjacent to the access roads and converter station site.	N	The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including the routes through Saxmundham. For example, construction traffic travelling to/ from the B1119 and through Saxmundham will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than five HGVs per day). A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that there are no anticipated significant effects as a result of the Proposed Project. There is likely to be a minor beneficial impact on employment generation and local spending as a result of the construction phase of the Suffolk Onshore Scheme. In terms of local accommodation capacity, in a worst case scenario where all 327 peak workers require accommodation during peak demand in July, all of Suffolk Onshore Scheme's construction workers could be accommodated within a 60-minute drive time of the Order Limits. In addition, impacts on residential properties, businesses, development land, recreation and tourism assets are concluded to be not significant.
		Onshore mitigation, Traffic and transport	**Mitigation** It is vital that Saxmundham remains as an attractive place to live, work and visit. If the Sealink proposals are consented, we therefore will seek, without prejudice, as part of any Traffic Impact Survey and Assessment, that NGET consecutively includes a feasibility study for road calming/one way traffic or pedestrianisation of the town's High Street.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the highway network through Saxmundham, with the mitigation identified within the **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport.
		Traffic and transport, Construction – general, Design	**Proposed Access Routes** NGET has identified two potential construction vehicle routes that we identify as the 'North Access Route' (via Kelsale) and the 'South Access Route' (via Benhall). NGET has identified that prior to construction of either the North or South Access Routes that HGV vehicles will access the site from the A12 via Benhall, South Entrance, Church Road and Church Hill to the B1121, which we identify as the 'Initial Stage'.	N	The southern access route has been adopted as part of the Proposed Project. The northern access route no longer forms part of the proposals.
		Traffic and transport Design, Safety	**Initial Stage**	N	National Grid recognises the constraints of the access through Saxmundham which is why a new access south of Saxmundham is being proposed for the majority of construction traffic. The construction vehicle routing has been

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			We are concerned about increased HGVs movements during the Initial Stage due to: the increase in traffic at the already congested controlled junction in the town centre which is widely used by pedestrians, cyclists, mobility scooters, HGVs, LGVs, buses and cars, the potential for delays to emergency vehicles who use this route, pedestrians, including young and elderly people, often do not wait for the signal at the controlled crossing indicating it is safe for them to cross, school children board and alight from buses daily at the South Entrance traffic lights, shoppers, particularly those with mobility issues, and delivery vehicles often stop, in contravention of traffic orders, in the High Street which compounds congestion and the potential for accidents, during the winter months when the sun is low on the horizon, glare can occur on this route obscuring visibility leading to the potential for accidents, Church Road is at times extremely congested with Tesco and Waitrose shoppers and delivery vehicles, bus stops both sides of the road, and a zebra crossing that is quite obscured at times due to queuing vehicles, Pedestrians, including young and elderly people, often do not use the zebra crossing on Church Road which increases the potential for accidents, there is no footpath from Manor Gardens into the town centre. Pedestrians must cross the road at the top of Church Hill to access the town and bus stops. Several residents identified that this is already potentially dangerous. Increased traffic at this location will compound the problem, to avoid the access road construction works, normal traffic habits may change, resulting in traffic to the town centre diverting to Rendham Road, Mill Road and Chantry Road. This is a densely residential area with two schools and the consequent dangers of increased traffic to pedestrians, particularly due to the lack of a continuous footway and the number of families with young children who use the zebra crossing on Rendham Road, the NGET data11 is incorrect as it omits Chantry Road from this alternative route. The very narrow carriageway at the controlled junction, the weight limit of 7.5 tonnes, and the		designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including the routes through Saxmundham. For example, construction traffic travelling to/ from the B1119 and through Saxmundham will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than five HGVs per day). Once the access on the B1121 Main Road has been constructed, all construction vehicles will use the new access and routing through Saxmundham will no longer be required.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			restriction to traffic flows twice per hour due to the level crossing has not been considered.		
		Traffic and transport, Onshore mitigation	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the above impacts: all NGET traffic must avoid the busy shopping and travel to work and school times, NGET must liaise with Suffolk County Council to ensure there is no conflict with roadworks, the zebra crossing between Waitrose and Tesco should be upgraded to a controlled pedestrian crossing, a zebra crossing should be installed at the top of Church Hill opposite the bus shelter, NGET should identify ways to deter vehicles from diverting to alternative routes such as Rendham Road, Mill Road and Chantry Road.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** sets out the management measures for the control of construction traffic. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the B1121 Main Road. Therefore, it is not considered that any additional mitigation is required. Notwithstanding the above, NGET will continue to liaise with Suffolk County Council throughout the development and delivery of the Proposed Project to coordinate works with any planned road works. All delivery vehicles will be monitored to ensure they are using the designated construction access routes. The limited nature of vehicle movements required through the initial phase will not warrant additional mitigation measures, however, community benefit funding will be available through the Proposed Project.
		Traffic and transport, Socio-economic. recreation and tourism, Intra-Project cumulative effects	**North Access Route** The North Access Route will cross the railway line and proceed to the east of houses that are part of the Church Hill development to the B1119 Saxmundham to Leiston road, from whence it will continue to the converter station site. This will cause delays for people travelling by car from Leiston, but due to the distance involved an alternative route will likely not be sought, and the outcome could deter shoppers from Leiston travelling to Saxmundham. The receptors living in the east part of Church Hill will be subject to intra-project cumulative effects of noise, vibration, air pollution and light pollution during the construction of the access route and converter station site.	N	The southern access route has been adopted for the Proposed Project. The northern access route no longer forms part of the proposals. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including the routes through Saxmundham and Leiston. For example, construction traffic travelling to/ from the B1119 and through Saxmundham will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than five HGVs per day). Once the access on the B1121 Main Road has been constructed, all construction vehicles will use the new access and routing through Saxmundham will no longer be required
		Traffic and transport, Onshore mitigation	**Mitigation** the North access route must be built below the brow of the hill to provide a natural barrier against noise, air and light pollution, and visual amenity. HGVs must not use the access route during unsocial hours which includes weekends. earth bank works should be considered to lessen impacts such as noise, vibration, air and light pollution and visual amenity.	N	The northern access route no longer forms part of the proposals. Therefore, none of this mitigation is applicable or necessary.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			houses near the access route should be offered triple double glazing and other noise mitigation measures. we request that NGET funds a feasibility study to address the long-identified hazards and issues in the High Street. Upgrading the North access route to a fully adopted highway connected to the B1119 for all traffic may offer opportunities for legacy benefit by providing a vehicular route from the north to the supermarkets via Church Road thus avoiding the busy traffic light-controlled crossroads in the town centre, increase pedestrian safety by allowing for wider pavements,12 and provide for a more convivial shopping experience in the High Street.		
		Traffic and transport, cultural heritage	**South Access Route** The South access route from the A12 passes the outskirts of Benhall then crosses the River Fromus to the converter station site. An access route on this site will be damaging to the setting of Hurts Hall, a grade II listed building, the landscape of the park, and the cultural heritage of Saxmundham. The Saxmundham Neighbourhood Plan identifies this area as a 'Green Gateway' due to its important public view. Developments which would have an unacceptable adverse impact on the landscape or character of the view will not be supported.	N	It is acknowledged that Hurts Hall and its associated parkland represents a designated building on the south of Saxmundham, outside of the Saxmundham Conservation Area. The non-designated parkland is much degraded with most of the original smaller areas of pasture opened up to form large arable fields, with significant tree loss. Furthermore, much of the area that formed the parkland is no longer in the same ownership as the hall. However, both features have been identified through consultation with stakeholders as heritage assets requiring a full detailed assessment of the potential for impacts on setting. The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visual**) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. These are Viewpoints 2 (Important View 1a and 1b) and 20 (Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham.
		Walking, cycling and horse-riders	There is a narrow footpath from the A12 along the B1119 from Benhall to Saxmundham, which is only suitable for single file walking. Young children walk along this route to and from Saxmundham and Benhall to attend primary schools in either parish. This is also a popular route for recreational cyclists. We consider that with increased traffic, pedestrians and cyclists may be reluctant to use this route and increased traffic will significantly increase the potential for accidents.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism and concludes that there are no anticipated significant effects as a result of the Proposed Project on PRoW or recreational routes. The construction vehicle routing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk**. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network or walking/ cycling network (including PRoW) during the construction phase with the proposed embedded mitigation and control and management measures in place, including the routes through Saxmundham. For example, construction traffic travelling to/ from the B1119 and through Saxmundham will be limited to mobilisation works only, where there will be a limited number of construction vehicles (fewer than five HGVs per day). Once the access on the B1121 Main Road has been constructed, all

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					construction vehicles will use the new access and routing through Saxmundham will no longer be required.
		Traffic and transport, Onshore mitigation, Walking, cycling and horse-riders	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the above impacts. NGET to provide a safe footpath/cycleway from the A12 to South Entrance. Opportunities to enhance the Public Rights of Way and bridleways should be considered.	N	Community benefit is separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. National Grid is maintaining ongoing dialogue with both the District and County Council to address such issues.
		Traffic and transport, Inter-Project cumulative effects, Legislation and policy inc. permits	**Cumulative Traffic Impacts** The above impacts do not consider the cumulative effects of other Nationally Significant Infrastructure Projects and other major housing and employment developments in the local area that will increase traffic movements. Whilst acknowledging in the Preliminary Environmental Impact Report (PEIR) the existence of the Saxmundham Garden Neighbourhood, comprising some 800 dwellings and the construction of a new roundabout and adjacent works for an employment area, NGET have ignored the cumulative traffic impacts as the proposals have not yet been submitted for planning consent. Should either project coincide, there is a potential, with major works to the east and west of the town, that the cumulative effects of greatly increased traffic on Saxmundham will contravene the provisions noted in paragraphs 110-113 in the National Planning Policy Framework. NGET, whilst acknowledging that works are being scheduled at Carlton Meres Holiday site, have not accepted that they should be considered as a cumulative effect on traffic. We disagree, as the works, whilst small on their own, should be included due to the large scale of works proposed in the area.	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** is based on **Application Document 6.3.1.5.C Appendix 1.5.C Inter-Project Cumulative Effects Short List**, which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, Nautilus, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. The traffic and transport cumulative assessment considers the additional traffic to be generated across the highway network (within the study area) by the Proposed Project and other cumulative schemes, based on the same assessment criteria assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Inter-Project cumulative effects, Traffic and transport, Construction - general	Saxmundham will be affected by Sizewell C, not least in the construction phase lasting 10-12 years. Road traffic will pass through on the A12 and night-time freight trains to Sizewell passing through the town centre will add to the transport and environmental pressures. It is understood that the scale of construction traffic for these smaller projects is much less than for Sizewell C, however, we are concerned about the cumulative impact of potentially multiple energy infrastructure projects and other development proceeding over the same period of years.	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** for each discipline, including Traffic and Transport. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** is based on **Application Document 6.3.1.5.C Appendix 1.5.C Inter-Project Cumulative Effects Short List** which includes more than 25 developments including Sizewell C Nuclear Power Station, LionLink, Nautilus, East Anglia ONE North Offshore Windfarm and East Anglia TWO Offshore Windfarm. The traffic and

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			We are concerned that increased levels of traffic on the A12 will increase the frequency of 'rat running' incidents along the minor roads, which were never intended for mass industrialisation, through Saxmundham and its neigbouring parishes.		transport cumulative assessment considers the additional traffic to be generated across the highway network (within the study area) by the Proposed Project and other cumulative schemes, based on the same assessment criteria assessed within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**.
		Traffic and transport, Onshore mitigation	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the above impacts. we recommend that NGET collaborate with Sizewell C Co to use their park and ride facilities to the north at Darsham and to the south at Hatcheson to negate the need to provide workers' car parking and reduce vehicle movements in and around Saxmundham, and to make use of the traffic incident management areas and postal consolidation facilities at both sites. we recommend that NGET collaborate with Sizewell C Co to use their freight management facility at Seven Hills to reduce the number of HGV and LGV movements in and around Saxmundham.	N	National Grid is in discussions with Sizewell C and other developers in the region and will look to coordinate and make use of facilities that are available such as park and rides and freight management facilities.
		Converter station location, Landscape and visual, Cultural heritage	**Visual Impacts** We are concerned that the development of the converter site will lead to industrialisation of the open countryside to the east of Saxmundham and due to the magnitude, will also adversely affect the open views to the south of the town next to Hurts Hall. Contrary to claims made in the consultation documents, this site is not naturally screened by adjacent woodland at Bloomfield's Covert and thus existing screening to the west is unlikely to provide mitigation to the north, south and east. The huge converter station buildings will be out of keeping with the character and landscape of rural East Suffolk where the local architecture is predominantly of low build.	N	The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visual**) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. These are Viewpoints 2 and 20. The effects on the landscape character and visual receptors as a result of the Suffolk Onshore Scheme is also set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to residual significant adverse effects primarily due to the scale of the infrastructure proposed. The design of the Suffolk Onshore Scheme has involved an iterative design process focused on minimising effects, including on landscape character and visual amenity. The indicative landscape strategy for the Suffolk Onshore Scheme is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**, which illustrates the proposed mitigation measures such as woodland planting to reinstate historic woodland found on the site and other measures including hedgerow and hedgerow tree planting. This will tie into existing vegetation in the local landscape to maximise potential screening of the proposed infrastructure.
		Converter station location, Landscape and visual, Legislation and	The above image13 clearly shows three converter stations to the right of Hurts Hall. Whilst NGET state that one convertor station would 'appear with a small part of the horizontal panorama in a break in vegetation in the middle ground' and 'would appear at a similar scale to Hurts Hall but would be out of character in the existing view', they conclude it 'would not be the focus of the receptors moving along and adjacent to the B1121'.14 We	N	The image referred to in the Council's feedback is from the Preliminary Environmental Information Report, Vol.3, Part 2, Chapter 2, Figures 2-6 Sea Link Suffolk Onshore Scheme and is viewpoint 2: B1121, south of Saxmundham, Figure 2.2.12-B (sheet 4 of 5). The comment is acknowledged and it should be noted that this was in reference to the preliminary assessment outlined in the PEIR. The effects on

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		policy inc. permits	disagree with this and contend that this should be tested thoroughly against National Policy Statement EN-1, 5.9.21 and the Saxmundham Neighbourhood Plan. The Neighbourhood Plan states15 that there are 'a number of important views and vistas', that should be protected, as they are important 'to the overall landscape character of the parish and which can be enjoyed from publicly accessible locations, e.g., footpaths, public highway, an existing open space, or through a gap between buildings'.		the landscape character and visual receptors as a result of the Suffolk Onshore Scheme is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visual**) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**). These are Viewpoints 2 (Important View 1a and 1b) and 20 (Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham. **Application Document 7.1 Planning Statement** sets out a comprehensive appraisal of the Proposed Project in relation to the relevant energy NPSs and other policy that may be considered important and relevant to the Secretary of States decision, including the Saxmundham Neighbourhood Plan.
		Landscape and visual	1a. 'View from the B1121 looking across to Hurts Hall and St John's Church: The road undulates and at the top of two rises there are open views across to the Church and Hurts Hall which are both important landmarks'.	N	The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visual**) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**). These are Viewpoints 2 (Important View 1a and 1b) and 20 (Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham.
		Landscape and visual	2. 'View from the high point of The Layers looking across the River Fromus to Hurts Hall: Looking due east from the tree line which marks the western edge of The Layers, across open farmland and the River Fromus. This gives a wide view of Hurts Hall and its associated buildings, and the backdrop of rising wooded land. It demonstrates the contrast between the open landscape of the valley and wooded ridge, below which the town sits.	N	The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visual**) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**). These are Viewpoints 2 (Important View 1a and 1b) and 20 (Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham.
		Landscape and visual, Legislation and policy inc. permits, Converter station location	We consider that the siting of the converter station(s) in this location contravenes our Neighbourhood Plan and NGET have not considered the loss of an important view against National Policy Statement EN-1 5.9.21.	N	The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visual**) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**). These are Viewpoints 2 (Important View 1a and 1b) and 20 (Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham.
		Landscape and visual, Converter station location, Legislation and policy inc. permits	The above image shows three converter stations with the historic Wood Farm dwarfed to the right. The proposed converter station site is on the top of a plateau. The Neighbourhood Plan states: 5) 'View towards the town from the B1119. The approach from Leiston is across a wide-open plateau. Looking west at point about 400m east of the access to Wood Farm the view of tree line along the ridge becomes conspicuous, the town below is hidden, but the view of the trees and the change in the landscape is the first clear indication that the town is nearby.'	N	The image referred to in the Council's feedback is from the Preliminary Environmental Information Report, Vol.3, Part 2, Chapter 2, Figures 2-6 Sea Link Suffolk Onshore Scheme and is viewpoint 1: public footpath east of Saxmundham, Figure 2.2.12-A (sheet 4 of 4). The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visua**l) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**). These are Viewpoints 2 (Important View 1a and 1b) and 20

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					(Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham.
		Landscape and visual, Legislation and policy inc. permits	We consider that the siting of the converter station(s) in this location contravenes our Neighbourhood Plan and NGET have not considered the loss of an important view against National Policy Statement EN-1 5.9.21.	N	NPS EN-1 paragraph 5.9.21 does not concern important views. It is not clear which paragraph the Town Council intended to refer to or whether they have been referring to out-of-date policy. Notwithstanding this, **Application Document 7.1 Planning Statement** sets out a comprehensive appraisal of the Proposed Project in relation to the relevant energy NPSs and other policy that may be considered important and relevant to the Secretary of States decision, including the Saxmundham Neighbourhood Plan.
		Converter station location, Needs case	NGET's proposals to locate up to three converter stations on Saxmundham's settlement boundary is considered overdevelopment and it is not acceptable.	N	This comment by the Town Council is not accurate. National Grid is proposing to locate one converter station on land near to Saxmundham. NGV, a different company and applicant, is developing two separate projects which may also involve converter stations located near to Saxmundham. All three projects are separate, however, the two applicants have been urged to coordinate as far as possible, including in relation to co-location of converter stations. The Proposed Project will be seeking consent for one converter station at Saxmundham. Should another applicant bring forward proposals for any further converter stations in similar locations, these would be subject to their own separate consenting process. Within this DCO application, for information only, an illustrative masterplan showing one way in which three converter stations could be accommodated on land near to Saxmundham is included (**Application Document 7.10 Coordination Document**). However, this would not form part of Development Consent for the Proposed Project, if granted.
		Landscape and visual, Legislation and policy inc. permits	The above image, just outside Saxmundham on the B1119, is based on three converter stations. The image appears to be misleading, as are others, with regards to height. With the proximity to the road, there is no scope for visual mitigation. The result is that visitors travelling from Leiston to Saxmundham will be greeted by an industrial landscape that is totally out of keeping with the culture of our predominantly rural market town and adjacent villages. Again, we refer to National Policy Statement EN-1 5.9.21 and suggest that any proposed development is modified. Additionally, we refer to National Policy Statement EN-1 5.9.19 as NGET have omitted to acknowledge that there is no similar infrastructure in the area.	N	The image referred to in the Council's feedback is from the Preliminary Environmental Information Report, Vol.3, Part 2, Chapter 2, Figures 2-6 Sea Link Suffolk Onshore Scheme and is viewpoint 4: public bridleway southeast of Saxmundham, Figure 2.2.12-D (sheet 3 of 3). The photomontages have been produced using the methodology set out within **Application Document 6.3.2.1.A ES Appendix 2.1.A Landscape and Visual Impact Assessment and Photomontage Methodology** and use the maximum height parameter set out within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The indicative landscape strategy for the Suffolk Onshore Scheme is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**, which illustrates the proposed mitigation measures such as hedgerows alongside the B1119 which are closer to the receptors to maximise screening effects. NPS EN-1 paragraphs 5.9.19 and 5.9.21 do not concern important views. It is not clear which paragraph the Town Council intended to refer to or whether they have been referring to out-of-date policy. Notwithstanding this, the Planning Statement sets out a comprehensive appraisal of the Proposed Project in relation to the relevant energy NPSs and other policy that may be

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					considered important and relevant to the Secretary of States decision, including the Saxmundham Neighbourhood Plan.
		Landscape and visual, Intra-Project cumulative effects, Socio-economic. recreation and tourism	In conclusion, we object to the proposed converter station(s) due to the loss of important views. The visual impact would create intra-project cumulative effects by deterring tourists and potential house buyers from visiting or living in the town. Moreover, the reduced desirability to visit and live in the town will affect the viability of local shops and amenities.	N	The 'important views' outlined in the Saxmundham Neighbourhood Plan have informed the representative viewpoint locations (**Application Document 6.4.2.1 Landscape and Visual**) and the assessment is set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. These are Viewpoints 2 (Important View 1a and 1b) and 20 (Important View 2). Important Viewpoint 5 has also been acknowledged as the approach to Saxmundham. An intra-project effect assessment has been carried out for the Proposed Project and has considered the residual effects resulting from the visual impact assessment. The purpose of this assessment is to identify and assess the potential for a combination of impacts associated from the Proposed Project to arise on a single receptor and determine whether a greater level of effect may arise than that identified within one of the standalone technical chapters. Further details regarding the outcome and any proposed mitigation required are contained in **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects**.
		Onshore mitigation, Design, Converter station location	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the above impacts: reduce the number of proposed converter stations to one and site it further east, thus mitigating the loss of views in and around Saxmundham, ensure that the converter station architectural design is sympathetic and blends, as much as possible, into its rural setting by incorporating NGET's proposed green roof, manipulate the form of the converter station, part-bury it, and/or raise the height of the land to reduce the height and the visual impact, plant shrubs and copses of trees around the converter station site to hide its scale, provide natural screening, preserve views, and increase biodiversity, clad the building with colours and textures sympathetic to the local landscape.	N	The reasoning for the siting of the converter station is set out within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The ES assesses one converter station on the Saxmundham site. The indicative landscape strategy for the Suffolk Onshore Scheme is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**, which illustrates the proposed mitigation measures such as woodland planting to reinstate historic woodland found on the site and other measures including hedgerow and hedgerow tree planting to enhance screening opportunities and tie into biodiversity opportunities. National Grid has given careful consideration to the design of the converter station, presenting a range of potential options in this consultation. Following this, Design Principles are being established with regard to the requirements of national policy and National Grid is maintaining ongoing dialogue with the Host Authorities with regard to design aspects of the Proposed Project. Furthermore, input is being sought from independent design review panels, as recommended by the Host Authorities. This will be an iterative process over the consenting, examination and delivery phases of the Proposed Project. The Design Principles for the Proposed Project will also reflect the principles set out in the National Infrastructure Commission's Design Group Project Level Design Principles. The design principles are contained in **Application Document 7.12.1 Design Principles – Suffolk**.
		Terrestrial ecology, DCO process	**Environmental Impacts** DEFRA has developed a biodiversity gain statement which sets out the detail of the biodiversity net gain requirement for NSIPs. All terrestrial NSIPs from November 2025 are expected to achieve at least 10% measurable biodiversity net gain for at least	N	National Grid acknowledges this feedback. Details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			30 years.16 We note NGET supports this aspiration for the Sealink project.		
		Terrestrial ecology	NGET advise that the 'majority of the ecological environment impact assessments are underway or have yet to commence, and therefore the amount of field survey data in this PEIR is limited'.17 Moreover, most of the work undertaken to date is based on desk studies. We are concerned that this work has not been undertaken and we expect it to be fully complete for inclusion prior to the submission of any application for a Development Consent Order. We will then be able to comment fully but we make the following observations.	N	A full suite of surveys has been concluded for inclusion within this DCO submission. Further details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**.
		Water environment, Geology and hydrogeology, Agriculture and soils	**Flooding and River Condition Impacts** NGET propose to install an access road over the river. The drift soil at Wood Farm is clay and is very well managed by the landowner to ensure that it drains efficiently, with water draining to well-maintained field ditches. The proposed construction of the converter station and associated works compounds and roadworks will impact on the land creating water run- off. This will impact the quality of the river, especially if the run-off floods the roads prior to entering the water courses.	N	Surface water runoff arising from the Proposed Project during both its construction and operation would be captured, suitably treated where necessary and attenuated prior to discharge into the surrounding water environment at rates no greater than existing (inclusive of suitable climate change allowances over the Projects lifetime). In addition, where the Proposed Project interacts with existing land drainage infrastructure, e.g. ditches, there is a project commitment, secured by the DCO, to re-provide a suitable alternative means of land drainage such that the existing land drainage regime is not compromised.
		Water environment	The introduction of a bridge will detrimentally alter river habitats.	N	The impacts associated with the Proposed Project on river habitats are included in **Application Document 6.2.2.2 Part 2 Chapter 2 Ecology and Biodiversity** for further details. The bridge across the River Fromus has been designed in order to avoid a significant adverse effect on habitats. It will be installed so the abutments are 8 m from the river bank and will be installed in an area where there is currently little to no emergent riparian vegetation on the river banks and where there is currently a willow plantation that provides considerable shading of the watercourse. The felling of the plantation (as part of routine plantation management prior to bridge installation) and the habitat creation works around the bridge therefore present an opportunity for enhancing the River Fromus corridor.
		Water environment, Converter station location, Legislation and policy inc. permits	Flooding, and in particular surface water flooding, is of extreme concern to the community and there have been historical and recent incidences of flooding in the town. Construction of a converter station will inevitably exacerbate the situation. National Policy Statement EN-1 requires that all sources of flooding be considered as part of site selection. We strongly recommend that NGET undertake a sequential test for ground water flooding on the Wood Farm site.	N	Flooding concerns are noted and **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The converter station would be served by a surface water drainage system that provides for the collection and treatment of all rainfall runoff from newly created impermeable surface areas, such that discharges to the surrounding water environment would be made at rates no greater than in the undeveloped situation, inclusive of resilience for future climate change. Groundwater as a source of flood risk, has also been appraised within the **Application Document 6.8 Flood Risk Assessment**.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					The converter station site is in Flood Zone 1 for fluvial flood risk and is at low risk areas for all other sources of flooding, including surface water and groundwater. It therefore passes the sequential test.
		Water environment, Onshore mitigation, Terrestrial ecology	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the above impacts: NGET should provide a fund for river protection and improvement between Kelsale, Saxmundham, Sternfield and Benhall to offset and reinstate lost or damaged habitats.	N	A commitment is secured within the Register of Environmental Actions and Commitments, to remove temporary watercourse crossings and reinstate riparian vegetation following completion of any construction works. Where the project permanently crosses the River Fromus, the crossing design of a clear span bridge with generous setbacks from both river banks, avoids impacts on the river and its riparian corridor.
		Terrestrial ecology, Ornithology, Agriculture and soils	**Wild Life Impacts** It should be noted that farmland, whilst not environmentally obviously diverse, plays an important role in the ecological system. There has been a dramatic crash in farmland birds, due to modern intensive methods and loss of habitat.18 Sightings of animals (although not an exhaustive list) in the area include those found in agricultural and river settings: Skylarks Badgers Buzzards Hedgehogs Sparrow Hawks Red Deer Red Kites Muntjac Deer Kestrels Grass Snakes Barn Owls Slow Worms Tawny Owls Adders Cuckoos Field Mice Kingfishers Bats Woodpeckers	N	The ecological surveys for the Environmental Statement have not neglected the importance of farmland (such as for nesting skylarks), this has been considered as part of the EIA and mitigation measures proposed for the Proposed Project. Please refer to **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** for further details.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Hares Swifts Foxes Marsh Harriers Possibly water voles Lapwings		
		Onshore mitigation, Terrestrial ecology Walking, cycling and horse-riders	**Mitigation** Without prejudice, we would propose the following if the project proceeds, to mitigate the impacts: arable land should be properly surveyed for birds and wildlife and compensation offered for any loss of habitat that might affect uncommon or rare species,19 for adequate drainage it will be necessary to continually reinstate ditches. NGET should consider curving ditches which provide improved and diverse micro-habitats for wildlife. similarly re-introduced hedgerows should not be straight but curved.	N	Hedgerow gaps will be restored on the same alignment as the removed hedgerow section. Detailed surveys of land to be affected by the Suffolk Onshore Scheme have been undertaken and are presented in the appendices of **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. This includes surveys for wildlife such as badgers and birds, and of uncommon arable weeds.
			the loss and diversion of Public Rights of Way is of concern, not only for wildlife but for human receptors. We strongly propose that the environmental offset includes a green pathway from near the converter site to Friston, thence to join the Suffolk Coastal Path north of Aldeburgh. Green corridors provide a haven for wildlife and improve wildlife diversity.	N	The opportunities for recreation have been developed in collaboration with other key disciplines including traffic and transport and socio-economics (further details within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This has included a permanent PRoW diversion on the converter station site which has been designed to have a variety of experiences with some sections more open and others adjacent to woodland planting to aid screening of views towards the Suffolk Onshore Scheme. This has also included the provision of open access areas, as requested through stakeholder feedback. The existing footpath connecting southwards is shown on **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**.
		Landscape and visual	**Light Impacts** Light pollution, not only effects human receptors adversely, but wildlife too.	N	The effects of the lighting proposals on landscape character and visual amenity as part of the Suffolk Onshore Scheme are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Such impacts have also be considered within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** but it should be noted that the converter station/substation will not be brightly illuminated structures as they will be generally unmanned. Details relating to the design, including lighting, are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
		Onshore mitigation, Landscape and visual,	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the impacts:	N	As above, the effects of the lighting proposals on landscape character and visual amenity as part of the Suffolk Onshore Scheme are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Such impacts have also be considered within **Application Document**

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Terrestrial ecology	All lighting should be shielded to prevent diffusion. Protectors should be fitted to all lights to stop the disruption of insect breeding.		**6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** but it should be noted that the converter station/substation will not be brightly illuminated structures as they will be generally unmanned. Details relating to the design, including lighting, are contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Mitigation measures relating to lighting have been included within **Application Document 7.5.3.2 Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured by Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
		Converter station location, Noise and vibration, Health and wellbeing	**Noise Impacts** There are concerns about exposure to operational noise from the convertor transformers, the transformer cooling fans and the valve cooling fan banks, all of which will be external to the convertor station buildings for safety reasons and to allow sufficient airflow, and these will operate continuously day and night. Manor Gardens and parts of the Church Hill development are especially close to the proposed site and access road. Noise pollution creates issues for those that live nearby, especially those that suffer sensory noise related health problems and for people who work from home. We are very concerned that the proposed works will create mental health and general health conditions.	N	An indicative assessment of operational noise from the proposed converter station, based on currently available design information, is included within **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. The assessment indicates that with appropriate design measures, significant adverse effects from operational noise can be avoided. Noise mitigation measures will be incorporated in the design, and further noise assessments will be conducted throughout the design process.
		Onshore mitigation, Noise and vibration, Landscape and visual	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the above impacts: the supply of triple glazing and other noise mitigation measures for affected properties, during the construction phase, NGET should ensure that noisy work is minimal and within industry standard limits, NGET should follow EDF's policy and undertake preliminary environmental work by creating a treeline barrier next to the potentially affected properties. Should the project proceed, young trees planted now would provide a buffer against light and noise pollution.	N	With regard to operational noise, the assessment presented in the ES shows that internal noise levels, due to noise from the proposed converter station, would not exceed guideline values at nearby properties, even with open windows where appropriate noise control measures are incorporated in the design. There is therefore no need for the provision of additional glazing, or other form of noise mitigation at nearby properties. With regard to construction noise, the assessment conducted as part of the ES indicates that noise levels are not expected to meet the requirement for noise insulation or temporary rehousing at any property. This will be reviewed as part of the contractors detailed construction noise assessments. Best practicable means will be employed by the contractor to reduce the impact of noise and vibration during construction. There are no industry standard noise limits. However, there are effect thresholds which would be avoided where practicable with the use of best practicable means. Noise mitigation measures will be incorporated in the design of the converter station. Trees are not considered to provide a material reduction in noise levels and therefore do not form part of the noise mitigation strategy. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**.
		Onshore environmental	**Greener Environment**	N	The ES submitted as part of the DCO application provides an assessment of the likely significant effects in accordance with the EIA Regulations 2017,

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		impact, Converter station location, Traffic and transport	We are committed to supporting a greener environment. Whilst we appreciate that the proposed Sealink project is involved primarily in the transmission of offshore wind generated electricity that we endorse, the converter station and associated access roads negate any efforts that we have already undertaken to provide a greener environment.		which require an ES to discuss only those effects that are likely to be significant. Further details on the EIA process and methodology are contained in **Application Document 6.2.1.5 Part 1 Introduction Chapter 5 EIA Approach and Methodology** and the outcomes of the assessments and any mitigation proposed are contained in the specific technical ES chapters. It is also worth noting that, National Grid has committed to 10% Net Gain in Environmental value including as a minimum 10% Biodiversity Net Gain across all its construction projects. This commitment is underpinned by the delivery of quantifiable enhancements for biodiversity measured from a baseline using the Department for Environment, Food and Rural Affairs Biodiversity Calculator (Department for Food, Environment and Rural Affairs, 2021) with actions formalised and secured by long term management arrangements with external organisations and partners. Wider environmental benefits such as carbon capture and storage, air quality and recreation and associated financial values are also considered and quantified using valuation tools and emerging methodologies. These commitments ensure that National Grid can deliver long term environmental improvements as part of our works. The commitments will align and make a positive contribution to regional and national strategies and facilitate collaboration and partnerships with its communities and stakeholders. Further information on this is presented in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
		Onshore mitigation, Climate change	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required, via a Deed of Obligation, to offset the carbon footprint created by NGET: at least one, locally shared, wind turbine, to offset households in the Saxmundham Conservation Area that are not permitted to install solar panels, to reduce electricity costs generally for the residents of Saxmundham and local villages, or alternatively to provide a fund to improve the quality of life for residents, a small-scale solar allotment scheme that benefits the town.	N	Community benefit is separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant programme which is available to nearby charities and not for profit organisations, when projects are in construction. National Grid is maintaining ongoing dialogue with both the District and County Council to address such issues. The Proposed Project has been designed to increase the capability of the network to carry low carbon and renewable energy from where it is generated to homes and businesses across the country. It will play an important part in allowing the UK to decarbonise its energy system in a meaningful way that will not only support net zero energy targets, but also deliver a more secure and resilient energy system. A lifecycle greenhouse gas assessment and a climate change risk assessment is included in the climate change chapter of **Application Document 6.2.5.1 Part 5 Chapter 1 Climate Change**. This includes an assessment of the lifecycle greenhouse gas emissions associated with the Proposed Project, as well as an assessment of the climate change risks facing the Proposed Project. These assessments have been conducted in accordance with the Institute of Environmental Management and Assessment good practice guidance for greenhouse gas assessments and climate change

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					risk assessments in EIAs. These assessments consider the mitigation measures embedded in the project to mitigate greenhouse gas emissions and climate change risks associated with the Proposed Project. **Application Document 7.5.13 Greenhouse Gas Reduction Strategy** has been developed alongside the climate change chapter. This document sets out how greenhouse gas emissions will be managed across the project lifecycle.
		Community benefits / enhancements, Socio-economic. recreation and tourism	**Socio-Economic Impacts** The infrastructure developers justify much of the environmental and economic damage by extolling the local benefits to the community. However, the onshore infrastructure of the Sealink project creates no long-term employment opportunities and no local investment. In fact, the proposed project creates a situation ultimately leading to unemployment and decline.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. However, community benefit is separate to compensation/mitigation and they will seek to mitigate against adverse impacts where they are identified. A complete assessment of socio-economics effects has been undertaken has be undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that there are no anticipated significant effects as a result of the Proposed Project. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** details the cumulative socio-economics impact of the Proposed Project alongside other proposed developments within the cumulative zone of influence. Again, it is concluded that there are no anticipated significant socio-economic effects.
		Socio-economic. recreation and tourism, Inter-Project cumulative effects, Construction - general	During the proposed construction phase, especially considering the cumulative impacts of other major projects in the area, traffic and construction works will be a barrier to tourists and potential house purchasers. Consequentially, the High Street shops, restaurants, hotel and tourist attractions will likely witness a decline, and this will result in a loss of jobs. When operational, the converter station will be a visual deterrent to visitors and potential house purchasers which will also negatively affect local shops and amenities.	N	A complete assessment of socio-economics effects has been undertaken has be undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that there are no anticipated significant effects as a result of the Proposed Project. **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** details the cumulative socio-economics impact of the Proposed Project alongside other proposed developments within the cumulative zone of influence. Again, it is concluded that there are no anticipated significant socio-economic effects.
		Socio-economic. recreation and tourism, Onshore mitigation	It is vital that Saxmundham gains a meaningful long-term legacy for the local economy and the community to offset the environmental and economic damage caused by the siting of onshore electricity transmission infrastructure.	N	National Grid acknowledges this feedback.
		Onshore mitigation	**Mitigation** Without prejudice, if the development is to proceed, we believe the following will be required to mitigate the above impacts: Historically the wages and educational levels in this area are lower than the national average.20 We strongly suggest this is	N	Community benefit is separate to compensation and mitigation. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. For example, it operates a community grant

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			addressed by the introduction of a Skills Training Centre21 funded by NGET, NGV, and EDF with the support of the Joint Industry Board and the Engineering Construction Industry Training Board who is currently actively seeking to fund new training centres. There are suitable premises becoming available in Saxmundham for a jointly funded training facility. Saxmundham and the locale also benefits from regular train services from Lowestoft and Ipswich, local bus services and the proximity to the A12, thus is centrally placed to attract suitable applicants from a radius of 50 miles. The provision of a training centre will increase long-term prosperity for the town.		programme which is available to nearby charities and not for profit organisations, when projects are in construction. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst it awaits clarity on the Government's position, it is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the project progresses, they it work with stakeholders and local communities to further inform this. "
		Onshore route location, Landscape and visual, Socio-economic. recreation and tourism	**Cable Route Impacts** The choice of the landfall location between Aldeburgh and Thorpeness, the substation site at Friston, and the converter station site at Saxmundham inevitably leads to inappropriate cable routes through unspoilt countryside, including the Suffolk and Essex Coast and Heaths National Landscape, which is of great value to the local tourist industry.	N	The landscape and visual team have been a key discipline when determining the route of the cable route. This has been developed to minimise effects on the landscape character, including avoiding landscape features where possible and visual amenity, including limiting the infrastructure in views from sensitive receptors including residential and recreational receptors. It should also be noted that the effects arising from the cable routes will be temporary and that reinstatement of the cable corridors will occur following the construction period as far as practically possible. Details regarding the reinstatement of the cable corridors is set out within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**. Effects on landscape character and visual amenity are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.
		Converter station location, Onshore route location, Design	The selection of Saxmundham for the converter station, as opposed to Blackheath Corner near the junction of the B1069 and A1094, involves a wider swathe of both AC and DC cables to the north of the proposed Friston substation, up to 200m wide if all three projects are accommodated. The Saxmundham converter station site requires an unnecessary long HVDC cable corridor which passes Friston and will therefore need to double-back on itself to connect to the substation.	N	The Proposed Project Options Selection and Design Evolution Report published alongside the Statutory consultation documentation outlines the rationale underlying decision-making around the preferred location for the converter station - including avoidance of the AONB. However, in addressing the specific detail of this comment, the overall length of cable required for Saxmundham and Blackheath Corner was comparable, due to the HVAC system requiring three times the amount of cable as opposed to the HVDC system. The longer HVAC required to connect a converter at the Blackheath Corner location was therefore similar in terms of cable requirements to the longer HVDC section needed to reach the Saxmundham site, with the HVAC connection also requiring a wider construction swathe between the Blackheath Corner site and Friston, along a route where there were a number of constraints. The Report can be found in **Application Document 8.2 Options Selection and Design Evolution Report (October 2023)**.
		Onshore route location, Walking, cycling and horse-riders, Socio-economic.	The cable routes also impact on the many Public Rights of Way (PRoW) which would suffer closure and diversion during the construction period. This extensive network of PRoWs are important to both local people and especially to local tourism which draws visitors from far and wide to enjoy the open and accessible landscape.	N	A complete assessment of socio-economics effects has been undertaken has be undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that there are no anticipated significant effects on PRoW or recreational routes as a result of the Proposed Project.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		recreation and tourism			
		Onshore route location, Landscape and visual, Terrestrial ecology	The land above and around the cable swathes could eventually be restored but it will not be possible to plant trees and shrubs directly above the cables resulting in the permanent loss of wildlife habitats.	N	Shrub and hedgerow planting over the cable route is possible provided they do not have deep penetrating roots. Therefore, it would be possible to maintain habitat connectivity by restoring gaps in hedgerows, albeit without standard trees.
		Coordination with other projects, Inter-Project cumulative effects	**Cumulative Impacts** This response to the Sealink statutory consultation combined with the Nautilus and Lion Link non-statutory consultations relevant to the project, has identified that there is insufficient coordination between the three National Grid projects, the two Scottish Power Renewables projects, and the Sizewell C project. This has resulted in sub-optimal individual project proposals which ignore or significantly downplay the opportunities to reduce cumulative impacts and leave meaningful legacy for this area which will endure significant disruption and industrialisation of its landscape over decades.	N	National Grid is coordinating with other large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within the **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Timescales / programme	We understand that the Scottish Power Renewables project to create a substation at Friston has been delayed by two years and therefore there is the potential for Sizewell C, EA1N and EA2 offshore wind farms, and the Sealink, Lion Link and Nautilus interconnectors to be in the construction phase concurrently from 2026 to 2030.	N	**Application Document 6.3.2.14.A ES Appendix 2.14.A Descriptions of Other Developments** contains updated information regarding other project timescales which will be used in the CEA. East Anglia One North and East Anglia Two construction is expected to commence in 2024/2025 and energisation to commence in 2027 (SPR, 2024).
		Inter-Project cumulative effects, Traffic and transport, Socio-economic. recreation and tourism	There is a risk that the cumulative impact of these projects will displace the resident population, severely impact the local road network, and deter tourists from visiting.	N	A full inter-project effects assessment has been carried out for the Proposed Project. This assessment has combined environmental impacts resulting from other proposed developments due to come forward within the cumulative zone of influence. The full assessment is available within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The chapter concludes that there are no anticipated significant adverse socio-economic effects.

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Construction – general, Inter-Project cumulative effects, Socio-economic. recreation and tourism	No assessment has been made of the accommodation needs of construction workers for Sealink. NGET should undertake this assessment, cumulatively with all known projects for the area, to ensure that local people and residents are not displaced or priced out of the market.	N	Assessment of accommodation needs for construction workers and the effects on tourism and recreation assets has been undertaken and is presented within **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. It is concluded that there are no anticipated significant socio-economic effects.
		Health and wellbeing, Coordination with other Projects, DCO process	The health and wellbeing of local people has already been badly affected for years by other proposed energy projects. All projects associated with the substation at Friston should be brought together in one set of consultations and DCO examination to shorten the length of time residents are subject to the stress of the examination process and, importantly, so that people can fully understand the cumulative impacts.	N	A complete cumulative assessment has be undertaken. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The chapter concludes that there are no anticipated significant health and wellbeing effects.
		Needs case	**Conclusion** For the reasons set out above, Saxmundham Town Council strongly opposes the Sea Link project and all the options set out in the consultation document.	N	National Grid acknowledges this feedback.
		Construction – general, Landscape and visual	We are concerned that there is no guarantee that all the projects proposed for this area will be progressed in a way that will minimise the damage during construction and will be sympathetic to the impact on the landscape and amenity once operational. We set out similar concerns in our responses to the Sizewell C consultations.	N	The Proposed Project will actively manage and monitor the mitigation proposals outlined within the Environmental Statement. Details are contained in **Application Document 7.5.3 Outline Onshore Construction Environmental Management Plan** which describes the mitigation proposals which are required to take place during the construction phase. In relation to the landscape and amenity once operational, details of the management of proposed mitigation beyond the construction phase of the Proposed Project are contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan - Suffolk**.
		Coordination with other Projects, Alternative solutions	While we support the commitment to explore the potential for co-location, this is only acceptable if the infrastructure is sited in an appropriate place. There is no evidence within the consultation documents that alternative locations have been considered for the three projects, given that the main requirement for power seems to be in other parts of the country.	N	National Grid is coordinating with other large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. Information on the alternatives considered in

Date Consulted	Response Deadline	Consultation Topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main alternatives Considered**.
		Coordination with other projects, Design	We are concerned that these proposals do not consider the wider potential opportunities to create a more coordinated and less impactful result for East Suffolk. Thus, we will seek a moratorium on any development until it is reviewed by a government led enquiry. These projects should be viewed holistically, as well as other electricity network infrastructure developments, and a suitable solution for East Suffolk and the country should be sought.	N	As set out in the application documents, National Grid has proactively sought to coordinate with other projects. It should be noted that the other projects are not in control of National Grid. The Secretary of State has directed that the Proposed Project be consented via the DCO process under the Planning Act 2008. It is therefore required to follow all of the relevant procedures and processes under the Planning Act 2008. National Grid has consulted the community in accordance with the requirements of the Planning Act 2008. Consistent with the Government's Net Zero target, there has been, and continues to be, growth in the volume of renewable and zero carbon generation that is seeking to connect to the electricity transmission system in the East Anglia and South East regions. UK Government policy clearly sets out the critical requirement for significant reinforcement of the transmission system to facilitate the connection of renewable energy sources and to transport electricity to where it is used. In particular, the British Energy Security Strategy sets targets for the connection of up to 50 GW of offshore wind by 2030 as a key part of a strategy for secure, clean and affordable British energy for the long term. Without reinforcement, the capacity of the existing network in East Anglia and the South East is insufficient to accommodate the connection of proposed new power sources connecting in the area. National Grid has therefore been assessing the reinforcement options available for providing the additional capability required.

24 October 2023	18 December 2023	Consultation	Thank you for your consultation in respect of the above NSIP project. I can confirm that South Norfolk Council has no comments or observations to make in respect of the project and would defer to the Host Local Authorities affected by the proposal.	N	National Grid thanks the Council for its response and notes the feedback.

Table 1.16 Suffolk County Council

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
24 October 2023	18 December 2023	Consultation	**Sea Link Statutory Consultation** Suffolk County Council welcomes the opportunity to comment on the National Grid Electricity Transmission (NGET) proposal for grid reinforcement between Suffolk and Kent, known as Sea Link, which is offered by this consultation. The response has been developed by Suffolk County Council technical officers, who have identified significant issues which will need to be acted upon. The proposals as they stand will cause significant impacts to host communities who are already under considerable strain due to the multiple NSIPs which have been proposed for the Suffolk Coast. On 12 December 2023, this response was discussed and approved for submission at the County Council's Cabinet meeting. The paper and recording of the meeting are available on the County Council website.1 The principal concerns of the Council are set out in detail in its full response and are also summarised as follows.	N	National Grid acknowledges this feedback. The feedback received has been addressed below.
		Coordination with other projects, inter-project cumulative effects	**Coordination between Sea Link and emerging proposals for LionLink** Suffolk County Council maintains its stance that coordination between projects, including the utilisation of immediately adjacent parallel onshore cable routing, should be a top priority in order to minimise the impacts upon the Suffolk coastline. While the Sea Link proposals allow for coordination, LionLink, in its recent supplementary consultation, continue to consider landfall options at Southwold and Walberswick where coordination with Sea Link would not be possible on landfall and subsequent cable routing to the converter station site. The County Council expects the fullest possible coordination and co-location of the cable corridors and infrastructure between Sea Link and LionLink, in order to minimise the combined impacts of the two projects. Any proposals that reduce the level of coordination would require robust justification as to why greater coordination is not achievable, including a full assessment of increased levels of impacts across both projects.	N	National Grid's plans in Suffolk have been developed for the Proposed Project as a standalone project but have been designed in a coordinated way with other projects, including two potential NGV projects. As development work on the Proposed Project and these other projects has progressed, National Grid's approach to coordination has evolved. A key part of its coordination strategy is to continue to explore opportunities to co-locate infrastructure where feasible and beneficial. At Statutory consultation, National Grid presented a design which showed the NGV works themselves at the landfall and along the cable sections. It also included the entire wider site at Saxmundham, to show how they could be flexible if constructing around one or two additional converter stations. This assumed a scenario where the NGV projects, whose routeing and siting work is at an earlier stage, identified the same cable and converter station sites as the Proposed Project. In March 2024, NGV's LionLink project announced that it had down selected its potential landfall at Aldeburgh and would be removing it from the LionLink proposals. LionLink is still proposing to co-locate its converter station alongside the Proposed Project's near Saxmundham. As National Grid's design work and their engagement with the NGV projects has progressed, they have evolved their approach to coordinating with NGV. They are considering further ways that they could coordinate their construction activities and other projects and developers, including NGV, EDF Energy and SPR.
		DCO process, legislation and policy, coordination with other projects	**Coordinated Consenting Approach** Given the spatial interdependences of Sea Link and LionLink and the expectation in the National Policy Statement (NPS) EN-5 for coordinated approaches, the County Council considers it essential for National Grid Group to fully align the projects both spatially and	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			in the timing of the development of their consenting, in order to minimise the impacts of their projects on the communities and environment of the area. Such an approach would also be consistent with National Grid' own 'Responsible Business Charter. The alignment of project development and consenting by National Grid Group would potentially allow the Planning Inspectorate (PINs) to consider both projects simultaneously using a single panel of examiners to achieve coordinated consenting. This approach would allow for a more efficient examination of the issues and reduce the impact of the consenting process on the communities.		Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is considered in the ES within **Application Document 6.2.13 Part 2 Suffolk Chapter 13 Inter-Project Cumulative Effects**.
		Socio-economic, recreation and tourism, construction, combined effect of the proposed project	**Tourism** Suffolk offers a rich and varied tourist offer and is known for its heritage assets such as the Suffolk Coasts and Heaths Area of Outstanding Natural Beauty (AONB) and Heritage Coast. The County Council urges the applicant to fully assess the direct and indirect impacts of onshore construction activities on visitor perception and experience and also identify and engage with businesses, in particularly which are associated with recreation and tourism, to discuss these impacts.	N	National Grid is confident that their desk-based analysis is sufficiently robust. The approach and methodology used remains consistent across DCO infrastructure projects. It recognises that certain effects can only be evaluated on a qualitative basis and in turn defined effects in the ES using beneficial, adverse and no effect classifications. The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and experience from the construction of the Suffolk Onshore Scheme.
		Inter-project cumulative effects, traffic and transport, socio-economic, recreation and tourism	Cumulative Impacts Current timelines suggest that Sea Link will be under construction alongside several other NSIPs in the same area, including Sizewell C, LionLink and those being developed by Scottish Power Renewables (SPR). Significant impacts are expected regarding traffic on the routes leading to and in the proximity of the Suffolk coast, local housing, service, and labour supply.	N	It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area which has been considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. This chapter of the ES considers each discipline, including Traffic and Transport and Socio-Economics. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/ operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/ operational traffic associated with all committed developments combined on the same basis. No significant cumulative effects on socio-economics, recreation and tourism are expected as a result of the Suffolk Onshore Scheme in combination with each of the other developments in isolation. In addition,

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
					no significant effects are expected when considering the impacts of the cumulative schemes in aggregation and in combination with the Proposed Project.
		Coordination with other projects, alternative solutions	**National Grid ESO Review of East Anglian Connections** In light of the announcement by National Grid Electricity System Operator on 11 December 2023 regarding the launch of a review of East Anglian Connections, I will be writing to National Grid ESO setting out a range of options that Suffolk County Council wishes to see considered as part of this review, in particular those proposals which have been developed by Dr Thérèse Coffey MP and Suffolk's communities for the coordination of offshore wind and interconnectors, connection to the onshore transmission network via Bradwell and the Isle of Grain.	N	These comments are acknowledged and while the preference for use of previously developed land is recognised, it remains imperative that alternative options address the overarching needs case for the Proposed Project by providing additional network capacity where it is needed. In developing the Proposed Project National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search that satisfy the needs were considered too small to accommodate the required infrastructure. The results of the ESO East Anglia Network Study were published in March 2024. The conclusions highlight that the ESO holistically assessed ten network configuration options in East Anglia, using the OCSS outcome as the baseline. Six of these options were developed by the ESO/NGET and four proposed by community representatives, ranging from onshore network configurations to a network involving no new overhead lines within East Anglia. However, from this assessment, it is evident that there is no single option that minimises impacts across all the metrics. Critical trade-offs will need to be made between the cost borne by consumers, communities hosting this nationally significant infrastructure as well as environmental considerations. **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered, Application Document 7.3 Design Development Report and Application Document 7.2 Strategic Options Back Check Report** contain further details on the main alternatives considered for the Proposed Project. Further historic information with regard to the Proposed Project design evolution and the alternatives considered are contained within **Application Document 8.1 Corridor Preliminary Routing and Substation Siting Study (October 2022), Application Document 8.2 Options Selection and Design Evolution Report (October 2023)** and **Application Document 8.3 Strategic Options Report (October 2023)**.
		Consultation, coordination with other projects, design	1 Introduction 1.1 The following comments by Suffolk County Council (the County Council) are in response to the Statutory Consultation stage, including the Preliminary Environmental Information Report (PEIR), for the Sea Link proposals held between 24th October and 18th December 2023 by National Grid Electricity Transmission (NGET). 1.2 The proposals consist of the construction of 2GW High Voltage Direct Current (HVDC) undersea electricity link between Suffolk and Kent, with the onshore infrastructure in Suffolk consisting of a converter station, onshore Direct Current (DC)	N	National Grid acknowledges these comments.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			cables, onshore Alternating Current (AC) cables and a transition bay. The AC cables will connect the converter station to the consented but as yet unbuilt NGET substation at Friston in East Suffolk which will entail its extension. 1.3 Sea Link has been designed to coordinate with two further projects with regards to the option to provide additional ducts from the landfall, along the cable corridor and the size of plot for the converter station site. However no commitments have been offered to achieve that coordination with other projects. 1.4 The County Council electoral divisions which will be directly affected by the scheme include the following: - • Aldeburgh and Leiston • Blything • Kessingland and Southwold • Wilford 1.5 The first section of this representation outlines the key issues which the County Council has identified, which has been informed by our technical specialists, whose comments are provided in Appendix A. The County Council has also set out a structured approach to the issues posed by this and other proposed developments coming forward 'Siting and Design Principles for Offshore Wind and Interconnectors in Suffolk' which can be found in Appendix B.		
		Legislation and policy, needs case, climate change	**2 General Comments** **National Policy** 2.1 The County Council acknowledges the need to increase renewable energy generation, the increasing demand for new additional generation and the UK Government's legal obligation to achieve Net Zero emissions by 2050, as supported by research and publications by the Committee for Climate Change. 2.2 The Government issued the revised version of the National Policy Statements on 22 November 2023, with the amendments having full effect in relation to 'those applications for development consent accepted for examination, after the designation of those amendments', which will include the Sea Link proposals. 2.3 The National Policy Statement, EN-1, is the UK Government's overarching strategy for energy. The County Council would like to draw the applicant's attention to the following assessment requirements: - • 'Applicants for Critical National Priority (CNP) infrastructure must continue to show how their application meets the requirements in this NPS and the relevant technology specific NPS,	N	National Grid notes the Council's acknowledgement of the urgent need for new electricity transmission infrastructure and that the Proposed Project will be considered against the relevant Energy NPSs that were published in November 2023 and came into for force in January 2024. NPS EN-1 sets out at paragraphs 3.2.6 to 3.2.8 that the Secretary of State should give substantial weight to the need for energy infrastructure covered by the NPS and is not required to consider separately the specific contribution of an individual project to satisfying the need established in the NPS. National Grid also notes the Councils' acknowledgement that the Proposed Project comprises Critical National Policy (CNP) infrastructure, as defined in NPS EN-1. National Grid notes the extracts of NPS EN-1 identified by the Council. National Grid will set out analysis of the compliance of the Proposed Project with NPS EN-1, EN-3 and EN-5, and other policy that may be considered important and relevant in its Planning Statement. This will include consideration of the application of the mitigation hierarchy for the Proposed Project, as is the subject of the NPS EN-1 sections the Council has referred to. However, National Grid notes that the third bullet point in paragraph 2.3 of the Council's response is incorrectly worded. NPS EN-1 does not make

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			applying the mitigation hierarchy, as well as any other legal and regulatory requirements.' • 'Applicants must apply the mitigation hierarchy and demonstrate that it has been applied. They should also seek the advice of the appropriate SNCB or other relevant statutory body when undertaking this process. Applicants should demonstrate that all residual impacts are those that cannot be avoided, reduced, or mitigated.' • 'Applicants should set out how residential impacts will be compensated for as far as possible. Applicants should also set out how any mitigation or compensation measures will be monitored, and reporting agreed to ensure success and that action is taken. Changes to measures may be needed e.g. adaptive management. The cumulative impacts of multiple developments with residual impacts should also be considered.' 2.4 The National Policy Statement (EN-5) is the UK Government's strategy for electricity network infrastructure. This policy statement applies to transmission systems and associated infrastructure (e.g. substations) and sets out the general principles that should be applied in the assessment of the application for development consent.		any reference to setting out how 'residential' impacts will be compensated for. It appears likely that the Council was intending to refer to NPS EN-1 paragraph 4.2.12, which refers to 'residual' impacts (not residential). It is not clear if this is a typographic error. NPS EN-1 acknowledges that even after the application of the mitigation hierarchy, it is likely that some significant residual effects will remain, including at paragraphs 3.1.2 and 4.1.7, the latter of which states: "Where this NPS or the relevant technology specific NPSs require an applicant to mitigate a particular impact as far as possible, but the Secretary of State considers that there would still be residual adverse effects after the implementation of such mitigation measures, the Secretary of State should weigh those residual effects against the benefits of the proposed development. For projects which qualify as CNP Infrastructure, it is likely that the need case will outweigh the residual effects in all but the most exceptional cases..." **Application Document 6.2.1.2 Part 1 Introduction Chapter 2 Regulatory and Planning Context** sets out an overview of the regulatory and planning policy framework that applies to the Proposed Project. Each topic chapter will set out the relevant legislation and policy that applies.
		Climate change, legislation and policy	**Suffolk County Council Energy and Climate Adaptive Infrastructure Policy** 2.5 The County Council has declared a climate emergency and is therefore predisposed to support projects which are necessary to deliver Net Zero Carbon for the United Kingdom (UK).	N	The Proposed Project has been designed to increase the capability of the network to carry low carbon and renewable energy from where it is generated to homes and businesses across the country. The Proposed Project will play an important part in allowing the UK to decarbonise its energy system in a meaningful way that will not only support net zero energy targets, but also deliver a more secure and resilient energy system. A lifecycle greenhouse gas assessment and a climate change risk assessment is included in the climate change chapter of the ES (**Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**). This includes an assessment of the lifecycle greenhouse gas emissions associated with the Proposed Project, as well as an assessment of the climate change risks facing the Proposed Project. These assessments have been conducted in accordance with the Institute of Environmental Management and Assessment good practice guidance for greenhouse gas assessments and climate change risk assessments in EIAs. These assessments consider the mitigation measures embedded in the Proposed Project to mitigate greenhouse gas emissions and climate change risks associated with the Proposed Project. **Application Document 7.5.13 Greenhouse Gas Reduction Strategy** has been developed alongside the climate change chapter. This document sets out how greenhouse gas emissions will be managed across the Proposed Project lifecycle.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		Climate change, inter-project cumulative effects, onshore mitigation	2.6 The County Council updated its energy infrastructure policy in May 2023, setting out its overall stance on projects required to deliver Net-Zero Carbon for the UK. However, proposals will not be supported unless the harms of the projects alone, as well as cumulatively and in combination of other projects, are adequately recognised, assessed, appropriately mitigated, and if necessary, compensated.	N	National Grid notes this local policy, which does not form part of the Development Plan, and is giving it due consideration; further information is contained in **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. National Grid also notes that paragraph 4.1.15 of NPS EN-1 sets out that where there is a conflict between local policy documents and a NPS, the NPS prevails for the purpose of Secretary of State decision making given the national significance of the infrastructure.
		Climate change, community benefits/enhancements, onshore mitigation	2.7 The policy also sets out how, in principle, the County Council will engage with and influence other parties to ensure adverse impacts to our communities are understood and addressed by future decisions. The County Council expects to have comprehensive and effective engagement with developers and their supply chain partners to maximise the local business opportunity, skills aspirations, and employment benefits. Where appropriate, the County Council and developers should promote synergies between projects that enhance these benefits, deliver growth, and attract inward investment. 2.8 The County Council expects projects to deliver appropriate community benefit schemes in addition to the necessary compensation and/or mitigation in accordance with the requirements of the regulator, Ofcom for Environmental Net Gain. 2.9 As part of the County Council's Centre of Excellence, the Council is currently developing guidance supplementary to this policy, to provide a strong technical steer to project promoters of future NSIP applications as to what they have to consider and provide to the Council, e.g. in terms of assessment approaches and types of mitigations. This will leave the County Council in a stronger position for future engagement and negotiations with project promoters.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. The former Government consulted on community benefit options associated with transmission infrastructure, and proposed the introduction of guidance in this regard. National Grid support this and believe it should be flexible, allowing community benefits to respond to local and regional need. Whilst they await clarity on the government's position, they are working to understand local and regional aspirations and priorities in relation to community benefits. They welcome the suggestions for delivering community benefits and as the project progresses, they will maintain dialogue with the County Council and other stakeholders to further inform their approach.
	Needs case	**Need for the Project** 2.10 NGET makes a case for its need to reinforce the network in and between East Anglia and the south-east of England for four main reasons: i) The existing transmission network was not designed to transport electricity from where we increasingly now generate it (largely offshore) ii) The growth in offshore wind, interconnectors, and nuclear power means that more electricity will be generated in the years ahead than the current network is able to securely and reliably transport iii) As a country, electricity demand is forecasted to at least double by 2050, increasing the amount of energy we need to transport to homes and businesses	N	The need for the Proposed Project is set out in **Application Document 6.2.1.1 Part 1 Introduction Chapter 1 Introduction**. National Grid notes the Council's summary of this information National Grid presented at its Statutory consultation. National Grid also notes that NPS EN-1 paragraphs 3.2.6 to 3.2.7 sets out that the Secretary of State should assess all applications for types of infrastructure covered by the NPS (which includes the Proposed Project) on the basis that the need for the infrastructure has been established and should be afforded substantial weight, and the specific contribution of an individual project to the overall established need is not required to be separately considered. These paragraphs are in bold typeface in the NPS.NPS EN-1 and the relevant information it contains is set out within **Application Document 6.2.1.2 Part 1 Introduction Chapter 2 Regulatory and Planning Context**.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			iv) Upgrading the existing network as it is today (such as through replacing cables to carry more power) will not be enough to carry the amount of future power whilst operating to required standards. 2.11 NGET states that, before considering building new parts of the network, it considers if existing network infrastructure can be upgraded, e.g. by building new substations, improving the transmission circuits using thicker conductors/wires on existing overhead lines, or adding smart power control devices to control the flow of electricity on parts of the network where power is needed. However, according to the company, these upgrades do not adequately address the shortfall in network capacity and several new network reinforcement projects are required, of which Sea Link is one. 2.12 According to NGET, Sea Link deals simultaneously with overcoming constraints in East Anglia – by connecting new power generation and reinforcing the Bramford to Sizewell radial circuits transferring power from the Sizewell Generation Group - and the Southeast - increasing the amount of power that can be transported to and from the south-east, helping to meet domestic demand as well as imports and exports to Europe via interconnectors. 2.13 Therefore, it should be noted in particular that in the strategic options report included in this consultation by National Grid states that: "To enable power transfer from the Sizewell Generation Group, it is necessary for all options to have a northern connection point in the Sizewell area."		
	Alternative solutions	**Consideration of Alternatives** 2.14 Four options are considered by National Grid in the detailed strategic options report. Three offshore connection options, and one alternative onshore pylon option were considered. The alternative onshore option was identified as LL1, between Sizewell and Canterbury, although this had lowest capital cost, the lifetime costs were higher, the lifetime costs were increased by the likely cost and complexity associated with tunnelling under the river Thames. Therefore, this alternative option was not considered any further by NGET. 2.15 In September 2023 Suffolk, Norfolk, and Essex county councils published a report that they had commissioned from Hirons Smart Energy Networks, to review the NGET proposals for East Anglia network reinforcement, with a focus on the need for, and timing of, the proposed 400 kV line from Norwich to Bramford to Tilbury.	N	National Grid notes this comment, which primarily concerns projects other than the Proposed Project. National Grid also notes that NPS EN-1 paragraphs 3.2.6 to 3.2.7 sets out that the Secretary of State should assess all applications for types of infrastructure covered by the NPS (which includes the Proposed Project) on the basis that the need for the infrastructure has been established and should be afforded substantial weight, and the specific contribution of an individual project to the overall established need is not required to be separately considered. These paragraphs are in bold typeface in the NPS.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			2.16 The report found that the need case for the Norwich to Tilbury pylon line was flawed, and that it was therefore unlikely to be required before 2035. The report also found that the timely development of the Bramford to Twinstead pylons and the Sizewell to Richborough HVDC link, (Sea Link) provides an opportunity to pause the development of the Norwich to Tilbury pylons, until future generation requirements a clearer and the need case has been reviewed.		
		Consultation, socio-economic, recreation and tourism, inter-project cumulative effects	**Project Engagement** 2.17 The County Council has been disappointed with the quality of engagement on the proposals, both with technical departments and with the community, particularly around socio-economic and tourism issues. 2.18 Thematic meetings have failed to engage with all technical stakeholders with some departments, including the Lead Local Flood Authority (LLFA) not having a meeting in advance of the release of the Statutory Consultation. 2.19 Engaging effectively with a community already extremely concerned with the potential cumulative impacts of several NSIP proposals in their area is essential in building trust and allowing both sides to understand the potential impacts and potential opportunities for mitigation through community benefits. 2.20 If this is not improved upon, the County Council will raise these shortcomings in its Adequacy of Consultation response at the time of submission.	N	Thematic meetings with the local planning authorities have taken place between the PEIR and ES stages of the DCO application process, including a water environment thematic meeting which included the Lead Local Flood Authority. The thematic meetings have primarily focused on discussing points raised by local planning authorities in the Statutory consultation. The meetings have been run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. A project update and Pre-submission engagement exercise took place between 22 November 2024 and 12 January 2025, focusing on design amendments made following Targeted consultation with further details contained in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. A complete cumulative assessment has been undertaken. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Coordination with other projects, legislation and policy	**Sea Link Proposals Allowing Coordination with Other Projects** 2.21 The County Council maintains its stance that coordination between projects, including the utilisation of closely parallel onshore cable routing, should be a top priority in order to minimise the impacts upon the Suffolk coastline 2.22 In respect of this stance, the County Council notes that the Sea Link proposals have been designed to coordinate with two further projects with regards to landfall at Aldeburgh, the converter station site east of Saxmundham, and the cable corridor from landfall to the converter station, via the proposed substation at Friston. This would be in accordance with National Policy Statement EN-5 2.15.1 which states that coordinated approaches to delivering offshore and onshore transmission, to minimise overall environmental, community and other impacts, as set out in detail in EN-5, must be considered. 2.23 The County Council expects that the laying of additional ducts will be undertaken if there is any possibility that further projects could use the same route in the future. This could	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application. Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			minimise considerable further disruption along the route of the cable corridor for future projects.		The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
		Coordination with other projects, design, converter station location	2.24 NGET have requested feedback regarding the potential design approach for the proposed converter station site. It is important to consider that any potential design which is chosen would in effect set the design principle for further converter stations if other projects were to utilise this site. Furthermore, the County Council considers it essential that NGET, as the first occupier of the site, demonstrates how three projects will be effectively accommodated. 2.25 Therefore, a preliminary masterplan would need to be developed for the site in consultation with relevant statutory consultees, to accommodate up to three converter station sites.	N	National Grid is working closely with NGV to establish design principles that can be adopted by other forthcoming projects looking to locate in this area and indeed on the proposed Converter Station site at Saxmundham. In accordance with the requirements for good design set out in Part 4.5 of NPS EN-1, **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** identifies the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Saxmundham Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. National Grid has developed design principles for both the Suffolk project elements. The scope of the principles is not limited to any one design discipline and instead reflect a multi-disciplinary approach for coordinated design in the round. As such the design principles cover several design disciplines including architecture, landscape architecture, ecology, hydrology, civil engineering, wider engineering disciplines, town planning, archaeology and heritage. Climate change is an important consideration as is developing the design to minimise light and noise intrusion, maximising the use of trenchless techniques in sensitive areas, and the use of sustainable construction techniques and efficient use of responsibly sourced materials (see **Application Document 7.12.1 Design Principles – Suffolk**). National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**. This Document includes information on the Converter Station Masterplan in Section 6.
		Consultation, design, converter station location	2.26 The County Council also considers that the masterplan should be developed in consultation, through a working group, with the Town Council of Saxmundham the other relevant parish councils, as defined in Schedule 1 of the Infrastructure Planning (Applications and Prescribed Forms and Procedure) Regulations 2009.	N	National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles, engaging with local design panels (as requested by the Host Authorities) to further inform the design and development process.
		Coordination with other projects, inter-project cumulative	**LionLink Emerging Proposals and their Coordination with Sea Link** 2.27 While the Sea Link proposals allow for coordination, LionLink, in its recent supplementary Non-statutory consultation, continue to consider options where coordination with Sea Link	N	National Grid is coordinating with other developers of large scale infrastructure projects in Suffolk, noting that those other projects are outside the control of National Grid. National Grid has set out details of how it has coordinated with other projects as part of its DCO application.

Date consulted	Response deadline	Consultation topic	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
		effects, consultation	would not be possible. This consultation put forward landfall options at Southwold and Walberswick which would fail to coordinate with the Sea Link proposals regarding landfall and subsequent cable routing to the converter station site. 2.28 The County Council continues to expect the fullest possible coordination and co- location of the cable corridors and infrastructure between Sea Link and the emerging proposals for LionLink, in order to minimise the combined impacts of the two projects. Any proposals that reduce the level of coordination would require robust justification as to why greater coordination is not achievable, including a full assessment of increased levels of impacts across both projects. 2.29 Failure to coordinate with LionLink could lead to the County Council objecting to the LionLink proposals at the next stage of consultation due to the lack of coordination with Sea Link. 2.30 The County Council responded to the LionLink supplementary non-statutory consultation in November 2023.		Further details are contained in **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. The Proposed Project has been designed to allow space in the surrounding area for the delivery of key infrastructure associated with the LionLink and Nautilus projects in Suffolk where it is feasible. The assessment of inter-cumulative effects with these other proposed developments is also considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Landscape and Visual In summary, based on the inter-project cumulative effects indicative screening matrix, significant cumulative effects on landscape and visual receptors are expected from the combined effects of the Suffolk Onshore Scheme with East Anglia ONE and TWO Offshore Windfarms and LionLink Offshore Interconnector at all project stages on landscape character and visual amenity. During construction and decommissioning stages only, there is the potential for significant cumulative effects as a result of the combined effects of the Suffolk Onshore Scheme and the Saxmundham South Green Neighbourhood. When considering the total potential cumulative effect of all the other developments combined with the Suffolk Onshore Scheme, there is the potential for significant cumulative effects for a short term and temporary period on the Suffolk Coast and Heaths AONB as a result of the potential simultaneous or sequential construction of the Suffolk Onshore Scheme, East Anglia ONE and TWO Offshore Windfarms and LionLink Offshore Interconnector. The concentration of construction activity associated with the landfalls and HVDC cable corridors within part of the Suffolk Coast and Heaths AONB has the potential to alter the perception of the AONB with construction of major energy projects becoming a temporary characteristic feature of the landscape. These total cumulative effects are unlikely to remain once all projects are operational, particularly once the cable corridors are reinstated and mitigation plantings become established over time. Total cumulative effects on LCAs only have the potential to be significant for LCA L1 [Heveningham and Knodishall Estate Claylands] as a result of the construction of additional converter stations and the connection at Friston associated with the LionLink Offshore Interconnector
