	security and balance of payments. More than 110 tons of wheat production will be lost from this area if this goes ahead.		In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I cannot agree with this location. This is prime grade 2 agricultural land as shown by the crops grown in the area - salad, asparagus and of course the wheat production.	N	
Sandwich Town Council	Sandwich Town Council is concerned over the choice of location for both structures. The proposed site is Grade 2 Agricultural Land.	N	
Q19 Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals?			
Local community	Use a sub soil so surfaces land top are not impacted.	N	During construction topsoil would be removed from the affected area and stored for later use in reinstatement.
Local community	All land to be used for farming where possible after construction.	N	National Grid acknowledges this comment. It is in close contact with landowners and affected farmers regarding reinstatement and what the land can be used for following construction.
Local community	Do not choose yet more Thanet farmland for mitigation. The whole of Thanet is BMV farmland and farm viability due to loss is becoming an issue. Having sold produce from this area I understand it's value for food security resilience.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

General commentary

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Our agricultural land, essential for food production, must be safeguarded against encroachment by projects that prioritise connectivity over the preservation of vital resources.	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project on agriculture both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure and the impact on best and most versatile (BMV) land. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference to EN-1 paragraphs 5.10.8 and 5.10.15, seeking to minimise impacts on best and most versatile (BMV) land. Any economic effects on landowners due to fragmentation or loss of land have been noted in the assessment and any that arise will be addressed through landowner discussions and through the compensation payments undertaken through the National Grid Lands Team; such agreements lie outside the scope of the ES. It is of note that, due to an elevated UXO risk across the Proposed Project, detailed agricultural land classification surveys have not been able to be carried out. Instead, a predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report** presents the results of the predictive modelling, which includes plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred the implications for soil type and land grade have been assessed. Preconstruction surveys are committed to, and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice (**Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk and Application Document 7.5.10.2 Outline Soil Management Plan – Kent)**.
Local community	The impact to the surrounding areas and communities cannot simply be pushed away, you are proposing to decimate high grade farming land, land that feeds the population of this country which keeps us self-sufficient and not reliant on overseas imports.	N	
Local community	The impact upon farming community will be huge with families who have farmed in the area for many generations losing their livelihoods to say nothing of their homes and identities. The area you have proposed for 2 converter stations is an area of grade 1 arable land with a main crop of wheat and beans.	N	
Local community	The site for the Suffolk converter station is land of a good quality and produces cereal crops without the need for irrigation even during the driest summers. This is the wrong location to industrialise.	N	
Local community	The 90-metre-wide corridors also would be going through and damage good irrigated agricultural land (Suffolk) with drainage pipes that have for the most part been extremely well cared for with the addition of organic matter, in some cases for more than 50 years, into a well tilled crumb and lower sub soil structure that will take many years to recover to their current use.	N	
Suffolk Coastal Friends of the Earth	The land that would be permanently lost under the footprint of the converter building and access road is currently arable land, much of it being of the best quality ranging from grades 1 to 3a. Loss of good farmland needs to be put in the context of development of the region as a whole, where vast swathes of productive land have already gone under concrete, currently worsened by the many new housing developments and the proposed Sizewell C.	N	
CPRE Kent	Loss of Best and Most Versatile Agricultural Land (BMV) It is accepted that the proposed project will result in the temporary and permanent loss of BMV land from agricultural production within the areas required for construction, maintenance and decommissioning works. While the temporary losses are deemed to not be significant, it is accepted that the permanent losses of BMV land have the potential to result in significant effects. It is also accepted that there is also the potential for construction, maintenance and decommissioning works to impact soil function and soil quality. Preventing the loss of BMV land is a significant campaigning issue for CPRE, with our recent report “Building on our food security” highlighting that in the past 12 years we have lost more than 14,000 hectares of prime agricultural land to development, including 287,864 houses – equivalent to the productive loss of some 250,000 tonnes of vegetables and enough to provide almost two million people with their five-a-day for an entire year. Further, this is	N	**Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project on agriculture both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure and the impact on best and most versatile (BMV) land. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change, efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference to EN-1 paragraphs 5.10.8 and 5.10.15, seeking to minimise impacts on best and most versatile (BMV) land. Any economic effects on landowners due to fragmentation or loss of land have been noted in the assessment and any that arise will be addressed through landowner discussions and through the compensation payments undertaken through the National Grid Lands Team; such agreements lie outside the scope of the ES. It is of note that, due to an elevated UXO risk across the Proposed Project, detailed agricultural land classification surveys have not been able to be carried out. Instead, a

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	a worsening situation, with 2022 seeing the greatest number of hectares of BMV land planned for development – equating to a hundredfold increase on the number of hectares of BMV land built on in 2010. Best and most versatile agricultural land is needed to help feed the country's population. Recent world events indicate the need to protect such land. The loss of such an important resource will compromise the ability of future generations to meet their own needs, contrary to the NPPF. It is therefore unacceptable to CPRE Kent for the relevant PEIR6 to simply conclude that, while it is likely that the extent of BMV land permanently lost will exceed the thresholds for a medium or large magnitude impact, it is not possible to mitigate for the permanent loss of BMV land. The applicant is well aware of the requirements of the EIA process, the NPPF and Thanet Local Plan Policy E16 to take a sequential approach within the site selection process to avoid loss of BMV land. We would therefore again ask what brownfield alternatives were considered but discarded ahead of detailed assessment within both the locality and at alternative landfall locations. As it is, it is again impossible to be able to conclude that the proposed location is the right location in terms of agriculture and soils.		predictive modelling approach has been utilised to assess the extent of agricultural (and BMV) land across the route. This modelling approach has been discussed and agreed with Natural England and has been based upon the recognised approach utilised by the Welsh Government Predictive ALC map. **Application Document 6.3.3.6.A ES Appendix 3.6.A Predictive Agricultural Land Classification Report** presents the results of the predictive modelling, which includes plans showing each location where the soils have been assessed and the associated grade at that point. Where design changes have occurred the implications for soil type and land grade have been assessed. Preconstruction surveys are committed to, and will be undertaken in line with published guidance and will be used to update the outline Soil Management Plans with site specific information as set out in the Defra Construction Code of Practice (**Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk and Application Document 7.5.10.2 Outline Soil Management Plan – Kent)**. The cable route will be reinstated to its previous use and therefore farming operations are able to continue post construction. Compensation claims for disturbance are considered on an evidence basis and landowners and farmers will therefore be encouraged to keep records to support their claims. Where productive land is lost as a result of the permanent infrastructure this needs to be balanced with the Proposed Project needs case, which will help the UK with British Energy Security Strategy 'Security of Supply' and with helping the UK to meet its Net Zero target to reduce carbon emissions. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure.
Substation Action Save East Suffolk	Loss of BMV land – as noted this is significant but there needs to be greater analysis. Loss of BMV land needs to be broken down, both for Sealink and cumulatively for all projects, between: i. loss during construction and duration of loss ii. loss during operation iii. loss of land used for the infrastructure itself iv. loss of land required for mitigation This needs to be expressed both in absolute terms acres/hectares and as a percentage of BMV land in East Suffolk. Further as agriculture is a key part of the local economy there needs to be an economic analysis in terms of the loss of productive land and the impact on food security.	N	Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.,10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Dr Thérèse Coffey MP	After various conversations with local farmers including those in Sternfield and Friston, their concern is that the cables are only going to be 0.9 metres underground. Farmers subject to future compulsory purchase are particularly concerned due to the nature of drainage and the effect of the sandy soil. There is a genuine risk to life if cables can be accessed so readily while farming. Any cabling needs to be at a minimum of 1.5 metres to avoid this (and engineers should explore if it needs to be further).	N	Based on feedback received during the consultation process, the typical depth of the cable trenches will be 1.5 m, see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** for further information. The minimum depth of burial of the cable to the top of the protective tile will be 0.9 m, below most land drains and held in protective ducts. Where possible, and to be agreed with the landowner, this may be deeper, but it will depend on the cable design. Any disturbance to or modifications required to the current land drainage system will be incorporated into the construction scope to ensure the land is properly reinstated and drains are left in no worse condition than prior to construction.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	This effectively sterilises a large portion of agricultural land along the proposed route for fear of interfering or damaging the infrastructure. For that reason, I would also encourage National Grid to pursue voluntary rather than compulsory purchase of what is primarily agricultural land to facilitate the cable corridor. It is vitally important that those who want to continue to farm their land can do so.		The cable routes will be reinstated post construction to allow the previous farming operations to continue. The Compulsory Purchase process requires applicants to justify any land included in a CPO application, keep it to the minimum required to deliver the proposed project and to seek voluntary agreement on reasonable terms ahead of the application being heard. National Grid is committed to seeking to acquire the necessary land rights on voluntary terms and undertake construction under those terms. A CPO application will also be progressed in parallel to ensure the project can be constructed to cover areas where no reasonable agreement can be reached and to cover any unknown land interest where diligent inquiry has not been able to identify and owner or person with an interest.
Cllr T-J Haworth-Culf	It (*Suffolk area for cable route, converter station and substation*) also has highly productive irrigated fields also producing much needed local food supporting the UK's food security requirements under an agreement with a local food grower/contract, together with managed ancient hedges.	N	A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Please see the answer to the CPRE above for more information. Where productive land is lost as a result of the permanent infrastructure this needs to be balanced with the Proposed Project needs case, which will help the UK with British Energy Security Strategy 'Security of Supply' and with helping the UK to meet its Net Zero target to reduce carbon emissions.
Local community	Thanet as a whole has more than bore the brunt of a reduction in most best and versatile agricultural land being sold off and developed for housing and this project will yet again impact on that issue. We may well need an upgrade in electricity infrastructure to meet the demands of the population but we also need the meet the food demands of the population and the use of farm land to build the convertor station has a great chance of creating a situation where the farm becomes no longer viable, regardless of whether the farmer enters into a voluntary arrangement. Our agricultural land is a precious resource and it must be protected. To Sealink, it's a couple of fields, to the area, it adds to the cumulative impact.	N	National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors (**Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual)** and recognises the importance of hedgerows with the landscape, with the mitigation section of the ES including screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
National Farmers Union	The NFU strongly feels that the operators of this project need to consult fully with landowners affected by any onshore apparatus and cable construction works. Section 3.4.13 of the non-statutory consultation report states that two events have been held for landowners in 2022, and further in Section 15 that National Grid will be in discussions with landowners over the coming months. National Grid need to engage with landowners and seek their feedback on both their proposed route and the site selection process, as well as providing information on the indicative route, any temporary compounds, and access tracks. National Grid do need to be carrying out one to one meetings on farm with landowners and tenants. It is imperative that National Grid understand the businesses that will be impacted and ensure any mitigation measures, or timings of the works, are incorporated into the scheme design and programme at the outset to try to minimise the impact. Any feedback received should be incorporated into the site selection process. The NFU notes that Volume 1 Part 2 Chapter 12 of the PEIR contains a preliminary assessment of the potential cumulative effects with other developments in the area. The project should explore options to work collaboratively with other infrastructure	N	As set out in this report, National Grid has undertaken extensive consultation with landowners affected by the Proposed Project. Consultation methods, including one to one meetings and other meetings formats have sought to ensure ample opportunity for landowners to engage with National Grid and understand how the proposals may affect their land. Where design changes are requested, these are subject to rigorous scrutiny. Where the design has been updated as a result of consultation feedback this is documented in Chapter 8 of this report. National Grid welcome's the NFU's support for coordination and is working closely with all other developers in the area to investigate where they can coordinate facilities to reduce the impact of the projects. This is set out in **Application Document 7.10 Coordination Document**. The Proposed Project will not be able to apply for its DCO relying on infrastructure proposed by other DCO's and **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022),** explains the assessment process behind decision-making for the location of new infrastructure. However, this does not mean that National Grid will not, where possible, agree with these projects should they come forward with a means of sharing infrastructure, if that is possible and it will not affect the programme of the other project. The impact of multiple projects in the area is assessed in **Application Document 6.2.2.13 Part 3 Kent Chapter 13 Inter Project Cumulative Effects and Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	projects in the area to reduce the overall cumulative effect, especially the overall impact on agricultural land and operations. The PEIR (Non-Technical Summary 3.6.2) also mentions that the project has considered an option to facilitate co-location of infrastructure with the Nautlius and Lionlink interconnector projects. This includes extra ducts for underground cables on the Suffolk part of the project, shared temporary and permanent access, and shared Biodiversity Net Gain mitigation. The NFU supports coordination between these projects to reduce the overall impact on agricultural operations and minimise the amount of agricultural land taken out of production. However, given the highly disruptive impacts of these projects, the NFU would like further clarity provided on the likelihood of this eventuality, and would expect National Grid to have engaged thoroughly with potentially affected landowners, clearly explaining the three different options, their impacts, and land take. The NFU is also aware of the recent announcement for the project to liaise with the North Falls and Five Estuaries Offshore Wind Farms and welcomes the possibility of these projects working together to reduce onshore disruption.		**Project Cumulative Effects** considers more than 25 schemes including Sizewell C, East Anglia ONE North, East Anglia TWO and LionLink. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken, informed by consultation with key stakeholders, and a rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance, such as loss of ability to irrigate a part of a field during the construction phase, are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. All soil handling (stripping, stockpiling and reinstatement) will be undertaken in accordance with good practice. **Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk and Application Document 7.5.10.2 Outline Soil Management Plan – Kent** will be submitted with the DCO application. These have been produced in line with good practice guidance including the Defra Construction Code of Practice. The oSMP contains measures informed by the site specific desk-based information and will be updated to form a detailed SMP prior to construction commencing to take account of detailed soil and Agricultural Land Classification (ALC) surveys, the detailed design and the specific contractor approach. The detailed surveys will be undertaken by suitably qualified soil scientists with expertise in ALC surveys and ALC grade assessment. This includes a requirement for an Aftercare Management Plan to be produced; this will include all measures required post-restoration to ensure the recovery of the soils to pre-construction condition. Where productive land is lost as a result of the permanent infrastructure this needs to be balanced with the Proposed Project needs case, which will help the UK with British Energy Security Strategy ‘Security of Supply’ and with helping the UK to meet its Net Zero target to reduce carbon emissions. With regard to National Grid’s work with North Falls and Five Estuaries, the Secretary of State for Energy Security and Net Zero has reviewed this study, amongst other information and has decided not to grant further funding to the consortium. The feasibility study identified that coordination is technically feasible however, it also identified an increase in capital costs of up to £890 million; constraint costs associated with an outage on the Proposed Project of over £500 million; and a programme delay for North Falls and Five Estuaries of up to five years. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's electricity system by 2030, the consortium supports the Secretary of State’s decision and will not be further pursuing a coordinated offshore connection.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
National Farmers Union	Cable depth - The NFU understands from the PEIR Volume 1, Chapter 4 (Tables 1.4.9 & 3.30) that the maximum cable depth will be 1.5m with a minimum depth of cover of 0.9mm. This depth will not be sufficient to avoid the risk of disturbance from agricultural operations. It is imperative that the cables are laid at a minimum depth of 1.2m to the top of a protective tile to ensure there is sufficient distance between the cables and farming operations to minimise risk.	N	National Grid can confirm that the minimum depth of burial of the cable to the top of the protective tile will be 0.9 m. In some instances, subject to discussion and agreement with the landowner this may be deeper, but this will depend on cable design.
National Farmers Union	Cable Corridor – The NFU understands from the PEIR that for the HDVC cables in both the Suffolk and Kent sections there will be a 40m temporary and permanent corridor. Similarly, the underground HVAC in Suffolk, if constructed independently from other projects, will have a 63m temporary and permanent corridor. However, if the HVAC in the Suffolk section is co-located with the other aforementioned NGV projects, we understand this would increase to either 95m or 112m, or potentially 131 if an HVDC is included. This range of options for co-location therefore creates significant uncertainty for those landowners affected by the project. While the NFU supports the co-location of projects to minimise overall impact on agricultural production, we would like to understand how National Grid has engaged with affected landowners along the Suffolk HVAC cable corridor to minimise disruption and provide clarity on the future of this cable route. If this co-location is to take place, construction must be coordinated and done concurrently. Sequential construction would not be acceptable and would make the land essentially unusable for a significant length of time. The NFU would like further information on how construction for this will take place for any combined projects.	N	National Grid during their consultation has provided the details of what the co-ordination and co-location of the three projects might look like; they have no control over the timescales of the NGV Projects. All three projects need to submit planning applications through the DCO process and gain planning permission for their individual assets, without this they cannot be installed. The benefits to co-location with other projects are recognised because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors, etc. National Grid Electricity Transmission is maintaining ongoing dialogue with National Grid Ventures regarding the possibility of co-locating new infrastructure. However, these are separate projects being promoted by different developers and working to different timescales for delivery. National Grid Electricity Transmission is committed to coordinating consenting and delivery with other projects where opportunities are available, including the co-location of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. With regard to the converter stations at Saxmundham, the process of site identification is based on technical feasibility parameters associated with proximity to the agreed connection location (Friston Substation), the National Landscape designation and other environmental constraints. The proposed approach for co-locating converter stations required for other projects seeks to conserve and enhance the designation by reducing the cumulative impacts that may be perceived through separate developments dispersed throughout the surrounding area. The impact of multiple projects in the area is assessed in **Application Document 6.2.2.13 Part 3 Kent Chapter 13 Inter Project Cumulative Effects and Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. National Grid is working with developers of other projects to minimise the disruption caused by the Proposed Project and, where possible, will look to provide a co-ordinated programme of works; however, this will depend on the programme of the other projects. The Proposed Project is a NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it. The approach to coordination is set out in **Application Document 7.10 Coordination Document**. Further details on coordinated construction will emerge in due course, as National Grid maintains ongoing dialogue with other developers.
National Farmers Union	Link Boxes/Joint Bay Kiosks – The NFU notes that the HVAC cable in Suffolk will feature above ground joint bay kiosks, measuring 1.2m high and 1m wide, with a minimum of two per cable connection, and more if the Sealink is co-located with other projects. Overground kiosks would provide significant disruption to agricultural operations, and the NFU would usually expect to see	N	For HVAC Cables a link box/ joint bay kiosk is required to enable inspection and testing of elements of the cable system. The sizes provided are typical sizes. Where possible these kiosks are placed at the edge of fields or roads to enable future access and minimise the impact on agricultural operations.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	much less intrusive above ground infrastructure where cables are joined, such as a manhole cover flush with the ground. The NFU would like to understand why the project requires these above ground kiosks, and why these cannot be below ground as with other projects. With regard to the HVDC cables in both Suffolk and Kent, the NFU understands that no above ground infrastructure will be required. However, the NFU would like further clarification on what link boxes may be required for these cables, as well as sizes of the link boxes and how they will be positioned in relation to the cable joint.		The HVDC cables do not require kiosks. The transition joint bay is an underground structure with a ground level access manhole which will be locked. Maintenance is required on a monthly basis to check the structure and at a five-yearly basis to check the condition of the joints. This will not be visible from the surface apart from the manhole.
National Farmers Union	Overhead Lines – The NFU understands that there will be 2.25 km of new overhead 400kv HVAC lines from the Minster convertor/substation to the Richborough to Canterbury overhead line. The NFU would like to receive clarification as to how many new pylons will be required.	N	**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** provides information on the number of new pylons.
National Farmers Union	Construction Compounds – The NFU would like to understand what type of construction compounds are required to build the project, and what negotiation has taken place with landowners/farmer in regard to the location of these compounds, as well any access requirements.	N	The construction compounds shown on the drawings are indicative. These are for the contractors to house offices, storage and parking for their plant and vehicles. National Grid has consulted landowners on the Proposed Project and their feedback and comments taken into account in the revised design.
National Farmers Union	Biodiversity Net Gain – The PEIR Vol 1 Ch 1 mentions National Grids commitment to 10% Biodiversity Net Gain across its construction projects. The NFU would like to see a full consultation with landowners over the location of land proposed for any environmental mitigation or BNG, to ensure it is located in areas that are less productive or that have the least impact on agricultural operations. The NFU would like to know what total area is required to meet the BNG requirement for this project, and what research has been done to locate BNG on areas of existing habitats and the possibility of enhancing these habitats, rather than taking land out of agricultural production. The NFU does not support compulsory acquisition of any agricultural land for the purposes of delivering Biodiversity Net Gain. If the project needs to acquire additional land to deliver such gain, then this should be acquired through voluntary negotiations.	N	National Grid is working with local stakeholders to understand the opportunities for optimising Biodiversity Net Gain that is to be delivered by the Proposed Project and avoiding the need to use compulsory acquisition powers for delivery. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. All landowners affected by the Proposed Project have been consulted and feedback taken into account.
National Farmers Union	Heat Dissipation – Heat dissipation, which can impact the land for the lifetime of the project, is a concern among farmers affected by the underground cable sections of the scheme. We have seen examples of heat dissipation on previous underground cable schemes, and they can have a significant impact on the crops growing in affected fields, such as crops growing at different rates, significantly complicating agricultural operations. Please can you confirm the measures taken to reduce the impact of heat dissipation on the scheme?	N	Electric current passing through the cables generates heat that must eventually be dissipated to the atmosphere. The heat dissipation is limited in part through the temperature limit at which the cables can operate. The cable is designed to limit the maximum temperature that occurs at the 'worst case' location along the entire route. This 'worst case' is generally the location where the cable is at the greatest depth, this is generally associated with a trenchless installation or another crossing point where the cable passes under a watercourse or embankment, etc. Therefore, if the peak temperature is reached at this 'worst case' location then the temperature at shallower depths along the route, such as through agricultural fields, will always be lower than this peak value as the cable is the same throughout. The cable system design is developed in accordance with the relevant National Grid Technical Specifications. These consider the seasonal variations of ground temperature

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			and the system is designed based on the most onerous seasonal ground temperature considered, Summer. Note the ground temperature is taken at 1 m depth. Further mitigation is provided through the separation of the cables and the provision of a thermally suitable surround material that helps to dissipate the heat uniformly away from the cables before it is conducted into the surrounding ground.
National Farmers Union	Impact on Agricultural Businesses – The NFU feels strongly that the impact the project will have on agricultural businesses needs to be considered in the development of the project. The NFU note in AS03 of the PEIR Vol 1 Part 2 (and 3) Chapter 7 that the access to agricultural land will be maintained during construction, although this may require temporary restrictions to access. It further goes on to say that means of access to affected properties/facilities/land parcels will be notified at the start of the project. National Grid should already be in discussions with potentially affected landowners over any potential restrictions to access in order to allow them to plan well in advance of construction and mitigate any disruption to agricultural operations. The construction and surface apparatus may cause significant disruption to agricultural land and businesses. The NFU would expect there to be consultation with farmers over practical matters including access, position of surface apparatus and accommodation works required to mitigate the impact on agricultural businesses. We note that 5.6.4 of the PEIR Non-Technical Summary acknowledges land parcels managed under agri-environmental agreements such as Countryside Stewardship, and that this will be further explored in the preliminary environmental assessment. The NFU would like National Grid to take into consideration the impact of construction on agri-environmental schemes and aim to avoid these areas where possible.	N	Potential impacts on agricultural operations have been assessed based on the final design presented within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Issues such as fragmentation of land parcels has been identified and, where applicable, mitigation set out. All landowners and occupiers affected by the Proposed Project have been consulted and feedback taken into account. Accommodation works will be discussed and agreed prior to construction commencing to minimise the impact and disturbance as far as possible. Where agri-environmental commitments are identified, National Grid is engaging with landowners and other relevant stakeholders to understand the potential effects of development. Details are contained in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils and Application Document 6.2.3.6 Part 3 Kent Chapter 6 Agriculture and Soils**.
National Farmers Union	Drainage - The CoCP (1.4.A.2.61) mentions that a surface water drainage strategy will be prepared and submitted alongside the DCO application, and a Drainage Management Plan (DMP) will be prepared prior to the commencement of works. The NFU is pleased to see that there will be consultation with affected landowners on existing land drainage. However, it is essential that the Project appoints a local drainage consultant to help develop and design both pre and post construction drainage plans.	N	National Grid acknowledges these comments and is engaging with local stakeholders to inform their understanding of the project area. Commitment W14 of **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** states that the appointed contractor shall develop a Drainage Management Plan which must be submitted to the Local Planning Authority for approval prior to construction. The Plan will demonstrate how surface water runoff will be managed during construction and how surface water would be managed during operation including maintenance of the drainage infrastructure over the lifetime of the Proposed Project. The requirement is secured through Requirement 6 of Schedule 3 of the draft DCO (A**pplication Document 3.1)**.
National Farmers Union	Soils - The NFU prefers to see infrastructure schemes avoiding best and most versatile (BMV) land but does understand that for linear schemes this is very difficult especially when there is a fixed end point. Due to the amount of BMV agricultural land being impacted on a temporary basis it is important that the reinstatement and aftercare of the soils is carried out to a high specification and at the right time to achieve favourable results.	N	National Grid acknowledges the comments and concerns. **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils** assesses the impact of the Proposed Project both during construction and operation, as well as the temporary and permanent land take for different aspects of the infrastructure. The potential impact any development which disrupts agricultural activity has on food security is complex given the range of variables involved. For example, productive land may not actually be used to its full potential, the extent of food imported can change,

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The CoCP ref AS01 mentions that soil management measures will be included in the Construction Environmental Management Plans (CEMP), and further lists various measures that will be included. The NFU would like to see further detail on this outlined prior to the DCO submission.		efficiency of transport routes can be affected by a variety of events, the role influence of big supermarkets has will vary and so on. In terms of policy, there is no requirement to have to take account of food security other than the reference (EN-1 paragraphs 5.10.8 and 5.10.15) to seeking to minimise impacts on best and most versatile (BMV) land; the assessment of impacts on BMV land is addressed within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Mitigation measures including but not limited to sensitive routeing and siting, restoration of land and its return to pre-construction use and rationalisation of the design to minimise permanent land take requirement are included within **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Further measures relevant to the control and management of impacts to BMV land during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
National Farmers Union	The NFU would welcome the opportunity to engage with the Project on this and for the wording to be included within the Outline Code of Construction, so that it is taken forward and becomes binding on contractors under the Code of Construction. The NFU wording covers the following: a) Role of an Agricultural Liaison Officer b) Records of Condition c) Biosecurity d) Irrigation e) Agricultural Land Drainage f) Treatment of Soils g) Agricultural Water Supplies	N	National Grid has an established and effective code of construction practice which has been used on many projects and covers the topics suggested, refer to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. In addition, **Application Document 7.5.10.1 Outline Soil Management Plan – Suffolk** and **Application Document 7.5.10.2 Outline Soil Management Plan – Kent** provide details on the effective management, protection, and reinstatement of soil resources for the Proposed Project. This includes but is not limited to the following: • a section on roles and responsibilities which outlines key activities to be undertaken by the Site Environment Manager and a Soil Scientist. • information on the various items that require monitoring, which includes soil condition. The findings of all examinations and assessments will be recorded and held by the Contractor for record keeping and to enable actioning of any necessary corrective actions. • construction methodologies will be such that appropriate biosecurity (disease and pest control) and weed control measures are in place to protect both on-site soils and adjacent land holdings. • ensuring good drainage, subsoiling will include a straight run across the width of the reinstatement area at an angle of approximately 45° to any slope followed by a subsequent oblique pass. • treatment of existing vegetation and overburden treatment.
National Farmers Union	Voluntary Agreements - The NFU would like to know when it is proposed to enter into voluntary agreements with affected landowners and occupiers. The NFU would like to see these discussions start as soon as possible to enable these discussions to progress ahead of the submission of the DCO.	N	National Grid has been conducting discussions around voluntary agreements on an ongoing basis and will continue to maintain dialogue where necessary throughout the application and examination period, as is the norm.

Table 1.7 Traffic and transport

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback Form			
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	Are Sealink intending to widen the B1121? Are they proposing to offer compensation to the residents of the B1121?	N	At the junction of the B1121 and the new permanent access road to the converter station, a permanent bellmouth would be constructed to allow vehicles to turn safely from the B1121 into the access road. The proposals can be viewed in **Application Document 2.14.1 General Arrangement Plans – Suffolk**. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation?			
Local community	Completely unsuitable road network to support this scale of construction. The A1094 is totally unsuitable for large amounts of construction traffic and two lorries cannot pass in places.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. This includes the A1094. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The choice of Friston is a bad one as our roads are country lanes and will not cope with the traffic required during construction or after. We have tourist traffic in the summer and at weekends which make it difficult for locals.	N	National Grid is obliged to fulfil the connection agreements that exist in this area. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** and **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. Impacts associated with the operational and maintenance phase were scoped out of the assessment on the basis that the vehicle movements associated with this phase will be infrequent and low. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q4 What do you think about our proposed HVAC cable route in Suffolk. Comments			
Local community	The digging of cable routes will be highly disruptive to what is already a problematic traffic problem on the affected roads; these	N	The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** The

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	roads are not suitable for the HGV vehicles involved in the development.		assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. Impacts associated with the operational and maintenance phase were scoped out of the assessment on the basis that the vehicle movements associated with this phase will be infrequent and low. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	It will cause disruption to people's lives and make roads worse to travel.	N	
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	The road network is not designed to accommodate the inevitable traffic that would be involved in the construction. The A12 would not cope and emergency services would be delayed, as would we when we go about our daily lives.	N	The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. During the development of the Proposed Project design, National Grid has engaged with the relevant stakeholders in order to understand and address any issues of concern regarding the Proposed Project and its impacts on emergency services. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The roads in this part of Suffolk were never built for the industrialisation of this rural part of Suffolk and the "A" and "B" roads will be grid locked with all the extra vehicles on our roads.	N	
Q7 What do you think about our proposed HVDC cable route in Suffolk? Comments			
Local community	Your representative on consultations took us through the haul route proposed for the corridor. He could not say whether Leiston Road in Aldeburgh would need to be closed or confirm that there would be no use of public roads. Consultation on other developments have confirmed Leiston Road is to be used by them and it is the major route for every services.	N	Although the Proposed Project is located close to a number of towns/villages including Saxmundham, Leiston and Friston, only a small proportion of trips are expected to either originate from or pass through these settlements during the construction, operation and maintenance, and decommissioning phases. The routes to/from the proposed site accesses are illustrated by the HGV routeing plan shown in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. All construction vehicles will travel to/from the access points via the A12, with the majority of these then using the B1121 Main Road, or the A1094 and B1069 Snape Road. Additional routes with considerably fewer construction vehicle movements include the B1119 Church Street, the B1121 Aldeburgh Road and B1121 Saxmundham Road, Leiston Road, as well as Thorpe Road for S-BM13.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	My main concern is heavy lorries on our local roads. The local 'main' roads are not wide enough for more heavy lorries. Car drivers already need to stop for wide lorries to get past on the A1094 and B1069. When the B1069 goes towards Leiston, the path is too narrow through Knodishall for residents - especially with pushchairs. As the B1069 goes through Leiston, there are places where car drivers have to slowly drive with wheels on the pavement to allow lorries to pass. With more heavy lorries, the road surface will	N	The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	deteriorate even faster, with more dangerous potholes. Heavy lorries will pose dangerous problems for the many local cyclists, many of which are children.		Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	All these proposals are going to share the same timeframe as Sizewell development. There is not enough road and rail access to support this at the same time.	N	The potential impacts on traffic are assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment takes account of the construction traffic management plans for Sizewell C. National Grid's plans will be prepared considering the plans for Sizewell traffic, e.g. peak traffic movement times will be programmed in consideration of each other wherever possible. Cumulative traffic impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Local community	Will the proposals during construction affect local traffic and transport facilities?	N	The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.
Local community	At the event, your representative advised that when crossing the B1122 Leiston Road and the B1069 Snape Road, both roads will need to be closed for a period of 3-4 weeks for the cable crossing works. Whilst he did add that these would not be done at the same time, nor would these be done during the very heavy summer tourism months of June – October, this is nevertheless absolutely not acceptable. 85% of the people who work in Aldeburgh, live in the Leiston area and need the B1122 Leiston Road to remain open. Also, the Leiston Doctors surgery covers for over 1,000 people that live in Aldeburgh. Likewise, most of the remaining working population that live in the Leiston area use the B1069 Snape Road to get to their work in and around Suffolk. You urgently need to develop this with the Highways agency and do some road use monitoring. Should this project ever be allowed to go ahead, then where you are proposing to cross these roads, you need to arrange to drill and insert ducts underneath the road to pull your cables through.	N	The description of the route and the assessment as detailed within **Application Document ES 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** sets out all of the road links, junctions and PRoW (including national walking and cycling routes) that may be subject to potential effects as a result of the Proposed Project. The construction vehicle routeing has been designed to minimise impacts across the highway network (including the A1094, B1122, B1069 and B1119), as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. The traffic and transport assessment within **Application Document ES 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the parts of the network identified (A1094, B1122, B1069 and B1119). The proposed management and mitigation relating to PRoW is set out within **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. The Management Plans are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Many constructive points were fed back to SPR in their consultation. It seems none of them have been considered in this early consultation including traffic and movement of HGV's in the village of Friston. It should not be near the village green where children play, and Grove Road is a single land through the village and cannot cope with construction traffic for this large project.	N	While National Grid is coordinating with SPR where possible (see **Application Document 7.10 Coordination Document**); these are separate projects that are being delivered on different timelines. Although the Proposed Project is located close to a number of towns/villages including Saxmundham, Leiston, and Friston, only a small proportion of trips are expected to either originate from or pass through these settlements during the construction, operation and maintenance, and decommissioning phases. The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	You make no, or very little, reference to the possibility of using the railway line for bringing goods on site. You show two possible access points for the converters outside Saxmundham. The northern access could be augmented by putting a railway siding in to the north east of Saxmundham, and then transporting goods by rail. This combined with a bridge over the railway line to the north of Saxmundham would mean this northern access would cover both road and rail access. This would be preferable to the south access because it would allow the use of both rail and road.	N	The potential to deliver construction materials by rail was investigated at the scoping stage although limited benefits were identified and this was not pursued as HGVs would be required to transport materials between railway sidings and the Order Limits in any case, and the use of the railway line for freight could potentially impact rail passenger services on the main line and Sizewell-related services on the branch line. Nonetheless, the southern access has been taken forward and the northern access no longer forms part of the proposals. Therefore, if railway sidings north east of Saxmundham were to be used then this could result in construction traffic on less suitable roads between the railway sidings and the Order Limits (including additional traffic through Saxmundham itself). Equally, if railway sidings were provided south of Saxmundham to be nearer to the selected southern access point, there would be no benefit in terms of local traffic as construction vehicles would still be required to use the B1121 Main Road to travel to/ from the proposed access point.
Local community	We have very few major roads in East Suffolk and no motorways. Most of our roads are B & C roads or less. These will hardly take the local traffic at times never mind anything large and heavy. The general state of roads in East Suffolk is not good and anything you add on to them will not improve the matter.	N	When considering proposed access routes for the Proposed Project, National Grid has given consideration to the nature of the local roads and has endeavoured to minimise impacts as far as is reasonably practicable. The potential impact of the Proposed Project on the local road network is assessed in **Application Document ES 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.
Local community	It is apparent from the Consultation which has taken place there is little detail on the volume and impact construction traffic from the Sea Link development will have on the village of Friston. It appears we, the residents, must wait until the Preliminary Environmental Information Report (PEIR) is produced before we can have all the facts regarding numbers of vehicles and their routeing. This is a lamentable method of consulting on the part of National Grid. The maps produced while they are numerous in quantity, provide no clarity about the route's construction traffic will take or the purpose of indicated access points. Near Friston there is but one A road, the A1094. It is narrow with restricted passing in areas such as Snape Watering. Access to Friston vicinity from the main trunk road, A12, requires travel on minor B roads. It is inconceivable that these B roads have the capacity to cope with the density of traffic required during the construction of a development such as Sea Link. In addition, the cumulative impact of traffic associated with other proposed projects such as Sizewell C, SPR, Lion Link or Eurolink would be unacceptable on such minor roads already in a poor state of repair. The reality of any increase in road traffic to this extent is unacceptable because of congestion on narrow roads an at junctions, danger to cyclists and pedestrians in the absence of refuges such as pavements or passing places, increase of collision risk brought about by the proximity of HGV's reducing the visual field and ingress on to oncoming lane, and fear and intimidation of residents when confronted by HGV's moving on narrow roads.	N	The PEIR was one of the documents shared by National Grid during the Statutory consultation. The traffic impact assessment presented in the PEIR was further developed in the Proposed Project ES. Details are contained in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. This chapter of the ES considers traffic impacts in Suffolk in relation to existing traffic and pedestrian route severance, pedestrian delay, non-motorised user amenity, fear and intimidation, driver delay, road safety and PRoW closures and diversion. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts. The routes to/from the proposed site accesses are illustrated by the HGV routeing plan shown in **Application Document 6.2.2.7 Part 2 Suffolk Traffic and Transport**. Cumulative traffic impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Friston village is a community with a mix of permanent residents, holiday homes and second homeowners. The village is known for its tranquillity and rurality. If, as National Grid suggest, the B1121 is to be used as a major route for HGV's and support traffic the village will be severed. This will be a tragedy for the community to access the amenities in the village it is necessary to cross the B1121. For example, The Village Hall, The Church, The Pub. All these places where people meet essential for the village life will be at risk and become dangerous to access from either side of the B1121. In addition, there is an extensive Village Green which is regularly used for recreation and Village events. This green is unfenced with only a narrow footpath dividing it from the B1121. Construction traffic along this stretch of road, classified as a "high risk road," would only increase the dangers already identified.		
Local community	Within the Feedback Form, page 5, the map shows access points off the B1121 at Friston House, Moor Farm and Red House Barn. There is no indication as to the use of these access points. This is a failing in this consultation as their proximity to the village of Friston and the potential for traffic of all designations HGV, LGV and support vehicle use is a serious omission on the part of this consultation. A development such as is proposed must by its nature need a large volume of traffic.	N	Maps which show the selected access routes are shown in **Application Document 2.2.2 Suffolk Location Plan, Application Document 2.7.1 Access, Rights of Way and Public Rights of Navigation Plans and Application Document 2.14.1 General Arrangements Plans – Suffolk**.
Local community	I have seen some plans which propose construction roads to the new Converter Station running south of Hurts Hall and accessed just past Peggs Building Supplies Store. If this was built, could it be considered as a permanent relief road to the central Crossroads and traffic lights in Saxmundham to give easier access to the Leiston Road? This would relieve what is sometimes very heavy traffic at these crossroads in the centre of town. Likewise a similar Construction route between Kelsale Road and Saxmundham is proposed to link to the Converter Station area, but I'm not sure if this could also become a permanent link.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the parts of the network identified (B1353 and B1122). The access routes of access tracks for the Proposed Project will not be made available as publicly accessible roads.
Local community	Preference for access route to the Saxmundham converter station (if built here) - this should be option 1 if at all possible, as it avoids the town of Saxmundham and the problems with the junction there, additionally route 2 crossing the main road (B1119) doesn't make much sense to me, although this is one option for turning this access / construction road into a possible bypass route for the town for traffic from the north at least (including access to estates on the east of Saxmundham). If this is done, providing an actual	N	National Grid acknowledges this comments. Following feedback received during Statutory consultation and upon further evaluation, it has selected a modified version of the proposed western access route for the Saxmundham converter station site. This was known as Option 3 at Statutory consultation. Selecting the western construction and maintenance access route means that National Grid has removed the alternative northern (option 2) and southern (option 1) access routes from their plans. The southern access route, following further review, is not suitable for the construction traffic required. The northern access route, which is approximately double the length of the western alternative, would have required bridge crossings of the River Fromus and one or both of the railway lines. There are engineering challenges associated with the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	community benefit, then access road option 2 becomes a good choice, but only in that instance.		construction of these bridges, including the likelihood of significant works being required to either the B1121 or the River Fromus itself. Construction work would have also been required in the immediate vicinity of residential properties at Oak Close and along neighbouring streets in Saxmundham. These factors increase the risk of delay and could result in a longer construction period, hence the decision to remove the northern access route from the proposals.
Q14 What do you think about our proposed converter station and adjacent substation near Minster?			
Local community	This is a small village with tiny lanes for traffic. I think this will cause chaos during construction, especially for parents getting children to school from Cliffsend.	N	National Grid has undertaken a complete and full assessment of traffic routes for construction. Details are contained in **Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.
Q17 Anything else? Comments			
Local community	The cable routeing for the Kent site will cross multiple roads and cycle paths. Are there plans in place to ensure these stay open during the construction?	N	Outline PRoW management plans have been prepared for both Suffolk and Kent as part of the DCO application. These have been developed in consultation with the relevant local planning authorities and provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**. **Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent** is provided to help mitigate any potential impacts. These documents include construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q18 Do you have any key concerns regarding the construction stage of Sea Link (Other)?			
Local community	Please plan traffic and road closures/diversions with special attention to the routes. That will really help the process.	N	National Grid has undertaken a complete and full assessment of traffic routes for construction. Details are contained in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent** are provided to help mitigate any potential impacts. These documents include construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. These Plans are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Traffic lights holding up journeys.	N	
Local community	The potential for rumblings of traffic and construction will disrupt the local residences in Saxmundham. The proposed converter site in Saxmundham is way too close to where children and families live. It's also across a popular walking route. My children and others in Manor Close will see a huge volume of construction traffic when trying to cross Church Hill. Put in a pedestrian crossing.	N	The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. The potential impact of traffic associated with traffic during construction of the Proposed Project is contained in **Application Document 6.2.2.7 Part 2 Suffolk Traffic and**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Transport which concluded that there are no likely significant effects. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q26 Do you have any further comments about our materials, consultation process or any suggestions for how we can improve our consultation?			
Local community	Do traffic surveys and tell the public how much construction traffic will be needed.	N	As part of the assessment of the potential impact of traffic that will be generated by the Proposed Project, both automatic traffic counts and manual classified counts were undertaken, together with a review of existing secondary information. Predictions on the volumes of traffic that will be generated by the Proposed Project in all its development phase are contained within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport**.
General commentary			
Local community	The local roads are notoriously bendy with many accidents so it would be beneficial if the location of the Suffolk converter station could be combined, as a planning gain, with a new piece of road replacing the existing road from the edge of Saxmundham as far as the junction with the roads to Friston and Knodishall and providing (partially utilising the newly redundant bit of road) new public footpaths from Sternfield and Friston through to Clay Hill in Saxmundham.	N	An assessment of road safety is set out within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** which has been informed by collision data obtained from Suffolk County Council for the surrounding highway network. The Converter Station will be served by the southern access, forming a junction with the B1121 Main Road to the south of Saxmundham. Construction vehicles will be required to travel to/ from the south (via A12) so that these do not pass through Saxmundham. Therefore, construction vehicles will not pass through Saxmundham other than during mobilisation works when limited construction vehicles (fewer than five HGVs per day) would travel to/ from an access on the B1119. The construction vehicle routeing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Two routes proposed via Bigsby's Corner (southern) and through Kelsale (northern) will impact traffic in the rural area. The northern route could be integrated into the Saxmundham bypass in the future, where the southern route will only be used for site access during the build and has limited impact other than a slightly shorter journey to the site. Single access via the northern route makes more sense and reduces traffic down the small roads around Sternfield. If the track to Hill Farm is also under consideration, then many HGV's through Sternfield will be detrimental to our quality of life in this rural community.	N	Following feedback received during Statutory consultation and upon further evaluation, National Grid has selected a modified version of the proposed western access route for the Saxmundham converter station site. This was known as Option 3 at Statutory consultation. Selecting the western construction and maintenance access route means that National Grid has removed the alternative northern (option 2) and southern (option 1) access routes from its plans. The southern access route, following further review, is not suitable for the construction traffic required. The northern access route, which is approximately double the length of the western alternative, would have required bridge crossings of the River Fromus and one or both of the railway lines. There are engineering challenges associated with the construction of these bridges, including the likelihood of significant works being required to either the B1121 or the River Fromus itself. Construction work would have also been required in the immediate vicinity of residential properties at Oak Close and along neighbouring streets in Saxmundham. These factors increase the risk of delay and could result in a longer construction period, hence the decision to remove the northern access route from the proposals. The access route at Kelsale has now been discounted, with the preferred option coming into the site from the south. It is acknowledged that the Proposed Project will be under construction alongside other schemes in the area. The assessment of inter-cumulative effects is considered within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** based on **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List** which includes more than 25
Local community	It is of great concern that until either the North haul road via Kelsale or South via Benhall is built, traffic will enter Saxmundham from the A12 to Benhall, South Entrance to the traffic-light controlled junction, turn right to Church Road, then Church Hill. This junction can be very busy at times and is used by pedestrians, cyclists, mobility scooter users, LGVs, HGVs and two bus services as well as shoppers visiting Waitrose and Tesco. Church Road is especially dangerous for pedestrians and mobility scooter users, there is an obscured zebra crossing and bus stops either side of the road. Increased traffic at this point is undesirable, especially if the construction phase coincides with a Sizewell B outage or the build of Sizewell C. Consideration should be given to finding an	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	alternative site for the converter, or at least reducing the number proposed, to alleviate the cumulative effects of traffic movement. It is apparent that should consent be granted for more than one converter station, the haul road will not be a temporary roadway. Consideration should be given to the residents of Benhall, Kelsale and Sternfield. These villages appear to have been ignored in the PEIR Traffic and Transport section, where only Leiston, Friston and Saxmundham are mentioned.		developments including Sizewell C Nuclear Power Station, East Anglia ONE North Offshore Windfarm, East Anglia TWO Offshore Windfarm and LionLink. This includes assessment criteria relating to traffic and transport, as covered within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. This Document also includes a review of the collision record (based on full collision data obtained from Suffolk County Council) and an assessment of Road Safety and Hazardous/Large Loads for the study area during the construction phase. This demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the road safety of the B1121, with the proposed embedded mitigation and control and management measures in place, as identified within the **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan - Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further consultation was held with Suffolk County Council as the ES was prepared.
Local community	It has just come to our attention that one of the proposed routes for a link/ haul road to service a convertor station at Wood Farm, Saxmundham, could be from Dorley's Corner, Kelsale to a newly formed and constructed road to be built opposite Carlton Park. It does not even seem possible that such a consideration has been put forward, this route travels past a cluster of many houses, both council owned and those in private owner ship, new estates that have just been completed or nearing completion, it also passes on a daily bases the school route of the children catching buses to higher education, along with the local primary school, the cost of creating a bridge over the railway line must also put it beyond common sense, in addition we are all hoping that the new health centre will be built at the very point of departure from the B1121 on to the proposed new link road. If you wish to disrupt so many people's lives and the devaluation of their homes, why don't you dismiss this route and use the other proposed route on the south side of Saxmundham, this route does not include the building of a bridge, it only interferes with a hand full of properties, we are all aware that the owner of Hurts Hall has a lot of say locally, but that does not give reason to basically destroy people tranquillity, the very reason they purchased properties where they did. Save the extra cost of bridge building and put it towards the new health centre and give Doctor Havard the chance to improve an already good practice. One last note. We own the Whitearch Residential Park in Benhall, the south route would pass directly past its entrance, we would rather this than Dorley's Corner.		
Local community	The impact of construction traffic in Suffolk cannot be under estimated and it is a totally negative and damaging impact. The cumulative effect of a staggering 6 proposed energy projects being built over a span of 12-15 years is almost indescribable in terms of the negative impact this will have. This is an area where we have to depend on cars to get around; to get children to school; to get to the doctors; to get shopping done; to get deliveries; to even get to the station to get train out of here. This area is classed as one of the most 'remote' in Suffolk taking into account access to essentials (doctors, dentists, shops). As a rural area farmers have to move their tractors and combines around adding to the mix on the A12.	N	National Grid has undertaken a complete and full assessment of potential traffic impacts of the Proposed Project in Suffolk. Details are contained in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. During the development of the Proposed Project design, National Grid has engaged with the relevant stakeholders in order to understand and address any issues of concern regarding the Proposed Project and its impacts on emergency services. The potential for cumulative impacts arising as a result of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The potential impact on emergency services is assessed in **Application Document 6.2.2.11 Part 2 Suffolk Health and Wellbeing** which concludes that there are no likely significant

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The area and its occupants and those who need to travel through depend on the A12 and the A and B roads to exist. Anyone needing an ambulance in a medical emergency will be potentially faced with the prospect of their lives being jeopardised with the crew stuck in traffic. It would be interesting to see what risk mitigation strategies are proposed to deal with that issue.		effects. The construction vehicle routeing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network (including with regard to Driver Delay), with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Residents of Friston were assured that heavy traffic would not be routed through the village, by Scottish Power and National Grid, yet the SeaLink proposals suggest up to 80 or more movements a day during the construction's peak, through the village. Which undoubtedly will result in single lanes, such as the very residential Mill Road becoming rat runs. This blatant disregard for promises made to the community is a disgrace and further erodes the trust between residents and National Grid SeaLink. Considering the potential adverse effects of construction-related traffic on the daily lives of Friston residents, I strongly urge National Grid to implement stringent traffic management measures. Specifically, I propose the restriction of construction activities from 1:00 pm on Saturdays until 7:00 am on Mondays. This measure would be necessary to provide the community (communities) with much-needed respite during weekends, allowing for some peace and quiet. This was promised at the Scottish Power consultations.	N	The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid cannot comment on the projects that are being undertaken by SPR but has consulted them at all stages of the Proposed Project's development. It has assessed the impacts of the Proposed Project together with other projects in the area in **Application Document 6.2.2.13 Part 2 Suffolk Inter-Project Cumulative Effects**.
Local community	As a resident of the parish of Benhall and Sternfield I am very concerned about safety and the impact of a significant increase in traffic during construction of this enormous infrastructure – if it does, sadly, go ahead. This is especially in relation to the safety of existing road users. For example: * At the A12/B1121 junction there will be conflict between turning traffic and overtaking traffic northbound, compounded by Sizewell C traffic on the same timescale; * the footway from Benhall to Saxmundham is along the west side of Main Road, whilst all but a few houses are to the east; there needs to be safe crossing points. – in addition, some school pupils walk between Benhall and Saxmundham, along Main Road; * there is a potentially fatal conflict between lorries and vulnerable road users (cyclists and equestrians); * also, the significant increase in HGVs from the proposal makes it imperative that vulnerable road users are separated from the main carriageway; Benhall is little more than a mile from Saxmundham, and non-motorised travel is encouraged; further, a cycle route to Saxmundham and beyond is signed from the A12, south of Benhall Green.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes a review of the collision record (based on full collision data obtained from Suffolk County Council) and an assessment of Road Safety and Hazardous/Large Loads for the study area during the construction phase, including the A12/ B1121 junction and the B1121 Main Road to the south of Saxmundham. This demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the road safety of the B1121, with the proposed embedded mitigation and control and management measures in place, as identified within the **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan - Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further consultation was held with Suffolk County Council as the ES was prepared. Further clarification has also been provided where requested.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	In order to leave Curlew Green and Dorley's Corner, residents need to get access onto the B1121 which is already a very dangerous road as the T junction is very close to the brow of the hill, causing poor visibility, there have already been two collisions that I know of, because of speeding cars colliding with stationary cars turning into Curlew Green. When leaving Curlew Green and turning right towards Saxmundham I have, on numerous occasions pulled out with a clear road only to be overtaken by a speeding car although it is a 40mph limit, cars regularly speed 50-60mph and do not slow down for the 30mph speed limit change. This also makes the road and footpath very dangerous for anyone walking, cycling, horse riding and walking to school, having to cross the B1121 in order to reach the only footpath into Kelsale and its local amenities, Village Hall/post office, Social club and Church, this is also the only pedestrian route for children walking to the recreation ground in Kelsale. With the expected 458 vehicular movements per day arising from the Sealink works this is going to be a nightmare for Curlew Green and Dorley's corner residents, extra noise, extra pollution, danger to life and mental wellbeing. The project is proposed to take five years, and I am concerned that the road will be made unsafe by this extra vehicle use, furthermore the proposal has two further converter stations which could be built at any time either during the initial construction or in years to come this has not been factored as far as I can tell into the time periods already suggested.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes a review of the collision record (based on full collision data obtained from Suffolk County Council) and an assessment of Road Safety and Hazardous/Large Loads for the study area during the construction phase, including the A12/ B1121 junction and the B1121 Main Road to the south of Saxmundham. This demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the road safety of the B1121, with the proposed embedded mitigation and control and management measures in place, as identified within the **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan - Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further consultation was held with Suffolk County Council as the ES was prepared. Further clarification has also been provided where requested.
Local community	At the consultation there was no coherent plan put forward from the developer as to who would be responsible for the policing of contractors and sub-contractors with regard to them adhering to any traffic requirements that may be in place. Such as making sure all contactors use only roads that they were designated to use, etc. When asked what sanctions would be applied to contractors who did not follow the guidance there was no coherent answer. This left the impression that the main contractor really did not care about the disruption that increase in traffic movements in the local area was going to cause. They were also very vague as to who would be ultimately responsible for policing of traffic and what the course of action would be for members of the public to follow should there be problems caused be contractors traffic movements.	N	Controls regarding construction traffic movements will be secured as part of **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**, which includes a section on monitoring and enforcement, to ensure contractors adhere to the agreed routeing strategy. The proposed measures and controls within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** are set out as follows: • working hours restrictions; • road condition surveys; • delivery management system; • traffic management and monitoring; • defining HGV routes; • HGV timing restrictions; • banksmen and site management; • communication strategy; • appropriate site access arrangements;

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• necessary escort, permits and traffic management for AILs; and • measures to minimise/safely manage interactions with pedestrians and cyclists. In addition, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** includes a section on community engagement and public information. A community relations team will be appointed to provide dedicated community relations and external communication support during construction. A free telephone project helpline and project website will be maintained. The community relations team will record the details of any complaints to allow these to be investigated and appropriately managed. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Aldringham-cum-Thorpe Parish Council	Construction Traffic through Aldringham We refer to Annex B – Construction Site Area Sections of Sea Link Preliminary Environmental Information Report Volume:2 Part1 Introduction, Appendix1.4.B Outline Construction Traffic Management Plan (Suffolk Onshore Scheme) October 2023, NATIONAL GRID (SEALINK) ORDER SUFFOLK Council- Suffolk Peak=MMD-SEAL-ENG-DWG-0250: Forecasted volumes of HGV/ LGV traffic through Aldringham on B1353 and B1122 would seem to be relatively light (10 vehicles per day, in and out,) in the context of the peak total of 946 HGV/LGV vehicles per 12 hour day (co-location scenario) across all local roads and relative to particular local roads such as for example B1069 and A1094. However, our residents would inevitably suffer congestion and delay. There are no alternative routes available for travel to almost anywhere beyond the proximity of our homes in the Parish. 1. Suffolk Onshore Scheme, Section Number 3 Construction Traffic along B1153 and B1122. NGET plans to use the narrow B1353 (Aldringham Lane) between existing road junction on B1069 and the four way road junction in Aldringham, at the Parrot and Punchbowl Pub on B1122, (Aldeburgh Road) in Aldringham village, in order to deliver large Cable Drums, on Carriers to and from points, S-BM01 and S-BM02 to the north of Aldeburgh. Their route from the Parrot junction would then continue through Aldringham in a southerly direction along the B1122. The stated dimensions of the Cable Drum Carriers are 25.44m (L) x 4.5 (W) x 3.7 (H). We believe that route is likely to be unsuitable for such vehicles. After its own survey, Scottish Power Renewables published its EA1N & EA2 Traffic and Transport Factsheet (October 2018), para 8 stating ‘ The B1353 (Aldringham Lane) between Aldringham and Coldfair Green is not wide enough for two HGVs to pass one another. Widening at this location will not be possible due to the	N	The construction vehicle routeing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The B1122 is proposed as an abnormal loads access only and is not proposed to be used as a main construction route to avoid routeing construction traffic through Leiston and Coldfair Green. No construction vehicles are expected to travel along the B1353 as a result of the Proposed Project. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the parts of the network identified (B1353 and B1122).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	proximity of residential properties to the edge of the road. HGVs will not travel between Aldringham and Coldfair Green'. Further, we believe it likely that the swept path required for a cable drum carrier 25.44m long would be difficult and perhaps impossible to achieve at both ends of Aldringham Lane. We raised this concern with NGET at the Sea Link public information events. An NGET representative initially responded by suggesting that NGET could use instead a temporary haul road that SPR intends to construct between B1069 and B1122 to support the cable route construction phase of its EA1N and EA2 projects. SPR haul roads were consented for temporary use by these two projects. SPR has also made a commitment that its design at the B1122 will not include swept bell mouths. The haul roads would have been removed before NGET's current forecast use in 2029. It almost seems that NGET are expecting an overlap between these two sets of projects.		
Substation Action Save East Suffolk	It is unacceptable for the B1121 to be used for construction traffic and for there to be accesses off the B1121 to the construction sites. The B1121 is narrow and twisty and in places there is not even a white line. In terms of HGVs, National Grid is proposing 84 a day which is 7 per working hour which equates to one less than every 10 minutes. The B1121 passes Friston village green where there is a children's playground. Also there are bus stops either side of the road where pedestrians cross without the benefit of a pedestrian crossing. Given the north of the village will be a no-go area for walking and recreation, all village residents will need to walk south which means much more pedestrian traffic across the B1121.	N	The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** includes reference to training for construction workers to increase their awareness of environmental issues as applicable to their role on the project, along with agreed traffic routes and access points, measures to reduce route and journey mileage to and from and around site, and prevent nuisance to the residents, businesses and the wider community caused by parking, vehicle movements and access restrictions. The Code also provide suitable control for the means of access and egress to the public highway.
Leiston-cum-Sizewell Town Council	The supermarkets on the easterly side of Saxmundham are used intensively by Leiston residents. The infrastructure around this area already makes traffic build up at the traffic lights in Saxmundham, causing lengthy traffic jams up the hill towards Leiston. The construction of the proposed converter station(s) at Wood Farm would add unprecedented pressure at this pinch point as one of the proposals for the haul road crosses the B1119 at the top of the hill. Although wholly against the Sea Link project hitting landfall on our Heritage Coast, should the project proceed LTC seeks assurance that all possible avenues to work collaboratively with other projects are explored, e.g., that the SZC link road with the A12 (already consented) is used to access the converter station construction site at Saxmundham, with a haul road branching off at a location west of Theberton, and that the SZC park and ride facilities are utilised for contractors.	N	National Grid is maintaining ongoing dialogue with Sizewell C and other developers in the area to coordinate works and will continue to do so as all parties construction programmes become clearer. Opportunities to further mitigate the impact of construction traffic will be considered including the potential of sharing facilities such as park and rides. As part of its DCO application submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**. The assessment of inter-project cumulative effects with other proposed developments is considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			are expected when considering construction/operational traffic associated with all committed developments combined on the same basis. The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport.** The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network.
Snape Parish Council	One of our specific concerns relate to traffic volumes on both the A1094 and the B1069. The PC is of the view that there remains (despite the DCOs) a complete lack of detailed granular analysis of the potential impact of traffic over peak periods such as holidays or the frequent and long established cultural events at both Snape and Aldeburgh on those roads, and the concerning reliance on the A12 and minor rural roads for traffic movements. The analysis even to this point, appears to be based on average traffic movements which given the nature of traffic in the area seemed to ignore the guidance of making calculations based on “site specific” information and circumstances.	N	The construction vehicle routeing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place, including for the parts of the network identified (A1094 and B1069). The assessment is based on the peak construction phase and the busiest day of the construction programme in terms of total construction vehicle movements and is therefore robust.
Local community	Traffic issues: - fly parking by workers; - damage to verges and roadside drainage; - danger to pedestrians and cyclists; - loss of trade, impact on businesses due to late deliveries reduction of tourist visitor income; - loss of ‘Quiet Lanes’.	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Outline Construction Traffic Management and Travel Plan – Kent** are provided to help mitigate any potential impacts. These documents include construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. These Plans are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All contractors working on the Proposed Project will be required to adhere to a Construction Code of Practice will help control and manage aspects of the development scheme that could have a detrimental effect on the local community. National Grid acknowledges the concerns regarding quiet lanes, pedestrians and cyclists and has considered the impact of construction traffic on these aspects in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Impacts on socio-economics are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism and Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	As a mum with young children that often walk to Kelsale Primary school, I am hugely concerned about the possible extra traffic from the HGV's that would come through Kelsale, not to mention the added pollution.	N	National Grid has undertaken a complete and full assessment of traffic routes for construction. Details are contained in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. In addition, the access route at Kelsale has now been discounted, with the preferred option coming into the site from the south, while **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality** indicates that the effect of peak construction traffic flows would be below the standard screening criteria threshold.
Local community	The said maintenance track (to be used once or so a year upon completion of the project) if consented, must continue to be via the	Y	Following consultation with the landowners this has been removed and access to this section of the route for maintenance will be along the length of the cable route. Use of the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	brownfield Aldeburgh Golf Club land adjacent to and south of Chapel Barn Farm's established right of way and south of the trenching. As you know, this would allow direct access from the B1122 with little damage and no hedges destroyed. Also, as you are aware, all surveyors that have gained access to Chapel Barn Farm have only ever entered and exited via the above-mentioned track over the golf course from the A1094 even last week, the surveyors carrying out a tree survey for the access road arrived and exited the farm using it! Therefore, you have a route that clearly works for you. We would support the positioning of the haul road for construction purposes again south of the trench. Robust, sight/noise/disturbance/light prevention measures must be provided alongside the Chapel Barn Farm site so that any disturbance/view etc is kept to a minimum. Already the impacts of these proposed projects are affecting the site and its users, not only in value but impacts that it will never recover from.		haul road will be lower at this end of the Proposed Project and it will be sited to minimise the disturbance where possible.
Melton Parish Council and Campsea Ashe Parish Council	We are particularly concerned that traffic generated by these projects will majorly impact its residents because of several factors:- 1 Insufficient road infrastructure in place to cater for these projects, especially with all energy projects most likely cumulating within a 6 year window, creating in excess of 800 extra HGV journeys a day; 2 The impact of increased subcontractor vehicle movements has not been assessed; 3 Alternative route usage, pre-dominantly by local road users, to avoid other heavily impacted roads has equally not been assessed for all the planned energy projects; 4 The Rendlesham located Bentwaters Industrial Estate has currently no development limit associated to its size. It is assumed that sub contractors will increasingly try and use/locate to this Estate, even though it is widely acknowledged that the road infrastructure is already insufficient for an operation of current size (see WSP traffic report 2018/19, produced for the ESC Local Plan 2020).	N	The increase in construction/ operational traffic as a result of the Proposed Project and committed developments has been assessed as part of the **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects** which considers more than 25 schemes including Sizewell C, East Anglia ONE North, East Anglia TWO and LionLink. The vehicle movements in relation to construction staff have been included in the assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. This is based on the busiest day of the programme in terms of construction workers to provide a robust assessment. The traffic and transport assessment within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase (including with respect to Driver Delay) with the proposed embedded mitigation and control and management measures in place. The Bentwaters Industrial Estate is located circa 7 km to the southwest of the Order Limits (southern boundary) for the Suffolk Onshore Scheme and therefore falls outside of the study area. It is also noted that there is no relationship between the Proposed Project and activities within the Bentwaters Industrial Estate that would affect travel by sub-contractors. It is anticipated that the majority of construction traffic would travel via the A12 to the north and south of the Proposed Project (rather than using local routes) which has been assessed as part of **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The construction vehicle routeing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. This Plan is Mitigation is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Theberton and Eastbridge Parish Council	Three potential site access points have been proposed and given the consideration that large Abnormal Indivisible Loads (AILs) will need to be brought to the proposed Saxmundham site during construction and for maintenance over the lifetime of the converter stations, easy and appropriate access to the A12 needs to be prioritized and minimize land take.	N	Following feedback received during Statutory consultation and upon further evaluation, National Grid has selected a modified version of the proposed western access route for the Saxmundham converter station site. This was known as Option 3 at Statutory consultation. Selecting the western construction and maintenance access route means that National Grid has removed the alternative northern (option 2) and southern (option 1) access routes from their plans. The southern access route, following further review, is not suitable for the construction traffic required. The northern access route, which is approximately double the length of the western alternative, would have required bridge crossings of the River Fromus

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The S-BM03 option to proceed south to the B1121 between Sternfield and Friston is the least suitable for general HGV traffic given the narrow width, the sharp corner junction between the Red House Farm Track and the B1121 and the lengthy routeing for AILs to Yoxford via the B1121, A1094, B1069 and B1122 through Leiston. General HGV access via this route to the A12 is over lengthy and alternate routes through Bigsby's Corner or Snape have issues with narrow and/or weak bridges are inappropriate. Whilst AIL access to the converter station site via S-BM03 may benefit from the proposed Sizewell Link Road, assuming the construction is completed in time, this route will be further constrained by the existing B1122 between the end of the SLR and the new roundabout at the Sizewell C site entrance and a new level crossing close to Lovers Lane in Leiston. Initial designs for this roundabout have taken into account AIL deliveries to the Sizewell C site, they have not allowed for AIL deliveries that will progress through Leiston to the B1069. The other two options are to proceed to the B1121 north (S-BM12) and south (S-BM09) of Saxmundham. The northern route will have to cross the East Suffolk railway close to the Leiston branch line junction on what is a lengthy route that also needs to cross the B1119 between Saxmundham and Leiston. The other route to the B1121 south of Saxmundham is the shortest and avoids having to cross the East Suffolk railway although will require a bridge across the Fromus. The increase in traffic along the A12, whilst not significant when considered cumulatively with the Sizewell C project and other projects, also misaligns the Scottish Power windfarm projects impacts as the start of that project has been significantly delayed and a start date is yet to be announced. Coordination with the Sizewell C Park and Ride schemes and HGV control system close to Seven Hills roundabout will improve impacts to all the parishes and towns along the A12 access route from both north and south and is encouraged.		and one or both of the railway lines. There are engineering challenges associated with the construction of these bridges, including the likelihood of significant works being required to either the B1121 or the River Fromus itself. Construction work would have also been required in the immediate vicinity of residential properties at Oak Close and along neighbouring streets in Saxmundham. These factors increase the risk of delay and could result in a longer construction period, hence the decision to remove the northern access route from the proposals. National Grid is maintaining ongoing dialogue with Sizewell C and other developers in the area to coordinate works and will continue to do so as all parties construction programmes become clearer. Opportunities to further mitigate the impact of construction traffic will be considered including the potential of sharing facilities such as park and rides. The assessment of inter-cumulative effects with other proposed developments is considered in the ES within **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Based on the inter-project cumulative effects indicative screening matrix, no significant cumulative effects on traffic and transport receptors are expected as a result of construction traffic associated with the Suffolk Onshore Scheme when combined with construction/operational traffic associated with each of the other developments in isolation. In addition, no significant cumulative effects are expected when considering construction/operational traffic associated with all committed developments combined on the same basis. In view of the above, no additional mitigation is expected to be required to that already outlined within **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport, Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan - Suffolk and Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. These Plans are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I live in Manor Gardens which is at the top of Church Hill in Saxmundham. It is already dangerous for my children, and others living in our close, to cross Church Hill due to the volume of traffic and speed at which it travels. I attended one of the public consultations and was not given any satisfactory answer as to mitigations and solutions to alleviate this when construction vehicles are travelling up and down Church Hill and when ongoing employees are travelling to and from the site. One solution I proposed was a traffic light controlled pedestrian crossing but I do not believe I was listened to. The potential for HGVs to speed up and down Church Hill is quite frankly terrifying for my children who seek to cycle to school often. During exploratory work on the field our road was filled with worker's cars. Despite assurances that there would not be disruption from	N	Following feedback received during Statutory consultation and upon further evaluation, National Grid has selected a modified version of the proposed western access route for the Saxmundham converter station site. This was known as Option 3 at Statutory consultation. Selecting the western construction and maintenance access route means that National Grid has removed the alternative northern (option 2) and southern (option 1) access routes from their plans. The southern access route, following further review, is not suitable for the construction traffic required. The northern access route, which is approximately double the length of the western alternative, would have required bridge crossings of the River Fromus and one or both of the railway lines. There are engineering challenges associated with the construction of these bridges, including the likelihood of significant works being required to either the B1121 or the River Fromus itself. Construction work would have also been required in the immediate vicinity of residential properties at Oak Close and along neighbouring streets in Saxmundham. These factors increase the risk of delay and could

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	parking there were still vans, cars, and lorries. Again, when this was raised with National Grid representatives at a meeting there were no adequate answers given nor any solutions proposed to ensure this does not happen during or after construction.		result in a longer construction period, hence the decision to remove the northern access route from the proposals. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is Mitigation is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All contractors working on the Proposed Project will be required to adhere to a Construction Code of Practice will help control and manage aspects of the development scheme that could have a detrimental effect on the local community. On the basis of the above considerations the existing perceived road safety concerns are not expected to be exacerbated by the Proposed Project.
Local community	I have a few brief points to make (albeit already made to SZC) in relation to East Green, a small hamlet in the aforementioned Parish. To save my time I am providing the same response to both of these projects highlighting some of the key points on cumulative impacts. Key Issues 1. Severance from other parts of the Community & from Service Centres: Our Hamlet risks being cut off from other parts of the Parish and its service centres by the cumulative impacts of all the various energy projects: for example, SZC intends constructing a roundabout on the A12 from which a new road 'the Sizewell Link Road' (SLR) will be constructed and used as a haul road initially. The SLR is proposed to start at a hamlet in our Parish called North Green and 'travel' via Theberton and Middleton to Sizewell. As part of SZC plans, Pretty Road & Moat Road (Theberton) will also be affected (some access routes to Leiston). On top of this SZC plan changes to the railway and green rial route which would affect Clayhills. As you know in addition there are also the Scottish Power Renewables proposals. As you would expect in a rural community, residents have to travel to access their needs. The main service centres for East Green are Saxmundham & Leiston where residents use GPs, Dentists, Vets & Shops amongst many other services. With so much construction in such a small area, in such close proximity, how are you going to GUARANTEE to residents they will be able to easily access their requirements.	N	Potential impacts on the local services associated with the Proposed Project are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This analysis demonstrates that at peak workforce employment and typical seasonal occupancy levels, all of Suffolk Onshore Scheme's construction workers could be accommodated within a 60-minute drive time of the Order Limits. On this basis, it is assessed that there would be negligible magnitude of impact on local services. It is anticipated that accommodation providers would be able to accommodate employees working at the Suffolk Onshore Scheme without any adverse effects on the sector. National Grid acknowledge comments regarding Sizewell C, but cannot have regard to specific proposals from other projects. Potential cumulative impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Inter-Project Cumulative Impacts**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Table 1.8 Air quality

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q18 Do you have any key concerns regarding the construction stage of Sea Link? (Other)			
Local community	Dust emissions and air quality.		National Grid acknowledges the potential for impacts on air quality during construction, particularly from dust generating activities. **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality and Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality** provide an assessment of dust impacts using the accepted methodology within the Institute of Air Quality Management Assessment of Dust from Demolition and Construction (2024) V2.2. The assessment includes potential impacts from vehicles and non-road mobile machinery. Air quality monitoring will be undertaken during the construction phase as part of the Air Quality Management Plan for the Proposed Project. Details are contained in **Application Document 7.6.6.1 Outline Air Quality Management Plan – Suffolk and Application Document 7.5.6.2 Outline Air Quality Management Plan – Kent**. These Plans are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Air quality will be affected by dust from digging and from vehicular activity; fumes from exhausts and additional dust from tyre wear and dried site spills on roads.		
General commentary			
Local community	Air pollution from HGV emissions, construction processes, service vehicles and worker traffic, and from light sandy soil that has been blown under windy conditions causing visibility hazards and health issues. Air pollution would also have a negative impact on tourism.		National Grid acknowledges the potential for impacts on air quality during construction, particularly from dust generating activities. **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality and Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality** provides an assessment of dust impacts using the accepted methodology within the Institute of Air Quality Management (IAQM) document Assessment of Dust from Demolition and Construction (2024) V2.2. The assessment includes potential impacts from vehicles and non-road mobile machinery (abbreviated to NRMM). Air quality monitoring will be undertaken during the construction phase as part of the Air Quality Management Plan for the Proposed Project. Details are contained in **Application Document 7.6.6.1 Outline Air Quality Management Plan – Suffolk and Application Document 7.5.6.2 Outline Air Quality Management Plan – Kent**. These Plans are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Potential impacts on the tourism economy are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The assessment of the potential impacts of the Proposed Project on tourism concludes that there are no likely significant effects, while **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Significant increase in air pollution due to the traffic involved during the construction phase.		
Local community	It seems ironic that a proposal which is supposed to improve the environment would have such a detrimental impact on the environment but here we are. So we are looking at increased levels of air pollution with negative impact on health outcomes. There are more than enough studies backing this one up and the impact is both immediate and long term. Playing health roulette with the lives		Potential impacts of the Proposed Project on air quality are assessed in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality and Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality**. These assessments conclude that there are no likely significant effects as a result of the Proposed Project.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	of our children. Looking at this in broad economic terms this will mean that there will be potentially greater call for medical intervention including critical care (thus an increased cost to the NHS), a potential negative impact on the health of working age people (so a loss to the economy) and potential increase of out of work benefits (increase in costs to the Dept of Health and Social Care).		Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I have very serious concerns about the sub-station at Friston being cooled by large amounts of a known greenhouse gas when we are being told that these are supposed to be green projects.		A lifecycle greenhouse gas assessment is included in **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This is an assessment of the greenhouse gas emissions (also known as 'carbon' for shorthand) associated with the Proposed Project over its whole life, including operational emissions and embodied carbon. This assessment considers the mitigation measures embedded in the Proposed Project to reduce greenhouse gas emissions, as well as puts forward additional mitigation measures where applicable. This assessment has been conducted in accordance with the Institute of Environmental Management and Assessment good practice guidance for greenhouse gas assessments in EIA. **Application Document 7.5.13 Greenhouse Gas Reduction Strategy** has been developed alongside the climate change chapter. This document sets out how greenhouse gas emissions will be managed across the project life cycle.
Local community	I am very concerned about the impact on air quality as I have asthma.		National Grid acknowledges your concerns. Potential impacts of the Proposed Project on air quality are assessed in **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality and Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality**. The assessment includes health indicators and concludes that there are no likely significant effects as a result of the Proposed Project. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Air quality will suffer from the Sea Link project and the other projects proposed for the area. There will be dust emissions from construction, as well as emissions of carbon monoxide, nitrous oxide and particulates from vehicles. Additionally, the local soil is mostly sandy and easily picked up by the wind when loose and dry and can cause localised dust storms, with sand deposited on roads and gardens.		National Grid acknowledges the potential for impacts on air quality during construction, particularly from dust generating activities. **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality and Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality** provides an assessment of dust impacts using the accepted methodology within the Institute of Air Quality Management Assessment of Dust from Demolition and Construction (2024) V2.2. The assessment includes potential impacts from vehicles and non-road mobile machinery and concludes that there are no likely significant effects as a result of the Proposed Project. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Wildlife Trust	The potential for construction phase air quality impacts on sensitive habitats and plant communities within the Sandlings SPA and Leiston-Aldeburgh SSSI, which the Preliminary Environmental Information Report identifies, will require further consideration within the DCO Environmental Statement. This must be dealt with in accordance with the mitigation hierarchy and all best practice guidance. We expect any measures to mitigate and compensate for unavoidable and residual impacts, including temporary impacts, to be designed to maximise long-term ecological benefits, for example		The air quality impacts on ecology receptors are assessed within **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The air quality assessment within **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality** has considered ecological receptors and outlines mitigation measures where these are deemed necessary. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to reduce impacts and effects through the process of design development,

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	by restoring and enhancing affected habitats as part of the delivery of a Nature Recovery Network.		and by embedding measures into the design of the Proposed Project such as the sensitive routeing and siting of infrastructure and temporary works. Through the EIA process, National Grid has developed mitigation measures to offset the impact on terrestrial ecology. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Table 1.9 Noise and vibration

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The negative impact of noise and light pollution from this project.	N	The potential for noise impacts as a result of the Proposed Project are assessed in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. The assumptions made about the lighting design that have informed the landscape and visual impact assessment are set out in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Consideration of the landscape and visual effects of light pollution during construction and operation is presented in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment, Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment, Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	There appears to be complete disregard for the local residents both in Friston particularly and surrounding areas. Noise will destroy the character of Friston.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities in Friston can be avoided at all nearby properties. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. In agreement with the Planning Inspectorate, the impact of the operation of switchgear was scoped out of the EIA. However, indicative assessments undertaken of operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines has been conducted at the request of East Suffolk Council. The assessments indicate that operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines would not be significant. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Construction and its related traffic will create noise pollution damaging the learning of students at the independent special school that is housed at Ebbsfleet farmhouse.	N	The potential impacts of the Proposed Project on the school have been assessed in **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. Under the assessment, the school was classified as a receptor of high sensitivity and prior to the adoption of any specific mitigation measures, the assessment concluded that there would be no significant impacts during construction. During construction Best Practicable Means will be applied to this receptor to reduce the potential effects of construction noise. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	According to your experts this project will take 4 years to build. That is 4 years of disturbance to the wildlife in and around the SSSI. Thanet's only Heronry & Egretry is located nearby. Noise from 18	N	The construction programme as a whole is estimated to be around four years, however, exact details of the different stages are yet to be confirmed. However, careful attention has been paid in the design and construction programme/methods for the Proposed Project to

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	months of heavy construction is very likely to cause them to abandon their nest site.		the possibility of habitat severance. In the coastal zone this will be avoided through use of a trenchless construction solution. The commitment to use a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). In those areas away from the coast, which will be crossed by open trench, a series of protected species surveys have been undertaken to inform mitigation measures and the works will be undertaken in such a way as to retain connectivity, such as through the inclusion of mammal ledges in culverts. The cable will be buried as each section is installed and habitats restored above the cable. Habitat connectivity around the Converter Station and Substation site will be preserved through enhancement of existing boundary features and the creation of new areas of woodland and wetland. The Proposed Project has committed to achieving 10% Biodiversity Net Gain and that will involve contributions to delivering strategic biodiversity schemes in Kent. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The Minster area is so quiet and whilst you have apparently looked into whether or not it will hum' from the machinery inside and the decibel levels. What are you basing your findings on scientific analysis? It would give more confidence if you actually looked at another convertor station up and running thereby getting the real decibel level. The last thing we would want it a constant hum no matter how soft the sound is.	N	An indicative assessment of operational noise from the proposed Kent Substation and Converter Station, based on current design information, is presented in **Application Document 6.3.3.9.D ES Appendix 3.9.D Kent Operational Noise Assessment**. With standard embedded mitigation measures, the impact of operational noise from the proposed Substation and Converter Station on all nearby Noise Sensitive Receptors, has been assessed as having a negligible magnitude during both daytime and night-time periods. This would result in a negligible effect at all nearby Noise Sensitive Receptors, which is considered to be not significant. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Local community	I attended the exhibition at the old generator station on the 8th November but was disappointed that some of my questions did not receive answers. One particular question was about the noise level at the converter site which seems strange you come to a consultation meeting without an important fact like that.	N	The noise source data for both the Suffolk and Kent Converter Stations is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation?			
Local community	What about the noise?	N	An assessment of the potential impacts of the Friston Substation during construction is provided in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. During the construction of the Substation, the EIA did not identify any significant adverse effects as a result of increased noise on nearby Noise Sensitive Receptors. In agreement with the Planning Inspectorate, the impact of the operation of switchgear was scoped out of the EIA. However, indicative assessments undertaken of operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines has been conducted at the request of East Suffolk Council. The assessments indicate that operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines would not be significant.
Local community	I do not live in Friston but would be worried about any noise from the substation when it was operational if I did.	N	
Local community	Having lived near substations and experienced noise pollution, i.e. humming, noise and intrusion by service vehicles and workforce. No I do not think this is the best location. The people who choose such sites, very rarely live close by and consequently do not have to be distracted by plant operating and service noise.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The close proximity to listed buildings, and the medieval village will cause considerable distress and disturbance particularly during the construction phase, and the ongoing noise particularly from the switchgear during operation.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to reduce impacts and effects through the process of design development, and by embedding measures into temporary works and the construction phase. Impact assessments examining setting impacts can be found in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. All assets where there was the potential for significant impacts on the setting of heritage assets were discussed with stakeholders at thematic meetings and viewpoint photography locations agreed with East Suffolk Council Conservation Officer and Historic England. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The infrastructure is designed to provide a high level of operational resilience, therefore the operational workforce and service requirements will be minimal.
Local community	There will be noise during construction (6 days a week) and when switchgear is being turned on and off.	N	
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	Having 3 converter stations in close proximity will be immense especially if they are 26 metres high. What mitigations will be made regarding light and noise pollution?	N	Inter-project cumulative effects are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. There are a number of projects which overlap with the noise ZOI and therefore there is potential for cumulative effects from construction noise at shared receptors. However, providing recommended mitigation is implemented, as detailed in outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk**, this is unlikely to be significant. The preliminary assessment of total cumulative effects for noise and vibration has not identified any significant cumulative effects. The assumptions made about the lighting design that have informed the landscape and visual impact assessment are set out in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Consideration of the landscape and visual effects of light pollution during construction and operation is presented in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment, Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment, Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q9 Are there any other ways that you would like us to explore coordination with other projects?			
Local community	All three on one site is too much noise pollution.	N	Inter-project cumulative effects are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. There are a number of projects which overlap with the noise ZOI and therefore there is potential for cumulative effects from construction noise at shared receptors. However, providing recommended mitigation is implemented, as detailed in outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk**, this is unlikely to be significant. The preliminary assessment of total cumulative effects for noise and vibration has not identified any significant cumulative effects.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q10 Is there anything that you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Be absolutely clear what your intentions are. Let people know if their property is in close proximity to any of your proposals. Be clear on noise levels the substations and converters will make when in use.	N	National Grid acknowledges this comments. The complete description of the Proposed Project including noise source data for the Converter Stations and Substation can be found in **Application Document 6.2.1.4 ES Introduction Chapter 4 Description of the Proposed Project** that will be submitted as part of the DCO application.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	Aquatic habitats & creatures will be adversely affected by noise.	N	**Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals** provides an assessment of the potential impacts of underwater noise on mammals during installation of the marine cable, and **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish** provides an assessment of construction noise on fish and shellfish. There are no anticipated noise impacts of the operation of the marine cable.
Q14 What do you think about our proposed converter station and adjacent substation near Minster?			
Local community	During construction and once built the pylons, light and noise pollution plus electromagnetic fields are all going to have an ongoing deleterious impact on the wildlife of the area and migrating birds which use the area due to its proximity to Pegwell Bay.	N	Details of the effects of light and noise pollution, and electromagnetic fields on wildlife are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. An indicative assessment of operational noise from the proposed Kent Substation and Converter Station, based on current design information, is presented in **Application Document 6.3.3.9.D ES Appendix 3.9.D Kent Operational Noise Assessment**. With standard embedded mitigation measures, the impact of operational noise from the proposed Substation and Converter Station on all nearby Noise Sensitive Receptors, has been assessed as having a negligible magnitude during both daytime and night-time periods. This would result in a negligible effect at all nearby Noise Sensitive Receptors, which is considered to be not significant. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Don’t locate it where noise and light pollution is going to affect wildlife, so make special requirements to reduce noise and sound pollution when installing and managing in the future after the construction.	N	Details of the effects of light and noise pollution on wildlife during construction and operation are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I understand that the proposed converter station will be noisy and thus will have a negative impact on the wellbeing of wildlife on the marshes and local people.	N	An indicative assessment of operational noise from the proposed Kent Substation and Converter Station, based on current design information, is presented in **Application Document 6.3.3.9.D ES Appendix 3.9.D Kent Operational Noise Assessment**. With standard embedded mitigation measures, the impact of operational noise from the proposed Substation and Converter Station on all nearby Noise Sensitive Receptors, has been assessed as having a negligible magnitude during both daytime and night-time periods.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			This would result in a negligible effect at all nearby Noise Sensitive Receptors including wildlife, which is considered to be not significant. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q16 What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line?			
Local community	These are an eyesore, noisy and inappropriate in marshes and reserves.	N	At the Environmental Scoping stage of the Proposed Project, potential noise impacts of the overhead line operation were scoped out of the EIA on the basis that the nearest noise sensitive receptor would be approximately 500 m away from the closest potential proposed overhead line.
Local community	We have a bat colony on Minster Marshes, whose ability to hunt insects effectively will be dramatically reduced by the noise pollution and electromagnetic fields of additional pylons.	N	The assessment of the effects of noise pollution on wildlife is contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. With regard to electromagnetic fields (EMFs), the UK has a carefully thought-out set of policies for protecting the general public against EMFs, the main component of which is exposure guidelines. These exposure guidelines are set by independent scientific bodies and are based on decades-long studies into the effects if EMFs and ill health. After those decades of research, the weight of evidence is against there being any health risks of EMFs below the guideline limits. It is National Grid's policy to ensure that all of its equipment comply fully with these exposure limits. Further information can be found in **Application Document 6.5 Electric and Magnetic Field Compliance Report**.
Q17 Anything else? Comments			
Local community	Noise during construction – daily hours, no weekends or evenings.	N	The potential for noise impacts as a result of the Proposed Project are assessed in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. The proposed construction core working hours (unless otherwise approved by the relevant Local Planning Authority) for all terrestrial works in Suffolk and Kent are: • Monday – Friday: 0700 to 1900; and • Saturday, Sunday and Bank Holidays: 0700 to 1700. Details relating to the proposed construction working hours and any associated restrictions are contained in **Application Document 6.2.1.4 Part 1 Chapter 4 Description of the Proposed Project**. The working hours are secured by Requirement 7 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Monkton Parish Council	We also have concerns over possible light and noise intrusion, which could be considerable, particularly for Minster as it is so close to the site.	N	An indicative assessment of operational noise from the proposed Minster Substation and Minster Converter Station, based on current design information, is presented in **Application Document 6.3.3.9.D Part 3 Appendix 9.D Kent Preliminary Operational Noise Assessment**. With standard embedded mitigation measures, the impact of operational noise from the proposed Minster Substation and Minster Converter Station on all nearby Noise Sensitive Receptors, has been assessed as having a negligible magnitude during both daytime and night-time periods. This would result in a negligible effect at all nearby Noise Sensitive Receptors, which is considered to be not significant.
Local community	The Minster area is so quiet, that is why wildlife choose to live and migrate there. The daily noise levels and even a low level of equipment 'hum' would be enough to change the conditions and balance of this precious area.	N	
Local community	Wildlife communication and navigation will be impacted by noise disturbance.	N	The assessment of the potential effects of noise pollution on wildlife is contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q19 Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals?			
Broadstairs and St Peter's Town Council	Surround the boundary with native hedging as a barrier from noise pollution.	N	During construction working areas will be fenced; the type of fencing will depend on the area to be fenced and the needs of fencing such as providing acoustic of visual screening. Vegetation will be retained wherever practicable. Once constructed, native planting will be provided including woodland, hedgerows and tree planting; details can be found in **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan – Kent**. It is not currently proposed that routine noise and/or vibration monitoring would be undertaken during the construction period. However, the need for monitoring, and any potential monitoring locations, would be identified in any Section 61 applications for specific activities where required and will be the subject of discussion between the contractor, National Grid and the relevant local authority prior to agreement of any Section 61 application. **Application Document 6.3.3.9.D ES Appendix 3.9.D Kent Operational Noise Assessment** indicates that operational noise from the proposed Minster Converter Station and Substation would be not significant. Additionally, the desired local authority aim of a noise rating level 5 dB below the background sound level at nearby noise sensitive receptors is achievable, subject to further design.
Local community	Surround the entire area with dense and high hedging to reduce noise pollution.	N	
Local community	Noise must be monitored, kept to a minimum and mitigated by soft landscape planting.	N	
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	This will affect my life as I am a shift worker who lives nearby and will be affected by building noise and traffic.	N	An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided at all nearby properties. Further detailed assessment will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. The potential for noise impacts as a result of the Proposed Project are assessed in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
General commentary			
Local community	Noise from Substation in Operation: Friston is a quiet village and the "background hum" from electrical equipment is likely to be noticeable. We also understand that noises from switchgear are "impulsive" - short duration but loud. It is not acceptable for these to occur at random times near the village, especially at night time when they may disturb people sleeping.	N	An assessment of the potential impacts of the Friston Substation during construction is provided in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. During the construction of the Substation, the EIA did not identify any significant adverse effects as a result of increased noise on nearby Noise Sensitive Receptors. In agreement with the Planning Inspectorate, the impact of the operation of switchgear was scoped out of the EIA. However, indicative assessments undertaken of operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines has been conducted at the request of East Suffolk Council. The assessments indicate that operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines would not be significant.
Dr Thérèse Coffey MP	Noise pollution – the permanent noise of the substation will be harmful to residents and drive wildlife away.	N	
Local community	Operation - all noise at the substations and convertor stations needs to be assessed including the impulsive noise from switchgear. The site is close to a quiet village with very low background noise.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Substation Action Save East Suffolk	Construction - National Grid needs to demonstrate it can achieve the noise requirements. For example will it be able to achieve the required noise level through BPM (Best Practicable Means) where there are multiple projects conducting construction at the same time?	N	A complete assessment of impacts relating to construction noise are presented in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Substation Action Save East Suffolk	Operation - all noise at the substations and convertor stations needs to be assessed including the impulsive noise from switchgear. The site is close to a quiet village with very low background noise. There was clear evidence in the Scottish Power examinations that the switchgear, when operated at night, will wake people up. In terms of continuous noise National Grid should take the noise limit of 31dB as a starting point for all infrastructure a combined basis.	N	In agreement with the Planning Inspectorate, the impact of the operation of switchgear was scoped out of the EIA. However, indicative assessments undertaken of operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines has been conducted at the request of East Suffolk Council. The assessments indicate that operational noise from auxiliary equipment within the proposed Friston Substation and alterations to overhead lines would not be significant. There are a number of projects which overlap with the noise zone of influence and therefore there is potential for cumulative effects from construction noise at shared receptors. However, providing recommended mitigation is implemented, as detailed in outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk**, this is unlikely to be significant. The preliminary assessment of total cumulative effects for noise and vibration has not identified any significant cumulative effects. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	We are keen naturalists and value greatly our ability to watch wildlife at the RSPB North Warren reserve. Whist we have been assured that crossing the north marsh would be achieved through horizontal drilling, we are concerned that there will still be noise and vibration that would disturb the wildlife which may never return.	N	National Grid confirms that a trenchless construction solution will be employed for the crossing of the North Warren Nature Reserve. This commitment is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The assessment of the potential effects of noise and vibration on wildlife is contained in **Application Document ES 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Suffolk Energy Action Solutions	In the PEIR, NGET have only completed a desk top study and do not quote their data source for the local noise environment - just "publicly available noise mapping and noise surveys". This is not acceptable for the following reasons: Construction noise: The idea that a buffer of 300 metres is sufficient to prevent noise nuisance from construction work on a development of this size is preposterous when in nearby villages a tractor ploughing can be heard at 500 metres. Operational noise: Beyond about 250 metres sound propagation is heavily influenced by topography, surface "roughness" atmospheric temperature gradients and wind shear. Simple statements like a '1000 m buffer' is OK to eliminate operational noise impacts are not acceptable. NG have failed to provide any numerical data to support this assertion. It is well known that transformer "hum" can travel	N	An assessment of the potential noise impacts of the Proposed Project during construction and operation is provided in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. The noise and vibration assessment indicates that there are potential significant adverse effects at a small number of properties during the construction phase, without mitigation. However, the assessment shows that these can be avoided through the use of standard mitigation measures in the form of Best Practicable Means. Further detailed construction noise and vibration assessments would be undertaken by the contractor prior to commencing works. The outcome of these detailed assessments would include details of specific mitigation measures for each activity. Noise and vibration effects during the construction phase are therefore expected to be not significant. The effects of routine and more substantial maintenance activities are expected to be similar or not worse than those during construction. Again, noise and vibration effects from routine and more substantial maintenance activities would be mitigated through the use of Best

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	considerable distance. Switchgear is also known to wake people at night when sounds travel even further distances. Vibration: The proposed converter station is in an area of clay and wet sand substrata. If drop hammer or vibration hammers are used, vibration displacements may be felt at nearest residential properties. Conclusion: NG's assertion that effects would be NOT SIGNIFICANT in relation to noise and vibration receptors (e.g. local resident) without defining 'NOT SIGNIFICANT' is dishonestly cited. The belief by NG that the noise and vibration effects of the proposed development are unchanged when combined with other collocated activity is risible. This could only occur if all three projects were silent – i.e. no noise of vibration is detectable.		Practicable Means and may be supported by detailed noise and vibration assessment, if applicable. The assessment of operational noise indicates that significant adverse effects can be avoided with the use of standard noise mitigation measures. Further detailed operational noise assessments would be undertaken by National Grid and/or the developer based on their specific designs. The outcome of these detailed assessments would include details of specific mitigation measures. Noise effects during the operational phase are therefore expected to be not significant. There are a number of projects which overlap with the noise zone of influence and therefore there is potential for cumulative effects from construction noise at shared receptors. However, providing recommended mitigation is implemented, as detailed in outlined in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice and Application Document 7.5.8.1 Outline Construction Noise and Vibration Management Plan – Suffolk**, this is unlikely to be significant. The preliminary assessment of total cumulative effects for noise and vibration has not identified any significant cumulative effects.
RSPB	We welcome the consideration given to reduction of noise impacts on sensitive breeding bird species of the Sandlings SPA in the PEIR, Vol. 2, Part 1, Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures through the inclusion of the following measure: “Where feasible and necessary, the most potentially disturbing elements of trenchless installation will take place between September and February, to minimise disturbance of breeding nightjar and woodlark in the adjacent Sandlings SPA” Whilst we acknowledge that full noise modelling and assessment is not yet available, we recommend that the wording is strengthened to indicate that such mitigation would be deployed should the noise modelling indicate that noise levels within any areas of the SPA would be likely to cause disturbance. We also acknowledge the proposal to install noise barriers around the construction compound to reduce impacts on both the Sandlings SPA and Leiston-Aldeburgh SSSI and RSPB North Warren, but it will be necessary to consider the outputs of the noise modelling with such a structure in place to determine whether there is also a need for timing restrictions to further reduce impacts on the breeding and wintering bird interest of the SSSI and nature reserve. Table 2.3.18 in the PEIR Vol. 1, Part 2, Chapter 3, Ecology and Biodiversity acknowledges that, despite the measures above, some bird species will be displaced during construction. Given the potential duration of the construction period, we are concerned that noise disturbance impacts on both the Sandlings SPA and Leiston-Aldeburgh SSSI could be significant. This will require more detailed assessment based on the outputs of the noise modelling, which should be mapped and include consideration of both average and peak noise levels. The impact of any displacement of birds will also require consideration cumulatively with other projects affecting the wider area; for example, the construction of Sizewell C may also have impacts on some wetland bird populations which use Leiston-	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. National Grid acknowledges that there may be a temporary adverse noise impacts during construction on Noise Sensitive Receptors. An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works, refer to **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Further detailed construction noise assessments would be undertaken by the contractor prior to commencing works. The outcome of these detailed assessments would include details of specific mitigation measures for each activity. Noise and vibration effects during the construction phase are therefore expected to be not significant. No residual significant adverse impacts of noise during operation were identified by the EIA. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1)**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Aldeburgh SSSI and RSPB North Warren, such as the White-fronted Goose (as acknowledged in Tables 2.14.3 and 2.14.31 of the PEIR Part 2, Ch. 14, Suffolk Onshore Scheme Inter-Project Cumulative Effects). At this stage, we do not have confidence that the noise disturbance impacts of this project alone, under the co-location scenario or cumulatively with other projects will be avoided or adequately mitigated. We welcome the proposal below to address impacts of maintenance activities during operation and which recognises the importance of both the breeding and wintering interest of the Leiston-Aldeburgh SSSI and RSPB North Warren, although given the inclusion of the wording “where practicable”, we recommend that the requirement to only “Consider” should be removed: “Consider undertaking potentially disturbing (noisy) maintenance activities during August and September, where practicable, reducing risk of disturbance of breeding or non-breeding birds using RSPB North Warren Reserve or breeding nightjar and woodlark using Sandlings SPA.”		

Table 1.10 Socio-economic, recreation and tourism

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	My business makes its money from tourism. We already have the Sizewell C construction work going on. I think this will stop people coming to the area for their holidays.	N	A complete assessment of socio-economics effects (including rental properties and accommodation of workers) has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.
Local community	Your landfall between Aldeburgh and Thorpeness will not only damage the general environment but tourism and economy of the area which is already being hit by Sizewell C, and with no benefit to the local community.	N	
Local community	The area will already be disrupted with the Sizewell plans. Scarce rental properties will be even harder to get - and the price will probably increase to accommodate construction workers. This is altogether an unfair expectation of this area and many of whom make their living through holiday makers who will not come.	N	
Local community	This area has enough with 3 power stations and this project should be located elsewhere. It's not just the disruption but the detriment to local businesses and tourist trade. They may benefit during building but after it take years to regain the tourist trade, hospitality business afterwards.	N	
Local community	The disruption, damage and negative eco effect on Pegwell Bay Nature Reserve and its associated environs and the Thanet coastline will be a disaster for Thanet, its local businesses, residents and tourists. Do you really think tourists will visit, business will stay, business will invest with this building infrastructure going on? What of the effect on house prices, will you compensate me for the drop in the value of my property. I can see Pegwell Bay from my house so nobody will be wanting to purchase it at its market value with all this construction going on for months and months and then the scaring on the landscape thereafter. The area is already in decline (Ramsgate town centre in particular) and this will cause further harm and is not supported.		A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. These plans will help control and management of potential impacts such as dust and noise. Landscape and visual impacts are considered in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** and ecological impacts in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). For further information on landscape and visual, please see Table 1.1 in this Appendix.
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Local community	The industrialisation of rural coastal Suffolk with trenches built over AONB, SSSI and RSPB sites is damaging to all and completely unnecessary. It would destroy our nature based tourism.	N	A complete assessment of socio-economics effects has been undertaken and this includes the assessment of the Proposed Project on local services such as doctors and dentists. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The National Grid has bulldozed through local concerns and completely ignored the horrific consequences for the people living in the area. The options will destroy tourism and although the workers will be here in Suffolk temporarily and may boost local economy it is not sustainable. There is not the infrastructure to support the influx of population. There are not enough doctors, dentists, sewage works our rivers are already polluted.	N	**Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). For further information on landscape and visual, please see Table 1.1 of this Appendix.
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston substation?			
Local community	The proposed substation is a particularly ugly part of the proposals which will do untold damage to the tourist economies of Aldeburgh, Thorpeness and surrounding towns and villages and the proposed cable paths will mean that a long swathe of land will be devastated. This will destroy the beautiful environment and way of life of the people living near it. Along with the other proposals it will help to destroy the local tourist economy.	N	The landscape and visual team have been a key discipline when determining the route of the required cables. This has been developed to minimise effects on the landscape character, including avoiding landscape features where possible and visual amenity, including limiting the infrastructure in views from sensitive receptors including residential and recreational receptors. It should also be noted that the effects arising from the cable routes will be temporary and that reinstatement of the cable corridors will occur following the construction period as far as practically possible. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.
Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness? Comments			
Local community	Aldeburgh and Thorpeness are thriving communities that provide long term jobs and income in this region. They co-exist sustainably with the evolving/changing coastline. Your project will undermine a successful industry to benefit Kent and London.	N	A complete assessment of socio-economics effects has been undertaken including the impact on PRoW and employment. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. Where there is a permanent impact on a footpath, a suitable diversion will be provided. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. Compensation claims will be considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
Local community	It is a well-loved tourist & walker area. Many people walk from Aldeburgh - Thorpeness & back. This would be ruined. Tourists would be put off coming to the area so businesses would suffer. Will you be compensating those of us who own and let out holiday homes, for loss of income? As well as cafes, etc. who will lose income?	N	
Q10 Is there anything that you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Give locals a chance to apply for jobs on the project.	N	During the construction phase of the Proposed Project, **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** estimates around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes.
Local community	Employ local tradesmen. Offer apprenticeships.	N	
Local community	This will have an adverse effect on tourism and business that depend heavily on tourism holiday makers and visitors.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.
Local community	This monstrous proposal will blight the lives of local residents during construction and adversely affect the values of the properties, and adversely affect local businesses. The local economy relies heavily on tourism and this proposal will ensure that many tourists stay away causing much financial hardship to local businesses. These local businesses employ thousands of local people and this ill	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	though through proposal will put many local jobs in the leisure and tourism industry at severe risk.		
Local community	Asset depreciation for the home owners has not been addressed. The social value is lip service, it does not set a value for how much will be dedicated to it. There is no contribution toward improving the infrastructure, the roads will be under further pressure however it will be my council tax that repairs the roads to that builds something that I object to.	N	National Grid acknowledges that development may cause concern to landowners. Diminution in property value known as 'injurious affection' and any other appropriate heads of claim will be considered on an individual basis in accordance with current legislation. The Compulsory Purchase Compensation Code allows for a claim of compensation for the loss that property owners may have suffered as a direct result of the retained part of their property ownership being worth less as a direct result of the works. National Grid will seek to minimise and mitigate against adverse effects upon the local community and the built and natural environment. While surveys of the local environment and analysis of other contextual evidence is an important part of informing its understanding of the potential impacts, so too is the feedback received during consultation. National Grid is committed to creating a positive impact in communities through infrastructure projects, emphasising social responsibility and equity via its Community Benefit Plan that aims to provide social, economic, and environmental benefits to local communities, ensuring it leaves behind a positive legacy. National Grid's Community Benefit Plan aligns with National Grid's Responsible Business Charter, emphasising impact in environment, communities, people, economy, and governance, shaping our strategic priorities with a focus on responsibility.
Q12 What do you think about our proposed landfall at Pegwell Bay?			
Local community	The houses are more expensive in Minster and Sandwich compared to other surrounding villages. The construction of this would have a massive impact in terms of accessibility to Pegwell. The house prices in view of the converter station and any pylons will drop.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. The effects arising from the Kent Onshore Scheme on landscape character and visual amenity are summarised within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**. This includes reference to the Kent Converter Station and overhead lines. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All planting associated with the reinstatement of the landfall and HVDC and HVAC corridors will be maintained for a five year period. All mitigation planting associated with the permanent access road and Minster Converter Station and Minster Substation will be maintained for the lifetime of the asset. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
Q18 Do you have any key concerns regarding the construction stage of Sea Link? (Other)			
Local community	The loss of jobs and economic benefit from tourism (and its adjacent industries) will be catastrophic for the Suffolk Coast. Construction for such projects is 100% guaranteed to go over budget and over time. A generation of residents and local business will suffer irreparable damage, please reconsider.	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The Chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.
Local community	The economic benefits to the local community will be transient. Local communities will be hugely disrupted with possibly no lasting benefit.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	If you go ahead with these plans we will end up with another economically depressed coastal area, exactly what the government is trying to reduce.	N	The socio-economic impact assessment undertaken for the Proposed Project did not identify any significant impacts.
Local community	Sea Link will damage the visitor-based economy resulting in significant and measurable net job losses. Our beautiful conservation/SSSI/RSPB reserves attract visitors. The land will be disturbed and will take decades to re-establish. Your vehicles will be ugly/noisy, cause traffic congestion and put off visitors. Aldeburgh high street will lose trade. Aldeburgh could return to becoming isolated - who will want to negotiate bulldozers/diggers/traffic lights just to eat fish and chips or go shopping in the high street or walk amongst diggers - local jobs will be lost!!	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The Chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. Landscape and visual impacts are considered in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** and ecological impacts in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). For further information on landscape and visual, terrestrial ecology and traffic, please see the themed tables in this Appendix for these parameters.
General commentary			
Local community	4,500 local people are employed in this valuable industry. Visitors come for the peace, tranquillity and 'off-grid' experience which this Heritage Coast offers. This is the most important revenue sector and it is forecast that there will be a year on year decline of 15% (source DMO report quantitative study Sept 2019). Visitors will go to more attractive places where there are no major infrastructure projects. Jobs will be lost. (There are no meaningful jobs for locals associated with these projects, hence a net loss).	N	The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and experience from the construction of the Suffolk Onshore Scheme. This Chapter estimates around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes. Compensation claims will be considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
Local community	Local employment would not benefit greatly, as the workforce is likely to be largely made up of external contractors, during the	N	The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	construction process and, if completed, would not offer huge employment potential to the local population. In fact, employment in our biggest industry, tourism, is likely to suffer as a direct result.		experience from the construction of the Suffolk Onshore Scheme. This Chapter estimates around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes.
Local community	The destruction of jobs in the local economy which is currently heavily dependent upon tourism, which will be massively disrupted on a permanent basis by the blighting of the East Suffolk coastal area. Sealink, itself, will likely generate few local jobs and not for the same people as those displaced from tourism.	N	The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and experience from the construction of the Suffolk Onshore Scheme. This Chapter estimates around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes.
Leiston-cum-Sizewell Town Council	While we understand the construction is temporary, the loss of tourist income from just a few seasons of upheaval in this location will be damaging. Comparison with Hinkley Point C and Bridgwater is not an appropriate benchmark as it is NOT a holiday destination. Therefore, we urge Sea Link not to be influenced by an apparent increase in tourism in the Hinkley area. The tourist offer for Leiston and the surrounding towns and villages is already under threat from the projects already consented and will further damage the tranquillity that visitors to this area, and the residents, are seeking. Tourist accommodation, currently much in demand, will be sought out by construction workers, making any tourism 'mitigation' a pointless exercise.	N	The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and experience from the construction of the Suffolk Onshore Scheme. This Chapter demonstrates that at peak workforce employment and typical seasonal occupancy levels, all of Suffolk Onshore Scheme's construction workers could be accommodated within a 60-minute drive time of the Order Limits. Given this, it is assessed that there would be negligible magnitude of impact on the hotel, bed and breakfast, and inns accommodation sector arising from the Suffolk Onshore Scheme. It is anticipated that accommodation providers would be able to accommodate employees working at the Suffolk Onshore Scheme without any adverse effects on the sector.
Local community	Tourism is a mainstay of the working population of this coastline. Who will want to come on holiday to an area with views such as a 26m high converter station or several as you are trying to get in, all of this will have a devastating impact on loss of trade. There will be no benefits to the people of Suffolk only long term disruption, heartache, loss of trade and a acceptable standard of living. There will be no increase in jobs to these communities, not even a benefit of better, cheaper energy as the energy produced from here will be used to benefit London and Belgium only.	N	The assessment of effect on tourism and recreation assets is included in the assessment within **Application Document Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** and concludes that no likely significant effects are anticipated on businesses, including those associated with recreation and tourism, and/or visitor perception and experience from the construction of the Suffolk Onshore Scheme. Compensation claims will be considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project Operational employment has been scoped out of the ES on the ground that the scale of operational employment is likely to be very limited. The Planning Inspectorate agrees with this approach on the basis that the description of the Proposed Project in the ES explains the level of employment generation in operation. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Inter Project Cumulative Effects**. National Grid has not committed to preparing and implementing a specific Employment, Skills and Education Strategy at a project level, as this is not considered to be an efficient or effective approach given the number of construction workers anticipated and that National Grid has not identified any likely significant effects in relation to construction employment.
Local community	At the consultation the contractors admitted that there would be minimal job creation in the local area as most of the workforce would be specialists and would therefore have to be brought in. Also, once the construction had been completed the sites would be unmanned. So, in both the short and the long term there would be no benefit to the local economy.	N	
Local community	My opinion is that it will cause immeasurable damage to the Suffolk Heritage coast, an area designated an Area of Outstanding Natural Beauty and a UNESCO World Heritage Site, and to the East Suffolk countryside. It is a region with a large tourist industry, accounting for 11,000 FTE jobs and generating revenue of £700M/year for the local economy. Tourists are drawn to this area because of the unspoilt nature of the countryside and the natural habitats and	N	A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The Chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. In developing the Proposed Project, National Grid has assessed a variety of other options, including other potential areas for new infrastructure. The reasoning behind the location of

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	abundant wildlife, especially along the coast. The damage and destruction that the construction of a huge substation and not one but ultimately three enormous converter stations, together with the trenching necessary for cables to connect on and off shore is almost inconceivable, and will go down in the annals of history as desecration of one of the most beautiful parts of England and will inevitably deter visitors to this area both during and after any building work has taken place.		the proposed new infrastructure is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. Further details relating to the assessment of impacts to the setting of AONB's (National Landscapes) and National Parks are provided within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Consideration of National Landscapes are also documented within **Application Document 7.11.1 Design Approach Document - Suffolk, Application Document 7.3 Design Development Report and Application Document 7.1 Planning Statement**. Impact assessments examining setting impacts can be found in **Application Document 6.2.2.3 Part 2 Suffolk Chapter 3 Cultural Heritage**. All assets where there was the potential for significant impacts on the setting of heritage assets were discussed with stakeholders at thematic meetings and viewpoint photography locations agreed with East Suffolk Council Conservation Officer and Historic England. Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	My wife and I have owned a cottage in Walberswick since 2005 having bought the business that is the Anchor in November 2004. Our response to this consultation focuses on both the adverse impact that the outlined developments are likely to have on our business as well as with the reduction in quality of working and residential life here in Walberswick. Unsurprisingly we are firmly and irrevocably opposed to the schemes proposed for the Suffolk Coast. Walberswick has two pubs, The Bell, and The Anchor. It is clear to us that any disruption to visitor numbers will place at least one and possibly both of these businesses in jeopardy. Both inns have been serving customers for centuries. We provide food, drink, accommodation and a venue for entertainment, 7 days per week, but since Covid not for all 52 weeks of the year. Our clientele includes local residents, but we rely on Walberswick's high-season, high volume visitors to tide us over financially during off-season periods. A large percentage of the 200,000 people who visit the village use our services. Our inn is not just our business, it is a community asset with amongst other facilities its heated and audio-visual projector equipped barn available for commercial and community purposes. We are a local employer, we support local initiatives and hold village and family events including weddings, funerals, celebrations, and public meetings. As custodians of the Anchor, we have given 18 years of our lives as well as reinvesting profits for the long-term sustainability of the business. Recent experiences of disruption to visitor numbers demonstrate the fragility of our business. Hard evidence of this includes the impact on our business of the COVID-19 lockdowns, the closure of the Bailey Bridge (our link to Southwold) and when either our main car park floods, or Cliff Field car park is taken out of action for bridge repairs. The recent flooding (late October) closed our	N	National Grid acknowledges these concerns about the potential effects of the construction phase of development on the visitor economy. These issues have been discussed with the local planning authorities between the PEIR and ES stages of the DCO application process. These thematic meetings have primarily focused on discussing points raised by local planning authorities in the statutory consultation, which reflect these concerns. The meetings have been run by the technical disciplines and provided an opportunity to bring questions, concerns and local context to attention to help inform the ES. An extensive assessment of the effects of the Proposed Project and a cumulative assessment with other projects has been undertaken. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	business for the day, simply because of the impact on visitor access of flooded roads. The effect of the infrastructure works proposed in this region will have a continual adverse impact on visitor numbers to the area generally and to our village in particular and would threaten the financial viability of the Anchor.		
Local community	I have heard no mention of the demands likely to be placed upon local services by large numbers of contractors staff. Where are they to be accommodated? Are there families to be brought into the area given the inevitable length of the contracts involved? Housing and medical facilities are limited.	N	Potential impacts on the local services are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This analysis demonstrates that at peak workforce employment and typical seasonal occupancy levels, all of Suffolk Onshore Scheme's construction workers could be accommodated within a 60-minute drive time of the Order Limits. Given this, it is assessed that there would be negligible magnitude of impact on the hotel, bed and breakfast, and inns accommodation sector arising from the Suffolk Onshore Scheme. It is anticipated that accommodation providers would be able to accommodate employees working at the Suffolk Onshore Scheme without any adverse effects on the sector.

Table 1.11 Health and wellbeing

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The transmission system needs to be secure for our life and wellbeing. This is particularly important with the move away from fossil fuels.	N	National Grid acknowledges these comments and welcomes the support. The proposal they are putting forward will support the aspirations to deliver net zero by 2050, supporting decarbonisation of domestic and business needs for Great Britain.
Local community	Will the area be habitable and what the health concerns and also will freedom of movement by the general public be affected.	N	A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. These conclude that there are no anticipated significant effects as a result of the Proposed Project. Outline PRoW Management Plans have been prepared for both Suffolk and Kent as part of the DCO application. These have been developed in consultation with the relevant local planning authorities and provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk and Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**.
Local community	My concern is the safety of residents and if there is evidence of medical issues (like that of mobile masts) to residents living close to the infrastructure or nearby.	N	The health, safety and wellbeing of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases. A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. These conclude that there are no anticipated significant effects as a result of the Proposed Project. With regard to electromagnetic fields (EMFs), the UK has a carefully thought-out set of policies for protecting the general public against EMFs, the main component of which is exposure guidelines. These exposure guidelines are set by independent scientific bodies and are based on decades-long studies into the effects if EMFs and ill health. After those decades of research, the weight of evidence is against there being any health risks of EMFs below the guideline limits. It is National Grid's policy to ensure that all of its equipment comply fully with these exposure limits. Further information can be found in **Application Document 6.5 Electric and Magnetic Field Compliance Report**.
Local community	In principle I am for increasing our renewable energy capacity but this is an important site on the Kent coast which is internationally recognised and contributes not only to tacking our biodiversity crisis but to the mental health and wellbeing of the community. There must be a way to accommodate both.	N	National Grid recognises the important designations of protected sites on the Kent coast. A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. The assessment concludes that there are no anticipated significant effects as a result of the Proposed Project. There will be some temporary disruption to the area during construction, but as the works in the Pegwell Bay area will be conducted using trenchless solutions, there will be no long-term impacts on access for the public. National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. Details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). A Construction Code of Practice (**Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**) will help control and manage aspects of the development scheme that could affect health and wellbeing.
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	The construction would cause significant chaos and those closest would have their lives ruined, I would anticipate many local residents could suffer mentally from the blight of the three converter stations.	N	National Grid recognise that the construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on people's mental health. Throughout the development phase of the Proposed Project, National Grid have therefore tried to clearly communicate the proposals including the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid have sought to provide certainty on the plans wherever possible. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**. The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. The health, safety and wellbeing of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases.
Q7 What do you think about our proposed HVDC cable route in Suffolk? Comments			
Local community	Destruction of local environment and traffic. as well as resident's mental health.	N	National Grid acknowledges that there will be some impacts on the local environment and the local traffic network. As part of the DCO submission, a robust EIA has been prepared for a number of environmental parameters, culminating in the production of an ES. National Grid recognise that the construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on people's mental health. Throughout the development phase of the Proposed Project, National Grid have therefore tried to clearly communicate the proposals including the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid have sought to provide certainty on the plans wherever possible. The potential impact of the Proposed Project on the local road network is assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			assessment demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. The health, safety and wellbeing of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases. A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**, concluding that there are no anticipated significant effects as a result of the Proposed Project.
Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness? Comments			
Local community	This is not the best location. This is an Area of Outstanding Natural Beauty, SSSI, part of the North Warren RSPB nature reserve all enjoyed by many, many people for their wellbeing and mental and physical health.	N	The potential impacts of the Proposed Project on the AONB and North Warren Nature Reserve are acknowledged. The assessment of effects on the AONB is set out within **Application Document Part 2 Suffolk Chapter 1 Landscape and Visual,** and the effects on the North Warren site in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The mitigation hierarchy has been applied to lessen effects where possible. Potential impacts on the tourism economy are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. Health and wellbeing impacts are assessed in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. The health, safety and wellbeing of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases.
Local community	It is devastating to see the bigger picture and see such a beautiful area blighted by land fill – what about the wildlife, tourists who come to enjoy the environment and mental wellbeing?	N	
Q9 Are there any other ways that you would like us to explore coordination with other projects?			
Local community	Can you imagine the disruption to people's lives and jobs whilst this is being built. Tourism will suffer so jobs will the main form of employment in this area. Local people's lives will be badly disrupted. There are many retired/elderly people in the areas you are going to destroy these people need easy access to services like doctors, hospital and shopping areas or visit from health care workers. All of which will become more difficult with road closures and diversions. Local bus routes will change so how are the people who rely on this form of transport cope no thought for the people who actually live here. Just a box ticking exercise sadly.	N	Potential impacts on the tourism economy are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. Impacts related to disruption to traffic are assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q10 Is there anything that you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	This whole proposal is a disaster. I live close by and it's a lovely quiet place. I work shifts and this is the reason I bought my house	N	National Grid acknowledges that there may be a temporary adverse noise impacts during construction on Noise Sensitive Receptors. An assessment of construction noise impacts

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	there. This proposal in Saxmundham would ruin a large aspect of my life. Please re-think this!!		has been undertaken as part of the ES, including consideration of any potential night-time works, refer to **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Further detailed construction noise assessments would be undertaken by the contractor prior to commencing works. The outcome of these detailed assessments would include details of specific mitigation measures for each activity. Noise and vibration effects during the construction phase are therefore expected to be not significant. No residual significant adverse impacts of noise during operation were identified by the EIA.
Local community	The new substation design is too tall for its location next to the village/church and also more details needed on gas used for health & safety reasons.	N	The effects arising from the Suffolk Onshore Scheme on visual amenity and landscape character is summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section within A**pplication Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1).** There is no oil-containing equipment at Friston and so there is less risk of toxic fumes from the Substation. Friston Substation will be constructed in accordance with buildings regulations which includes consideration of measures needed in the event of a fire or an explosion. Furthermore, a fire risk assessment will be carried out and the Substation will be constructed in line with this risk assessment. It will be equipped with relevant fire suppression equipment and systems. In accordance with best practice, the fence line will be placed at a distance to contain an event, such as a fire or explosion, within its confines. Within the fenceline, vegetation is removed to reduce the possibility of the spread of fire. An Emergency Response Plan would be provided for operation and as part of this Plan, resilience exercises are conducted to test the systems and procedures. The fire and rescue service are a key consultee whom National Grid are engaging. They have had a chance to comment on the Proposed Project and National Grid will produce guidance for them for operation.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	The idea of so much voltage under our local ground is very worrying for health and happy living. They built houses a couple of years ago here, close and had to use piling. The house I live in shook violently, it physically moved. So engineering below and on top so close to the cliff structure is a bother due to harmful possible side effects.	N	The health and safety of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing assess the overall impact on social cohesion and community identity, including mental health, to be minor, temporary and not significant.
Q16 What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line?			
Local community	Yet again, using rural parts of Suffolk and Norfolk for gigantic pylons is not a green option. These pylons cause health issues.	N	The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. Details are contained in **Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing** which concludes there are no likely significant effects as a result of the Proposed Project. The effects arising from the Suffolk Onshore Scheme on visual amenity and landscape character is summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Potential impacts on ecology are considered in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**). With regard to electric and magnetic fields (EMFs), the UK has a carefully thought-out set of policies for protecting the general public against EMFs, the main component of which is exposure guidelines. These exposure guidelines are set by independent scientific bodies and are based on decades-long studies into the effects if EMFs and ill health. After those decades of research, the weight of evidence is against there being any health risks of EMFs below the guideline limits. It is National Grid's policy to ensure that all of its equipment comply fully with these exposure limits. The proposed overhead lines have been designed to ensure they are fully compliant with guidelines and policies. This ensures that health concerns are properly and adequately addressed. Where possible the required cabling has been placed underground. Further information can be found in **Application Document 6.5 Electric and Magnetic Field Compliance Report**.
Local community	The electrical interference to both wildlife and local residents - who knows what this impact will be?!?!	N	
Local community	Pylons - Still not proof if they cause danger to life. Have lost x2 people to cancer living under pylons. We had a small substation bottom of our garden when I was a child. They moved it said was a danger to our health.	N	
Local community	Overhead lines are unsightly and dangerous to health for anyone living close by - would prefer if you went underground.	N	
Q17 Anything else? Comments			
Local community	Thanet is experiencing huge development. This area already has its share of other power related projects. Green space is becoming more and more limited and is already having a detrimental impact on the local resident's mental health and wellbeing.	N	National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. National Grid cannot comment on the extent of ongoing development in the Thanet area not related to the Proposed Project; however, the cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	We cannot underestimate the importance of Pegwell Bay and Minster Marshes for the overall wellbeing of the human population that lives in the surrounding area. We are all entitled to our green spaces and they need to be preserved for future generations.	N	National Grid recognises the important designations of protected sites on the Kent coast in relation to biodiversity and as an important space for recreation. There will be some temporary disruption to the area during construction, but as the works in the Pegwell Bay area will be conducted using trenchless solutions, there will be no long term impacts on access for the public. The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. Details are contained in **Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing** which concludes there are no likely significant effects as a result of the Proposed Project. Potential impacts on ecology are considered in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). A Construction Code of Practice (**Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**) will help control and manage aspects of the development scheme that could affect health and wellbeing.
Local community	This area is incredibly important to the people of Thanet. With a population of 140000, set to increase to 180000 people this is a much loved wildlife area. Mental health in Thanet is one of the worst in the UK. People enjoy and love Pegwell bay and the marshes. It should be protected and preserved.	N	
Q18 Do you have any key concerns regarding the construction stage of Sea Link (Other)? Comments			
Local community	Peoples' mental health. The coast area is a place where people walk and relax. The part between Aldeburgh and Southwold was a favourite walk of Benjamin Britten, who would compose whilst walking. People today come from far and wide to enjoy the peace and quiet of the area.	N	National Grid acknowledges that there will be some impacts on the Suffolk coast during construction. As part of the DCO submission, a robust EIA has been prepared for a number of environmental parameters, culminating in the production of an ES. The impacts on walking are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	There will be a big impact on peoples' mental health as getting out into the Marshes is, healing for our souls. A place to unwind and enjoy the country and wildlife, away from the craziness of everyday life.	N	The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. Details are contained in **Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing** which concludes there are no likely significant effects as a result of the Proposed Project. National Grid acknowledges that there will be some impacts on the Kent coast during construction. As part of the DCO submission, a robust EIA has been prepared for a number of environmental parameters, culminating in the production of an ES. The impacts on walking are considered in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Kent as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			construction, operation and decommissioning phases. See **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	Noise and total long term mental damage to the residents of residence in question. We MUST consider quality of life for the generations to follow.	N	The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. Health and wellbeing impacts are assessed in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. Noise impacts are considered in **Application Document 6.2.2.9 Part 2 Suffolk Noise and Vibration and Application Document 6.2.3.9 Part 3 Kent chapter 9 Noise and Vibration**. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I am concerned that the impact of the stress and environmental impacts caused by having so many co occurring large energy projects converging in the East Suffolk area will negatively impact the mental health of people living and working in the area.	N	A complete cumulative assessment has been undertaken. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The chapter concludes that there are no anticipated significant health and wellbeing effects.
Q26 Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation?			
Local community	This is the first time I, and many others in this community, have heard about this project. Now we know we are incensed that Pegwell Bay/Minster Marshes are even being considered for this project. There can be no mitigation for the damage this will cause to the environment and the wildlife on this nationally important wildlife sanctuary. It is also so important for mental health and wellbeing. In Thanet we are one of the most deprived areas of the country, both economically and for wildlife. Your consultations I fear will just be a tick box exercise. I note you have "scoped out" a lot of concerns in the documentation I have read, just dismissing important concerns about wildlife, habitat, marshland. Please, please listen to locals who know and respect the area, No greenwashing please.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. Health and wellbeing impacts are assessed in **Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**.
General commentary			
Local community	Many people find solace in wild open spaces, and the value of this to the population's well-being became very clear during the Covid pandemic. Destruction of this area will have a detrimental effect on people's mental health.	N	National Grid acknowledges that there will be some impacts within the area of influence of the Proposed Project during construction. As part of the DCO submission, a robust EIA has been prepared for a number of environmental parameters, culminating in the production of an ES. The impacts on walking are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economic, Recreation and Tourism and Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. Health and wellbeing impacts are assessed in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. Outline PRoW Management Plans have been prepared as part of the DCO application. These has been developed in consultation with the relevant local planning authorities and provide details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk and Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	As a resident for some 35 years, I find the scale of the project combined with several other projects within the area intrusive and damaging to our local community's health and well-being.	N	A complete cumulative assessment has been undertaken. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The chapter concludes that there are no anticipated significant health and wellbeing effects. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This news of the "done deal" that National Grid are pushing to the people to believe has raised our stress levels hugely. This is having a major impact on our health. I have had to go on anti-depressants and my husband needs to go on them, but is fighting to keep his stress levels down without having to be forced to go on medication due to the stress National Grid and Sea Link have heaped upon us. We're worried our jobs may be affected, as they rely on tourism to our beautiful coast. We don't want the traffic stress that comes with up to 10 years of construction and over 400 construction workers will have on our small town and narrow B roads, which are unable to take the strain of large and abnormal loads. The impact this will have on locals and tourists trying to live a normal everyday life is huge and detrimental to our wellbeing.	N	The health and safety of the public, local communities and employees is National Grid's highest priority. National Grid has consulted on the Proposed Project, seeking feedback from local residents so it can identify means of mitigating impacts from construction and operational phases. The proposals will be scrutinised by the Planning Inspectorate's independent Examination Panel and determined by the Secretary of State. Should the Proposed Project be approved, it will not take ten years to complete, there will be approved transport routes for construction traffic and a dedicated community team that will be available to respond to any issues arising during the build phase.
Substation Action Save East Suffolk	These projects are already damaging the health and well-being of the community. The construction impacts of Sealink in isolation and cumulatively with the other projects will have a very serious effect on the well-being of all local residents many of whom are elderly or vulnerable. These projects do and will continue to blight the last productive lives of many residents. There needs to be a proper assessment of well-being impacts.	N	Health and wellbeing impacts are assessed in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. An extensive assessment of the effects of the Proposed Project and a cumulative assessment with other projects has been undertaken. This is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Cllr T-J Haworth-Culf	The impacts are already being felt on the site, rentals are down for the individual owners that offer holiday lets and the values are being	N	The Proposed Project is a linear project and all landowners and tenants along the proposed routes have been consulted. The health and safety of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals,

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	effected. The anxiety, stress and worry by the users who come here for the peace, quiet and tranquillity is not fair to them, or us.		National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases. **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism and Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism** assess the overall impact on tourism in both Suffolk and Kent to be small, with minor adverse effects that are not considered to be significant.
Local community	Human health: the stress that the cumulative impact of consultations and plans for multiple projects is having on the local population is significant. There is a justified fear of loss of tourism and therefore businesses and jobs locally. This is coupled with compulsory purchase threats, the impact on homes and peoples' properties due to the proximity of these huge developments, and the concern over noise, pollution, flood risk, etc. continues to be stressful and damaging to health for many.	N	The health and safety of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases. The Proposed Project Team has engaged with other developers in the local area to identify opportunities to reduce the impact of construction and will continue to do so.
Local community	The mental well-being of the Friston community is a crucial aspect that seems to be overlooked in the Sea Link project proposals. The continuous noise, disruptions, dust and the strain of construction activities can have severe consequences on the mental health of residents. I implore National Grid to conduct a thorough assessment of the potential psychological impact on the community and implement measures to mitigate such effects.	N	Health and wellbeing impacts are assessed in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. These plans will help control and management of potential impacts such as dust and noise. A list of mitigation measures is also contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. These two appendices of the CEMP are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Table 1.12 Inter-project cumulative effects

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The number of projects in this area is overwhelming. I went to a recent information event for Lionlink but it has a possible route from Walberswick. So this is yet another project in addition to this National Grid route and the Scottish Power. We already have 2 nuclear reactors, two more on their way and we are a nuclear waste storage site. I am keen on wind power but the number of varying projects in this area is more than it can take. With so many routes for cables, substations, converter stations, railways and bypasses for Sizewell C it's going to be one giant construction site and one giant traffic jam.	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**. National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Local community	The location has already seen planning approvals from a number of other power related developments, for example the Battery Plant and Grid Stability Plant. While the Nemo link has resulted in a convertor station and associated infrastructure on the old Richborough Power Station site close by. My concern is that the biodiversity of this area has already been drastically affected by a number of large developments and it is therefore extremely important that the cumulative impact of these combined developments and any future ones are taken seriously into consideration.	N	National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**.
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Sudbourne Parish Council	The Council has significant concerns regarding the impact of multiple potential energy projects within a similar geographic location on similar timescales and urges NGET to actively co-ordinate activity with the other projects to ensure that disruption is minimised for the local resident community.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			coordination benefits and to also explore further opportunities for coordination where they arise. National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. **Application Document 6.3.2.13.A ES Appendix 2.13.A Descriptions of Other Developments** contains updated information regarding other project timescales which have been used in the cumulative assessment.
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	Works well with other proposed sites.	N	National Grid acknowledges this feedback and thanks the respondent for the support.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	I have lived with these reviews and consultations for the last 5 - 6 years, what we have not had is a complete and honest review of all the proposed energy projects, it is now an urgently requirement that this should be presented as soon as possible. This must show where all the substations and interconnectors are to be situated, where the cable runs will be, what provision will be made vehicle and plant movements. What will the over effect of light and noise be how long will all these projects take, a start date and finish date, these are just some of the question that need to be answered, at present we are just given each project, saying that this is our project, we can't comment on what the others are doing.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO and LionLink. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. The consultations undertaken are discussed in **Application Document 5.1 Consultation Report**. The assumptions made about the lighting design that have informed the landscape and visual impact assessment are set out in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Consideration of the landscape and visual effects of light pollution during construction and operation is presented in **Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment, Application Document 6.3.2.1.D ES Appendix 2.1.D Visual Amenity Baseline and Assessment, Application Document 6.3.3.1.C ES Appendix 3.1.C Landscape Designation and Landscape Character Assessment and Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment**. An assessment of construction noise impacts has been undertaken as part of the ES, including consideration of any potential night-time works. The assessment indicates that with mitigation in the form of best practicable means, significant adverse effects from construction activities can be avoided at all nearby properties. Further detailed assessments will be conducted by the contractor and specific mitigation measures will be identified and incorporated in the works. Further details are contained in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration**. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project programme is presented in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The cumulative impact of all energy infrastructure projects proposed for Suffolk need to be considered together before the true short and long term impact on the environment of the region can be estimated. It is my view that Suffolk cannot support such a huge number of major projects and continue to function as before. In other words these infrastructure projects will change the nature of the region and negatively impact all existing communities and the region's economy.	N	National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.The impacts on communities and the economy are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economic, Recreation and Tourism** which concludes that there will be no likely significant effects as a result of the Proposed Project.Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Saxmundham is the gateway to the sunshine coast incorporating Aldeburgh, Thorpeness, Southwold and Walberswick, as well as the RSPB reserves at Minsmere and Snape Warren. The impact on Saxmundham and its attraction as a place to stay and live will be seriously affected if it is surrounded by construction sites. 2026 is a key year. Not only is the Sea Link, Lion Link and Nautilus projects due to start in this year, but also Sizewell C Nuclear facility and the construction of an 800 Garden Neighbourhood development to the south west of the town. No consideration seems to have been taken into the impact on all this construction on the people who live, work and visit Saxmundham. If these projects do go ahead, the residents will be seeking significant funds to mitigate against the impact of these numerous energy projects	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. This assessment includes the impact on tourism and the local workforce. Impacts on the economy are also considered in **Application Document 6.2.2.10 Part 2 Suffolk Socio-Economics, Recreation and Tourism**.
Local community	Construction of these facilities simultaneously with the development of Sizewell C nuclear power station (if that project goes ahead) and the onshore facilities for the EA1N and EA2 windfarms threatens to completely jam our already inadequate rural road network. The resultant congestion and environmental damage would not only cause great distress to local residents but would also lead to a significant reduction in year-round tourism-related income, which is the mainstay of the local economy.	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The impacts on communities and the economy are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economic, Recreation and Tourism** which concludes that there will be no likely significant effects as a result of the Proposed Project.
Q17 Anything else? Comments			
Local community	I am also extremely concerned that the 'cumulative impact', of a number of significant and already approved projects: Battery Plant (F/TH/22/0579), Grid Stability Plant F/TH/23/0170), as well as any	N	National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.3.13 Part 3 Kent**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	future proposals in the pipeline, including the possibility of increased battery storage and solar farms, has not been mentioned. The impact on the environment, biodiversity, flood risk, light and noise pollution, loss of amenity, transport and effect on neighbours is not considered in relation to the project itself in this documentation and makes absolutely no mention of the combined impact of all projects in the area. The Minster Marshes for example will be directly and indirectly impacted by the Sea Link Project but is also being directly and indirectly affected by all the other projects going on in the area that are encroaching from all sides and given the height of the converter, from above as well. These developments are also located close to Southern Waters Sewage Treatment Plant and it is well documented that the system is not coping. This additional development would limit the possibility of expansion of the sewage treatment plant, something many, feel is necessary given the present situation and increased housing numbers being given permission in areas served by this. The increased risk of flooding due to run off is likely to also affect the sewage treatment plant.		**Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. This includes and assessment of the cumulative impacts relating to ecology (including Minster Marshes), flooding, light and noise, traffic and transport and socio-economics. The list of projects considered in this assessment is contained in **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**. National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the waste water treatment works. Assessments of the potential impacts of the Proposed Project relating to ecology, flooding, light, noise, recreation, and traffic and transport are contained in the following documents: • **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity;** • **Application Document 6.2.3.4 Part 3 Kent Chapter 4 Water Environment;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration; and** • **Application Document 6.2.3.7 Part 3 Kent Traffic and Transport.**
Local community	This is not the only development in this area and I am really concerned that other developments including the battery plant and grid stability plant, which already have planning permission, have been viewed in isolation. There is no overall appreciation of the impact that these developments will have on Minster Marshes, gradually encroaching and decimating this richly biodiverse area. The marshes simply cannot sustain a converter station in addition to these other developments and these must be mentioned as detrimental to consent when applying for the DCO. We must maintain the wildlife corridor of which Minster Marshes is part, from Pegwell Bay, along the river Stour to the ancient woodlands of Blean. Only that way can we ensure a healthy, diverse wildlife population and not isolated pockets of wildlife cut off by vast infrastructures be it for electricity, water treatment plants or housing. Additionally we cannot underestimate the importance of Pegwell Bay and Minster marshes for the overall wellbeing of the human population that lives in the surrounding area. We are all entitled to our green spaces and they need to be preserved for future generations.	N	The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	The failure to present this project alongside all the other energy projects hitting the Suffolk Heritage Coast is appalling. The cumulative impact of half a dozen projects similar to Sea Link arriving in the Sizewell area at the same time as Sizewell C construction is enormous. Not only will this blight the lives of residents for decades, but it will seriously damage the visitor-based economy resulting in significant and measurable net job losses. The	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	area has boomed since the end of the Cold War, these proposals will take us backward and risk creating isolated coastal “left behind” communities the Government is trying to address. There have been no Government or industry assessments of the total picture in this area, showing the cumulative impacts of multiple projects. This in itself is a significant abrogation of duty at best, or deliberate obfuscation at worst. The piecemeal presentation of individual projects puts an onerous responsibility on individuals to stay informed, attend events and provide feedback repeatedly over the last 5 years. This is likely to continue for more years. Not only is it unfair and unreasonable, but it is also inefficient and ineffective as the total picture is hard to discern.		Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. National Grid cannot provide comment on Government actions, but as part of the Proposed Project ES, the cumulative effects of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The potential impacts of the Proposed Project on the economy and local amenity are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economic, Recreation and Tourism** which concludes that there will be no likely significant effects as a result of the Proposed Project. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I feel that National Grid have been hiding in the background - putting forward via SPR the Trojan Horse of a substation for Friston to then connect up all of these other projects (Sealink etc) in the area. No account has been taken of the cumulative impact of these projects occurring at the same time, on your construction programme & timings you show the Friston substation AND Saxmundham converter station starting work in Q3 2026 through to 2030as a minimum. Add to that the start of Sizewell C construction the area will be overwhelmed by construction traffic, and the subsequent loss of tourism (which the area relies on heavily). The fact that all of these projects are being “floated” independently puts tremendous strain on the local population, making it almost impossible to see the overall view of the issues involved.	N	The cumulative effects of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The potential impacts of the Proposed Project on the economy, tourism and local amenity are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economic, Recreation and Tourism** which concludes that there will be no likely significant effects as a result of the Proposed Project. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I accept that each development must be considered on its merits but in this case because of the cumulative impact of projects similar to Sea Link close to Sizewell at the same time as Sizewell C may be built is enormous and all known projects should therefore be considered together. There seems to be a failure by the proposers of the project to effectively link Sea Link alongside all the other projects hitting the Suffolk Heritage Coast. If all the proposals go ahead it will blight the lives of residents for decades, will seriously damage the local tourism industry resulting job losses locally. Employment in these new developments is likely to be minimal compared to the existing employment opportunities. In practice the area will become another coastal employment black spot which the Government is trying to resolve. I understand there have been no Government or industry assessments of the total picture in the area, showing the cumulative impacts of multiple projects. As a result local residents affected by the developments will need to keep on their toes to stay informed as the planning process does not cater for notification to individuals other than at a very local level. These proposed developments, encompassing many local authority areas, are undoubtedly more than local. As I see it the situation will continue in this area for many	N	The cumulative effects of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The potential impacts of the Proposed Project on the economy and tourism are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economic, Recreation and Tourism** which concludes that there will be no likely significant effects as a result of the Proposed Project. Around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes. Mitigation is listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid cannot provide regard to comments made on Government assessments.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	years to come and some combined local oversight, perhaps under a national wing, is needed.		
General commentary			
Local community	The cumulative impact on local communities and environment of up to six energy projects occurring at the same time or one after the other, over 12 to 15 years has not been fully taken into account. Nor has other housing, road and utility projects causing increased traffic pollution, health and other risks to residents' daily lives and business activities. If two other energy projects are co-located into the same area as Sea Link the impact is three times as each project is operated by separate developers.	N	National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects, Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. These assessments have taken into consideration a wide range of projects within the local area. Details are contained in **Application Document 6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**. These documents also contain cumulative assessment of the impact of the Proposed Project together with other projects for a wide range of parameters such as traffic and transport, air quality, noise and vibration, ecology and biodiversity, health and wellbeing and cultural heritage, among others. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**.
Local community	The impact on the health of the area - in terms of air, light and noise pollution would be significant, as would the impact of what would inevitably be a gridlocked local road system upon the local tourist industry, on which the area substantially relies. There would be substantial job-losses, which would contribute to making the area less attractive to visitors - a vicious downwards spiral which would be caused by these ill-thought out proposals. All these concerns seem to be glossed over in the proposals and, again, no alternative solutions are offered whatsoever! We already have the prospect of huge disruption due to Sizewell C, and the cumulative impact of this with the LionLink and Sea Link projects appears to have been completely side-stepped - this is all unacceptable.	N	The health, safety and wellbeing of the public, local communities and employees is National Grid's highest priority. Throughout the development of the proposals, National Grid has carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts of the construction and operational phases. Details of the assessment are contained in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 2 Health and Wellbeing**. National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects, Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. The Proposed Project's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for the Proposed Project.
Local community	The community would struggle under the burden of multiple projects of energy construction road traffic on county lanes and road access multiple projects, cable routes through countryside, noise, unsociable working hours, environmental impact damage to flora and fauna would take years to recover if at all and flood risk. I would also like to put to you the economic impact on tourism I for one	N	National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects, Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. These assessments have taken into consideration a wide range of projects within the local area. Details are contained in **Application Document**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	would not come for a holiday on a building site so local business will suffer and will also affect house values. The impact that multiple projects in this area have not been holistically assessed which undermines the consultation process. There will be overlapping construction periods at Sizewell, Friston, Saxmundham, Aldeburgh. Potentially Walberswick and Southwold too.		**6.3.1.5.C ES Appendix 1.5.C Inter-Project Cumulative Effects Short List**. These documents also contain cumulative assessment of the impact of the Proposed Project together with other projects for a wide range of parameters such as traffic and transport, air quality, noise and vibration, ecology and biodiversity, health and wellbeing and cultural heritage, among others. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**).
Local community	Sea Link as a project cannot really be considered without looking at the Cumulative effect of all the energy infrastructure projects - National Grid, Scottish Power, EDF - planned for this area and none of the consultations I have been to for all the below projects in the past 4 years have addressed this issue. They act as if they are the only project coming to this area and that it will only be a little bit of chaos. The Sizewell C & D projects are already proposed to be the largest construction project in Europe and in your wisdom, you think that these projects are just going to tuck in alongside and cause no harm, be unnoticeable? I think there might be something amiss with your eyesight. Here is a list of all the projects that YOU have instructed to join the grid at Sizewell connection, and the 2 new EDF power stations: Scottish Power, East Anglia One North, East Anglia 2, Lion Link, Nautilus, Sea Link, (North Falls?), (Five Estuaries?), EDF and Sizewell C and D. These projects are all proposed to be built over a period of 12 to 15 years and the effect of this construction on the people who live here has not been considered properly. Construction of Sizewell C and D, the Friston Substation and a Saxmundham converter station will all be going on at the same time. These projects will bring with them a lot of Heavy Goods traffic on the roads which will impact on residents in a. multitude of ways - Getting around doing our daily business will be much more difficult; roads will be closed, some areas and villages inaccessible; more traffic controls, a lot of construction vehicles on the roads transporting building materials.. This is an ageing population, emergency vehicles will be a lot slower to reach us.. home deliveries difficult. Particularly for us residents in Sizewell as all of the proposed projects will be using the Sizewell Gap road and Lovers Lane, this extra traffic jeopardises our Nuclear evacuation routes. Workers will need housing.; that will impact on the local tourist industry and falsely inflate the cost of housing/outprice locals. You have not produced reports which show you have considered any of these issues.	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. The potential impact on emergency services is assessed in **Application Document 6.2.2.11 Part 2 Suffolk Health and Wellbeing** which concludes that there are no likely significant effects. The construction vehicle routeing has been designed to minimise impacts across the highway network, as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network (including with regard to Driver Delay), with the mitigation identified within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. In terms of local accommodation capacity, in a worst case scenario where all 327 peak workers require accommodation during peak demand in July, all of Suffolk Onshore Scheme's construction workers could be accommodated within a 60-minute drive time of the Order Limits. In addition, impacts on residential properties, businesses, development land, recreation and tourism assets are concluded to be not significant.
Westleton Parish Council	Westleton Parish Council understands the need for the Great Grid Upgrade, but believes that the proposed implementation programme is ill-conceived. Crucially, the proposed plans for each of the projects should not be looked at in isolation as their	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	cumulative impact will be environmentally, socially and economically disastrous for the Suffolk Heritage Coast. The construction work will cut through protected environmental areas and damage wildlife, the buildings will blot the landscape, the quality of life of the residents will suffer, the local economy will suffer as tourists will avoid the area and the projects themselves will not generate local jobs. Conversely, taking all the cable projects off-shore and making landfall at a brownfield site closer to the demand not only avoids all of these impacts, but surely also makes good business sense. Westleton Parish Council therefore urges that National Grid re-think its approach, cooperate with the other energy interests, and develop a programme of works which better meets its needs whilst avoiding the damage that the current proposal present to the Suffolk coast, its communities and its economy.		National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. Around 30% of the construction staff will be sourced from the surrounding area, based on benchmarks against similar energy infrastructure schemes. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure.
Local community	With multiple projects proposed to be taking place apparently at the same time in a small area, how will you ensure access at all times for residents and that the cumulative effect will not be intolerable?	N	**Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This plan takes into consideration the traffic management plans from other proposed projects in the vicinity.
Aldringham-cum-Thorpe Parish Council	We refer to PEIR Volume: 1 Part 2 Suffolk Onshore Scheme Chapter 14 Suffolk Onshore Scheme Inter Project Cumulative Effects 2.1 NGET admits that it has not assessed the cumulative of Construction Traffic with respect to Scottish Power Renewables EA1N and EA2 projects. Its justification for this is that it assumes both of these projects will have been completed before Sea Link's scheduled peak construction period around 2029. We believe that this might not be the case. SPR have not yet published a construction programme for these projects and are still fighting Judicial Reviews at the time of writing. 2.2. NGET Sea Link admit that there will significant cumulative effects with respect to each of the NGV projects, Nautilus and Lion Link, but claims that it is not possible to make such an assessment as there is, as yet, insufficient information available for those projects. We believe it should have been possible as these two projects appear to be planning to use ducts laid by NGET in their Sea Link groundworks. They would claim to be two separate companies from Sea Link so would not be party to their programme of works. Whatever the outcome of this will be, it is hard to envisage how the overlap of all these projects will not cause consequential cumulative effects or can be avoided.	N	**Application Document 6.3.2.14.A ES Appendix 2.14.A Descriptions of Other Developments** contains updated information regarding other project timescales which have been used in the updated cumulative impact assessment in the ES. EA1N and EA2 construction is expected to commence in 2024/2025 and energisation to commence in 2027 (Scottish Power Renewables, 2024). The judicial review challenges at the Friston Substation have been rejected by the London Court of Appeal. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Snape Parish Council	We have raised our concerns over many years around the cumulative impact of all the concurrent major projects, including yourselves. Those concerns have been consistent around the many projects' potential impact on Snape and the area and also the lack of consultation with the village over an extended period. They remain largely unaddressed and in our view the Sea link project can only add to existing issues, given the scale of the work there will be an impact on Snape, wherever the location of the proposed converter and landing sites and cable corridors given the nature of East Suffolk and particularly the road and transport infrastructure. All the concerns that we have raised at the DCOs for SZC and SPR will be compounded and remain largely unaddressed. At this stage there is little detail available but at the point that more information is available we will raise again our specific concerns.	N	The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. **Application Document ES 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** sets out all of the road links, junctions and PRoW (including national walking and cycling routes) that may be subject to potential effects as a result of the Proposed Project. The construction vehicle routeing has been designed to minimise impacts across the highway network (including the A1094, B1122, B1069 and B1119 for example), as set out within **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk**. The traffic and transport assessment within **Application Document ES 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** does not identify any significant impacts on the highway network during the construction phase with the proposed embedded mitigation and control and management measures in place. National Grid welcomes any feedback regarding this assessment.
Substation Action Save East Suffolk	The length and complexity of this chapter is proof of the excessive burden of at least four other projects (in addition to Sealink and the National Grid connection hub) being developed in the same small area and connecting in the same place where the temporal construction duration of the projects overlap. It is self evident that National Grid has chosen the wrong development and the connection location for these six projects. This is significantly exacerbated by the Sizewell C project. 46. In particular cumulative construction impacts have not been properly assessed which undermines the consultation process. National Grid has included incorrect information on the construction period for the Scottish Power projects (2023 - 2026). These are already running two years late which is a matter of public knowledge and obviously no construction activity has been going on this year. There will be overlapping construction periods for all six projects. It is unacceptable that cumulative impacts are not being assessed and consulted upon based on information that National Grid knows to be incorrect. The cumulative impact of potentially six projects (EA1N, EA2, the National Grid connection hub, Sealink, Lionlink and Nautilus) across a vast construction site will be severe and unsustainable.	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a scheme that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. **Application Document 6.3.2.14.A ES Appendix 2.14.A Descriptions of Other Developments** contains updated information regarding other project timescales which have been used in the updated cumulative impact assessment in the ES. East Anglia ONE North and East Anglia TWO construction is expected to commence in 2024/2025 and energisation to commence in 2027 (Scottish Power Renewables, 2024). The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	The Coraline Crag protects against coastal erosion, will damaging this area impact the tidal flow at Aldeburgh?	N	**Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment** considers the coastal processes operating at both the Suffolk and Kent landfalls, and how they may alter through the lifetime of the Project taking into account the influence of climate change. The ES also assesses the impact of cable installation processes and the presence of the cable on nearshore/coastal hydrodynamics and sediment transport, and morphology. The offshore Coralline Crag outcrop is interconnected to many of the physical processes that maintain the geomorphology of the Suffolk coastline. Any activity that adversely affects this feature may have implications for the stability and character of the coastline as far north as Dunwich and as far south as Orford Ness (Royal Haskoning DHV, 2019). The Coralline Crag Ridges outcrop is a geologically resistant feature that has low sensitivity to erosion, however, its significance in determining the hydrodynamics, sediment transport patterns and coastal geomorphology in the region, incurs a higher level of sensitivity (medium-high) that reflects how even moderate alterations to the Ridges may then significantly impact the geomorphology of the coastline. However, whilst the potential for any physical damage to the Coralline Crag feature could result in regional alternations to coastal processes and coastal geomorphology, the magnitude of the impact as a result of the installation of the cable is assessed as being small due to the relatively small area they may be impacted compared to the large extent of the Coralline Crag outcrop. Within **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** it is noted that the Coralline Crag shoal/outcrop is in close proximity to the west of the break-out point and recommends installation should not create pre-cut trenches at the Coralline Crag due to the sensitivity of the system. Instead, concrete mattresses should be used to protect the cable. Accounting for the recommendations to protect the Coralline Crag Ridges, this results in a minor effect which is not significant.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	What surveys have been undertaken to ensure the work to install the cable will not damage any shipwrecks, sunken submarines or crashed military aircraft.	N	Potential impacts on maritime and aviation archaeology was assessed in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**. The assessment was conducted by means of accessing any records of sites, findspots, wrecks, casualties and other seabed features from reliable datasets and understanding this resource further through the assessment of available marine geophysical survey data along with discovering new sites and features (**Application Document 6.3.4.6.A ES Appendix 4.6.A Marine Archaeological Technical Report, Annex 6.7 and 6.8**). As well as summarising the known archaeological resource, the baseline assessment also underlines the potential for encountering unknown shipwreck and aircraft crash sites within the study area.
General commentary			
Cllr T-J Haworth-Culf	If bringing in the cable under the freshwater RSPB reserve penetrates too far, is there not the potential to cause a breech in the saline / fresh water supply inland? Chapel Barn Farm's lake for example is supplied by a freshwater bore hole that if contaminated will cause great damage to the ecosystem established there, and	N	**Application Document 6.3.2.5.B ES Appendix 2.5.B Qualitative Groundwater Risk Assessment** includes an assessment on the potential for saline intrusion to occur at the landfall location. The assessment concluded that there is a low risk of significant saline intrusion caused by the Proposed Project.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	any cross contamination of the irrigation system will prevent crops from being supplied.

Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The offshore cable will impact European protected Annex I habitats, likely associated with Margate Long Sands Special Area of Conservation (SAC). The development has the potential to cause irreversible habitat loss to Goodwin Sands which is in a Marine Conservation Zone (MCZ) and supports diverse epifauna such as Sabellaria Reefs, a priority habitat and blue mussel beds. The sandbanks are also important spawning and nursery grounds for species such as thornback rays.	N	Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. This will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area including *Sabellaria spinulosa* and *Mytilus edulis.* Information can be found in **Application Document 6.11 Marine Conservation Zone Assessment**.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	How much damage will there be done laying the cables on the seabed and what are the impacts during operation?	N	Depending on the location of the cable, between 10-20 m of seabed would be cleared. Drop Down Video or Remotely Operated Vehicle mounted cameras may be used to confirm the locations and extents of sensitive benthic habitats or features. This would inform micro-routeing of submarine cable systems to avoid or minimise interactions with these features in so far as practicable. A total area of 0.15 km^2 of permanent loss of habitat is expected due to cable protection. Many of the habitats comprise subtidal muds and mixed sediments, which are widespread and of low value. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. The Offshore Scheme is designed for a lifespan of approximately 40-60 years. The cable system installation is designed such that a regular maintenance regime is not required to maintain the integrity of the link. The impacts on benthic ecology are presented in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**.
Local community	I feel that it is less suitable because of the possible very great disturbance to the seabed, which is a very fragile ecosystem.	N	
Local community	Least possible disturbance to the seabed please.	N	
Local community	As a marine biologist this will definitely disturb the sea bottom, the sea life and habitats. There's enough pollution in this area already without more disturbance of the marine areas. We already have a lack of fish life, bottom feeders and reefs. This will be a disaster!	N	
Local community	Damage of seabed and existing aquatic habitats will be immense. Aquatic habitats and creatures will be adversely affected by noise, destruction of seabed, therefore proving contrary to efforts to alleviate The Climate & Biodiversity Emergency.	N	
Local community	Not clear any thought has been given to avoiding disturbance of marine habitats.	N	
Local community	Keep out of marine nature reserves please.	N	
General commentary			
Suffolk Wildlife Trust	We note that the relevant chapters within the Preliminary Environmental Information Report state that there is no predicted likely significant effect on benthic ecology, fish and shellfish, marine mammals, or intertidal waterbirds, and waders, and seabirds. However, we highlight impacts cannot be ruled out at this stage as only moderate confidence can be given to many receptors as further detail obtained from route refinement is not yet available. Route refinement must be undertaken with a consideration to ensure there is no significant effect in the marine section of the proposals. However, past experiences of marine impacts must be highlighted. We note and share the concern expressed by Kent Wildlife Trust	N	The Offshore Route has been sited to avoid sensitive receptors in the marine environment wherever possible. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. Drop Down Video or Remotely Operated Vehicle mounted cameras may be used to confirm the locations and extents of sensitive benthic habitats or features. This would inform micro-routeing of submarine cable systems to avoid or minimise interactions with these features in so far as practicable. A comprehensive ES has been produced as part of the DCO application which assesses the potential impacts on benthic ecology, fish and shellfish, marine mammals and birds.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	that commitments to deliver trenchless crossings of particularly sensitive protected sites cannot be assured. The risk remains that open-cut trenching techniques may eventually be used, and irreparable damage will be done to protected and priority wildlife and habitats. This concern is based on past impacts of trenching at Pegwell Bay, when in 2018, the National Grid, in partnership with Belgian Elia Group, installed the Nemo Link interconnector cable. We also again highlight that proposals must deliver a net gain within the marine environment, ensuring that the marine section of Sea Link delivers a significant enhancement of marine habitat which delivers for a wide range of marine wildlife.		National Grid acknowledges the sensitivity of the area around the landfalls and as such the HVDC cable will be installed through Pegwell Bay by trenchless technology from the mudflats to the rear of the golf courses (namely Stoneless and St Augustine's). The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
Kent Wildlife Trust	KWT are extremely concerned regarding the lack of mitigation to benthic habitats, despite the Offshore Scheme passing through marine designations. With regard to Goodwin Sands MCZ, it is noted within Volume: 1 Part 4 Offshore Scheme Chapter 3 Benthic Ecology that "[…] the only feature of this designated site [Goodwin Sands] identified within the Offshore Scheme was 'subtidal sands'. This habitat is considered to be of medium value and grab samples from within the MCZ were found to have sparse fauna. Sandy habitats such as this are dynamic as they are frequently exposed to significant wave and tidal energy. Considering the low biodiversity, this habitat is considered to have high capacity to tolerate physical disturbance and so has a low sensitivity to temporary disturbance." Marine habitats move naturally with the tide and current; however, this does not justify National Grid's assessment that they can tolerate physical disturbance. More information is needed on the level of disturbance, if this involves moving sediments which will directly impact soft sand banks which are exposed and vital for seals and birds, then KWT strongly disagree with National Grid's assessment of Goodwin Sands MCZ. KWT also disagree with the statement that 'subtidal sands' have low biodiversity as sand/mud benthos are extremely important for burrowing invertebrates. Goodwin Sands MCZ is designated for the protection of Sabellaria Reefs, which are a UK BAP Priority Habitat. Within the MCZ, Kent and Essex Inshore Fisheries and Conservation Authorities (KEIFCA) have identified Sabellaria Reefs, blue mussel beds, soft corals, pink sea fans, cup corals and sponges, including a wide range of predatory fish which use the sandbanks for spawning, such as the thornback ray which use them as a nursery ground. Therefore, if the benthic ecological surveys have identified marine sites to be low in biodiversity, then there is the question around cumulative impacts from other offshore developments, such as Nemo Link. The Project will also result in the loss of NERC Habitats of Principle Importance 'communities on circalittoral rock' and 'subtidal sand and gravels'. National Grid have identified these sites as having high biodiversity and supporting communities that are likely to be more vulnerable to physical disturbance. However, it is stated within the Benthic Ecology report that these habitats are widespread in the region of the North Sea and therefore "are of low	N	Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. This will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area including *Sabellaria spinulosa* and *Mytilus edulis.* Information can be found in **Application Document 6.11 Marine Conservation Zone Assessment**. The assessment of the impacts on benthic ecology can be found in **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology**. This appraises the disturbance of the seabed (and its recoverability) and recruitment of habitat dependent species back to the location of the cable lay as having no significant effects.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	importance, and so are considered to have low sensitivity to direct loss.” KWT strongly disagree with this statement as the majority of infauna in muds and sediments are invertebrates at the base of the food web and should be considered in more detail regarding cumulative impacts. The routeing of the cable should avoid direct impacts to these important areas and scheduling works should avoid important spawning times. Overall, we would expect National Grid to mitigate against the negative impacts the Offshore Scheme will cause in the same way they are proposing to mitigate against impacts to terrestrial habitats. MCZs have the same level of protection as SSSIs and therefore we would expect the same level of effort made to avoid these habitats and as a last resort, provide adequate bespoke mitigation and compensation measures. It is also extremely discouraging that National Grid do not plan to mitigate against the direct loss and disturbance to Goodwin Sands MCZ, benthic Habitats of Principle Importance and Annex I habitats, as stated within Volume: 1 Part 4 Chapter 3 Benthic Ecology “no additional mitigation measures have been identified to mitigate impacts on benthic ecology, as none are considered necessary beyond the embedded, control and management measures.”

Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	Don't kill any fish and least possible disturbance to sea bed please.	N	The potential impact of the Proposed Project on fish is assessed in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**. There are no significant impacts on fish. The route of the marine cable has been designed to minimise the impact on the sea bed. Pre-installation surveys will be undertaken which will include, as appropriate, the use of drop down video or remotely operated vehicle surveys to confirm the locations and extents of sensitive benthic habitats or features.
General commentary			
Local community	It seems that directional drilling will be undertaken for 1 km through a SSSI. After this a lot of damage can be done to the sea bed dragging the cable to bury it from the cable laying vessel. At this point, how can we minimize the impact of this cable? I note you consider laying the cable on the surface and creating rock beds on top of it. A question for the ecologists is, would a rock covering on the sea floor be better at promoting biodiversity in the area, particularly jelly fish, mussels and oysters. We need a method less destructive than dragging a cable behind the cable laying vessel. In addition, can the trenching at the beginning of the network also be reduced through further directional drilling?	N	**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** provides a detailed overview of the cable installation techniques for the Proposed Project. The primary method of cable installation for the Offshore Scheme is burial to a target depth of 1-2.5 m to avoid impacts to other sea users and existing hydromorphology. The following cable laying methodologies may be used: • simultaneous cable lay and trenching/burial (SLB); and • surface cable lay followed by post lay trenching of cables/burial (PLB). SLB is becoming more widespread as installation contractors design and build their own ploughs. It has the advantage of providing immediate protection to the cable but requires the cable lay vessel (CLV) to be longer on site due to the slower speed compared to surface laying. This may become an issue in areas where weather patterns are unpredictable. It does however reduce the overall duration of lay and protection works. SLB is not being encouraged for the Proposed Project due to the nature of the seabed conditions found along the route. PLB separates the lay and protection activities, enabling the CLV to lay quickly and then move onto other operations whilst a separate spread undertakes the burial activities. This also has advantages in that a wider range of burial tools may be considered, depending on the nature of the seabed. Rate of progress for PLB is approximately 10 km - 12 km per day. Rates depend on seabed sediments and required depths of lowering. For the Proposed Project, the majority of the route is London Clay so rates would be lower than for sands and less cohesive materials. As burial of the cable is the preferred option, the Proposed Project aims to reduce the use of rock protection as far as practicable as this can pose dangers to existing sea users such as fishermen, but also change existing sensitive benthic habitats such as sand banks. The trenchless solution construction at both landfalls has been extended as far as practicable to reduce impacts to the intertidal zone. **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Processes** indicates that installation of the cable will not result in significant effects.

Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	We have seals and important wildlife in the area of natural beauty in Pegwell Bay - NO!		National Grid acknowledges the importance of Pegwell Bay to wildlife. Following consultation with Kent Wildlife Trust, marine mammal surveys of seals have been undertaken in Pegwell Bay. During these surveys, National Grid maintained contact with Kent Wildlife Trust to ensure it was targeting the correct areas. The data from these surveys has been used in the assessment in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			
Local community	I am resolutely against the landfall at Pegwell Bay. As one of many examples, the proposed site is home to Kent's largest population of seals, and it is clear that the 'desktop mammal survey' conducted as a part of the project is insufficient to account for this important habitat. Kent Wildlife Trust and ecologists remain concerned that the development will impact the seal colonies living along the shore.	N	National Grid acknowledges the importance of Pegwell Bay to wildlife. Following consultation with Kent Wildlife Trust, marine mammal surveys of seals have been undertaken in Pegwell Bay. During these surveys, National Grid maintained contact with Kent Wildlife Trust to ensure it was targeting the correct areas. Local community	Pegwell Bay is home to Kent's largest population of seals. Plans for Sea Link have only involved a 'desktop mammal survey' and ecologists remain concerned that the development will impact the seal colonies living along the shore. Local recording data needs to be taken into consideration. This site is part of an interconnected network of sensitive seal sites around the UK. As grey and harbour seals are highly mobile marine species, the impact of degrading or losing this key seal habitat will likely have knock on effects for seals from the SW UK to the North Sea. Seals in this area are our UK native, heritage and globally rare, speciality grey seal and European harbour seal species that already face a multiplicity of cumulative impacts from environmental and anthropogenic sources reducing their chances of survival (Gulland, Deirauf, & Whitman, 2018; Kovacs et al., 2012). These include fishery related pressures such as overfishing and depletion of prey fish stocks (Königson, 2011), live entanglement in lost and discarded fishing gear (Allen, Jarvis, Sayer, & Mills, 2012) and fatal bycatch (Cosgrove et al., 2016; Northridge, Kingston, & Thomas, 2016). These impact cumulatively in addition to other factors including climate change, habitat loss, disturbance, toxic chemical pollutants, shooting and culling (Bowen & Lidgard, 2013; Fietz et al., 2016; Nunny, Simmonds, & Butterworth, 2018; Simmonds, 2017). This vital reserve for seals must be avoided as the Kent landfall site at all costs!	N	
General commentary			
Kent Wildlife Trust	One of our survey prerequisites to National Grid and their ecologists during the site visit, and highlighted within our original response, was the need for marine mammal surveys, particularly for seals as		National Grid acknowledges the importance of Pegwell Bay to wildlife. Following consultation with Kent Wildlife Trust, marine mammal surveys of seals have been

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	the Sandwich to Pegwell Bay NNR is a seal haul-out location, supporting Kent's largest seal population which use the NNR all year round to rest, moult and breed. Therefore, it is extremely disappointing to see that "baseline conditions were established by undertaking a desktop review of published and publicly available information and through consultation with relevant organisations." It should be made evident who these "relevant organisations" are and what datasets were used as to our knowledge marine mammals in Kent are understudied and therefore, we would like to know how National Grid quantified their data. Since our meeting with National Grid on 5th December 2023 they have provided us with links to studies used for assessing the likely impacts on seals, however the links to these studies do not work and therefore we are unable to review them. From reviewing Image 4.5.2 and Image 4.5.4 within Chapter 5 Marine Mammals report, which display the harbour and grey seal population counts, we note that this data is referenced from studies undertaken by Zoological Society of London (ZSL) in 2014 and 2015 and therefore are significantly out of date. We strongly disagree with the statement "No marine mammal field surveys were undertaken as the information collected through the desktop review was considered sufficient for an assessment of the project activities." As highlighted directly to National Grid during the site meeting and within our previous response, we made our concerns regarding impacts to the known seal population at Pegwell Bay very clear, and that surveys needed to be undertaken to understand how the seal population use the NNR to prevent disturbances to the colony, including impacts to prey availability and the sand banks the colony uses for hauling-out. We are not convinced that National Grid have provided sufficient evidence to support their assessment of impacts to marine mammals.		undertaken in Pegwell Bay. During these surveys, National Grid maintained contact with Kent Wildlife Trust to ensure it was targeting the correct areas. The data from these surveys has been used in the assessment in **Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals**.

Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	Pegwell bay is an SSSI, which provides winter/summer landing/nesting sites for migrating birds. The proposed site for the land fall will cause massive disruption to the breeding or life cycle of endangered bird species.	N	National Grid recognises the importance of the English East Coast and its coastal wetlands (to include the Pegwell Bay SSSI) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway. National Grid is committed to trenchless construction solutions for installation of the landfall and associated onshore cabling. No open trenching will take place within the SSSI. Significant disruption will also be reduced through phasing the most potentially disturbing elements of work to avoid the bird nesting season. The commitment to a trenchless solution and a list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness? Comments			
Local community	Totally wrong! Natural habitat for various migratory geese and other birds in winter and aquatic birds throughout the year. Beach area special breeding ground for the Little Tern, a rare bird easily disturbed whilst nesting - danger in losing the habitat.	N	National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	The proposed route with the inlet to land via Pegwell Bay would disturb a local nature reserve and country park renowned for rare breeds of birds.	N	National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. 			Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway.
Local community	The area of the Thames estuary is an important wintering area for Red Throated Divers. The area is looking to be expanded to include the sea area inside the Thanet wind farm as a large number of Red Throated Divers occur here during the winter months.	N	The Red Throated Diver has been the subject of a separate assessment within **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. A specific protocol has been developed for this species of bird (**Application Document 7.8 Red Throated Diver Protocol**).
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			
Local community	The previous Nemolink has left lasting damage to the saltmarsh. Yet there is no guarantee, nor effort, to avoid similar damage. Although it was stated the previous one would be underground it was trenched and the damage can still be seen. It must be guaranteed that it is all underground if it is allowed to go ahead. There should be no trenching anywhere from low water up to the other side of the RAMSAR/SSSI/nature reserve. These classifications are based on years of data and follow national and international guidelines designed to help protect valuable habitat. Why is full consideration not given to the impact on feeding and roosting birds. Golden Plover, of which there is a significant roost are easily disturbed for instance. The bird observatory has been recording the birds for over 60 years yet was not even consulted. We have not seen regular, rather than occasional observations being made. This is the only such site on the South Kent coast. If it is 1 month to set up site 4 months to drill and 1 month to take down how does this avoid significant disturbance to wildlife? There is no way of providing an alternative mudflat or saltmarsh. Waders need to feed to continue their migration or to survive the winter.	N	The Nemo Link project was a joint venture, continental interconnector in partnership with Belgian Elia. The Proposed Project is a piece of domestic transmission infrastructure owned by National Grid. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. At the time of the PEIR submission, bird surveys were ongoing. These surveys covered feeding and roosting birds including the golden plover. A full dataset is available, which has informed the further assessment of potential impacts, refer to **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. Appropriate mitigation measures, informed by bird surveys conducted, have also been provided, including the consideration of seasonal restrictions and avoiding severe weather conditions. The commitment to a trenchless solution and a list of mitigation measures is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Pagnell Bay is important to many waders - including curlews (which are becoming endangered).	N	National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway.
Local community	I am resolutely against the landfall at Pegwell Bay. This area is haven for wildlife, designated as internationally important and protected by UK law.	N	National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Secondly, bird species such as the ringed plover, turnstone, and red-throated diver have all been recorded at Pegwell Bay and the surrounding sites and are at risk of being displaced through disturbance. The ringed plover and turnstone are designated features for Thanet Coast and Sandwich Bay Special Protection Area (SPA). Their displacement would be a tragedy. This area has already been damaged once by National Grid. In 2018, the installation of the Nemo Link electricity cable (in partnership with the Elia Group) was carried out via the use of open-cut trenching techniques. This already resulted in irreparable damage to the salt marsh and marine habitats. Having inflicted this damage to the site once already, it would be better to leave the important natural area at peace -- especially when other landfall sites have been identified.		conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway. The Nemo Link project was a joint venture, continental interconnector in partnership with Belgian Elia. The Proposed Project is a piece of domestic transmission infrastructure owned by National Grid. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. The commitment to a trenched solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Pegwell Bay is a world class wetland protected under UK and EU legislation. This area is important for breeding, migrating and wintering birds all year round. Birds are easily disturbed and any works will prevent them feeding, resting or breeding. This is particularly important for lapwings, curlews, grey and golden plover, dunlin, sanderling to name but a few. There were 84 species of bird identified at Pegwell Bay in October this year by Bird Wise East Kent. The area is incredibly rich in wildlife and must be protected from this disruption. Again, no amount of mitigation can make up for the damage landfall in this area would cause.	N	National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway. The Nemo Link project was a joint venture, continental interconnector in partnership with Belgian Elia. The Proposed Project is a piece of domestic transmission infrastructure owned by National Grid. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. The commitment to a trenched solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q13 What do you think about our proposed HVDC cable route in Kent? Comments			
Local community	There is very little detail in your proposals about how these cables will actually be installed. As described above, the installation of the Nemo Link caused immense damage to the area. The proposed route for Sea Link will cause even greater damage. The additional pylons will be responsible for even more completely unnecessary and preventable bird deaths than we currently see.	N	The Nemo Link project was a joint venture, continental interconnector in partnership with Belgian Elia. The Proposed Project is a piece of domestic transmission infrastructure owned by National Grid. Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL**
Local community	This is not a suitable site, and whatever mitigation measures that are promised are not good enough or never are carried out as promised.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The area concerned is a very well established and used migratory route for birds and additional cables/pylons will cause continuous bird deaths!		**Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Bird diverters are to be included on the new section of overhead line. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q16 What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? Comments			
Local community	Overhead cables can be lethal to birds, either when perching or flying. Pegwell Bay is an important staging post for migrating birds and they can be killed if they fly into the overhead cables.	N	As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Bird diverters are to be included on the new section of overhead line. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The existing pylons have already created a negative impact on the local amenity as well as creating a hazard for birds, of which a significant number have been killed flying into the powerlines. This is well evidenced. This document does not make it clear that the additional pylons will be higher and it must be assumed larger and with a greater footprint as a result. Additional pylons will have a negative environmental impact as a consequence.	N	Please see the above response regarding the potential impact of the overhead lines of birds. National Grid acknowledges concerns regarding the visual impact of overhead lines which is summarised in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual** and detailed within **Application Document 6.3.3.1.D ES Appendix 3.1.D Visual Amenity Baseline and Assessment.** Following feedback from stakeholders and the public following both Non-statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour. Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Additionally, the location of these pylons has been refined to reduce the size of the triangular area that would be formed by the construction of pylons between the existing overhead line and the proposed substation.
Local community	Overhead lines are detrimental to birds, particularly those overwintering which are often seen in large flocks.	N	Please see above response regarding the impact of overhead lines on birds.
Local community	Birds use the river Stour to navigate so any pylons or cables crossing the river create another hazard for them. In the winter large flocks of Cormorants take off from Pegwell Bay at dusk and fly up the river to Stodmarsh to roost for the night. At dawn they return to fish out at sea. Also Swans with such a large wingspan are very vulnerable to these types of obstacles. The Minster area already has a forest of pylons running the length of the river this would just create a very dangerous potential obstacle that runs across the river.	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to remove the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause issues for the railway line. National Grid looked further up towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions. Once under the river, it would then need to build further electrical infrastructure (a smaller substation) in the flood plain. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Of the options consulted on previously, National Grid confirm the use of full-height (approximately 50 m) lattice pylons for the connection between the proposed combined converter station/substation and the Richborough to Canterbury 400 kV overhead line. This means there would be fewer new pylons in total when compared to the low-height pylon option. Additionally, the location of these pylons has been refined to reduce the size of the triangular area that would be formed by the construction of pylons between the existing overhead line and the proposed substation. As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Bird diverters are to be included on the new section of overhead line. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	More bigger pylons to a major bird migratory route is madness! This will only act as a death trap for them. There are too many pylons there as it is! The wild bird population in the U.K is in serious decline. Pylons should be a thing of the past! Our precious landscapes should be protected. A less damaging longterm option would be to bury the cables. More pylons will mean much much more bird deaths! This is totally not acceptable!	N	Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Beware of all the flocks of birds these pylons and overhead lines will kill! and do not use them. Even with the use of overhead line deflectors birds will not always see them or won't see them in the dark or in bad weather conditions! Many of the birds using this area are 'Red listed' and protected by the Wildlife & Countryside Act 1981. Why do the cables have to go overhead, why isn't there an underground option for here?		because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. Local community	I am aware there is a proposed huge investment in new high voltage pylons and overhead cables with an estimated five-fold increase in transmission capacity required between 2010 and 2050. However, this raises concerns about possible impact on bird movement, especially wildfowl. The expansion of renewable energy infrastructure required to achieve this is a challenge to wildlife conservation due to collision and electrocution risks, particularly for birds and is a proven aerial threat to those that migrate. If this development goes ahead, any Overhead Power Lines must be made more visible by having the red anti-collision markers that were on display at the Consultation Meetings. However, currently there are very few of these on existing lines which prompts the need for this to be addressed on existing cables as soon as possible thus avoiding further unnecessary bird strokes in this area. Plus, surveying should be initiated for bird deaths and regular monitoring ongoing.	N	Please see the above response with regard to the need for overhead lines and National Grid's assessment of the potential impacts of them on birds.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	There must be no more pylons or crossed pylons creating a net effect. Pylons are a hazard to birds' flightpaths. All pylons, (including those already within the area) must have nest boxes for species such as kestrels, peregrine falcons, ravens, swift, swallows, house martins and stork as well as bats.		
Broadstairs and St Peter's Town Council	The map in this document is not clear, the colours used to show existing and new pylons are similar, but it seems to indicate there is clearly the need to add 13 new pylons and remove/refurbish 3 creating a net gain of 10, seemingly to enable overhead cables to cross the river Stour. The new pylons appear to 'fan-out', creating a type of 'funnel-shape'. There is no information explaining why this is needed instead of a single line of pylons. There is also no indication within this document as to how high these new pylons will be. The impact of the existing pylons on the area's wildlife in particular birds, is well documented. In 2023, at a short distance from the site, 179 mute swans were killed after hitting the overhead powerlines in one incident. The area and site is teeming with wildlife, much protected by the Wildlife & Countryside Act 1981 and a significant number of Red Listed birds. The new pylons would effectively create a barrier across a major migratory route, creating a 'fishing net type' scenario that birds could not avoid. None of this has been identified or addressed and unlike other most other sections of cabling the option to place underground seems not to be present.	N	A description of the proposed overhead lines is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. Local community	The Ash Levels/Minster Marshes/Stour Valley is an extensive and important wildlife corridor. The addition of more power lines will result in more bird deaths. Currently there are no-anti-collision markers on the existing mass of power lines in this corridor and last week 7 Mute Swans were found dead under power lines west of Richborough Castle. Suggest you look at what has been added to the lines around the Welney/Ouse Washes in Cambridgeshire area to stop Swans and Cranes being killed. A report was conducted about bird deaths from the power lines at Dungeness power station area over several years - available on request.	N	The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. Local community	There is already a serious issue with birds colliding with the existing overhead powerlines. Adding even more, especially in the 'migration superhighway' between Pegwell Bay and Minster Marshes, will have a disastrous impact on bird life. The spiral style bird flight divertors National Grid has displayed at the public consultation meetings are significantly less effective than the flapper type in preventing bird collision with power lines, particularly at night and during fog which is a regular feature of this low-lying landscape. National Grid needs to do more investigation into identifying and deploying the most effective solutions to reduce bird deaths caused by high voltage power lines. The proposals should seek to reduce the number of pylons as much as possible and run cabling underground and/or bridge over rivers. As per international best practice, all pylons should be constructed with nesting platforms to encourage birds such as peregrine falcons, ravens and storks.	N	The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
General commentary			
Local community	I have been bird watching in this area for over 11 years. The Minster Marshes are part of a vital wildlife corridor that connects from the nature reserve at Pegwell Bay (SSSI) through the old Richborough Railway track (SSSI) at the side of the wind turbine to Minster Marshes and beyond into the Stour valley. It is disturbing to see that you plan to expand beyond the Richborough Energy Park boundary onto the marshes. Also worrying is that the Battery storage facility plans to demolish the wind turbine that has been the nesting site of Ravens for the past two years. A bird that has only recently returned to breed in the area. A bird that Ramsgate is named after! The wind turbine is also a popular roosting site for a pair of Peregrine falcons. These areas have a large variety of wildlife many of them endangered. Including Turtle Dove, Nightingale & Cuckoo. Not far from the proposed Converter site location is as far as I know the only Heronry and Egretry in Thanet. This is where our Pegwell Bay Grey Herons and Little Egrets breed. The Converter site building is apparently going to cover the size of seven football pitches and be 30 metres high. Higher than the heronry itself with the addition of pylons and cables across the river.	N	National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay and Minster Marshes) as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. This commitment is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Kent Wildlife Trust	We understand that some ecological surveys such as breeding, wintering and intertidal surveys for birds have been undertaken during the 2022 – 2023 seasons. We note that during these surveys, dunlin and sanderling were recorded in large numbers and peak counts for both species exceeded the 1% Great Britain national thresholds. Ringed plover, turnstone and red-throated diver were recorded in much smaller numbers than the original SPA/Ramsar counts, however are comparable to the latest Pegwell Bay BTO Wetland Bird Survey (WeBS) data.	N	The application for development consent is accompanied by an ES which will contain the full non-breeding bird reports undertaken in 2022-23 and 2023-24 and the breeding bird reports undertaken in 2023 and 2024. These surveys do cover Pegwell Bay and do include maps showing distribution of birds recorded. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	From the data collected, we would expect to see maps showing the locations and movements of species to understand how they use Pegwell Bay NNR. Currently, no survey data maps/plans have been provided within the PEIR, therefore it is difficult to gauge what areas of the NNR are most important and should be protected from direct impacts.		
Kent Wildlife Trust	It is noted that in the preliminary assessment of cumulative impacts, that ecological receptors, particularly relating to loss of habitat and disturbance to birds, would be significant. However, detailed mitigation has not yet been provided and therefore we cannot assess these impacts and proposed mitigation in detail.	N	Meetings have been held with Kent Wildlife Trust in which the impacts of the Proposed Project on designated and undesignated biodiversity have been discussed. As part of the ES, National Grid has undertaken an extensive programme of environmental surveys (not available at the time of Statutory Consultation) including for breeding and non-breeding birds, reptiles, invertebrates, badger, aquatic wildlife, riparian mammals, dormice and plants. The timing of works has been considered, and the Proposed Project will avoid certain types of work within breeding and/ or wintering seasons depending on which is the most sensitive in a particular location. An assessment of impacts on breeding birds and non-breeding birds has been undertaken, informed by surveys, noise modelling information and other data. Minimising impacts on Pegwell Bay is one of the main reasons for traversing the saltmarsh and upper mudflat using a trenchless construction solution. Mitigation measures for the Proposed Project can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Kent Wildlife Trust	We are also concerned over the lack of information and survey effort regarding the invertebrates within the mudflats. As stated within our previous response, a healthy invertebrate community supports the structure and function of the habitats within the SPA, as well as providing food for many species of importance. We strongly urge that invertebrate surveys of the coastal habitats are undertaken to assess the cumulative impacts this will have on wildlife and the SPA.	N	**Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** addresses the potential impact of the Proposed Project on the mudflats. This Chapter concludes that there are no significant effects.
Kent Wildlife Trust	One of our main concerns is the direct loss of 13.6ha of FLL for the Thanet Coast and Sandwich Bay SPA/Ramsar. It has been identified within the PEIR that a flock of 700 golden plover were recorded during a survey within the agricultural field the converter and substations are proposed to be built. This number of golden plover equates to more than 1% of both the SPA population and the BTO WeBS counts. It is understood that National Grid plan to “offset” this loss of FLL by converting arable land along the river corridor and enhancing the Lower Stour Wetlands Biodiversity Opportunity Area (BOA). At this stage, is it unknown on the specific location and details of the proposed mitigation/compensation site and therefore we cannot comment on its suitability.	N	Meetings have been held with Natural England where the approach to addressing loss of functionally-linked land for golden plover has been discussed at length. Various strategies have been discussed with Natural England. Options, including the possibility of creating new wetland south of the River Stour have been explored, but technical challenges identified in the course of discussions led to an alternative approach being pursued (discussed and agreed in principle with Natural England) to instead enhance an area of arable land close to the coast for non-breeding golden plover.
Kent Wildlife Trust	The proposed enhancement of the Lower Stour Wetlands BOA is also being considered to comply with Biodiversity Net Gain (BNG). KWT welcome the inclusion of BNG, however we wish to point out that any legislative mitigation, such as mitigation for designated sites and protected species, cannot provide net gain, as they can	N	National Grid is providing 10% Biodiversity Net Gain over and above any on-site habitat mitigation that will be delivered to address impacts on designated sites or protected species. Meetings have been held with Natural England where the approach to addressing loss of functionally-linked land for golden plover has been discussed at length. Various strategies

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	only be considered as providing no net loss. Whilst enhancements to the Lower Stour Wetlands BOA has the potential for improving BNG, we remain unconvinced that sufficient evidence has been provided to demonstrate that it would provide adequate mitigation and compensation for the loss of FLL and therefore risks the integrity of Thanet Coast and Sandwich Bay SPA/Ramsar. We urge that a detailed EcIA of FLL is provided before the DCO stage, so consultees have the opportunity to review and assess the impacts and mitigation/compensation.		have been discussed. The possibility of creating new wetland south of the River Stour has been explored but technical challenges were identified in discussion with hydrologists and Natural England with keeping it sufficiently wet. Therefore, an alternative approach has been pursued (discussed and agreed in principle with Natural England) to instead enhance an area of arable land close to the coast for non-breeding golden plover.
Kent Wildlife Trust	The overhead cable route is suitable for a variety of birds such as birds of prey, heron, swans, geese and white stork, which would be at risk to bird strikes. We understand that bird strikes have occurred after the installation of overhead cables for Nemo Link, despite these cables being installed with “bird deterrents”. It is noted within the PEIR regarding bird collision risk that “impact assessment is ongoing, but standard mitigation is available that would reduce impact.” Taking into account the knowledge of bird strikes even with “bird deterrents” on the existing overhead cables, KWT are not convinced that this can be adequately mitigated, especially due to the lack of survey effort to identify the flight paths of bird species.	N	As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Bird diverters are to be included on the new section of overhead line. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
CPRE Kent	While the Government’s draft National Policy Statement EN-5 acknowledges that many birds are killed or injured by flying into overhead power lines, pylons carrying such lines near the coast pose a particular danger in spring and autumn, when many thousands of birds migrate to and from the UK. They are also notably hazardous near rivers, between bodies of water, close to arable fields used by grazing wildfowl and of course where they lie across flight paths used by swans, geese, ducks, gulls and waders, among other birds. The potential for casualties and fatalities increases with birds that leave their daytime feeding grounds and fly to nocturnal roosting areas. The coming together of so many factors at the site of the proposed Sea Link converter station on Minster Marshes, where National Grid is suggesting running a double line of pylons over the River Stour to join the Richborough-Canterbury pylon route, is potentially catastrophic for birdlife. Just two to three miles away, Sandwich and Pegwell Bay National Nature Reserve covers an estuary on the coast. It is a nationally important site for bird migration, evidenced by the establishment of Sandwich Bay Bird Observatory. Many of the migratory birds arriving at the estuary fly up the Stour to inland sites across the UK – what they would face should National Grid’s scheme at Minster be approved is effectively a ‘fishnet’ of pylons and power lines with near-certain disastrous effects that would not be quantifiable due to the location over a river. It isn’t just migrating birds that would be negatively affected by the pylons and power lines. If permitted, they would cross a grass	N	As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Bird diverters are to be included on the new section of overhead line. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**. The impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. National Grid recognises the importance of the English East Coast and its coastal wetlands (to include Pegwell Bay) as being globally important for migratory waterbirds using the East

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	meadow that has not been cultivated for 20 years and has a wealth of birdlife – enhanced by wetland scrapes created in 2018 for wintering waterfowl under Higher Level Stewardship, part of the Environmental Stewardship scheme. This area is functionally linked to Sandwich and Pegwell Bay NNR and has a critical role in hosting waterfowl forced from that site by high tide or bad weather. Bordering the Sandwich Bay to Hacklinge Marshes SSSI, it comprises one of the last unspoilt stretches of a heavily developed district where waterfowl can rest and feed without disturbance. To effectively destroy it by running lines of pylons and power lines over it is environmentally irresponsible and, in our view, unacceptable. Upstream of the Minster site is the environmentally rich Stour Valley, which includes Stodmarsh NNR. Many birds commute between the estuary and Stodmarsh on a near-daily basis – again the hazard posed by the proposed pylons at Minster on their route is unacceptably high. One of the species known to be most at risk from pylon bird strike is mute swan – and one of the worst incidents in the UK occurred less than two miles away at Monkton in January 2003, when at least 177 birds were killed by flying into power lines. Large numbers had been feeding on arable land before in the evening flying to nearby waterbodies, whether nature reserves or farm reservoirs, to roost.		Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. In thematic meetings National Grid has been discussing with Natural England proposals for mitigating the loss of functionally linked habitat for golden plover, as well as for mitigating any disturbance effect on the nearby SSSI and ensuring no significant bird strike results from the new section of overhead line.
CPRE Kent	According to the Electricity Act 1989, National Grid has environmental responsibilities that include: - - - Schedule 9 preservation of ecological resources. Section 38 and Schedule 9 – duty to have regard to the desirability of… conserving flora, fauna and geological or geophysical features of special interest. Doing what it reasonably can to mitigate any effect on… any such fauna. We believe that National Grid would be negligent in relation to the Electricity Act were it to propose overhead lines at Minster and no other options, when it is aware there are other deliverable options that are better for the environment. National Policy Statement EN-1 says in paragraph 3.7.10 "… in most cases, there will be more than one technological approach by which it is possible to make such a connection or reinforce the network (for example, by overhead line or underground cable) and the costs and benefits of these alternatives should be properly considered as set out in EN-5 before any overhead line proposal is consented". We are not convinced this has been done. The NPS's EN-5 (current and draft) requires National Grid to assess risk of bird strikes and to consider whether the risk has been appropriately mitigated. Alternatives to overhead lines must be presented for consultation for stakeholders and the Planning Inspectorate to be able to determine the risk levels of each.	N	As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Bird diverters are to be included on the new section of overhead line. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places, however, such as south of the River Stour, it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The current EN-5 states: “2.7.1 Generic biodiversity effects are covered in Section 5.3 of EN-1. However, large birds such as swans and geese may collide with overhead lines associated with power infrastructure, particularly in poor visibility. Large birds in particular may also be electrocuted when landing or taking off by completing an electric circuit between live and ground wires. Even perching birds can be killed as soon as their wings touch energised parts.” Given all of the above, it is difficult to envisage a worst place to site overhead pylons and power lines than that suggested at Minster. National Grid has an environmental responsibility that it would not be fulfilling were it to progress with this scheme in its current form. Given the clear detrimental impacts of using overhead pylons in terms of environmental and landscape harms, along with what must only be a modest cost increase of undergrounding the short section that’s to go overhead, surely the significant benefits of undergrounding must prevail?		
Local community	Going ahead with this badly thought out plan anywhere along this bit of coast would undermine all the conservation work that has been carried out over many years in building precious wildlife habitats. Bird migration will be disrupted to this winter sanctuary for many species of wading birds and ducks, Bitterns, Marsh Harriers - including endangered species. Nearby Minsmere Bird reserve will be badly affected.	N	National Grid recognises the importance of the English East Coast and its coastal wetlands as being globally important for migratory waterbirds using the East Atlantic Flyway which extends from the Arctic to South Africa. The importance of the English East Coast and these wetland sites is reflected by a series of existing protected nature conservation areas, designated for their international importance, including SPAs and Ramsar Convention Wetlands of International Importance and underpinned by other national designations such as SSSIs. Detailed assessments are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites for waterbirds and waterbird populations, and thus the relevant components which contribute to the East Atlantic Flyway.
Suffolk Wildlife Trust	The importance of this site (Suffolk landfall location) for both breeding and wintering birds means that timing construction to avoid impacts to birds will be very challenging as there is only a short window where disturbance can be avoided. Significant impacts to bird populations on the Suffolk coast will likely be unavoidable at this landfall location, despite the mitigation proposed in the Preliminary Environmental Impact Report. These include timing works for the brief window between breeding and winter seasons; however, we note that this period can overlap in some years, with early wintering birds arriving while breeding birds are still present. We further note that this timing is proposed “when practicable”, suggesting that it will not always be possible. Therefore, the assessment, “Preliminary magnitude - Negligible with mitigation in place”, should be extended to include a magnitude for when this mitigation measure is not feasible. The Preliminary Environmental Information Report states that assessment work has progressed to differing degrees for different technical assessments and that mitigation measures have not all been defined or designed. This appears to include measures to ensure no significant hydrological impact on water levels in RSPB	N	Impacts from construction of the onshore cable on the RSPB Reserve, Leiston-Aldeburgh SSSI and Sandlings SPA have all been considered in the design, construction methods and programme for the Proposed Project. This assessment has been discussed with Natural England, Suffolk Council and East Suffolk Council. Significant disturbance is to be ensured against by a combination of construction methods (adopting a trenchless construction solution rather than open cut trenching), technical mitigation (noise fencing), moving the construction compound further from the SPA than it was identified at Statutory consultation, and phasing the most potentially disturbing elements of work in that area to avoid the bird nesting season. Detailed investigation has been undertaken into the feasibility of a trenchless construction solution under RSPB North Warren without affecting surface hydrology or leading to frac out and this is reported in the ES. This has been confirmed to be feasible. All of the potential effects identified in the PEIR have been subject to detailed assessment, presented in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites and the bird habitats within them.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	North Warren nature reserve, for which little information on the mitigation measures is provided. Given the ecological importance and sensitivity of this wetland site, the design of these mitigation measures must be provided, along with detailed evidence to support an assessment of their likely effectiveness and risk of failure and published for scrutiny prior to the submission of any DCO application. We believe that despite the information now provided in the Preliminary Environmental Information Report, the uncertain outcomes of mitigation measures and the preferred trenchless crossing method mean that we must assume that there may be long-term significant damage to this nationally important wildlife site from this development. This will have wider implications for breeding and wintering birds on the Suffolk Coast, as RSPB North Warren forms a part of a network of wetland sites along the Suffolk coast which support declining bird species.		
RSPB	There is potential for construction-related disturbance to birds which use the marshes identified within the Suffolk route corridor. Wintering White-fronted Geese prefer the area north of the footpath which crosses RSPB North Warren roughly east, whilst breeding waders are found either side of the footpath and wildfowl are likely to be present across the whole marsh. The presence of a construction compound just to the west of the site has potential to result in significant noise and visual disturbance to SSSI features. The proposed route west of North Warren passes through habitat that supports Woodlark (and therefore may have a functional linkage with the Sandlings SPA) and also supports breeding Turtle Dove and Nightingale. As explained in Table 2.3.15 of PEIR Vol. 1, Part 2, Chapter 3, Ecology and Biodiversity, the proposed cable corridor to the west of RSPB North Warren passes through areas of importance for Woodlark and Nightjar. These species are both features of the Sandlings SPA and Woodlark is listed under Schedule 1 of The Wildlife and Countryside Act. Given the number of breeding records of Woodlark in close proximity to the onshore works, we are concerned by the statement in the Table that “there will be temporary loss of up to approximately 116 ha of potentially suitable foraging habitat within 2 km of the SPA” and that this is not considered significant. Further information is required to show how this potential impact will be minimised, with mitigation proposed if needed. The cable corridor also passes through areas which may support Turtle Doves. This species is on the Birds of Conservation Concern (BoCC) Red List due to its dramatic decline and the RSPB has been working with partners and land managers through Operation Turtle Dove to try to halt this decline through improvements to breeding and foraging habitats. Due to the fragile state of the breeding population, it is important that impacts on key habitats for these species (including scrub and mature hedgerows) are avoided and	N	Impacts from construction of the onshore cable on the RSPB Reserve, Leiston-Aldeburgh SSSI and Sandlings SPA have all been considered in the design, construction methods and programme for the Proposed Project. This assessment has been discussed with Natural England, Suffolk Council and East Suffolk Council. Significant disturbance is to be ensured against by a combination of construction methods (adopting a trenchless construction solution rather than open cut trenching), technical mitigation (noise fencing), moving the construction compound further from the SPA than it was identified at Statutory consultation, and phasing the most potentially disturbing elements of work in that area to avoid the bird nesting season. Detailed investigation has been undertaken into the feasibility of a trenchless construction solution under RSPB North Warren without affecting surface hydrology or leading to frac out and this is reported in the ES. This includes a refinement of the assessment of the area of habitat affected. The assessment concludes that there will be no effects of trenchless construction on surface features and negligible risk of frac out within the reserve. All of the potential effects identified in the PEIR have been subject to detailed assessment, presented in provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2, Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the Proposed Project on important sites and the bird habitats within them. Mitigation measures appropriate to the magnitude of the identified impacts are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	minimised as far as possible, as reinstatement through replanting of young trees after up to 5 years is likely to mean that the habitat would not be sufficiently mature to support breeding Turtle Doves for some time beyond this. Reduction and/or mitigation of this impact is also likely to be beneficial for breeding Nightingale. We also note that the sandy, acidic soils in parts of this section of the cable corridor make the area potentially suitable for Stone-curlew. Stone-curlew are amber listed on BoCC and listed under Schedule 1 of the Wildlife and Countryside Act. Presence of this species should be considered in any areas of suitable acidic grassland or arable farmland, with particular consideration given to the potential for colonisation of any areas of bare ground created during the construction of the cable route. Surveys and mitigation may be required in order to avoid impacts on this species.		
RSPB	We are also concerned about the impact of new pylons across the Stour on flying birds moving between designated sites and functionally linked land. This concern is recognised by National Grid: "At this stage of the Proposed Project, the potential for operational period collision risk cannot be dismissed, associated with the new section of overhead powerline and species travelling to Stodmarsh SPA/Ramsar" (Paragraph 3.3.8.17 of the PEIR Vol. 1, Part 3 Kent Onshore Scheme, Ch. 3 Ecology and Biodiversity). We seek further detail and clarity about how impacts would be avoided or minimised in the Stour and Minster Marshes area, as well impacts of light pollution on wildlife there. There are substantial areas of farmland, including habitat managed for wildlife, in this area that are important for Red-listed birds and others, including land around the proposed converter station site. These farms are managed sympathetically for declining wildlife and have produced impressive results: some examples include a thriving Grey Partridge Perdix perdix population, breeding Nightingales Luscinia megarhynchos and Long-eared Owls Asio otus, as well as wintering Curlews and Lapwings. Some land is part of Operation Turtle Dove8 - with Turtle Dove Streptopelia turtur successfully breeding in recent years. There are also ongoing habitat enhancement efforts such as creating scrapes for Lapwings Vanellus vanellus. The work local farmers are undertaking for wildlife there is increasingly valuable given the widespread declines of British farmland and woodland birds, and it is important that Sea Link does not impede these efforts. Survey work undertaken by Sea Link must be sure to capture the extent of the bird fauna in this area and to incorporate data from the long-running bird studies, such as bird ringing, the landowners have overseen.	N	As part of the Proposed Project ES National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Bird diverters are to be included on the new section of overhead line. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
RSPB	The RSPB is particularly concerned about the disturbance and displacement impacts of construction, installation, maintenance and decommissioning of the subsea high voltage cable (HVDC) on red-throated diver in the Outer Thames Estuary SPA.	N	In discussion with Natural England, National Grid has committed to a seasonal restriction (01 November – 31 March) for offshore cable burial activities in the Outer Thames Estuary SPA and a seasonal restriction (01 January – 31 March) for landfall cable installation activities at the Suffolk landfall in Aldeburgh. The assessment presented in the ES reflects this seasonal restriction.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Our concern is reinforced by the Secretary of State's recognition in the East Anglia ONE North (EA1N) and East Anglia TWO (EA2) Decision Letters of a likely "adverse effect on integrity … in relation to alone and in-combination impacts on red-throated diver from displacement/disturbance, a qualifying feature of the Outer Thames Estuary SPA". As PINS also noted in the Sea Link Scoping Report (para. 5.3.3), the Outer Thames Estuary SPA "qualifying features include species such as red-throated diver which are known to be vulnerable to disturbance and which could be affected by construction and maintenance activities". We consider that the preliminary assessment (at 4.6.9.6/Table 4.6.14, PEIR Volume: 1 Part 4 Offshore Scheme Chapter 6 Ornithology (PEIR 1/4/6)) that red-throated diver has only "a medium sensitivity to disturbance from anthropogenic activities such as shipping and offshore wind farms during construction, maintenance and decommissioning" may underestimate the level of sensitivity of the species to those impacts. Furthermore, notwithstanding what are described as the "temporary, short-term nature of the construction, maintenance and decommissioning works", the preliminary assessment that the "temporary" displacement of red-throated diver during construction is "not significant" is also likely to be an underestimate of the actual impacts. This flaw in the preliminary assessment follows through into the assessment of intra-project cumulative effects because by categorising the displacement of red-throated diver during construction as "not significant", stage 2 of the intra project cumulative effects assessment (Table 4.11.6, PEIR Volume: 1 Part 4 Offshore Scheme Chapter 11 Offshore Scheme Intra-Project Cumulative Effects) is avoided.

Feedback form			
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	The Nautical Archaeology Society is pleased to see that this project is taking marine heritage assets into account at this early stage of the process and would welcome the opportunity to comment on future archaeological works. We applaud your planned marine corridor for recognising areas of archaeological importance. You state that you will use trenchless crossing techniques in Sandwich and Pegwell Bays. Please note that as well as having scientific and environmental significance, this is an area of high archaeological interest with a high concentration of known and unknown wrecks. It is imperative that detailed surveys and geophysical sensing by experienced and qualified archaeologists are undertaken to identify heritage assets on and below the seabed and foreshore prior to trenching taking place.	N	National Grid acknowledges this comment. As part of the ES that accompanies the DCO application, National Grid has undertaken as assessment of the potential effects on marine archaeology to include physical disturbance activities causing direct damage and/or loss of heritage receptors on and below the seabed, and physical disturbance activities causing changes to hydrodynamic and sedimentary regimes leading to sediment reduction on the seabed and scour, causing adverse indirect effects on seabed heritage receptors. Furthermore, the assessment has considered works that would change the setting of a heritage receptor and character of the historic seascape. These assessments have been undertaken using archaeological specialists in line with recognised good practice guidance documents. The results of the assessment are found in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**. A number of sources of primary and synthesised information were consulted for the assessment which are contained in **Application Document 6.3.4.6.A ES Appendix 4.6.A Marine Archaeological Technical Report**. The assessment did not identify any potential significant adverse effects of the Proposed Project on marine archaeology.
Local community	The society has a longstanding involvement with the maritime heritage in Sandwich Bay and has developed an extensive network comprising local individuals and groups with an interest in maritime archaeology located in the Bay. We would welcome the opportunity to work with National Grid and its contractors to enable them to take an active role in the ongoing community archaeology of the area as part of their corporate social responsibility. There are many opportunities to show the work of the National Grid in a positive light and show how through their marine planning process they can contribute positively to the heritage asset. This would help to ensure positive community relations throughout the course of the project. We are well set up to assist with this aspect of the project should you be in need of such services. The Nautical Archaeology Society support your stated community engagement methods and offer our assistance for engaging with heritage and community archaeology groups and individuals in the Sandwich and Pegwell Bay area. Your project overview document states that mitigation and offsetting are key components of your work. Due to the high concentration of marine heritage in the Sandwich and Pegwell Bay areas, we strongly suggest a community archaeology co-created project to mitigate any heritage asset impact and to foster good community relations. The NAS are well placed to assist with this if required and would welcome the opportunity to discuss this further.	N	National Grid acknowledges these comments and welcomes your support of their community engagement methods. Further details about this are set out in **Application Document 5.1.5 Appendix D Statement of Community Consultation**. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
Local community	There is a mention of "avoidance" of potential sites of archaeological importance or marine life at sea but I can't see any	N	National Grid can confirm that embedded measures such as sensitive routeing and siting of infrastructure and temporary works have been integral in reducing the marine archaeological effect of the Proposed Project. The results of the impact assessment on

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	real evidence of how this has been considered. This is worrying given how vulnerable so much of our marine life is.		marine archaeology can be found in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**. Further marine environment assessments are set out in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment, Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology** and **Application Document 6.2.4.2 Part 4 Marine Chapter 3 Benthic Ecology and Application Document 6.11 Marine Conservation Zone Assessment**. The mitigation hierarchy has been applied to lessen effects where possible, with the Offshore Scheme being re-routed to completely avoid the Goodwin Sands MCZ. As such, no direct impacts will occur.
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			
Local community	Destruction to nature and disturbance to shipwrecks.	N	As part of the ES that accompanies the DCO application, National Grid has undertaken as assessment of the potential effects on marine archaeology to include physical disturbance activities causing direct damage and/or loss of heritage receptors on and below the seabed, and physical disturbance activities causing changes to hydrodynamic and sedimentary regimes leading to sediment reduction on the seabed and scour, causing adverse indirect effects on seabed heritage receptors. Furthermore, the assessment has considered works that would change the setting of a heritage receptor and character of the historic seascape. These assessments have been undertaken using archaeological specialists in line with recognised good practice guidance documents. Receptors comprise known and potential marine paleogeographic sites and prehistoric finds; known and potential maritime and aviation features in a marine context; and intertidal and coastal heritage receptors (including known and potential paleogeographic sites and prehistoric finds, historic terrestrial, marine and aviation features). This includes shipwrecks. The results of the assessment are found in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**. A number of sources of primary and synthesised information were consulted for the assessment which are contained in **Application Document 6.3.4.6.A ES Appendix 4.6.A Marine Archaeological Technical Report**. The assessment did not identify any potential significant adverse effects of the Proposed Project on marine archaeology.
Local community	There is a high concentration of marine heritage in the Sandwich and Pegwell Bay areas. As long as heritage assets are not impacted, or the risk identified and appropriately mitigated for, then the NAS consider the proposal appropriate and proportional.	N	
General commentary			
Goodwin Sands Conservation Trust	Our Background The Goodwin Sands Conservation Trust was formed in 2018 following Dover Harbour Board's application for a marine aggregate extraction licence for the Goodwin Sands. The charity's stated objectives are to conserve, protect and improve the natural and historic environment of the Goodwin Sands and the safe anchorage of The Downs for the benefit of the public in perpetuity. Overview The area of sea off Pegwell Bay on the east Kent coast is bordered to the north by the cliffs of Thanet and to the east by the Goodwin Sands. Up until the 15th century Sandwich boasted a large harbour capable of anchoring hundreds of ships (see attached map). This harbour encompassed the area that is now proposed for	N	National Grid acknowledges welcomes this broader contextual information relating to Goodwin Sands and its significance for marine archaeology. Information on the assessment of the Proposed Project on marine archaeology is contained in **Application Document 6.2.4.6 Part 4 Marine Chapter 6 Marine Archaeology**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	development by National Grid at Minster Marshes, Ebbsfleet, St Augustine's, Stonelees and Sevenscore. When the harbour started silting up in the early 1500s the fleets moved their anchorage into The Downs, the expanse of calm water lying between the Goodwin Sands and the East Kent foreshore. Despite being a safe anchorage, storms and errors of navigation led to thousands of ships foundering in these waters, leaving behind a wealth of maritime archaeology found nowhere else in the world. Wessex Archaeology has described the Goodwin Sands as 'archaeologically extraordinary' as they hold the highest density of shipwrecks in UK waters, if not the world (source: National Importance and Marine Assets – The Goodwin Sands and the Farne Islands, Wessex Archaeology March 2015). Over 2,000 shipwrecks have been recorded in the waters around the Goodwins including in Pegwell Bay and north towards Ramsgate, but the real number is probably twice this. The area contains seven Protected Wrecks and one Scheduled Monument – the highest density of heritage assets in UK waters. There are also several score of military aircraft crash sites and the remains of their aircrew scattered around the area and at least seven sunken submarines. There is therefore high potential for Underwater Cultural Heritage (UCH) - shipwrecks, sunken submarines and military aircraft crash sites to be located along the proposed cable route - and for shipwrecks to be present on the land identified for development. The map on page 119 of the Scoping Report (attached) shows about 70 sites recorded by the UK. Hydrographic Office together with 18 from the National Marine Heritage Record (NMHR) lying along the proposed cable route – although it seems that only three of the latter are separate sites. Since some of these could prove to be historically important any development in this archaeologically sensitive area must ensure that both known and unknown maritime heritage assets are not detrimentally impacted – both on land and underwater.		
Goodwin Sands Conservation Trust	Geophysical surveys Please confirm that the following geophysical surveys were undertaken to protect our Underwater Cultural Heritage • Magnetometer • Side Scan Sonar • Sub Bo_om Profiler • Mul` Beam Echo Sounder Please clarify who interpreted the geophysical survey results.	N	No geophysical surveys were conducted by Wessex Archaeology. Sidescan sonar, Multibeam Echo Sounder, magnetometer and sub-bottom profiler surveys were undertaken by MMT in 2021. See PEIR report Appendix 4.7.A pages 15 - 18 for the technical specifications and pages 42 – 52 for the results. Additional survey data obtained in 2024 included sidescan sonar, Multibeam Echo Sounder, magnetometer and sub-bottom profiler surveys undertaken by Next Geo and a gradiometer survey of Pegwell Bay obtained by SEP Hydrographic. The results of the archaeological assessment of this data will be presented within the DCO application. Wessex Archaeology conducted an archaeological assessment of all the marine geophysical data. This is outlined in section 6.4 of **Application Document 6.2.4.6 Part 4**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	What are their qualifications and experience in interpreting geophysical data? Our previous experience with Wessex Archaeology has shown that their skills in analysing geophysical data can be unreliable. For instance, they analysed the survey data for Dover Harbour Board's 2016 marine aggregate extraction licence and misidentified several important sites, including a crashed WWII bomber complete with unexploded bombs - which they described as a 'seafloor disturbance'. Two other sites identified by Wessex as being of no archaeological importance later turned out to be remains of crashed WWII aircraft. Parts of a steam ship were also missed. These are just the sites of which we are aware.		**Marine Chapter 6 Marine Archaeology**. This assessment was undertaken by leading offshore experts, following good practice and guidance. As is the nature of remote sensing surveys, geophysical assessments identified geophysical anomalies at the time of the survey which can subsequently be further investigated by ground truthing methodologies resulting in further discrimination; in some instances, towards greater archaeological significance, in others lesser.
Goodwin Sands Conservation Trust	Underwater Cultural Heritage (UCH) on Land. There is no evidence from the project documents that geophysical surveys have been carried out to identify the presence of any Underwater Cultural Heritage remaining on land, for which there is high potential. Please confirm what geophysical surveys have been carried out to detect the presence of UCH in both the land proposed for development and the route of the onshore cable.	N	As above, see PEIR report Appendix 4.7.A pages 15 - 18 for nearshore technical specifications. Figure 4.7.A.1 in Appendix 4.7.A (Marine Archaeological Technical Report) shows the extent of the marine geophysical survey area extending into Pegwell Bay. For the DCO application, a gradiometer survey was undertaken by SEP Hydrographic in 2024. The results of which have been integrated into the ES chapter and accompanying technical report and draft WSI. National Grid are planning a UXO survey in 2026 within the Order Limits. Geophysical survey was undertaken as part of the terrestrial archaeological assessment in areas where the scheme would involve open trenching, areas of significant disturbance, and areas where access could be agreed. This was followed by evaluation trenching in areas where impacts were predicted to be most significant, with geophysical anomalies as well as blank areas targeted. The results are included in **Application Document 6.3.3.3.D ES Appendix 3.3.D Geophysical Survey Report; Application Document 6.3.3.3.F ES Appendix 3.3.F Archaeological Evaluation Trial Trenching Report (Draft)**, and the data collected was incorporated in the baseline (**Application Document 6.3.3.3.A ES Appendix 3.3.A Cultural Heritage Baseline Report**), as well as the assessment **Application Document 6.2.2.3 Part 3 Kent Chapter 3 Cultural Heritage**.
Goodwin Sands Conservation Trust	Written Scheme of Investigation (WSI) 1. In the Written Scheme of Investigation (WSI) Wessex has identified 41 anomalies along the Kent portion of the proposed cable route - 26 A1 sites and five A3 ones. However, the map on the Scoping Report shows at least 70 UKHO sites. Please clarify the inconsistency in the number of sites identified. 2. Wessex has listed 26 sites as A1 and five as A3 plus a further ten sites they decided not to include. Please clarify why these ten sites have been excluded from the WSI. Please clarify why none of the sites have been listed as A2. For reference: A1 = anthropogenic origin of archaeological interest	N	The marine geophysical study area is constrained to the extents of the sidescan sonar dataset within the wider Offshore Scheme Scoping Boundary. The UKHO data search was undertaken for an area that included the whole of the Offshore Scheme Scoping Boundary, much of which was not covered by geophysical data (as is standard practice), and the results were incorporated into the Scoping Chapter for Marine Archaeology. See PEIR report Appendix 4.7.A page 11 for clarification and Figure 4.7.A.1. The WSI uses a more refined development area (Offshore Scheme Boundary) and only seabed features that may be impacted by the Proposed Project will be addressed and included, hence the 41 sites given Archaeological Exclusion Zones (AEZs). AEZs are determined on a project-by-project basis, based on a range of factors including data quality, interpreted type of site, how well constrained the site boundaries are, potential for burial of associated material, and confidence of interpretation. They are not applied universally as a standard size, and so will vary from project to project as appropriate. Seabed features identified from UKHO records and located beyond the extent of the marine geophysical survey area have been given appropriately sized AEZs (see Table 4.7.B.2 in the WSI Sea Link PEIR Volume 2 Appendix 4.7.B Written Scheme of

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	A2 = uncertain origin of possible archaeological interest A3 = historic record of possible archaeological interest with no corresponding geophysical anomaly 3. Wessex Archaeology recommends the following Archaeological Exclusion Zones (AEZs): • 25m radius around debris fields • 25m– 50m radius around a wreck of a dangerous wreck • 100m radius around recorded wrecks BUT On the Thanet Offshore Windfarm project, Wessex set AEZs of 50m – 200m around anomalies they considered to be either shipwrecks or anomalies of medium archaeological potential (source: Thanet Offshore Wind Farm WSI Ref: 60071.03 March 2018) AND On National Grid's Interconnexion France-Angleterre 2 (IFA2) project (WSI also by Wessex Archaeology) they set AEZs of between 50 m – 100m around detected anomalies depending on significance and 150m radius AEZs around known wrecks (source: IFA2 Offshore WSI ref: 116350.01 July 2017) Please clarify the inconsistency in the size of proposed AEZs between Sea Link and the other two similar projects (all WSIs have been written by Wessex Archaeology). In his letter of 10th March 2020 (see attached), Professor Dave Parham FSA MCIfA, Professor in Maritime Archaeology at Bournemouth University recommended that AEZs of at least 150m radius should be seen as a minimum for any anomaly. Please confirm that 150m radius AEZs will be placed around all anomalies. Potential landfill requirement since the proposed site of the new converter station and substation is flooded on a regular basis, we presume that the area will have to be infilled by a height of several metres. Please confirm whether there is any intention to use marine aggregate extracted from the Goodwin Sands for any landfill.		Investigation. The size and extent of the AEZs recommended for the Proposed Project have been refined following the additional marine geophysical surveys undertaken in 2024 and the Technical Report will be updated with the results of these additional surveys, submitted as part of the DCO application. The landfill requirements for the Proposed Project have not been finalised but there is no intention to extract any material from Goodwin Sands.
Goodwin Sands Conservation Trust	Mitigation If National Grid are to proceed with this proposal, we would suggest a substantial donation is made towards funding maritime archaeology in the area by way of mitigation. This is notwithstanding the fact that adequate measures should be taken to protect our Underwater Cultural Heritage.	N	The Proposed Project acknowledges these suggestions for mitigation measures and will maintain ongoing discussions on this matter with relevant stakeholders. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Goodwin Sands Conservation Trust	The primary mitigation methodology of dealing with cultural heritage is to avoid any site or geophysical anomaly detected. Such avoidance is guaranteed by the use of an Archaeological Exclusion Zone (EZ) (CE 2010 4.1.1) which normally includes the site or geophysical anomaly itself, plus a buffer zone situated around the periphery of the site or anomaly. Industry guidance states that the position, extent and design of an AEZ should take into account all available information including geology, hydrology and sediment transport and should extend around the boundaries of the asset rather than around a centre-point within the site (COWR|E 2OO7 7.2.2). This does not appear to have occurred in the case of the Goodwin Sands. The WSI supplied merely provides a 2Sm buffer around each anomaly which has been given a single geographical centre-point and no attempt has been made to define the exact spread of the material that has been detected. A number of anomalies have been detected over multiple survey lanes which may suggest that they extend beyond the single point. A 25m buffer around would result in a circle of 50m radius. This would not appear to be in proportion with the size of sites that may be present within the dredge area. Even relatively small vessels commonly exceed 25m: a 19th century Thames barge, a relatively small vessel, could easily exceed this size and early'1gth century East lndiamen such as the Britannia, as yet undiscovered but known to have been lost in the vicinity, were over 50m long. Late 19th century sailing vessels often exceeded 60m in length. Many \ A//ll aircraft had wingspans in excess of 30m (Avro Lancaster, B17 Flying Fortress, He 177, B24 Liberator and Short Sunderland, the latter of which had a wingspan of almost 35m and most of these types suffered multiple losses in the broader geographical area within which the dredge area lies. Any wreck site that would result from the loss of one of these types of aircraft would in all probability considerably exceed the area covered by a circle 2Sm in radius. Indeed, given the huge density of shipping and aircraft known to have been lost in the area and the dynamic nature of the Sands themselves, that can completely cover wrecks as large as the East lndiaman Admiral Gardenerand the third rate HMS Stirting Casile, both over 45m in length, it is not improbable that those anomalies detected may be the relatively small, exposed remains of much larger features. This does not appear to have been considered when setting the AEZs. Other infrastructure projects undertaken in areas where similar densities of known losses and where sites of comparable sizes were expected have used much larger AEZs. The lnterconnexion France-Angleterre Z (lFA2) project conducted by National Grid for example, used AEZs between 50m and 100m for detected anomalies depending on significance and 150m around known wrecks. tr/y experience of excavating ships oi the size of the Britannia would	N	Locations of known marine archaeological interest/value within the marine environment will be avoided by all marine vessels by the implementation of appropriately sized Archaeological Exclusions Zones (AEZs). No works that could impact the seabed will be undertaken within the extent of an AEZ during the construction, operation and maintenance, or decommissioning phases of the Offshore Scheme. AEZs may be amended (enlarged, reduced, moved or removed) because of further data assessment or archaeological field evaluation and must be undertaken in consultation with the Archaeological Curator, Historic England. The locations and extents of all recommended AEZs are presented in the Outline WSI (**Application Document 7.5.5 Outline Offshore Overarching Written Scheme of Investigation (OWSI**). The 2000 numbers gazetteer within the draft offshore WSI submitted for PEIR were for sites located within the boundary of the Offshore Scheme draft Order Limits but that were not covered by the geophysical survey data. As the extent of these sites on the seabed is not known, the AEZs were generated on a site-by-site basis based on available information from secondary sources. Table 4.7.B.2 in the WSI: Sea Link PEIR Volume 2 Appendix 4.7.B Written Scheme of Investigation. Sites identified within the geophysical survey data received 7000 numbers and where the extent of the feature could be ascertained, then the AEZ was provided around the buffer of the feature extent. Further geophysical survey data was acquired in 2024 and this data will be integrated into the ES chapter and updated technical report and updated draft WSI for DCO application.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	indicate that significant material can be found as far as 45m from the main wreck site making a radius of 150m a minimum.

Feedback form			
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	Estuary Services provide a critical infrastructure service of boarding and landing marine pilots for the Port of London, Medway and Ramsgate. Close marine traffic management will need to be coordinated during the construction phase to avoid service disruption, particularly around the Tongue pilot diamond and Tongue anchorages with consideration to guard zone requirements to facilitate works/anchor spreads and shipping/pilot vessels for the Thames estuary. It would appear that there will be a number of pre-existing cable crossings (Thanet Offshore export/Nemo) close to the Kent landfall and we're also aware of a planned telecom cable in consultation from Joss Bay (Broadstairs, Kent) to Belgium.	N	National Grid acknowledges the feedback and thanks you for your comments. As part of the Proposed Project EIA, National Grid undertook an assessment of the potential impacts on shipping and navigation, **Application Document 6.2.4.7 Part 4 Marine Chapter 7 Shipping and Navigation**. The assessment recommended the establishment of communication plans with clear protocols to ensure effective communication and coordination between all relevant shipping and navigation stakeholders. During construction and operation, National Grid will develop a well-coordinated communication strategy, and proactive planning of operations, to ensure safe and efficient operations with minimal disruption to shipping and navigation.
Ramsgate Port	Will the cable pass to the east of RA buoy in the Ramsgate compulsory pilotage area? When is crosses the Thanet offshore windfarm will mats be used? If so will it lessen the depth of water there? Currently about 5.7m - 7.2 above Datum. Currently Ramsgate has no commercial ferry operator. Please be aware that this might change. Will the cable laying effect the passage of ferries in and out of Ramsgate?	N	National Grid is able to confirm that the cable route will pass to the east of the RA buoy. At the Thanet offshore wind farm the water depth will not reduce by more than 5%. Comments regarding the status of Ramsgate and commercial ferry operations is acknowledged. National Grid will seek to maintain dialogue with the Port in order to identify and address any changes in circumstance. **Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment** considers the potential effects of the Proposed Project on ferry movements at Ramsgate.
Local community	How will inspection and maintenance take place in one of the busiest shipping lanes in the world plus entry to estuary to London?	N	The cable system installation is designed such that a regular maintenance regime is not required to maintain the integrity of the cable. However, monitoring may indicate that localised lengths along the cable may require maintenance. Cable repairs may be required at any time however these are expected to be rare. During the operational lifetime of the cable a number of inspections to examine integrity are foreseen. This is expected to take place annually via ROV/autonomous operated underwater vehicle in the early stages of the operation moving to every 2 – 5 years once suitable functional/operational stability is established. Impacts on shipping lanes are covered in **Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**.
Local community	How will inspection and maintenance of the sea cable be carried out and will this interfere with shipping lanes?	N	
Local community	You don’t understand the problems you will encounter when crossing the River Stour. The river has a right of navigation which cannot be taken away. During recent upgrades to the overhead line which required two bridges being constructed and a desire from your contractors to fence of areas restricting access to construction staff in a belief that river traffic could be diverted and use an alternative route.	N	Impacts on navigation are covered in **Application Document 6.3.4.7.A ES Appendix 4.7.A Navigational Risk Assessment**. National Grid has had and will continue to maintain ongoing dialogue with key stakeholders on matters relating to the river, including the Environment Agency and the local authorities.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Our Boat club currently has approx. 250 members with vessels moored in the upper reaches of the river around Grove Ferry with some navigating to the sea so requiring unrestricted access. This is something which depends on which season works are planned. Bridges having at less 4mtr airdraft, notice being given when stringing works are being carried out, involving the other boat yacht clubs on the river so everyone is aware of any restrictions in the right of navigation.		

Table 1.20 Commercial fisheries

Feedback form			
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	Disruption to fishing industry.	N	The potential impacts on the fishing industry are assessed in **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries**. This assessment concludes that there will be no significant effects on the fishing industry, taking into account fishing rights and grounds. National Grid will maintain ongoing dialogue with Fisheries liaison officers and other appropriate representatives.
Local community	What will be the impact on the local small-scale fishing community their livelihood and working habitat?	N	
Local community	Fishing rights and grounds need to be taken into consideration when construction takes place.	N	
Local community	Disturbance to breeding fish.	N	The potential impacts on the fish are assessed in **Application Document 6.2.4.3 Part 4 Marine Chapter 3 Fish and Shellfish Ecology**.
Local community	If the marine proposals can be combined with marine conservation measures, such as no trawling areas.	N	National Grid cannot condone fishing over its assets due to the potential risks to vessel operators and to the cables, which are of critical national importance and if damaged could result in implications for the UK transmission system and security of supply. As such, it advises that vessel operators follow the longstanding maritime guidance regarding the avoidance of demersal trawling (and anchoring) in the vicinity of subsea cables. Specifically, this guidance includes the Mariner's Handbook (P100) 12th Edition (UKHO, 2020), all Admiralty charts, and the recent Marine Guidance Note (MGN) 661 published by the Maritime and Coastguard Agency (MCA). National Grid do, however, recognise that that some fishing may still occur over its subsea cable assets, either inadvertently or at the discretion of individual vessel operators, acknowledging that there is not a statutory exclusion zone. As such, the subsea cables will be suitably designed and protected to reduce the risk of them being damaged by fishing activity as far as is practicable. In the first instance this will be through burial, then through external protection where necessary. Where external protection is used, this will be designed in accordance with best-practice and industry guidance to minimise snagging risks in so far as practicable. As built surveys of the cables will also be conducted, and their positions (including locations of external protection) will be reported to the UKHO and Kingfisher for inclusion on Admiralty and KIS-ORCA charts. These details will also be shared with relevant fisheries stakeholders There will be temporary loss of fishing grounds during survey work and installation activities, as such they work with the fishing industry to put in place management and conservation measures to mitigate this disruption.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	How are areas of cable fishing protected from trawler fishing?	N	The cable installation and protection methods are explained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The cable burial depth is outlined and secured in the Deemed Marine Licence DCO Schedule 16.
General commentary			
Thanet Fishermen's Association	The TFA wrote to Sea Link in February 2023 setting out our key. The letter raises the point of fishing over cables and refers to bottom drift netting and trawling. The reason this was raised is because Sea Link had classed bottom drifting as mobile gear and elected to treat this method the same way as trawling, meaning it would not be	N	National Grid acknowledges this feedback.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	included in any disruption agreements and would be dealt with during surveys via COLREG's. Bottom drift gear is very light and is in contact with the seabed when fishing, but has minimal ground penetration. During bottom drifting, the gear is not fixed to the vessel and up to 6 fleets drift across the seabed, making it very different to trawling in how it acts and in its sensitivity. While disruption agreements are not a part of the PEIR, this is relevant because bottom drifting is a vital passive fishing method for the Thanet Fishermen, and others in the Outer Thames, and the points raised below highlight that the impact on bottom drifting specifically has not been considered fully.		
Thanet Fishermen's Association	TFA/Kent fishing data We have looked through the PEIR volume 1, part 4, chapter 9 and can only find reference to static netting and drifting. It is not made clear that bottom drifting is a main method used and that the gear makes contact with the seabed, hence the concern around seabed condition pre and post cable laying. We have not seen reference to the concerns raised about the sensitivity of this method when any ground disruption might occur from cable laying, PLGR, cable crossings or redundant cable cutting. The current position of Sea Link on bottom drifting and fishing over cables resulted in a disagreement on how TFA would proceed, this included data gathering from Thanet Fishermen. At 4.9.3.3 it states that 'Fishers from the majority of ports adjacent to the Cable Route were represented, with consultees from the regional IFCAs providing representation encompassing those unable or unwilling to engage at the time; non-UK stakeholders from the EU were also included in consultations. Topics discussed included, but were not limited to, vessel details, fishing effort (including location of grounds relative to the cable route), gear specifications, seasonality, and target species.' At the time of consultation, TFA Fishermen were not willing to share large amounts of data due to disagreements on fundamental differences of opinion on bottom drifting and fishing over cables. In figure 4.9.A.6.13 through to figure 4.9.A.6.16 there is almost no Kent fishing data shown, presumably meaning none was gained from the KEIFCA either. The small amount of Kent data, shown in red on figure 4.9.A.6.14 (Fishing ground for static nets as identified through consultation) was given to Sea Link by TFA to specifically show bottom drift ground directly on the cable route, not static netting grounds. The charts were sent in to show the importance of these strips of ground and to highlight ground that could be bottom drifted on the route, not to show the extent of bottom drift grounds and clearly not showing any static netting ground. The distinction between these two different methods is important because they target different grounds and are affected in different ways by changes to the seabed. It is	N	The inclusion of bottom drift netting was also raised through regulator comments on the PEIR. Bottom drift netting is now included in the ES, and a key consideration in determining the potential for significant effects to occur. **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries** concludes there to be potential for moderate effects (significant) on static gear fisheries during construction, operation, and decommissioning phases, relating to the Proposed Project. Additional mitigation has therefore been included to reduce this potential impact, and ensure early and regular consultation with fishers are upheld, with the aim of ensuring the fishing communities' views are heard in a timely manner, allowing the development to take an informed approach moving forward. **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** appraises the disturbance of the seabed (and its recoverability) and recruitment of habitat dependant species back to the location of the cable lay as having no significant effects. The technical report that accompanies the ES chapter has been updated to include distinct bottom drift netting data which has informed the updates to the assessment since PEIR.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	also important to understand that when bottom drifting, the gear is shot across the tide and not along it as with static netting. Without proper consideration of bottom drifting, any assessment of sensitivity and magnitude and the impact on the Thanet fleet is incorrect.		
Thanet Fishermen's Association	Cable Crossings/Cable protection We are aware that the Sea Link cable route will cross multiple other cables which will include BT Mercator, Q&E telecom, Neuconnect interconnector, Gridlink interconnector, Thanet Offshore Windfarm, Nemo Interconnector, Britned Interconnector and numerous others, all of which have dealt with Thanet Fishermen's Association. How these cable crossings, and any other sections where the cable needs external protection, are dealt with will potentially have a direct impact on any bottom drift ground that the cable route dissects. Up to 13.2km of external protection such as rock berm, concrete mattress, rock bags etc are mentioned near the start of the document, but later under preliminary sensitivity on page 33, it states that up to 13.2km of berms at a 3:1 gradient are planned to prevent fishing gear snagging. A 3:1 rock berm will stop any bottom drifting occurring and is obviously a major concern to TFA. The type of protection that is used can make a significant difference to whether the ground can be fished again by certain methods and TFA continuously asks that consideration is given to each crossing/protection area to minimize the loss of ground. Similar issues occurred with the Nemo cable which passed through drift ground, but having added frond mats to the cable protection, these have since been drifted over. On the chart we provided showing where TFA vessels fish, we consider there will be between 6 and 10 cable crossings, depending when Sealink is laid, but we have not been able to find a chart in the Commercial Fisheries chapter showing where cable protection will be used in order that we can see which fishing grounds might be affected.	N	Communication between developers regarding cable crossings, post installation surveys, and ongoing consultation with the fishing community regarding cable protection design are mitigation measures included in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**; particularly with consideration of snagging risk to bottom drift net fisheries. Regarding the 1:3 ratio of berms placed at crossings locations, **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** states that where specialised structures may be required, an alternate design may be co-engineered by the 3rd Party Asset Owner and National Grid. Nemo Link was also raised in regulator feedback as a learning point for this development. As states above, consultations with the fishing community on the design of cable protection will be ongoing.
Thanet Fishermen's Association	Redundant cable removal We have not seen reference to redundant cable removal and how cable cut ends are dealt with. Redundant cables can have a significant effect on how the ground can continue to be fished, depending on how they are dealt with. We have recently had significant problems with the BT Mercator cable, where cut ends were connected to concrete blocks and put back on the seabed, closing the ground to drifting until the problem was solved.	N	**Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** states that an initial decommissioning plan (including potential redundant cable removal) will be written once the final route and installation methodology is engineered by the Contractor post submission. This will be in accordance with all applicable legislation, best practice guidance and Shoreline Management Policies at the time of compilation. However, as decommissioning of the cable will be many decades into the future, regulatory requirements and industry best practice may change. This initial decommissioning plan will be updated throughout the life of the Proposed Project in preparation for the eventual decommissioning of it. When decommissioning comprises cable removal, the recovered cables/cable sections would be disposed of in accordance with the relevant waste stream management regulations at the time of decommissioning. In light of the previous issue noted, it is expected that these events and any others will inform future best practice and legislation.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Thanet Fishermen's Association	Preliminary Assessment of Effects TFA has a number of concerns about the assessment of effects, but these are largely due to the lack of information or assessment on bottom drifting. The temporary loss of ground is common in this area as there are so many cross-sector projects, but the cumulative effect of multiple temporary or permanent ground closures must be considered when assessing displacement. Depending on the year that cable laying is undertaken there will need to be consideration for other projects and how they are also closing access to grounds for the Fishermen in the same area, this will affect the assessment of displacement.	N	The impact of multiple projects in the area on commercial fisheries is assessed in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**.
Thanet Fishermen's Association	On page 41 under Operation phase, National Grid states it does not condone demersal fishing taking place over cables and goes on to say 'Furthermore, vessels are expected to follow Mariner's Handbook, MCA, and admiralty chart guidance, avoiding the immediate location of the cable. This will result in permanent loss of localised fishing grounds to trawlers.' There are currently no trawlers in TFA, though this may change at any time, but there are trawlers from Whitstable who fish the middle section of the route. There is currently no law stopping fishermen trawling over cables. The Telegraph Act states a Fisherman cannot wilfully damage a cable but does not say he cannot fish or trawl over a cable. The assessment of this permanent loss of ground to trawlers is then briefly considered as medium but is later reduced to not significant due to the availability of other fishing grounds. The sheer volume of cables in this area means that if the Sealink position were applied and trawling was not allowed over cables it would be the demise of the trawling industry. We consider this position on trawling over cables should not be part of the impact assessment because it is an opinion of Sea Link, which TFA strongly disagrees with, and not a law. We are also conscious that a statement like this means discussions on mitigation for this fishing method are less likely, which takes us back to how cables are protected and crossings are covered. This position on demersal fishing again highlights our concern that bottom drifting has been classed as mobile gear by Sea Link. We accept that the document states that consultation is ongoing but want to make sure that engagement on all of the concerns and mitigations above are recognised now, prior to final decisions being made. Our response is brief and has been quickly put together as we were not aware of the deadline on comments until a couple of days ago. We ask that TFA is engaged on all the points of concern and is given the opportunity to have input on decisions that will affect our vessels, including cable protection, redundant cable cut ends, fishing over cables and trawl and bottom drift surveys.	N	This statement has been updated in the ES, acknowledging that no legislation or private powers currently exists which prevent access to the area where cables will be buried and / or protected, and referencing the key guidance highlighted in this response. The permanent loss of fishing grounds for all fisheries, including trawlers, has been considered and updated in **Application Document 6.2.4.8 Part 4 Marine Chapter 8 Commercial Fisheries** and, with commitment to additional mitigation, have been deemed to have minor significance. Additionally, a preliminary assessment of the cumulative impacts of multiple cable routes have been appraised in **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects**. Additional mitigation measures include commitment to ongoing and timely consultation with the fishing community, including the design of cable protection, and cumulative effects, highlighting bottom drift nets as a key consideration. This will provide an opportunity for Thanet Fishermen's Association to discuss the topics raised. The ES has been updated to ensure clarity that drift nets are classified as static gear, and assessed as such. Additional reference and consideration has been made and to their movement while soaking.

Table 1.21 Climate change

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The positions chosen land based are impacting many habitats both in Suffolk and in Kent at Pegwell and Minster Marshes which will be severely impacted. There is a Climate Change and Ecological Crisis the 2 are intrinsically linked the proposed does not deal with the infrastructure implications for flora and fauna. Mitigation, Biodiversity Net Gain and translocation of species cannot replace the damage caused by the converter construction at Minster Marshes that is a reality. Also the Environment Agency own flood risk maps show this area could be severely impacted by 2050 so it seems insane to build a converter in such a vulnerable location.	N	A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. A separate, more detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. The link between climate change and ecology is recognised. Through the EIA process, National Grid has developed mitigation measures to offset the impact on terrestrial ecology. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
Q17 Anything else? Comments			
Local community	I appreciate that you have to consider your shareholders when making these plans and so will be planning for the most cost effective way to achieve this. However, there are more important considerations than money: especially now when so much of our wildlife is under threat. Minster Marshes are a very special place and should not be disrupted in this way. Also as I have already commented, the cost to your shareholders will be enormous as when this area becomes flooded it will all have been a complete waste of their money. The Climate Change Risk and Impact Assessment for Kent (June 2020) predicts that in less than 20 years the sea will have risen by 0.29 m and by 0.8m in less than 40. Further it also states that rainfall will have increased by up to 20% in the winter by 2040. These projections are already on the conservative side as we all know that global warming is happening exponentially quicker than anticipated. This site will become unusable by you and further it will add to the flooding that will occur.	N	A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change**. This assessment includes an assessment of climate change risks (including flooding) in accordance with the Institute of Environmental Management and Assessment good practice guidance for climate change risk assessments in Environmental Impact Assessments. A separate, more detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding.
Local community	I don't think there is anything else that needs to be in or discarded as the proposals are very detailed and do highlight the importance of Sea Link to national infrastructure and is important to UK's key commitments to reach Net Zero and have a low carbon economy for 2040/2050.	N	National Grid acknowledges this comment and thanks the respondent for the support.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	Is money making obfuscating a strategic plan for the future of the grid? There seems to be a mismatch in the rhetoric and speed for net zero. Projects seem to be springing up without due consideration of the air traffic control (my words) to land them all by 2030. The rush to net zero without an overall spatial strategy, particularly in East Anglia, looks like a Heath Robinson approach. I feel that the national conversation on energy infrastructure must	N	National Grid acknowledges this feedback but it is not possible for them for give regard to comments made about Government policy. National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. Efforts to minimise the impacts of the Proposed Project are therefore embedded within the design.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	include the many other harms in its pursuit. Where is the conversation that includes how net zero pollutes too. Where in the supply/value chain are the polluting climate harms and human rights in the manufacture (cables), transportation of products, and the scarcity of materials in the pursuit of net zero. Where is the bigger picture impact of chasing our UK net zero goals - the need for speed driving poor decision making and bad projects.		National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. The Proposed Project Environmental Statement has been produced in line with guidance and legislation, following extensive consultation with key stakeholders and survey work to inform avoidance, mitigation or (where necessary) habitat compensatory provision requirements.
General commentary			
Local community	Wetlands are known to be highly effective forms of carbon capture, needing to be extended to meet climate change targets. It is perverse to destroy wetlands in the name of "green" electricity.	N	National Grid has a duty to balance the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. As such, National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring and offsetting impacts. A climate change risk assessment is included within **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change,** while the assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** considers the effect of the Proposed Project upon habitats within this area. Where land perceived to be of value is lost as a result of new permanent infrastructure this needs to be balanced with the Proposed Project needs case, which will help the UK with British Energy Security Strategy 'Security of Supply' and with helping the UK to meet its Net Zero target to reduce carbon emissions. National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a Proposed Project that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
RSPB	The RSPB believes that climate change poses the greatest threat to wildlife and people that we face today. Decarbonising the UK's energy sector will be vital in the fight against dangerous climate change and switching to renewable sources of energy is essential to achieving this goal. The RSPB is therefore supportive of renewable energy projects (and associated works required to the network) providing adverse impacts on wildlife and habitats can be avoided through careful siting and design. Currently, however, protected wildlife sites are threatened by damage from a range of energy projects in Suffolk, including Sizewell C and several National Grid infrastructure projects. We need Government, National Grid and OFGEM to work together to develop a more strategic approach to the planning of energy projects to enable a response to the energy	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid has engaged with other project developers, seeking to identify opportunities for co-ordination whilst maintaining its obligations to facilitate network connection agreements by providing the required network reinforcement. In doing so, National Grid acknowledges the respondent's concerns about the potential impacts of the Proposed Project and is committed to developing a Proposed Project that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	and climate crisis that helps us to achieve a ‘nature friendly net zero’.		The effects of the Proposed Project and the other projects planned in Suffolk are considered together in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Table 1.22 Combined effect of Proposed Project

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	I strongly oppose the proposed location of the Sea Link converter station and associated infrastructure at Minster Marshes. The site's proximity to several protected marine environments, including Special Protection Areas (SPAs), Special Areas of Conservation (SACs), Ramsar sites, and a National Nature Reserve, raises significant concerns about the potential harm it could inflict on the delicate ecosystems within these areas. The construction activities would undoubtedly disrupt the natural habitats of numerous wildlife species, many of which are protected under the Wildlife and Countryside Act 1981, including endangered and Red List species. Moreover, the site adjoins the Minster Marshes SSSI, a strip of land teeming with diverse wildlife, putting its delicate balance at risk. The proposed site falls within an area that has already undergone considerable development related to power generation, including the Battery Plant and Grid Stability Plant, and the Nemo link project, which resulted in the construction of a converter station and associated infrastructure on the nearby Richborough Power Station site. This string of large-scale developments has already had a detrimental impact on the biodiversity of the region, necessitating careful consideration of the cumulative effect of these projects and any future ones. The proposed site's susceptibility to flooding and its long-term vulnerability to sea-level rise further compound the environmental concerns. The proposed infrastructure could exacerbate these risks, potentially jeopardizing the site's stability and posing a threat to the surrounding environment. While I recognize the importance of decarbonization and the need to facilitate the efficient distribution of renewable energy, I believe that alternative sites, such as brownfield areas, should be explored as more suitable locations for the Sea Link converter station and associated infrastructure. Additionally, Modular Offshore Grid options warrant thorough consideration. The absence of information regarding the evaluation of alternative sites and the evidence used to select Minster Marshes raises questions about the thoroughness of the planning process. In conclusion, I firmly oppose the proposed location of the Sea Link converter station and associated infrastructure at Minster Marshes due to the site's proximity to protected marine environments, its proximity to an already impacted area, its susceptibility to flooding, and the lack of consideration of alternative sites. I urge the planning authorities to reconsider this decision and prioritize the protection of the environment while pursuing decarbonization and renewable energy goals.	N	National Grid acknowledges the ecological sensitivity of Minster Marshes and Pegwell Bay and recognises the statutory designations mentioned in the feedback. A detailed impact assessment is provided in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. The marine impacts of the Proposed Project are assessed in **Application Document 6.2.4.1 Part 4 Marine Chapter 1 Physical Environment**. National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. A detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Local community	We have told you again and again that a substation in Friston is not acceptable. In addition to not listening to the public and our local politicians you have now rerouted your landing point and coming across Leiston Road on your way to Friston. Your suggested landing area is in the middle of AONB and has nature reserves on it and should not be allowed to be dug up. In addition, it is a large draw for tourists with several bird viewing platforms so you would not only disturb nature but also the local economy. Leiston road is not suitable for heavy traffic or machinery either from the Aldeburgh side (narrow road and roundabout) or from Aldringham as the road cannot take this traffic without properties along the road being damaged by movement in the ground (sand soil), Are you planning to pay for all the damage in our properties? It is quite clear that a more suitable landing is by Sizewell as that area is already disturbed, coordinate with EDF.	N	The effects arising from the Suffolk Onshore Scheme on the AONB are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. This includes reference to the statutory purpose of conserving and enhancing natural beauty as set out in the assessment considering the published Natural Beauty indicators and the relevant AONB indicators to landscape and visual matters. A complete assessment of socio-economics effects, including tourism, has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport,** informed by surveys and modelling, demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the surrounding highway network. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure.
Local community	My comments relate to the Suffolk plans. The area is largely covered by an AONB and already has one nuclear power plant, very soon it will almost certainly have another. With a third decommissioned nuclear plant also a blight on the landscape. These plans will have a strong and unwanted ecological effect not only on the AONB but also SSSIs. A further concern is heavy and plant machinery using the few narrow access roads that exist, which are also used by school buses and families. Furthermore, I understand that brownfield sites exist in Essex which would be better suited to house this infrastructure.	N	
Q7 What do you think about our proposed HVDC cable route in Suffolk? Comments			
Local community	A high voltage direct current cable connection of approx. 10km in length between the proposed converter station near Saxmundham and a transition joint bay approximately 900m inshore from a landfall point is not needed if other solutions were developed. There will need to be haul roads, workers compounds/parking, areas for spoil and equipment access to dig the trench across rural, farm land with residential properties in an area of tranquillity, dark skies and important habitats. This will negatively affect wildlife, the environment, people's lives and our tourism economy. The joint bay has been located immediately adjacent to the Area of Outstanding Natural Beauty and North Warren RSPB reserve which should be protected from development.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. The need case for the Proposed Project has identified that connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the route of the HVDC cable and the location of the joint bays and the high importance of the RSPB reserve and the AONB is noted. This is a major reason why the reserve will be traversed through trenchless methods.
Local community	This cable route would not be needed if other solutions were developed. North Warren RSPB reserve should be protected from development. I see the joint bay has been located immediately adjacent to the Area of Outstanding Natural Beauty! The cable route will require haul roads, parking areas, workers compounds.	N	A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. The effects of the Proposed Project have been assessed and carefully considered in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The trenches will go across rural, farm land in an area of tranquility and wildlife habitats. All of this will greatly affect people's lives and the important tourism economy. The local people will be greatly affected by all of the above.		**Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The mitigation hierarchy has been applied to lessen effects where possible. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. These plans will help the control and management of any nuisance such as air and noise during construction. Furthermore, **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase.
Q10 What do you think about our proposed landfall between Aldeburgh and Thorpeness? Comments			
Local community	This is totally unacceptable in an area of Outstanding Natural Beauty, SSSI, part of the North Warren RSPB nature reserve and internationally important for our tourism economy, enjoyed by everyone for their mental and physical health and well-being. This option has been discounted by other developers. It is of great concern that you claim that up to three projects could use this area for landfall.	N	National Grid is in discussion with the RSPB and Natural England (as well as the Suffolk Councils) regarding the route of the HVDC cable and the location of the joint bays and the high importance of the RSPB reserve and the AONB is noted. This is a major reason why the reserve will be traversed through trenchless methods. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. The health and safety of the public, local communities and employees is central to everything that National Grid does. Throughout the development of the proposals, National Grid have carefully evaluated the potential impacts of the Proposed Project on health and wellbeing, and where appropriate identified means of mitigating any impacts. Health and wellbeing impacts are assessed in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. National Grid acknowledges that the Proposed Project, together with other planned projects in the area, may have cumulative impacts and as such has undertaken a complete assessment of potential cumulative impacts in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This proposed landfall route is entirely unsuitable. It will cause irreparable damage to the seashore, the AONB and the RSBP reserve. The narrow roads between Aldeburgh and Thorpeness, and Aldeburgh and Leiston are entirely unsuitable for this level of development. The much-loved walkway along the disused railway line will be closed and irreparably damaged. This route hosts hundreds and hundreds of visitors at all times of the year. Added to this devastation for residents and visitors is the mindless destruction of wildlife habitats. We are told the wildlife will return but this is not born out by the evidence. The other projects have not selected this option but Sea Link still try to convince us that all three projects might collaborate!	N	The potential impacts of the Proposed Project on the AONB and North Warren Nature Reserve are acknowledged. The assessment of effects on the AONB is set out within **Application Document Part 2 Suffolk Chapter 1 Landscape and Visual,** and the effects on the North Warren site in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. The mitigation hierarchy has been applied to lessen effects where possible. An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. This construction solution will minimise potential impacts on terrestrial biodiversity and the AONB. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics,**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Recreation and Tourism. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project. Further details on coordinated construction will emerge in due course, as National Grid maintains ongoing dialogue with other developers. However, these other projects are outside the control of National Grid. Details of how the Proposed Project it has coordinated with other projects are contained in **Application Document 7.10 Coordination Document**.
Q14 What do you think about our proposed converter station and adjacent substation near Minster? Comments			
Local community	The proposed location for the converter station and adjacent substation is a very poor choice. The planned site is Grade 2 Agricultural Land – very good quality. Protecting the UK's ability to produce our own food to avoid reliance on imports is crucial and the location currently produces in excess of 110 tons of wheat a year which will be lost if this land is compulsorily purchased. In addition, the site is a haven for wildlife and supports a unique biodiversity. The convertor station and associated construction will not only cause immense damage to the local ecosystem during its lengthy construction but will also have a long-term impact which will be nothing short of disastrous. The massive construction will not only affect wildlife through its sheer mass but the pylons, light pollution, noise pollution and electromagnetic fields will all adversely affect this fragile landscape. The flood risks do not appear to have been considered. In the short term, this will impact Southern Water's ability to expand its sewage treatment operations which will be critical to deal with the additional load created by the expansion of housing in Thanet. The proposed construction will inevitably create massive amounts of 'run-off', even with mitigating measures such as a green roof. A large part of the marshes will no longer soak water up because the vast area of the building will mean there will be nowhere for the rainwater to go. According to Climate Central forecasts, this site will be underwater by 2050. This will necessitate building additional flood defences near the proposed cable landing site at Pegwell Bay and in Sandwich Town to stop the River Stour breaking its banks, as it has already done on several occasions. Creating holding lakes or underground tanks will be of little use as the area is already just above sea level and saturated most of the year. We were not provided with modelling of this, or an assessment of how it would affect surrounding areas and buildings as well as the village of Minster itself.	N	A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. Lighting impacts are included within the Proposed Project ES in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. The potential for noise impacts as a result of the Proposed Project are assessed in **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. In the UK there are exposure limits in place to protect against EMF effects. Those exposure limits have been set independently by an international commission of scientists who carefully review all the research which has investigated EMF and health effects. There have been over four decades of research looking into whether EMFs can cause health effects, and there are no established effects below the exposure limits. All of National Grid's electricity equipment is designed to produce EMFs below the limits set by the Government that are in place to protect us all. This will be fully and publicly documented in the DCO submission. A detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. National Grid is aware of Southern Water's requirements and is maintaining ongoing dialogue with them about the potential impacts of the Proposed Project upon its assets in terms of ongoing maintenance, future needs and access to the waste water treatment works.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	I am extremely concerned that the decision-makers will not listen to the responses of local people and take them seriously enough to halt these proposals and explore other options that will be significantly less harmful to the environment and the local	N	National Grid has carefully considered all feedback submitted in response to its pre-application public consultations when developing its plans. Throughout the development of the proposals, it has sought to show how feedback has informed the development of the plans. For example, the Project Overview Document published as part of the Statutory

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	communities. We are the ones that will have to live with up to 12 years of a significant increase in traffic, noise, light, pollution and then the resulting eyesore, with its accompanying noise and light pollution, dominating the landscape for generations to come. Wildlife will be destroyed, ecosystems destroyed, the tourism trade will reduce, and the scheme offers no meaningful employment options so the community will lose on every level if this goes ahead. I am not averse to progress - this proposed scheme does not feel like progress, it feels like a small rural community being beaten into submission by large corporations that want to make their jobs easier. There are other alternatives that would save the country money and would have far less impact on the environment and the local community and I would urge the decision makers to explore these and make a reassessment of this scheme.		consultation specifically addresses how feedback had informed changes to its plans, whilst the Non-Statutory Consultation Report published at this consultation considers in further detail feedback received to the Non-statutory consultation. This Consultation Report provides a detailed analysis of feedback received to National Grid's pre-application public consultations on the Proposed Project, along with how this feedback informed the development of its plans. The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid has undertaken a full and complete assessment of the potential impacts of the Proposed Project as evidenced in the suite of ES documents that accompany the DCO application. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Referral should be made to the following documents regarding the issues mentioned in the feedback: • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual;** • **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.3.8 Part 3 Kent Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport; and** • **Application Document 6.2.2.7 Part 3 Kent Chapter 7 Traffic and Transport.** It is anticipated that around 30% of the construction phase jobs would be taken by local workers.
Local community	The proposed Sea Link project's sheer scale and scope will undoubtedly inflict a negative impact on the surrounding environment, particularly the unique biodiversity and the highly valued marine and SSSI habitats. The documentation fails to acknowledge this crucial aspect, raising concerns about the project's environmental impact assessment.	N	National Grid has undertaken a full and complete assessment of the potential impacts of the Proposed Project as evidenced in the suite of ES documents that accompany the DCO application. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The transportation of construction materials alone will pose significant ecological harm. The initial surveying and borehole activities have already damaged access roads, hedgerows, fields, grasslands, and scrubland, disrupting the natural habitats of wildlife that are not accustomed to such disturbances. The anticipated four-year construction period will involve the creation of temporary construction areas to accommodate the plant and construction materials. These areas, along with the associated roadways, will undoubtedly cause widespread damage beyond the project's footprint, jeopardizing the delicate balance of the ecosystem. Once displaced, wildlife is unlikely to return to these disturbed areas. The massive earthmoving operations and material handling during construction will generate noise, dust, and light pollution, further disrupting the ecosystem and creating an environment incompatible with the survival of many wildlife species. The increased traffic, both during and after construction, will also exacerbate the adverse effects on the local environment. The lack of a comprehensive mitigation plan to address the projected environmental impacts, particularly the displacement and potential loss of wildlife, raises serious concerns about the project's sustainability. The document fails to provide a clear picture of how the existing wildlife will be able to survive the construction phase and the long-term operation of the Sea Link project.		the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. The potential impacts of the construction phase in relation to noise, dust and traffic generation and light pollution are considered in **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration, Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality, Application Document 7.5.1.1 Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**, while National Grid is committed to conserving and enhancing the natural beauty of the landscape, including a dark skies policy pertaining to use of lighting on new infrastructure. Related mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. The Proposed Project environmental specialists are responsible for determining the mitigation measures to be put in place, and mitigation is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'.
General commentary			
Local community	The choice of the area to the East of Saxmundham for the construction of the converter station (possibly up to three converter stations, currently) seems to have been made to achieve maximum visual impact. The site is elevated and the 26-metre-high converter station(s) will therefore be a widely visible eyesore that will degrade the attractiveness of the area to tourists. Concrete will render large parts of these fields impermeable to water, causing a flood risk to the surrounding area. This is not a brownfield site; there will be a substantial loss of Grade 1 arable land. NG's proposals are predicated upon the construction of the substation proposed at Friston. The Friston site was itself recognised as being unsuitable for the Scottish Power Renewables	N	National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. When assessing potential options for the location of new infrastructure, National Grid sought to minimise impacts on the most sensitive areas, including the Suffolk and Essex Coast and Heaths National Landscape. Potential impacts of the converter station on the visual amenity and landscape are set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	(SPR) substation proposals by the Examining Authority. It is widely felt locally that over the last five years we have been subjected to a process of manipulation and obfuscation by NG and SPR with the objective of obtaining consent for the construction of the Friston substation. This substation is a Trojan horse used to justify a series of further projects, including Sealink. In short, the proposed Saxmundham site will have serious detrimental effects on the local landscape, economy and people, and is itself based on the ill-conceived selection of Friston as the site for the substation. It is a compounding of errors by which NG and SPR profit while the people of East Suffolk pay. The proposals include a landfall between Aldeburgh and Thorpeness. This delicate coastline is important to wildlife and includes the RSPB North Warren nature reserve. Wildlife habitat will be degraded by disturbance. The sediments here are fragile and may be damaged by drilling. The proposals appear careless of these risks. The Sea Link proposals include a HVAC cable route from the Friston substation to Saxmundham, and a HVDC cable route to just North of North Warren RSPB reserve. The construction of these will be environmentally damaging and disruptive to traffic, especially as they will broadly coincide with cable corridor construction by SPR.		Furthermore, the ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A Design Code for the building will be provided with the application for development consent. The Design Code will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process. A detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. The judicial review challenges at the Friston Substation have been rejected by the London Court of Appeal. An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. This construction solution will minimise potential impacts on terrestrial biodiversity and the AONB.

Table 1.23 Habitat screening regulations

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
General commentary			
Local community	I am aware that National Infrastructure Projects such as Sealink can sometimes override predicted impacts on European sites, if considered to be of great enough importance. However, there is an important clause in the Habitats Regulations legislation, underpinning the SPA and SAC designations: the first derogation test, which states there must be no other feasible alternative solutions that would cause less or no damage to this or other European sites. A famous precedent for this law was set by the Dibden Bay Enquiry in 2004, which rejected the proposal for a port on the grounds that there were suitable alternatives elsewhere. One possible feasible alternative solution to the current Sealink proposal would be to build an offshore grid connection and make landfall at a less damaging location, potentially with existing terrestrial infrastructure that could be adopted, such as at Bradwell or the Isle of Grain. NG seem not to have recognised the need to fully explore the feasible alternatives to the chosen route. They risk this becoming a very protracted and expensive planning process if they do not fully explore these alternatives, which will be counter-productive for the UK and its net zero energy target. I therefore strongly disagree with the current landfall and routeing options, and the overall principle of bringing Sealink onshore in Suffolk, to connect with the existing electricity network at Friston, where wildlife sites of European importance are very likely to be impacted. I recommend that an offshore grid alternative is fully explored so that energy can be fed directly from offshore wind farms and interconnectors, into areas where this electricity is most needed, thereby circumventing the requirement for Sealink.		**Application Document 6.6 Habitats Regulations Assessment Report** provides an assessment of the likely significant effects of the Proposed Project on internationally important wildlife sites such as Special Areas of Conservation, Special Protection Areas and Ramsar sites. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Table 1.24 Marine conservation zone assessment

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	I am extremely concerned that the marine proposals include running the cable through the protected area of Margate Long Sands Special Area of Conservation (SAC). This area supports Annex I habitats, which are protected under European Law, and it should therefore not be disturbed with the cable. I am also concerned about the extent to which this level of development may cause irreversible habitat loss to Goodwin Sands which is in a Marine Conservation Zone (MCZ) and supports diverse epifauna such as Sabellaria Reefs, a priority habitat and blue mussel beds.	N	Margate and Long Sands SAC is 3 km west of the Offshore Scheme. A detailed routeing and siting study was undertaken to ensure the complete avoidance of the Annex 1 habitat features in this SAC. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. This will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area including *Sabellaria spinulosa* and *Mytilus edulis.* Information can be found in **Application Document 6.11 Marine Conservation Zone Assessment**.
Local community	How can a national infrastructure project be developed to ignore protected areas such as the Outer Thames Estuary SPA, Thanet Coast and Sandwich Bay SPA, Thanet Coast and Sandwich Bay RAMSAR, Sandwich and Pegwell Bay NNR, Sandwich to Hacklinge Marshes SSSI? These sites are protected for good reason, i.e. their importance to the environment, providing a safe haven and habitat for wildlife, including redlisted species. Thanet Coast is an internationally designated Special Area of Conservation with Pegwell Bay Nature Reserve being in the nationally designated Marine Conservation Zone. What does this mean? If not that these areas should be preserved and cared for because they are environmentally important. Grey and common seals rest on sandbanks in the Stour estuary. These are protected mammals in the UK and under the EU Habitats directive Conservation of Seals Act 1970 and Conservation of Offshore Marine Habitats and Species Regulations 2017. These would be severely disturbed by any works in this area. Why can't the marine proposal be sited alongside already existing shipping lanes to avoid disruption to these protected and fragile ecosystems? Consideration of the former Kingsnorth Power Station site for the Converter station must surely restrict the marine impact as the cable would not then be required to pass through these protected marine zones.	N	National Grid has recognised the importance of statutory designated sites in its assessments of potential impacts of the Proposed Project. Further details are contained in to **Application Document 6.11 Marine Conservation Zone Assessment, Application Document 6.2.4.4 Part 4 Marine Chapter 4 Marine Mammals, Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The Offshore Route has been sited to avoid sensitive receptors in the marine environment wherever possible. Drop Down Video or Remotely Operated Vehicle mounted cameras may be used to confirm the locations and extents of sensitive benthic habitats or features. This would inform micro-routeing of submarine cable systems to avoid or minimise interactions with these features in so far as practicable. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes the old power station at Kingsnorth. The main alternatives to the Proposed Project are outlined in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Local community	At sea I understand there is risk to a Marine Conservation Zone at Goodwin Sands where fish use the area as a spawning and nursery grounds. The offshore cable will impact habitats, associated with Margate Long Sands which is a Special Area of Conservation. I would have thought anyone at the National Grid would not want to come within miles of these areas, not so close as to risk causing a major problem	N	Margate and Long Sands SAC is 3 km west of the Offshore Scheme. A detailed routeing and siting study was undertaken to ensure the complete avoidance of the Annex 1 habitat features in this SAC. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. This will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area including *Sabellaria spinulosa* and *Mytilus edulis.* Information can be found in **Application Document 6.11 Marine Conservation Zone Assessment**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			
Local community	The offshore cable will impact European protected Annex I habitats, likely associated with Margate Long Sands Special Area of Conservation (SAC). The development has the potential to cause irreversible habitat loss to Goodwin Sands which is in a Marine Conservation Zone (MCZ) and supports diverse epifauna such as Sabellaria Reefs, a priority habitat and blue mussel beds. The sandbanks are also important spawning and nursery grounds for species such as thornback rays.	N	There will be no impacts of the Proposed Project on Margate Long Sands SAC. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. This will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area including *Sabellaria spinulosa* and *Mytilus edulis.* Information can be found in **Application Document 6.11 Marine Conservation Zone Assessment**.
General commentary			
CPRE Kent	As a countryside-focused charity, our expertise and therefore principal concerns are naturally land-oriented. We, however, note the significant concerns being raised by those environmental and NGO counterparts who do have more of a marine focus. In particular, we note and endorse the comments of Kent Wildlife Trust, which again points to the fact that the cable is planned through the protected area of Margate Long Sands Special Area of Conservation (SAC), which supports Habitats Protected under European Law. We would also agree that the development clearly has the potential to cause irreversible priority habitat loss to Goodwin Sands, which is in a Marine Conservation Zone (MCZ). We also note its comments regarding damage to Sabellaria Reefs, a priority habitat, and blue mussel beds.	N	There will be no impacts of the Proposed Project on Margate Long Sands SAC. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. This will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area including *Sabellaria spinulosa* and *Mytilus edulis.* Information can be found in **Application Document 6.11 Marine Conservation Zone Assessment**. The Nemo Link project was a joint venture, continental interconnector in partnership with Belgian Elia. The Proposed Project is a piece of domestic transmission infrastructure owned by National Grid.

Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	National Grid must look to brownfield sites, not greenfield sites if they must build converter stations and their infrastructure. I do support 'Green Energy' but not at the expense of our wildlife and biodiverse environments. We have a biodiversity crisis as well as a climate one. Why not use brownfield site Kings North on the Hoo Peninsula? Or any other brownfield site? Why not put the converter station on a platform out at sea? What other sites were considered and why were they unsuitable?	N	Potential impacts on wildlife in Kent are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and impacts relating to climate change are considered in **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change.** In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	The network needs reinforcing between Suffolk and Kent, however the choice of Friston and Saxmundham for sub-station and converter station is completely flawed. The obvious choice for the infrastructure is Sizewell where the overhead lines originate and where work will shortly be undertaken on a 3rd nuclear power plant. All of the electrical infrastructure for Sealink, Lionlink and Scottish Power should be kept in one power generating centre, namely Sizewell, and central government should be banging heads together in order to facilitate such an outcome. National Grid were originally meant to be using the cable route from Bawdsey to the electrical sub-station in Ipswich, and this still strikes me as a preferable alternative to concreting over attractive agricultural land in the middle of the countryside. The argument against Bawdsey was that somehow the wrong cables had been laid, but as the cable route already exists, why not use it / enhance it / upgrade it for these latest developments.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. As part of the DCO submission, National Grid has prepared **Application Document 7.10 Coordination Document**. This document provides an overview of the coordination efforts to date, including details of ongoing coordination activities in the design stages, proposed approaches to coordination in the forthcoming DCO application process and throughout the delivery phases of the related projects. Bawdsey is the landfall location for the East Anglia ONE and East Anglia TWO offshore windfarms. This location has not been assessed as a potential option for the Proposed Project and is not referenced in the Strategic Options Report or the Corridor Preliminary Routeing and Siting Study. The underground HVDC cable route will not materially change the rural character of the area in which it will be located, while the Proposed Project's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	I reject all of the Sea Link, as well as Scottish Power, proposals as the much better solution is to take all this infrastructure offshore. This would the easier for all those involved, so quicker and therefore cheaper with the vastly reduced impact on the environment and communities. Sea Link should consolidate its energy infrastructure offshore with the energy from the wind farms such as EA1/EA2 and take the power directly to where it will be used in London/South East. The landfall and onshore infrastructure should be at a brownfield site (e.g. Bradwell). This is the same transmission	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current

Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Local community	Previous feedback requested alternative option to use brown field sites or an offshore solution and this wasn't incorporated. National Grid has ignored concerns at all stages of previous consultation. Local MP has suggested alternative Brownfield sites and this has been ignored.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network.
Local community	It is essential from a delivery perspective as well as an environmental and sustainability perspective that the proposals requiring the erection of large numbers of new pylons and or new converter station(s) and or substation(s) are located on 'brownfield land' and as close as possible to National Grid's existing (high-voltage) assets and existing corridors. There are significant amounts of available brownfield land in the required scale that could be utilised throughout the area of interest.	N	It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	In some instances similar utility infrastructure uses are already present. In our opinion sites/land with these characteristics should be utilised in the first instance. Brownfield land is available in sufficient scales to accommodate the required converter and substation land take plus the additional land inevitably required during the construction phase.		German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Local community	Should be in the Thames Valley where the power is needed.	N	The use of sites outside of East Suffolk does not resolve the needs case/network boundary issues as outlined in sections 4 and 5 of the Project Background Document. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q4 What do you think about our proposed HVAC cable route in Suffolk? Comments			
Local community	A High voltage alternating current (HVAC) underground cable of approximately 1.7km in length between the proposed Friston substation and the proposed Converter station (near Saxmundham)	N	Where National Grid has a converter station which changes the energy from DC to AC, they then need to connect it back to their system at the nearest AC substation. There is no alternative network which could accommodate the high levels of energy (circa 2 gigawatts) that this Proposed Project seeks to deliver.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	would not be needed if the power could be transmitted via the existing network.		
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	It is not the right location. The converter station would not be needed if alternative solutions are developed.	N	HVDC is the most efficient solution where power needs to flow in either direction depending on transmission faults between the Kent and the Sizewell area. To have a HVDC system, converter stations are required.
Q7 What do you think about our proposed HVDC cable route in Suffolk? Comments			
Local community	It looks like National Grid propose to bring a HVDC cable ashore from the offshore windfarms between Aldeburgh and Thorpeness, then dig a trench to lay the cable in to just outside Saxmundham to your proposed converter station and then dig another trench to the proposed Friston substation with a HVAC cable. Then from Friston substation another HVDC cable will be installed back to the coast and along a single marine corridor down to Kent. If an offshore converter station was installed near the windfarms just like they are on the other side of the North Sea, Sea Link could take the cable from the offshore converter station direct to Kent, saving destroying this lovely part of Suffolk coast and cost at the same time.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. The need case for the Proposed Project has identified that connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	A marine solution is the only answer to this problem. The subsea high voltage direct current cable could be extended up to the North Norfolk coast to facilitate connection of other offshore installations off of that coast, thus obliterating the need for a new 120km run of high voltage pylon through Norfolk, Suffolk and Essex, which is widely opposed by the local authorities, local population and local MPs!	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for the Proposed Project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

			• **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	The proposed 130km of subsea high voltage direct current cable running between the landfalls at Suffolk and Kent is an interesting given Kent already has a Nemo cable and so the question needs to be asked why this infrastructure could not have included a 'future proof' element to ensure cables were laid at the same time where they cross over and so reducing the additional impact on our much protected, marine environment. In addition, there seems to have been no consideration of: • The possibility of an off shore converter, as they are doing off the coast of Belgium where new technologies are being developed that will future proof their supply and which would limit the impact on land or • The use of the old power station site at Kingsnorth, near Rochester on the Hoo Peninsula, a brown field site that would enable connection to the National Grid and reduce the length of subsea high voltage direct current cable needed.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for the Proposed Project. Due to the different timescales of the Proposed Project and the Nemo project, coordination reflected in this comment was not possible. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Our marine life need to be protected as well as our wildlife on land. Using the old power station site at Kingsnorth on the Hoo Peninsula, which is a brown field site would surely be a better option as it would enable connection to the National grid and reduce the amount of high voltage subsea cable needed.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. Local community	Makes no sense to go around Kent in to Pegwell, you're using more cable than needed and destroying more of the ocean than you need to. Go straight from Margate for example or Cliftonville where there is already an eyesore of a sewage works which pollutes the sea so a substation won't make any difference next to it.	N	
Local community	It would make more sense to run the Kent end of the cable from the Isle of Grain as there is a large brown site where the old power station was. If you worked with the German link both cables could be run from here to a point out at sea where they could spur off to their intended locations. This would at least go some way towards saving some natural habitat. Have you ever considered platforms at sea to house these buildings and be more like the Belgiums.	N	
Local community	If a connection is needed? I wonder if this is so then the route seems sensible as there is a landfall location in Cliffsend already and this should be utilised. If this is not possible there is a large area along in Sandwich, formally the Pfizer site which is unused and could be easily regenerated for the converter station. It is close to the existing substation network and so connection is easier. Green marshland should not be used.	N	
Sandwich Town Council	The Sea Link Project provides no evidence that it has considered the possibility of other options such as: - An offshore converter, such as is being utilised off the coast of Belgium where new technologies are being developed that will future proof their supply and which would limit the impact on land, or - The use of the old power station site at Kingsnorth, near Rochester on the Hoo Peninsula. This option would reduce the length of subsea high voltage direct current cable needed. - The Dungeness site has also not been considered as an option in the evidence presented in the consultation documentation.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. Q17 Anything else? Comments			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	National Grid do not appear to have given enough consideration to looking for alternative sites in the area which may also provide access to the National Grid. In Suffolk several sites were considered but in Kent only one. National Grid should widen their consideration of suitable sites and look for a site near existing commercial development, brown field sites or green field sites that will have less impact on the local environment, wild life and landscape before deciding on the site they are now proposing.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	While I fully understand the need for increased energy provision and increased energy security, for all the reasons given above I do not agree with, and do not believe that it is sustainable, to build a converter building on this ecologically important marshland. I know that other options have been suggested, such as an offshore platform or a site on the Isle of Grain. However, I am pragmatic and realise that NGET are already a long way down the path of this project and have already spent a lot of time and money exploring their options and consulting with statutory organisations. I also understand that there are time pressures to complete this project in order for the UK to meet its net zero targets. Therefore, my suggestion is to utilise a site that NGET have already considered, namely Site B. Site B was discounted because the terrestrial route between landfall at North Foreland and the converter station was deemed too problematic. Ideally this should be looked at again applying some lateral thinking and circumnavigating the perceived problems. Failing that, I would like to put forward a suggestion that Site B is reinstated as the primary option but using the landfall at Pegwell Bay instead of North Foreland. I must emphasise that I still do not support the landfall at the sensitive Pegwell Bay site but if this Sea Link project is given the go ahead I believe this proposal could be preferable to building on the Minster Marshes. The underground terrestrial cables could be extended across farmland towards Monkton village, staying South of the airport, and then cross under (or over) the A299 to site B.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. While there are technical challenges associated with delivery of a converter station for each option in Kent (as acknowledged in in the comments), **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022),** explains the assessment process. This study concludes that Richborough Energy Park and Richborough Port are located within Area A which provides an opportunity to site the converter station within an area adjacent to similar infrastructure or industrial land uses. Part of the Sandwich Bay to Hacklinge Marshes SSSI extends into this area but converter station siting could avoid this designation. Part of this area is within the flood zones 2 and 3 but there are opportunities to site a converter station outside of these zones. The network connection point (Richborough substation) is located within this area therefore minimising the length of HVAC connection back to the network. There is one designated site within Area B (a Scheduled Monument) located immediately adjacent to the south of the A299. The area contains Manston Business Park, Columbus Avenue Industrial Estate, and an area with larger scale agricultural buildings. Manston airport is located to the southeast. Whilst the existing development in this area is not related to energy there are opportunities to site a converter station adjacent to these other industries. Area B is located further from the network connection point at Richborough substation and development of a converter station site in this area would require approximately 5km of HVAC connection. When considering all receptors, constraints and opportunities the preferred converter site option area for the Richborough Substation connection point is converter site option Area A. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in:

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Site B is much higher above sea level than the Minster marshes, and therefore not at risk of flooding. When I made this suggestion at one of the consultation meeting there was some initial interest shown. However, one representative remarked that, due to the mass of the converter station, it would appear too prominent in this raised location. That one remark seemed to shut down the conversation, but I do think that this solution deserves more investigation. There are many large industrial units on or near site B, such as Thanet Earth and Manston Industrial Park, so I am sure that, with careful screening and some of the mitigating design options outlined in the Converter Station design booklet the building would not appear too prominent. The Minster marshes site would need to be built up an estimated 3m to bring the converter station above the water table level, just as the battery plant next door has had to do. So, if there is a problem with the height of the converter at site B, perhaps the ground could be excavated to a depth of 3 metres or more to mitigate it. A converter at Site B would also be able to hook up to the exiting overhead lines which run close by. I believe this is an option worth considering.		• **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q19 Do you have any other comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals?			
Local community	You need to pay attention to the feedback. Many viable alternatives have been made. You now need to study these properly and you will then be better informed. There is no sense in blindly forging ahead without fully assessing the alternative options proposed by public feedback. There are no constraints to your moving the project to a hub and grid offshore. It has been achieved by other energy projects and is the only conceivable solution for the future.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental

			impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	I have lived in this area for many years and was very disappointed by the recent Sea Link consultation. It did not take into account the suggestions from last year's non-statutory consultation regarding offshore options and brownfield landfalls. I am in favour of offshore wind energy, but not the current misguided plans for the associated onshore infrastructure. The cumulative impact of these plans will devastate Nationally protected environmental areas, bring roads to a standstill and destroy the local tourism economy with the loss of jobs for many years. A better solution for consumers involves an offshore grid approach, taking wind energy offshore, closer to where it is needed in London and the South East, going onshore at Brownfield sites, e.g. Bradwell-on-Sea, Isle of Grain, Tilbury, etc. There would be no need for Sea Link if pilot tests were considered taking power directly closer to where it is needed, e.g. East Anglia One North and East Anglia Two pooling their energy with LionLink taking the power to Bradwell-on-Sea. I support a pause to allow for a review of all proposed East Anglian transmission infrastructure and a fully costed cost-benefit analysis for an integrated offshore grid.	N	National Grid Electricity Transmission (the Proposed Project), North Falls (Offshore Wind Farm) and Five Estuaries (Offshore Wind Farm) have been working together to explore the potential for offshore coordination as part of the Offshore Transmission Network Review (OTNR) “Early Opportunities” workstream. The projects, acting together in a consortium led by North Falls, were awarded funding by the Department of Energy Security and Net Zero (DESNZ) through the Offshore Coordination Support Scheme (OCSS) in December 2023. On 28 March 2024, the consortium submitted a high-level feasibility study that formed the first step of the grant funding agreement. The study assessed the feasibility of a coordinated offshore connection specifically: the capital costs; building blocks; construction and commissioning methodologies and overall programme associated with a coordinated solution. The Secretary of State for Energy Security and Net Zero has reviewed this study, amongst other information and has decided not to grant further funding to the consortium. The feasibility study identified that coordination is technically feasible however, it also identified: • an increase in capital costs of up to £890 million; • constraint costs associated with an outage on the Proposed Project of over £500 million; and • a programme delay for North Falls and Five Estuaries of up to five years. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's electricity system by 2030, the consortium supports the Secretary of State’s decision and will not be further pursuing a coordinated offshore connection. As part of the DCO application, National Grid has undertaken an inter-project cumulative impacts assessment for any potential of cumulative or in-combination effects,

			Application Document 6.2.2.13 Part 2 Suffolk Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Inter-Project Cumulative Effects.
Local community	You have failed to consider the obvious solution of an offshore grid. This could have an 2GW offshore converter station allowing AC from the wind farms (and potentially Sizewell C) to be converted into DC for onward distribution to areas of high electricity usage via an offshore cable. The technology exists and TenneT Nederland are a key player. Why despoil a unique environment in coastal East Suffolk when there is a viable alternative solution?	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes the old power station at Kingsnorth. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. Flooding concerns are noted. **Application Document 6.8 Flood Risk Assessment** has been informed by information on historical and recent flooding incidents in the locality. The Proposed Project has engaged with the Environment Agency regarding the
Local community	I would like to see National Grid prove that they are a green, environmentally responsible company by providing serious brown field alternatives for their reinforcing of the network project. They should not just take the path of least resistance. We must be joined up when thinking of our future. Achieving net zero cannot be at the expense of the environment. This is needed for human health and well being as much as moving away from using fossil fuels. The two go hand in hand. Just because Minster marshes have similar constructions in the surrounding area encroaching on the land doesn't mean that it is right to add more. This particular area has lost so much of its green spaces and is in need of regeneration in this respect, not more building. Richborough has already lost a nature reserve. Thanet only makes up 2% of the area of Kent and already it has been tasked with building 9% of Kent's required house building. A converter station of this magnitude just cannot be sustained in this area.	N	
Local community	I am very concerned about the area chosen as once destroyed it can never be replaced, would feel more at ease if fully explained why any other sites have not been considered and tested: could an offshore converter not be considered like in Belgium, surely in another few years this site will need to be expanded which is not possible at location chosen also by 2050 the converter station would be underwater according to scientific proposals for flood levels! There is also the brownfield site of the old power station site at Kingsnorth, near Rochester.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			proposed works within areas prone to flooding and has agreed a flood risk mitigation strategy. The mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** secured through Requirement 6 of Schedule 3 of the draft DCO **(Application Document 3.1**).
General commentary			
Local community	Why have you not considered an offshore/brownfield solution? In your option selection process, you have failed completely to justify at the outset the selection of a landfall and converter station in Suffolk. Para 3.1.6 of your Strategic Option Report sets out where the power is needed, and the following sections 3.2 and 3.3 set out quite clearly how the 'NETS SQSS' defines performance parameters in discrete transmission systems, and detail the surplus of power expected to be generated above local needs in the Suffolk transmission systems. Figure 3.1 on page 23 of the report inadvertently demonstrates the oddity of bringing still more locally unnecessary (and unwanted) power to the region, and then transferring it out again, rather than looking for ways to bring it more efficiently to the areas where it is needed. If there were a way of doing exactly that, then Sealink would be unnecessary; and if this way involved working as our interconnector partners in Belgium and Holland and Denmark and Germany are working, then so much the better, surely? Experience to build on. If avoiding Suffolk entirely and building a strategic network offshore through the construction of a Modular Offshore Grid could be done without delaying the outputs of Sealink (such as they are), and without risking the destruction of greenfield and ecologically/environmentally sensitive sites by making a combined landfall at a brownfield site closer to the relevant transmission system, then that too would surely be a Good Thing? And finally, if it could be done for less money that would be, surely, an advantage to the taxpayer and the consumer? Or even if it could be done for not much more money, since economic efficiency should be '..considered on an equal footing..' with environmental and community impacts, and even the Electricity Act of 1989 asks applicants for connections to '…have regard to the desirability of preserving natural beauty, of conserving flora, fauna and geological or physiographical features of special interest and of protecting sites, buildings and objects of architectural, historic or archaeological interest; and …do what [they] reasonably can to mitigate any effect which the proposals would have on the natural beauty of the countryside or on any such flora, fauna, features, sites, buildings or objects…..' So my request to NGET is to please explain clearly in its next steps exactly why the only options that have been considered for public comment exclude all those options which our neighbouring	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Similarly, in developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the available brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. National Grid have listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

	countries, our government (in the ONTR/HND) and local communities and their elected representatives are anxious to see tested.		• **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Campsea Ashe Parish Council	Like most affected neighbouring PC's, Campsea Ashe opposes all onshore elements of Sea Link and Lion Link (& Nautilus). These projects do not generate renewable energy or improve energy security, they create no long term employment but will cause widespread environmental damage and pose a further risk to the local tourism industry, a key part of the local economy. Furthermore, with the feasible option of a Modular Off-shore Grid (MOG) solution, as has already been demonstrated by our European neighbours, it seems not logical to pursue an option that would create such massive impacts in such a small geographical area.	N	National Grid acknowledges your objection to the Proposed Project. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An ES has been prepared and submitted as part of the DCO application (see Volume 6 of the DCO submission). With regard to the impact on tourism, details are contained in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This chapter concludes that there are no likely significant effects on tourism as a result of the Proposed Project. It is anticipated that around 30% of the construction phase jobs would be taken by local workers.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Mitigation measures are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I would like to inquire whether any offshore alternatives have been considered in the planning stages of this project. Offshore energy solutions, if strategically implemented, can offer several advantages, including minimized environmental impact, reduced visual disturbance, and a more efficient use of resources. Exploring offshore alternatives may present a more sustainable and responsible long-term solution. I urge you to consider the long-term consequences of the Sealink proposal and thoroughly explore alternative, environmentally friendly options, such as offshore wind farms. Investing in sustainable energy solutions that prioritize the well-being of our communities and ecosystems will contribute to a cleaner and more responsible energy future.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. This includes Bradwell. The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for the Proposed Project. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce environmental impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;**
Local community	Why has there been no offshore assessment? As mentioned above, why are our European neighbours going down the offshore route? They will also be needing cost-effective proposals so it would not appear that case that offshore would be more expensive. What about brownfield sites such as Bradwell, or in the Thames Estuary where there is already a vast amount of industrialisation. There would be no need for Sea Link if pilot tests like East Anglia One North and East Anglia Two pooled their energy to LionLink and took the power to Bradwell.	N

Feedback form			
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	Confirmation that all of the excavated trench will be reinstated to ground level and topsoiled and allowed to return to its original natural condition, any trees that are removed are replaced with new trees but not necessarily in their original location.	N	National Grid confirms that this is the case. All trenches will be reinstated to ground level, topsoil replaced and new tress will be planted as part of the Biodiversity Net Gain programme.
Local community	Coming ashore between Thorpeness and Aldeburgh seems the least disruptive, compared to the Sandlings north of Thorpeness. Friston substation needs more work; still too high. Needs to be sunk so hardly visible from ground level. Convention station near Saxmundham also needs to be sunk to below ground level. Can all the work that is being done combine with other projects so there is less destruction across our coastline?	N	With regard to sinking Friston Substation, National Grid has assessed the ground conditions at the proposed site and they are not suitable to allow this to occur. National Grid are looking at how to keep the size as small as possible. Similarly, ground conditions are not amenable to fully sinking the converter station. Excavation of a vast amount of material is also an issue here. Where possible, National Grid is looking at cutting into the slope to provide a small a footprint as possible. The topographical features of the site will be harnessed in the design. As part of the DCO submission, National Grid has produced a report which provides an overview of its coordination efforts to date, including details of ongoing coordination activities in the design stages, proposed approaches to coordination in the forthcoming DCO application process and throughout the delivery phases of the related projects (**Application Document 7.10 Coordination Document**).
Q3 What do you think about our proposal to connect into the existing network via the proposed Friston Substation?			
Local community	The transmission lines are already there. The proposed site is in a good rural location - provided adequate access roads are provided.	N	National Grid acknowledges this comment and thanks the respondent for the support.
Q4 What do you think about our proposed HVAC cable route in Suffolk? Comments			
Local community	The cable should be constructed using horizontal direct drilling not surface trenching.	N	For the HVAC cable route, a trenchless construction solution is not the preferred option as it will require a wider swathe and larger construction compounds. Instead the installation will be ducted which will allow the trenches to be opened and backfilled quicker than a direct buried solution. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	Can it be sunk to ground level?	N	Ground conditions at the site for the converter station are not amenable to fully sinking it. Excavation of a vast amount of material is also an issue here. Where possible, National Grid is looking at cutting into the slope to provide a small a footprint as possible. The topographical features of the site will be harnessed in the design.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Your literature keeps mentioning how big the converter station and transition joint bays are, but I cannot find any information on the width and depth of the trenches? I read Sealink require a three cable duct and other projects could require an additional eight cable ducts for their HVDC cables, so what is the total width and depth of this trench? When DC cables are carrying current in the same direction they cannot be laid side by side, as the magnetic field pushes them apart, so they will have to have a certain distance between them, this distance will increase the total width of the cable trench, so I	N	The HVDC cables in the marine environment will be bundled together; however, it is anticipated in the terrestrial environment, there will be a degree of separation for thermal efficiency and ease of maintenance. National Grid will be installing 2 HVDC cables in a trench approximately 2.3 m wide and 1.5 m deep. The project description is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	can only imagine the total width of a duct with 11 cables would be around the width of a four lane carriageway or wider? Strange you omit this information from your literature.		
Local Community	You have provided no detail on the following: (1) service roads, etc. (future needs of sites). (2) heights and scales of buildings (these structures cover areas and will be seen from space). (3) what the works will look like entail, spoil heads, junction structures, etc. The level of detail is very poor and not satisfactory when assembling a development proposal of such scale.	N	A large amount of information regarding the Proposed Project was provided during the Statutory consultation, as follows: • a summary newsletter (Section 7 of **Application Document 5.1.6 Appendix E Statutory Consultation**) outlining how members of the public could get involved in the consultation, including dates and times of public exhibitions, webinars and 'Ask the Expert' sessions, locations of where more detailed information about the proposals can be found (including both physical and virtual locations), how to submit feedback and the contact details for the Proposed Project team; • a Project Overview Document (Section 4 of **Application Document 5.1.6 Appendix E Statutory Consultation**) which gave a comprehensive overview of the Proposed Project, its various components and where to find more detailed information and contact the Proposed Project team. The document was written in non-technical language; • a condensed version of the Project Overview Document (Section 13 of **Application Document 5.1.6 Appendix E Statutory Consultation**) intended to concisely summarise and explain the background to the Proposed Project and proposals. This document was intended to have a read-time of less than 10 minutes; • an Options Selection and Design Evolution Report (**Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**) which was a report outlining the development of the Proposed Project and the rationale behind each component; • Non-Statutory Consultation Report (Section 1 of **Application Document 5.1.4 Appendix C Non-Statutory Consultation**) which is a report presenting the results of the Non-statutory consultation that took place between 24 October and 18 December 2022. The report presents the feedback received and how National Grid had regard to the feedback; • a Feedback Form (Section 8 of **Application Document 5.1.6 Appendix E Statutory Consultation**) which had both open and closed questions designed to gain the thoughts and feedback on the Proposed Project. The Form was split into sections for Suffolk, Offshore, Kent and General; • consultation banners (Section 15 of **Application Document 5.1.6 Appendix E Statutory Consultation**) which were used during public information events. These were designed to provide an overview of key components of the Proposed Project and assist the understanding of the Proposed Project during consultation events. An audio version of the banners was made available; • plans and drawings were produced and made available on the Proposed Project website. Paper copies could be requested at no cost; and • a non-technical summary of the PEIR (Section 16 of **Application Document 5.1.6 Appendix E Statutory Consultation**) which summarises the environmental information and the results of the preliminary assessments of any likely significant effects of the Proposed Project, along with proposed mitigation

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			measures. The full PEIR was available to view on the Proposed Project website and paper copies of the PEIR could also be requested. Since the end of the Statutory consultation, National Grid has prepared an Environmental Statement which contains a complete description of the Proposed Project.
Local community	Any cable routeing should be using Horizontal Directional Drilling for all areas listed on SSSI, AONB and other protected classifications. It would not be acceptable to use open-cut, trenching technique in these protected areas.	N	Where cables are routed through sites with statutory designations, National Grid will employ trenchless solutions. It acknowledges that there will be a temporary impact until the trench is fully reinstated and any planting established. The impact on statutory designations is contained in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.2.2 Part 2 Suffolk Ecology and Biodiversity**. Mitigation measures and the commitment to a trenchless solution are contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I do not know what "kiosks" will look like - will they be intrusive? If so, all the more reason to locate the cable close to existing roads, Sizewell, and pylons. Why spoil the unspoilt?	N	Kiosks will be the only above-ground infrastructure associated with the cable routes. At each cable joint bay there would be an above ground kiosk, which would be used to monitor and occasionally test the underground cables. For the Proposed Project, it is likely that there would be two HVAC circuits each containing three cables, there would be a joint bay per circuit wherever cables need to be jointed and a kiosk per joint bay. Generally, the joint bays for the circuits would be aligned so that they are roughly in the same location, therefore in each of these locations you would expect to see two above ground kiosks, one for each circuit. These are non-intrusive and generally sited near roads and field boundaries. The complete project description is contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	There appears to be a depressing lack of future-proofing in terms of offshore links to current and likely future windfarms. I understand the 2GW limitation - but that suggests that the current plans should incorporate the facility for (or at least facilitate the future implementation of) a second (duplicate) line allowing for future offshore links.	N	National Grid Electricity Transmission (the Proposed Project), North Falls (Offshore Wind Farm) and Five Estuaries (Offshore Wind Farm) have been working together to explore the potential for offshore coordination as part of the Offshore Transmission Network Review (OTNR) “Early Opportunities” workstream. The projects, acting together in a consortium led by North Falls, were awarded funding by the Department of Energy Security and Net Zero (DESNZ) through the Offshore Coordination Support Scheme (OCSS) in December 2023. On 28 March 2024, the consortium submitted a high-level feasibility study that formed the first step of the grant funding agreement. The study assessed the feasibility of a coordinated offshore connection specifically: the capital costs; building blocks; construction and commissioning methodologies and overall programme associated with a coordinated solution. The Secretary of State for Energy Security and Net Zero has reviewed this study, amongst other information and has decided not to grant further funding to the consortium. The feasibility study identified that coordination is technically feasible however, it also identified: • an increase in capital costs of up to £890 million; • constraint costs associated with an outage on the Proposed Project of over £500 million; and • a programme delay for North Falls and Five Estuaries of up to five years. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			electricity system by 2030, the consortium supports the Secretary of State's decision and will not be further pursuing a coordinated offshore connection.
Local community	I have no problems with the marine proposals, but I think it is important that the cables are kept away from the wind farms as future development of the wind farms may be key to reach Net Zero so, keep that in mind when building and laying the cable near wind farms especially the 'London' wind farm.	N	National Grid acknowledges and thanks you for your comment. Details of the selection of the cable routes are contained in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**.
Sandwich Heritage Harbour	We would comment that the sub surface presence be buried deep enough to be clear of craft capable of navigating in the area.	N	National Grid confirms that the target depth for marine cables will be 1-2.5 m. In line with Maritime and Coastguard Agency guidance, it is not planned to reduce the existing navigable water depth by more than 5% along any section of the cable (with respect to Chart Datum). It is therefore expected that under-keel clearance is only reduced at a very small number of locations, which are anticipated to be located close to the shore.
Q12 What do you think about our proposed landfall at Pegwell Bay?			
Local community	This is the best location from an environmental and cost perspective based on all the publicly available information.	N	National Grid acknowledges this comment and thanks the respondent for the support.
Local community	Low environmental impact at landfall the cable will be below the mudflats and buried under the roadway.	N	National Grid acknowledges this comment and thanks the respondent for the support.
Local community	It is in an area that already has industrial sites and is away from housing and wildlife areas.	N	National Grid acknowledges this comment and thanks the respondent for the support.
Q13 What do you think about our proposed HVDC cable route in Kent? Comments			
Local community	Needs underground cables.	N	National Grid confirms that the HVDC cables in Kent are underground from the landfall at Pegwell Bay to the converter station.
Local community	There is also very little detail in your proposals about how these cables will actually be installed. As described above, the installation of the Nemo Link caused immense damage to the area. The proposed route for Sea Link will cause even greater damage as it is so much longer. The additional pylons will be responsible for even more completely unnecessary and preventable bird deaths than we currently see because of the right angle effect of the proposed new lines. If the birds are flying parallel to the lines, which they can learn to do – they will now by caught by the crossing lines.	N	National Grid acknowledges the sensitivity of the area around the landfall and as such the HVDC cable will be installed through Pegwell Bay by trenchless technology from the mudflats to the rear of the golf courses (namely Stoneless and St Augustine's). This approach does not require the removal or topsoil or subsoil and minimises disruption at the surface. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). As part of the Proposed Project Environmental Statement, National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**.
Local community	This cable route impacts on the environment and there is no clear indication as to how the underground cables will be put in place. Also, how it will cross the road and through St Augustine's golf course.	N	National Grid will employ a trenchless solution for the HVDC cable route and this includes construction under St Augustine's golf course and the A256. There are multiple techniques available with the choice of technique being dependent on the ground conditions and the parameters of the cable installation required. All techniques typically involve drilling under the obstacle and installing a duct or tunnel opening through which the cables can be pulled. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q14 What do you think about our proposed converter station and adjacent substation near Minster? Comments			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The height of the station is huge- 26 metres. If possible, enlarge the footprint and reduce the height and select a green colour like the Thanet waste buildings close by.	N	The building will be designed where possible to sit within the landscape. It is not possible from an engineering perspective to increase the footprint of the building and decrease the height. The potential impacts of the Proposed Project with regard to the landscape are considered in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	This will place two large structures very close to each other. Are there plans to reduce the impact of the substation by using a design that is similar to the one proposed for the converter station (on page 22).	N	
Q15 We have identified several design approaches for the converter station. Which approach(es) would you like to see explored at later design stages?			
Local community	I feel unable to select a 'design approach' because they are not to scale and not in context of the actual location, so do not give an accurate indication of how a horizontal view would look. In addition, it would have been helpful to give an aerial view of the various 'design approaches' again in the contact of the location and to scale. This needs addressing.	N	National Grid acknowledges that the design approaches given were not backed up by detailed design drawings. Views were sought over the architectural design approaches for both the Suffolk and Kent converter stations. National Grid are still in the process of considering feedback on this topic which will inform the detailed design approach within its DCO application (**Application Document 7.12.2 Design Principles – Kent**). The design contractor(s) will be required to follow the specific design codes and principles within this document.
Local community	It is difficult to comment on the design approaches for the converter station given this seems to be an inappropriate question to ask at this stage. A great deal more detail is therefore needed regarding the exact location, size and scope of the entire project and in the context of its location, 3D views would help. As a result, I feel unable to answer this question	N	
Local community	I think all the buildings should be underground.	N	It is not possible to accommodate all of the infrastructure underground due to the ground conditions and the nature of the technology being used in the at the Converter Station. The potential impacts of the Proposed Project with regard to the landscape are considered in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	I feel very strongly that regardless of the design the buildings must have a living roof, and maybe the option of adding colour. There are many, many benefits to living roofs plus they are extremely low maintenance. They will help the pollinators and help to manage run-off during rain which is going to be a real issue if you plan to build here.	N	National Grid acknowledges this comment and thanks you for your interest in the Proposed Project. National Grid is still in the process of considering feedback on this topic which will inform the detailed design approach within its DCO application.
Local community	I understand that solar panels in the roofs are subject to restrictions due to NG not being allowed power generation except where it can be used in the buildings it is generated from, but there must be some way to make the buildings self-sufficient in energy production? From discussions with your engineers, I understood that bunding could only be a few inches high, and that due to the nature of the land, it would not be possibly to dig into the soil to any great extent. Therefore, my preferred option of a truly green roof, sunken building, with blended colouring, will not be possible. I am against	N	National Grid is working to ensure that the buildings are as energy efficient as possible, utilising all available technologies, while remaining within the parameters of the operational licence. National Grid are still in the process of considering feedback on this topic which will inform the detailed design approach within its DCO application. **Application Document 7.12.1 Design Principles – Suffolk** and **Application Document 7.11.1 Design Approach Document - Suffolk** provide information on the objectives of the design process for the Proposed Project including the Saxmundham Converter Station.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	any building on the marshes site, as I do not belief it can be performed without destroying the local ecosystem.		
Local community	My default position is that I do not want a huge converter station, sub-station and all the accompanying roads, hardstanding and paraphernalia on the Minster marshes, I believe that there are other options which are much less harmful to this rare terrain which is home to so much wildlife. With that caveat, and if we do have to accommodate this monstrosity, please make sure that it as least conspicuous and least harmful to the environment and the wildlife as possible. A curved grass roof would help the pollinators, bunding would help to reduce the perception of size. Alternatively, appropriate use of colour to break up the mass and match to the surroundings. Screening with trees, either painted on the building and / or avenues of real trees. Any hardstanding such as parking spaces and roads should be constructed using permeable or semi-permeable materials wherever possible to allow rainwater absorption. Care should be taken to divert and attenuate rainwater runoff from the roof and elsewhere.	N	National Grid acknowledges your concerns. As part of the DCO application a comprehensive ES will be submitted which assesses the potential impacts of the Proposed Project on a wide variety of parameters. The potential impacts of the Proposed Project with regard to the landscape are considered in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. With regard to wildlife, **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** considers the potential impact of the Proposed Project. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid will seek to minimise the impacts of the building. A set of Design Principles for the building is provided with the application for development consent (**Application Document 7.12.2 Design Principles – Kent**). The Design Principles will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the Converter Station site design and in establishing masterplanning principles and is engaging with local design panels to further inform the design and development process. The Converter Station site will be designed in accordance with current guidance around management of surface water run off on the site itself and use of Sustainable Drainage Systems.
Local community	The structures built on the old Richborough Power Station site are of no architectural merit, resembling a cheap industrial unit using all coloured corrugated (i presume aluminium sheeting) the construction also has a short limited life. The new converter station should have some architectural merit because its' position is further away from the industrial zone and encroaching into Minster Marshes. Flat roof areas should be pitched to the maximum to allow green roofs (sedum) traditional pitched roofs should incorporate traditional finishes that reflect the marshes area. (Slate, copper to provide longevity to the building. The main structural steelwork frame should have elegant facades of hand made brick.	N	National Grid acknowledges this comment and thanks you for your interest in the Proposed Project. National Grid are still in the process of considering feedback on this topic which will inform the detailed design approach within its DCO application (**Application Document 7.12.2 Design Principles – Kent**). The design contractor(s) will be required to follow the specific design codes and principles within this document.
Q16 What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? Comments			
Local community	Is there no way the overhead lines could be routed underground?	N	Alternative options have been extensively assessed and while there may be perceived visual benefits associated with use of underground cables, on balance, overhead lines involve less impact on the marshes during construction and over the lifetime of the asset.
Local community	All new power lines should be ducted underground.	N	
Local community	Overhead cables will have an adverse effect on the environment, wildlife and landscape and will cross an area designated an SSSI. The increase in the number of pylons is undesirable and the change in direction will potentially affect the flight of wild fowl and wading	N	As part of the Proposed Project ES, National Grid commissioned various surveys looking at the potential impacts of the overhead lines on birds. These surveys included a collision survey and a carcass survey. The assessment of avian collision risk is an annex to **Application Document 6.3.3.2.F ES Appendix 3.2.F 2023-2024 Vantage Point Survey** and the surveys are reported in **Application Document 6.3.3.2.G ES Appendix 3.2.G OHL**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	birds using nearby land taken out of agriculture to improve the environment for them. Underground cables are preferable but the need to avoid having structures on Ash Levels and outside the flood plain is understood. The powerline already crosses the River Stour to the west so a river crossing could be avoided if a site on the north side of the river further west could be found for the substation such as near to the existing Minster water treatment works. Alternatively a river crossing could be avoided if power lines are run west north of the river and east onto the Energy Park land. This would also mean that a longer length of the power line and more pylons could be removed from Ash Levels and because the powerlines will not need to turn so sharply, fewer towers are likely to be needed.		**Mortality Monitoring Report**. The Kent Onshore Route has been designed to reduce the number of towers required and the area between the lines has been kept to a minimum to help prevent birds from getting trapped. The potential impacts on birds in Kent is presented in **Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity**. Mitigation measures are detailed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)**. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of **Application Document 3.1 draft Development Consent Order**. Moving the OHL north of the river was considered during the optioneering process for this part of the Proposed Project, however, National Grid were advised by the project ornithology specialists that this could increase risks to the local bird population and move the OHL closer to sensitive receptors within Minster itself, along with further construction activity on the Ash Levels.
Q26 Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation?			
Local community	How wide and deep are the cable trenches?	N	The typical width and depth for the cable trenches is 2.3 m and 1.5 m respectively, see **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project** for further information.
General commentary			
Local community	Firstly the converter station just beyond Saxmundham with a height of 26 metres could easily become an eyesore. It needs to be built in an excavated hollow, minimising visual intrusion and enclosed by extensive mature tree planting. I think this would be geologically feasible if combined with local stream realignment.	N	The ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. However, it is not possible to construct it in an excavated hollow due to the nature of the technology used, operational requirements and ground conditions. Details of the assessment are contained in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Kent Wildlife Trist	It is understood that National Grid plan to use trenchless techniques such as HDD for Sea Link, however we are not convinced that there is enough evidence to support these claims. Within Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures it states, “at the Kent Landfall, the preferred installation method is a trenchless technique that will drill beneath the ground surface to avoid the need to trench the cables through the saltmarsh.” We wish to remind National Grid that they previously “committed” to trenchless techniques for the Nemo cables, however used open-cut trenching across the saltmarsh instead, damaging the bank at the back of the lagoon which was never restored. This has changed the flow of water throughout the area, altering the vegetation structure and integrity of the saltmarsh. KWT need more reassurance that National Grid can commit to trenchless techniques. If trenchless methods cannot be used, it is essential that National Grid review their alternative routes again, as	N	The Proposed Project has committed to making landfall using a trenchless technique. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Nemo Link interconnector is a joint venture between National Grid Interconnector Holdings Limited, a subsidiary company of the UK’s National Grid Plc, and the Belgian Elia group which is a separate entity to National Grid Electricity Transmission. While the Proposed Project does make landfall in Pegwell Bay, National Grid have committed to the aforementioned trenchless technique to go beneath the sensitive saltmarsh habitat. It has undertaken two campaigns of marine surveys which have included geophysical and geotechnical surveys which have covered the marine route (see Appendix A of **Application Document 7.3 Design Development Report**). National Grid has also undertaken intertidal surveys at each landfall which included phase I and phase II surveys to characterise intertidal habitats and species. These can be found in **Application Document 6.3.4.2.C ES Appendix 4.2.C Intertidal Surveys 2023**. The potential impact of the Proposed Project in relation to noise and vibration is considered in **Application Document 6.2.3.9 Part 3 Kent Chapter 9 Noise and Vibration**. Commitment GH02 in **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** includes for the provision of a Foundation Works Risk Assessment,

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	the rationale for choosing route K1 was that trenchless techniques could be used. We also note that open-cut trenching is proposed along ditches and watercourses. Commitments to using trenchless techniques should include all sensitive ecological areas and not be restricted to designated sites. The impacts using trenchless techniques also need to be addressed, such as breakout of drilling fluids, noise and vibrations. We would still expect to see measures made to mitigate against these risks and impacts. Overall, we feel the commitments made within the Outline Schedule of Environmental Commitments and Mitigation Measures fall short on ensuring designated sites and important ecological habitats are protected.		where required in areas proposed for trenchless crossings. This will be undertaken in accordance with Environment Agency guidance and will include the risk of drilling fluid loss. This is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The impact of the landfall between Thorpeness and Aldeburgh needs to be set out in much more specific detail given its potential scale and the environmental sensitivity of the area concerned. For instance: why is the landfall so broad; will ecological corridors be severed; will there be tunnelling to reduce surface impacts; how long will the surface impacts last; what will be done to restore the habitats, with biodiversity net gain in the immediate area rather than somewhere quite different?	N	National Grid will employ a trenchless solution for the cable route. There are multiple techniques available with the choice of technique being dependent on the ground conditions and the parameters of the cable installation required. All techniques typically involve drilling under the obstacle and installing a duct or tunnel opening through which the cables can be pulled. The area for the landfall sites shown on the drawings is to allow for micro-siting and will not be fully taken up by the cables. Where trenchless techniques are not proposed, National Grid acknowledges that there will be a temporary impact until the trench is fully reinstated and any planting established. Details are contained in **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk**. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
RSPB	Commitment to use trenchless techniques at landfall PEIR, Vol. 2, Part 1, Appendix 1.4.F Outline Schedule of Environmental Commitments and Mitigation Measures states that: “The preferred installation method for the Suffolk Landfall is a trenchless technique to minimise the loss of habitat within the Site of Special Scientific Interest (SSSI): Leiston – Aldeburgh and North Warren RSPB Reserve.” Whilst we welcome this intention, this should be made a firm commitment as soon as geotechnical trials confirm that trenchless techniques are a suitable option. In the event that this cannot be confirmed, an alternative route should be proposed. This is because the works to install a cable via open trenching, along with the associated haul route and vehicle movements could cause long term damage to coastal and wetland habitats (including ditches) which support features of SSSI interest.	N	The Proposed Project has committed to making landfall using a trenchless technique. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	While we recognise that Sea Link is proof that offshore transmission is feasible, viable and necessary, we continue to call for a pause and review which aims for:	N	National Grid Electricity Transmission (Proposed Project), North Falls (Offshore Wind Farm) and Five Estuaries (Offshore Wind Farm) have been working together to explore the potential for offshore coordination as part of the Offshore Transmission Network Review

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	· a co-ordinated review of all proposed transmission infrastructure that makes landfall on the East Anglian coast, · the use of the most up-to-date methodology and cost assumptions to assess need, and provide full transparency to all stakeholders. Recently, the Hiorns Report has thrown doubt on National Grid Electricity Transmission's methodology ('Norwich to Tilbury'), saying that workings and assumptions are not transparent, that limited sensitivities have been tested and that the most up-to-date methodology may not have been used. We have no reason to assume that the same incorrect methodology has not been used for Sea Link, · An objective assessment of landing points at both ends of Sea Link, specifically brownfield and where there is existing infrastructure (as required by National Policy Statements and the Electricity Act 1989). Hiorns found that interconnectors could be moved further south to Bradwell or Tilbury, · A fully costed scenario for an integrated offshore grid, consistent with and directly comparable to projections for the currently proposed transmission schemes. Furthermore, Hiorns found that the earliest likely connection date for Sizewell C is 2035 and that there are doubts about timings of wind farm connections that Sea Link's justification is based upon. All of these findings have a bearing on Sea Link timing and capacity. The entire need case on which Sea Link is based remains unproven and may collapse upon using most up-to-date methodology or post OCSS/NG ESO review. We call for a pause for breath to enable the findings of the Hiorns Review on need case and timings, and the forthcoming OCSS/NG ESO review, to be taken into account. This is an opportunity to re-evaluate the required capacity and contingency for all the interdependent projects in the East of England. We remain confident that a robust review will recognise that, and allow moves towards an integrated offshore grid, which will provide the most effective solution, at least cost, in the shortest possible timeframe.		(OTNR) "Early Opportunities" workstream. The projects, acting together in a consortium led by North Falls, were awarded funding by the Department of Energy Security and Net Zero (DESNZ) through the Offshore Coordination Support Scheme (OCSS) in December 2023. On 28 March 2024, the consortium submitted a high-level feasibility study that formed the first step of the grant funding agreement. The study assessed the feasibility of a coordinated offshore connection specifically: the capital costs; building blocks; construction and commissioning methodologies and overall programme associated with a coordinated solution. The Secretary of State for Energy Security and Net Zero has reviewed this study, amongst other information and has decided not to grant further funding to the consortium. The feasibility study identified that coordination is technically feasible however, it also identified: • an increase in capital costs of up to £890 million; • constraint costs associated with an outage on the Proposed Project of over £500 million; and • a programme delay for North Falls and Five Estuaries of up to five years. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's electricity system by 2030, the consortium supports the Secretary of State's decision and will not be further pursuing a coordinated offshore connection. Please see the **Application Document 7.2 Strategic Options Backcheck Report**, which details the needs case for the Proposed Project, which has been reviewed to reflect the current position.
Cllr T-J Haworth-Culf	The Holford Rules' design principles from 1959 were of their time – but more than six decades on are out of date, and of course crucially only apply to overhead transmission lines. Nick Winser CBE in his report, 'The Winser Report' states that the current system will not be fit for purpose when in the context of providing clean, secure, affordable electricity; that the Holford Rules require replacing; that these replacement rules must be dynamic and therefore updated as new technologies and expertise progresses; also that generous and sufficient compensation both individual and community should be instigated, that the application processes require speeding up. However: there are issues with this report. Local Council, community or any other bodies are not referenced in democratic engagement terms, and without involving them the same lengthy	N	National Grid acknowledges the publication of the TAAP/Winser Report and welcomes its recommendations for streamlining the process. However, the Proposed Project is at a relatively advanced stage and any formal direction and decision making on the merits of aligning further progress towards fulfilling the established connection agreements that underpin the needs case with these recommendations has not been forthcoming. Similarly, the report recommendations are yet to be enshrined in policy and legislation. National Grid has consulted the community in a manner that is consistent with the requirements of legislation and its Statement of Community Consultation (Section 6 of **Application Document 5.1.5 Appendix D SoCC**). National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised impacts onshore and offshore where possible, while the design of the Proposed Project is intended to fulfil the requirements set out in National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	processes will stall, drag out the application time with the same legal challenges, and the same costs to the applicant to defend their plans. In other words, nothing will change and the stress and concern for members of the public who stand to be affected by these construction plans won't either. The update email of 22/10/23 from them suggesting that NG has arrived at a solution to pay off those affected unfortunately misses the point entirely. If NG and other applicants had consulted with the various public and private representatives at commencement of the applications, it would have been clear that none of the current plans as they stand for the energy aspirations in this area were suitable. There would be a good chance that better solutions would have been arrived at by now, rather than the prolonged agony of drawn-out court cases and challenges that exists currently.		cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for the Proposed Project.
Cllr T-J Haworth-Culf	Specifics: While in principle against the project in as much as it is part of an undesirable mass of other energy NSIP applications, we are realistic in our response. While we have identified many specific and general issues that Sea Link shares with other NSIPs applied for in the area, we hope to have identified some common ground on which we can build some mitigation as follows: As the property most closely affected by this application, Chapel Barn Farm is remotely located. Any works that may be undertaken – either prior or if consent is given after - must pay heed to any potential increased lack of security impacting the vulnerable elderly people and young children who reside or regularly visit the site and the Lodges. Should this be consented, we would not currently challenge the route as discussed 23/11/23, on the absolute understand that the current project known as Sea Link HVDC is the only installation relating to the transmission network to be constructed within a 100metre zone of Sea Link's agreed (and to be consented) path. We would support this option whether or not additional ducts are constructed to accommodate cables for up to two other projects; providing this was undertaken and completed without additional space disturbance or works etc being required; and it was to be constructed concurrently (with and part of) the Sea Link application; also, providing we were satisfied there were no other invasive or construction works involved (or found to be required) to be undertaken, in the event that co-located cables were installed at a time after completion.	N	National Grid acknowledges these concerns. However, the development of other projects is outside of National Grid Electricity Transmission's control. National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO and LionLink. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. While there are clear benefits associated with coordination of project delivery and colocation of infrastructure with other projects, proposals coming forward in close proximity must show consideration of the cumulative effects. In the case of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.

Table 1.27 Needs case

Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	Grid stability and guaranteed power supply are essential as demand forecasts for the next 50 years indicate exponential increases. Local industry and farmers require non-interrupted power.	N	National Grid acknowledges these comments and welcomes the support. The proposal they are putting forward will support the aspirations to deliver net zero by 2050, supporting decarbonisation of domestic and business needs for Great Britain.
Local community	It is necessary to support domestic and industrial future power demand.	N	
Local community	I support the development of cleaner energy and ending our reliance on polluting fossil fuels. I accept the need to adapt the electricity system to accommodate solar, wind and other clean sources.	N	
Local community	Excellent idea to use more wind energy to meet UK's zero target.	N	
Local community	We will need secure electricity in the future and this will require new and improved transmission to avoid power cuts, otherwise people will want to keep fossil fuels.	N	
Local community	It is incredibly important for our national security and for the democratic well-being of all who live here that England is able to securely transmit renewable and low-carbon energy from where it is generated to our homes and businesses.	N	
Local community	Whilst in general I am in support of the development of green energy infrastructure in the UK, including off shore wind, I do wonder why, especially as we have such decaying national grid, that we don't build the infrastructure as local networks where the power needs to be used. It does not make sense in my mind to build at sea, potentially damaging marine ecosystems and requiring building landfall infrastructure, causing terrestrial ecosystem damage, when a lot of the power could be produced more locally to the point of consumption. Yes, this would probably impact power availability and lifestyles but that is, it seems, exactly what may be required to provide continued access to power that our society have come to view as a basic human right and protect the functioning processes of our planet. If the power was produced locally would this Suffolk, Kent network need to exist? I am increasingly depressed by the way Government and energy companies are sticking to existing energy business and infrastructure models rather than trying new approaches outside of what we know and already do in the UK. I believe that the sole interest of all the companies involved in the Sealink project and the co location projects is profit for share holders. Co location is not the same as true collaboration and therefore will not reduce the stress	N	National Grid acknowledges this comments. The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	of such projects on the local area as much as would be possible otherwise. I am also confused as to why we are not having a national conversation about energy consumption reduction as part of the strategy to meet CO2 emissions targets and energy security. If we were focusing on reduction of energy consumption would we need this project?		• **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Many of the comments here are related to Government policy which are not within National Grid's remit.
Local community	I reject the principle of building Sea Link, said to be needed to transport the electricity generated in Suffolk ('this location') elsewhere in the UK. I do not believe that large GW scale power stations are necessary anywhere, due to recent technological innovations and that smaller, clean and decentralized power units might be located close to homes and businesses. Large Wind and Nuclear plants are both transitory and obsolete, giving way to cheaper and safer means long before the 15 years needed to build Sizewell C. Electricity generation will therefore become more efficient and less (thermally) wasteful, storage in a variety of battery types a way to even out the variable supply from renewables, whilst Micro and Macro grids will account for local and regional usage. There has been a failure of Government and statutory bodies to anticipate and plan how and where electricity is generated in relation to greatest need. The many projects planned for Suffolk constitute a massive industrialization that will change the nature of the area and which cannot be ameliorated. The Intra-Project Cumulative Effects outlined in PEIR 5.13 are huge and complex; the previous local problems associated with building Sizewell A and B stations will be dwarfed by the twin reactors of C, when also combined with these other huge projects.	N	National Grid acknowledges this comments. National Grid as a national infrastructure provider is seeking to deliver the Government's policies regarding net zero by 2050. Many of the comments here are related to Government policy which are not within National Grid's remit for the Proposed Project. Information on cumulative impacts is contained in the following documents: • **Application Document 6.2.2.12 Part 2 Suffolk Chapter 12 Suffolk Onshore Scheme Intra-Project Cumulative Effects;** • **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects;** • **Application Document 6.2.3.12 Part 3 Kent Chapter 12 Kent Onshore Scheme Intra-Project Cumulative Effects;** • **Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects;** • **Application Document 6.2.4.10 Part 4 Marine Chapter 10 Intra-Project Cumulative Effects; and** • **Application Document 6.2.4.11 Part 4 Marine Chapter 11 Inter-Project Cumulative Effects.**
Local community	Why does the network between Suffolk and Kent need to be reinforced, I don't think you have made that argument clear, Sizewell has the pylons to the grid at Bramford. You further state in Principle of Development "this is an essential project as the network between Suffolk and Kent needs reinforcing so it can securely transmit renewable and low carbon energy from where it is generated to homes and businesses. This really means to get the power to London and its urban area, why not have the power stations nearer the place of need and save energy lost in the transmission process. On the same subject of transmission energy loss, why use a DC link with all the extra equipment needed and more losses in the rectifying and inverting back to AC. The old Bradwell Power station site is closer to where the power is needed why not build a power station there and take all the windfarm cables to that site and if necessary connecting them all together on an island constructed on an off shore sandbank. Why bring it on land and then all the way back out again.	N	National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including the Bradwell Power station. However, this site was considered too small to accommodate the required infrastructure. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	Your question is badly worded and is a leading question. Combining the 'principle of reinforcing the network' with 'in this location' in the question makes it almost impossible for people to answer, since they may support one without the other, as I do. Yet ticking Unsure, may group this answer with those who do not understand the issues nor have provided any further information in support of their choice. Will you simply analyse the YES, NO, Unsure tick boxes or will you pay any attention to the comments? I would like an answer to this. I have answered NO, because I support the principle – but certainly not coming ashore at Pegwell Bay. The march of pylons and converters throughout East Anglia is equally unacceptable. I also understand that the Government's energy planning has been woefully inadequate for many years and continues to be so. This has led to a fragmented policy with major infrastructure projects being part funded by private investment and nationally important projects relying on overseas funding that is unreliable. The driver for private investment in these projects is central Government's lack of money and a frankly unhealthy focus on market economics for everything, even public goods such as energy. The Drive to Net Zero is frankly laughable when they are even now licensing new coal and gas extraction. This has led to the ridiculous situation where curtailment payments have to be made to the wind farm generators when they produce excess power because they are money making concerns. So I understand there is therefore a necessity to move this energy around the grid to where it may be needed to offset curtailment payments. In addition there is a need to upgrade the cabling and infrastructure to cope with the increase in offshore wind generation towards the 50GW offshore wind target by 2030. No sensible person would object to an increase in renewable energy generation offshore (provided it is built in an environmentally friendly way). But the infrastructure to manage this increase of the end product should not be at the expense of our valuable land based environment. This indeed makes a mockery of Net Zero if all the environmental externalities are ignored.	N	National Grid has followed an extensive process to choose the locations of the landfalls at each end of the Proposed Project and they understand the concerns that are stated in your response. National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. Comments regarding Government policy are not within National Grid's remit for the Proposed Project. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Local community	This project would not be needed if there was an offshore hub with convertor station and cable to the South East/Kent. If the network does not have the capacity to transmit from the proposed substation, why come ashore to begin with. Why not use brown field sites nearer to where the energy is needed.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. As such, where there is a need for mitigation measures to ensure the conservation of sensitive ecological receptors, the EIA process has identified opportunities to enhance biodiversity interests and these are reported in **Application Document 7.1 Planning Statement and Application Document 6.12 Biodiversity Net Gain Feasibility Report** submitted with the application for development consent.
Local community	I cannot see sufficient evidence that off-shore alternatives have been compared and costed in preference to multiple land access points. I cannot understand why the Sea Link project imports power	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	from sea to land only to be exported (in a different format) once again en-route to Kent. The Sea Link project has been a fairly well kept secret so far as members of the public are concerned.		National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Local community	I am not clear what has really changed - these are refinements, but I don't think you are taking into account comments from previous consultations, just tweaking at the edges. You have not really provided any useful information in the consultation documents about why you are doing this, or the overall strategy for the Grid. Without that information it is hard to say whether this is an improvement.	N	The documents and reports that were made publicly made available during Statutory consultation specifically talk about the needs case for the Proposed Project. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. **Application Document 5.1 Consultation Report** and its associated appendices provides information on National Grid's consultation exercises, together with summaries of feedback received and its regard to this feedback. Annual reports are produced by the Electricity System Operator which provide information on the overall strategy for the grid.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Whilst Suffolk needs electricity, it should not bear the location of all the infrastructure for electricity for the whole of the southeast of England.	N	A significant amount of the electricity generation for Great Britain is off the east coast. This electricity needs to come ashore and be delivered to the whole of the country as over 80% of UK electricity demand is outside of London, therefore it is vital that new infrastructure is provided for the whole country and the electricity generated is distributed accordingly. The Proposed Project is a key part of delivering net zero by 2050 for the whole nation.
Local community	It is unfortunate that the beautiful and environmentally sensitive Suffolk coast should be disrupted, dug up and altered. However, for the sake of future generations, environmental sense and international safety, we should accept mass alternative energy generation, both offshore and onshore. We must have more, not fewer, wind turbine farms, solar panel farms, and - by extension - sub-stations, to transform the energy into a regular supply of power to the country. There will be a period of disruption, but we must persevere with this local and countrywide work, and plan for the landscape to be returned to its former shape but with clean energy powering the country. Our landscape has to change, whilst preserving the environment. Both are possible.	N	National Grid acknowledges these comments and welcomes the support. The proposal they are putting forward will support the aspirations to deliver net zero by 2050, supporting decarbonisation of domestic and business needs for Great Britain. The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and detailed within Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment takes into account the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	I'm not clear why you need to go between Kent and Suffolk, and not just direct to Kent. I think the energy should be moved as quickly (that is, as straight) as possible to where it is needed.	N	National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The alternative suggested does not satisfy this need. Further information can be found in **Application Document 4.2**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Volume 4 Compulsory Acquisition Information Statement of Reasons and Application Document 8.2 Options Selection and Design Evolution Report (October 2023).
Q20 Do you have any other comments about Sea Link to give that you have noy previously mentioned?			
Local community	It is very reassuring that the network is being upgraded and expanded in terms of energy security. The new sites due to be constructed have to be built somewhere and there will always be objections. However, the proposed locations seem ideally suited in terms of landscape and logistics, especially when considering the practicalities of linking the new infrastructure to the current one in terms of the National Grid.	N	National Grid acknowledges these comments and welcomes the support. The proposal they are putting forward will support the aspirations to deliver net zero by 2050, supporting decarbonisation of domestic and business needs for Great Britain.
Local community	I have visited the Suffolk area on vacation on a number of occasions. I believe that the plan is reasonable. As the whole country benefits from this project I feel that national concerns should have priority.	N	National Grid acknowledges these comments and welcomes the support. The proposal they are putting forward will support the aspirations to deliver net zero by 2050, supporting decarbonisation of domestic and business needs for Great Britain.
Local community	I would like to see a map published of where all the demand for all the extra power is needed. Why do communities that do not require the power have to be impact for power demand that is not local to them. Why do local communities receive free electricity for the impact caused and why do populations far from the power generation location not have to pay premium prices for the long distance electricity?	N	The annual reports produced by the Electricity System Operator set out the overall strategy and needs of the country's electricity grid. These reports can be found on the Operator's website: www.neso.energy. National Grid are unable to comment on specifics of Government policy.
General commentary			
Local community	I am against the proposal. I support the idea of energy security for the United Kingdom, with renewable sources of said energy being at the heart of any such move however, I believe strongly that detrimental impact upon innumerable aspects of life in East Suffolk, would render the proposals 'green' credentials obsolete.	N	The Proposed Project is focused on decarbonising the country's electricity supply. National Grid has followed an extensive process to choose the locations of the various elements of the Proposed Project and we understand the concerns that are stated in your response. National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. The ES is presented in Volume 6 of the DCO submission. A non-technical summary of the ES is contained in **Application Document 6.1 Environmental Statement Non Technical Summary**.
Local community	Analysis of NGV's Sea Link Project Overview makes it clear that the additional power provided by LionLink and offshore wind developments such as Scottish Power Renewables (SPR) EA1N and EA2 projects is mostly required near to London, Northern Kent and Southern Essex. These areas are very densely populated areas with a very high electricity consumption per unit area. This area is designated LE1 by NGV and encompasses other sub-areas. Although the wind power is question is largely generated off the East Anglian coast, it is mostly not consumed here. Similarly power imported from the Netherlands (NL) via the LionLink Interconnector will also largely be consumed in Area LE1. Therefore it makes little sense to land this power onshore on the Suffolk Heritage coast only	N	A significant amount of the electricity generation for Great Britain is off the east coast. This electricity needs to come ashore and be delivered to the whole of the country as over 80% of UK electricity demand is outside of London, therefore it is vital that new infrastructure is provided for the whole country and the electricity generated is distributed accordingly. The Proposed Project is a key part of delivering net zero by 2050 for the whole nation. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	to have to re-export it via Sea Link to transfer it to the required destination.		• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	I am in favour of offshore wind energy, but it makes no sense to come onshore so far from the point where the energy is required, when it would make so much more sense to run an offshore grid, coming onshore on a brown field site as close to London as possible.	N	A significant amount of the electricity generation for Great Britain is off the east coast. This electricity needs to come ashore and be delivered to the whole of the country as over 80% of UK electricity demand is outside of London, therefore it is vital that new infrastructure is provided for the whole country and the electricity generated is distributed accordingly. The Proposed Project is a key part of delivering net zero by 2050 for the whole nation. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Local community	I do not believe that the fundamental need for the Sea Link project has been established as public consultation to date has lacked any consideration of a coordinated strategic approach for the multiplicity	N	The documents and reports that were made publicly made available during Statutory consultation specifically talk about the needs case for the Proposed Project. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	of projects under consideration along this fragile coastline, nor has there been a comparative study of all grid options and landfall sites, in particular of brownfield as opposed to greenfield development.		The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Annual reports are produced by the Electricity System Operator which provide information on the overall strategy for the grid. National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.13 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	Suffolk Wildlife Trust supports the transition to renewable energy to mitigate the worst impacts of climate change. We understand that additional electricity transmission infrastructure is needed to facilitate this transition towards a decarbonised energy sector, but it is essential that this is not at the expense of wildlife and biodiversity. Energy infrastructure schemes, like all development, can have significant ecological impacts during construction and operation. Careful siting, design, and construction are essential to prevent avoidable harm to the natural environment. More than this though, nationally significant strategic electricity infrastructure schemes should make a positive and meaningful contribution to UK Government commitments to halt and reverse biodiversity loss, and to establish a national Nature Recovery Network in England. To this end, we support a coordinated strategic approach to planning, design, and construction of new energy infrastructure to reduce the overall negative impacts from schemes on nature and maximise potential for habitat creation and restoration to conserve and enhance biodiversity and deliver wider environmental and social benefits.	N	The proposal National Grid is putting forward will support the aspirations to deliver net zero by 2050, supporting decarbonisation of domestic and business needs for Great Britain. Annual reports are produced by the Electricity System Operator which provide information on the overall strategy for the grid. Further information can be found in **Application Document 4.2 Volume 4 Compulsory Acquisition Information Statement of Reasons**. A full suite of ecological surveys (and other environmental surveys) has been undertaken and a rigorous impact assessment has been produced in line with guidance and legislation. Extensive consultation with key stakeholders such as Suffolk County Council, East Suffolk Council, Natural England, RSPB and Suffolk Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain in Suffolk. Further details relating to the ecology assessment are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. Cumulative impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	However, multiple energy infrastructure projects – including National Grid schemes – are putting wildlife on the Suffolk Coast at risk. We need Government, National Grid and OFGEM to work together on a more strategic approach to the planning and delivering new low carbon energy infrastructure that helps us to achieve a 'nature friendly net zero'.		not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
Dr Thérèse Coffey (formerly MP)	I also question the overall need for Sea Link. Ultimately, Sea Link is being proposed as a response to resilience for energy in the South East and London, not the East of England, as backup or insurance in layman terms. First, I question if this insurance is truly necessary – especially given the timings of other projects for the future. This project feels premature at best. Furthermore, if changes are to be made onshore, improvements should be made in Kent, Surrey and Sussex for resilience rather than the undersea cabling proposed between Suffolk and Kent. Alternative technology is also possible through a series of offshore grids, like we see on the continent, making landfall further down the coast where the power is needed. There is absolutely no need to deviate power generated offshore into Suffolk if its final destination is the South East.	N	The Proposed Project is part of National Grid's Great Grid Upgrade programme, which comprises 17 major infrastructure projects that will both scale up the grid and update our existing networks. Over 80% of UK electricity demand is outside of London, therefore it is vital that new infrastructure is provided for the whole country and the electricity generated is distributed accordingly. Alongside the Proposed Project, the Great Grid Upgrade includes proposals for infrastructure all over the country, including a new high voltage transmission line between East Yorkshire and Nottinghamshire and an overhead line in Lincolnshire. A significant amount of the electricity generation for Great Britain is off the east coast. This electricity needs to come ashore and be delivered to the whole of the country. The Proposed Project is a key part of delivering net zero by 2050 for the Government. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Siting Study (October 2022);**

Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Farnham with Stratford St Andrew Parish Council	There is a lack of coordination between this proposal and other energy projects proposed in the District and that, consequently, the cumulative impact, for example, on traffic levels, is not being adequately considered or mitigated.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. National Grid acknowledges the Parish Council's concerns about the potential impacts of the Proposed Project and is committed to developing a Proposed Project that takes account of the feedback received during the course of consultation to avoid or minimise as far as possible and to mitigate the significant effects of the construction and operation phases. The cumulative impact of the Proposed Project together with other projects in the area is set out in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Farnham with Stratford St Andrew Parish Council	Please consider improved coordination with other energy projects in order to mitigate any adverse impact, where possible.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
Q9 Are there any other ways that you would like us to explore coordination with other projects?			
Local community	I do not see the benefit of co-location. As far as I understand it all developments need separate infrastructure and would not necessarily reduce the overall infrastructure footprint although some small benefit might be gained through joint worker compounds and spoil heaps. Whatever more development in the area increases the infrastructure needed and increases the harmful effects on the environment. I can see benefits however if the whole was sited on a brownfield site or offshore.	N	National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the colocation of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. There are benefits to co-location with other projects because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors, etc. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Local community	Future infrastructure will still require the digging up and trenching of the land at every point where cable joints and cable monitoring points are needed. Whilst it sounds sensible in principle, in practice there will still be a considerable amount of disruption in future. Co-location is not coordination, as infrastructure remains separate. It will not reduce the main infrastructure footprint, only minor elements such as worker compounds if projects are co-located into the same area. Your question on landfall is misleading. At the event you held, your representative confirmed that co-location would only start from the west side of the old railway line and that any drilling under the RSPB marshes would have to be done at the time of a future install. Your question and plans do not indicate this. More infrastructure in one place will increase the harmful impact even more, even if it is done at the same time. If the project were co-located to the same brownfield site or to an offshore hub and grid I would support co-location in principle.	N	National Grid acknowledges your concerns and continues to work with other developers on minimising the impact of infrastructure construction within the region and will continue to do so throughout the lifetime of the Proposed Project. Details are provided in **Application Document 7.10 Coordination Document**. As published in a number of their consultation documents, National Grid were unable to find a brownfield site in the region suitable for construction. Other brownfield sites mentioned by MPs and other stakeholders would not fulfil the underlying needs case. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Local community	You are not really talking about co-location because ultimately we are being presented with different infrastructure projects sponsored by different companies (owners) being built on an unsuitable site which will completely industrialise and divide up what is currently an extensive natural environment.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	There is no benefit of co-location to us and the beautiful area we live in as the infrastructure is essentially to remain separate. It's just a means of opening up the opportunities for other companies to come and do their irreparable damage. If the project were co-located to the same brownfield site or to an offshore hub and grid I would support co-location in principle.	N	National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities, see **Application Document 7.10 Coordination Document**. As published in a number of their consultation documents, National Grid were unable to find a brownfield site in the region suitable for construction. Other brownfield sites mentioned by MPs and other stakeholders would not fulfil the underlying needs case. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.
Local community	Yes if this has to go ahead putting all three projects in one infrastructure makes sense. Otherwise we will be dug up three times.	N	National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the colocation of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. There are benefits to co-location with other projects because if infrastructure can be sited in one location it reduces the difficulties associated with finding locations for up to two other converter station sites in the surrounding area which meet the requirements for the connection agreements, whilst taking into account landscape designations and other sensitive receptors, etc. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
Local community	I do agree with co-location on minimal impact on an area that is already under pressure with the construction of the Sizewell C	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	stations. I understand that there are already to Nautilus + LionLink projects under discussion. Surely all of these should be looked at in conjunction with the development of infrastructure at Sizewell C. It seems that whilst this project is under way it makes sense to keep it all in one place?		Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
Local community	If the projects were located on a brownfield site or to an offshore hub and grid we might support co-location.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);**

			• **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Yes, request to present the complete picture of energy projects in this area, not just isolated projects, rather see the full big picture and longer term potential for growth.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. Additionally, the cumulative effects of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Local community	There appears to be no co-ordination between the various energy producing and transfer projects currently being investigated. A better co-ordination would undoubtedly reduce overall costs which would ultimately benefit the electricity consumer.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
Local community	My main recommendation is that such a scheme needs to be constructed as part of a national plan. It feels as if there are numerous separate schemed but with no joined up thinking or plan. Government needs a national plan for upgrading the grid. The move to a carbon-neutral economy, which the present government has just undermined with its present policies, is of crucial importance. With all the different schemes, there needs to be a much more thought through policy from Government. This part of rural Suffolk should not become a super-hub for power management. The area	N	National Grid is seeking to deliver the Proposed project in accordance with the needs case, which is set out in **Application Document 8.3 Strategic Options Report** (**October 2023**). Please also see the **Application Document 7.2 Strategic Options Backcheck Report**, which details the needs case for the Proposed Project, which has been reviewed to reflect the current position. The Proposed Project is one of many network reinforcement projects that National Grid is pursuing. Comments relating to Government policy are not within the remit of the Proposed Project, National Grid is coordinating with other large scale

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	has managed to cope with Sizewell A, B and (illegible word) Sizewell C. There is no way that the proposed schemes should be allowed to go ahead here in rural Suffolk. There are far better options - solutions at sea and the use of old industrial sites at the mouth of the Thames.		infrastructure projects in Suffolk, noting that those other projects are also outside of its control. Details of how it is coordinating with other projects will be set out in the DCO application.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	We already have one cable from project Nemo that runs through the Pegwell nature reserve to the Converter at Richborough Energy Park. Even while that cable was being laid it was known that more cables were planned. Why was that not taken into consideration when building a Converter that could take more than one cable? Are we to see other private companies who want to lay more cables build more separate converter sites in the area?	N	National Grid has provided the details of what the co-ordination and co-location of the local projects might look like but have no control over the timescales of the NGV Projects. All three projects need to submit planning applications through the DCO process and gain consent for their individual assets, without this they cannot be installed. The Proposed Project is an NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it. The Proposed Project is an NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it. National Grid is working closely with NGV and other developers to minimise the disruption caused by the Proposed Project and, where possible, will look to provide a co-ordinated programme of works where possible. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**).
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	It is extraordinary that we are asked to respond to each project separately when the reality is that the combined impact of the projects would turn this area into an industrialised horror show. Visitors and holiday makers would go elsewhere and the local economy would collapse. It is easy for National Grid and other stakeholders to see opposition as nimby-ism but that is unfair. We are not wanting to shunt the misery on to somebody else. We are wanting the authorities to move with the times and take a lesson from other countries who have opted for underwater grid solutions.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The needs case for the Proposed Project has identified that a connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. Cumulative impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Local community	I agree that the movement to clean energy as soon as possible is totally required if we are going to try to limit climate change. So, I accept that several of these infrastructure projects may well be required but I would urge you to stop working mostly in what appears to be isolation and start to properly collaborate with other proposals so that the relatively unspoiled beauty of this part of rural Suffolk is not blighted by the industrial scars that could be created by such infrastructure projects. More convincing effort to locate hardware on brownfield sites or offshore. And more openness/conviction to find an acceptable/supported solution rather than the least bad solution.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. General commentary			
Local community	I have recently attended a Sealink Statutory Consultation event held in Aldeburgh, Suffolk. I am strongly in favour of offshore wind energy becoming the principal part of the UK's energy strategy for the future. So, I attended the event with some optimism and an open mind. I approached the staff there expecting answers to my questions based on the information displayed in the exhibition. However, I ended feeling that there were more uncertainties and little by way of an overall strategy. Indeed there seemed to be no evidence of a comprehensive and joined up approach between the agencies involved in future energy provision that will impact on the east coast or elsewhere in the region. I feel very strongly that this is a huge opportunity missed - for all the agencies that are seeking support for major infrastructure in our area to work together rather than, as at present, working separately with uncoordinated plans. It must be the case that a coordinated approach would be both less environmentally damaging and more cost effective. Evidence of this weakness in the current approach was apparent when I asked the national grid engineer at the Aldeburgh meeting - how other proposals by other agencies would impact national grid's plans. He could not give definitive answers, whereas any lay person can see that if all the proposals are approved the area encompassed by Aldeburgh, Friston and Saxmundham will be devastated a. By the construction processes. b. by the associated heavy traffic during the construction period (we were advised that on average there would be 140 lorries per day between the already	N	National Grid has provided the details of what the co-ordination and co-location of the local projects might look like but have no control over the timescales of the NGV Projects. The Proposed Project is an NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it. The Proposed Project is an NSIP and therefore its programme cannot be delayed as National Grid has an OFGEM Licence condition to deliver it. National Grid is working closely with NGV and other developers to minimise the disruption caused by the Proposed Project and, where possible, will look to provide a co-ordinated programme of works where possible. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). The potential impacts on traffic are assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment takes account of the construction traffic management plans for other project traffic. National Grid's plans will be prepared considering the traffic plans for other project traffic, e.g. peak traffic movement times will be programmed in consideration of each other wherever possible. Cumulative traffic impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Inter-Project Cumulative Impacts**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	stretched A12 and the various sites) and c. by the enormous structures that will truly be blots on the Suffolk landscape.		National Grid acknowledges the impacts on the landscape setting and visual amenity. Landscape and visual impacts are included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All planting associated with the reinstatement of the landfall and HVDC and HVAC corridors will be maintained for a five year period. All mitigation planting associated with the permanent access road and Kent Converter Station and Substation will be maintained for the lifetime of the assets. Cumulative landscape and visual impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Reydon Parish Council	We call upon the Government and National Grid to reject the current infrastructure plans for Sea Link and produce a coordinated offshore scheme for all the energy and electricity transmission projects planned for the Suffolk Coast. This should then be appraised along with current plans for onshore infrastructure as part of a new and adequate consultation.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise.
Local community	It is time to withdraw your current proposal and develop more environmentally and financially viable alternatives, pooling Sea Link with other energy and transmission providers utilising offshore hubs and interconnectors, developing a north sea cable corridor and using brownfield rather than greenfield sites for any essential land based infrastructure.	N	National Grid has ensured throughout the development of the Proposed Project that, where it is aware of other projects' requirements, it has developed the Proposed Project in a way to not preclude other projects from constructing their required infrastructure. National Grid continues to work with other projects to explore opportunities for co-location and coordination. As part of the DCO submission, National Grid has produced a report on coordination which covers how it approached coordination with other projects with the aim of

			reducing the impact on the environment and location communities, see **Application Document 7.10 Coordination Document**. This Document demonstrates that coordinated approaches to consenting; site and routeing selection; design; and delivery of the Proposed Project with other proximate projects has been considered appropriately and has been, and can be, achieved where practicable. This is anticipated to minimise environmental and local community effects of the Proposed Project in combination with other projects following its consent, and in the future, in accordance with coordination policies set out in the NPSs for Energy. National Grid remains committed to continuing engagement with all the projects identified to secure these coordination benefits and to also explore further opportunities for coordination where they arise. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Leiston-cum-Sizewell Town Council	Although wholly against the Sea Link project hitting landfall on our Heritage Coast, should the project proceed LTC seeks assurance that all possible avenues to work collaboratively with other projects are explored, e.g.: ● That the SZC link road with the A12 (already consented) is used to access the converter station construction site at Saxmundham, with a haul road branching off at a location west of Theberton ● That SZC park and ride facilities are utilised for contractors ● That cables routes for multiple projects reach landfall at the same location	N	National Grid is working closely with all other developers in the area to investigate where they can coordinate facilities to reduce the impact of the projects. The Proposed Project will not be able to apply for its DCO relying on infrastructure proposed by other DCO's. However, this does not mean that National Grid will not, where possible, agree with these projects should they come forward with a means of sharing infrastructure, if that is possible and it will not affect the program of the other project.
NGV LionLink	Co-Location The Sea Link Statutory Public Consultation has identified and considered potential opportunities for co-location around key interfaces with LionLink based on the siting and routeing options presented at our Supplementary Non-Statutory Consultation. LionLink is supportive of the considerations given to co-location, acknowledging that the opportunities would only be possible should the refinement of the LionLink siting and routeing options identify the same sites as Sea Link (these are a Landfall at Aldeburgh and a Converter Station at Converter Station Site 3). Where the same	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Landfall and/or Converter Station Site are identified, these will need to be subject to further discussions on siting, design, mitigation and construction. The potential co-location opportunities identified in the Sea Link Statutory Public Consultation are: • the provision of potential ducting for the HVDC cables at Landfall (should Aldeburgh be identified as the preferred landfall site for the LionLink Project) • the provision of potential ducting for the HVDC cables from a Landfall at Aldeburgh to Converter Station Site 3 (should Aldeburgh be identified as the preferred landfall site, and Converter Station Site 3 for the Converter Station for the LionLink Project. Note this provision, subject to amendments, may also support HVDC cable routeing from a landfall at Aldeburgh to any of the other Converter Station Sites proposed by the LionLink Project) • the provision of up to three Converter Stations and associated landscaping within Converter Station Site 3 (should Converter Station Site 3 be identified as the preferred Converter Station Site for the LionLink Project) • the provision of advance ducting for the High Voltage Alternating Current (HVAC) cables between Converter Station Site 3 and the proposed Friston Substation (should Converter Station Site 3 be identified as the preferred Converter Station Site for the LionLink Project). Should the Development Consent Order (DCO) for Sea Link include the ducting in respect of the HVDC cables and/or HVAC cables for LionLink and/or the converter station for LionLink then the DCO should either secure compulsory acquisition of the land required for the LionLink project or include provision to safeguard the land from future development.		
NGV LionLink	Converter Station Site 3 If selected as the preferred Converter Station Site for LionLink, there would be a minimum of two Converter Stations erected at the Site (potentially three should Nautilus also select Converter Station Site 3). Further discussions and detail design will need to be developed for the siting and design of the Converter Stations, including consideration of cumulative impacts, mitigation and construction. Careful consideration would also need to be given to the potential scenarios for up to three Converter Stations being located at the site. Should Converter Station Site 3 and a Landfall site other than Aldeburgh be selected by LionLink, further consideration will also need to be given to the routeing of the HVDC and HVAC cables for the projects which should seek to avoid crossings where feasible. Where a cable crossing cannot be avoided an acceptable technical proposal will need to be developed.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
NGV LionLink	Advance Ducting (HVAC and HVDC cable routes) All options will require further detailed discussions between LionLink and Sea Link to ensure that the proposals can accommodate both projects.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.
NGV LionLink	Proposed Friston Substation Both Sea Link and LionLink will interact with the landscaping and other infrastructure, including drainage and Public Right of Ways associated with and in proximity to the proposed Friston Substation and proposed East Anglia One North (EA1N) and East Anglia Two (EA2) substations located to the south. All options will require further detailed discussions between LionLink, Sea Link and the EA1N and EA2 projects. It is recommended that this should seek to agree a Consenting Strategy for the proposed Friston Substation (including routeing of HVAC cables connecting into, or in close proximity to the substation, mitigation and construction) to support a co-ordinated consenting approach for all projects. Sea Link's DCO should include the extent of works to the Friston Substation required to connect LionLink to the national electricity transmission system, together with the associated mitigation scheme.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.
NGV LionLink	HVAC and HVDC cable routes Should an alternative Landfall (i.e. not Landfall E – Aldeburgh) and/or Converter Station Site be selected by LionLink there is the potential for the cable routes for LionLink to be installed in proximity to, or even cross the proposed Sea Link HVAC and/or HVDC cable routes. Whilst LionLink would seek to avoid crossings, where this is not feasible an acceptable technical proposal will need to be developed and agreed by both projects.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.
NGV LionLink	Landfall Proposed Location E – Aldeburgh If Landfall Location E (Aldeburgh) is selected by LionLink there is no obvious impact to the landfall entry point location, but further offshore detail and plans of routeing are required to understand the impact of nearshore activity and cable crossing points.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.
NGV LionLink	Environmental Mitigation Both LionLink and Sea Link acknowledge the need for environmental mitigation to support the projects and given the potential cumulative impacts and geographical proximity there will be a need for both projects to work together to support a co-ordinated approach to deliver for each individually and cumulatively. This will also need to include engagement with the EA1N and EA2 projects to identify and consider potential impacts (and opportunities) with their proposed (and emerging) environmental mitigation.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures and SPR regarding interfaces and discussion around coordination of projects.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
NGV LionLink	Construction LionLink recognises and supports the importance of Sea Link and will continue to work with Sea Link with a continued focus on co-location and co-ordination, including the potential project interactions identified in this response.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.
NGV Nautilus	Co-Location and Construction The Nautilus Project has an agreement for connection at the Friston substation in Suffolk. If this connection option is taken forward, this would require the Nautilus Project to make landfall on the Suffolk coast. As highlighted during consultation events for both the NGV LionLink and Nautilus Projects and the Sea Link project, the co-ordination and co-location of infrastructure is a topic of significance for the relevant local communities and local authorities. NGV also holds a connection agreement on the Isle of Grain in Kent as part of its development portfolio and we are currently actively investigating if this could be a potential location for the Nautilus Project. The Sea Link Statutory Consultation has identified and considered opportunities for co-location around potential key interfaces with the Nautilus Project. The Nautilus Project is supportive of the considerations given to co-location, acknowledging that the opportunities would only be possible should the refinement of the Nautilus Project siting and routeing options identify the same sites as Sea Link (these are a landfall at Aldeburgh and a converter station at Converter Station Site 3). Where the same landfall and/or converter station site are identified, these will need to be subject to further discussions on siting, design, mitigation and construction.	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.
NGV Nautilus	In addition, NGET's Development Consent Order for the Sea Link project should include the extent of works to the Friston Substation required to connect the Nautilus Project to the National Electricity Transmission System, together with the associated environmental mitigation scheme. In the offshore environment there may be further interfaces between the Nautilus Project and the Sea Link project. Depending on the preferred landfall and final route alignment, the Nautilus offshore cable may need to cross the Sea Link cable in order to connect to the Belgium energy island. If a subsea cable crossing is required, NGV would look to engage with NGET to identify suitable crossing points that minimise the effects on the environment, marine users and the respective projects. In summary, the NGV Nautilus Project recognises and supports the importance of the Sea Link project and will continue to work with NGET in relation to the Sea Link project with a continued focus on co-location and co-ordination	N	National Grid acknowledges these comments and will seek to maintain an ongoing dialogue with National Grid Ventures regarding interfaces and discussion around coordination of projects.

Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness? Comments			
Local community	In light of the recent attack on the underground gas pipeline (as to where responsibilities lie... still hypothetical and unresolved) I would raise the question as to why Sea Link should be sited in such a vulnerable position. If a gas pipeline can be disabled easily then so could the Sea Link cable and infrastructure.	N	As an operator of national infrastructure, National Grid commit significant resources and investment into maintaining the security of their sites and assets. National Grid liaise with the Department for Energy Security and Net Zero, other government departments and agencies, and law enforcement on security matters including the threat from hostile nation states, terrorism, and other security threats. Through these partnerships, appropriate protective security controls are identified and put in place to mitigate threats across their network. It follows government advice, industry standards and best practice, and the network is designed to allow for potential equipment failure or disruption and be able to continue to deliver safe, secure and reliable electricity. As new assets are built, significant changes are made to any site, or the threat landscape changes, security is considered/reviewed. National Grid is unable to comment further on security measures.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	I do have worries about 'state actors' (i.e. Russia) interfering with the cables. I would worry about the security, especially as the government has run the royal navy down to the level of a coastguard with two useless aircraft carriers!	N	As an operator of national infrastructure, National Grid commit significant resources and investment into maintaining the security of their sites and assets. National Grid liaise with the Department for Energy Security and Net Zero, other government departments and agencies, and law enforcement on security matters including the threat from hostile nation states, terrorism, and other security threats. Through these partnerships, appropriate protective security controls are identified and put in place to mitigate threats across their network. It follows government advice, industry standards and best practice, and the network is designed to allow for potential equipment failure or disruption and be able to continue to deliver safe, secure and reliable electricity. As new assets are built, significant changes are made to any site, or the threat landscape changes, security is considered/reviewed. National Grid is unable to comment further on security measures. The potential impact of the Proposed Project on public services is contained in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. This Chapter concludes that there are no likely significant effects on public services as a result of the Proposed Project.
Local community	Please take in account adequate surveillance and protection from sabotage e.g. by Russian Forces, etc.	N	
Local community	Do try to ensure that accidental or malicious actions do not damage the cable. I am thing of recent problems in the Baltic Sea.	N	
Local community	When the Russians or any other enemies have worked out where your high voltage direct current cable crosses the Concerto, Farland North, Mercator and Tangerine submarine cables, they will know exactly where to place subsea mines that will cut off both communications and power in the event that hybrid warfare ever moves to a hotter stage (You will doubtless recall that cutting undersea cables were among the earliest acts of both the First and Second World Wars. What are your plans for security and protection?	N	
Local community	As this will be part of CNI, have you properly considered the CT implications and associate risks, capabilities and plans to mitigate, those that exist currently to protect against Russian Subs attacking this underwater infrastructure. The RN manage this on a daily basis with other security services. This this will add extra burden on exhausted and broken public services and greater risk on the Kent Suffolk coastline.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Time to think again.		
Local community	Under sea cabling on this route is vulnerable to Russian Interference, suggest routed further towards London for protection by Navy.	N	
Q17 Anything else? Comments			
Local community	I am amazed that a country that is facing conflict with an aggressive enemy is not suggesting any protective measures for new infrastructure. Russia has shown, repeatedly, that they attack infrastructure (north sea gas) and the UK (Salisbury) you are planning critical infrastructure without a plan for protection???	N	As an operator of national infrastructure, National Grid commit significant resources and investment into maintaining the security of their sites and assets. National Grid liaise with the Department for Energy Security and Net Zero, other government departments and agencies, and law enforcement on security matters including the threat from hostile nation states, terrorism, and other security threats. Through these partnerships, appropriate protective security controls are identified and put in place to mitigate threats across their network. It follows government advice, industry standards and best practice, and the network is designed to allow for potential equipment failure or disruption and be able to continue to deliver safe, secure and reliable electricity. As new assets are built, significant changes are made to any site, or the threat landscape changes, security is considered/reviewed. National Grid is unable to comment further on security measures.
General commentary			
Local community	It seems insane in this volatile world to concentrate so much of our electricity infrastructure in such a small area making it very vulnerable to attack. Would it not be better to be spread over a wider area within the country to make it far more difficult to disrupt our electricity supply infrastructure.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The needs case for the Proposed Project has identified that a connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)

Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	What are the emergency measures for the Minster plant in the event of a catastrophic explosion and fire?	N	During operation National Grid will follow all relevant health and safety policies to reduce the risk of fire and explosion. All Proposed Project buildings will be constructed in accordance with buildings regulations which includes consideration of measures needed in the event of a fire or an explosion. Furthermore, a fire risk assessment will be carried out and the project buildings will be constructed in line with this risk assessment. All buildings are equipped with relevant fire suppression equipment and systems. In accordance with best practice, the fence line of all buildings is placed at a distance to contain an event, such as a fire or explosion, within its confines. Within the fenceline, vegetation is removed to reduce the possibility of the spread of fire. An Emergency Response Plan would be provided for operation and as part of this Plan, resilience exercises are conducted to test the systems and procedures. The fire and rescue service are a key consultee whom National Grid is engaging. They have had a chance to comment on the Proposed Project and National Grid will produce guidance for them for operation.
Q11 Do you have any comments or issues you would like us to take into consideration regarding our marine proposals?			
Local community	There is a real risk to the village of Friston from fire from this sort of project. The risk is twofold. If the substation was to catch fire as some do, the close proximity of the project to the village could mean that during a drought period any fire would spread quickly and put our lives at risk, especially if it happened at night. Secondly, these types of fires produce toxic fumes which could be extremely harmful if inhaled. I would hope that it would be mandatory if this project goes ahead that the substation has a suppression system fitted to mitigate any risk from fire. This area only has an on-call Fire & Rescue Service, so a major incident would not be attended that quickly.	N	During operation National Grid will follow all relevant health and safety policies to reduce the risk of fire and explosion. Friston Substation will be constructed in accordance with buildings regulations which includes consideration of measures needed in the event of a fire or an explosion. Furthermore, a fire risk assessment will be carried out and the Substation will be constructed in line with this risk assessment. It will be equipped with relevant fire suppression equipment and systems. In accordance with best practice, the fence line will be placed at a distance to contain an event, such as a fire or explosion, within its confines. Within the fenceline, vegetation is removed to reduce the possibility of the spread of fire. An Emergency Response Plan would be provided for operation and as part of this Plan, resilience exercises are conducted to test the systems and procedures. The fire and rescue service are a key consultee whom National Grid is engaging. They have had a chance to comment on the Proposed Project and National Grid will produce guidance for them for operation. In addition, there is no oil-containing equipment at Friston and so there is less risk of toxic fumes from the Substation.
General commentary			
Local community	This project will jeopardise the local Nuclear evacuation route from Sizewell.	N	National Grid is working closely with the Emergency Planning Department at Suffolk County Council with regard to emergency situations. During construction, a project-specific emergency evacuation plan will be provided and there will be no effect on the nuclear evacuation route from Sizewell.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	The potential for instability from drilling vibrations and as we now learn the use of extremely toxic chemical used in horizontal drilling are huge concerns. The poisoning of the Rivers Fromus and Hundred, and possibly into the Alde and aquifers is serious. This cannot be considered as green energy, when using such poisons.	N	The drilling fluid that will be employed by the Proposed Project is bentonite which is a chemically inert (non-toxic), naturally occurring clay. National Grid will not be conducting any trenchless construction near the Fromus, Hundred or Alde.
Local community	Electricity Substations have been known to catch fire. The environmental impact of such an occurrence would be catastrophic for our local area.	N	During operation National Grid will follow all relevant health and safety policies to reduce the risk of fire and explosion. All Proposed Project buildings will be constructed and operated in accordance with buildings regulations which includes consideration of measures needed in the event of a fire or an explosion. Furthermore, a fire risk assessment will be carried out and the project buildings will be constructed in line with this risk assessment. All buildings are equipped with relevant fire suppression equipment and systems. In accordance with best practice, the fence line of all buildings is placed at a distance to contain an event, such as a fire or explosion, within its confines. Within the fenceline, vegetation is removed to reduce the possibility of the spread of fire. An Emergency Response Plan would be provided for operation and as part of this Plan, resilience exercises are conducted to test the systems and procedures.
Substation Action Save East Suffolk	Substations and convertor stations can and do catch fire. When they do they emit toxic gases. This infrastructure will be surrounded by vegetation which will be very dry in the summer. Such a risk is unacceptable next to a village. A full fire safety assessment needs to be conducted including the impact of a serious fire upon the village of Friston in the summer months, when prevailing winds could drive the fire and smoke/gases towards the village across very dry vegetation. A similar assessment should be conducted for Saxmundham.	N	
Local community	The website of The Electrical Engineering Portal says: "The risk of fire in substations has been historically low, but the possible impacts of a fire can be catastrophic… These fires can also create a fire hazard to utility personnel, emergency personnel, and the general public." Given that the Friston substation will be huge and that the possible impacts of a fire "can be catastrophic", why are NG and SPR proposing to put this substation so close to a village?	N	The fire and rescue service are a key consultee whom National Grid is engaging. They have had a chance to comment on the Proposed Project and National Grid will produce guidance for them for operation. National Grid cannot comment on the rationale behind the siting of SPR's project at Friston because it is a separate company.
Local community	We understand that the GIS substation uses SF6 gas, sulphur hexafluoride. The website of the United States Environmental Protection Agency says: "(Yet), it is also the most potent greenhouse gas known to-date. Over a 100-year period, SF6 is 23,500 times more effective at trapping infrared radiation than an equivalent amount of carbon dioxide (CO2). SF6 is also a very stable chemical, with an atmospheric lifetime of 3,200 years. As the gas is emitted, it accumulates in the atmosphere in an essentially un-degraded state for many centuries. Thus, a relatively small amount of SF6 can have a significant impact on global climate change." The website of the Institution of Engineering and Technology says: "Sulphur hexafluoride (SF6) gas, renowned for its effectiveness in switchgear applications, is a critical part of any electrical infrastructure, However, it carries a drawback: its potent greenhouse gas properties. With a global warming potential (GWP) tens of thousands of times worse than carbon dioxide, and annual emissions growing (global SF6 emissions grew 24% between 2008 and 2018)[1], SF6 poses a real threat to the planet's climate stability and global warming."	N	It is the policy of National Grid to reduce SF6 gas within the electricity transmission system. For the Proposed Project the plan is to use a non-SF6 gas within the substation. A full description of the Proposed Project is contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid are unable to comment on the operational practices of Scottish Power Renewables.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	"Because of this, it is imperative for the data centre industry and other electricity intensive sectors to take the lead and champion innovative switchgear solutions that eliminate the use of harmful SF6 gas." Why are NG and SPR inflicting this environmental damage on East Suffolk in the name of combatting climate change, while simultaneously proposing to use the most potent greenhouse gas known in its equipment?

Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	What measures have been put in place regarding Electromagnetic fields? These can be damaging to health. How far are they likely to extend?	N	In the UK there are exposure limits in place to protect against EMF effects. Those exposure limits have been set independently by an international commission of scientists who carefully review all the research which has investigated EMF and health effects. There have been over four decades of research looking into whether EMFs can cause health effects, and there are no established effects below the exposure limits. All of National Grid's electricity equipment is designed to produce EMFs below the limits set by the Government that are in place to protect us all. This will be fully and publicly documented in the DCO submission, see **Application Document 6.5 Electric and Magnetic Field Compliance Report**.
General commentary			
Local community	Monitoring the electromagnetic field created by the station and cables is important as EMFs affect many birds' navigation.	N	The magnetic fields produced by cables are extremely localised. They reduce to below the level of the Earth's natural geomagnetic field around 1.8 m above ground (2.8 m form the cable itself), even when it is operating at full capacity. Given the low level of localised magnetic fields produced by the Proposed Project, there will be no significant impact on the navigation of birds.

Table 1.32 Community benefits/enhancements

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The purpose of Seal Link is to enable surplus power to be exported from Suffolk to Kent. It is not clear how this benefits Suffolk residents. Their environment is being destroyed to benefit power supply in Kent. Where is the mutuality in this?	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The needs case for the Proposed Project has identified that a connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.**
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	The proposal doesn't adequately explain why disrupting more landscape to build further inland is a good idea. No consideration for any obvious community improvements.	N	The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. 			• **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
Local community	I would strongly like you to take into strong consideration the following: (a) Undertaking a planned annual discount on energy bills for those living in the 10% most deprived LSOAs by Indices of Multiple Deprivation in the local authority Thanet District Council, Kent. (b) Undertaking a planned annual discount on energy bills for those living in the local authority Thanet District Council, Kent.	N	National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	I would like you to be more proactive on the benefits and also re-assure local residents on what upheavals and inconveniences will be attained to this project.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Local community	Suffolks east coast seems to have been targeted for industrialisation but with no employment benefits for the community.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Q17 Anything else? Comments			
Local community	We, the local residents get absolutely nothing from this building project.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Giving the kids locally some ownership on the works, with decent apprenticeships and opportunities to work on the developments. Take the idea to the schools so that the kids discuss it with parents when they get home. Involve the kids/locals in repairing the wildlife areas once the works are complete.	N	National Grid supports community benefit and believes that communities should benefit from hosting infrastructure. It has a number of existing programmes that deliver this; however, it is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Local community	National Grid will need to do far more to demonstrate what local benefits (not past window-dreaming) this National project can bring to Kent. And how these benefits will be sustained beyond the construction phase and bring enduring sustainable long-run community gain and benefit.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
General commentary			
Local community	The problem is that no-one wants the infrastructure near them! People who live next to wind turbines should have cheaper electricity. By the same token, communities who host converter stations, like proposed in Saxmundham, should receive a community benefit. The Town Council surveyed the population about their local improvement desires and the new Saxmundham Health One Stop Shop was the top priority. National Grid and Sizewell C should be making a substantial donation to help the NHS out as they do not have the funds to commit at present - despite the new building having passed the Project Initiation Document step with local, regional and NHSE level approvals being signed off. This is like a 'Planning gain' but it would generate local goodwill.	N	National Grid supports community benefit and believes that communities should benefit from hosting infrastructure. It has a number of existing programmes that deliver this; however, it is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Local community	The Community benefits you moot are derisory and insulting. To suggest Sea Link will benefit the community is offensive. You'll do nothing for the community and our much valued environment but destroy them.	N	National Grid supports community benefit and believes that communities should benefit from hosting infrastructure. It has a number of existing programmes that deliver this; however, it is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Local community	There are no economic benefits to the area of Suffolk planned to suffer the heaviest environmental disbenefits, and the most likely economic out-turn is that there will be a sharp decline in tourism income and the associated employment and economic multiplier effects. There will be no permanent new jobs as a result of the destruction and inconvenience over the next decade. As is customary, loosely defined and described 'community benefits' have been proposed,	N	National Grid acknowledge the fact that the Proposed Project has the potential to have adverse impacts across a range of environmental disciplines. A comprehensive ES has been prepared as part of the DCO submission. The ES summarises the findings of the EIA to inform decision-makers (in this case the SoS) about the environmental implications of the Proposed Project. National Grid acknowledges that the scale of operational employment generated is likely to be very limited. **Application Document ES 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	perhaps by way of subsidy to local authority bodies for discretionary expenditure, but these are insubstantial. Central government proposals for lower electricity costs for neighbourhoods destroyed (I believe the governmental term is 'affected') by poorly designed new infrastructure are out of the scope of this consultation and would not in any way compensate the community as a whole for their loss of amenity and environment.		**Economics, Recreation and Tourism** assesses the effects of the Proposed Project. It is anticipated that around 30% of the construction phase jobs would be taken by local workers. In addition to the direct employment generated by the construction of the Suffolk Onshore Scheme, there would be an increase in local employment arising from indirect and induced effects of the construction activity. Employment growth would arise locally through manufacturing services and suppliers to the construction process (indirect or supply linkage multipliers). Additionally, it is assumed that part of the income of the construction workers and suppliers would be spent in the Study Area, generating further employment (in terms of induced or income multipliers). National Grid supports the delivery of community benefits associated with transmission infrastructure, with a number of established programmes to deliver this; however, it is also expected that the forthcoming update to Government's position on the provision of community benefits associated with transmission infrastructure will determine their future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Local community	There are no meaningful sustainable jobs associated with these projects which would result in a net overall loss of employment.	N	National Grid acknowledges that the scale of operational employment generated is likely to be very limited. **Application Document ES 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism** assesses the effects of the Proposed Project. This identifies the likely effects of construction as being of a medium-term temporary nature. Although these jobs are temporary, they represent a positive economic effect for a substantial period that can be estimated as the function of the scale and type of activities required to construct the Suffolk Onshore Scheme.
Melton Parish Council	We do not feel there are any discernible community benefits, other than those seeming to mean some vaguely defined payments to local authorities, which we feel is inadequate to the scale of impact this industrialisation of our region will create.	N	National Grid supports community benefit and believes that communities should benefit from hosting infrastructure. It has a number of existing programmes that deliver this; however, it is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.

Q3 What do you think about how our proposal to connect into the existing network via the proposed Friston substation? Comments			
Local community	The time frame is of concern. SPR project has been delayed by 2 years and this rural area cannot cope with multiple projects.	N	The cumulative impact assessment for the Proposed Project was based on the most up-to-date information for other projects in the area. Information can be found in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Q18 Do you have any key concerns regarding the construction stage of Sea Link? Other			
Local community	Yes, I have many concerns regarding the construction of Sea Link which will cause disruption and destruction. But the bigger picture is worse, the cumulative impact will stretch over a wide area and a long timescale.	N	Cumulative impacts of the Proposed Project with other projects in the area are assessed in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	A time table (Gantt chart) of the plan is needed to consider impacts.	N	An indicative construction programme is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The design-life of the different Proposed Project elements are also provided. A detailed construction programme cannot be furnished until the construction contractors are appointed.
Local community	We also need detailed time scale as you indicate 24-30. 6 years. We need stage by stage timelines so that Kent residents can sort their future.	N	An indicative construction programme is provided in **Application Document 6.2.1.4 ES Part 1 Introduction Chapter 4 Description of the Proposed Project**. The design-life of the different Proposed Project elements are also provided. A detailed construction programme cannot be furnished until the construction contractors are appointed.
Local community	I am concerned about how long all these projects will take. I reckon it will take at least 10 years from now, which is just too long.	N	Cumulative impacts of the Proposed Project with other projects in the area are assessed in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. These documents consider the various timeframes of other projects in the area.
General commentary			
Local community	Given that the Friston substation is subject to JR, and Sizewell C is, despite our government's desire to impose it upon us, far from certain with costs reportedly already rising to over £40billion, why are two new infrastructure projects being consulted upon now that totally hinge on these developments. You are propagating anxiety in a community that is already under existential attack due to the amount of development being thrown at it.	N	The judicial review challenges at the Friston Substation have been rejected by the London Court of Appeal. The Proposed Project is a reinforcement project that is required to enhance the network due to the change in predicted generation and use of electricity by 2030. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The needs case for the Proposed Project has identified that a connection is required within the Sizewell area, therefore delivery outside of this area would not fulfil the network reinforcement requirement that the Proposed Project is intended to provide. Further information on the reasoning behind the connection location for the Proposed Project, the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project.** National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid recognises that the development, construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on people's mental health. Throughout the development phase of the Proposed Project it therefore tried to clearly communicate the proposals, including through the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid has sought to provide certainty on the plans wherever possible. A complete assessment of health and wellbeing effects has been undertaken. This is set out in **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing**. This concludes that there are no anticipated significant effects as a result of the Proposed Project.
RSPB	With regard duration of the works, we are concerned that no commitments are made to ensure that works are temporally co-ordinated as far as possible. Extending the duration of the works required at the landfall would increase the significance of noise and visual disturbance impacts as well as any direct effects on habitats at the landfall within Leiston-Aldeburgh SSSI and RSPB North Warren. Table 1.4.12 in PEIR Vol. 1, Part 1, Ch. 4 Description of the Proposed Project indicates that the duration of HDD drilling would increase from 125 days for one project to 250 days for three projects (assuming one drilling rig is used). Whilst this gives an indication of the additional duration of the work involved with co-location, this is only one aspect. We are also concerned about the sequencing of work and the potential for work to cross into several bird breeding/wintering seasons due to gaps between the installation of ducts for one project and cable pulling for subsequent projects. Repeated periods of disturbance (and any repeated impacts on habitats) would exacerbate the effects of the proposals on designated sites significantly, with a longer duration of	N	National Grid acknowledges your concerns regarding timeframes for construction. Impacts on birds are assessed in **Application Document 6.2.4.5 Part 4 Marine Chapter 5 Ornithology**. National Grid as part of its submission has produced a report on coordination which covers how it approached coordination with other projects with the aim of reducing the impact on the environment and local communities (see **Application Document 7.10 Coordination Document**). National Grid acknowledges the impacts on the landscape setting and visual amenity. Landscape and visual impacts are included within the Proposed Project ES in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified likely significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	impacts potentially more likely to result in longer term changes to breeding and/or wintering bird populations.		Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). All planting associated with the reinstatement of the landfall and HVDC and HVAC corridors will be maintained for a five year period. All mitigation planting associated with the permanent access road and Kent Converter Station and Substation will be maintained for the lifetime of the assets. Cumulative impacts of the Proposed Project with other projects in the area are assessed in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
RSPB	There is good evidence that the overwintering period for red-throated diver in the Outer Thames Estuary SPA runs from September through to April (not just from January to March) so within the SPA it is essential that this longer overwintering period is observed and that no construction, installation, maintenance or decommissioning activities, or any project-related vessel movements, take place within that period. If there is any possibility that such activities and vessel movements may occasionally need to take place in the SPA between September and April, a vessel management plan should set out detailed measures to include exactly what route or routes are to be used, how vessel operators will be made aware of the importance and sensitivity of the birds to disturbance, how vessel operators will recognise and steer clear of rafting birds and areas with high densities of birds, and how all such measures are to be monitored and enforced.	N	The Proposed Project is committing to a full seasonal restriction of 01 November to 31 March for marine installation works and a reduced seasonal restriction of 01 January to 31 March for landfall works. National Grid has engaged with Natural England regarding these restrictions. It has also produced **Application Document 7.8 Red Throated Diver Protocol** which is secured through Requirement 5 of Schedule 3 of the draft DCO **(Application Document 3.1**).

Feedback form			
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Our children are so upset about the proposals. What thought has been given to the lessons they will learn about environmental concern and care for wildlife. If these go further that I would like please do really consider a pedestrian crossing at the top of Church Hill by Manor Gardens to protect the children who live there. The alternative routes you suggest won't be built quickly. Your exploring vehicles here already caused disruption and danger on our road. It is not OK.	N	National Grid acknowledges your concerns. The EIA process undertaken for the Proposed Project is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that must be put in place. This is then discussed with the relevant statutory advisory services. **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** provides the results of the traffic impact assessment undertaken for the Suffolk Onshore Scheme. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q17 Anything else? Comments			
Local community	Key consideration should be given to: 1. Underground Ducting rather than pylons. 2. Create local jobs during the construction phase and beyond. The term of this project should see apprentices, graduate trainees from the area and upskilling. 3. Support the local economy and use local business and suppliers. This is an essential part of the scheme to see local business thrive on the back of infrastructure investment. 4. Fund the local community on environmental initiatives. Support funding for private solar installation, heat pump, etc. 5. A big issue locally for villages like Monkton and Minster is a lack of public transport. Support towards sustainable local public transport would be welcomed.	N	Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. National Grid supports community benefit and believes that communities should benefit from hosting infrastructure. It has a number of existing programmes that deliver this; however, it is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this. A complete description of the Proposed Project is contained in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q19 Do you have any comments about how we could deliver environmental mitigation and enhancement (such as hedgerow creation, native tree planting or funding local wildlife groups) as part of our proposals?			
Local community	Planting as many native trees and plants as possible. Regular monitoring of bird deaths through the massive pylons and cables, and measures to help combat this. Other wildlife monitoring, i.e. bats and installing as much wildlife friendly things as possible, i.e. owl box's and other roosting and nesting areas made possible. Lots of Barn owl boxes on stands. Having a living green roof to help capture the carbon and to help feed the wildlife which will have lost so very much. Maybe filter systems installed to help prevent pollution. The pylons will need to have deflectors and nest boxes for bats, ravens and other birds. Very careful management of water levels. Pumping of water must not be done at night to protect the eel population there. National grid must make public their survey	N	The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	results on the wildlife, water and flora at Minster Marshes. The mitigation work must be done well in advance of the construction works beginning to help the wildlife losing their habitat adjust.		Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	• Any mitigation works finally agreed such as scrub areas, trees and hedges must be planted in advance of starting any scraping of the existing site to give wildlife ready areas to move to if they must. • Buy land behind the proposed build to turn it into further managed wildlife areas to be managed by an independent community group. This should be planted with mixed native woodland, and scrubland with a focus on nightingales and turtle doves, which use the area extensively and are endangered species. • Find and purchase an additional 300 acres of wetland and give the land in perpetuity to the management of an NGO such as Kent Wildlife Trust or the Royal Society for the Protection of Birds. • Finish your surveys with RSPB and all the other groups and publish the results. • Undertake a flora survey by recognised experts in the field before making any decisions. • The buildings must have green living roofs to help to reduce impact of heavy surges of rain run-off and to allow butterflies and solitary bees to flourish. • There must be no crossed pylons creating a net effect. Pylons are a hazard to birds' flightpaths. • All Pylons must have nest boxes and platforms for birds. • Install bat and bird boxes. It is predicted that mosquitos will increase in marsh areas with climate change. Birds and bats will help in controlling their numbers. (If Terria have been doing this for years in collaboration with Omnia Italica, so can you). • Ensure any boxes do not face into the prevailing wind. • Replace damaged owl boxes. • Underground cabling or low level bridging across the river. • Low level access holes in all fencing to allow movement of mammals. • Brickwork to have bee bricks every 1 to 4 square metres • Create wildflower meadow areas with a management plan for maintenance (mow, rest and collect programme). • Seek professional advice about encouraging critically endangered European eels (The Stour and estuary are important for them). • Leave the beavers space to do their own land management around the river. • Ban the use of rodenticide outside buildings. • Limit the amount of hard standing areas and complete and publish your SUDS work.	N	The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	• Any lighting to switch off by 10.00pm at the latest. CCTV to be infra-red only. The whole island of La Palma in the Canary Islands uses orange spectrum lights for all public lighting to protect the resident bat population. If a whole island can manage it, NG can implement it on a single plant site. • Surround the boundary and all buildings where possible with native hedging as a barrier to noise pollution • NG must think about reuse and recycling at the outset of the project, not at the end. A detailed circular economy plan must be created to consider how all components will be reused at the end of life of the facility, rather them ending up in landfill like fibreglass turbine blades.		
Local community	If against better judgement this project was to be given the go ahead then I would expect an ambitious 'mitigation' plan from National Grid. I would want to see the construction phase done with as little disturbance as possible. The site needs to be located as far away from the SSSI as possible so that Badgers & Brown Hares etc can still access the remaining land. The site should include suitable nest boxes/platforms (suitable for Raven, Peregrine & Barn Owl in particular), living walls/roofs etc. Replace any lost hedgerows. Replace the lost dyke and add wader friendly water features/scrapes in the surrounding fields. The purchase of the SSSI Richborough strip and the area of the old Richborough Nature Reserve that is located beyond the wind turbine (reinstate the bird hide that has collapsed by the reed bed). I would like these to be given over to KWT, RSPB or similar organisation to be safe guarded for the wildlife and to be accessible to the public as the New Richborough Nature Reserve. A footbridge could be located at the side of the existing railway bridge, accessible from the old Richborough Nature Reserve, crossing the river Stour to connect with the Saxon Shore Way where you could walk back along the river to Sandwich avoiding the industrial area that currently blights the walk from Pegwell to Sandwich town. Further land on the walk back to Sandwich on the other side of the river across from the Energy park should be turned in a large nature reserve with another footbridge across the river that connects to the Sandwich Road. The land beyond the Converter site should be purchased by National Grid and be made into suitable wildlife habitat in a similar way to what has been achieved at Worth Marshes and Lydden valley as a template and with the ambition to achieve SSSI status. Any mitigation should be in the area surrounding the Converter site not miles away in another location.	N	The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Although it is good to see that there are plans for mitigation, these are not enough to outweigh the damage that will be done to the wildlife in the area. You cannot expect the wildlife to move to the areas that you have designated for them - it doesn't work like that. Also the disruption that will be caused by all the construction work will cause a great deal of distress and suffering. No amount of mitigation will compensate for what you will destroy.	N	The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	You could provide financial compensation to all who own property near the proposed sites whose properties will devalue due to your plans.	N	This text provides a joint response to the feedback. The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project. Where planting areas do not conflict with construction compounds and activities, advanced planting will be undertaken in the first available planting season prior to construction commencing. These areas will be developed in detail as part of the detailed landscape and ecological management plan but, subject to contractor discussions, could include the areas identified on Figure 3 Minster Converter and Substation Outline Landscape Mitigation - Timing of Planting within **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**. Impacts on ecology are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. National Grid is committed to a trenchless construction for the construction of the cable under the Sandwich Bay and Hacklinge SSSI. This commitment is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Mitigation measures are listed in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Planting hedgerows, trees, and providing wetland habitat must be established before removing existing habitat. To compensate for the loss of all habitats further land in the immediate area should be purchased to provide safe areas for wildlife in perpetuity. Other considerations should include no pylons creating a 'net effect', pylons should include next boxes, a viable wildlife corridor is maintained linking Pegwell Bay to the rest of the Stour Valley.	N	
Local community	If National Grid is serious about their commitment to mitigation, compensation and enhancement that would include a biodiversity net gain of 10%, on the pre-development baseline, then it will need to work with local organisations and experts, other stakeholders including those who are directly affected by this process, to ensure every effort is taken to gather data relating to the ecology of the area. This would need to include wildlife not only on the site but that which might pass through, given that the area is an important 'corridor-habitat' linking the National and Internationally protected marine environments of the Thanet Coast and Sandwich Bay Special Protection Area, Special Area of Conservation and Ramsar site, Sandwich Bay and Heckling Marshes SSSI, Sandwich and Pegwell Bay National Nature Reserve, inland to the Stodmarsh SSSI. The proposed Sea Link development will seriously impact upon this vital 'corridor', a 'corridor' so important that its significance is clearly demonstrated upon viewing drone footage of the area. Disturbing and encroaching on this 'corridor' will directly and indirectly impact upon the many species which use the Minster Marshes SSSI permanently or for periods of time to feed, rest, bred or pass through on their way to other areas of the UK and/or the rest of the world. Details records and extensive footage exists of the type and extent of wildlife within the SSSI and surrounding area, all of which I believe would be made available to the NG. The area is also an essential place for birds to move inland at hightide or in bad weather and as an aerial view would indicate, they have few places to go that could offer the same quality of habitat. The convertor and substation will be built on what is effectively a field	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	which has been appropriately managed to encourage a rich biodiversity and this should be fully recognised by National Grid.		
Local community	The developer must absolutely minimise removal of hedges/trees etc for temporary works. I have seen on other projects significant deforestation for temporary construction compounds. These trees may have low biodiversity value but their amenity value to the local community should not be underestimated. For example if a construction haul road needs to go through a hedge, the opening cut in the hedge should be as narrow as possible (i.e. one vehicle width) and traffic management applied if necessary. It is too easy for construction teams to cut things down to make their short existence on site easier for themselves; this requires careful management and close oversight to avoid. Mitigation planting is not enough if removal could be avoided in the first instance.	N	Following Statutory consultation, National Grid undertook a survey of all trees within the Order Limits of the Onshore Scheme. **Application Document 6.10 Arboricultural Impact Assessment** details how trees located within and immediately adjacent to the Order Limits will be protected and what mitigation measures are embedded in the design to offset the loss of trees. Careful attention has been paid in the design and construction programme/methods for the Proposed Project to the possibility of habitat severance. In the coastal zone this will be avoided through use of a trenchless construction solution. In those areas away from the coast, which will be crossed by open trench, a series of protected species surveys have been undertaken to inform mitigation measures and the works will be undertaken in such a way as to retain connectivity, such as through the inclusion of mammal ledges in culverts and hurdles or similar to close gaps in hedgerows overnight for bats. The cable will be buried as each section is installed and habitats restored above the cable. Further details are contained in **Application Document 2.12.1 Trees and Important Hedgerows to be Removed or Managed Plans - Suffolk and Application Document 2.12.2 Trees and Important Hedgerows to be Removed or Managed Plans – Kent**.
Local community	These would not be required if you listened to our feedback. Many credible alternative proposals have been made, but we see little evidence of these being properly assessed. National Grid's response is generally to dismiss them out of hand "too difficult", "too expensive", "offshore shipping lanes", "offshore breeding grounds". Most of these "constraints" have subsequently been overcome by other energy projects.	N	The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'.
Local community	Help local landowners to plant woodland and hedges. Help to maintain existing footpaths and to create more wheelchair friendly footpaths in local area.	N	
Local community	Creating habitats on land where there were none before is a gain. However, you can replace habitats which have been in place and developed over hundreds of years with new habitat, but these will not contain the same biodiversity. I suggest contracting a specialist firm to overhaul and consider the environmental impact. The habitat and mitigation should be suitable and relevant to the area.	N	
Local community	Since the scheme involves 130km under the sea, disturbances of Pegwell Bay I would like some contribution to preserve the unique heritage and ecosystem of the Goodwin Sands. The Goodwin Sands conservation trust Goodwindsands.org.uk is a vital influential trust and only crowd funded. A generous donation would help to preserve this natural grace to 2,000 ships and 50,000 souls as well as helping the work to protect its ecosystem.	N	
Local community	The developer must absolutely minimise removal of hedges/trees etc for temporary works. I have seen on other projects significant deforestation for temporary construction compounds. These trees may have low biodiversity value but their amenity value to the local community should not be underestimated. For example if a construction haul road needs to go through a hedge, the opening cut in the hedge should be as narrow as	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	possible (i.e. one vehicle width) and traffic management applied of necessary. It is too easy for construction teams to cut things down to make their short existence on site easier for themselves; this requires careful management and close oversight to avoid. Mitigation planting is not enough if removal could be avoided in the first instance.		
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	I just would like National Grid to be responsible and take more care to protect the landscape, its character and setting, but also ensure it doesn't impact the biodiversity of the area, but greatly improve it. It would be great to see that, along with providing all the infrastructure, National Grid went above and beyond and provide benefits to both the local wildlife and the locals. Improvements for locals may be more access to countryside via new PROW's or green spaces near the area.	N	The special nature of the landscape around the Proposed Project is acknowledged by National Grid. The effects arising from the Proposed Project on landscape and visual aspects have been assessed in **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. These Chapters include proposed mitigation measures that have been embedded in the design to minimise the effects. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
Local community	Consideration should be given to: - Underground ducting and cabling rather than pylons and overhead lines. This may cost more, but we then don't have to look at a significant number of large pylons. - Enhancement to the local economy by ensuring principal contractors are required to use local supply chain and contractors within 5 miles of the development. Targeting the use of 70% local business will add real values to the local economy. - s106 funding made available to enhance green public transportation and build a sustainable environment.	N	Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. The nature of the construction and installation work is highly specialised and National Grid cannot guarantee that contractors will be sourced from within five miles of the Proposed Project. The mechanism for determining the environmental mitigation that National Grid put in place is the EIA; the outcome of the EIA informs National Grid where mitigation will be required. This could include modifications and/or enhancements to the transport network. Furthermore, National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach.
General commentary			
Local community	In order to appropriately mitigate a full, transparent, open, honest and thorough biodiversity/ecology assessment needs to be undertaken over the course of an entire year. It needs also to involve local experts, residents and other skate holders including landowners who will be directly affected by this as well as other statutory and non-statutory organisation. Any identified mitigation should be in place before construction begins, so any displaced wildlife will have somewhere to go. This also needs to be appropriate to need.	N	An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants over appropriate timeframes. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Details are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Ongoing monitoring of the success of mitigation needs to be undertaken.		place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. Where planting areas do not conflict with construction compounds and activities, advanced planting will be undertaken in the first available planting season prior to construction commencing. These areas will be developed in detail as part of the detailed landscape and ecological management plan but, subject to contractor discussions, could include the areas identified on Figure 3 Saxmundham Converter Station Outline Landscape Mitigation - Timing of Planting within **Application Document 7.5.7.1 Outline Landscape and Ecological Management Plan – Suffolk** and Figure 3 Minster Converter and Substation Outline Landscape Mitigation - Timing of Planting within **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**. These Plans contain details of the monitoring and management of any mitigation and/or reinstatement.
Local community	NG's document asks "How we could deliver environmental mitigation and enhancement" and suggests planting hedgerows and trees, or funding local groups. Hedges and trees are hugely valuable in their own right, but are a completely different habitat to wetlands, supporting a completely different population. The suggestion that they would provide compensation for the loss of marshes is laughable. Likewise I'm sure many local groups could make good use of extra money, but no amount of cash can redirect migrating birds as if they were inbound aircraft.	N	National Grid acknowledges the concerns. Suggestions were made in the feedback form as a guide only. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency.
Suffolk Wildlife Trust	Given the scale of the proposals and potential ecological impacts, we seek reassurance that the mitigation hierarchy – with a first step to avoid ecological impacts, before mitigating, compensating, and enhancing – will be applied at every stage in the development, design, and implementation of the Sea Link project proposals to minimise the risk to protected wildlife and sites of nature conservation value.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works.
Kent Wildlife Trust	The saltmarsh hasn't recovered from the impacts of Nemo Link. These negative impacts and failed mitigation should be addressed in the Sea Link documents and be used to inform how National Grid propose more adequate measures to ensure the recovery of the saltmarsh and other impacted habitats. All previous environmental damages caused by the Nemo Link needs to be highlighted to understand how to better mitigate the impacts of Sea Link. Likewise, we requested to see the evidence that supports National Grid's claim that the mudflats have recovered from the environmental damages caused by Nemo Link.	N	National Grid acknowledges these comments, however, it is not clear where this claim is made in order to respond directly. National Grid is committed to a trenchless solution beneath the sensitive saltmarsh habitat at Pegwell Bay and it has not included the option of a trenched installation. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). While the Proposed Project team have listened carefully to the points raised by Kent Wildlife Trust with regard to the Nemo Link, this was a separate project which assessed a different installation methodology to that of the Proposed Project.
Kentish Stour Countryside Partnership	We are a not-for-profit organisation working in Countryside Management. We have implemented several projects aimed at enhancing wildlife habitat in or near to the Sea Link project area. These include: * Installation and annual surveys of barn owl boxes	N	National Grid acknowledges the projects you have undertaken in the area of the Proposed Project. The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	* Installing fencing to facilitate conservation grazing at Weatherlees SSSI If funding for mitigation schemes were to become available, we would like to be considered for implementing such projects. Priority species for conservation in this area include: * Water vole Arvicola amphibius – the lower Stour marshes contain a nationally important population, main threat comes from American Mink * Barn owl Tyto alba – overhead power cables represent a collision hazard for adult birds * European Eel Anguilla anguilla – passage between the Stour and nearby drainage channels is limited by water level control structures managed by the Environment Agency * Shining Ramshorn Snail Segmentina nitida – periodic surveys have demonstrated significant reductions in extent of local population * Turtle Dove Streptopelia turtur – severe population decline nationally, breeding pairs are still found in East Kent. RSPB have a project officer engaging with local landowners		Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'.
Local community	We have the opportunity to be innovative with the sea's biodiversity, putting the sea into the centre of conservation. Sea Link construction is essential for producing renewable energy and is important in and of itself. But we are also presented with an opportunity to be innovative with other Green technology, capitalize on the BNG credits system and take carbon sequestration above statutory levels, all to produce real gains for the environment. I suggest a few solutions: Carbon sequestration above the amount you are creating in the construction process. Consider sea weed farms between the windmills. This is a great way to increase employment for fisherman in the area and produce a new local market for seaweed sales in food and cosmetic production. Margate already has a seaweed-based cosmetics company. You can also create blue carbon credits. Seaweed sequesters more carbon more quickly than forests. We need huge seaweed farms to be planted to help sequester the carbon made by the construction industry. The seaweed farms also support species such as stalker jelly fish and other threatened species. There are several wins for the local community and the planet. In addition to the commercial use of seaweed, waste seaweed can be collected for biochar feed stock. There is ongoing research in Northern Ireland where farmers are using seaweed biochar as natural fertilizer on their farms. Biochar also helps reduce rainwater runoff and filter nutrients from farms, which can be damaging to the sea. Biochar Pyrolysis is a green technology to get rid of waste while capturing CO2 and producing no methane. Kent has several	N	National Grid acknowledges the projects you have undertaken in the area of the Proposed Project. The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. **Application Document 6.2.4.2 Part 4 Marine Chapter 2 Benthic Ecology** appraises the disturbance of the seabed (and its recoverability) and recruitment of habitat dependant species back to the location of the cable lay as having no significant effects. Although some conservation measures have been adopted in other parts of the Order Limits, this does not conclude further offshore mitigation in regard to benthic habitats. National Grid note that seaweed farms have been utilised on other projects, however, in this instance where the cable is passing through different habitat largely soft mobile sediments, seaweed farms would not be a suitable like for like habitat mitigation.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	areas of farming which could also be a part of this new innovation. I know of investors who are interested in expanding this technology in the UK. Of interest, Amazon has funded the largest seaweed farm in the Netherlands between windmills in the North sea. This has become an area for scientific research. We could create a similar and even more ground breaking project in Margate. Grant opportunities are available in the Amazon Environmental fund.		
Local community	Rewilding: Improve the outcomes for blue mussels and stalker jelly fish which are under threat in this area- Natural England has shown this in recent surveys. Rewilding seaweed in the near shore can help this. We can improve oyster stock through rewilding as well– similar projects are running in Scotland and Wales.	N	National Grid acknowledges the projects you have undertaken in the area of the Proposed Project. The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'.
Local community	Support introduction of wild life such as beaver in the Pegwell Bay area to help restore damaged marsh and ultimately aim to expand the marsh by engaging groups such Kent Wildlife Trust, Blue Marine Foundation and Project Sea Grass. I know that Kent Wildlife Trust is very unhappy about you disturbing this fragile habitat. The expansion of the marshes can help with needed flood defences, increase biodiversity and provides water filtration from farm run off. So, the plan must be to make this area even bigger and more diverse than it is now. We must also do what we can to not damage the chalk reef, which leads back to your directional drilling method as being essential and the benefits of this method being clearly laid out to the community.	N	National Grid acknowledges the projects you have undertaken in the area of the Proposed Project. The Proposed Project team greatly appreciate the insights of the local communities in how they can best mitigate any residual impacts on the environment and enhance the environment further than its baseline condition. The EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area, which then determines the mitigation that National Grid must put in place. This is then discussed with the relevant statutory advisory services such as Natural England, Historic England and the Environment Agency. With regard to the feedback of the local community described in this report, this has been provided to and read by the environmental specialists who are responsible for determining the mitigation measures to be put in place, and is actively being considered within the relevant Management Plans to be provided to the Main Works Contractors'. National Grid is committed to the use of trenchless construction solutions within Pegwell Bay for the construction of the landfall and the cable. This commitment is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
Local community	Measure the carbon and biodiversity loss accurately through your whole process including the materials you are using. The biometric 4.0 will help you measure your baseline, losses and potential gain through various ecological strategies, but also you can use the metric to measure the costs of the materials you are using in construction. This will help you understand the real costs incurred and set higher goals for biodiversity and carbon sequestration. Seaweed farms, rewilding habitats and expanding marsh land can all improve carbon sequestration, increase biodiversity beyond what has been damaged and contribute to needed flood defences. Looking at your whole biodiversity loss and gain cycle is possible with the biodiversity metric 4.0 from Natural England and will go far in helping you engage with the conservation community. I have links with businesses who do both these things.	N	The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	By kickstarting several projects in order to meet your own BNG requirements, further BNG credits can be created locally, which can help the housing agenda. The construction industry is set to the be the leader in how we manage human needs in balance with nature. Kent has a target of just under 200,000 new homes to be built over the next decade. These developers are going to need biodiversity credits. You can be a trail blazer in helping kickstart this market for Thanet.	N	Where possible, the Proposed Project will deliver Biodiversity Net Gain offsite at scale through partnerships and seek to provide value-added Biodiversity Net Gain with wider benefits to ensure best value for money from consumer-funded Biodiversity Net Gain. Other options are by the purchase of Biodiversity Net Gain commercial units or statutory credits but as a last resort.

Table 1.35 Consultation

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q9 Are there any other ways that you would like us to explore coordination with other projects?			
Local community	It is vitally important that you have meaningful discussions with Kent and Suffolk Wildlife Trusts, they should be a key part of the process. It is vital that you come up with the right answers for wildlife and for that to happen there is a key role for both the Kent and Suffolk Wildlife Trusts, you really do need to work with them for the best outcomes for wildlife. We need to ensure that this project doesn't make the decline in wildlife any worse. You need to consider the best outcomes for saving habitats and their wildlife.	N	National Grid has engaged with both Suffolk and Kent Wildlife Trusts throughout the development of its proposals. National Grid has treated both Trusts as non-prescribed consultees, and therefore consulted them as part of both the Statutory and Targeted consultations.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Yes, you need to present the complete picture of energy projects in this area, not just isolated projects. The area is subject to multiple large scale energy projects all over the same time period which surely means decades of works - all detrimentally impacting the residents and businesses.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk (see Section 4 of **Application Document 5.1.6 Appendix E Statutory Consultation**). These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. Additionally, the cumulative effects of the Proposed Project and the other projects planned in Suffolk is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**.
Local community	You need to present all your Energy Plans. Combine projects on wind and Sizewell and join together consulting the local community.	N	National Grid is not an electricity generator in its own right – its role is to ensure that power can be transported from where it is generated to where it is needed. Whilst National Grid Ventures, a legally-separate part of the National Grid Group, is responsible for two energy projects planned in East Anglia (the LionLink and Nautilus interconnectors), the range of other energy projects being planned in East Anglia are being developed by different private developers. National Grid considered the cumulative effect of these other projects when developing its plans for the Proposed Project, with more information available for Suffolk in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. It has additionally considered the potential for coordination of their proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham converter station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures projects. That said, it is not possible to bring all these different projects forward at the same time as they are at varying different stages of development. For example, projects such as Sizewell C, East Anglia ONE North and East Anglia TWO have all had their applications for development consent approved. The Proposed Project has now submitted its DCO application, whilst National Grid Ventures' LionLink and Nautilus interconnectors are at a much earlier stage of development. Delaying the more advanced projects in this area to

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets.
Local community	I would like you to be more proactive on the benefits and also reassure local residents on what upheavals and inconveniences will be attached to this project. I would like you to counteract that you will not be damaging the environment At the moment nimbys and people who don't want the project have stolen the narrative but you never counteract their claims of devastation and environmental damage.	N	The Proposed Project will reinforce the electricity transmission network between Suffolk and Kent, helping to connect new sources of renewable and low carbon power to homes and businesses across the UK. In turn, this will contribute to the UK meeting its legally binding net zero targets, which will ensure that the worst effects of climate change are avoided. National Grid recognises that the construction of the Proposed Project will result in disruption to the environment, and to communities living and working in the Proposed Project's vicinity during the construction phase. As part of the pre-application public consultations, it has shared detailed information on these impacts and the steps it is taking to mitigate and manage them. More information on this topic is included within the ES that forms part of the Application for Development Consent **Volume 6**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Whilst the Proposed Project will result in some adverse impacts to the natural environment, it will deliver a minimum of 10% Biodiversity Net Gain, meaning that National Grid will leave the natural environment in the vicinity of the project in an overall better state than it was before. Further details relating to the ecology assessment are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity** and **Application Document 6.6 Habitats Regulations Assessment Report**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	We appreciate the effort being made to consult and to inform us.	N	National Grid welcomes the respondents' views and is pleased that they welcomed the consultation activity undertaken.
Local community	I feel public consultations and rapid-fire online seminars full of jargon are a PR exercise rather than a genuine attempt to gauge the impact of these projects.	N	National Grid has carefully considered all feedback submitted in response to its pre-application public consultations when developing its plans. Throughout the development of the proposals, it has sought to show how feedback has informed the development of the plans. For example, the Project Overview Document published as part of the Statutory consultation specifically addresses how feedback had informed changes to its plans, whilst the Non-Statutory Consultation Report published at this consultation considers in further detail feedback received to the Non-statutory consultation. This Consultation Report provides a detailed analysis of feedback received to National Grid's pre-application public consultations on the Proposed Project, along with how this feedback informed the development of its plans. When undertaking its pre-application consultations, National Grid sought to avoid the use of jargon and technical terms wherever possible. Where present, it endeavoured to define any unfamiliar technical terms as part of its consultation materials. Additionally, it produced materials with the specific purpose of explaining the proposals in as non-technical a manner as possible. These documents include the Project Overview Document – 10 minute read and the Preliminary Environmental Information Report – non-technical summary, both of which were published as part of the Statutory consultation.
Local community	Listen to public opinion.	N	National Grid has listened extensively to the views of stakeholders and the wider public throughout the development of its proposals. This Consultation Report provides an account

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			of how National Grid has responded to feedback throughout the development of its proposals, including where this feedback has resulted in a change in the plans for the Proposed Project. National Grid has also demonstrated how it has had regard to feedback throughout the pre-application process. As part of the Statutory consultation in 2023, it set out how it had responded to the key themes from Non-statutory consultation feedback. It also published a detailed Non-Statutory Consultation Report as part of this consultation. As part of the subsequent Targeted consultation, the Project Update Document set out some of the key themes of Statutory consultation feedback, and again set out how National Grid was responding to these comments.
Local community	The red lines on the maps are very confusing, the key indicates that they are the 'draft Order Limits' but there is no mention of what this is and what single red lines represent. In addition, within the red lines are other areas of red lines but it is not clear if these exclude these areas or not. I am aware that there are protected woodlands and ancient monuments and it maybe that these are within these red lines. Greater detail would be helpful. In addition, although the maps do show a number of important marine and coastal areas, it does not show the site of the Minster Marshes SSSI and I cannot believe this is an oversight worryingly.	N	National Grid has endeavoured to provide an explanation of any unfamiliar terminology throughout its consultation materials. For example, on both page 31 and page 35 of the Project Overview Document published as part of the Statutory consultation, it explained what the Draft Order Limits represent. The Project Overview Document also explains other technical terminology where applicable. It is of note that Minster Marshes is not a SSSI. The statutory designation of SSSI is for the Sandwich Bay and Hacklinge Marshes. The location of this SSSI was shown on some plans within the Project Overview Document published for the Statutory consultation, but National Grid acknowledges that the map of the proposals around the converter station and substation does not include the SSSI. However, other maps of the proposals around the converter station and substation published as part of the consultation did include the SSSI. Additionally, it is worth recognising that the Proposed Project is located adjacent to the SSSI, and that the proposed converter station and substation are not located within the SSSI itself. Further details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.3 Part 3 Kent Chapter 3 Cultural Heritage**.
Local community	There has been no joined up plan since the licenses for the wind turbines were issued. There are too many consultations and plans by too many stakeholders that has caused confusion, frustration and anger.	N	The development of offshore wind farms is outside of National Grid Electricity Transmission's remit and is a matter for the Government. National Grid considered the cumulative effect of the Proposed Project and other projects being progressed in the local area when developing its proposals, with more information available in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. It additionally considered the potential for coordination of its proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham Converter Station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures projects. It is not possible to bring all these different projects forward at the same time as they are at varying different stages of development. For example, projects such as Sizewell C, East Anglia ONE North and East Anglia TWO have all had their Applications for Development consent approved. The Proposed Project has now submitted its DCO application, whilst National Grid Ventures' LionLink and Nautilus interconnectors are at a much earlier stage of development. Delaying the more advanced projects in this area to allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets.
Local community	If this is the last chance for public consultation I do not think it has sufficient detail and many aspects of the information provided seem to be not fully developed.	N	The purpose of the Statutory consultation is to present proposals for a project prior to their finalisation, so that consultation feedback can inform the development of plans ahead of the submission of an Application for Development Consent. As such, it is appropriate that information, such as the Preliminary Environmental Information Report, was not final at the time of the Statutory consultation. Whilst National Grid welcomed views on all aspects of its proposals during the Statutory consultation. There were areas where its proposals were less developed as it was seeking consultation feedback on these specific areas. These areas included the architectural approaches to the proposed converter stations. If National Grid's proposals in these areas had been more developed at the time of the Statutory consultation, then this could have prevented feedback from helping to shape its plans. Whilst National Grid's proposals were not final at the time of the Statutory (or subsequent Targeted) consultations, it is worth noting that the level of detail in documents published at the Statutory consultation was much greater than that published at the Non-statutory consultation. Although it was expected at the time of the Statutory consultation that this would be the final round of public consultation, National Grid subsequently made a series of changes to its plans which it decided to consult on as part of a further Targeted consultation. Outside of these two consultations, National Grid has and will continue to engage with local authorities and other technical stakeholders with regard to its plans.
Local community	You have, rather, carefully not described these proposals (with your alternatives suggesting a done deal) along with the many other proposals, which include a nuclear power station among others. The blight on our lives, the economic impact, the possible long term decline in local tourism and local quality of life for residents and retirees means this already fragile economy is at risk alongside the ecosystem. This is short sighted and feels a bit like your consultation is being 'done by numbers" because you must, not with genuine thinking about how to do this better for everyone. So many projects have been presented separately one might begin to think that this was the only co-ordination- to blindside the local population. Please do not bamboozle us.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the Proposed Project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. National Grid considered the cumulative effect of its proposals alongside other projects planned in their vicinity in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. It has additionally considered the potential for coordination of its proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham Converter Station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures projects. That said, it is not possible to bring all these different projects forward at the same time as they are at varying different stages of development. Delaying the more advanced projects in this area to allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	It was extremely disappointing that Broadstairs was the only main Thanet town ignored in the consultation as there are many residents in Broadstairs very concerned about this proposal, indeed they are some of the main contributors to the Save Minster Marshes campaign. There were no materials or feedback forms deposited at the Broadstairs Library or elsewhere in the town. Broadstairs is closer geographically to the proposed site than Margate or and Ash. My final plea is to work closely with the community, over and above what you are required to do to satisfy the Planning Inspectorate. Appointing a local advisory group would be beneficial to both parties. I am afraid your lack of local knowledge of this very sensitive site is glaringly obvious as shown in your consultation meetings and documents.	N	When preparing for the Statutory consultation, National Grid consulted the relevant host local authorities on its public consultation plans through a draft Statement of Community Consultation (SoCC). As part of this process, it set out two proposed Consultation Zones, including a Primary Consultation Zone and a Secondary Consultation Zone. Much of Broadstairs was included within the Secondary Consultation Zone, which was targeted by promotional activity that included advertising in local newspapers and on social media. Whilst National Grid placed copies of consultation materials at Broadstairs Library during the Non-statutory consultation, it elected to remove this location from its list of deposit points at the Statutory consultation due to the low level of interest it had seen for paper copies of consultation materials at Broadstairs Library. No comment was made by local authorities as part of the draft SoCC consultation on National Grid's proposal to not use Broadstairs Library as a deposit point or to not hold public information exhibitions in Broadstairs. However, a request was made to add Thanet District Council's offices and Thanet Gateway to the list of deposit point locations, which National Grid subsequently fulfilled. A total of three public consultations on the Proposed Project took place during the pre-application phase, which is in excess of the single statutory consultation required under the Planning Act 2008. In addition, it has engaged local authorities on behalf of their residents throughout the pre-application process, with regular meetings both during and outside of formal consultation periods. National Grid will continue to engage with local authorities now the Application for Development Consent has been submitted, thereby ensuring that the views of local residents continue to be represented throughout the planning process.
Local community	This whole process has been extremely stressful and confusing its seriously affected my mental health the fact that you would come into a place so special and build such a monstrosity. I have spent many, many hours going through all your paperwork, talking to others and trying to get my head round this whole process. The public exhibition staff act like this is a done deal; there's no alternative which is extremely unfair as this is a proposal. Many of the illustrations and in particular the 3D modelling are very misleading by making the area look mostly green and the development look much smaller when in reality there is already other plant development in the area how much of existing has been destroyed.	N	National Grid recognises that the development, construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on people's mental health. Throughout the development phase of the Proposed Project it therefore tried to clearly communicate the proposals, including through the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid has sought to provide certainty on the plans wherever possible. Several alternative options were considered when developing plans for the Proposed Project, with details of these alternatives shared as part of the pre-application public consultations. For example, as part of the Strategic Options Report, National Grid set out how it considered connections to the Sellindge, Richborough and Canterbury areas. These areas were considered because the existing electricity transmission network is between Kemsley and Lovedean, meaning that any reinforcement must connect between these two locations. A connection in the Isle of Grain or Kingsnorth, two of the alternative locations suggested by stakeholders, would therefore not reinforce the network in the right place. Further details are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. A connection close to Richborough was found to offer environmental and socio-economic benefits over connecting in the Canterbury area, whilst a northern Kent landfall was found to be significantly constrained. At Richborough, National Grid also found opportunities to locate the converter station and substation close to the existing network and similar infrastructure. Whilst National Grid presented defined proposals during the Statutory consultation, these proposals were not final and it actively sought feedback, including at public information exhibitions, to help develop its plans further. This feedback, together with the results of environmental assessments, led to several changes to the plans being made following the Statutory consultation that led to National Grid choosing to hold a further round of Targeted consultation. The 3D model available at the public information exhibitions was one of several tools utilised by National Grid to help explain its proposals. In developing the model, National Grid has

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			sought to balance the need to show other nearby infrastructure, such as that at Richborough Energy Park, with the need for the model to be at an appropriate size. To include all local developments would have required either a larger model or the scale of the map to be reduced, which would have made the model more difficult to view.
Local community	Most importantly within all your plans you have submitted you have mentioned ZERO mitigation or biodiversity features of your build. I feel this shows your true colours as one of the largest investor-owned companies on the planet paying billions to the shareholders every year.	N	National Grid has committed to delivering a minimum of 10% Biodiversity Net Gain through its proposals. The measures it is proposing to deliver this Biodiversity Net Gain were set out during the Statutory consultation as part of the PEIR, with reference to National Grid's commitment to delivering at least 10% Biodiversity Net Gain included within the main Project Overview Document. As part of the Application for Development Consent, National Grid has also submitted a Net Gain report, refer to **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. The assessment of ecological impacts is considered in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Half a dozen projects all arriving at the same time on the Suffolk Heritage Coast is horrific. We are struggling to understand and keep up with all these separate proposals. All these different consultations over five years and to keep on giving feedback which seems to be ignored.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. National Grid considered the cumulative effect of its proposals alongside other projects planned in their vicinity in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. It has additionally considered the potential for coordination of its proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham Converter Station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures projects. National Grid has listened extensively to the views of stakeholders and the wider public throughout the development of its proposals. This Consultation Report provides an account of how National Grid has responded to feedback throughout the development of its proposals, including where this feedback has resulted in a change in the plans for the Proposed Project. The way in which National Grid has had regard to feedback has been demonstrated during the pre-application process. As part of the Statutory consultation in 2023, it set out how it had responded to the key themes from the Non-statutory consultation feedback. It also published a detailed Non-Statutory Consultation Report as part of this consultation, whilst the Project Update Document produced for the subsequent Targeted consultation set out some of the key themes of Statutory consultation feedback, along with how National Grid was responding to these comments. National Grid recognises that the development, construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			people's mental health. Throughout the development phase it has therefore tried to clearly communicate the proposals, including through the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid has sought to provide certainty on the plans wherever possible. When developing new infrastructure projects, National Grid always tries to avoid communities and individual properties as much as possible. As part of the pre-application process, it has set out through documents, such as the ES, which areas may experience an adverse impact as a result of the Proposed Project. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on retained property will be considered in line with the Compulsory Purchase Compensation Code. Compensation claims for other disturbance are considered on a case-by-case basis if there is evidence of negative impacts as a result of the Proposed Project.
Local community	We need to see the big picture of how your proposals fit with all the other energy projects. Timelines and integration. How will all projects be working together to minimise the impact on tourism and road capacity to name just two concerns. The public in this area is disempowered and unable to keep up with everything going on. It doesn't help that your online webinar recently got cancelled and many people who would have attended that could not attend the walk-in consultation events.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk. These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. The cumulative effect of National Grid's proposals alongside other projects planned in their vicinity in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. It has additionally considered the potential for coordination of its proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham Converter Station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures project Whilst the webinar advertised for 31 October 2023 had to be postponed due to technical difficulties, it was subsequently rearranged for 22 November 2023, with notice of the webinar added to the website prior to the rearranged session. All stakeholders that had registered for the previous webinar were due to be contacted with notice of the rearranged session on 17 November 2023, but due to human error some were missed. A further session was therefore held on 8 December 2023, with all those who had registered for the postponed session or contacted the Proposed Project team to say they had been unable to attend a previous session contacted.
Local community	The technical language you use in your documentation and in this feedback form is not easy to understand for the person on the street.	N	National Grid sought to avoid the use of jargon and technical terms wherever possible. Where present, it endeavoured to define any unfamiliar technical terms as part of its consultation materials. Additionally, it produced materials with the specific purpose of explaining the proposals in as non-technical a manner as possible. These documents include the Project Overview Document – 10 minute (see Section 13 of **Application Document 5.1.6 Appendix E Statutory Consultation**) read and the Preliminary Environmental Information Report – Non-Technical Summary (see Section 16 of **Application Document 5.1.6 Appendix E Statutory Consultation**), both of which were published as part of the Statutory consultation. Whilst a feedback form was provided to help

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			people provide their consultation response, free text responses could also be submitted by email or post.
Q22 What did you think of the information we have published for this consultation in terms of how clearly it was presented and how easy it was to understand?			
Local community	Well communicated, easy to follow. Words and maps are very clear and the opportunities to comment are clear. Your staff at the consultation are knowledgeable and nice.	N	National Grid welcomes the respondents' views and is pleased that they found the consultation materials easy to understand.
Local community	Clear maps and diagrams. Not too many questions. Good use of simple diagrams.	N	
Local community	Some of the diagrams and maps were quite congested and therefore rather confusing to understand.	N	In developing the maps and diagrams in its consultation materials, National Grid sought to provide sufficient detail without this being overwhelming or confusing. It acknowledges the feedback from the respondent that some maps and diagrams could have been simplified and will consider this feedback when preparing for future consultations on its projects.
Q26 Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation?			
Local community	Be transparent and explain in laymen terms what you are proposing. No where in your material do you address the impact to the local areas and the environment, even though it is patently obvious that the impact will be considerable. It makes you appear deceptive and makes you wonder what you are trying to hide. By addressing the obvious concerns and questions people will have - without them having to ask (or google or search through your incredibly long consultation document looking for anything that might explain it clearly or address the obvious impact) - by making it easy to find out the impact - you allay possible fears. By not doing so you automatically wonder what else you are hiding and what the real impact of this will be.	N	National Grid sought to avoid the use of jargon and technical terms wherever possible. Where present, it endeavoured to define any unfamiliar technical terms as part of its consultation materials. Additionally, it produced materials with the specific purpose of explaining the proposals in as non-technical a manner as possible, such as the Project Overview Document – 10 minute read (see Section 13 of **Application Document 5.1.6 Appendix E Statutory Consultation**). Extensive detail on how the Proposed Project could impact on the environment, along with the steps it would take to mitigate and manage any such impacts, was provided in the Preliminary Environmental Information Report published as part of the Statutory consultation. Recognising that this is a detailed technical document, it also produced a simpler non-technical summary to make it easier for respondents to consider the potential impacts of the Proposed Project. This document was available on the Proposed Project website, at deposit points and at in-person public information exhibitions (see Section 16 of **Application Document 5.1.6 Appendix E Statutory Consultation**).
Local community	The model of the convertor was a total waste of time - there were no road signs or indication where it was and definitely not to scale - it could be anywhere! The consultant could not answer our questions.	N	The indicative 3D model available at the public information exhibitions was one of several tools utilised by National Grid to help explain its proposals. In developing the model, National Grid has sought to balance the need to show other nearby infrastructure, such as that at Richborough Energy Park, with the need for the model to be at an appropriate size. The model included local road names and was to scale, whilst members of the team were on hand at each event to help explain what the model showed in further detail. A range of technical disciplines were represented at each public information exhibition. All members of the team were able to talk about the broad plans for the Proposed Project, whilst representatives from each discipline were able to talk about their specialism in further detail. Where a person attending the public information exhibitions expressed a desire to talk about a specific subject, the Proposed Project team tried to ensure that they were able to talk to the relevant discipline wherever possible, but this may have not always been possible. In the event that a member of the team was unable to answer a question posed by an attendee, they first tried to find the relevant discipline representative to provide an answer during the event. In any rare instances that this was not possible, Proposed Project team representatives will have offered to follow-up by phone/email with a response.
Local community	We were able to talk to someone who actually knew the project in detail, what your plans are and what mitigation measures you are taking.	N	National Grid welcomes the respondent's views and is pleased that they were able to get answers to their questions from the members of the project team in attendance at the public information exhibitions.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	Your public information exhibit sessions need to be more widely publicised, and more is needed in using venues where there is ample parking facilities and for that matter signs / posters to show exactly where they are being held.	N	A range of measures were employed to help promote the public information exhibitions. These promotional measures included sending a newsletter to every property in the Primary Consultation Zone that gave details of the consultation, including details of every public information exhibition. The Statutory consultation and public information exhibitions were also advertised in local newspapers and on social media. Signage was placed at the events to help direct attendees to where the public information exhibition was taking place. When identifying potential venues, National Grid sought to ensure that car park facilities were available alongside public transport connections. The presence of these facilities was weighed against the need to hold public information exhibitions at venues of a suitable size and at locations close to the route of the Proposed Project, to avoid attendees having to travel out of their way to attend.
Local community	Please ensure that the local landowners are kept informed. We are building close to Aldeburgh but don't yet live there. We only found out about the project when the TerraQuest letter arrived a few months ago. This is poor.	N	National Grid acknowledges this feedback. National Grid is maintaining ongoing dialogue with landowners in order to better understand issues arising from the Proposed Project and appropriate mechanisms for safeguarding privately owned assets where interfaces are identified.
General commentary			
Local community	The consultation process to the affected community has been very poor. It would seem like a tactic that you inundate the communities with copious reports that are confusing and contain concise details. For majority of the communities who are not tech and data savvy, they have been left in the dark and therefore cannot appreciate the full impact of your proposals. I attended your consultation presentation at Saxmundham on 24 November 2023. The SEALINK team present at the meeting were non informative, nor very helpful to any queries that I raised. The materials that were presented at the meeting were poorly laid out and the models were misleading of the scale of the proposal. The statutory consultation period for a DCO should be a minimum 12 weeks, however the Saxmundham community who are greatly affected by the converter stations and the SEALINK as a whole was only consulted at that meeting, so we only had less than 4 weeks after the meeting to digest your information and provide our feedback. Also to set up the consultation period in the run up to Christmas when people have other focus, it would seem that National Grid is deliberately 'running down the clock' to discourage any thorough feedback from the communities. A shameful tactic!	N	As part of the Statutory consultation, National Grid produced materials with the specific purpose of explaining the proposals in as non-technical a manner as possible. These documents include the Project Overview Document – 10 minute (see Section 13 of **Application Document 5.1.6 Appendix E Statutory Consultation**) read and the Preliminary Environmental Information Report – Non-Technical Summary (see Section 16 of **Application Document 5.1.6 Appendix E Statutory Consultation**), both of which were published as part of the Statutory consultation. For those that required more detailed information regarding the proposals, this was available in the document library on the Proposed Project website. For those who could not access information online, paper copies of most consultation materials were available in paper copy at public information exhibitions, deposit points across the local area, and could be posted out upon request. National Grid also wrote to every property in its Primary Consultation Zone to advertise the Statutory consultation, including how people could access further information about the proposals. A range of technical disciplines were represented at each public information exhibition. All members of the team were able to talk about the broad plans for the Proposed Project, whilst representatives from each discipline were able to talk about their specialism in further detail. Where a person attending the public information exhibitions expressed a desire to talk about a specific subject, the Proposed Project team tried to ensure that they were able to talk to the relevant discipline wherever possible, but this may have not always been possible. In the event that a member of the team was unable to answer a question posed by an attendee, they first tried to find the relevant discipline representative to provide an answer during the event. In any rare instances that this was not possible, Proposed Project team representatives will have offered to follow-up by phone/email with a response. The indicative 3D model available at the public information exhibitions was one of several tools utilised by National Grid to help explain its proposals. In developing the model, National Grid has sought to balance the need to show other nearby infrastructure, such as that at Richborough Energy Park, with the need for the model to be at an appropriate size. The model included local road names and was to scale, whilst members of the team were on hand at each event to help explain what the model showed in further detail. The Planning Act 2008 stipulates that statutory consultations must take place for a minimum of 28 days. The Statutory consultation on the Proposed Project was eight weeks, meaning that the consultation was double the length required in legislation. The consultation took

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			place outside of school holidays (notwithstanding the autumn half term) and before the Christmas break. The first public information exhibition in Suffolk took place on 8 November 2023, six weeks before the close of the consultation. Residents were welcome to attend any public information exhibition and did not have to attend the event closest to them. Additionally, residents were not obliged to attend a public information exhibition in order to submit a consultation response, with all information on the consultation available online from the start of the consultation period.
Thanet Green Party	We note that one of the questions on the online consultation form was about the quality of the materials and information you provided about the project. At one level, these were exemplary – friendly, helpful people at the consultation events, advance information for elected members via dedicated webinars, extensive and well-produced written and web materials. However, there were severe limitations to the effectiveness of the information shared. The models at the consultation sessions had no labels, no comparators in terms of size and scale, and Sea Link colleagues had no information on other NG projects in the area, which was important for participants to understand the full picture. The written information was inevitably extremely technical, but no attempt was made to provide an executive summary or easy-read version, which will have deterred many residents in this educationally disadvantaged area from engaging or responding. This is unacceptable in what was surely intended to be an inclusive consultation.	N	National Grid welcomes the respondent's views about the quality of materials and information provided about the Proposed Project. The indicative 3D model available at the public information exhibitions was one of several tools utilised by National Grid to help explain its proposals. In developing the model, National Grid has sought to balance the need to show other nearby infrastructure, such as that at Richborough Energy Park, with the need for the model to be at an appropriate size. The model included local road names and was to scale, whilst members of the team were on hand at each event to help explain what the model showed in further detail. As part of the Statutory consultation, National Grid produced materials with the specific purpose of explaining the proposals in as non-technical a manner as possible. These documents include the Project Overview Document – 10 minute (see Section 13 of **Application Document 5.1.6 Appendix E Statutory** Consultation) read and the Preliminary Environmental Information Report – Non-Technical Summary (see Section 16 of **Application Document 5.1.6 Appendix E Statutory Consultation**), both of which were published as part of the Statutory consultation. As part of these documents, National Grid endeavoured to show information on other projects where possible. National Grid's strategy with regard to consulting with seldom heard groups (defined as being inaccessible to most traditional and conventional methods of consultation for any reason) is set out in Section 6 of **Application Document 5.1.5 Appendix D SoCC**. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk (see Section 4 of **Application Document 5.1.6 Appendix E Statutory Consultation**). These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. That said, it is important to recognise that LionLink and Nautilus are being promoted by National Grid Ventures rather than National Grid Electricity Transmission. As such, the projects are being developed by separate teams, meaning that members of the Proposed Project team will have been unable to answer detailed questions about these other projects, which are also at an earlier stage of development.
Local community	From the outset proposals for the industrialisation of costal Suffolk have been presented piecemeal and avoided given a full picture of the impact of the proposals. This has carried alarm and confusion in local communities which are often unsure as to what exactly is being proposed. Some at the Aldeburgh consultation were under the impression that there was no more to it than this particular scheme. You need to offer a genuine consultation on all possibilities and not inform the public that because Friston has permission all other projects must be routed through it.	N	National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document produced for the Statutory consultation included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk (see Section 4 of **Application Document 5.1.6 Appendix E Statutory Consultation**). These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the project website during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			The cumulative effect of National Grid's proposals alongside other projects planned in their vicinity is considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects and Application Document 6.2.3.13 Part 3 Kent Chapter 13 Kent Onshore Scheme Inter-Project Cumulative Effects**. National Grid has additionally considered the potential for coordination of its proposals with National Grid Ventures' proposals throughout the development of plans for the Proposed Project. Coordination with National Grid Ventures has been considered as part of every public consultation on the Proposed Project, with the Saxmundham Converter Station site having been identified partially because of its capacity to accommodate further converter stations, such as those that would be required for the National Grid Ventures projects. That said, it is not possible to bring all these different projects forward at the same time as they are at varying different stages of development. Delaying the more advanced projects in this area to allow for consultation on all projects at the same time means that projects such as the Proposed Project, which has been identified by the National Energy System Operator as an 'essential' project that needs to be operational by the end of 2030, may not meet these deadlines. This would prevent other projects from connecting into the network and thereby jeopardize the UK's ability to meet its net zero targets.
Local community	I was very disappointed with the quality of information, particularly the mapping, at the consultation. I was expecting at the very least to see a very large scale map showing all the possible sites, together with all the places that I know (e.g. by superimposing on an Ordnance Survey style map). The maps must also include all protected habitats (both marine and terrestrial). Instead, the maps on offer were small, confusing and all local references had been more or less removed. It was hard even to find village names! I, like most other local residents, know this area really well and expect to be able to see details that enable me to accurately locate possible areas of development. The quality of the mapping was dismal. Further, there should also be a similarly largescale map that maps not just your project proposals but also other major infrastructure projects that are potentially in the pipeline for East Suffolk, along with proposed years of operation. Our road infrastructure is not well-developed and just one major project could cause daily gridlock, impacting tourism and businesses and everyone's lives. We need to see that you understand what you are proposing. It absolutely cannot be considered in isolation.	N	A range of mapping was made available at the public information exhibitions. This mapping included A0 prints of the General Arrangement Plans, which were set on Ordnance Survey basemapping and included road names. Whilst these maps did not include details of the different environmental designations in the vicinity of the Proposed Project, other maps available at the public information exhibitions, including those in the Project Overview Document and on the interactive map, did include these designations. More generally, National Grid has endeavoured to show information on other projects where possible. As part of the Statutory consultation, the Project Overview Document included a map which included the Draft Order Limits for the Proposed Project alongside committed and planned developments in Suffolk (see Section 4 of **Application Document 5.1.6 Appendix E Statutory Consultation**). These other developments included Sizewell C, East Anglia ONE North, East Anglia TWO, LionLink and Nautilus. The interactive map on the Proposed Project website (and available on a touchscreen television at the public information exhibitions), during the Statutory consultation also included a number of layers showing the location of other infrastructure projects in Suffolk. National Grid did not include these developments on all of its plans as it would have made the plans more difficult to understand. Impacts on tourism are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 2 Socio-Economic, Recreation and Tourism**. This Chapter concludes that there are no likely significant effects on tourism as a result of the Proposed Project.
Cllr Graham	You will have received the responses from the affected Parish Councils, as well as numerous individual responses to the consultation. Every time our residents engage with one of these consultations, it places a large burden on their time and intellectual energy to understand them fully, to evaluate them and to formulate a response. Considering this, I think the numbers of well-articulated responses you will have received demonstrate the degree of increasingly felt opposition to this particular project across our community. Many of those who have written have already been through this arduous process for several other consultations for other energy projects, both in the unofficial consultation period and the official consultation. There are many more I speak to who are desperately worried about the future impacts of this and similar	N	National Grid recognises that the development, construction and operation of major infrastructure projects can cause stress, uncertainty and anxiety that may impact on people's mental health (see **Application Document 6.2.2.11 Part 2 Suffolk Chapter 11 Health and Wellbeing and Application Document 6.2.3.11 Part 3 Kent Chapter 11 Health and Wellbeing**. Throughout the development phase it has therefore tried to clearly communicate the proposals, including through the establishment of dedicated contact channels, a project website and by holding multiple rounds of public consultation as the plans became more refined. As the Proposed Project has progressed, National Grid has sought to provide certainty on the plans wherever possible.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	infrastructure projects but who simply do not have the capacity to respond due to other life pressures, and a sense of helplessness about the unrelenting threats that these projects pose to their homes and lives.		
Local community	Residents should be fully informed about proposed projects, there should be no questions unanswered. Failure to fully inform only results in hostility and suspicion. The model provided at the drop-in sessions failed to show the converter station against any landmarks and the model trees were far higher than the building. This seemed to be very misleading. Moreover, when told about the error, NGET failed to rectify at following drop-in sessions. The plans showed cable routes and proposed access/haul roads but no landscape or existing road features. They were totally useless as a reference tool. The statutory consultation period was only seven weeks. This, considering the time of year with poor weather and proximity to Christmas, whilst within guidelines, was unacceptable. Generally, the layperson could not understand the documentation given. Albeit, the engineering staff, were willing to explain. But during the drop-in session I visited, the number of visitors overwhelmed the staff, so many left as confused as when they arrived. There were no visualisations of the converter station(s) in situ on the Wood Farm site. Only those that delved into the full PEIR document could find anything that documented the location(s) and visual implications. This omission was not satisfactory and seemed misleading. How difficult would it have been to provide good visualisations to the public?	N	Throughout its pre-application public consultations, National Grid has been happy to respond to any questions that residents might have about its proposals. Where an immediate response to a question was not able to be provided (such as at a public information exhibition), it has offered to follow-up by phone/email with a response. The indicative 3D model available at the public information exhibitions was one of several tools utilised by National Grid to help explain its proposals. In developing the model, National Grid has sought to balance the need to show other nearby infrastructure with the need for the model to be at an appropriate size. The model included local road names and was to scale, whilst members of the team were on hand at each event to help explain what the model showed in further detail. A range of mapping was made available during the Statutory consultation. This mapping included the General Arrangement Plans, which were set on Ordnance Survey basemapping and included road names. Whilst these maps did not include details of the different environmental designations in the vicinity of the Proposed Project, other maps available during the consultation, including those in the Project Overview Document and on the interactive map, did include these designations (see Section 4 of **Application Document 5.1.6 Appendix E Statutory Consultation**). The interactive map on the Proposed Project website also allowed for the proposals to be set on satellite basemapping, providing an alternative means of contextualising the proposals to their surroundings. The Statutory consultation on the Proposed Project was eight weeks, which is double the length required in legislation. The consultation took place outside of school holidays (notwithstanding the autumn half term) and before the Christmas break. As part of this consultation, National Grid produced materials with the specific purpose of explaining the proposals in as non-technical a manner as possible. These documents include the Project Overview Document – 10 minute (see Section 13 of **Application Document 5.1.6 Appendix E Statutory** Consultation) read and the Preliminary Environmental Information Report – Non-Technical Summary (see Section 16 of **Application Document 5.1.6 Appendix E Statutory Consultation**), both of which were published as part of the Statutory consultation .For those that required more detailed information regarding the proposals, this was available in the document library on the Proposed Project website. A range of technical disciplines were represented at each public information exhibition. All members of the team were able to talk about the broad plans for the Proposed Project, whilst representatives from each discipline were able to talk about their specialism in further detail. Where a person attending the public information exhibitions expressed a desire to talk about a specific subject, the project team tried to ensure that they were able to talk to the relevant discipline wherever possible, but this may have not always been possible. In the event that a member of the team was unable to answer a question posed by an attendee, they first tried to find the relevant discipline representative to provide an answer during the event. In any rare instances that this was not possible, project team representatives will have offered to follow-up by phone/email with a response. At the time of the Statutory consultation, National Grid had not confirmed detailed designs for the proposed converter stations. Instead, it consulted on potential architectural approaches that would inform future detailed designs. Details of these approaches were summarised in the Project Overview Document and Feedback Form, whilst a separate

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Converter Station Design – Background to Potential Architectural Approaches document provided further detail, including indicative artist impressions.
Local community	The online form does not encourage participation: it's 14 pages long and has to be completed in one go as there is no "save and return" facility. It is not possible to read all the pages before you fill in the form.	N	Whilst a Feedback Form was provided to help people provide their consultation response, free text responses could also be submitted by email or post.
Cllr J Ewart	Points Of Concern Re The Statuary Consultation Process As a proactive Councillor in the community, many residents in the surrounding villages to Saxmundham, Kelsale, and indeed Sternfeld rang and wrote to tell me they were not aware of the Sea Link Consultation nor the that a response was required. This has caused great distress and frustration. It has certainly tarnished the trust required in such an important transaction. Residents discussed having not received any information in some circumstances about Sea Link nor had they been informed to any degree of Sea Link's public events. This included those in homes on or around the considered site who will be impacted. On a door to door survey in Kelsale-cum-Carton this concern transpired to be very much true. NGET Booklet The booklet produced with questions for the public to complete and return was not I feel written ethically and saw the questions being leading and not open. Academically this would have been rejected at the edit stage due to its bias. Future booklets should be scrutinised so as to be seen to be appropriate and not leading.	N	A range of measures were employed to help promote the Statutory consultation. These promotional measures included sending a newsletter to every property in the Primary Consultation Zone that gave details of the consultation, including details of every public information exhibition. The Statutory consultation and public information exhibitions were also advertised in local newspapers and on social media. The locations referenced by the respondent are all within the Primary Consultation Zone, and were therefore due to receive this newsletter, which was sent via Royal Mail. National Grid considers that the Feedback Form produced for the Statutory consultation did not include leading questions. Every question included a free text box in which respondents could provide further written comments. When asking about its proposals in each area of the Proposed Project route, it specifically sought feedback on whether respondents did or did not support a given aspect of the proposals. Although the Feedback Form sought feedback on specific areas of National Grid's proposals, at question 20 it also invited respondents to provide comments on any aspects of the proposals not covered elsewhere in the Feedback Form. Furthermore, whilst the Feedback Form was provided to help people provide their consultation response, free text responses could also be submitted by email or post.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	I understand the need to reinforce the network but am very concerned about the upheaval to rural areas especially the Heritage Coast and footpaths.	N	The sensitivity of the area is noted. The routeing and siting of the Suffolk Onshore Scheme has taken into consideration designations, including the Suffolk Coast & Heaths AONB and Suffolk Heritage Coast. The effects arising from the Suffolk Onshore Scheme on the AONB (and Heritage Coast) are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q8 What do you think about our proposed landfall between Aldeburgh and Thorpeness? Comments			
Local community	No landfall should be made on the stretch of coast between Aldeburgh and Thorpeness. This is the most popularly walked on and visited, of any portions of the Suffolk coast. This can be confirmed on any day in the holiday season/ at half terms / bank holidays etc when literally thousands of journeys will be made up and down the tarmacked path by older and younger residents, family groups with prams, push chairs bicycles, scooter, dogs. The people walking up this coast past the famous Maggi Hambling Scallop are both local residents and visitors. day-trippers or people on holiday lets. The experience of walking on this apparently desolated stretch of shingle beach is the perfect antidote to urban congestion and frustration. It must be protected and safeguarded as national heritage.	N	NG has followed an extensive process to choose the locations of the landfalls at each end of the Proposed Project and they understand the concerns that are stated in your response. National Grid is rigorously assessing the Proposed Project's impact on footpaths and the environment in general, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. This construction solution will minimise potential impacts on terrestrial biodiversity and the AONB. Details are contained in Appendix A of **Application Document 7.3 Design Development Report**. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	It is a well-loved tourist & walker area. Many people walk from Aldeburgh - Thorpeness & back. This would be ruined.	N	
Local community	This route cuts through the Suffolk Coast path. Why does the marine cable have to be here?	N	
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	I am a regular cyclist along the lanes East of Friston, including the stipulated 'quiet lane', so I would urge that these routes are protected as far as possible.	N	National Grid acknowledges the concerns regarding quiet lanes and has considered the impact of construction traffic on quiet lanes in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The impacts will be temporary during the construction phase and mitigation measures will be put in place to minimise the severity, see **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			
Local community	All the well-used footpaths will be unusable and amenity land lost forever.	N	National Grid acknowledges that there will be a temporary disruption to footpaths during the construction phase. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. National Grid will employ a trenchless construction solution for installation of the landfall and HVDC cabling which will significantly minimise the long term impact on PRoW. Once construction is complete, the footpaths will no longer be affected. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Where National Grid has a permanent impact on a footpath, a suitable diversion will be provided. Impacts on footpaths in Kent are considered in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Kent as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q14 What do you think about our proposed converter station and adjacent substation near Minster? Comments			
Local community	This will be a significant blot on the landscape and is being positioned in a well-used area by walkers.	N	The sensitivity of the area is noted. The assessment of effects arising from the Kent Onshore Scheme on landscape and visual amenity is set out within **Application Document Part 3 Kent Chapter 1 Landscape and Visual**. National Grid acknowledges that there will be a residual impact on visual amenity and will be providing screening, see **Application Document 7.5.7.2 Outline Landscape and Ecological Management Plan - Kent**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q18 Do you have any key concerns regarding the construction stage of Sea Link? (Other)			
Local community	The marshes are a frequent walking route for many locals, enhancing mental and physical health.	N	National Grid acknowledges that there will be a temporary disruption to footpaths during the construction phase. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. National Grid will employ a trenchless construction solution for installation of the landfall and HVDC cabling which will significantly minimise the long term impact on PRoW. Once construction is complete, the footpaths will no longer be affected. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Where National Grid has a permanent impact on a footpath, a suitable diversion will be provided. Impacts on footpaths in Kent are considered in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Kent as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.2 Outline Public Rights of Way Management Plan – Kent**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Local community	I regularly lead walks for Ipswich Ramblers. I am annoyed that footpaths are not mentioned anywhere. The old Aldeburgh railway lines, the coastal path and the Sandling Walk will all be disrupted for a number of years. For coastal walks, circular walks, where do we go?	N	NG has followed an extensive process to choose the locations of the landfalls at each end of the Proposed Project and they understand the concerns that are stated in your response. National Grid is rigorously assessing the Proposed Project's impact on footpaths and the environment in general, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). An initial ground investigation survey has been undertaken to provide information to confirm the viability of a trenchless solution for the landfall at this location. This construction solution will minimise potential impacts on terrestrial biodiversity and the AONB. Details are contained in **Application Document 7.3 Design Development Report**.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	The proposal does not make clear how maintenance of access to footpaths (that I currently use regularly across the field east of Saxmundham) will be managed both during construction and after, as this passes through the final plot of land. It is therefore not clear to me how that is handled.	N	National Grid acknowledges that there will be a temporary disruption to footpaths during the construction phase. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The Augustine Camino Pilgrimage Route uses the track on the north border of the draft order limits in Kent along the railway line between the rough and St Augustine's Cross. How will access be maintained during construction?	N	
General commentary			
Local community	We and our neighbouring parishes in Theberton & Middleton have a network of Quiet Lanes. These are single track, unpaved winding lanes on which (dog) walkers, riders (horse or bicycle) joggers, etc. co-exist with a small quantity of motorised traffic, how will they be protected against construction traffic?	N	National Grid acknowledges the concerns regarding quiet lanes and has considered the impact of construction traffic on quiet lanes in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. National Grid considers sensitive receptors when drawing up the proposed construction access routes. The impacts will be temporary during the construction phase and mitigation measures will be put in place to minimise the severity, see **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	There is already Sizewell C happening, with an enormous impact on the local community. Adding Friston substation, Saxmundham and Aldeburgh cabling will bring our community to a standstill. The immense amount of heavy traffic, roadworks, contractor's vehicles cannot be sustained around these local small roads. Damage to verges and road surfaces will happen. Cyclist and pedestrians will be in danger and emergency service response times will be slower. Public footpaths and bridal paths will be lost.	N	The potential impacts on traffic are assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment takes account of the construction traffic management plans for Sizewell C. National Grid's plans will be prepared considering the plans for Sizewell traffic, e.g. peak traffic movement times will be programmed in consideration of each other wherever possible. Cumulative traffic impacts are considered in **Application Document 6.2.2.13 Part 2 Suffolk Chapter 13 Suffolk Onshore Scheme Inter-Project Cumulative Effects**. **Application Document 7.5.1.1 Outline Construction Traffic Management and Travel Plan – Suffolk** is provided to help mitigate any potential impacts. This document includes construction traffic management measures that will be implemented in support of the

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Proposed Project, to avoid any adverse impacts on the surrounding networks during the construction phase. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Thousands of people visit this coastline every year and enjoy the use of beaches, footpaths, bridleways, byways and cycle paths, these will be closed for many, many years whilst this development is undertaken and which will be irreparable thereafter.	N	National Grid is rigorously assessing the Proposed Project's impact on footpaths and the environment in general, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Footpaths and bridleways make up a vital very well-used network in this part of East Suffolk through the Sandlings and along the Heritage Coast - as well more inland. The Sandlings Walks and the Coastal Paths and all the other public rights of way are crucial to the tourist industry and to local residents' wellbeing. Permanent and temporary closure of these during Sea Link's proposed 4 to 12 year project makes the project unacceptable on its own - anywhere in this AONB and our local other special landscape areas.	N	National Grid acknowledges that there will be a temporary disruption to footpaths during the construction phase. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. National Grid will employ a trenchless construction solution for installation of the landfall and HVDC cabling which will significantly minimise the long term impact on PRoW. Once construction is complete, the footpaths will no longer be affected. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Where National Grid has a permanent impact on a footpath, a suitable diversion will be provided. Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and detailed within Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment takes into account the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	My second concern relates to the route for the site access, particularly the option to use the B1121 with a new road starting near to Bigsby's Corner. The increase in heavy traffic will be extremely dangerous for Benhall residents and will severely impact their access to Saxmundham. Perhaps you could provide further information as to how this traffic will be controlled and monitored? We have a number of elderly people, cyclists and horse riders that regularly walk / cycle / horse ride into Saxmundham. The pavement along the B1121 is dangerously narrow currently and unsuitable for heavy traffic passing so closely.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes a review of the collision record (based on full collision data obtained from Suffolk County Council) and an assessment of road safety for the study area, which includes the A12/ B1121 junction. This Chapter includes an assessment of pedestrian safety. This demonstrates that the additional construction traffic to be generated by the proposals during the peak construction phase is not expected to result in any significant impacts on the road safety of this junction, with the mitigation identified within the **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan - Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further consultation was held with Suffolk County Council as the ES was prepared.
Local community	We are concerned about the disruption to the public rights of way network. Should this development proceed, suitable temporary diversion must be in place at all times during construction and any proposed permanent diversions must be no less commodious than the existing routes. We would expect considerable sums to be paid by way of planning gain to improve the current network by the addition of new paths.	N	National Grid acknowledges that there will be a temporary disruption to footpaths during the construction phase. Where National Grid has a temporary impact on a PRoW during construction, mitigation measures will be put in place. Where National Grid has a permanent impact on a footpath, a suitable diversion will be provided. Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. For Kent details are contained in **Application Document 6.2.3.10 Part 3 Kent Chapter 10 Socio-Economics, Recreation and Tourism**. National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Cllr Graham	Additional traffic will discourage cyclists and pedestrians and horse riders. This is not only a practical limitation but removes an activity that is very significant for many of our residents' wellbeing – as will the closure of much loved and used public rights of way.	N	

Table 1.37 DCO process

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	I spent 9 years on the Aldeburgh town council planning committee and the Large infrastructure group and can only say that I am totally appalled at the way the planning system is gamed by developers. Their only concern is to get their DCO through as cheaply as possible. I will also remind National Grid that if the NSIP process is chosen for a development then the assumption is that there will, as a quid pro quo, be benefits accruing to the local community from the development, as far as I can see no such benefits accrue and therefore the NSIP process is not applicable and the development should go through the normal planning process.	N	National Grid supports the delivery of community benefits associated with transmission infrastructure, and already has a number of established programmes which deliver this. National Grid is waiting for the Government's position on the provision of community benefits associated with transmission infrastructure. This will determine its future approach. National Grid is working to understand local and regional aspirations and priorities in relation to community benefits. It welcomes the suggestions for delivering community benefits and as the Proposed Project progresses, it will work with stakeholders and local communities to further inform this.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	I only wish to reiterate the decision to put a substation at Friston by National grid in the first place was a complete and utter disgrace in the way it was handled. From the redacted information that was produced on the decision making process to the way the planning system was circumvented. National Grid would do well to consider that they need to be open and transparent about these issues as all they are doing is making opposition a certainty rather than a possibility.	N	At the time of the option identification and selection, the proposed Friston Substation was advanced in the consenting process. A DCO application had been submitted and was progressing through examination and determination, this was subsequently granted in March 2022, prior to non-statutory consultation on the Proposed Project. It was therefore reasonable for the Proposed Project to select a connection point that, whilst not yet implemented was reasonably foreseeable by virtue of it having been granted development consent. Furthermore, it was also reasonable to select a connection point that whilst not sited by the Proposed Project was still appropriate by virtue of it having been granted development consent. The identification and selection stage detailed in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)** looked at options for the creation of an additional network connection point by co-locating a new substation within the relevant converter site option areas. As any new substation would need to be connected to the existing network, this looked at either diverting the existing overhead lines into and out of the new substation or a cable route from the substation to the overhead line with a cable sealing end compound located adjacent to the overhead line. The proposed Friston Substation was selected as the connection point for the Proposed Project as the alternative options that would result in an additional connection point provided no environmental or socio-economic, technical, or economic benefit over a connection into the proposed Friston Substation. Engagement with stakeholders and feedback through consultation has also highlighted the importance of coordination with other developments proposed in the area. This supports the outcome of the option identification and section stage that connecting to an existing or proposed substation was preferable to the development of an additional connection point for the Proposed Project in isolation. Following the feedback from stakeholders on the initial option identification and selection outputs and the need to coordinate with other energy projects in the area, coordination opportunities were explored as set out in **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022)**. This further coordination work which fed into the options identified and selected for the Proposed Project assumed the proposed Friston Substation as the network connection point. This has been backchecked

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			and for the reasons stated above remains the preferred connection point for the Proposed Project. Friston Substation has been included within the Proposed Project to achieve a comprehensive consenting position however it is envisaged that the substation will be implemented through the SPR projects.
General commentary			
SASES	9. National Grid has not used “utmost care” as recommended by the Examining Authorities for the Scottish Power and National Grid connection hub projects who recognised the unsuitability of the Friston site.	N	At the time of the option identification and selection, the proposed Friston Substation was advanced in the consenting process. A DCO application had been submitted and was progressing through examination and determination, this was subsequently granted in March 2022, prior to non-statutory consultation on the Proposed Project. It was therefore reasonable for the Proposed Project to select a connection point that, whilst not yet implemented was reasonably foreseeable by virtue of it having been granted development consent.
Reydon Parish Council	5. Without a full appraisal of this genuine alternative, the statutory consultation for Sealink fails the key test for Development Consent for major infrastructure projects. The requirement to consider fully all alternatives to such development in an AONB is a key part of the National Planning Policy Framework. The Sea Link consultation completely fails to meet this requirement.	N	The alternatives considered are addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.

Table 1.38 Legislation and policy including permits

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
General commentary			
Local community	One might expect that projects such as yours would operate under the umbrella of government policies and promises. A government promise, made at the time of the Sizewell enquiry, was that 30 percent of the land area of the UK would be given protected status in order to protect the environment and to contribute to solving the looming biodiversity crisis. Currently less than 10 percent is protected. So to destroy currently protected sites, as both your project and the Sizewell project propose is madness. What is the definition of a protected site? Protected against destruction.	N	National Grid acknowledges this comments but cannot comment on Government policy. A rigorous impact assessment has been produced in line with guidance and legislation which has taken into consideration statutory designations. Details are contained in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Extensive consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. One such example is the use of trenchless solutions for the cable where it crosses designated sites. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
Cllr T-J Haworth-Culf	We take note for the following in general: Taken from RELEVANT UPDATED SECTION OF THE NATIONAL PLANNING POLICY FRAMEWORK (5th September 2023) Note: 54 Except for applications for the repowering and life-extension of existing wind turbines, a planning application for wind energy development involving one or more turbines should not be considered acceptable unless it is in an area identified as suitable for wind energy development in the development plan or a supplementary planning document; and, following consultation, it can be demonstrated that the planning impacts identified by the affected local community have been appropriately addressed and the proposal has community support. While this addition to the NPPF refers to onshore wind generation, surely the concerns relating to the mechanism and infrastructure associated with offshore wind are equally valid? In many cases these will be equally invasive or even more so as onshore wind turbines.	N	National Grid acknowledges the concerns raised in these comments, however, the Proposed Project is not directly related to offshore wind energy generation. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and Kent, along with a combination of other factors. Furthermore, paragraph 5 makes clear that the NPPF does not contain specific policies for developments requiring development consent and that such applications are to be determined in accordance with the decision-making framework set out in the Planning Act 2008. On this basis the NPPF is considered to be generally of less relevance to the SoS than the relevant Energy NPSs.
RSPB	2016 Review of Special Protection Areas In respect of land with potential functional links to nearby SPAs we draw your attention to the 2016 UK review of Special Protection Areas. The need to extend the UK's protection for scarce birds was set out in the third review of the UK's terrestrial Special Protection	N	National Grid is maintaining ongoing dialogue with Natural England regarding proposals for mitigating the impacts/loss of functionally linked habitat. In addition, a robust alternatives assessment has been undertaken for the Proposed Project to determine if it could be located elsewhere.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Area network, published by JNCC in 2016. This SPA Review examined whether existing SPAs sufficiently met the ecological needs of Annex 1 and regularly occurring migratory species. The review outlined that the current suite of SPAs is considered insufficient for many species. As a result, any potential impacts on the SPA and its associated species should be avoided, including on FLL. The SPA Review also looked at the boundaries of existing sites to assess whether they meet the needs of the species they are designated to protect. This included consideration of habitats outside the current SPA boundaries that species are reliant on. The RSPB strongly advises that the findings of the SPA Review are fully taken into account for any surveys or decisions associated with the potential cable route. This will ensure that recognised important sites for nature can be properly considered alongside the existing SPA citations in survey and monitoring, impact assessment and decision-making, as clearly intended by the SPA Reviews.		Impacts on breeding birds are considered in **Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity.**
Local community	We do not believe that a proper community impact assessment has been conducted pursuant to the recently published Transmission Acceleration Action Plan (TAAP). The proposal is not holistic in its approach as recommended by the Winser Report as subsequently adopted by the Secretary of State in the TAAP. We do not now regard Sea Link to be sufficiently advanced so as to escape TAAP, not least given the recent announcement to conduct research on combining Sea Link with other North Sea projects which will require a back to the drawing board approach. No proper assessment has been made of the project in accordance with HM Treasury Green Book Appraisal Guidelines, in particular Annex 2 thereof and as such are not in line with public policy requirements for projects such as these. We look forward to receiving a thorough response to the points raised in this letter at your earliest convenience.	N	National Grid acknowledges the publication of the TAAP/Winser Report and welcomes its recommendations for streamlining the process. However, the Proposed Project is at a relatively advanced stage and any formal direction and decision making on the merits of aligning further progress towards fulfilling the established connection agreements that underpin the needs case with these recommendations has not been forthcoming. Similarly, the report recommendations are yet to be enshrined in policy and legislation. As the recommendations are transposed into policy, these will become requirements for National Grid and other energy developers, however, Government policy is not within National Grid's remit for the Proposed Project. In addition, the Proposed Project is not funded by the Government, meaning that HM Treasury Green Book Appraisal Guidelines are not applicable in this instance.
Local community	Ministers and project planners should be aware that paragraph 177 of the National Planning Policy Framework makes it clear that major development defined by footnote 60, for which this and other proposals certainly qualify, should be refused unless in exceptional circumstances and only after assessment of ; The need for the development, including in terms of any National considerations, and the impact of permitting or refusing it on the local economy- the cost of, and scope for developing outside the designated area, or meeting the need for it in some other way- and any detrimental impact on the environment, the landscape and recreational activities, and the extent which that could be moderated. Such necessary assessment has not been conducted, in particular the scope to progress less damaging alternatives. The proposal does not satisfy the para 177 NPPF requirement and it ignores	N	The Paragraph 5 makes clear that the NPPF does not contain specific policies for developments requiring development consent and that such applications are to be determined in accordance with the decision-making framework set out in the Planning Act 2008. On this basis the NPPF is considered to be generally of less relevance to the SoS than the relevant Energy NPSs. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and Kent, along with a combination of other factors. The Strategic Options Report and **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered** detail the decision-making process and factors that have influenced the evolution of the design up to the current proposed iteration.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	National Planning Practice Guidance in that the need for renewable energy does not override environmental protections or indeed the planning concerns of local residents. For the reasons set out in this objection and noting that Government planning policy and guidance has not been adhered to, this proposed project should not be permitted to proceed.		

Table 1.39 Land rights and CPO

Feedback form			
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Local community	As stated before it's completely unfair to landowners, particularly farmers	N	National Grid acknowledges that the Proposed Project may cause concern to landowners. All affected landowners will be compensated on a fair and reasonable basis for any rights acquired, and any impacts on the retained property will be considered in line with the Compulsory Purchase Compensation Code.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	You need to compensate property owners and residents: 1. For the permanent loss of value to property (including loss of development potential). 2. For the massive disruption during the planning and building phase. 3. For planning blight incurred whilst all the projects are being considered.	N	National Grid will pursue voluntary agreements with affected landowners. Compensation offered for voluntary land rights is benchmarked against other similar utility providers. If a voluntary agreement cannot be reached, then the Compulsory Purchase Compensation Code allows for a claim of compensation for the loss that property owners may have suffered as a direct result of the retained part of their property ownership being worth less as a direct result of the works. Compensation for compulsory acquired rights is governed by statute. Through engagement with the local authority, National Grid will seek to minimise impacts of the construction phase and wherever possible coordinate with other development projects occurring in close proximity.
Q17 Anything else? Comments			
Local community	Our family farm lies along the Richborough Connection. It is depressing that within a very few years of tall the disruption of its construction that there will have to be an upgrade of insulators as well as cables, with inevitable disruption to landowners. I make the pleas that: 1. NG makes direct contact with all landowners along the Richborough Connection as soon as possible to explain the plans and discuss the potential difficulties of access etc. [Landowners were NOT advised of the current meetings and consultation!] 2. NG ensures that the work is done at times to suit the agricultural cycle of the farms in question.	N	National Grid is and will continue to work with all landowners including tenants who may be affected by the proposals to understand the impacts on their operations and to work with them as the construction programme is developed. National Grid will seek to work with the farming community to limit disruption where practicable. The cable route will be reinstated to its previous use and therefore farming operations are able to continue post construction. The cable width is relatively minimal, and accommodation works will be discussed and agreed prior to commencement of construction to ensure disruptions to normal farming operations are minimised. Compensation claims for disturbance are considered on an evidenced basis and landowners and farmers will therefore be encouraged to keep records to support their claims.
Local community	More consideration and focus should have been given to existing landowners in the areas and priorities to those parties in the ownership Brownfield land of sufficient scale to accommodate the new buildings proposed. Current landlords within the areas should receive more of a focal point and better taken into consideration. The most important consideration should be to those that own Brownfield land of large scale in order to assist the new buildings proposed. The proposals at present are probably going to come up against planning approval difficulties and if the approach suggested above is taken then it would in turn make the project much more	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the available brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Details are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	deliverable in terms of planning preparation, consultation and approval terms.		
General commentary			
Country Land and Business Association	The CLA would like to reaffirm to National Grid and its agents that Landowner interests need to be taken into consideration. Fair levels of compensation must be paid for any new infrastructure being installed and paid in a timely manner. Any affected land must be reinstated to an acceptable standard and compensated for accordingly. In addition, any damage to the natural environment ought to be mitigated where possible, and if it is not possible to effectively mitigate some of the harm being caused, we would remind National Grid that it is both possible and preferable in such situations to consider alternative routes/ solutions. At present, feedback from our members is that Farmers and Landowners are not being effectively communicated with, that the compensation on offer is not equitable – especially where proposals have a major impact on the viability and ease of farming of a holding, and the environmental schemes over the land and the overall value of the affected land are taken into account. In addition, we are told that some un-mitigatable damage to nature is being proposed which could easily be avoided if some of the proposed above-ground infrastructures were to be undergrounded. These key requests form part of what the CLA would like to see as a Duty of Care offered by large infrastructure schemes to ensure landowners are treated fairly.	N	National Grid acknowledges the concerns and will pursue voluntary agreements with affected landowners. Compensation offered for voluntary land rights is benchmarked against other similar utility providers. If a voluntary agreement cannot be reached, then the Compulsory Purchase Compensation Code allows for a claim of compensation for the loss that property owners may have suffered as a direct result of the retained part of their property ownership being worth less as a direct result of the works. Compensation for compulsory acquired rights is governed by statute. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. National Grid is and will continue to work with all landowners including farmers who may be directly affected by the Proposed Project to understand the impacts on their operations and to work with them as the construction programme is developed. National Grid will seek to work with the farming community to limit disruption where practicable. Compensation claims for disturbance are considered on a case-by-case basis if negative impact on farming operations can be established. Where new overhead lines are required, this is as a result of assessments concluding that this is the most feasible option. In the case of the connection to the existing network line in Kent, National Grid has engaged with the Environment Agency, the Lead Local Flood Authority (County Council) and Internal Drainage Boards extensively during the pre-application phase of the Proposed Project. This engagement has helped to inform the surface water drainage principles and flood risk mitigation measures that will be integrated in to the design.

Table 1.40 Project finance/cost of scheme

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	We agree with the need to reinforce the network to provide more sustainable power and to regulate availability and price. We do not agree that these proposals are the correct way to do it. Destroying areas of natural beauty is not appropriate nor is it appropriate to materially and significantly damage areas relied on by a large variety of wildlife including migratory bird populations. There are other ways this can be achieved without damaging these. This proposal puts profit over people and nature.	N	National Grid acknowledges your concerns. However, the need to reinforce the network in this area determines the geographical parameters for delivering the Proposed Project. National Grid is seeking to minimise potential impacts through careful consideration of construction methods and design, while the EIA process is responsible for establishing the baseline environmental condition of the Proposed Project area. This then determines the mitigation that must be put in place and is then discussed with the relevant statutory advisory services. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project. The sensitivity of the area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual, Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual, Application Document 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity.**
Local community	I cannot support any development which includes onshore structures, whether you leave scars on the landscape, for future generations. No doubt options you have are to save costs, but spending more now and doing the job properly will be recouped over time and would provide local support both here and in Kent.	N	The sensitivity of the area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.
Local community	Any investment in the UK power infrastructure, especially where there are costs passed on to consumers, must sort energy security as well as cheaper prices.	N	As a national infrastructure provider, National Grid is seeking to support delivery of the Government's policies regarding net zero by 2050. This includes increasing capacity to transmit energy generated from renewable sources. National Grid is funded by a price control mechanism which is agreed with and set by Ofgem. National Grid pays up front the many millions of pounds it costs to build a new

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Shareholders of National Grid should not profit from the construction phase or for a period after if there is any cost passed on to the consumer.		power transmission line. The cost is then gradually passed to customers through their electricity bills over the next 40 years. The funding for these up-front costs comes from National Grid's shareholders and the institutions that lend the company money. This amounts to many billions of pounds across all National Grid infrastructure and investments. The shareholders invest in National Grid because they expect that it will make a sufficient profit to provide an appropriate return on the investment and eventually pay the shareholders back. This brings a major benefit to electricity bill payers as it allows the recovery of the cost of for investment in the network to be spread out over many years, rather than having a spike in electricity bills when large new transmission connections are required.
Local community	I understand the need for increasing the size of the one UK energy system by 2/3 but I think you are putting business and profit before any less profitable actions such as retro-fitting old housing stock with insulation and less damaging methods to the environment of heating. I see minimal effort from NG in guiding the increasing population into living more sustainably.	N	Many of the comments here relate to Government policy and are not within National Grid's remit for the Proposed Project. National Grid is a national infrastructure provider and is seeking to deliver the Government's policies regarding net zero by 2050. In delivering the Proposed Project, National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously?			
Local community	It seems, yet again, nature is not being adequately valued and the cable running straight through Sandwich and Pegwell Bay NNR is very disappointing when there are other route options - possibly more expensive in monetary terms but much less expensive in terms of damage to wildlife and loss of natural capital.	N	National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Alternative options have been carefully considered. Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.
Q9 Are there any other ways that you would like us to explore coordination with other projects?			
Local community	All projects connecting into the Sizewell to Bramford lines should have their converter stations/sub stations on the coast at Sizewell. Building numerous cable corridors inland in parallel to the already in situ overhead lines cannot be anything other than a waste of bill payer's money. I fear there is little incentive for the developer to minimise costs as they likely get a fixed rate of return on the investment.	N	National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. When assessing potential options for the location of new infrastructure, National Grid sought to minimise impacts on the most sensitive areas, including the Suffolk and Essex Coast and Heaths National Landscape – therefore avoiding locations on the coast. Further information on the reasoning behind the connection location for the Proposed Project, the alternatives considered, how National Grid has coordinated with other projects and a complete project description is contained in: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			• **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The description provided in Chapter 4 is the preferred solution for the Proposed Project. The assessment of effects arising from the Suffolk onshore scheme on landscape and visual amenity is set out in **Application Document 6.2.1.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. Routeing cables underground is more costly than use of overhead lines. However, as in this case, where there are serious concerns about the potential adverse landscape and visual effects of a proposed overhead line, this has been balanced against other relevant factors, including the need for the proposed infrastructure, the availability and cost of alternative sites and routes and methods of installation (including undergrounding). National Grid is funded by a price control mechanism which is agreed with and set by Ofgem. National Grid pays up front the many millions of pounds it costs to build a new power transmission line. The cost is then gradually passed to customers through their electricity bills over the next 40 years. The funding for these up-front costs comes from National Grid's shareholders and the institutions that lend the company money. This amounts to many billions of pounds across all National Grid infrastructure and investments. The shareholders invest in National Grid because they expect that it will make a sufficient profit to provide an appropriate return on the investment and eventually pay the shareholders back. This brings a major benefit to electricity bill payers as it allows the recovery of the cost of for investment in the network to be spread out over many years, rather than having a spike in electricity bills when large new transmission connections are required.
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	Consider the environment over profit.	N	National Grid's duties and obligations, primarily set out in Schedule 9 of the Electricity Act, involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.
Local community	Technological advances in transporting, storing and converting electricity are taking place all of the time. It is quite possible that on offshore platform would be better suited for the needs of this and many of the other proposed projects. This would be cheaper and far less controversial than the current proposals.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible.
Local community	Economic viability vs practicality. Whatever method is the cheapest when considering development, yet beneficial for the optimum upgrade of the National Grid infrastructure.	N	National Grid is a national infrastructure provider and is seeking to support delivery of the Government's policies regarding net zero by 2050. In delivering the Proposed Project, National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. National Grid undertakes an options appraisal as the method to compare options and differentiate between its relative costs and benefits. Please refer to 'Our Approach to Consenting' and 'Our approach to Options Appraisal' to find out more. This approach was applied to the Proposed Project, for more information about the evaluation and findings please refer to the following: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study (October 2022);** • **Application Document 8.3 Strategic Options Report (October 2023);** • **Application Document 7.2 Strategic Options Back Check Report;** • **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered;** • **Application Document 7.10 Coordination Document; and** • **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Local community	I'd like you to take into account the real cost of your proposals. You should prepare a cost benefit analysis for all options including an offshore one. We need to see how you evaluated the original proposal to bring the electricity onshore. Your short term goals that are profit driven will be paid for by the visitors and residents of Suffolk for generations to come.	N	
Q12 What do you think about our proposed landfall at Pegwell Bay? Comments			
Local community	I do not know the area but as with Suffolk, there appears to be many less disruptive options which may just cost National Grid a few more pennies.	N	National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The reasoning behind the selection of this location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Q17 Anything else? Comments			
Local community	For once deliver what we were led to believe would be the case - an environmentally friendly scheme to benefit the consumer and deliver UK electricity, responsibly produced and priced with the reliability we ostensibly pay for with our standing charges and energy costs.	N	National Grid is seeking to deliver the Proposed Project in accordance with its duties and obligations that involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	This should not be a covert way of establishing an energy exporting business route, especially if we have to buy it back at an increased cost for us and profiteering for the few.		National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. The Proposed Project is not an interconnector. National Grid is funded by a price control mechanism which is agreed with and set by Ofgem. National Grid pays up front the many millions of pounds it costs to build a new power transmission line. The cost is then gradually passed to customers through their electricity bills over the next 40 years. The funding for these up-front costs comes from National Grid's shareholders and the institutions that lend the company money. This amounts to many billions of pounds across all National Grid infrastructure and investments. The shareholders invest in National Grid because they expect that it will make a sufficient profit to provide an appropriate return on the investment and eventually pay the shareholders back. This brings a major benefit to electricity bill payers as it allows the recovery of the cost of for investment in the network to be spread out over many years, rather than having a spike in electricity bills when large new transmission connections are required.
Local community	No way this will bring cheaper energy, this will only line the pockets of sea link - it's the cheapest but most damaging way, it must not happen.	N	
Q18 Do you have any key concerns regarding the construction stage of Sea Link? (Other)			
Local community	If it ends up being approved, do it as quickly as possible. Nature will recover, it is only a question of time. Don't waste more money trying to do nature's job, move quickly for the sake of us locals. A short sharp shock better than a protracted operation wasting more money.	N	National Grid acknowledges these comments. National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	Is the choice of Pegwell and Minster governed by the starting point being Suffolk? Could Suffolk be strengthened in a different direction and a different Kent location used which would be less detrimental from an environmental point of view? The main concern throughout appears to have been cost and, whilst I appreciate that most costs will ultimately be passed on to consumers, should we not be prepared to pay in order to protect our wildlife?	N	National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project Link to transport power between each area depending on the fault in either direction is set out as the requirement for this project. direction is set out as the requirement for this project. The reasoning behind the selection of this location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. National Grid is funded by a price control mechanism which is agreed with and set by Ofgem. National Grid pays up front the many millions of pounds it costs to build a new power transmission line. The cost is then gradually passed to customers through their electricity bills over the next 40 years. The funding for these up-front costs comes from National Grid's shareholders and the institutions that lend the company money. This amounts to many billions of pounds across all National Grid infrastructure and investments. The shareholders invest in National Grid because they expect that it will make a sufficient profit to provide an appropriate return on the investment and eventually pay the shareholders back. This brings a major benefit to electricity bill payers as it allows the recovery of the cost of for investment in the network to be spread out over many years, rather than having a spike in electricity bills when large new transmission connections are required.
Local community	These projects seem to be driven by profit for shareholders with minimal consideration for the impact on communities, livelihoods and a precious natural landscape. We all support the need for renewable energy, wind farms, etc. but it does not have to come at such a cost.	N	
Local community	This is all about future profits for the energy industry. Yes we need infrastructure for the future, but this project, like so many is about maximising profit for the lowest cost, no matter how much long term damage and effect is caused.	N	
Local community	It's apparent to me that you are hell bent on doing what you want to do and that you are not concerned enough to seek out cheaper and less harmful alternatives.	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible.
Q26 Do you have further comments about our materials, consultation process or any suggestions for how we can improve our consultation?			
Local community	I strongly believe this is a tick box exercise and you don't care of the mindless damage and destruction. Whatever you do care about is making money for the shareholders at any cost to the public	N	National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring and offsetting impacts. National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. National Grid's has a duty to balance the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality.
General commentary			
Local community	In proposing its "best" option NG has only considered financial cost and has given no consideration at all to other intrinsic values of this area.NG has completely failed to justify its choice of routes and buildings. This is national infrastructure, we will all live with consequences - "quick and cheap" is not an appropriate choice.	N	National Grid's duties and obligations involve balancing the need to be economic and efficient, whilst also having regard to preserving amenity, which includes the natural environment, cultural heritage, landscape and visual quality. Efforts to minimise the impacts of the Proposed Project are therefore embedded within the design.
Local community	The change in the location of 3 convertor station has had a detrimental impact on the value of my property, at Glebe Farm we will be directly impacted by building noise, increased traffic noise and pollution, light pollution, noise pollution and loss of habitat. I would like to know what the process is for compensation for loss of quality of life and value of property should we wish to sell and move.	N	National Grid acknowledges that development may cause concern to landowners. Diminution in property value known as 'injurious affection' and any other appropriate heads of claim will be considered on an individual basis in accordance with current legislation. The Compulsory Purchase Compensation Code allows for a claim of compensation for the loss that property owners may have suffered as a direct result of the retained part of their property ownership being worth less as a direct result of the works.
Local community	So why on earth do we have so called highly educated, highly qualified people in business looking so narrowly at the world that their only yardsticks are cost, benefits and profitability for now in the short term. Stop sloppy self centred managements spoiling the world in pursuit of profits or convenience, let's see some positive creative thinking offering lasting benefits, happier outcomes, achieving targets by clever strategies and delicate dedicated thinking and designs with happier outcomes for all. Seek to have the objectors lining the streets and hailing creative thinking and design solutions rather than shuffling around the slag heaps and tumble down workings of obsolete industrial developments long since milked of their profits and left derelict and dire for generations. We have the knowledge, expertise and ability to do better.	N	National Grid acknowledges these comments.
Local community	The main purpose of this project appears to be mainly motivated by greed, creating profits for National Grid shareholders in the USA by selling power generated offshore in East Anglia to Europe and not to benefit the people in the UK.	N	The purpose of the Proposed Project is set out in the needs case, which explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			each area depending on the fault in either direction is set out as the requirement for this project.
Local community	At the end of the day it is cheaper for NG to build substations on-shore (income generated from every connection made on-shore) instead of offshore rigs from which to distribute the offshore generated energy to where it will be used; it is cheaper for NG to build pylons instead of burying cables; it is cheaper to build substations at brownfield sites in Kent but they refuse to look at this option. This is only about political posturing and making money. This infrastructure project is but a means to an end and little to do with a thoughtful and sensitive contribution to the common weal.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**.
Dr Thérèse Coffey MP	I know some work has been done, as described in the option selection and design evolution report, which includes three offshore connection options and one onshore pylon option all with a starting point at Sizewell – with the alternative onshore option dismissed because of lifetime costs. However, I cannot see that any serious work has been done to assess the costs of an offshore transmission network or undertaking a comparative study properly assessing the environmental impact of landfall in Suffolk with brownfield alternatives.	N	National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. Similarly, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure.
Local community	I strongly oppose National Grid's plans to site the Sea Link Converter Station at Saxmundham because off-shore cabling	N	National Grid's publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. The needs case sets out how

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	routes, on-shore brownfield conversion sites and co-location of energy infrastructure at pre-existing energy hubs offer better viable alternatives which are cheaper, more efficient and don't require the needless destruction of the Suffolk countryside. The 'National' in National Grid is unquestionably a misnomer. National Grid is a publicly listed company with a primary responsibility to generate maximum profit for its shareholders. The Sea Link proposals represent a tremendous investment opportunity and as National Grid holds a monopoly over on-shore electricity transmission, its plans for Sea Link are without competition. It is not in National Grid's interests for any alternative methods of off-shore electricity transmission to be taken into consideration. I would suggest that National Grid's proposals are solely in the interests of National Grid and that National Grid's domination over on-shore electricity transmission has led to a situation in which viable alternatives have not been given adequate consideration.		electricity transmission faults in each area cause overloads specific to that area. The unique ability of the Proposed Project to transport power between each area depending on the fault in either direction is set out as the requirement for this project. Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. National Grid is funded by a price control mechanism which is agreed with and set by Ofgem. National Grid pays up front the many millions of pounds it costs to build a new power transmission line. The cost is then gradually passed to customers through their electricity bills over the next 40 years. The funding for these up-front costs comes from National Grid's shareholders and the institutions that lend the company money. This amounts to many billions of pounds across all National Grid infrastructure and investments. The shareholders invest in National Grid because they expect that it will make a sufficient profit to provide an appropriate return on the investment and eventually pay the shareholders back. This brings a major benefit to electricity bill payers as it allows the recovery of the cost of for investment in the network to be spread out over many years, rather than having a spike in electricity bills when large new transmission connections are required.
Local community	Sea Link is an infrastructure project of national significance and should therefore be subject to cost-benefit analysis (CBA), as large public projects are. The costs include not only the private costs to National Grid but also external costs imposed on other members of society. These include the key concerns listed on page 26 of the Feedback Form under 'Construction', although most continue to apply during the operational phase. The CBA results would significantly reduce, if not eliminate, the cost advantage of the current project over an offshore hub connected to a brownfield site closer to London, where the extra capacity is needed.	N	National Grid undertakes an options appraisal as the method to compare options and differentiate between their relative costs and benefits. Please refer to 'Our Approach to Consenting' and 'Our approach to Options Appraisal' to find out more. This approach was applied to the Proposed Project, for more information about the evaluation and findings please refer to the following: • **Application Document 8.1 Corridor Preliminary Routeing and Substation Siting Study;** • **Application Document 8.2 Option Selection and Design Evolution Report (October 2023);** • **Application Document 8.3 Strategic Options Report (October 2023); and** • **Application Document 7.2 Strategic Options Back Check Report.**

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			In addition, National Grid considers that the Proposed Project strikes an appropriate balance in the context of national policy and its statutory duties, which include the need to be economic and efficient. It is for the Government, through the planning process, whether this balance is right. Regarding the comment about a brownfield site located in proximity of London, attention is drawn to the summary of need case, found in the SOR, which states the capacity of the existing network in East Anglia and the South East is insufficient to accommodate the connection of the proposed new power sources connecting in the area.

Table 1.41 Construction

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q5 What do you think about our proposed converter station, including its proposed location? Comments			
Local community	As a resident of the parish of Benhall and Sternfield I am very concerned about safety and the impact of a significant increase in traffic during construction of this enormous infrastructure, especially in relation to the safety of existing road users. For example at the A12/B1121 junction there will be conflict between turning traffic and overtaking traffic northbound, compounded by Sizewell C traffic on the same timescale. The footway from Benhall to Saxmundham is along the west side of Main Road, whilst all but a few houses are to the east. There needs to be safe crossing points; in addition, some school pupils walk between Benhall and Saxmundham, along Main Road. There is a potentially fatal conflict between lorries and vulnerable road users (cyclists and equestrians). Also, the significant increase in HGVs from the proposal makes it imperative that vulnerable road users are separated from the main carriageway. Benhall is little more than a mile from Saxmundham, and non-motorised travel is encouraged. Further, a cycle route to Saxmundham and beyond is signed from the A12, south of Benhall Green. I understand that Scottish Power has accepted that some of the small, local road network is unsuitable for the routeing of HGVs, and I strongly oppose any proposal to route any HGVs along the B1121 through Sternfield.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** includes a review of the collision record (based on full collision data obtained from Suffolk County Council) and an assessment of road safety for the study area, which includes the A12/ B1121 junction. This demonstrates that the additional construction traffic to be generated by the Proposed Project during the peak construction phase is not expected to result in any significant impacts on the road safety of this junction, with the mitigation identified within **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan – Suffolk**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Further consultation was held with Suffolk County Council as the ES was prepared.
Q7 What do you think about how our proposed HVDC cable route in Suffolk? Comments			
Local community	To carry out the work there will need to be haul roads, workers compounds/parking areas for spoil and equipment access to dig the trench across rural, farmland with residential properties in an area of tranquillity, dark skies and important habitats. This will have a negative effect on wildlife, the environment, people's lives and the tourism economy.	N	The Proposed Project EIA (Volume 6 of the DCO Application) assesses the potential impacts of the construction phase on a wide range of parameters including biodiversity, the landscape and socio-economics, recreation and tourism. The locations of construction haul roads and compounds have been selected to minimise the impact on the environment wherever possible. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q10 Is there anything further you would like us to take into consideration when developing our proposals in Suffolk?			
Local community	There remains a high degree of uncertainty in relation to construction methodology, sequencing, access strategy, etc, and the stated intention that these will be decided by the appointed contractor is likely to result in a construction strategy that prioritises cost and convenience to the contractor rather than minimising construction duration and detrimental impacts on local residents. If the HVDC cable corridor is to proceed, the current proposals should be revised at the Aldeburgh Golf Club's northern field to avoid unnecessary impact on High Warren, Tall Pines, and Pinehurst. The layout should revert to the original, diagonal route across the field, shortening the route by approx. 50m and therefore	Y	The route of the installation and the access strategy is being finalised based on further survey work and the feedback received in response to Statutory consultation and will be provided in the DCO submission. However, further work will be required once the contractor is appointed, confirming the construction methodology. The routeing through this area is being reviewed in consideration of this feedback. The routeing will need to balance the requests and requirements of all landowners and neighbours affected. The proposal is to provide a ducted solution which will allow works to be completed sequentially, with trenches back filled as the works progress.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	reducing the programme and minimising the period of impact on adjoining properties. The implementation of the works should be carried sequentially (i.e., commencing and completing the works on a phased basis) This would allow works at the AGC field to be completed as quickly as possible and reinstated before the entirety of the works are completed, lessening the period of disruption to the adjoining owners. The access and construction strategy and methodology should avoid unnecessary detrimental impacts on adjoining properties including noise, dust, staging, lighting, hours of operation, etc.		Measures relevant to the control and management of impacts during construction have been included within **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice**. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Q18 Do you have any key concerns regarding the construction stage of Sea Link? (Other)			
Local community	I am surprised that the proposals make no mention of the issue of implementation. Will there be a new road to provide access. The influx of contractors will create huge problems of accommodation/access/management. We need to see a detailed construction plan.	N	Available information of the proposed methods and programme of construction is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. Outline information on the proposed permanent access roads, temporary haul roads and compounds is also provided. A detailed construction programme cannot be furnished until the construction contractors are appointed.
Local community	So little information is provided about the construction phase it is difficult to comment. The working compounds for the construction are not shown on any of the maps and although these may be temporary, temporary roads and the erection of double height portacabins that are craned into place will cause long term damage to fragile soil structures surrounding the site. Putting things back the way they were will not truly be possible.	N	Project drawings indicate where construction compounds will be located, including typical compound layouts. Compound site restoration will follow a standard method that has successfully been implemented in numerous other sites, which have reverted to previous uses with no lasting adverse impacts. Furthermore, National Grid is working with other developers to identify opportunities to coordinate construction activities. Potential impacts on the local services are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. This analysis demonstrates that at peak workforce employment and typical seasonal occupancy levels, all of Suffolk Onshore Scheme's construction workers could be accommodated within a 60-minute drive time of the Order Limits. Given this, it is assessed that there would be negligible magnitude of impact on the hotel, bed and breakfast, and inns accommodation sector arising from the Suffolk Onshore Scheme. It is anticipated that accommodation providers would be able to accommodate employees working at the Suffolk Onshore Scheme without any adverse effects on the sector.
Local community	Our concerns regarding Sea Link from an environmental perspective are magnified and increased further when considering the actual delivery and constructions phase. The fact that virtually all of the chosen routes and or locations for above ground development are on high-value green land (ecology, tourism, agriculture) then it also means that access roads and site compounds will also need to be formed. This could quite easily double if not triple the land that will be effected and we would like to understand the proposed access routes and location of the site construction compounds sufficient to receive, store and build building which will no doubt contain numerous items of plant weighing over 50-tonnes per item. Should Brownfield land have been chosen then in many cases existing access or indeed temporary access routes would be far easier to deliver and have a significantly reduced impact on the surrounding area.	N	The locations of construction haul roads and compounds have been selected to minimise the impact on the environment wherever possible. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Comments regarding use of previously developed land are noted and National Grid is working with other developers to identify opportunities to coordinate construction activities and minimise local impacts. Potential impacts on tourism are assessed in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. Details relating to the ecology assessment are contained in **Application Document ES 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. Please see the themed tables in this Appendix for more information on these parameters.
Local community	All onshore infrastructure and landfall should be using brownfield and existing industrial zones with adequate port/road/rail access	N	Comments regarding use of previously developed land are noted and in developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure,

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	and with accommodation for the workforce. By using existing industrial zone supply chains can also be built up creating an economic hub. Scattering infrastructure all over the country side does not create economies of scale to develop and maintain port road and rail facilities and a flexible workforce.		including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. The alternatives that National Grid considered are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main alternatives Considered**.
Local community	Given the size and scope of the Sea Link project the construction phase is clearly going to have and already is having a negative impact on the area and in particular upon the unique biodiversity and the much-projected marine and SSSI environments. There is no mention of this in the documentation which is worrying, bringing materials alone onto site will have a negative impact. Indeed, the surveying has resulted in damage to access roads, hedgerows, fields, grass and scrub areas as well as disruption to the wildlife that is not normally subjected to these activities. The assumption must be made that construction will go on for some time, involve a massive amount of earth moving and materials, while creating noise, dust and light pollution as well as traffic not normally associated with this area. It is hard to see exactly how mitigation is possible and how the existing wildlife will survive sadly.	N	Available information of the proposed methods and programme of construction is provided in **Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The Proposed Project EIA assesses the potential impacts of the construction phase on a wide range of parameters including biodiversity, noise, air quality and traffic and transport. The locations of construction haul roads and compounds have been selected to minimise the impact on the environment wherever possible. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Project drawings indicate where construction compounds will be located, including typical compound layouts. Compound site restoration will follow a standard method that has successfully been implemented in numerous other sites, which have reverted to previous uses with no lasting adverse impacts. National Grid is working with other developers to identify opportunities to coordinate construction activities. Details relating to the ecology assessment are contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity and Application Document 6.2.2.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.
Local community	We are very worried about the construction of the station, because of the massive churning up of the land from diggers, lorries, etc. The amount of construction vehicles needed to build the station and the pylons will churn up the soil no matter how careful you might be. After it's all built, the land churned up and scared will never be the same again. Also the mud on roads can never be fully cleared up during construction. This alongside the noise of diggers, generators etc will be very noisy.	N	
Local community	There should be at least a four-month installation period to minimalize noise during setup and takedown, as noise disturbance – impacts on wildlife communication and navigation. It is suggested to use a static rig in the bay during installation and of course, any planned bore hole drilling in mid-2024 will require Natural England consent. It has been suggested that drilling should start inside the golf course to minimize impact. Plus, any lighting in the area should be on timers and switched off by 10.00pm at the latest. CCTV to be infra-red only. Light pollution will cause an adverse impact on wildlife, the countryside, coastal species not to mention the fact that dark skies are needed for star observation by many birds, butterflies, moths as well as star-gazers. Underground cabling should be only under the river, but should that be found to be impossible then low level bridging must be constructed. There is a disregard of heritage assets and archaeology, particularly on the route of the buried cable from Pegwell Bay. It is advisable to have small, low level access holes in all fencing to allow the movement of mammals. The critically endangered European eels are currently thriving in this area and so there will be a need to seek professional advice to ensure this. NB	N	National Grid acknowledges this comments. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation. Consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. Where necessary, and insofar as possible, mitigation measures will be implemented for identified significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	The use of rodenticides should be banned. Finally, the boundary should be surrounded with native hedging to form a barrier from noise pollution and will also encourage diversity of species.		
Q20 Do you have any other comments about Sea Link to give that you have not previously mentioned?			
Local community	Make sure the workforce are well trained and comply with procedures and associated risk assessment and checklists, so that the project will completed with little or no accidents and incidents. Involve your workforce throughout, seek and value their input. This will result in a workforce who feel they have ownership of the project and are keen to get the work done!	N	National Grid acknowledges this comments. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	The damage already being caused at the surveying stage to access roads, hedgerows, fields, grass and scrub areas is very worrying. How will damage be kept only to the footprint of the converter site during the 4 year construction stage? The amount of earth needing to be moved at construction will cause huge amounts of noise & light pollution along with large volumes of traffic, surely this will damage the wildlife before the converter is even in place, not mentioning the flood risk of moving earth that is holding water with nothing in place to hold that water.	N	National Grid acknowledges this comments. During construction, contractors will be required to adhere to **Application Document 7.5.3.1 CEMP Appendix A Outline Code of Construction Practice** and develop their own task-specific management plans. This Plan is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). National Grid are bound to remain with the extent of the red line boundary that is consented for the Proposed Project. No construction activity will be permitted outside of these parameters. The issues raised by the respondent are addressed in the following Application Documents: • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.7 Part 2 Suffolk Traffic and Transport;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual; and** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment.** Where necessary, and insofar as possible, mitigation measures will be implemented for identified significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
General commentary			
Local community	The massive increase in road usage as a result of constant construction traffic, will put intolerable pressure on rural infrastructure, never designed for such usage and resulting in increased carbon pollution. There is high usage of these roads already from intensive farming, necessary as it is for greater national food self-sufficiency.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport and Application Document 6.2.3.7 Part 3 Kent Chapter 7 Traffic and Transport** provide an assessment of the impact of traffic movements during the construction phase of the Proposed Project. In developing the impact assessments, National Grid consulted with relevant stakeholders such as Suffolk and Kent County Councils. Measures to offset/mitigate any potential impacts are provided within **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan – Suffolk and Application Document 7.5.1.2 Construction Traffic Management and Travel Plan - Kent**. These Plans are secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	As a local resident (Suffolk), onshore projects present major concerns with regard to road traffic congestion in what is already a popular holiday destination. During the summer months and on days of good weather, local roads already become congested with	N	

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	traffic, with an influx of holiday makers and day-trippers. Construction traffic would only add to this, possibly with further risk to life, with heavy vehicle movements and poor access for emergency services. Our local road network regularly floods during the winter months and year-round is only suitable for local domestic traffic. Absolutely no construction vehicles should be allowed to pass through any of the villages using the existing road network. Key concerns remain with any increase in road traffic, construction noise, air pollution, light pollution, and routes close to residential buildings. Furthermore, it is unacceptable for the B1121, through the middle of the village of Friston, to be used for construction traffic and also for access to construction sites. The road passes close to a number of properties as well as the village green where there is a children's playground.		The other issues raised by the respondent in the feedback are considered in the following: • **Application Document 6.2.5.1 Part 5 Combined Chapter 1 Climate Change;** • **Application Document 6.2.2.8 Part 2 Suffolk Chapter 8 Air Quality;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration; and** • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual.** Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). For further information, please refer to the themed tables for these parameters in this Appendix.
Leiston-cum-Sizewell Town Council	The community of Leiston has shouldered responsibility for a proportion of the UK's electricity generation for decades. It has been host to two nuclear power stations and is about to embark on a decade plus of construction for SZC. During consultation for SZC, residents sought some solace from knowing that the countryside to the south and west of Leiston would not be impacted by construction and that our leisure amenity could be sought via both those directions. However, the impact of the proposed onshore cabling infrastructure has left Leiston facing many years of upheaval in every direction. Effectively, cutting the town off from all the major routes north, south and west. The following is a snapshot of issues facing our community: ● Residents working outside the immediate area will face the prospect of a difficult and longer commute as they negotiate construction traffic and associated infrastructure build to support the projects. ● Employees working in Leiston will face longer journeys to the town and could be forgiven for seeking employment elsewhere. ● Trips to hospital (already 45 minutes) will take even longer and emergency vehicles accessing the town will face even longer delays getting to patients. ● The demographic of our town will suffer an imbalance, as those who seek a quieter life move away from the town. This is not conducive towards a healthy community. In effect, the lives of our residents will lose all the qualities associated with living on the Suffolk Heritage Coast as it becomes increasingly industrialised, and could force out the residents who are not directly, or indirectly, associated with the construction projects.	N	**Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport** provides an assessment of the expected impact of traffic during construction of the Proposed Project. The assessment did not find any significant effects relating to construction traffic as a result of the Proposed Project. Mitigation is identified within **Application Document 7.5.1.1 Construction Traffic Management and Travel Plan – Suffolk** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The effects arising from the Suffolk Onshore Scheme on the Suffolk Coast and Heaths AONB are summarised within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual and detailed within Application Document 6.3.2.1.C ES Appendix 2.1.C Landscape Designation and Landscape Character Assessment**. The assessment takes into account the Natural Beauty indicators and the relevant associated Suffolk Coast and Heaths AONB indicators relating to natural beauty indicators to landscape and visual matters. It is considered that there would be no significant adverse effects on the Heritage Coast or AONB at any Proposed Project stage as a result of the Suffolk Onshore Scheme. National Grid's landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Mitigation is contained in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Commitments and Actions (REAC)** which is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
RSPB	Construction compound	N	The drawings 006 and 007 are general arrangement drawings; these show the areas for which works will be required, therefore they are more an overview of the Proposed Project

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Design Drawings S42_M/TDD/SS/1044 and S42_M/TDD/SS/1038 show the layout of the HDD construction compound adjacent to the Leiston-Aldeburgh SSSI and RSPB North Warren under the Sea Link only and co-location scenarios respectively. We query why the layout appears to differ to that of the construction compound shown in General Arrangement Plans S42_S/IGA/PS/0006 and S42_S/IGA/PS/0007. Clarity regarding the location of the compound and the activities that are proposed within it is essential for the purposes of assessing impact on the SSSI and RSPB reserve. At this stage, we cannot have confidence in any conclusions around such impacts as there does not appear to be certainty regarding the designs assessed.		requirements without the specific detail. Drawings 1044 and 1038 are typical layouts for a compound of this type. National Grid has received a number of items of feedback with regard to this area and have completed more surveys. Based on this they have made some revisions to the layout of the area to take into consideration the impact on the surrounding designations and surrounding properties. This new layout is therefore reflected in the works plans and General Arrangement Plans accompanying the DCO application. These updated plans show the confirmed location of the construction compounds and the ES has assessed the impacts on the areas shown on the plans see **Application Document 2.1 Guide to the Plans**.

Table 1.42 Norwich to Tilbury

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
General commentary			
Local community	National Grid plans to build pylons from Norwich to Tilbury, tunnelling beneath the Dedham Vale AONB to link to a proposed substation in Tendring, and running a line of 50m tall pylons through North Colchester. These plans will do huge damage in the Dedham Vale AONB and North Colchester, destroying landscape which is important in its own right and forever altering the setting of the AONB as well as impacting upon a significant number of Listed Buildings and Archaeological sites in the North Colchester area. The need to tunnel beneath the AONB, to build a substation in Tendring, and to run pylons through North Colchester arises only because of the proposed connection in Tendring which you have offered to the Five Estuaries and North Falls wind farms. In November 2020 ESO published a paper highlighting that huge savings are possible through building offshore instead of onshore, but INTEGRATING projects instead of building them separately. They identified savings of £2Bn for East Anglia alone. Not only are your N2T plans hugely destructive, due to the need to provide mitigation near to the AONB they are also very expensive to yourselves. Meanwhile your proposed Sea Link offshore connection between Suffolk and Kent would see cables run in close proximity to Five Estuaries and North Falls. Your Sea Link plans should be modified and Sea Link should be used to connect the two wind farms back to shore at brownfield sites. This would avoid the need for the substation in Tendring, remove the need for cables through the AONB, remove the need for Pylons in the North Colchester area. Making use of Sea Link to interface with Five Estuaries and North Falls offshore would generate very significant cost savings. Firstly, underwater cabling as well as sub-sea and onshore engineering by the windfarms would be eliminated. These costs typically include significant lengths of expensive underground cables between the shore and windfarm substations. Although these costs do not directly fall to National Grid at the time of construction, they would later fall to National Grid as a required purchaser of the assets given that the windfarms cannot legally both generate and transmit. Secondly, the need for Windfarm substations in Tendring would be removed. Thirdly, the need for National Grid substations in Tendring as part of N2T would be removed.	N	The Proposed Project is a separate project to Norwich to Tilbury. Each project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. Since the connecting projects are being promoted by different companies, with different project teams, covering several different geographical locations and on different timelines for delivery, it is not possible to co-ordinate simultaneous delivery of all of the network reinforcements coming forward under the Great Grid Upgrade programme. As National Grid have developed the Proposed Project, they have considered a number of strategic options that could provide the reinforcement required. It assessed a variety of potential areas for infrastructure, including brownfield sites. However, in accordance with National Grid's regulatory obligation to find more efficient ways to work, a connection between East Anglia and Richborough in Kent has been identified as the most efficient means of resolving the capacity requirements within the electricity network, while the brownfield sites within the areas of search are too small to accommodate the required infrastructure. National Grid is rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. The Proposed Project is a network reinforcement, providing increased network capacity. National Grid is committed to coordinating consenting and delivery with other projects where opportunities are available, including the colocation of infrastructure where it can be demonstrated that this will support reductions in cumulative impacts. However, it must fulfil the requirements outlined in the publicly documented needs case by 2030. Coordination with North Falls and Five Estuaries has been pursued through the Offshore Transmission Network Review (OTNR) "Early Opportunities" workstream. National Grid, North Falls and Five Estuaries acted together in a consortium led by North Falls and were awarded funding by the Department of Energy Security and Net Zero Government's Offshore Coordination Support Scheme. On 28 March 2024, the consortium submitted a high-level feasibility study that formed the first step of the grant funding agreement. The study assessed the feasibility of a coordinated offshore connection specifically: the capital costs; building blocks; construction and commissioning methodologies and overall programme associated with a coordinated solution. However, a recent announcement from the Secretary of State for Energy Security and Net Zero confirmed that no further funding will be granted to the consortium. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's electricity system by 2030, the consortium supports the Secretary of State's decision and will not be further pursuing a coordinated offshore connection. With regard to a HVDC offshore grid, some of the technology required is not commercially available especially the requirement for HVDC circuit breakers.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Fourth, the need for underground cables built by National Grid through the AONB and in Great Horkesley within the N2T plans would be removed, which represents a significant proportion of the costs of the N2T project. Set against the sum of these savings this would be a degree of engineering offshore, although likely nothing more complex or costly than that already included in the radial connections of the Windfarms due to the similarity in technical use case and hence a very substantial saving overall is to be expected. More importantly the destruction to our landscapes and cultural heritage would be avoided. This is not something which would be beyond your ability. Your own Lion Link website highlights that you already plan to follow exactly this model, joining your Lion Link cables to Dutch wind farms in order to save money for Dutch consumers and protect landscape in Holland. And, ESO have already considered this possibility in detail in their paper “Early Opportunities, ESO Assessment Criteria, North Falls, Five Estuaries, Nautilus, Eurolink and Sea Link pathfinder project” dated June 2022. In that paper they found NO ROADBLOCKS to the use of Sealink. The most plausible alternative Scenario 2 was deemed to be ‘Green’ along all considered axes save for those associated with ‘Technical Obligations and Compliance’ and ‘System operability’. With respect to the former, no significant challenges were identified beyond those which “may require some thought”. The “System Operability” issue was an observation that with less cables there are reduced alternatives for network management, although it is not obvious that this is true when topology is properly considered: as Sea Link would have an additional interface halfway along its length electricity could be directed either northwards or to the south. Other alternatives did include ‘Red’ status but due to cable capacity. It should however be noted that since the publication of ESO2022 the North Falls windfarm has been reduced in scale and hence the risk identified would no longer occur. Even if North Falls were to be built to the original specification, the concerns are manageable through improved design, for example, the risk of injecting 3.5GW into a 2GW cable can be managed straightforwardly by sending half of the power through the northern Sea Link leg and half through the southern Sea Link leg. Alternatively, adding one extra cable would bring both legs to 3GW capacity to make a capacity of 6GW in total. We consider that the proposals outlined in ESO2022 constitute real and valid alternatives to the N2T proposals, at least in so far as the AONB, Tendring and North Colchester area is concerned		

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	If the solution is good enough and possible for the Dutch then it is good enough and certainly possible here. Your Sea Link proposals MUST be amended to lift synergies and remove the need for the destruction caused by your N2T proposals in North Colchester and the Dedham Vale through integration with North Falls and Five Estuaries.		
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons action group; Little Horkesley Parish Council; Great Horkesley Parish Council	5) We are further aware of the work by National Grid ESO entitled "Early Opportunities, ESO Assessment Criteria, North Falls, Five Estuaries, Nautilus, Eurolink and Sea Link pathfinder project" dated June 2022 (hereafter "ESO2022") which was released by National Grid pursuant to a request under EIR. ESO2022 is included in the appendix to this document. 6) ESO22 considers in detail the 'Status Quo' alternative comprising of radial connections back to shore for North Falls and Five Estuaries and Sea Link combined with the N2T proposals, counted against 10 other alternatives of which 9 would avoid the need for N2T infrastructure in Tendring, Dedham Vale AONB and mid--/north Essex entirely. Some of these 9 alternatives relied only upon Sea Link, North Falls and Five Estuaries, others included EuroLink and / or Nautilus. 7) Of the 9 alternatives which void the need for infrastructure in Tendring, and hence remove the need for damage to the AONB, Tendring, North Colchester and our Parish ESO22 included 7 options making use of Sea Link (Scenario 2, Scenario 4, Scenario 5, Scenario 6, Scenario 8, Scenario 10 and Scenario 11).	N	Coordination with North Falls and Five Estuaries has been pursued through the Offshore Transmission Network Review (OTNR) "Early Opportunities" workstream. National Grid, North Falls and Five Estuaries acted together in a consortium led by North Falls and were awarded funding by the Department of Energy Security and Net Zero Government's Offshore Coordination Support Scheme. On 28 March 2024, the consortium submitted a high-level feasibility study that formed the first step of the grant funding agreement. The study assessed the feasibility of a coordinated offshore connection specifically: the capital costs; building blocks; construction and commissioning methodologies and overall programme associated with a coordinated solution. However, a recent announcement from the Secretary of State for Energy Security and Net Zero confirmed that no further funding will be granted to the consortium. The alternatives considered by National Grid are discussed in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons action group; Little Horkesley Parish Council; Great Horkesley Parish Council	8) ESO concluded that the alternative of using Sea Link to bring power back to shore from the two windfarms would be possible. The most plausible alternative Scenario 2 was deemed to be 'Green' along all considered axes save for those associated with 'Technical Obligations and Compliance' and 'System operability'. With respect to the former, no significant challenges were identified beyond those which "may require some thought". The "System Operability" issue was an observation that with less cables there are reduced alternatives for network management, although it is not obvious that this is true when topology is properly considered: as Sea Link would have an additional interface halfway along its length electricity could be directed either northwards or to the south. Other alternatives did include 'Red' status but due to cable capacity. It should however be noted that since the publication of ESO2022 the North Falls windfarm has been reduced in scale and hence the risk identified would no longer occur. Even if North Falls were to be built to the original specification, the concerns are manageable through improved design, for example, the risk of injecting 3.5GW into a 2GW cable can be managed straightforwardly by sending half	N	National Grid acknowledges these comments. As a national infrastructure provider, National Grid is seeking to deliver the Government's policies regarding net zero by 2050. Many of the comments here reference opportunities associated with coordination between the Proposed Project and North Falls and Five Estuaries. This has been pursued through the Offshore Transmission Network Review (OTNR) "Early Opportunities" workstream, where National Grid, North Falls and Five Estuaries acted together in a consortium led by North Falls and were awarded funding by the Department of Energy Security and Net Zero Government's Offshore Coordination Support Scheme. However, a recent announcement from the Secretary of State for Energy Security and Net Zero confirmed that no further funding will be granted to the consortium. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's electricity system by 2030, the consortium supports the Secretary of State's decision and will not be further pursuing a coordinated offshore connection.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	of the power through the northern Sea Link leg and half through the southern Sea Link leg. Alternatively, adding one extra cable would bring both legs to 3GW capacity to make a capacity of 6GW in total. 9) We consider that the proposals outlined in ESO2022 constitute real and valid alternatives to the N2T proposals, at least in so far as the AONB, Tendring and North Colchester area is concerned, including our Parish.		
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons action group; Little Horkesley Parish Council; Great Horkesley Parish Council	10) The consultation for Sea Link has therefore been conducted too narrowly, a much wider area including the Dedham Vale, Tendring, North Colchester and our Parish should have been included. Consultation events should have been held in these areas, residents provided with information and made aware of the consultation through letter, leafletting and local community magazines. 11) The information provided during the course of the Sea Link consultation is too narrow, pursuant to the Gunning Principles it was required to include information — known to National Grid — of alternatives including those set out in ESO2022 to all consultees.	N	The extent of the geography included for consultation on the Proposed Project has been informed by extensive engagement with local authorities (including preparation of the Statement of Community Consultation) and by advice in the EIA Scoping Opinion received from the Planning Inspectorate. National Grid has consulted on its proposals several times during the pre-application phase. The details of the events and the materials shared with the public as part of these consultations are all available on the Proposed Project website. As the Proposed Project has developed, National Grid has shown how the different options have been narrowed down, with consultation documents showing how feedback received has helped to inform the proposals. Additionally, this Consultation Report (**Application Document 5.1**) sets out National Grid's consideration of the more than 3,800 pieces of consultation feedback received across the various rounds of pre-application public consultation. National Grid believes this work meets the standards required by the Planning Inspectorate and the Secretary of State, and that it meets the requirements of the Gunning Principles. The consultation strategy for the Proposed Project has been informed by engagement with the local planning authorities, and there are further stages in the DCO process which allow the planning authorities, the Planning Inspectorate, and others, to consider the adequacy of its consultation.
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons action group; Little Horkesley Parish Council; Great Horkesley Parish Council	12) Making use of Sea Link to interface with Five Estuaries and North Falls offshore would generate very significant cost savings. Firstly, underwater cabling as well as sub-sea and onshore engineering by the windfarms would be eliminated. These costs typically include significant lengths of expensive underground cables between the shore and windfarm substations. Although these costs do not directly fall to National Grid at the time of construction, they would later fall to National Grid as a required purchaser of the assets given that the windfarms cannot legally both generate and transmit. Secondly, the need for Windfarm substations in Tendring would be removed. Thirdly, the need for National Grid substations in Tendring as part of N2T would be removed. Fourth, the need for underground cables built by National Grid through the AONB and in Great Horkesley within the N2T plans would be removed, which represents a significant proportion of the costs of the N2T project.	N	Coordination with North Falls and Five Estuaries has been pursued through the Offshore Transmission Network Review (OTNR) "Early Opportunities" workstream. National Grid, North Falls and Five Estuaries acted together in a consortium led by North Falls and were awarded funding by the Department of Energy Security and Net Zero Government's Offshore Coordination Support Scheme. On 28 March 2024, the consortium submitted a high-level feasibility study that formed the first step of the grant funding agreement. The study assessed the feasibility of a coordinated offshore connection specifically: the capital costs; building blocks; construction and commissioning methodologies and overall programme associated with a coordinated solution. However, a recent announcement from the Secretary of State for Energy Security and Net Zero confirmed that no further funding will be granted to the consortium. Given the significant extra costs and the negative impact on the delivery timeline of connecting more renewables to the UK energy system, especially considering the government's commitment to quadruple offshore wind and fully decarbonise the UK's electricity system by 2030, the consortium supports the Secretary of State's decision and will not be further pursuing a coordinated offshore connection.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	Set against the sum of these savings this would be a degree of engineering offshore, although likely nothing more complex or costly than that already included in the radial connections of the Windfarms due to the similarity in technical use case and hence a very substantial saving overall is to be expected.		
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons action group; Little Horkesley Parish Council; Great Horkesley Parish Council	13) Making use of Sea Link to interface with Five Estuaries and North Falls offshore would remove the need for N2T infrastructure in the AONB, Tendring, North Colchester and our Parish thereby essentially eliminating damage described in (3) above to protected and other landscapes of high value, heritage assets including Grade I and Grade II listed buildings, Archaeological sites, areas of significant community amenity and ecology. 14) Making use of Sea Link to interface with Five Estuaries and North Falls offshore would remove entirely the risk to the Airfield at Wormingford arising from N2T.	N	
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons action group; Little Horkesley Parish Council; Great Horkesley Parish Council	15) Holford Rule (1) states “avoid altogether, if possible, the major areas of highest amenity value, by so planning the general route of the first line in the first place, even if the total mileage is somewhat increased in consequence.“ 16) Horlock Rule (2) states that sealing end compounds should “as far as reasonably practicable seek to avoid altogether international and nationally designated areas….”.	N	The Holford Rules relate to the siting of high voltage overhead transmission lines (OHL). Following feedback from stakeholders and the public following both Non statutory consultation and Statutory consultation, National Grid reviewed the engineering design to consider removing the need for the overhead lines across the railway and the River Stour. The poor ground conditions under the railway preclude the use of trenchless technology to cross from the substation to the overhead line; these would cause settlement issues for the railway line. National Grid considered locations further north from the Converter Station site towards Minster for a crossing point where the ground is more suitable, and this would introduce more trenching, ditch crossings and land take. Once across the railway, the river would still have to be crossed which proves difficult again due to the ground conditions because trenchless technology needs stable ground conditions for it to be feasible and the conditions under the river are not considered to be stable enough. Once under the river, construction of further electrical infrastructure (a smaller substation) would be required in the flood plain to connect the cables to the existing overhead line. Considering all of the engineering challenges set out above alongside the environmental impacts of a larger footprint of the construction works and the safety concerns over going under the railway, the conclusion was to use overhead lines. The Horlock Rules are not relevant to converter stations. However, acknowledging the principles these rules contain, National Grid’s publicly documented needs case explains the requirements to reinforce the network between the Sizewell area and the Kent area. Where fulfilment of connection agreements dictates the geographic scope for the location of new infrastructure, National Grid rigorously assesses impacts on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts.
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons	17) Given the obvious benefits to the AONB, use of Sea Link to bring electricity from North Falls and Five Estuaries back to shore would have been required by both Horlock Rules and Holford Rules had it been considered.	N	The Proposed Project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. Since the other projects referenced here are being promoted by different companies, with different project teams, covering different geographical locations and on different timelines for delivery, it is not possible to co-ordinate simultaneous delivery of all of the network reinforcements coming forward under the Great Grid Upgrade programme.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
action group; Little Horkesley Parish Council; Great Horkesley Parish Council	18) Finally, use of Sea Link to bring electricity from North Falls and Five Estuaries back to shore would have a major positive impact when assessed against the Treasury Green Book criteria. 19) We support and call for the use of Sea Link to carry electricity from North Falls and Five Estuaries, removing the need for the N2T infrastructure in the AONB, Tendring, North Colchester and our Parish and thereby removing the damage described in FeedbackAugust23.		
Fordham Parish Council; Great Horkesley, Little Horkesley and Fordham Against Pylons action group; Little Horkesley Parish Council; Great Horkesley Parish Council	20) We note that the choice of landing sites for Sea Link will also be a matter of debate and potentially controversy as currently planned. We urge the use of brownfield sites in already industrialised areas and that National Grid listen carefully to the views of local residents and councils in those areas selected.	N	In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. Details of alternatives that National Grid considered are contained in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.
Local community	There is a lack of clarity as to the proposals' relationship with other 'Great Grid' projects (especially 'Norwich to Tilbury') and with the projects of other companies with similar objectives and geographies. This urgently needs resolving. It is relevant both to the need for the infrastructure and to the impacts in the Suffolk coastal area. If only the Government can provide the necessary leadership and co-ordination then they must do just that; given the centrality of decarbonisation to Government objectives it is not an unreasonable ask.	N	The Proposed Project is a separate project to Norwich to Tilbury. Each project is designed to meet specific network reinforcement needs arising from grid connection agreements that National Grid is obliged to fulfil by 2030. Since the connecting projects are being promoted by different companies, with different project teams, covering several different geographical locations and on different timelines for delivery, it is not possible to co-ordinate simultaneous delivery of all of the network reinforcements coming forward under the Great Grid Upgrade programme. As we have developed the proposals for the Proposed Project, we have considered a number of strategic options that could provide the reinforcement required. We assessed a variety of potential areas for infrastructure, including brownfield sites. However, in accordance with National Grid's regulatory obligation to find more efficient ways to work, a connection between East Anglia and Richborough in Kent has been identified as the most efficient the most efficient means of resolving the capacity requirements within the electricity network, while the brownfield sites within the areas of search are too small to accommodate the required infrastructure. We are rigorously assessing the Proposed Project's impact on designated sites and the environment, adhering to the "mitigation hierarchy" by avoiding, minimising, restoring, and offsetting impacts. National Grid are unable to comment on Government policy.

Table 1.43 Environment - general

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
Feedback form			
Q1 Do you have any comments to make about the principle of reinforcing the network between Suffolk and Kent?			
Local community	The current suggestion will have a hugely negative impact on wildlife and habitats at the proposed locations. National Grid need to review the strategic alternative routes and their impacts on the environment to choose the least damaging route. If you go ahead with the current plans you will cause untold damage to this environment which we cannot afford to happen. Britain is already one of the most Nature depleted countries in the world. We cannot afford any further damage to our natural environment. See points below: 1] Sandwich and Pegwell Bay is a haven for wildlife, designated as internationally important and protected by UK law. However, the area and sites around it is under threat from this proposal. 2] Pegwell Bay is home to Kent's largest population of seals. Plans for Sea Link have only involved a 'desktop mammal survey' and ecologists remain concerned that the development will impact the seal colonies living along the shore. We cannot afford to risk this habit. Saving nature is more important 3] The offshore cable will impact European protected Annex I habitats, likely associated with Margate Long Sands Special Area of Conservation (SAC). The development has the potential to cause irreversible habitat loss to Goodwin Sands which is in a Marine Conservation Zone (MCZ) and supports diverse epifauna such as Sabellaria Reefs, a priority habitat and blue mussel beds. The sandbanks are also important spawning and nursery grounds for species such as thornback rays. 4] The golden plover, turnstone, and red-throated diver have all been recorded at Pegwell Bay and the surrounding sites and are at risk of being displaced through disturbance. The golden plover and turnstone are designated features for Thanet Coast and Sandwich Bay Special Protection Area (SPA) Bird numbers have plummeted on the east coast and the action proposed would put more bird life in jeopardy 5] The proposed route for overhead cables and converter and substation will directly impact Sandwich Bay and Hacklinge Marshes SSSI, Ash Level and South Richborough Pasture Local Wildlife Site (LWS) and Woods and Grassland Minster Marshes LWS. As above: Bird numbers have plummeted on the east coast and the action proposed would put more bird life in jeopardy.	Y	The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. National Grid recognise the sensitivity of Minster Marshes and Pegwell Bay and have taken into account statutory designations in the Proposed Project EIA. An extensive programme of environmental surveys has been undertaken including for breeding and non-breeding birds, reptiles, invertebrates, badger, riparian mammals, dormice and plants. A rigorous impact assessment has been produced in line with guidance and legislation. Consultation with key stakeholders such as Natural England, Environment Agency, RSPB, Suffolk County Council, East Suffolk Council and Suffolk Wildlife Trust, Thanet Council, Dover Council, Kent Council and Kent Wildlife Trust has taken place and the survey data and impact assessment has informed avoidance, mitigation or (where necessary) habitat compensatory provision requirements. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details relating to the ecology assessment are contained in **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. There will be no impacts of the Proposed Project on Margate Long Sands SAC. Since the production of the PEIR and Statutory consultation, the Offshore Scheme has been re-routed to avoid the Goodwin Sands MCZ. This will avoid direct impacts, and reduce the impacts to the known and potential benthic receptors located within the area including *Sabellaria spinulosa* and *Mytilus edulis.* Information is contained in **Application Document 6.11 Marine Conservation Zone Assessment**. Detailed assessments for ornithology are provided in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 3 Ecology and Biodiversity, Application Document 6.2.3.2 Part 3 Kent Chapter 3 Ecology and Biodiversity, Application Document 6.2.4.5 Part 4 Chapter 5 Ornithology and Application Document 6.6 Habitats Regulations Assessment Report**, which consider the impacts of the scheme on important sites for waterbirds and waterbird populations.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	6] The development would result in the loss of 13.6ha from within Minster Marshes, an area with priority habitats and functionally linked land which plays a vital role in supporting the species for which Thanet Coast and Sandwich Bay SPA has been designated. Significant numbers of golden plover have been recorded using the field where the new converter and substation are proposed. We just cannot allow this to happen. These plans are harmful to wildlife and will potentially involve trenching areas of Pegwell Bay National Nature Reserve, a wildlife-rich habitat with multiple protections. The National Grid need to urgently review the strategic alternative routes and their impacts on the environment to choose the least damaging route. Whatever the cost the existing natural environments must not be harmed. This country is not doing enough to stem the decline in nature, we cannot allow further declines to happen. The proposals will cause harm coming to these valuable sites and this must not be allowed to happen. Natural environments such as these are irreplaceable and need to remain untouched.		
Q2 What do you think about how our proposals have evolved? Do you think this is an improvement on what we presented previously? Comments			
Local community	There is nothing National Grid can do to make their proposals in anyway acceptable. They have ignored all concerns raised at previous consultations. The whole project it wrong and is going to destroy a beautiful natural landscape with years of disruptions and chaos to the unique wildlife. Those that live in the area will find it impossible to move around, will have to look on as the area is decimated and it will do untold damage to our tourist economy. We will then have to live with the monstrous structures National Grid are proposing to erect.	N	National Grid has listened to community feedback in order to understand concerns about the impact of the Proposed Project and minimised these impacts onshore and offshore where possible. Reasoning behind the connection location for the Proposed Project has been addressed within **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered and Application Document 6.2.1.4 Part 1 Introduction Chapter 4 Description of the Proposed Project**. The issues raised by the respondent are addressed in the following Application Documents: • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.7 Part 2 Suffolk Traffic and Transport; and** • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual.** Where necessary, and insofar as possible, mitigation measures will be implemented for identified significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the DCO (**Application Document 3.1**).
Local community	The proposal to make landfall at Aldeburgh Beach is unacceptable. We are fundamentally opposed to this landfall option. It would be seriously damaging to a much loved and fragile coastline which is part of a nationally protected Area of Outstanding Natural Beauty.	N	The sensitivity of the area is noted. The routeing and siting of the Suffolk Onshore Scheme has taken into consideration designations, including the Suffolk Coast & Heaths AONB and Suffolk Heritage Coast. The effects arising from the Suffolk Onshore Scheme on the AONB (and Heritage Coast) are outlined within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	No incursions of this kind into the AONB should be permitted without specific and public government authorisation. The Aldeburgh beach stretches northwards uninterrupted from the Martello Tower to Thorpeness village, it is beloved of residents and visitors, and the Haven is a favourite walking and cycling area as well as the site of many protected and rare seashore plants. A landfall structure requiring a two hectare construction area and a motorway-width cable corridor leading from it would cause immense damage to this unique stretch of coastline. The fact that the cable corridor would then cross a significant wetland nature reserve and important rural areas further inland before reaching a giant industrial-style converter station compounds the offence. Horizontal direct drilling might reduce the impact if it is practicable - if not, the environmental damage would be immense.		**Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** provides an assessment of potential impacts on wildlife. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. Where cables are routed through sites with statutory designations, National Grid will employ trenchless solutions. It acknowledges that there will be a temporary impact until the trench is fully reinstated and any planting established. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** provides an assessment of potential impacts on vulnerable species. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. Where necessary, and insofar as is possible, measures will be implemented to mitigate identified significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). Impacts on footpaths in Suffolk are considered in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. An outline PRoW Management Plan has been prepared for Suffolk as part of the DCO application. This has been developed in consultation with the relevant local planning authorities and provides details on PRoW diversions, closures and management during the construction, operation and decommissioning phases. See **Application Document 7.5.9.1 Outline Public Rights of Way Management Plan – Suffolk**.
Q16 What do you think about our plans to use overhead lines to connect the proposed substation into the existing Richborough to Canterbury overhead line? Comments			
Sudbourne Parish Council	The Parish welcomes the undergrounding of cables from the landing point to the substations. However the PC has concerns regarding the impact on the special landscape of the area and wishes to have assurance that this is minimised and suitable mitigation is put in place. In particular the PC supports the response from the Nature conservation organisations (including Suffolk Wildlife Trust and RSPB) with regard to the protection of vulnerable species impacted by your proposed works. Full and accurate environmental impact assessments must be carried out and all mitigation works, including the realignment of the route (where necessary) must be undertaken.	N	National Grid acknowledges these concerns. The visual impact of the overhead lines on the character of the area and how the impacts have been quantified is assessed in **Application Document 6.2.3.1 Part 3 Kent Chapter 1 Landscape and Visual**. Wherever possible National Grid has designed the cables associated with the Proposed Project to be underground. In some places it will be necessary to install overhead lines due to consideration of a range of factors concerning engineering feasibility, environmental impact and cost. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity** provides an assessment of potential impacts on vulnerable species. The Proposed Project is committed to achieving 10% Biodiversity Net Gain. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
			Where necessary, and insofar as is possible, measures will be implemented to mitigate identified significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. Compliance with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
General commentary			
Local community	The sites you have earmarked are wrong - they would be huge eyesores; the landfall at Aldeburgh would be destructive of tourist and wildlife sites; the 'cable corridor' proposed is highly destructive, permanently; construction traffic forecasts are entirely inappropriate for this part of the country with its narrow lanes, leading to emergency vehicle delays, to name only one probable outcome; noise and light pollution in these protected country areas would be severe and permanent; probably flood risks would be increased with no alternative escape routes for the population; heavy negative impact on tourism and therefore livelihoods of all the people living in this area. I beg you to reconsider and choose the offshore and brownfield sites instead.	N	The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. The issues raised by the respondent are addressed in the following Application Documents: • **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism;** • **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity;** • **Application Document 6.2.2.7 Part 2 Suffolk Traffic and Transport;** • **Application Document 6.2.2.9 Part 2 Suffolk Chapter 9 Noise and Vibration;** • **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual; and** • **Application Document 6.2.2.4 Part 2 Suffolk Chapter 4 Water Environment.** Where necessary, and insofar as possible, mitigation measures will be implemented for identified significant effects. The mitigation measures proposed can be found in **Application Document 7.5.3.2 CEMP Appendix B Register of Environmental Actions and Commitments (REAC)** submitted with the application for development consent. 			with the REAC is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**).
Local community	Large infrastructure projects often have profound implications for the environment and local communities and the Minster Marshes proposed connector site certainly ticks those boxes. It will damage an area used by a diverse range of species example IUCN red listed bird species like Turtle Doves, Curlews also other bird species that are declining rapidly Skylarks, Ravens, Nightingales and a plethora of other fauna and flora. Whilst you claim a biodiversity net gain and mitigation measures the reality is 22 acres will be covered largely in concrete. The site is some 3 m above sea level and as you indicate climate change is here. This means inevitable increases in sea level. I believe the UK Environment Agency predicts these marshes may be flooded by increasing sea levels within 30 or 40 years so building in such a place is by no means long term in thinking. We have a climate change and ecological crisis emergency the 2 are intrinsically linked. We should not be impacting areas near to existing SSSI's on the guise of supposedly resolving longer term energy needs. The minister marshes site already has nearby industrial facilities on both sides and the remaining area between acts as a corridor for a diverse range of species, including migratory birds which have been and will be impacted by high voltage pylons. The entry to the coast of underground cables through the Pegwell bay National Nature Reserve also a Ramsar designated site and also has SSSI's within it is unacceptable. Work was done some 2 or 3 years on the Pegwell Bay area and the site still has not recovered from that scenario. I would personally like to see an emphasis on local energy production for local energy consumption. However I do recognise that a grid is necessary to supply heavy industrial energy uses and to add to city energy requirements, these should not be achieved by trashing more of this declining earth diversity of species flora and fauna. However the idea that large grids are the way ahead is really questionable particularly with the voltage drop losses that are accrued. I believe this can account for around a 40% with voltage drop. I understand there are alternative approaches including an offshore option that would cost more financially initially. Financial costs should not outway environment diversity of species and community welfare.	N	The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. National Grid recognise the sensitivity of Minster Marshes and have taken into account statutory designations in the Proposed Project EIA, refer to **Application Document ES 6.2.3.2 Part 3 Kent Chapter 2 Ecology and Biodiversity**. The Proposed Project is also committed to achieving 10% Biodiversity Net Gain. Further details regarding Biodiversity Net Gain are contained in **Application Document 6.12 Biodiversity Net Gain Feasibility Report**. A detailed flood risk assessment has been conducted within **Application Document 6.8 Flood Risk Assessment**. The flood risk assessment involves detailed modelling and assessment, and accounts for the impacts of climate change on flooding. Where cables are routed through sites with statutory designations, National Grid will employ trenchless solutions. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**. In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide.
Local community	First of all I would like to say that in general we are in favour of the development of offshore wind and other "green" solutions to the UK's energy needs. What we are not in favour of is National Grid's proposals with regard to the development of onshore infrastructure in Suffolk. It seems to us that National Grid is guilty of taking the (for	N	The reasoning behind the selection of the location and the alternatives considered is set out in **Application Document 6.2.1.3 Part 1 Introduction Chapter 3 Main Alternatives Considered**.

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	them) easy way out, regardless of its impact on local areas which obtain no benefit from the proposals but must bear the cost in terms of disruption, destruction, environmental damage etc. We have not been persuaded that National Grid has properly explored the option of an offshore transmission network connecting to brownfield sites closer to where the power is actually required, in spite of the fact that this is the preferred solution by our local elected representatives. National Grid has ignored previous consultation feedback requests and, as far as we can tell, has made no proper assessment of the offshore solution or of possible brownfield sites such as Bradwell. This seems particularly ironic in light of the fact that National Grid has recently announced that a study has just been commissioned into the replacement of the contentious onshore Norfolk/Suffolk/Essex pylon route by an offshore cable route. That being the case, it seems that National Grid (and by extension the country generally) could obtain much greater cost efficiency and savings in terms of construction and taking a genuinely joined-up approach by combining these two projects. In terms of specific objections to the current proposals, we would cite the following. The converter station to be sited just outside Saxmundham (with the possibility of a further two stations to be built next to it) will destroy a substantial area of highly productive farmland at a time when food security in the UK is also an issue. Each Converter Station will be 26 metres high and cover an area of nearly 20 acres. They will completely overshadow the town of Saxmundham and create an enormous eyesore in a rural area of natural beauty, without even taking into account the potential light and noise pollution. No proper account has been taken of the impact on the area of the fact that this project will substantially overlap with the construction of Sizewell C. This is likely to be particularly severe in the case of the enormously increased traffic load on both major and minor roads, with the latter in particular being entirely unsuited to the type and number of vehicles which will be required to use them. At the recent public information exhibition in Saxmundham one of National Grid's representatives was closely questioned on just this point and was completely unable to give any coherent answer to how this was to be mitigated or, perhaps more concerning, could not demonstrate to any of his listeners satisfaction that either he or whoever had briefed him actually understood the situation or had bothered to look into the detail. The route of the Landfall and Cable Corridor seems almost to have been chosen to create the maximum adverse environmental impact, passing as it does across Aldeburgh beach and RSPB North Warren, next to protected areas such as AONB and SSSI and on through other environmentally sensitive areas to the detriment of fragile wildlife and conservation work. The principle driver of much of the area’s economic activity outside farming is tourism - employing at least 4500 local people directly		In developing the Proposed Project, National Grid assessed a variety of potential areas for new infrastructure, including brownfield sites. However, the brownfield sites within the areas of search were considered too small to accommodate the required infrastructure. National Grid is constantly assessing new technologies and looking for different ways in which to future-proof the electricity transmission network. It is recognised that in Europe there is a trend towards multiple windfarms feeding into offshore converter stations. However, on the continent, offshore windfarm arrays are typically smaller and generate less power than the larger arrays that are located around the UK coastline. In addition, underground and offshore high voltage direct current cables which can carry more than 2 GW are not available yet. As such, in Belgium, the 3.5 GW from the proposed Princess Elisabeth Island will be connected to the onshore network by up to 10 cables coming ashore and requiring construction of over 100 km of new overhead lines and around 20 km of new underground cables. Similarly, the German and Dutch transmission network operator, TenneT, is building at least 13 individual 2 GW connections from offshore windfarms directly to land. Each connection will use three cables, instead of the two used by the Proposed Project, along with a similarly sized converter station. This evidence shows that the offshore grid approach does not result in less onshore infrastructure, nor does this approach represent a feasible solution to the network reinforcement that the Proposed Project is seeking to provide. A complete assessment of the impacts on agriculture in Suffolk has been undertaken. This is set out in **Application Document 6.2.2.6 Part 2 Suffolk Chapter 6 Agriculture and Soils**. The sensitivity of the area is noted and is reflected in the assessment of effects as set out within **Application Document 6.2.2.1 Part 2 Suffolk Chapter 1 Landscape and Visual**. National Grid’s landscape strategy has been developed to minimise effects on landscape and visual receptors, as set out within the embedded mitigation section of the ES. Mitigation includes screening in the form of proposed woodland, hedgerow and hedgerow tree planting and has been designed in collaboration with relevant stakeholders. Furthermore, the ES sets out the environmental considerations, including landscape and visual considerations, which have informed the siting and outline design of the proposed Converter Station. The design of this structure, in terms of the building form and the external materials, will be developed alongside consultation and stakeholder feedback. A Design Code for the building will be provided with the application for development consent. The Design Code will provide guidance regarding the design intent and design principles that will be adopted and embedded into the detail proposals of the structure. National Grid will continue to engage with relevant stakeholders throughout the development of the converter station site design and in establishing masterplanning principles and will seek engagement with local design panels to further inform the design and development process. The potential impacts on traffic are assessed in **Application Document 6.2.2.7 Part 2 Suffolk Chapter 7 Traffic and Transport**. The assessment takes account of the construction traffic management plans for Sizewell C. National Grid’s plans will be prepared considering the plans for Sizewell traffic, e.g. peak traffic movement times will be programmed in consideration of each other wherever possible. The Proposed Project has been designed, as far as possible, following the mitigation hierarchy in order to, in the first instance, avoid or reduce ecology and biodiversity impacts and effects through the process of design development, and by embedding measures into the design of the Proposed Project such as sensitive routeing and siting of infrastructure and temporary works. National Grid confirms that a trenchless construction solution will be

Consultee	Matters raised in response to 2023 statutory consultation	Change Y/N?	Regard had to response (s49)
	and benefitting many more. This stands to be permanently damaged by the proposed agglomeration of major infrastructure projects, to an extent that cannot be realistically mitigated or compensated for. For these reasons we urge National Grid and Government to reconsider the current SeaLink proposals and give proper consideration to the undoubtedly viable, less destructive and more forward thinking alternatives offered by offshore and brownfield utilisation.		employed for the crossing of the North Warren Nature Reserve and the AONB. The commitment to a trenchless solution is secured through Requirement 6 of Schedule 3 of the draft DCO (**Application Document 3.1**). An assessment of ecological impacts is contained in **Application Document 6.2.2.2 Part 2 Suffolk Chapter 2 Ecology and Biodiversity**. A complete assessment of socio-economics effects has been undertaken. This is set out in **Application Document 6.2.2.10 Part 2 Suffolk Chapter 10 Socio-Economics, Recreation and Tourism**. The chapter concludes that there are no anticipated significant effects as a result of the Proposed Project.
