

It has become increasingly evident that the drive towards net zero is failing, indeed has failed. It is now realised that the world's system of national electricity grids cannot be extended internationally to transmit electricity from those in surplus to those in need. There is just not enough raw materials, particularly copper, in the world to build the infrastructure. Therefore the plans that National Grid and Sealink have to bring North Sea wind power ashore and distribute from Friston is even more futile particularly because so much devastation is being wrought upon the countryside.
