

I continue to feel that any of these proposed developments on protected sites are likely to have unacceptable impacts both offshore and onshore and that not enough surveys of any kind have yet been carried out in order to clarify what all the possible effects both short and long term might be.

It does not seem possible that it is not felt that no significant socio-economic, recreational or tourism effects are anticipated with the amount of disruption that will take place if this development goes ahead, whatever routes the necessary vehicles take before, during and after the development takes place.

It appears it will be an extremely complicated process requiring a large amount of heavy machinery and this in itself makes the possibility of things "going wrong" more likely. This could have disastrous effects on an area which has been shown to be a valuable habitat for a very large amount of wildlife of all kinds and there are no guarantees that this might not be permanently damaged or even destroyed for ever by this development
