

We stand to lose 80% of our grade 1 BMV farmland to this nonsensical project.

No alternative options (integrated offshore grid, HVDC underground cabling or updating existing structures with modern conductors) have been publicly considered or investigated.

Affected landowners have not been given data from surveys carried out on their land by National Grid and are now being bribed into signing 'Heads of Terms' which are premature ahead of any determination.

I feel strongly that National Grid has failed from day one to provide transparency.

National Grid has failed to consider the cumulative effect on local communities, National food security and indeed National security in terms of defending major infrastructure from terrorist attacks (highly likely given current world conflicts),

I appreciate the need for the grid system to be updated, but as things currently stand, the harms far outweigh the benefits!
