1. Introduction

1.1 Background

1.1.1 This Bat Roost Report has been produced as an appendix to Chapter 8: Ecology and Biodiversity (document reference 6.8) (Revision C) of the Environment Statement (ES) (Volume 6 of the Development Consent Order (DCO) application) for Norwich to Tilbury (the 'Project'). This report presents the methods and results of the desk study and Ground Level Tree Assessments (GLTA) undertaken between 2023 and 2025, and the further roosting surveys for barbastelle *Barbastella barbastellus* undertaken between March 2025 and September 2025.

1.1.2 The ecological background and the scope for this report is set out in the Environmental Impact Assessment (EIA) Scoping Report (document reference 6.19) and agreed within the EIA Scoping Opinion received from the Planning Inspectorate in December 2022 (document reference 6.20).

1.1.3 It was anticipated that the landscape surrounding the Project contained habitat suitable for bats that is well connected to the wider landscape by features such as rivers, tree-lined watercourses, arable field margins, extensive hedgerows, and broadleaved woodland. These habitats have the potential to support a wide range of UK bat species, including Annex II bats (i.e., barbastelle) that do not occur where habitat diversity is of lower quality.

1.1.4 The general approach to impact assessment for bats is to ensure that the impacts to bats are avoided, where possible, minimised and/or mitigation provided to maintain the favourable conservation status of species present that utilise the habitats across the Project. Overall, the Project approach aims to provide habitats of equal or better quality habitat than that affected by the Project and to ensure that these habitats are well connected to the wider landscape. This would be achieved by avoiding permanent effects to habitats of perceived value to bats, reinstating habitats affected by temporary habitat loss to equal or better condition than existing and improving the quality and availability of ecological networks across the Project.

1.1.5 Based upon this approach, the EIA Scoping Report (document reference 6.19) identified the need for roosting surveys for bats where:

- Trees required removal to facilitate the construction of the Project
- Where significant potential adverse effects to roosting, foraging, and commuting bats may occur, for example, in areas where underground cables, Cable Sealing End (CSE) compounds, new and extensions to existing substations and associated construction areas are proposed.

1.1.6 No buildings or other man-made structures have been identified that would be removed by the Project and so there has been no assessment for roosting bats on structures.

1.1.7 This report details the desk study methodology and findings, the approach to surveying roosting bats through GLTAs, as identified in the EIA Scoping Report (document reference 6.19), and the results of the GLTA surveys. Through consultation with Natural England, who agreed the scope in May 2024, the survey

methods and roost characterisations reflect the best practice guidelines published in September 2023 (Collins, J. (ed.) (2023)).

1.1.8 This report should be read in conjunction with the following reports:

- Appendix 8.10: Bat Activity Report (document reference 6.8.A10) (Revision C) which provides the approach and results of the bat activity (using static detectors) surveys
- Appendix 8.11: Bat Radiotracking Report (document reference 6.8.A11) (Revision B) provides the approach and results of the bat radiotracking surveys.

1.1.9 The Project has also been sub-divided into eight geographical sections for reader accessibility, based largely on Local Planning Authority boundaries. These are shown on Figure A8.9.1: Ground Level Tree Assessment and Further Survey Results (Rev B) in Annex A and comprise:

- Section A – South Norfolk Council
- Section B – Mid-Suffolk District Council
- Section C – Babergh District Council, Colchester City Council and Tendring District Council
- Section D – Colchester City Council
- Section E – Braintree District Council
- Section F – Chelmsford City Council and Brentwood District Council
- Section G – Basildon Borough Council and Brentwood Borough Council (and part of Chelmsford City Council)
- Section H – Thurrock Council.

1.2 Brief and Objectives

1.2.1 The brief of the survey work was to establish a robust baseline for roosting bats to support an impact assessment through undertaking the following:

- Complete a detailed desk study of bat presence and confirmed roosts
- Use of the baseline dataset to determine the importance of the Survey Area (see Section 1.3 below) for roosting bats
- Field surveys to gain an understanding of tree suitability to support roosting bats and establish the presence of roosting bats and determine likely bat species within the Order Limits.

1.3 Study Area and Survey Area

1.3.1 The following Study Areas were used for the desk study:

- The Order Limits plus a 6 km buffer was selected, within which bat records were obtained from the Local Records Centres (LERCs). This search area was selected based upon the furthest bat core sustenance zone, which is for barbastelle bats (Collins, J. (ed.) (2023))

- The Order Limits plus a 30 km buffer was selected, within which Special Areas of Conservation (SACs) with bats as a designating feature were identified from Multi-Agency Geographic Information (MAGIC) (Natural England, 2025)
- The Order Limits plus a 2 km buffer was selected to identify nationally and locally designated sites that may reference bats within their citation. This included Sites of Special Scientific Interest (SSSI) from MAGIC, as well as Local Wildlife Sites (LWS) and Country Wildlife Sites (CWS) information obtained from LERCs.

1.3.2 The Survey Area comprises all land within the Order Limits.

2. Relevant Legislation and Policy

2.1 Legal Compliance

2.1.1 Surveys and assessments have been undertaken in accordance with current legislation and planning policy in the context of the Project. A summary of the relevant legislation is provided in Table A8.9.1.

Table A8.9.1 Legal compliance

Legislation	Details
Conservation of Habitats and Species Regulations 2017 (as amended in 2019) ('Habitats Regulations')	The Regulations require authorities on behalf of the Secretary of State to maintain a list of sites which are important for bats (SACs) and to provide protection for these sites through designation, planning and other controls. Barbastelle, Bechstein's bat *Myotis bechsteinii*, greater horseshoe bat *Rhinolophus ferrumequinum* and lesser horseshoe bat *Rhinolophus hipposideros* are also listed on Annex II of the European Habitats Directive, which means that SACs may be attributed to internationally important roosts and foraging areas of these species. The Regulations make it an offence (subject to exceptions) to deliberately capture, kill or injure, disturb, trade in, damage or destroy a breeding site or resting place the animals listed in Schedule 2. However, these actions can be made lawful through the granting of licences by the appropriate authority (Natural England). Licences may be granted for several purposes (such as science and education, conservation, preserving public health and safety), but only after the appropriate authority is satisfied that there are no satisfactory alternatives and that such actions will have no detrimental effect on the favourable conservation status of the bat species concerned.
The Environment Act 2021	The Environment Act 2021 is a significant legislative framework aimed at enhancing environmental protection and biodiversity in the UK. In relation to bats, the Act reinforces existing measures to safeguard their habitats, as they are vital indicators of ecosystem health. It includes provisions that require public authorities to conserve and restore biodiversity, which directly supports bat populations by ensuring the protection of roosting sites and foraging areas. Additionally, the Act introduces Biodiversity Net Gain requirements for new developments, mandating that construction projects must leave the natural environment in a better state, benefiting bat habitats. By embedding long-term strategies to improve ecological conditions, the Environment Act 2021 plays a critical role in addressing threats to bats caused by habitat loss and environmental degradation.

Legislation	Details
The Wildlife and Countryside Act 1981, as amended (WCA)	The Act is the main mechanism for legislative protection of wildlife in England. It gives protection to native species (particularly threatened species), their resting places and places of shelter. All 18 native UK bat species receive protection under Schedule 5 of the Wildlife and Countryside Act 1981 (as amended). Under this Act it is an offence to intentionally kill, injure or take any protected species; intentionally or recklessly damage, destroy or obstruct access to any structure or place which a protected species uses for shelter or protection; and intentionally or recklessly disturb any protected species while it is occupying a structure or place which it uses for shelter or protection.
The Natural Environment and Rural Communities (NERC) Act 2006	The NERC Act 2006 places a duty upon public bodies to maintain Section 41 (s41) lists of flora, fauna, and habitats and to consider these ecological features as a material consideration in planning. It also requires decision-makers to have regard to the conservation of biodiversity in England, when carrying out their normal functions. Seven species of bats are identified as species of principal importance these are: greater horseshoe bat; lesser horseshoe bat; Bechstein's bat; noctule *Nyctalus noctula*; soprano pipistrelle *Pipistrellus pygmaeus*; brown long-eared bat *Plecotus auritus*; and barbastelle.

2.1.2 The Conservation of Habitats and Species Regulations 2017 references Favourable Conservation Status (FCS). FCS is defined as the minimum threshold at which it can be confidently predicted that the species is thriving in England and is expected to continue to thrive sustainably in the future. The conservation status will be taken as 'favourable' when:

- Population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats
- The natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future
- There is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis.

2.1.3 Barbastelle bats are widely distributed through southern and central England, but they are uncommon and occur in low numbers. Their range is highly fragmented, reflecting the distribution of their preferred habitat of woodlands. As of July 2022, based on a comparison of the favourable values with the current values, barbastelle bats are not in favourable conservation status. To achieve favourable conservation status, barbastelle populations should increase to between 73,000 and 147,000 individuals, occupying the habitat available across the species' current and historic range (Zeale, M. R. K. and Natural England (2024)).

2.2 Planning Policy

2.2.1 Chapter 8: Ecology and Biodiversity (document reference 6.8) (Revision C) provides further details of relevant planning policy.

3. Methodology

3.1 Nomenclature

3.1.1 Common and scientific names of bat species recorded follow the Bat Conservation Trust (BCT) Guidelines published in September 2023 (Collins, J. (ed.) (2023)). Capital letters have not been used for the common names in keeping with guidance used for the compilation for the Environmental Statement, whereby capital letters are only to be used for proper nouns. Scientific names are provided at first occurrence within the main body of the text.

3.2 Desk Study

3.2.1 Records were obtained from the following LERCs, which includes records from the local bat groups:

- Norfolk Biodiversity Information Service (NBIS)
- Suffolk Biodiversity Information Service (SBIS)
- Essex Field Club (EFC).

3.2.2 Following advice from Natural England in September 2023, a 6 km Study Area was selected based upon the core sustenance zone (CSZ) for barbastelle (Collins, J. (ed.) (2023)). Barbastelle have the largest CSZ of any of the bat species that have the potential to be impacted in this part of the UK. The CSZ refers to the areas surrounding a communal bat roost within which habitat availability and quality will have significant influence on the resilience and conservation status of the colony of the roost. Records were requested from the last 10 years in September 2023, based on standard practice (Department for Environment, Food and Rural Affairs (DEFRA), 2024).

3.2.3 A desk study was conducted in September 2023, to identify records of bats (roosting and activity) within the Study Area (up to 6 km from the Order Limits). These were then re-visited in January 2025 to update the distances from the Order Limits

3.2.4 A search for SACs was also undertaken within 30 km of the Order Limits, where bats are cited as a qualifying feature, using the MAGIC website (DEFRA, 2024).

3.2.5 A search of other statutory designated sites within 2 km was also conducted using MAGIC mapping, where bats are identified in the citation.

3.2.6 The record centres provided information on non-statutory designated sites (CWS and LWS), within 2 km of the Order Limits. Non-statutory designated sites were reviewed for any mention of bats in their designation citation.

3.2.7 The National Infrastructure Planning website and the planning portals for all local planning authorities were searched for any information relating to Annex II bat species geographically present within East Anglia (barbastelle) within 2 km of the Order Limits.

3.3 Survey Scope

3.3.1 Following consultation with Natural England in May 2024, it was agreed that tree climbing inspections and/or emergence surveys would not take place across the Project pre-consent, after the GLTA. A more effective and proportionate approach is to conduct a combination of GLTA, static detector surveys and advanced licence bat survey techniques (ALBST) surveys pre-consent with the view of using precautionary mitigation methods, including pre-construction surveys.

3.3.2 The scope for the subsequent pre-construction tree climbing inspections/emergence surveys will be informed by the results of all three survey methods and once detailed design has been developed, post consent. This will ensure surveys are targeted where impacts to bats are likely and the habitat is of high value for tree-dwelling, woodland roosting bats (i.e., barbastelle) with a particular focus on locations where roosts of high conservation value may be impacted (i.e., maternity roosts). Both survey types will be undertaken in line with best practice guidelines (Collins, J. (ed.) (2023)). The approach to pre-construction surveys has been agreed with Natural England and detailed within the Draft Bat Licence Application.

3.3.3 Barbastelle are the only Annex II species known to be present in East Anglia, a specific survey approach to determine the likely location of any roosting barbastelle bats was needed pre-consent. Aerial tree inspections, emergence surveys and/or back tracking surveys of individual or groups of trees were carried out at targeted locations where recordings of barbastelle during the static detector surveys reached a trigger point (trigger point explained in Section 3.5 below).

3.4 Ground level Tree Assessment Survey Methodology

3.4.1 The survey methodology detailed below is based on professional judgment, based upon previous experience, and the best practice guidance (hereafter referred to as the BCT Guidelines) published in September 2023 (Collins, J. (ed.) (2023)).

3.4.2 GLTAs were undertaken in line with the BCT Guidelines. Surveys were undertaken during daylight hours and involved the identification of potential bat roosting features within trees.

3.4.3 Trees that were assessed were visually inspected with the use of high-powered torches, endoscopes and binoculars (where appropriate) from the ground for evidence of roosting bats including droppings, urine staining, feeding remains and for potential roost features (PRFs), in line with best practice guidelines (Collins, J. (ed.) (2023)). The use of torches or endoscopes was only undertaken by appropriately licensed bat ecologists. Photographs were taken of each suitable feature, and any evidence of bats was recorded. Where landowner permission was granted, assessed trees were tagged with aluminium tree tags.

3.4.4 The following tree features were considered to have potential to support roosting bats (this is not an exhaustive list, just the typical features):

- Natural holes
- Woodpecker holes
- Cracks/splits in major limbs
- Loose bark

- Bat, bird or mammal boxes
- Partially detached large-stemmed ivy
- Other hollows/cavities.

3.4.5 Each tree was categorised depending on the presence of PRFs suitable for supporting bat roosts, the criteria for which is provided within Table A8.9.2.

Table A8.9.2 Criteria for categorising trees for their potential to support a bat roost (Collins, 2023)

Suitability	Description
None	Negligible habitat features likely to be used by roosting bats.
FAR	Further assessment required (FAR) to establish if PRFs are present in the tree.
PRF	A tree with at least one PRF present

3.4.6 Where a PRF could be inspected internally from ground level by endoscope, or where the suitability of a PRF above head height could be evaluated with confidence from ground level without an internal inspection, it was categorised according to the criteria provided in Table A8.9.3.

Table A8.9.3 Criteria for categorising trees for their potential to support a bat roost (Collins, 2023)

Suitability	Description
PRF-I	PRF only suitable for individual bats or very small numbers of bats either due to size or lack of suitable surrounding habitat.
PRF-M	PRF is suitable for multiple bats and may therefore be used by a maternity colony.

3.4.7 Information recorded for each tree included:

- Tree tag number (where applicable)
- Tree species
- Height
- Diameter at breast height (DBH)
- Status (alive or dead)
- Life stage
  - Young
  - Mature
  - Veteran
  - Ancient
- Suitability for bats (see Table A8.9.3)

- Evidence of bats
- Further survey recommendations.

3.4.8 All data was captured in the field digitally in Geographic Information System (GIS).

3.4.9 For efficiency, large groups of trees categorised as having no potential for bats ('None') were lumped together and not individually surveyed. A description of the group of trees was recorded. Any trees with PRFs within groups were individually assessed and a separate record made.

3.5 Further Roosting Surveys for Barbastelle Methodology

Site Selection

3.5.1 It was agreed with Natural England during consultation that a proportional approach to bat roost surveys was to be undertaken on the Project, with GLTA surveys undertaken pre-consent and further roosting surveys to be undertaken in line with BCT guidelines post-consent, once detailed design had been undertaken. However, a specific survey approach to determine the likely location of high value barbastelle roosts was needed pre-consent.

3.5.2 A trigger for the need for further inspection of trees pre-consent was determined using the data collected using automated static detectors (for further details refer to Appendix 8.10: Bat Activity Report (document reference 6.8.A10) (Revision C). All barbastelle passes recorded on the static detectors within 60 minutes post sunset were taken forward for review. Based upon a recent study using static surveys to identify maternity colonies in woodland (O'Malley et al., 2023), it was determined that if a static detector recorded more than four barbastelle passes between sunset and 60 minutes post sunset during the maternity period (between May and August, inclusive) there is a higher risk that a roost of high conservation value may be present. This principle was applied, using four barbastelle passes as a trigger point for further survey effort. This approach to further roost survey was agreed in advance with Natural England.

3.5.3 A review of the bat activity data revealed 17 discrete locations where one or more high value barbastelle roosts could be present (for further details refer to Appendix 8.10: Bat Activity Report (document reference 6.8.A10) (Revision C). Radio-tracking surveys covered three of these locations (static locations 37, 38, and 39) fulfilling the requirement for further roosting surveys, the results of these surveys are presented in Appendix 8.11: Bat Radio-tracking Report (document reference 6.8.A11) (Revision B). The other 14 locations are considered within this report and listed in Table B1 in Annex B and shown on Figure A8.9.3 Barbastelle Survey Areas (Rev B) in Annex A.

3.5.4 Within the 14 survey locations the GLTA results were reviewed alongside the Project to identify FAR and PRF-M trees that had the potential to be impacted by the Project. PRF-M and FAR trees which met the following criteria were identified as requiring further roosting surveys:

- Trees where removal is likely to be required to facilitate the construction of the Project
- Trees where management is likely to be required to facilitate the construction of the Project

- Trees where there is the potential for disturbance to roosting bats from construction activities.

3.5.5 Following this assessment, five of the 14 survey locations were removed from the survey schedule on the basis that there are no PRF-M or FAR trees that are likely to be impacted by the Project. The remaining nine survey locations were subject to further roost surveys for barbastelle in the 2025 bat survey season as identified in the paragraphs that follow.

Field Surveys

3.5.6 Further roosting surveys included either one, or a combination of, close PRF inspections, aerial inspections, emergence surveys and/or bat backtracking surveys dependent on the suitability of the tree(s) to be climbed and the number of FAR / PRF-M trees within each location.

- Ground/Aerial PRF Inspection Surveys
- Dusk Emergence Surveys
- Backtracking Surveys.

3.5.7 A summary of the methodology proposed for each of the discrete locations is presented in Table C1 in Annex C.

3.5.8 Survey location 7 was subject to a partial ground / aerial PRF inspection in March 2025. This revealed that it contained a high number of trees with suitability to support roosting barbastelle. Backtracking was identified as the most appropriate methodology for subsequent surveys.

Ground/Aerial PRF Inspection Survey Methodology

3.5.9 PRF inspections were undertaken following the BCT guidelines. Close inspections of each PRF were conducted from the ground, using a ladder, or by a pair of qualified tree climbing and aerial rescue surveyors using rope and harness techniques.

3.5.10 The survey involved an initial close inspection of each PRF to refine the PRF classification that was attributed to the feature in the initial GLTA survey. Following the initial close inspection survey, trees with PRF's which were classified as PRF-M were subject to three PRF inspections across the May to September core bat survey season. Following the initial close inspection, trees with no features classified as PRF-M were not subject to further surveys.

3.5.11 Internal inspections of the PRFs were conducted using an endoscope, torch and mirror by licensed surveyors with a Level 2 class licence. Surveyors recorded the following in line with the BCT guidelines:

- The diameter of the stem or limb where the PRF is located
- Whether there are multiple entrances to the PRF
- The PRF entrance width
- The internal height, width and depth of the PRF
- The substrate within the PRF
- The PRF apex shape

- Whether the PRF is dry, damp or wet
- Whether the feature is used by other species
- Whether bats are absent or present
- Whether droppings are absent or present
- If evidence of bats is lacking
- If present - bat species, number of bats, whether bats are awake or torpid, location of bats, distance of bats from entrance
- Any odour.

3.5.12 If bats were present, a photograph was taken and any droppings found were collected (where possible) for Deoxyribonucleic Acid (DNA) analysis to determine the species of bat using the tree. Where features could not be fully inspected using an endoscope, emergence surveys were subsequently undertaken.

Emergence Survey Methodology

3.5.13 A series of three emergence surveys per tree were undertaken between May and September 2025 following BCT Guidelines. The surveys were undertaken by two surveyors visiting at dusk to listen / record (using bat detectors) and observe bats emerging from their roosts. The surveyors positioned themselves around the tree such that all PRFs were covered. Night Vision Aids (NVAs) including infra-red or thermal imaging cameras were focused on the features.

3.5.14 The following information was recorded:

- A brief description of the tree and the features present
- Weather variables at the start and end of the survey (temperature, cloud cover, wind speed, wind direction, rainfall and humidity)
- The flight time, species, behaviour and flightpath of all emerging bats.

3.5.15 The survey started 15 minutes before sunset and continued for 1.5 to 2 hours after sunset.

Backtracking survey Methodology

3.5.16 Backtracking surveys were undertaken between May 2025 and September 2025 in line with the BCT Guidelines. Each survey required three separate visits; each survey visit involved a walkover by a group of surveyors at either dusk or dawn. Handheld bat detectors and NVAs were used to observe bats flying towards or away from potential roosting locations, the bats were then tracked back to their roosts by foot.

3.5.17 Dusk surveys commenced between 30 and 15 minutes before sunset and ceased when it was too dark to observe bats or when the roost had been identified. Dawn surveys commenced approximately 3.5 hours before sunrise and ceased once bat activity had ended or when the roost had been identified.

3.6 Dates of Survey and Personnel

Ground Level Tree Assessments

3.6.1 Surveys were conducted between November 2023 and March 2024, between July and December 2024, and between March and September 2025.

3.6.2 These surveys were undertaken by suitably experienced and competent ecologists with several years of experience undertaking GLTA surveys. The surveys were undertaken by a pair of ecologists with the lead ecologist in each pair holding as a minimum a Level 2 class licence to survey for bats. Those surveyors without licences did not undertake licensable activities (i.e., surveys using endoscope and powerful torch). Following the BCT best practice guidelines, during sub-optimal periods (July and August) all parts of the tree that were visible were assessed, those parts that were not visible and could not be assessed were given the FAR categorisation.

Further Roosting Surveys for Barbastelle

Ground/Aerial PRF Inspections

3.6.3 The ground inspections were undertaken by qualified ecologists as identified above. The aerial inspections were undertaken by suitably experienced and qualified tree climbing and aerial rescue surveyors. The surveys were undertaken by a pair of ecologists with the lead ecologist in each pair holding as a minimum a Level 2 class licence to survey for bats. Those surveyors without licences did not undertake licensable activities (i.e., surveys using endoscope and powerful torch).

3.6.4 These surveys were conducted between March 2025 and August 2025. Specific survey dates are presented in Annex D.

Emergence Surveys

3.6.5 Surveys were conducted between July 2025 and September 2025 by a pair of suitably experienced and competent ecologists with several years of experience undertaking emergence surveys. Emergence survey dates are presented in Annex D.

Backtracking Surveys

3.6.6 Surveys were conducted between May 2025 and July 2025 by a team of suitably experienced and competent ecologists with several years of experience undertaking backtracking surveys. Backtracking survey dates are presented in Annex D.

3.7 Notes and Limitations

3.7.1 Every effort was made to fully survey every tree without restrictions, but where access to trees was restricted or sight of trees was obscured some trees could not be fully assessed and some information, such as tree height or diameter at breast height, could not be recorded with confidence.

3.7.2 Where trees bordered non-accessible land parcels, it was not always possible to assess trees fully from all aspects. In this case, trees were categorised as FAR[1], unless a PRF-M[2] was identified, in which case the tree was categorised as PRF-M.

3.7.3 Access restrictions limited further roosting surveys for barbastelle in two locations:

- Barbastelle Survey Area 13: due to access restrictions, part of this area was inaccessible for both GLTA and any further roosting surveys
- Barbastelle Survey Area 14: due to access restrictions, backtracking surveys could not be completed in June and July 2025 resulting in incomplete data for this site.

3.7.4 Impacted trees within barbastelle Survey Area 13 and barbastelle Survey Area 14 would be subject to further roosting surveys in line with the BCT guidelines post-consent, once detailed design has been undertaken.

[1] FAR – Further Assessment Required of a potential roost feature that could not be fully assessed from the ground.

[2] PRF-M – Potential Roost Feature suitable for multiple bats and may therefore be used by a maternity colony

4. Results

4.1 Overview

4.1.1 The results section below presents the summary results of the desk study and GLTA surveys. All desk study results (including LERC records) are shown on Figure A8.9.2: Desk Study Bat Records in Annex A. Field survey results are shown on Figure A8.9.1: Ground Level Tree Assessment and Further Survey Results (Rev B) in Annex A.

4.2 Desk Study Results

Local Environmental Record Centres

4.2.1 Desk study records identified the presence of 300 confirmed, or likely, bat roosts for 10 species within 6 km of the Order Limits. The most recent records were from 2022.

4.2.2 As shown in Table A8.9, and shown on Figure A8.9.2: Desk Study Bat Records in Annex A, the species recorded at these roost sites included barbastelle, brown long-eared bat, common pipistrelle, soprano pipistrelle, Nathusius's pipistrelle *Pipistrellus nathusii*, pipistrelle sp *Pipistrellus sp.,* Daubenton's bat *Myotis daubentoniid*, myotis sp *Myotis sp.*, Leisler's bat *Nyctalus leisleri*, Natterer's bat *Myotis nattereri*, noctule, and serotine *Cnephaeus serotinus*.

4.2.3 In Essex, roosts were recorded for all the species listed above, in Norfolk no Nathusius's pipistrelle or Leisler's species roosts were recorded, in Suffolk no Leisler's species roosts had been recorded.

4.2.4 Barbastelle bats were recorded in all three counties, within Section A, B, C and E. Of these, one in Section A was classed as maternity roost and three in Section E were classed as hibernation roosts.

4.2.5 *Myotis* sp. (including Natterer's) were also recorded in all three counties within all Project Sections, except Section F. There were three maternity roosts recorded, one within Section A and two in Section B. Twenty-one hibernation roosts were recorded, of these Section H had the most recorded with six.

Table A8.9.4 Summary of desk study roost records provided by LERCs within 6 km of the Order Limits

Project Section	Bat Species	Number of Roosts	Roost type recorded (if known)
A	Pipistrelle sp.	14	1 satellite and maternity
	Common pipistrelle	1	Unknown
	Soprano pipistrelle	9	1 day roost
	Brown long-eared	10	3 day roosts
	Daubenton's	2	2 hibernation
	Natterer's	7	2 hibernation and 1 maternity
	Noctule	1	Unknown
	Serotine	1	Unknown
	Barbastelle	2	1 day roost and 1 maternity
B	*Pipistrelle* sp.	25	1 maternity, 2 hibernation and 2 day roost
	Soprano pipistrelle	8	1 day roost and 1 night roost
	Nathusius's pipistrelle	1	Unknown
	Brown long-eared	22	2 hibernation, 1 maternity, 1 transitional and 1 night roost
	Daubenton's	5	5 hibernation
	Myotis sp.	3	1 maternity and 1 hibernation
	Natterer's	8	4 hibernation, 1 maternity and 1 night
	Noctule	1	1 night roost
	Barbastelle	7	2 day and 1 night roost
	Serotine	2	1 night roost

Project Section	Bat Species	Number of Roosts	Roost type recorded (if known)
C	*Chiroptera* sp.	1	Unknown
	Pipistrelle sp.	14	3 night and 3 day roosts
	Common pipistrelle	2	1 day roost
	Soprano pipistrelle	5	2 day and 1 night roost
	Brown long-eared	12	2 day roost and 1 hibernation
	Daubenton's	1	1 hibernation
	Natterer's	4	3 hibernation
	Noctule	2	1 day and 1 night roost
	Serotine	2	1 night roost
	Barbastelle	3	1 day and 1 night roost
D	*Chiroptera* sp.	1	Unknown
	Pipistrelle sp.	1	Maternity
	Common pipistrelle	1	Unknown
	Soprano pipistrelle	3	Unknown
	Brown long-eared	4	1 maternity
	Daubenton's	1	1 hibernation
	Natterer's	3	1 hibernation
	Serotine	2	Unknown
E	*Pipistrelle* sp.	1	Night roost
	Common pipistrelle	3	Unknown
	Brown long-eared	7	2 hibernation and 2 night roost
	Daubenton's	3	3 hibernation
	Myotis sp.	1	Unknown
	Natterer's	4	3 hibernation
	Barbastelle	3	3 hibernation

Project Section	Bat Species	Number of Roosts	Roost type recorded (if known)
F	*Chiroptera* sp.	2	Uknown
	Pipistrelle sp.	4	Unknown
	Common pipistrelle	3	Unknown
	Soprano pipistrelle	1	Unknown
	Brown long-eared	2	Unknown
	Daubenton's	1	Unknown
G	Common pipistrelle	6	1 maternity and 1 hibernation
	Soprano pipistrelle	9	2 hibernation
	Nathusius's pipistrelle	1	Unknown
	Brown long-eared	9	Unknown
	Daubenton's	2	Unknown
	Natterer's	4	Unknown
	Noctule	1	Unknown
	Leisler's	1	Unknown
H	*Chiroptera* sp.	1	Unknown
	Pipistrelle sp.	3	1 hibernation
	Common pipistrelle	6	3 hibernation
	Brown long-eared	4	2 hibernation
	Daubenton's	13	5 hibernation
	Myotis sp.	4	1 hibernation
	Natterer's	10	5 hibernation

Statutory Designated Sites

4.2.6 No SACs with bats listed as a qualifying feature are present within 30 km of the Order Limits. Therefore, this is Study Area is not shown on Figure A8.9.2: Desk Study Bat Records in Annex A.

4.2.7 A single SSSI lists bats within its citation, this is Hangman's Wood and Deneholes SSSI (Section H) approximately 0.49 km south of the Order Limits. This SSSI is known for its medieval chalk mines that provide important underground hibernation sites for brown long-eared bat, Natterer's bat and Daubenton's bat, with the woodland providing foraging and commuting habitat.

Non-Statutory Designated sites

4.2.8 As shown in Table A8.9.5 and shown on Figure A8.9.2: Desk Study Bat Records in Annex A, there were six non-statutory designated sites of nature conservation importance in the 2 km Study Area that mentioned the presence of bat in their description.

Table A8.9.5 Non-statutory sites within 2 km of the Order Limits that mention bat roosts or bat presence within their description

Project Section	Site Name	Distance/ Direction to Order Limits	Site Description	Bat comment/records
Site with bat roosts in the description				
B	Bonny Wood CWS	0.5 km south	Adjacent to ancient woodland and SSSI, the site comprises mixed deciduous woodland priority habitat.	Wood provides forage and roosting opportunities for bats.
Sites with bat presence in their description				
B	Bramford Meadows CWS	0.59 km north-east	The site consists mainly of the priority habitat floodplain grazing marsh, situated in the valley of the River Gipping.	Key habitat for priority mammals including bats especially Daubenton's
C	Sproughton Park CWS	Within Order Limits	The site supports grassland, wet woodland (predominantly alder Alnus sp.), scrub and hedgerow habitats. It is adjacent to Belstead Brook.	Mosaic grassland and hedgerows are ideal feeding habitats for bats.
C	Raydon Great Wood CWS	0.13 km west	Ancient woodland, holding characteristic features of medieval woods.	Priority species are recorded here including bats
C	Chantry Park, Beech Water and Meadow CWS	1.23 km east	A high-quality mosaic of habitats making the site valuable for wildlife, hosting assemblages of priority species.	High quality habitat for bats including brown long-eared, common pipistrelle and noctule.

Project Section	Site Name	Distance/ Direction to Order Limits	Site Description	Bat comment/records
G	Mill Meadows LWS	1.91 km east	Within a stream valley, comprising well-drained, acid soils on the higher ground and waterlogged neutral soils closer to the stream.	Provides vital habitat for several bat species to forage, commute and roost.

Nationally Significant Infrastructure Projects and Local Planning Authority Projects

4.2.9 The results from the search of ecological survey reports produced in support of Nationally Significant Infrastructure Project (NSIPs) and Local Planning Authority projects found one project within 2 km of the Order Limits that note the presence of Annex II bat species roost geographically present within East Anglia (barbastelle). This was the Bramford to Twinstead overhead lines project 2 km north-west of the Order Limits, which undertook targeted barbastelle field surveys and recorded a likely maternity roost within Hintlesham Woods SSSI. This SSSI is 2.4 km west of the Order Limits at its closest point.

4.3 Ground Level Tree Assessments

4.3.1 Approximately 97% of the land within the Order Limits was subject to GLTA surveys between September 2023 and September 2025.

4.3.2 Of the trees surveyed within the Order Limits, 347 were assessed as containing at least one PRF suitable for multiple bats and may therefore be used by a maternity colony (PRF-M). A total of 1,993 trees were assessed as Further Assessment Required (FAR) and a total of 650 trees were assessed as having features only suitable for individual bats or very small numbers of bats either due to size or lack of suitable surrounding habitat (PRF-I).

4.3.3 In some instances, where there were large groups of trees with the same classification, the trees were grouped together and recorded by area. A description of the group of trees was recorded as well as the recommended further survey requirements to be completed post-DCO consent. In total 0.29 ha of PRF-M trees, 19.01 ha of FAR trees and 4.69 ha of PRF-I were recorded by this method.

4.3.4 In line with the BCT guidelines trees assessed as PRF-M or PRF-I would require further assessment to confirm the status of PRFs and to have reasonable confidence in the presence or absence of bat roosts. Further surveys, such as aerial inspections and emergence surveys would be undertaken on these trees post-DCO consent. Trees classified as PRF-I do not require further survey as outlined in Collins, J. (ed.) (2023).

4.3.5 No confirmed roosts (CR) have been recorded within the Order Limits. A single confirmed roost was identified during ground-level inspections of PRFs in Section H,

however this has been avoided through sensitive routeing and therefore is no longer in the Order Limits.

4.3.6 Tree assessment data recorded in each Project Section (A to H) within the Order Limits are summarised in Table A8.9.6 below.

Table A8.9.4 Results of GLTA surveys

Project Section	Suitability of surveyed trees within the Order Limits				
	PRF-M	PRF-I	FAR	Hib*	CR*
A	58	131	284	3	0
B	49	94	310	5	0
C	72	131	324	17	0
D	53	76	284	5	0
E	10	36	231	5	0
F	58	95	351	4	0
G	17	47	140	7	0
H	30	40	69	2	0
Total	**347**	**650**	**1,993**	**48**	**0**

** Hib supporting PRFs suitable for use by one or more hibernating bats; CR a single confirmed roost. Numbers of hibernation trees and confirmed roosts are estimates based on the data to date in absence of further survey information. Any confirmed roosts identified during the bat radiotracking surveys are detailed within Appendix 8.11: Bat Radiotracking Report (document reference 6.8.A11) (Revision B).*

4.3.7 It is anticipated that at detailed design it would be possible to avoid direct effects on many of the trees that have been assessed and adverse effects on bats should they be roosting in the trees. However, if all the trees assessed within the Order Limits were impacted, the following shows the further survey requirements informed by the results of the GLTA:

- 1,877 would require aerial inspections by climbing and/or ladder
- 245 would require ground inspection by torch and endoscope
- 218 would require emergence surveys (where trees are unsafe to climb or where features are so numerous that emergence surveys are the safest or most effective method for assessing PRFs)
- 648 would not require further survey.

4.3.8 48 trees were identified as having suitability to support hibernation roosts for bats. PRFs with hibernation suitability are defined as those that offer bats protection against predation and extreme ambient weather condition, allowing them to remain in torpor for extended periods. Further surveys on these trees will be required should they be impacted at detailed design stage.

PRF Inspections

4.3.9 Across 2023, 2024 and 2025 where trees were found to be suitable for further ground level inspection, during the GLTA surveys, bat licensed surveyors used torches and endoscopes to inspect the PRF where possible. Further ground level inspections were undertaken at 99 trees.

4.3.10 For 87 of these trees, the PRF categorisation remained unchanged as either PRF-I (64) or PRF-M (23), following the more detailed survey. Of the remaining 12 trees, two were downgraded to PRF-I from PRF-M, eight were assessed as PRF-I from FAR and two were assessed as PRF-M from FAR.

4.4 Further Roosting Surveys for Barbastelle

Ground/Aerial PRF Inspection Surveys

4.4.1 PRF inspections were conducted at 32 trees across six locations. Following the initial close inspection survey, nine trees were assessed as having no features suitable for roosting bats, 17 trees were assessed as PRF-I and six trees were assessed as PRF-M. Trees which were classified as either None or PRF-I, were not subject to any further surveys. The trees which were classified as PRF-M were subject to three PRF inspections in line with the BCT guidelines.

4.4.2 No evidence of roosting bats was identified.

Emergence Survey Results

4.4.3 Emergence Surveys were conducted at two trees within barbastelle Survey Area 8.

4.4.4 No bats were observed leaving either tree, no roosts observed.

Backtracking Survey Results

Barbastelle Survey Area 3

4.4.5 No roosts observed.

4.4.6 One barbastelle pass was recorded during visit 1 at 21:42 (sunset +59 mins). The mean emergence time of barbastelle is sunset +24 minutes. As such it is not expected that a barbastelle roost is in the immediate vicinity. There were no recordings of barbastelle in visits 2 and 3.

4.4.7 Other species recorded: common pipistrelle *Pipistrellus pipistrellus*, soprano pipistrelle, brown long-eared, and *Myotis sp*.

4.4.8 Activity was generally low in this location with most activity recorded along the public footpath with bats foraging under the canopy of tree cover.

Barbastelle Survey Area 12

4.4.9 No roosts observed.

4.4.10 Two brief barbastelle passes were recorded during visit 1 (sunrise -150 mins and sunrise- 77 mins). Mean return times for barbastelle is 194 minutes before sunrise.

Although barbastelle was recorded within average return times, the passes were very brief and indicated that barbastelle use the River Colne to commute east to west.

4.4.11 Two brief barbastelle passes were also recorded during visit 2 at sunset +50 mins and sunset +58 mins. Mean emergence time of barbastelle is sunset +24 minutes. As such it is not expected that a barbastelle roost is in the immediate vicinity. Once again, the bats were using the River Colne to commute and forage.

4.4.12 No barbastelle activity was recorded in visit 3.

4.4.13 Other species recorded: common pipistrelle, soprano pipistrelle, brown long eared, *Myotis sp.*, and *Nyctalus sp.*

4.4.14 Activity was concentrated around the River Colne, again the bats were using the river as a commuting route and foraging corridor.

Barbastelle Survey Area 14

4.4.15 No roosts observed.

4.4.16 No barbastelle passes recorded.

4.4.17 Species recorded: common pipistrelle, soprano pipistrelle, *Myotis sp*.

4.4.18 Activity mainly along the southern edge of the woodland. Little to no activity within the woodland.

4.5 Incidental Findings

4.5.1 A long-eared bat *Plecotus sp*. roost was identified during the partial PRF inspection at barbastelle Survey Area 3. The roost is located outside of the Order Limits 10 m east of the construction temporary haul road that would make use of an existing road (TM 12929 90994) with no impact to this tree likely.

4.5.2 A concrete pillbox with low bat roost suitability was identified within the Order Limits at barbastelle Survey Area 12 (TL 92527 27129). The closest potential impact to the structure is the proposed 11 kV underground cable which is located approximately 60 m to the east. It is therefore expected that there would be no impacts to bats if they are using the pillbox.

5. Conclusion

5.1.1 A thorough desk-based review has been undertaken to identify habitats offering suitable bat roosting potential. The desk study identified six non-statutory sites of nature conservation importance and one SSSI in the 2 km Study Area that mentioned the presence of bats in their description. The LERC search recorded presence of 300 confirmed, or likely, bat roosts for 10 species within 6 km of the Order Limits (shown on Figure A8.9.2: Desk Study Bat Records in Annex A).

5.1.2 Between September 2023 and September 2025, approximately 97% of the land within the Order Limits was subject to GLTA surveys.

5.1.3 The result of the GLTA and further bat surveys have revealed the following within the Order Limits:

- 350 trees and 0.29 ha of tree groups with PRF-M
- 1,941 trees and 19.01 ha of tree groups with FAR
- 684 trees and 4.69 ha of tree groups with PRF-I

5.1.4 There were 48 trees that were also identified as having hibernation potential for bats.

5.1.5 No barbastelle roosts were identified during any of the further roosting surveys.

5.1.6 No confirmed bat roosts have been found within the Order Limits.

5.1.7 Further surveys, such as aerial inspections or emergence surveys, will be required prior to the commencement of construction, for PRF-M and FAR trees that would be impacted, as agreed with Natural England at consultation. Trees with PRF-I features will be subject to a pre-felling check by a bat licensed ecologist.

5.1.8 Any future confirmed roosts identified during future PRF inspection surveys that need to be ‘removed’ or ‘affected managed’ by the Project would need to be subject to sufficient surveys to characterise the roost in line with the requirements detailed within the draft bat licence.

Glossary

Term	Description
Ancient woodland	Land that has been continually wooded since at least 1600 in England. Regarded as 'irreplaceable habitat' in national planning policy and guidance. Ancient woodland greater than 2 ha is recorded on the Natural England Ancient Woodland Inventory.
Ancient Woodland Inventory	A dataset managed by Natural England to identify and record information about ancient woodland sites in England.
Biodiversity	The variability among living organisms from all sources including terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part: this includes diversity within species, between species and of ecosystems.
Cable	An insulated conductor designed for underground installation.
Cable Sealing End	Structures used to transfer transmission circuits between underground cables and overhead lines.
Cable Sealing End Compound	Electrical infrastructure used as the transition point between overhead lines and underground cables. A compound on the ground acts as the principal transition point.
Consultation Strategy	A strategy setting out National Grid's approach to and programme of public consultation.
Core Sustenance Zone (CSZ)	The CSZ refers to the areas surrounding a communal bat roost within which habitat availability and quality will have significant influence on the resilience and conservation status of the colony of the roost.
County Wildlife Site	Non-designated areas of land important for their wildlife and nature conservation value. Designation in Suffolk.
Ecosystem	A dynamic complex of plant, animal and micro-organism communities and their non-living environment interacting as a functional unit.
Environmental Impact Assessment (EIA)	An assessment of the likely effects of a development project on the environment, which is reported in an Environmental Statement that is publicised and consulted on and taken into account in the decision on whether a project should proceed.
Environmental Statement (ES)	The main output from the EIA process, an ES is the report required to accompany an application for development consent (under the Infrastructure Planning (EIA) Regulations 2017) to inform public and stakeholder consultation and the decision on whether a project should be allowed to proceed. The EIA Regulations set out specific requirements for the contents of an ES for Nationally Significant Infrastructure Projects.

Term	Description
European Protected Species	Animals and plants listed under the Habitats Directive and protected under the Conservation of Habitats and Species Regulations 2017, as amended.
European Protected Species Licence	The licence issued to permit an activity affecting European Protected Species that would otherwise be an offence under the Habitats Regulations.
Fauna	All the animals in a given area.
Flora	The plants within a particular habitat or region.
Geographical Information System	GIS is a framework for gathering, managing and analysing data. It analyses spatial location data and organises layers of information into visualisations on maps.
Habitat	The natural home or environment of an animal, plant, or other organism.
Landscape	An area, as perceived by people, the character of which is the result of the action and integration of natural and/or human factors.
Local Nature Reserve	Sites dedicated by the Local Planning Authority under Section 21 of the National Parks and Access to the Countryside Act 1949 for nature conservation which have wildlife or geological features that are of special interest locally.
Local Planning Authority	The public authority whose duty it is to carry out specific planning functions for a particular area.
Local Wildlife Site	Non-designated areas of land important for their wildlife and nature conservation value.
Mitigation	The action of reducing the severity and magnitude of change (impact) to the environment. Measures to avoid, reduce, remedy or compensate for significant adverse effects.
National Planning Policy Framework	The National Planning Policy Framework is a key part of the government's reforms to make the planning system less complex and more accessible. It vastly simplifies the number of policy pages about planning. The planning practice guidance to support the framework is published online and regularly updated.
Nationally Significant Infrastructure Project	Typically, a large-scale development of national importance that requires development consent from The Secretary of State, under the Planning Act 2008.
Non-statutory designated site	A site designated at a local level for its biodiversity and/or geological value. These are not underpinned by legislation.
Order Limits	The maximum extent of land within which the authorised development may take place.
Overhead Line	Conductor (wire) carrying electric current, strung from pylon to pylon.

Term	Description
Priority species	Species identified as of principal importance in England, in accordance with requirements of the Natural Environment and Rural Communities Act 2006. These are based on the UK Biodiversity Action Plan Priority Species.
Special Area of Conservation	Protected sites designated under the Habitats Directive, representing internationally important, high-quality conservation sites.
Sites of Special Scientific Interest	SSSIs are protected by law under the Wildlife and Countryside Act 1981. They are important because they support rare or endangered fauna and flora, and they represent the United Kingdom's best wildlife and geological sites.
Species	A group of living organisms consisting of similar individuals capable of exchanging genes or interbreeding.
Statutory Consultee	A national public organisation or body that must be consulted with on planning applications, depending on the nature of the development and its location.
Statutory designated site	A site which receives protection by means of legislation in recognition of its biodiversity value.
Substation	Substations are used to control the flow of power through the electricity system. They are also used to change (or transform) the voltage from a higher to lower voltage to allow it to be transmitted to local homes and businesses.
UK Power Networks	UK Power Networks (Operations) Limited (registered company number 03870728) and/or its affiliate Eastern Power Networks plc (registered company number 02366906) as applicable.
Underground cabling	An insulated conductor carrying electric current designed for underground installation. Underground cables link together two Cable Sealing End compounds.
Zone of Influence	The defined geographic area within which the project's environmental receptors are located.
