

1. I live in a rural location with a poor road infrastructure and the project passes along the boundary of my property and crosses several roads. Any diversions during construction would significantly increase traffic on very minor roads, hence I requested information regarding anticipated road closures and alternate routes to which I have not seen a response.

2 with the construction being so close to the border of my property and a main storage and transition area extremely close I also requested information on what mitigations NG plan to manage the environment , I.e dust and noise, again no response.

In fact I have responded with various questions on NGs consultations but to date have had no response. I have been left with the feeling that NG are treating the consultations as a paper exercise that they just need to tick the box on. Also have only ever seen information on the pylon option although I believe other studies have identified better alternatives such as DC under grounding or offshore.

I personally have no faith in the integrity of the process that's been used to move this project forward and have no trust in the information NG are providing.

I think this project should be postponed until a thorough investigation of alternatives can be carried out by independent experts to verify or otherwise if NGs only proposed option of pylons are the best long term alternative.
