NB. The following referencing system reflects a wider survey scope than that reported on in Volume 5.21.1 Arboricultural Impact Assessment and has been retained for consistency; consequently, trees, groups and hedgerows that are no longer within influencing distance of the Order Limits no longer appear in the list below.

## Hinkley Point C Connection Project - Environment Statement Volume 5.21.2 Appendix 21B

The following data fields are based on those provided in British Standard British Standard 5837:2012. Where applicable the method of recording these has been simplified to suit the nature and scale of the Proposed Development.

The survey of trees is conducted from ground level only. The nature of the soils on site is not assessed.

Trees are dynamic living organisms with a constantly changing structure; even trees in good condition can suffer from damage or stress. The information recorded is presented as being correct at the time of survey.

<b>Species</b>	The common name is given. The Latin name may also be given if further clarification is required.	
<b>Height</b>	Top height of tree recorded in metres using a digital hypsometer.	
<b>Stem Diameter</b>	<p>For single-stemmed trees an estimation is made at 1.5 metres above ground level and recorded to the nearest 100 millimetres.</p> <p>For multi-stemmed trees an estimation of the average of all stems measured at 1.5m above ground level is made and recorded to the nearest 100 millimetres.</p> <p>For tree groups an estimation of range from minimum to maximum diameters is provided based on one of the aforementioned methods.</p> <p>Trees with a stem diameter at 1.5 metres above ground level of less than 100mm were not recorded.</p>	
<b>Crown width</b>	The greatest branch spread on a single cardinal point is recorded to the nearest metre.	
<b>Maturity</b>	<b>Young</b>	Trees within the first quarter of their species life expectancy;
	<b>Middle Age</b>	Trees in the established growth stage of their life with the potential to continue increasing in size;
	<b>Mature</b>	Trees that have reached their ultimate size, given their location and surroundings;
<b>Condition</b>	<p><b>Good</b> Trees displaying particular vigour and lacking in significant visible structural defects;</p> <p><b>Fair</b> Trees in an average physiological and structural state for their age and species; those lacking significant visible structural defects;</p> <p><b>Poor</b> Trees that display impaired structural condition or signs of physiological stress sufficient to reduce life expectancy;</p> <p><b>Veteran</b> Trees that are in such a condition as to significantly increase their biological, cultural or aesthetic value. This is characteristic of, but not exclusive to, individuals surviving beyond the typical age range for the species concerned.</p>	
<b>Estimated Remaining Contribution</b>	An estimation of the life expectancy as healthy functioning tree. This will be influenced by species and the condition of the tree at the time of survey.	
	<b>Long</b>	> 40 years
	<b>Medium</b>	20 – 40 years
	<b>Short</b>	less than 20 years
<b>Comments</b>	An optional field used to record specific detail on form, health, growing environment, previous management and any significant defects or symptoms of ill-health.	
<b>Value Categorisation</b>	The assessment is based on Table 1 of BS 5837:2012 (See below). Four categories (A, B, C and U) are used to denote tree quality (A= High, B = Moderate, C = Low, U= Unsuitable for retention). Subcategories (1-3) denote the specific function value of the trees and the reasoning behind the allocation of a specific category (the subcategories may be used in combination but do not accumulate collective weight).	
<b>Root Protection Area (RPA)</b>	<p>The RPA is allocated to ensure that a sufficient area is left undisturbed during development. It is provided as an area (m<sup>2</sup>) and as the radius of a circle (m) typically plotted from the centre of the stem.</p> <p>The RPA is calculated using a mathematical equation included in BS 5837:2012 (Section 4.6 and Table D.1) and is based on a trees stem diameter.</p>	

**Cascade chart for tree quality assessment taken from BS 5837:2012<sup>1</sup> (Table 1, Pg 9)**

Category and definition	Criteria (including subcategories where appropriate)	Identification on plan	
<b>Trees unsuitable for retention (see Note)</b>			
<b>Category U</b> Those in such a condition that they cannot realistically be retained as living trees in the context of the current land use for longer than 10 years	<ul style="list-style-type: none"> <li>Trees that have a serious, irremediable, structural defect, such that their early loss is expected due to collapse, including those that will become unviable after removal of other category U trees (e.g. where, for whatever reason, the loss of companion shelter cannot be mitigated by pruning)</li> <li>Trees that are dead or are showing signs of significant, immediate, and irreversible overall decline</li> <li>Trees infected with pathogens of significance to the health and/or safety of other trees nearby, or very low quality trees suppressing adjacent trees of better quality</li> </ul> <p><i>NOTE Category U trees can have existing or potential conservation value which it might be desirable to preserve; see 4.5.7.</i></p>	See Table 2	
	<b>1 Mainly arboricultural qualities</b>	<b>2 Mainly landscape qualities</b>	<b>3 Mainly cultural values, including conservation</b>
<b>Trees to be considered for retention</b>			
<b>Category A</b> Trees of high quality with an estimated remaining life expectancy of at least 40 years	Trees that are particularly good examples of their species, especially if rare or unusual; or those that are essential components of groups or formal or semi-formal arboricultural features (e.g. the dominant and/or principal trees within an avenue)	Trees, groups or woodlands of particular visual importance as arboricultural and/or landscape features	Trees, groups or woodlands of significant conservation, historical, commemorative or other value (e.g. veteran trees or wood-pasture)
<b>Category B</b> Trees of moderate quality with an estimated remaining life expectancy of at least 20 years	Trees that might be included in category A, but are downgraded because of impaired condition (e.g. presence of significant though remediable defects, including unsympathetic past management and storm damage), such that they are unlikely to be suitable for retention for beyond 40 years; or trees lacking the special quality necessary to merit the category A designation	Trees present in numbers, usually growing as groups or woodlands, such that they attract a higher collective rating than they might as individuals; or trees occurring as collectives but situated so as to make little visual contribution to the wider locality	Trees with material conservation or other cultural value
<b>Category C</b> Trees of low quality with an estimated remaining life expectancy of at least 10 years, or young trees with a stem diameter below 150 mm	Unremarkable trees of very limited merit or such impaired condition that they do not qualify in higher categories	Trees present in groups or woodlands, but without this conferring on them significantly greater collective landscape value; and/or trees offering low or only temporary/transient landscape benefits	Trees with no material conservation or other cultural value
