RiverOak Strategic Partners

Revised ES Chapter and Noise and Air Quality Technical Notes

TR020002/D5/ESA2

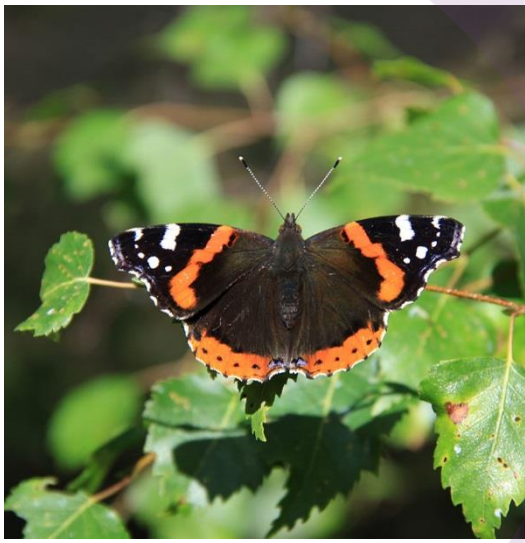
Examination Document

Project Name:	Manston Airport Development Consent Order
Application Ref:	TR020002
Submission Deadline:	**5**
Date:	**5** April 2019

RiverOak Strategic Partners Limited

Manston Airport DCO

Chapter 14: Traffic and Transport Addendum



Wood Environment & Infrastructure Solutions UK Limited – April 2019

Contents

14. Traffic and Transport

14.1 Introduction

14.1.1 This Chapter sets out the results of an assessment of the traffic and transport related environmental effects of the Proposed Development. It outlines the key traffic and transport aspects of the Proposed Development, relevant policy, legislation and guidance, the data gathering methodology, the baseline conditions, scope and methodology alongside the results. This Chapter should be read in conjunction with the Proposed Development description (**Chapter 3: Description of the Proposed Development**).

14.1.2 **Figure 14.1** shows the location of the Proposed Development in the context of the wider highway network with the Proposed Development site shown in **Figure 1.1** in **Chapter 1: Introduction**, which sets out the proposed masterplan layout for the site.

14.1.3 This document has been updated to reflect the post DCO submission consultation with KCC Highways which has resulted in changes to the traffic generation estimates and use of the KCC Thanet Strategic Traffic Model.

14.1.4 Further details of these changes are set out within this Chapter and within the revised Transport Assessment.

14.2 Key Traffic and Transport Aspects of the Proposed Development

Site Context

14.2.1 The Proposed Development site is well located to access key highway routes in the area which comprise: the A299 which links to the M2 and the A28 to Canterbury and the M20; and the A256 which links to Dover. Access to the A299 from the site is via the Manston Road (B2050) and the Spitfire Way (B2190) which are the roads which bound the site.

14.2.2 The key local aspects of the local highways network are set out in further detail in **Section 14.5**, which includes key local context maps showing the site and key local highways infrastructure.

Proposed Site Access Points

14.2.3 As shown in the masterplan, the following access points are proposed:

- Cargo Facility – new access onto Spitfire Way in the form of a roundabout;
- Passenger Terminal – existing access onto Manston Road will be upgraded to a signal junction;
- 'Northern Grass' area – new southern access onto Manston Road in the form of a signal junction;
- 'Northern Grass' area – new western access onto Manston Road in the form of a priority junction; and
- Fuel Farm – existing access onto Canterbury Road West will remain unchanged.

14.2.4 The accesses have been designed in accordance with the national design standards set out in the Design Manual for Roads and Bridges (DMRB) and have been based on junction modelling to

ensure that the design has capacity to accommodate the full development and future traffic flows. The following sets out the details of the proposed accesses. The detailed plans of the proposed accesses are set out in the Transport Assessment (TA) provided to support this DCO application.

Cargo Facility Access with Spitfire Way

14.2.5 The Cargo Facility and associated vehicle parking for Heavy Goods Vehicles (HGVs) and staff will be served by one access which will form a new junction off Spitfire Way. This is proposed to be a three-arm roundabout.

Passenger Terminal Access with Manston Road

14.2.6 The Passenger Terminal and associated car parking for passengers and staff will be served by one access, which remains in the existing location. The junction will be upgraded to a fully signalised junction, linked with a second new junction to the west (The 'Northern Grass' area Southern Access).

14.2.7 The junction has been designed to incorporate pedestrian crossing facilities across the Airport access arm and across Manston Road.

'Northern Grass' Area Southern Access with Manston Road

14.2.8 The 'Northern Grass' area will be served by two accesses, the main one from Manston Road, which will be a three-arm signalised junction and will be linked with the Passenger Terminal junction to optimise traffic flow throughput.

14.2.9 The junction has been designed to incorporate pedestrian crossing facilities across the Airport access arm and across Manston Road.

'Northern Grass' Area Western Access with Manston Road

14.2.10 The second access to the 'Northern Grass' area will be from Manston Road, to the west of the site. This will be a ghost island priority junction which incorporates a right turn lane.

Fuel Farm Access

14.2.11 The existing access to the fuel farm off Canterbury Road West is an established access to the facility that has been designed to accommodate large tankers hence it is not proposed to be amended.

Other Proposed Local Highways Improvements

14.2.12 As part of the Proposed Development, the Spitfire Way/Manston Road junction will be upgraded to a signalised crossroad. Both Spitfire Way and Manston Road will be widened to form a 7.3m carriageway, with pedestrian footways provided on the southern side of Manston Road and eastern side of Spitfire Way between the Cargo Facility and the Passenger Terminal junctions. Further details on the nature and design of these improvements will be provided within the TA, which forms part of the Development Consent Order (DCO) application.

14.3 Policy and Legislative Context

14.3.1 The assessment has been undertaken in accordance with relevant traffic and transport related planning policy, legislation and guidance at the national, regional and local level. This helped

identify any requirements which the Proposed Development needs to consider, aiding the process of defining the scope of assessment and informing the identification of local issues.

Policy and Guidance Context

14.3.2 Policy and guidance documents relevant to traffic and transport environmental effects of the Proposed Development are listed in **Table 14.1**.

Table 14.1 National and Local Planning Policies relevant to Traffic and Transport

Policy Reference	Policy Information Relevant to Traffic and Transport
National Planning Policy Framework (NPPF): Draft for Consultation (March 2018)[i]	Chapter 9 Promoting sustainable transport - the key changes relate to: • Transport impacts should address highway safety as well as capacity and congestion; • Designs should priorities pedestrian and cycle movement, followed by access to high quality public transport; and • The importance of creating high quality places. Paragraph 103b reflects the housing White Paper proposal that authorities should be expected to identify additional development opportunities arising from strategic infrastructure investment. Paragraph 105f sets out new policy to recognise the importance of maintaining a national network of general aviation facilities. Policy on assessing the transport impact of proposals (now at paragraphs 108-110) has been amended to refer to highway safety as well as capacity and congestion in order to make it clear that designs should prioritise pedestrian and cycle movements, followed by access to high quality public transport (so far as possible) as well as to reflect the importance of creating well-designed places.
National Planning Policy Framework (NPPF) (2012)[ii]	The NPPF outlines the Government's planning policies and how they are expected to be applied. The NPPF states that "*the purpose of the planning system is to contribute to the achievement of sustainable development*." Paragraphs 29 to 32 encourage sustainable transport modes for the movement of goods and people and for plans and decisions to take account of whether safe and suitable access to sites can be achieved for all people, whilst ensuring developments are designed to accommodate the efficient delivery of goods and supplies, give priority to pedestrian movements, and create safe and secure layouts which minimise conflicts between traffic and pedestrians. Paragraph 32 identifies that development should only be prevented or refused on transport grounds where the residual cumulative impacts of the development are severe.
Kent County Council (KCC) Local Transport Plan 4: Delivering Growth without Gridlock 2016–2031[iii]	It is identified in LTP4 that the "*elected members of KCC fully support the continued regeneration of Manston and East Kent and are supportive of a business park or an airport, depending upon the viability of such plans and their ability to deliver significant economic growth and job opportunity*." Within the local priorities, infrastructure improvements such as the A299 Thanet Way, the East Kent Access scheme and the introduction of High Speed rail services have helped to address isolation issues of Thanet district. Further improvements identified include an inner circuit of new and improved highway routes, including improved links to Westwood Cross, the Westwood Relief Strategy – Westwood Road to Margate Road Link and the Thanet Parkway railway station.
KCC Freight Action Plan (2012)[iv]	The Freight Action Plan has been produced with a vision to "*promote safe and sustainable freight distribution networks into, out of and within Kent, which support local and national economic prosperity and quality of life, whilst working to address any negative impacts on local communities and the environment both now and in the future*."

Policy Reference	Policy Information Relevant to Traffic and Transport
	Objective six encourages sustainable distribution that involves more efficient transport and warehousing. The Airport would achieve this through the co-location of the 'Northern Grass' area which will enable local storage of freight cargo.
The Thanet Local Plan Saved Policies (2006)[v]	Policy TR3 – Provision of Transport Infrastructure states that "*The district and county councils will ensure, by means of a legal agreement that proper provision is made for transport infrastructure that is necessary and relevant to the development to be permitted. Proposals for transport infrastructure will be assessed in terms of their impact on capacity and safety of the transport network together with their social and economic impacts*."
Draft Thanet Local Plan 2031	The Local Plan sets out the strategy for growth in the district up to 2031. This includes a minimum of 5,000 additional jobs and 17,140 additional homes. The Manston Airport NSIP-DCO process is recognised in the draft Local Plan and the site is not allocated for any specific purpose. Strategic housing site allocations and infrastructure requirements are identified, with reference to the draft Transport Strategy in relation to highway links and improvements. Policy SP01 – Implementation: this sets out the requirement for all new development to fully meet its infrastructure requirements, directly on site or by contribution to that provision elsewhere, and to comply with the provisions of the Infrastructure Delivery Plan.
Draft Thanet Transport Strategy	The Strategy will replace the Thanet Transport Plan (2005). Its purpose is to provide a framework of transport policy to the year 2031 to support planned growth within the Thanet District. To address concerns regarding road network resilience, the draft Transport Strategy includes the Inner Circuit Route Improvement Strategy (ICRIS) which incorporates a new road link which affects the Airport site, known as the Manston-Haine Link Road.

Guidance Documents

14.3.3 Current guidance for assessing potentially significant environmental effects is the Institute of Environmental Assessment (IEA) publication Guidance Notes No. 1: Guidelines for the Environmental Assessment of Road Traffic[vi] (hereafter referred to as GEART). This has been utilised within this assessment.

14.4 Data Gathering Methodology

14.4.1 The following section sets out the data gathering methodology that has been used to inform the assessments within this Chapter.

Desk Study

14.4.2 The desk study included a review of the overall network, public transport and accident data. Further detail is set out in the following sections.

Network Review

14.4.3 A detailed review of the local highways network and Public Rights of Way (PRoW) was undertaken to inform an understanding of the study area, including sensitive locations such as schools, areas

with high pedestrian flows and congested sections of the local road network. This review was undertaken using street mapping, aerial photography and Google traffic.

14.4.4 For PRoW, the details of the local routes and nature of these routes has been taken from the "Public Rights of Way Map"[vii] online mapping available on the KCC website.

Local Public Transport Facility Review

14.4.5 A review of existing public transport facilities (bus/rail stops and interchanges) and routes (rail lines and bus routes) was undertaken.

14.4.6 Detailed information on the local bus stops and route has been obtained from the "Thanet Bus Map" and from the Travel Line South East journey planner website[viii].

14.4.7 Rail information on train times has been extracted from the National Rail Enquires website[ix].

14.4.8 The details of the baseline review of the public transport infrastructure locally is contained within the Transport Assessment, though that information has been used to assist in the identification of receptors in this Chapter.

Accident Data

14.4.9 Personal Injury Accident (PIA) data recorded by the police has been reviewed. The PIA data categorises whether the accident is slight, serious or fatal in nature and includes information on the location of the accident, the time it took place, the weather and light conditions, motorised and non-motorised users involved and casualty numbers. The data also sets out the causation factors of the accidents which have been identified by the police.

14.4.10 Records of the PIA have been obtained from KCC for just over a six-year period, dating from June 2011 to September 2017. Full details of the accident records are provided as **Appendix 14.1**. The accident data assessment area is shown in **Figure 14.2.**

Survey Work

14.4.11 A site visit was undertaken on 27 September 2017 and included detailed notes and photographs recorded on a GPS iPad system. The following was included during the site visit:

- All roads and junctions that formed part of the study area;
- All proposed site accesses locations;
- The PRoW affected by the Proposed Development were walked;
- Peak hour observations of traffic conditions were made on the A299;
- On-site observations of the operation of signalised junctions within the study area were recorded;
- Road width measurements of Spitfire Way and Manston Road were taken;
- Observations of sustainable transport provision such as pedestrian footways, bus stops etc. were made;
- A visit to Ramsgate train station was made, including observation of key traffic and pedestrian routes to and from the station; and
- Observations were made of key sensitive locations identified as part of the desk top review.

Baseline Traffic Data and Surveys

14.4.12 Traffic count surveys were commissioned to understand the existing traffic conditions within the study area. **Table 14.2** provides a summary of the traffic count surveys commissioned and traffic data obtained as well as provides the source of information.

Table 14.2 Summary of Traffic Surveys and Data Information

Source	Survey Information
360TSL	Manual classified turning counts (MCC), automatic traffic counts (ATC) and queue surveys commissioned on links and at junctions anticipated to be affected by the proposals – March 2017.
PCC Traffic Information Consultancy Limited	Following discussions with KCC, additional MCC counts and ATC's as well as queue surveys were commissioned on the links and at the junctions anticipated to be affected by the proposals– October 2017.
Highways England (HE)	Traffic data for the strategic HE road network has been extracted through the HE traffic data portal[x]

14.4.13 As per **Table 14.2**, 360TSL were commissioned to undertake a series of traffic counts and queue surveys. MCC traffic surveys were undertaken on Wednesday 1 March, Thursday 2 March and Thursday 9 March 2017 at the following junctions, for the period of 06:00 - 24:00:

- 1 – A256 / Sandwich Road;
- 2 – A256 / A299/Cottingham Link Road;
- 3 – A299 / Canterbury Road West;
- 4 – A299 / B2190 (Minster Road) / B2190 (Tothill Street);
- 5 – B2190 / Minster Road;
- 6 – A253 (Canterbury Road) / A299 / Willetts Hill / Seamark Road;
- 7 – A299 / A28 (Canterbury Road) / Potten Street Road;
- 8 – A28 (Canterbury Road) / The Square (Station Road);
- 9 – B2050 (Park Lane) / Acol Hill / B2050 (Manston Road);
- 10 – B2050 (Manston Road) / Shottendane Road / Margate Hill;
- 11 – B2190 (Spitfire Way) / Columbus Avenue;
- 12 – B2050 (Manston Road) / Manston Road / B2190 (Spitfire Way);
- 13 – B2050 (Manston Road) / Manston Court Road;
- 14 – A28 (Canterbury Road) / B2052 (George V Avenue);
- 15 – B2052 (Heartsdown Road) / B2052 (Tivoli Road) / B2052 (College Road) / Nash Road / Empire Terrace / Manston Road (Coffin Corner);
- 16 – A254 (Ramsgate Road) / B2052 (College Road) / B2052 (Beatrice Road);
- 17 – A254 (Margate Road) / A254 (Ramsgate Road)/ Star Lane/ Poorhole Lane;

- 18 – Star Lane Link / Manston Court Road;
- 19 – A256 (New Haine Road) / New Cross Road;
- 20 – A256 (Hain Road) / B2050 (Manston Road);
- 21A – A256 (Haine Road) / Canterbury Road West / A256; and
- 21B – A299 (Canterbury Road East) / A299 (Hengist Way) / Sandwich Road / A256 (Lord of the Manor Roundabout).

14.4.14 Following discussion with KCC, a series of additional MCC traffic counts were commissioned in October 2017 to widen the scope of assessment, undertaken by PCC Traffic Information Consultancy Limited. The counts were undertaken at the following junctions:

- 22 – B2052 (Tivoli Road) / Tivoli Road / B2052 (Beatrice Road);
- 23 – B2050 Park Lane / A28 (Canterbury Road);
- 24 – Star Lane / Nash Road;
- 25 – B2050 Manston Road / Tesco Supermarket Access;
- 26 – B2050 (Manston Road) / B2014 (Newington Road);
- 27 – B2014 (Newington Road) / A255 (High Street); and
- 28 – A255 (High Street) / A255 (Park Road) / Wilfred Road / Grange Road.

14.4.15 The above junction traffic counts data has been supplemented by ATC data within the area to better understand the seven-day traffic conditions. The ATC data has been collected for a period of one week starting 07 March 2017 and for a 24-hour period per day (360TSL). The ATC survey locations are as follow:

- ATC1 - A256 north of Sandwich;
- ATC2 – A299 near to Windermere Avenue;
- ATC3 – Manston Road near to Princess Margaret Avenue;
- ATC4 – A254 near Coxes Lane;
- ATC4A – A256 west of Northwood Road;
- ATC5 – A254 near Farley Road;
- ATC6 – A254 near Connaught Road;
- ATC7 – A28 near Westbrook Road;
- ATC8 – A28 near Domneva Road;
- ATC9 – A299 east of Grays;
- ATC10 – A28 Canterbury Road east of Sarre;
- ATC11 – A253 east of Sarre;
- ATC12 – A299 between Minster Road and Canterbury Road West; and
- ATC13 – B2190 Spitfire Way between Minster Road and Manston Road.

14.4.16 Following discussion with KCC, a series of additional ATC counts were undertaken in October 2017 to widen the scope of assessment at the following locations (PCC):

- ATC 14 – Minster Road (South of Acol);
- ATC 15 – Manston Road (North of Woodchurch Road);
- ATC 16 – Shottendane Road between Minster Road and Park Road;
- ATC 17 – Manston Road, north of junction with Bramble Lane;
- ATC 18 – Manston Road, south of junction with Vincent Road;
- ATC 19 – Manston Court Road, east of Valley Road;
- ATC 20 – Manston Court Road, south of the junction with Preston Road; and
- ATC 21 – Manston Road (East of Manston).

14.4.17 The locations of the relevant traffic counts are included in **Figure 14.3**.

14.4.18 In addition, traffic flow information for the strategic road network (M2, A2 and A20) was extracted from the Department for Transport (DfT) online traffic count system. This data, however, only provides 24-hour Annual Average Daily Traffic (AADT).

14.4.19 This data has been used to validate junction models and to review the baseline situation.

Highway Modelling

14.4.20 KCC and Thanet District Council (TDC) have commissioned a SATURN model, known as the strategic transport model, as part of the transport evidence base for the draft Local Plan and to support the Transport Strategy for the district.

14.4.21 At the time of the preparation of the DCO for submission the strategic transport model was not available for third party use until January 2018, at which point the then draft local Plan was rejected and was redrafted requiring further modelling to support this. A spreadsheet model was developed based on the 2017 traffic count surveys and growth factors which took account of the aspirational housing and employment growth within the draft Local Plan.

14.4.22 In the post DCO submission phase the strategic transport model became available for third party use and in consultation with KCC, the Applicant commissioned KCC's consultant, Amey, to undertake model runs to include the traffic generated by the Proposed Development.

14.4.23 As the KCC strategic model has been developed for the end of Local Plan period year of 2031, there was a requirement to growth the model flows to 2039, Year 20 of the Proposed Development.

Consultation

14.4.24 Since 2015, RiverOak has engaged with consultees who have an interest in potential traffic and transport effects as part of the wider scoping/consultation effort for the Proposed Development. A Scoping Report including a chapter covering traffic and transport, was produced and submitted to the Planning Inspectorate (PINS) who distributed it to stakeholders and provided a scoping opinion an Initial Preliminary Environmental Information Report (PEIR) was then submitted by the applicant for consultation and review in summer 2017. Wood has also held meetings with KCC, HE (in relation to the strategic road network) and with Network Rail (in relation to the rail network). Finally, a second PEIR consultation was undertaken in early 2018.

14.4.25 A summary of the consultation response is set out in the following tables:

- **Table 14.3** – Consultee responses to the Scoping Report;
- **Table 14.4** – PINS responses to the Scoping Report;
- **Table 14.5** – Responses to June 2017 statutory consultation;
- **Table 14.6** – Consultation with KCC – including comments on Transport Scoping Note;
- **Table 14.7** – Consultee response to January 2018 PEIR;
- **Table 14.8** – Consultation with KCC during preparation of the ES; and
- **Table 14.9** - Discussion with KCC Post DCO Submission.

14.4.26 It should be noted that the text in the **Tables 14.3** to **14.7** refers to other documents prepared to support the DCO application, with particular reference to the TA. The TA provides the details of some of the technical background to the provision of development traffic flows as well as mitigation schemes required to support the Proposed Development. The TA needs to be read in conjunction with this Chapter to understand the traffic and transport issues associated with the development proposals. Appended to the TA are a range of other documents which also provide further background on mitigation proposals and these are set out in **Table 14.9** of the TA.

Table 14.3 Consultee Responses to the Scoping Report

Consultee	Comments and Considerations	How This Has Been Addressed
Cliffsend Parish Council	The response from Cliffsend Parish Council related to the Stone Hill Park proposals, however some of the comments and observations apply to the Proposed Development. They are as follows: The existing highway network is overcrowded and the proposals need to be adequate and delivered in a timely manner. There is concern over: • Canterbury Road West becoming a rat run; • Extra traffic on the Sandwich Road and Southern Lord of the Manor roundabout; • The inadequacy of Manston Road heading towards Haine Road & Westwood Cross Roads; • The suitability of the highway network for Birchington bound traffic via Acol; • Construction haul routes; and • The location of extra bus stops.	These comments are noted and have been considered in the development of the masterplan, TA and accompanying documents. All roads mentioned in the comments are included in the study area for the Proposed Development. The development traffic will not need to use Canterbury Road west apart from a short section from the A299 and proposed fuel farm site. It is not anticipated that development traffic will use Sandwich Road along Pegwell Bay. Development traffic is anticipated to route onto the Southern Lord of the Manor Roundabout. The TA identifies the impact and mitigation requirements. The section of Manston Road along the site frontage will be improved through widening and the provision of pedestrian facilities. It is not anticipated that Manston Road east of the passenger terminal access will be a key route to and from the site as airport signage will be via Spitfire Way. However, traffic originating from Ramsgate would be anticipated to use this route as an access from Ramsgate. The TA identifies the impact and mitigation requirements. It is not anticipated that development traffic would route along Minster Road through Acol with Birchington bound traffic routeing along the B2050 (Manston Road/Park Lane) to Birchington. The details of the provision for improved or relocated bus stops are provided within the Airport Surface Access Strategy, TA and other documents.

Consultee	Comments and Considerations	How This Has Been Addressed
Highways England	There is concern about the potential impact of freight-related trips on the M2 and A2 therefore traffic impacts on these roads should be assessed during the construction and operational phases including where necessary, junction modelling. Justification of assumptions should be provided to ensure a robust assessment. The EIA and TA should be mutually compatible.	A meeting was held with HE on the 28 September 2017 and it was agreed that the TA will provide a chapter setting out the impacts on the M2/A2 and any other key parts of the strategic highways network that may be affected (such as the A20). The TA and environmental assessment will be using the same traffic flow figures based in the same methodology. Details of the environmental impacts on the HE network are set out later in this chapter for the M2, A2 and A20.
Kent County Council	There will be a requirement for a full transport assessment using any strategic transport model that KCC may have developed. This will inform a requirement for more detailed modelling processes at individual junctions. Assessments should be made on existing PRoW, historic footpaths and public access; dog walking and recreation routes.	A TA has been provided to support this DCO application. A meeting was held on the 11 September 2017 to agree a way forward with the development of the TA with KCC. Whilst it is acknowledged that the TA would normally use the KCC strategic transport model to assess the impact of the Proposed Development, this is not currently completed or available for use. It is intended that testing will be undertaken as soon as it is available, but this is likely to be post-submission of the DCO application. As is common practice in situation where detailed strategic models are not available, a robust spreadsheet model has been developed which has informed this Chapter and the TA, the methodology of which has been consulted on with KCC and comments taken onboard. In addition to the TA a PRoW Management Plan is provided to support the DCO application which will include the impacts on local PRoW and effects on public access, dog walking and recreation routes.
Minster Parish Council	Consideration of improving the road infrastructure from the Minster roundabout to the main airport entrances. Better definition of the local road network is required.	Road infrastructure proposals to accommodate the Proposed Development include widening Spitfire Way and Manston Road and improvements to the Spitfire Way/Manston Road junction are proposed to support the development. Details of these mitigation schemes will be included within the TA. This Chapter sets out a detailed breakdown of the local highways network and the scope of the assessment. This is the scope of the assessment that is proposed to be used in all the documents prepared to support the DCO application.
National Grid	The construction and operation of the Richborough Connection Proposed Development (RCP) should be considered in the cumulative assessment.	The Richborough Connection Project (RCP) is at its closest point 7.5km from the site boundary. However, the application (15/00136) for the RCP has been included within the list of considered committed developments considered within the cumulative assessments in the environmental assessments. However, related to this Chapter, according to the National Grid Development website the major construction work will be complete on the Richborough connection by August 2018 which is before the first year of construction of the Proposed Development. As such, with no cross over of RCP traffic on our construction and operational period, the RCP has not been considered further.

Consultee	Comments and Considerations	How This Has Been Addressed
Royal Mail	Concerned with disruption to Royal Mail's road operations. More information on: • Construction phase length; • The extent and phasing of the proposed employment development; • Cumulative traffic impact during the construction and operation phases; and • The disruption to major road users.	The TA prepared to support this application provides information on the issues raised by Royal Mail.
Thanet District Council	Would like the operational and junction capacity assessment to be included in the ES Chapter. A 5% threshold should be used for operational capacity of the highway.	It is not usual practice to include junction capacity assessments within the Chapter, but this is included in the TA provided to support the DCO. This Chapter has considered the assessment thresholds set out in GEART will be applied as is standard practice.
Police	Kent Police consider that the existing road infrastructure leading to and in the vicinity of the site require significant investment to allow for increased traffic volume and growth. Local roads can become congested, particularly those to the North and East of the site and a detailed road strategy and infrastructure plan would be required. Roads to the west and east would require significant work. The roads to the north of the site are wholly inappropriate for use in conjunction with a cargo hub. Traffic count locations are limited and may not present a reliable baseline at this time. Other data collection should be broadened in order to get a more accurate picture of what is required in this case. A broader, county view should be taken including the A2, M2, A256, A28 and future road infrastructure Proposed Developments such as the proposed Lower Thames Crossing. A Transport Assessment, a Travel Plan, and a Traffic Management plan are essentials for this Proposed Development from construction through to completion and daily business. Manston Airport is currently a contingency site for Operation Stack and the implications on this if the Proposed Development were to occur before Manston are no longer required.	The TA has set out the required improvements to mitigate the impact of the development traffic both locally and in the wider context for junctions or highways links. A Surface Access Strategy (SAS) and Construction Traffic Management Plan (CTMP) have also been provided to support the DCO. The roads to the east of the Passenger Terminal access are not anticipated to be used by HGVs or development traffic other than that originating from Ramsgate and environs. The HGVs to and from the Cargo area and 'Northern Grass' area are proposed to route along Spitfire Way, Minster Road and onto the A299. This route has been identified as requiring a road widening scheme from the junction of Spitfire Way and Columbus Avenue. This route was identified as key given the nature of where these HGVs are required to route to and from is predominantly to the east and the London area and Ashford or south to Dover, essentially from the A299. The data collection has been supplemented with further counts undertaken in October 2017. A broader view has now been taken after discussion with HE and KCC. Details of the impacts on the A2, M2, A28 and A256 are included in this Chapter and other supporting documents. To support the DCO application a TA, Travel Plan, CTMP and PRoW Management Plan have also been prepared. The use of the site for Operation Stack is a temporary measure, regardless of the development proposals. It should also be noted that although an agreement exists between the owner of the Site, Stone Hill Park Limited and the Secretary of State for Transport regarding the use of the Site in connection with Operation Stack, the site has never actually been used for the parking of lorries as part of Operation Stack.

Table 14.4 PINS Response to the Scoping Report

PINS Comments and Considerations	How This Has Been Addressed
The Secretary of State drew particular attention to the plan to scope out 'potential noise, vibration, visual, dust, dirt, air pollution and ecological effects as a result of traffic and transport associated with the Proposed Development. It is the opinion of the Secretary of State that they should be assessed as part of the ES but is content for them to be presented within the relevant topic chapters.	The effects scoped out will be assessed within the wider chapters as follows; • Noise and Vibration – **Chapter 12: Noise and Vibration**; • Dust, Dirt Air Pollution – **Chapter 6: Air Quality**; and • Ecological Effects – **Chapter 7: Biodiversity**.
The Secretary of State welcomes the proposed assessment of traffic related environmental effects based on the GEART as well as the preparation of a separate TA, Traffic Management Plan (TMP) and Travel Plan (TP). The study area and methodology for these assessments should be agreed with the local highways authority (KCC), TDC and Highways England, where appropriate. The assessment should include consideration of freight related trips on the strategic road network (e.g. M2 and A2).	Meetings have since taken place to agree a wider scope of assessment within Thanet District with KCC, which incorporates the same study area as that included in the strategic transport model. It was also agreed to include not just the M2 and A2, but the A20 and any other elements of the HE network that might be affected. Although not all of these routes are assessed in this Chapter, they are covered in the TA.
The Secretary of State would expect on-going discussions and agreement, where possible, with the relevant authorities regarding transport and highways proposals.	On-going consultation and meetings on traffic and transport are being undertaken and an agreement will be reached where possible. It is proposed that a Statement of Common Ground (SoCG) will be prepared with KCC Highways and HE before the examination of the DCO application commences.
The Secretary of State requires robust justification for the use of professional judgement in moderating any assessment of significant effects.	Where the assessment of effects is considered to differ from the theoretical, robust justification will be provided.
The Secretary of State supports the principle of a proportionate EIA but requires that sufficient information is presented in the ES to justify the exclusion of effects that do not trigger the thresholds and are therefore considered not significant	The ES ensures that data gathered and analysed in addition to the assessment methodology will provide sufficient justification for exclusion or inclusion.
The Applicant's attention is drawn to the comments, contained in **Appendix 3** of this Opinion, of Highways England; of KCC, in relation to the revision of their Local Transport Plan, and potential impacts on Pegwell Bay; of TDC, particularly in relation to operational and junction capacity of the area road network; and of Royal Mail, particularly in relation to potential additional vehicle movements during the operational phase of the Proposed Development, and the need for thorough consultation	See **Table 14.3**.
The Applicant should also take into account National Grid's and Royal Mail's comments, contained in **Appendix 3**, about potential cumulative effects on construction traffic routes of the Proposed Development together with the RCP	See **Table 14.3**.

14.4.27 Local stakeholders also responded to the summer 2017 (June) Section 42 consultation (PEIR) documentation and these responses are detailed in **Table 14.5**.

Table 14.5 Consultee Response to June 2017 Statutory Consultation

Consultee	Comments and Considerations	How This Has Been Addressed
Thanet District Council	We are concerned about the potential impacts on the network surrounding the site from both construction and operational phase given the likely level of traffic generated by the Proposed Development, especially regarding Spitfire Way, Spitfire Junction and Manston Court Road. At this stage in the process there is insufficient information to consider these impacts. We therefore await further information about the scope of the transport assessment, which should include any additional housing requirement (see Economic impacts section), the methodology for distributing trips on the network and physical improvements to the network as well as mitigation measures in due course.	The impacts of the construction and operational traffic on Spitfire Way, Manston Road and Manston Court Road (and associated junctions) is set out in the TA and this Chapter. This Chapter sets out the environmental impacts while the TA sets out capacity and safety issues with the local network. The study area of the TA has now been established in a local context, comprising 29 key junctions. In a wider context, impacts on the key elements of the strategic road network have also been established. The methodology of the traffic generation and distribution methodology undertaken to inform this Chapter is set out in the TA.
Thanet District Council	We request that we are directly involved in coordinating the list of committed development to be included within the future baselines with KCC.	A meeting was held on the 11 September 2017 with TDC and KCC to agree an approach for the development of the TA. Whilst it is acknowledged that the TA would normally use the KCC strategic transport model to assess the impact of the Proposed Development, this is not currently completed or available for use. It is intended that testing will be undertaken as soon as it is available, but this is likely to be post-submission of the DCO application. In the absence of the availability of the strategic transport model, a detailed traffic and transport spreadsheet model has been developed which has informed this Chapter and the TA. The methodology of this model has been consulted on with KCC and comments taken onboard. A growth rate has been applied to the study area highway network to account for the housing and employment growth identified in the draft Local Plan. This is considered to be a robust approach.
Thanet District Council	An assessment of the impact from the Proposed Development on the Thanet Transport Strategy must also be included within the submission, which should also be taken into account when agreeing modelling scenarios with KCC.	As previously identified, the strategic transport model is not currently available for developers to use and will not be available before the Manston Airport DCO submission. However, a formal request to use the model in the post submission period has been made. It is anticipated that further modelling of the local highways network will be undertaken.
Thanet District Council	Operational and junction capacity assessment should be included within the ES.	As set out above, the junction capacity analysis is set out in the TA to support the DCO.
Cogent Land LLP	CL consider that the following matters need to be considered and assessed thoroughly before any proposed plans to expand the airport are taken further: • Clarification on Multi-Modal Split; • Clarification on Travel Patterns; • Traffic Distribution; and • Committed Development/Transport Schemes.	Details on multi modal split, travel patterns, and traffic distribution are set out in the TA which also sets out the traffic generation methodology. As the local transport model is not available to use at this stage of the planning process, a growth rate has been applied across the whole highway network within the study area. This is considered a robust approach and further details are set out within this Chapter.

Consultee	Comments and Considerations	How This Has Been Addressed
Dover District Council	Dover District Council (DDC) supports the Applicant's intention to submit the following supporting documents as part of the formal DCO application: Operational Traffic Management Plan; Travel Plan; Public Transport Access Strategy; and Pedestrian, Cycle and Equestrian Access Strategy. The District Council is keen to engage with the Applicant as the preparation of these documents advances to ensure the provision of necessary infrastructure to accommodate visitors and staff, as well as sustainable links to the development site for residents in the Dover District.	At this stage, no further discussion has taken place with DDC. Further comments have been received on the January 2018 PEIR consultation. We note DDCs support of the documents being prepared to support the DCO application. Sustainable links to the site from the Dover District will predominantly be via rail with a proposed shuttle bus to the site. Details of this are set out in SAS, provided to support the DCO.
Kent County Council	Resilient and reliable surface access on the strategic road network will be essential for freight traffic using Manston Airport. With the anticipated increase in traffic through growth at the Port of Dover and the future demand once the Lower Thames Crossing is constructed (anticipated to be 2026), a series of wider network improvements are needed. The location of Manston gives it direct free-flow access between the M2 and the A299, but the M2 has limited capacity being only two lanes in each direction from the A299 to M2 Junction 4.	The capacity impacts on the A2 and M2 as well as other key parts of the strategic highways (A2) network are set out in the TA. Environmental impacts at three of the strategic highways network links are set out in this Chapter.
Kent County Council	Kent Highways and Transportation has not been invited by RiverOak to engage in any discussions relating to this proposal. Therefore, the County Council has not had an opportunity to discuss the relationship with an emerging Thanet Transport Strategy. KCC, as Local Highway Authority, would welcome the opportunity to discuss how these proposals could more appropriately reflect or respond to this emerging strategy in due course.	Meetings and on-going consultation has been undertaken with the KCC highways team, which has informed the study area and scope and methodology for assessment. Meetings were held on 11 September 2017 and 4 December 2017. Various responses to consultation periods and ad hoc phone conversations and email correspondence have also helped inform the development of the TA and related documents.
Kent County Council	The consultation documents suggest a significant expansion in aviation and other associated operations to those previously present on the site in its former aviation capacity. This in turn would generate a significant increased traffic demand on the surrounding highway network. Therefore, the reopening and redevelopment of this site should also be complemented by appropriate highway links. These are currently limited in the locality, particularly to the north east. Given the scale and location of the proposal, an agreed solution to delivery of key strategic improvements in the area will be essential to accommodate increased traffic activity and ensuring that highway safety and amenity is managed in future years.	Key improvements are set out in the masterplan, provided as part of the DCO application. This includes the improvements to the key links and junctions adjacent to the airport. Not included in the master plan are off-site junction and link improvements which are required. This is included within the TA.
Kent County Council	Paragraph 14.1.5 (pg. 14-1) suggests that the site has good access to the surrounding highway network. However, KCC, as Local Highway Authority, considers that access around parts of the site is not currently satisfactory and consists of local routes with constrained geometry and junctions.	Good access to the surrounding network specifically refers to an appropriate route from the site to the A299. It is understood that some of the other routes to the north and east present issues in some of the current link and junction restrictions. In this submission, a number of local and wider improvements are proposed to support the Proposed Development. Details of this are set out in the TA. It is noted, however, that widening of Spitfire Way and Manston Road from Columbus Avenue to the Airport Terminal access is a key necessary improvement that's been included.

Consultee	Comments and Considerations	How This Has Been Addressed
Kent County Council	It is suggested that all HGV access to the site would take place from the A299 (via the B2190 approaching the site to its northern boundary). The B2190 Spitfire Way beyond the Manston Business Park is subject to a lower standard (both in terms of restricted geometry and construction) and as such it is likely that this section of road would need to be improved to reflect the proposed uses on the site and the type of vehicle movements associated with it. It is also suggested that staff and passenger terminal vehicles will make use of the full extent of the highway network, which is a reasonable assumption to make as these trips have the potential to be more local in nature.	Airport routing for traffic and HGVs will be along appropriate roads and as such the proposed key route is from the A299 onto Minster Road and then Spitfire Way. It is proposed to widen Spitfire Way from Columbus Avenue to a new signalised junction with Manston Road. Manston Road will also be widened to the Main Airport Terminal access. The traffic and transport methodology does take into account local traffic routing to and from the north and east using Manston Road and Manston Court Road. The impacts of this traffic in capacity terms is set out in the TA, while the environmental impacts are set out in this Chapter.
Kent County Council	The proposed complementary business/ industrial uses on the Northern Grass will potentially generate more local based trips, thus rendering local routes such as Manston Court Road and Manston Road as an attractive route to certain destinations. Whilst limited transport information has been provided to date, without a comprehensive package of improvements to cater for trip origins and destinations to the north, the proposals in their current form could lead to the use of inappropriate minor highway routes for both walking and cycling and/ or a proliferation of trips by private car on roads which are not suitable for additional traffic loading.	The traffic flow methodology and associated figures included in the TA set out the proposed distribution, specifically of staff based trips and its impact on the peak hours and the Airport Peak hour on the local highways network and resultant mitigation required. The environmental impact on Manston Court Road and Manston Road, with particular regard to pedestrian and vehicular modes will be assessed within this Chapter.
Kent County Council	There is no specific reference to the need for corridor improvements aside from a new junction at Spitfire Way/ Manston Road, although a comprehensive transport assessment will be required by the applicant to provide more fully informed recommendations in relation to wider highway impacts and subsequent mitigation requirements. The emerging Thanet Local Plan seeks to introduce policy to secure an enhanced package of connected highway improvements/ routes, to complement the existing primary highway route corridors. This methodology also forms part of the emerging Local Transport Plan 4. It would appear that with some changes to the proposed layout, there is scope to provide a new highway route through the Northern Grass to connect to Manston Court Road, however an appropriate mechanism to facilitate an improved vehicle/ pedestrian and cycle route to Westwood should also form part of this methodology. This is currently absent from the proposals subject to the current consultation	Corridor improvements have now been proposed for the Manston Road/Spitfire Way corridor so a consistent 7.3m wide carriageway is provided. The TA sets out wider improvements for capacity and safety effects. A meeting was held on the 11 September 2017 with KCC to agree an approach for the development of the TA. Whilst it is acknowledged that the TA would normally use the KCC strategic transport model to assess the impact of the Proposed Development, this is not currently completed or available for use. It is intended that testing will be undertaken as soon as it is available, but this is likely to be post-submission of the DCO application. In the absence of the availability of the strategic transport model, a detailed traffic and transport spreadsheet model has been developed which has informed this Chapter and the TA. The methodology of the model has been consulted on with KCC and comments taken onboard.
Kent County Council	Paragraph 14.1.7 (pg. 14-2) indicates that some 4,300 staff could be employed at the airport (with up to 1,500 being present on site at any one time). This represents the potential for a considerable number of trips for staff alone although no modal split figures are provided. This section also suggests that a high proportion of passengers will travel to the site by private vehicle, either by parked car or drop off, although at this stage it is unclear where these figures are derived from. Rail travel is not listed as one of the possible modes of travel, however there is potential to promote further modal shift in view of the proposed delivery of the	Revised staff numbers split across specific jobs and sites are provided within the TA, specifically within the traffic generation methodology section**.** This includes for modal split targets. This identifies the number of staff who may wish to access the site via rail (and then a local bus service). The TA also sets out a detailed breakdown modal split for staff trips.

Consultee	Comments and Considerations	How This Has Been Addressed
	Thanet Parkway Railway Station (with appropriate bus shuttle services to complement it). It is considered that Thanet Parkway would significantly enhance the sustainability credentials of the site.	At this stage, Thanet Parkway station is not a committed scheme locally and not within current local transport policy. As such, it has not been included in rail calculations. This could be considered a robust worst-case approach focusing all rail trips to Ramsgate station and vehicular trips.
Kent County Council	Chapter 9 of the 2017 Consultation Overview Report makes reference to sections of the highway that could be adversely affected by the Proposed Development. The list is extremely limited and refers only to the roads immediately surrounding the site. Local impacts on Manston Court Road, Manston Road, the A299 and parts of the A256 are notably absent from this initial list with some of these links being missing from the screening assessment data tables. The nature of the uses intended on the site could have a material impact on the primary road network, which in turn feeds into the strategic road network falling under the jurisdiction of Highways England. It is anticipated that the scope of junctions and links that will need to be assessed will increase as further transport assessment work is undertaken.	The study area has been broadened following consultation with KCC and includes junctions and links in Ramsgate, Birchington and Margate. The assessment now also includes locations along the strategic road network as agreed with HE.
Kent County Council	Taken at face value, at this stage, it would appear that the proposed uses on the site would make this site a destination for many new and existing residents for work based trips. Therefore, it is essential that appropriate links (vehicular and non-vehicular) to the wider highway network are provided to reflect this anticipated demand. Until such time that further transport modelling/ assessment work has been submitted by the applicant, it would be difficult at this stage to identify the extent of any impact and the subsequent mitigation package that might be necessary.	A series of highways improvements related to access and improvements to the local highways network are proposed as part of the DCO submission within the TA. These junctions and improvements are focused on the ability to deliver the development at peak operating capacity in Year 20.
Kent County Council	It is essential that any further transport assessment work is fully scoped with Kent Highways and Transportation at an early stage to avoid potential delays later in the Development Consent Order process.	Meetings and on-going communication has been undertaken with the KCC Highways team to establish a wider study area and agree/confirm other matters, the specifics of which are detailed within **Tables 14.3** to **14.6**. It is considered that further consultation and work with KCC will be required to undertake a second set of junction modelling post DCO submission with the local strategic transport model.
Cliffsend Parish Council	Must ensure any traffic does not use Canterbury Road West.	The only traffic that would use this route would be the fuel tankers travelling to the fuel farm, as was the case when the airport was last operational. No traffic is proposed to continue past this point into the village of Cliffsend.
Spitfire and Hurricane museum	Social: improve public transport options (bus etc.)	A SAS for the Proposed Development has been submitted in support of the DCO application, as well as a Travel Plan. These documents set out in detail the anticipated future year improvements to public transport to and from the airport but also the local area improvements that may result.
St Johns College Cambridge	Thanet and Kent Councils are proposing a new strategic route within the Local Plan which will serve the Proposed Developments within the Local Plan. It is important that the	Corridor improvements have now been proposed for the Manston Road/Spitfire Way.

Consultee	Comments and Considerations	How This Has Been Addressed
	EIA which accompanies the DCO application is required to include this completed road network as one of its scenarios. The Proposed Development which is subject to this DCO application will need to proportionately and fairly contribute towards the proposed road network in the Thanet Local Plan.	The TA prepared to support the DCO application has set out wider improvements for capacity and safety effects. A meeting was held on the 11 September 2017 with KCC to agree an approach for the development of the TA. Whilst it is acknowledged that the TA would normally use the KCC strategic transport model to assess the impact of the Proposed Development, this is not currently completed or available for use. It is intended that testing will be undertaken as soon as it is available, but this is likely to be post-submission of the DCO application. In the absence of the availability of the strategic transport model, a detailed traffic and transport spreadsheet model has been developed which has informed this Chapter and the TA. The methodology of the model has been consulted on with KCC and comments taken onboard.
Thanet Green Party	The very substantial increase in road traffic that would arise from a freight hub would aggravate both the noise and air pollution problems caused by the planes themselves. We understand that aviation fuel would have to be delivered by road as Manston is not part of the national fuel pipeline system that connects large UK airports. The need to transport such fuel and store it safely in the immediate neighbourhood of the former airport gives rise to concerns in itself, and the number of vehicle movements required would add to both noise and particulate pollution. They would also increase volumes of heavy traffic on roads not suitable for them, leading to congestion, delays and a vicious circle of further pollution.	Noise and Air quality issues will be addressed in **Chapter 6: Air Quality** and **Chapter 12: Noise and Vibration**. The proposals for fuel are as they were when the previous aviation operations were in place at the site, with tankers routing along the A299 and then a short distance along Canterbury Road West into the existing fuel farm. The majority of tanker journeys would therefore be along the strategic road network and then the A299 and only a short distance on local roads. Estimates of the HGV trips per hour to and from the fuel farm are provided in the TA. This indicates only a peak of 2 tanker movements (one in and one out) per hour.

Table 14.6 Consultation with KCC – Comments on Transport Scoping Note

KCC Comments and Considerations	How This Has Been Addressed
It is noted that 2446 parking spaces are proposed. It will be necessary for this level of parking to be justified through the final Transport Assessment.	A revised masterplan design has been provided as part of this submission with updated car parking numbers for staff and passengers. With the final design established, the TA will set out in detail the justification for all car parking spaces, the split between passenger and staff parking, the split between long stay and short stay parking, details on how the car park will operate and any other car parking matters. Details regarding car parking will also be included in the SAS for the Airport.
It is stated that it is likely that the vast majority of flights would occur between 07:00 and 23:00 hours, however the anticipated traffic flow figures appear to suggest an even split if movements across the whole 24-hour day. Further justification will be required to substantiate this approach.	A revised and detailed traffic generation methodology for the Airport has been provided in the TA. This considers a detailed breakdown of flights across the day and the times vehicles may route to and from the Airport.
Flights destined for later departure times may result in some passengers arriving prior to booking in time,	A detailed breakdown of the times of arrivals and departures has now been made in the revised traffic generation methodology.

KCC Comments and Considerations	How This Has Been Addressed
which in turn could coincide with road network peaks. Allowance for such occurrences should be made in peak hour trip generation figures.	It has been proposed that: • 20% of all passengers would arrive 2 hours before a flight; • 80% of passengers would arrive 3 hours before a flight; and • All passengers would depart the airport 1 hour after an arrival flight has landed. These figures are based on average travel patterns at comparable airports in the UK.
A proportionally low level of passenger numbers has been estimated within the highway network peak hours. Future operators are at this time undefined and the flight patterns unknown. Therefore, in order for an appropriately robust assessment to be provided, the maximum number of flights capable of being handled by the facility within the peak hour should be considered for robust assessment purposes.	The revised traffic flow methodology is based on a flight schedule developed via considering arrivals and departures to similar sized or natured airports (obtained from Civil Aviation Data for October 2017). This has now provided a flight schedule on which the traffic generation of passengers can be based on. This is set out in the TA. It should be noted that due to the nature of flights arriving and departing, the peak traffic generation falls in the mid afternoon and not within the traditional highways network peak hours.
Passenger travel model assumptions are noted, but the submission lacks further clarification in relation to the data sources that have been used to inform such forecasts. Given the location of the site, staff and passenger travel plans may have limited scope for success. At this point in time there is no basis on which to assess the likely feasibility/likelihood of achieving the stated modal shift across the 20-year period. Rail is a feasible travel alternative for staff and passengers in the medium term, however this would rely on regular shuttle bus services being provided to link the airport to the station.	Details of the mode share targets and the justification for these will be provided within the SAS for the airport which supports the DCO application. The figures have recently been revised based on details from aviation and airport experts consulting on this DCO application.
There is a significant amount of staff strips associated with the aviation uses, which in turn could generate a material impact on the road network. It is essential that this element of the assessment is undertaken using robust estimates. On initial inspection, it is unrealistic to assume that all staff movements would occur outside of the network peak hours and that staff will all follow the same shift patterns. It would be very difficult to monitor or ensure future compliance with such a regime and in turn this could potentially underestimate the peak hour impact of staff movements.	A revised traffic generation methodology has been prepared, which set out in detail the types of jobs related to the aviation uses. It breaks these down by shift patterns, shift times, staff numbers and likely modal split targets. This information has been tested to provide a robust estimate of how staff trips would actually impact the local highway network and the times these would impact the network. This robust assessment now takes into account some staff trips occurring in the peak hour based on a better understanding of 24-hour shift pattern working (unlikely to affect peak hour) and traditional working day work patterns (likely to affect traditional highways network peak hours).
The mix of uses on the Northern Grass is assumed to be 10% office, 40% light industrial and 50% warehousing. As these uses have significantly different trip profiles, it is important that they are defined in the final TA and application documentation, so that they can be conditioned as such. If unconditional consent is sought for any combination of potential uses, then the worst-case scenario in terms of peak hour traffic generation would need to be assessed, in this case B1 office. The location filters appear to be generally acceptable, however it is noted that suburban areas are included in the business park analysis, which should be removed as the site is not in a suburban location. Population filters have not been applied, which could have a bearing on final trip rate outputs. I suggest that TRICS outputs are recalculated considering local	The figures used for the split of land uses on the 'Northern Grass' area have changed significantly and are now as follows: • 25% B1 (Office); and • 75% B8 (Warehousing). The zonal masterplan for the 'Northern Grass' area has defined this split and the total GFA of the development in this area. Compared to the previous estimates for the land use on the 'Northern Grass' area this is a more robust traffic scenario with B1 office development having been increased from 8% to 25%. The TRICS rates have not been changed in line with the comment due to the lack of comparable sites within the defined restrictions suggested which would lead to a less robust assessment than that which has been calculated.

KCC Comments and Considerations	How This Has Been Addressed
demographics and as such the trip rates shown in **Table 3.5** are not agreed at this stage.	
The [construction] Traffic figures are noted; however, the final TA should outline how the impact of these movements will be managed. This could be dealt with through an associated Construction Management Plan.	A PCTMP is provided as part of the final DCO submission, which will set out the mitigation required to facilitate the construction of the site.
The peak traffic flow scenario for both development and network traffic need to be examined, with the scenario for both development and network traffic need to be examined, with the scenario generating the highest overall flows through a given junction being assessed/ modelled in more detail. The figures presented in **Table 3.8** and **3.9** will need to be revised to encompass the comments outlined within this correspondence.	This has been undertaken in the TA provided, to support the DCO application. In this Chapter, the network peaks and 24-hour period have been used as basis for assessment as is standard in environmental assessments of traffic impact. However, within the TA all junctions and links that form part of the study area will be assessed for the AM and PM peaks, as well as the development peak which falls between 13:00 – 14:00.
The scope of junction to be assessed within the TA should be based on the local traffic conditions. It is noted that a blanket 50 vehicle per hour threshold for further assessment is proposed. Junctions that are severely congested could be disproportionally impacted by traffic increases, lower than 50 vehicles per hour. I recommend that existing flows on each link are examined and any links which are subject to a 5% increase or greater are examined/assessed in more detail.	Of the junctions selected to form the scope of assessment, these will be assessed to understand capacity impacts should there be any increase above 1 vehicle to complete a robust set of assessments.
The transport assessment is not based on the KCC **strategic transport model which KCC suggests was available to the Applicant.**	A further call was held with KCC Highways on 31 May 2018 in order to establish the status of KCC's Strategic Transport Model (STM) and to understand whether and how Thanet's emerging local plan was included within it. It was also the intention to understand whether KCC had any concerns regarding the Wood model developed for the Manston Airport proposals in the absence of an STM and if so what those concerns might be. At the time of this meeting KCC were unable to confirm whether the STM was available or whether a validation report for the model had been prepared. KCC were not prepared or able to provide details regarding any perceived limitations of the model created by Wood however they continued to suggest that their preference would be that all developments should be modelled using the STM.

14.4.28 KCC also responded to the January 2018 Section 42 consultation (PEIR) documentation and these responses are detailed in **Table 14.7**.

Table 14.7 KCC Response to January 2018 PEIR

KCC Comments and Considerations	How This Has Been Addressed
At this point in time, the freight cargo tonnage figures used to inform this traffic generation calculations are taken at face value, as they have simply been provided by the client team. As these figures are used to form the basis of traffic impact estimates, it is important that there is a restriction imposed on the level of freight	The figures used to build the first principles traffic and transport model are based on estimates provided by the aviation experts imbedded within the project team alongside experience at other airports. In terms of restrictions, there are no restrictions proposed as part of the traffic and transportation traffic generation assessments. These have been based on the aviation expert's predictions of freight tonnages.

KCC Comments and Considerations	How This Has Been Addressed
that the airport would be permitted to handle. In the absence of such a restriction, it is essential that the maximum freight handling capacity is robustly identified and justified, as this could have a material bearing on subsequent peak hour freight traffic figures.	
A 30% reduction in cargo tonnage has been applied to allow for efficient HGV movements (i.e. those that enter and leave the site full). However, it is unclear where this figure has been derived from. It is essential that any reductions are fully justified using an appropriate evidence base. There is an assumption that the cargo movements will take place evenly across a 24-hour day, however in reality, there are likely to be peaks and troughs throughout the day. Whilst it is understandable that for ease of assessment, a simplistic view has been taken, for a robust assessment to be undertaken, it would be necessary to look at a worst-case scenario. A worst-case scenario would be the maximum amount of freight that could be theoretically handled at the airport within any given hour applied to the network peak, for assessment purposes.	The figures used to build the first principles traffic and transport model (including the 30% reduction in cargo tonnage for efficient HGV movements) are based on estimates provided by the aviation experts imbedded within the project team alongside experience at other airports. The assumption that cargo movements take place evenly across the hour is based on how these sites traditionally operate. It is acknowledged that a worst-case of the maximum HGVs leaving in an hour could have been undertaken, but considering the low numbers of freight HGVs entering and exiting the network in an hour (in Year 20, 5 arrivals and 5 departures per hour) it is deemed that this would not be a material impact.
A similar methodology should also be applied to proposed passenger flights. Whilst an attempt to estimate likely passenger numbers has been provided, a number of assumptions have been made that could have an impact on subsequent traffic generation. For a robust assessment to be undertaken, a realistic maximum passenger throughput should be estimated, and necessary restrictions placed on operations. Paragraph 3.1.22 (pg. 19) refers to aviation experts providing an estimate of passenger travel mode share, however no further information to cross reference these forecasts has been provided.	As set out in the TA, further details to the background assumptions have been made and are specifically related to a mode share. These mode share targets are based on those typical for smaller airports (less than 2 million passengers per year) and in locations similar to Manston. Airports such as Newquay, Cardiff, Exeter, Inverness and Norwich as well as others. At this stage the upper limit of flights is as is predicted in Year 20, however no restrictions on maximum daily throughout has been applied or form part of the DCO application.
The methodology of using TRICS to inform Northern Grass area trip rates is largely accepted, however as outlined within the recent Transport Assessment (TA) scoping exercise, this is based on the understanding that land uses in this area of the site are restricted to the proportions as outlined within the assessment document.	The land use mix and site area GFA have been fixed in the masterplan and this matches what has been assessed in the TA. If the DCO is granted this is the mix of land uses and GFA that could be constructed.
Fuel tanker trips are noted, however it is necessary to provide further justification in relation to the number of deliveries required to service the site in a worst-case scenario. For example, the capacity of each tanker and how much fuel is required for each plane (as identified earlier within the report based on tank capacity). This should then correlate with the number of planes estimated, with an allowance made for operational fuel requirements for on-site vehicles and equipment.	Further details of the development of fuel farm tanker trips are set out in the TA. Based on the capacity of the tankers that are to be used, the fuel required per year has been broken down to understand the fuel requirements per day. It should also be noted that tankers are not required on a one tanker vs one aircraft ratio; tankers are required as and when to keep the reserves topped up to a certain level at the fuel farm.
As outlined in the TA scoping exercise, it is unrealistic to assume that all staff movements will occur outside of the network peak hours and that staff will all follow the same shift patterns. It would be very difficult to monitor or ensure future compliance with such a regime and in turn, this could potentially	Staff members will likely have differing shift patterns, arrival times and departure times depending on the job that is being undertaken. The traffic generation methodology is set out in this TA. It is a key issue to note that airports do not have traditional 9-5 business working hours and as such the majority of staff strips do not have an impact on the peak hours. 24-hour shift patterns and the differing requirements of an airport and cargo

KCC Comments and Considerations	How This Has Been Addressed
underestimate the actual peak hour impact of staff movements.	handling facility across the day mean that staff have a wide range of travel times. There are, however, trips that affect the network peak associated with the airport for the operational and administration jobs proposed at the site.
The document states that a gravity model approach has been used to identify the origins and destinations and subsequent routes, and this has been informed by information provided by the wider project team. Further information to substantiate the assumptions made on origins and destinations would be helpful to support the final TA document. It is noted that a gravity model approach has also been used to derive origin and destination information for the Northern Grass uses. It would be more appropriate to use census data to provide an improved local perspective on likely trip distribution, and this could be derived by interrogating the data for local output areas that encompass other key employment areas within the Thanet District to provide a more robust basis for assessment.	The gravity models that have been prepared are based on the journey to work census data from 2011 for Thanet and where required further afield. Details of this methodology are set out in this TA.
The provision for a new highway link between A256 Haine Road and the B2050 Manston Road, as outlined in the emerging Thanet Transport Strategy, is absent from the proposed masterplan. The indicative layout also appears to compromise the delivery of an appropriate form of link road in the future. Failure to comply with this emerging infrastructure requirement could prejudice the delivery of identified highway solutions to manage the impact of future housing growth requirements over the emerging Local Plan period (subject to further highway modelling outputs).	An assessment of the proposals on Manston Road/Haine Road proposals have been included in the TA. However, with the issues related to the emerging local plan it is considered, that by assessing the existing layout and the proposed new roundabout with arm onto a link road, a robust assessment of the issues at this junction has been undertaken. It should be noted however, that this assessment was only included as of February 2018 when the scheme was granted over £2.5 million of government funding and as such it is considered more likely to come forward than other proposals in the emerging local plan.
In addition, there are initial concerns in relation to the absence of provision for a new highway route to and from Westwood (including appropriate walking and cycling links). The proposed development has the potential to encourage inappropriate use of rural roads within the proximity of the site by both vehicles and non-motorised users. It is evident that limited pedestrian facilities or improvements are proposed outside of the immediate site confines, which further limits the accessibility of the site by non-motorised transport. The impact of the development within Manston Village remains a concern due to the restricted road geometry throughout the village, as well as the ability of the local road network to serve the site efficiently and reliably by public transport.	The TA sets out the proposed impacts of development traffic on the rural roads to the north of the proposed development site and the environmental impacts of this are set out in this Chapter. At this stage no improvements are proposed to these routes. The TA also includes for details on the impacts on Manston Village and there are details within this Chapter as to why proposals are not proposed on this link.
The previously indicated roundabout solution at the Spitfire Way has been replaced by a signalised junction arrangement. An initial appraisal would suggest that this is not an optimal form of junction and is potentially out of keeping with the nature of the approach roads to the site. There are initial concerns over the approach geometry to the junction and future capacity for increased traffic flow in line with planned growth. In the absence of strategic highway modelling and detailed junction appraisal, it would not be possible to confirm if this junction would be supported as an appropriate solution.	The detailed traffic and transport modelling of this junction sets out the need for a junction improvement and determines that a signalisation scheme is a suitable solution. It should be noted as a result of the development proposals the "*nature of the roads around the northern airport boundary will change as a new roundabout, and three sets of signalised junctions are proposed along the access from the A299 as well as the widening of Spitfire Way and Manston Road*". The detailed geometric designs (to relevant DRMB standards) and associated transport models are included within this TA. If further discussion on the final layout is required, then this could be included in post submission discussions with KCC as part of agreeing a statement of common ground.

KCC Comments and Considerations	How This Has Been Addressed
	It is hoped further discussion will allow KCC and the project team to come to a junction layout that is supported.
There is a proposed priority junction on B2050 Manston Road between the two new signalised junctions, which would appear to be intended to serve the cargo facilities. It is strongly recommended that access at this junction is restricted to emergency access to manage traffic flow at the Spitfire Junction and traffic flow on the B2050. The proposed junction onto Manston Road (to the west of the Northern Grass) could potentially encourage HGV rat running along this section of highway.	There is no proposal for a priority junction onto Manston Road from the south between Spitfire Way and the Airport Access. This was something shown on a previous masterplan which has led to confusion that has now been amended. It's not clear what vehicles on what routes could potentially rat run though the 'Northern Grass' area, since there are very few HGVs using Manston Road to the North.
A full Stage 1 Road Safety Audit and associated designer's response will be required for all proposed highway changes. In view of the above, at this moment in time it would not be possible to provide a definitive steer on the acceptability of the proposed highway alterations.	This has not been included at this stage of the DCO submission, but as with all highways improvements will be provided at the appropriate time.
It is important to reiterate that due to its existing constrained geometry, the B2190 Spitfire Way (between Columbus Avenue and the proposed site access) is not suited to accommodate a significant increase in HGV movements. This section of highway should be improved to reflect the likely change in HGV demand from expanded aviation activity and associated development on the Northern Grass (both in terms of geometry and construction specification where appropriate). No improvements to the B2190 are indicated on the Masterplan document although Section 14.2.12 of the PEIR (pg. 14-2) refers to potential improvements on Spitfire Way/Manston Road, but with limited clarity on the extent of such proposals. Failure to appropriately improve these important highway links could have an impact on the ability of the local road network to serve the proposed development and could prejudice a future aviation operation.	The final masterplan proposals are to widen Spitfire Way from Columbus Avenue to Spitfire Way and also Manston Road from Spitfire Way to the Airport Access. This route is identified as the key HGV route to the site and as such it is agreed that the route needs to be widened to a 7.3m wide carriageway for the entirety of the length. The details of these improvements schemes are set out in detail in the TA.
The increase in on-site parking provision is noted. The ability of the main site access junction onto the B2050 Manston Road to accommodate the potential increase in demand will need to be examined within the detailed TA.	Detailed traffic assessments of the site access junction are included within the TA.
The ability for traffic (particularly HGVs and abnormal loads) to enter and leave the site in a forward gear should be demonstrated in the final submission. Any existing informal access points onto the public highway that are planned to remain in use will also need to be clarified along with their anticipated uses.	Details on the proposed accesses (formal) and any informal accesses are set out within the DCO submission documentation. For clarity, however, the TA sets out the issues with the operational accesses into and out of the proposed site. All of the accesses have been designed as formal DRMB compliant access junctions which would not present any issues for vehicles to leave in a forward gear. Informal accesses primarily refer to crash gates which are simply not used unless there is an airport emergency. This is the only time any informal access will be allowed onto the site.

14.4.29 Discussions were held with KCC during preparation of the ES and these responses are detailed in **Table 14.8**.

Table 14.8 Discussion with KCC during preparation of the ES

Date	Discussion Points
June 2016	The first time KCC was directly consulted on the transport assessment of the application was in June 2016 when the EIA scoping report for the project was prepared. A formal response was received from KCC setting out the need for traffic and transport assessment (comments shown in **Table 14.3**) in a letter to PINS sent on the 28th of July 2016 and included in the Scoping Opinion report published on the 10th of August 2016.
Late 2016/ Early 2017	Initial telephone discussions with KCC took place in late 2016/early 2017, during which KCC informed Wood that in partnership with TDC, it was developing the Thanet STM using SATURN software for the purpose of supporting the emerging Local Plan. The existing Manston Airport site was not included in the baseline, and the Manston Airport proposals were not being tested, as these were not part of the emerging Local Plan. KCC advised that the DCO proposals would need to be assessed using the Thanet STM, as this was the expectation of all development sites in Thanet. KCC advised that the Thanet STM was not expected to be completed until late 2017. Following this, Wood began the process of undertaking detailed Transport Assessment (TA) scoping discussions with KCC and paid the pre-application fee in August 2017.
31st August 2017	A TA scoping note was sent prior to a scoping meeting with James Wraight and Sally Benge of KCC which was held on 31st August 2017, during which JW advised that the base strategic model (i.e. current year) had been completed and validated and that future test scenarios were being progressed, with completion expected in October/November 2017. Future scenarios were based on the preferred site allocations in the emerging draft Local Plan. It was noted that testing for the Local Plan evidence base would take priority and there may be issues with capacity for modellers to undertake work on behalf of developers (with agreement from KCC and TDC). The initial estimate for availability of the model was close to the end of the year (2017), particularly if TDC had further revisions to the Local Plan. At the meeting and in a subsequent email and telephone conversation, Wood requested the Local Model Validation Report (LMVR) when available (email 25th September 2017 to James Wraight). Notes of the meeting are provided in **Appendix A** to the TA. Wood advised during the meeting that in the absence of the availability of the KCC traffic model, a detailed traffic spreadsheet model based on extensive traffic count surveys of junctions and links would be used to assess the Proposed Development as part of the DCO submission which was proposed for early 2018. The spreadsheet model includes a growth factor which takes account of the household and employment growth assumptions in the now rejected draft Local Plan, and also a sensitivity test of the Thanet Transport Strategy proposals to the north of the Proposed Development comprising a number of new link roads. Wood considers this to be a robust methodology and appropriate for the purpose of the DCO submission, as spreadsheet modelling is an acceptable approach in the absence of a strategic transport model. It was agreed, however, that the Proposed Development would also be tested in the Thanet STM when it becomes available in the post DCO submission period.
21st September 2017	Formal comments on the TA scoping note were received on the 21st September (included in the TA as **Table 3.1**) and details of how these comments were addressed in the document are included.
September / October 2017	Telephone conversations were then undertaken in September and October 2017 and KCC advised that the strategic traffic model should still be used to test the traffic impact of the Proposed Development, subject to the agreement of TDC, but that it would not be available for developers to use until Spring 2018 following its completion to support the (at the time) still emerging Local Plan.
28th November 2017	On 28th November, Bev Coupe and Glyn Price had a Skype call with James Wraight, KCC, to discuss the latest position on the KCC/TDC strategic model and other transport/highways matters in relation to the forthcoming DCO submission. During the call, JW advised that the model was now complete but would not be available for use by third parties until the new year at the earliest. He suggested that other developers were putting in requests for use of the model, but that timeframes for availability would be dependent on requirements for further modelling following public consultation of the emerging local plan.
15th December 2017	A formal request to use the model was made to James Wright via email on the 15th of December 2017. This was not followed up with a specification for use of the model, as requested by KCC, as following the rejection at Committee of the draft Local Plan, it was considered by Wood that the model was not valid as it would need

Date	Discussion Points
	revising to reflect a new Local Plan. In addition, the LMVR had not been completed by KCC's traffic model consultants and therefore there was no opportunity to understand and review the model set up in terms of development, calibration and validation of the highway assignment. On the basis of the model still not being available to meet DCO submission deadlines, it was agreed with the Manston Airport DCO Project team that Wood would continue with the approach of developing a spreadsheet model. As KCC required all developers to use the Thanet STM, it was acknowledged that testing of the DCO proposal would be undertaken once the model became available for general use, still assumed to be in the post DCO submission phase.
14th May 2018	A call with James Wraight of KCC was held on 14th May 2018 during which there was discussion of the Thanet Transport Strategy and the Thanet STM. KCC advised that modelling work hadn't yet been undertaken for other developers and that new scenarios would need to be built. He advised that their traffic modelling consultant (Amey) would still be undertaking the model tests, but there is limited resource and the priority is for the work to be undertaken to support the emerging new Local Plan.
31st May 2018	A meeting with TDC and KCC was held on 31st May 2018, during which TDC advised that the new draft Local Plan is anticipated to be published on 25th June 2018, with the expectation of going to Committee on 25th July. The Thanet STM is being revised and updated and would be expected to be complete in six weeks' time. At the time of this meeting KCC was not prepared or able to provide details regarding any perceived limitations of the model created by Wood however they continued to suggest that their preference would be that all developments should be modelled using the STM. It was discussed during the meeting that the timescales between DCO submission and the Examination were sufficient to undertake the required modelling, recognising that based on the current Local Plan programme and Thanet STM completion, the model would be available for testing during this period. Wood noted that on the basis that the Thanet STM is not available for use and there is no guarantee on timescales, the spreadsheet model approach adopted for the DCO submission is considered acceptable and robust. It includes allowance for the household and employment growth anticipated in the Local Plan, and incorporates sensitivity testing of the Thanet Transport Strategy. As such, notwithstanding the continued uncertainty surrounding the local plan, the bespoke model developed for the Manston Airport submission is considered to be the best available tool for determining the application. As discussed with KCC, should the STM become available for use by third parties before or during the examination, the applicant (Riveroak) is willing to test the 'with Manston Airport' development scenario using the STM. If KCC and Thanet meet their own timetable and objectives, there remains sufficient time to undertake the modelling exercise without delaying the examination of the DCO application.

14.4.30 Discussions were held with KCC in the post DCO submission period. The discussions were based on the KCC comments in relation to the TA submission. A summary of the KCC comments is provided in **Table 14.9** below and a note on the agreements made with KCC is produced as **Appendix 14.2**.

Table 14.9 - Discussion with KCC Post DCO Submission

KCC Comments and Considerations	How this has been addressed
The Thanet District Transport Strategy and its interventions should be included in the assessment.	The TA and associated technical work has been revised based on output from the Thanet Strategic Transport Model which includes the draft Transport Strategy interventions.

KCC Comments and Considerations	How this has been addressed
The KCC SATURN strategic highway model is now being used to test the impacts of Local Plan growth and potential mitigation strategy outlined within the emerging Thanet Transport Strategy and should be used to test the development.	Modelling has been undertaken and a TA Addendum produced. The traffic flow output has been used in this ES chapter.
A full, independent Stage 1 Road Safety Audit is required for all material highway alterations and new site access junctions.	Stage 1 Road Safety Audits of access junctions have been undertaken and will be undertaken for the off-site mitigation proposals. The onsite junction assessment is included within the Addendum TA.
The Thanet Parkway Station project remains a material consideration for this proposal.	This is considered in the TA Addendum.
KCC has various comments on the trip generation and distribution methodology.	RiverOak has reached agreement with KCC on the trip generation and distribution methodology and undertaken modelling using the KCC strategic model.

14.5 Overall Traffic and Transport Baseline

Current Baseline

Site Description

14.5.1 **Figure 14.1** illustrates the site location in relation to the local highway network, the main junctions and railway stations in the vicinity of the site. The following section provides descriptions of the junctions and highway network.

Existing Highways Network

14.5.2 The highway network surrounding the site is shown in **Figure 14.4,** which indicates the anticipated routes to and from the site based on the traffic flow distribution methodology set out in the TA.

14.5.3 The following section describes the key local roads that form part of the study area.

Roads Forming Part of the Key Access to the Site

14.5.4 It is anticipated that the main signed access route to the site will be from the A299 and then onto Minster Road and along Spitfire Way. From Spitfire Way traffic routes north onto Manston Road for the 'Northern Grass' area western access and east on Manston Road to the Passenger Terminal and the 'Northern Grass' area.

14.5.5 It should also be noted that Canterbury Road West provides access to the fuel farm directly from the A299.

B2050 Manston Road

14.5.6 Manston Road is a single carriageway road that runs between Birchington-on-Sea (to the north-west of the site) and Ramsgate (to the east of the site). This road forms the northern boundary to the site for a short distance and is a key link providing access to various elements of the Proposed

Development. The access to the Passenger Terminal and to the 'Northern Grass' area will be from Manston Road. The road intersects with Spitfire Way to the west and the A256 (Haine Road) to the east.

B2190 Spitfire Way

14.5.7 Spitfire Way is a single carriageway road that runs between Minster Road and Manston Road. This road forms the northern boundary to the site for a short distance and is a key link providing access to the various elements of the Proposed Development. Access to the Cargo Facility will be from Spitfire Way.

A299

14.5.8 The A299 is a key strategic road which runs between the M2 / A2 / A299 junction near Faversham to the access to the Port of Ramsgate. The road is a high standard dual carriageway. The A299 forms the southern boundary to the site for a short distance. The A299 is a key link for the development as a large percentage of arrival and departure trips will use this road to local and strategic destinations.

B2190 Minster Road

14.5.9 Minster Road is a short section of road which runs between the A299 and Spitfire Way and forms the western boundary of the site. The road is initially a dual carriageway and transitions into a single carriageway as it becomes Spitfire Way. This forms part of the main link into the Proposed Development site from the A299.

Canterbury Road West

14.5.10 Canterbury Road West runs between the A299 and the A256 Lord of the Manor roundabout. The short road link has two characteristics. The first section runs from the A299 to the fuel farm access and forms the southern boundary to the site. East of fuel farm access, the road runs through a village setting. It is not proposed that traffic would use the eastern element of the road and only tankers and some small private vehicles would access the fuel farm from the west (A299).

Other A Roads Affected by Proposed Development Traffic

A256

14.5.11 The A256 runs between a junction with the A2 near Dover to a junction with the A255 in Margate. The road forms part of a key route for traffic routing between the site and Ramsgate, Dover, Sandwich, Margate and Broadstairs, as well as a key route for HGVs to Dover. The road varies in standard from elements of a dual carriageway (south towards Dover) to running through constrained residential areas in Margate.

A254

14.5.12 The A254 runs between Margate and Ramsgate town centres and has a small section of dual carriageway, but is predominantly a single carriageway. This road is affected by trips to and from the residential areas between Margate and Ramsgate, such as Haine and Newington.

A255

14.5.13 The A255 runs between Margate town centre and Broadstairs and is a single carriageway. This road is affected by development traffic routing to and from Broadstairs and south Margate.

A28 Canterbury Road

14.5.14 The A28 runs between Canterbury and Margate and is a key link in the area for east/west traffic. The road has some elements of dual carriageway but is predominantly a single carriageway. Separate elements of this road are proposed to be affected by development traffic. South of the junction with the A299, traffic to and from Canterbury and other areas of Mid Kent will use the road. Further, in the area surrounding Birchington-on-Sea, it is likely that development traffic will also use the road.

M2

14.5.15 The M2 is part of the HE Strategic Road Network (SRN) and runs between the junction of the A299 / A2 in the east, to where it merges into the A2 near Strood. The road is a motorway classification road with various lane configurations between two and four running lanes in both directions. The motorway has 7 junctions and is 41.4km long. It is proposed this is the major route between the airport and London, and between the airport and the surrounding region, as well as any other national destinations.

A2

14.5.16 The A2 is part of the HE SRN and runs from London to Dover. It is the primary route for this journey other than in Mid Kent where the M2 is the most direct route (the A2 runs through a number of the Medway towns). The road has various lane configurations between two and three running lanes in both directions. It is proposed this is the major traffic route between the airport and London, the airport and the surrounding region, as well as any other national destinations.

A20

14.5.17 The A20 is part of the HE SRN and runs from London to Dover. The road has various lane configurations between two and three running lanes in both directions. Relative to the Proposed Development, the element of the A20 that is being analysed is that between Dover and Folkestone. This is to understand the impacts on any traffic travelling to and from Folkestone.

Other Local Roads Affected by the Development Traffic

Manston Court Road

14.5.18 Manston Court Road runs between Manston Road and Star Lane. This is a single carriageway road which is width restricted in some locations. This road provides access from the Manston Road corridor running through the site area to Margate.

B2050 Park Lane

14.5.19 Park Lane is a single carriageway road which runs between Acol Hill / Manston Road /the A28 junction in Birchington-on-Sea. This road provides access from the site towards Birchington-on-Sea and areas in the A28 corridor.

Shottendane Road

14.5.20 Shottendane Road is a single carriageway road, which routes south-east/north-west between Manston Road in the south-east, to a priority junction with Manston Road in the north-west. This road will accommodate some trips from the Proposed Development routing to and from the Westgate-on-Sea.

B2014 Newington Road

14.5.21 Newington Road is a single carriageway road which runs between the A255 in Ramsgate to a junction with the A254 in Northwood. The road routes through urban areas and is subject to a 30mph speed limit.

Existing Baseline Traffic Flows

14.5.22 As set out in Section 14.4, traffic counts were undertaken in March 2017 and October 2017, following which the data collected was analysed and entered onto a traffic flow network diagram of the local highways network. **Figures 14.5** to **14.7** set out the traffic flow network diagram and the 2017 baseline traffic flows for the AM, PM and 24-hour period.

14.5.23 Issues were recorded with the traffic counts undertaken in March 2017 due to congestion in the peak periods. This resulted in double counting of HGVs in some locations. To address the issues at these locations, a comparison has been made to the adjacent junction turning counts to establish a valid flow based on the figures recorded in the junction turning count videos that Wood have been provided. This issue did not affect the October 2017 ATC.

14.5.24 A second limitation regarding the data is that not all receptor locations selected matched the locations where ATC were undertaken. For these locations, the nearest junction turning counts have been used to inform the traffic flows at the receptor. Data for turning counts was only for 12-hours, so a local factor has been applied based on the split between 12 and 24-hour flows at an adjacent ATC point. It is not considered that these slight limitations in the data collection process undermine the validity of the final baseline data set as the solutions offer a robust way of providing information where it is missing.

14.5.25 Data for the SRN is only available as 24-hour AADT flows as, standard with the online traffic data provided by the DfT.

14.5.26 The 2017 two-way traffic flows are set out in **Table 14.10**.

Table 14.10 Two Way Average AM Peak, PM Peak and 24-hour Traffic Flows (All Vehicles and HGVs) - 2017

Road	AM Peak All Vehicles	AM Peak HGV	AM Peak % HGV	PM Peak All Vehicles	PM Peak HGV	PM Peak % HGV	24 Hour All Vehicles	24 Hour HGV	24 Hour % HGV
A256 north of Sandwich	2782	173	6%	2660	82	3%	28006	3546	13%

Canterbury Road West between A299 and Cliff View Road	320	10	3%	475	9	2%	4795	389	8%

Existing Accident Record

14.5.27 This section reviews the PIA data that has been obtained from KCC for the most recent six-year period, up to and including June 2017. A six-year period was selected to ensure that a thorough understanding of the existing accident record was gained. The area covered in the PIA analysis is illustrated in **Figure 14.2**, along with the accident locations and severity, whilst the full accident report is presented in **Appendix 14.1.**

14.5.28 The PIA data indicates that there were 708 accidents recorded within the wider study area over the six-year period, of which 246 were on junctions/roads analysed below. Of those analysed, 209 were classified as slight in severity, 28 were classified as serious and five were classed as fatal. The accidents have been split into junctions and key links in order to present the data geographically. **Table 14.11** and **Table 14.12** summarise the number of accidents and the severity over the assessment period. These tables have been split between accidents occurring within 100m of the centre point of a junction and on links between junctions.

14.5.29 Consideration has been given to the PIA data when identifying sensitive locations, roads and with regards to mitigation identification.

Table 14.11 Summary of Accident Record 2011-2016 (Junctions)

Junctions	Total	Fatal	Serious	Slight
A299 / A28	12	1	0	11
A253 / A299 / Willetts Hill	15	0	2	13
A299 / B2190	10	1	0	9
B2050 / Manston Road / Spitfire Way	8	0	1	7
A299 / Canterbury Road W	12	0	2	10
A256 / A299	9	0	1	8
Cottington Link Road / Cottington Road	5	0	0	5
A256 / Sandwich Road	6	0	1	5
Canterbury Road E / Sandwich Road / Hengist Way	7	0	0	7
Haine Road / Canterbury Road W	1	0	0	1
A256 / Manston Road	7	0	0	7
A256 / Spratling Lane	3	0	1	2
New Haine Road / Marlowe Way	1	0	0	1
Haine Road / New Haine Road	4	0	0	4
Haine Road / Star Lane Link	2	0	0	2
A254 / B2052	5	0	0	5
B2050 / Acol Hill / Park Lane	4	0	0	4
B2190 / Minster Road	1	0	1	0
A256 / Margate Road	7	0	0	7
B2050 / Shottendane Road / Margate Hill	7	0	0	7
B2050 / Manston Court Road	5	0	1	4

Table 14.12 Summary of Accident Record 2011-2016 (Links)

Links	Total	Fatal	Serious	Slight
A299 between A253 and A28	1			1
A299 between B2190 and A253	3	0	0	3
A299 Hengist Way between Canterbury Road W and Minster Road	6	0	3	3
Canterbury Road W between Haine Road and the Cliffsend Roundabout	7	0	1	6

Links	Total	Fatal	Serious	Slight
Hengist Way between Richborough Way and Sandwich Road	7	1	1	5
A256 between Sandwich Road and Cottington Road	7	1	2	4
Haine Road between Canterbury Road W and Manston Road	5	0	1	4
Haine Road between Spratling Road and Spratling Street	3	0	0	3
A256 between Star Lane Link Margate Road	6	0	1	5
Manston Court Road between Manston Road and Star Lane	5	0	0	5
B2050 Manston Road between Spitfire Way and Shottendane Road	24	0	4	20
Manston Road between Manston Court Road and A256	9	0	0	9
Manston Road between Spitfire Way and Manston Court Road	2	0	0	2
Manston Road between Spitfire Way and Shottendane Road	6	0	1	5
Spitfire Way between Minster Road and Manston Road	15	1	2	12
Minster Road and The St between B2190 and Acol Hill	8	0	1	7
B2190 between A299 and Minister Road	1	0	1	0

14.5.30 In addition to the wider overview set out above, it was considered that a detailed analysis of the key junctions on the local road network likely to experience the largest change in traffic flows would also be appropriate. For further information and detail on this element, refer to the TA. The roads (and junctions) considered for further assessment were:

- Spitfire Way / Columbus Avenue;
- Spitfire Way / Alland Grange Lane;
- Spitfire Way / Manston Road;
- Manston Road / Manston Court Road;
- Manston Road / Haine Road Roundabout;
- Manston Road / Vincent Road;
- Manston Road / Fleet Road;
- Spitfire Way / Minster Road Roundabout;
- Minster Road / A299 / Tothill Street Roundabout; and

- A299 / Canterbury Road West Roundabout.

14.5.31 The analysis undertaken in the TA outlines that there are inherent accident issues at the locations listed below. It also includes a description of the proposed mitigation:

- Spitfire Way / Alland Grange Lane – visibility issues from minor arm;
  - Mitigation proposed - improving visibility (vegetation clearance) from the Alland Grange Lane arm of the junction as well as formalisation of the kerb line on Alland Grange Road;
- Spitfire Way / Manston Road – issues with accidents related to staggered priority junction;
  - Mitigation proposed – in relation to increase in traffic and capacity constraints as well as accident issues at the junction a new formal signalised junction with appropriate pedestrian crossings is proposed; and
- Manston Road / Manston Court Road – issues with visibility from minor arm;
  - Mitigation proposed – in relation to increase in traffic and capacity constraints as well as accident issues at the junction a new formal signalised junction with appropriate pedestrian crossings is proposed.

Cumulative Assessment and Future Baseline

14.5.32 The assessment of the Proposed Development within the KCC strategic transport model '2031 Do Maximum' scenario takes into account the cumulative impacts of permitted development, the Local Plan residential and employment allocations, committed highways schemes and those included within the Thanet Transport Strategy. Details of the proposed highways interventions included within the KCC strategic transport model are included within Table 2-5 of the KCC document "*Local Transport Plan Evidence Base – Forecasting Report*" [xi] which forms part of the transport evidence base for the Local Plan.

14.5.33 The 2031 Do Maximum scenario includes the Manston-Haine link which forms part of the proposed Inner Circuit scheme. The draft Thanet Transport Strategy suggests that the routeing is through the Northern Grass Area (NGA).

Future Baseline with Proposed Development

14.5.34 As set out in the statement of need, the NGA is aviation related development that lies within the airport boundary. As aviation related development, it is undesirable to have a link road passing through the site due to the variety of uses that may be required on the site but are at this stage not fully known. An alternative route has been identified which meets the required highway standards. This route has been tested in the strategic transport model for the 'with Proposed Development' scenario.

14.5.35 As the KCC strategic model has been developed for the end of Local Plan period year of 2031, there was a requirement to growth the model flows to 2039, Year 20 of the Proposed Development.

14.5.36 The following was undertaken in preparation of data provision for the purpose of the TA and ES:

- Vehicle turning flow validation - the strategic transport model includes a 2016 baseline model, on which the forecast modelling is based. However, given the strategic nature of the modelling, the base flows in SATURN were not validated to the same level as a more local model (such as LinSig or VISSIM) and a number of the modelled turning flows are very different to the traffic counts. There was therefore the need to validate the vehicle turning flow output

to the KCC 2016 traffic counts, and the Wood 2017 traffic counts at junctions where there was no 2016 count;

- Calculation of HGV flows - the strategic transport model output flows are vehicles only, and for the purpose of the environmental impact assessment work, needed to be converted into light vehicle and HGV flows. An HGV percentage provided by KCC was used to understand the split of light vehicles and HGVs (based on traffic counts); and
- Growth of baseline traffic flows to 2039 - the strategic transport model future year is 2031 (end of Local Plan period). It was necessary to growth these base flows up to 2039 (Year 20 of construction/operation). It was agreed with KCC that a growth rate should be applied to the base flows, and this was calculated from TEMPRO, as shown in **Table 14.13** below.

Table 14.13 2031 – 2039 Growth Rates

	Light Vehicles	HGV
AM	1.0452	1.0529
PM	1.0443	1.052

Process for Calculations of Future Year Scenarios

14.5.37 The following process was used to develop the junction turning counts used in the assessment within this chapter based on the outputs of the strategic model scenarios.

Methodology for 2039 Baseline Scenario – KCC Link Road Alignment

- The 2031 Reference Case (KCC 'Do Maximum' scenario) total vehicle traffic flows were split into light vehicle and HGVs using the HGV % figures provided by KCC or where not provided HGV % from the RiverOak 2017 junction turning counts; and
- The 2031 base light vehicle and HGV flows were growthed using the growth rates set out in **Table 14.13**.

Methodology for 2039 + Development Scenario

- The 2031 + Development total vehicle traffic flows were split into light vehicle and HGVs using the HGV % figures provided by KCC or where not provided HGV % from the RiverOak 2017 junction turning count;
- Select link analysis provided by KCC's consultants was used to identify the Proposed Development the traffic movements across the study area road network. This was disaggregated into light vehicles and HGVs based on the distribution of HGVs from the TA. The Proposed Development flows were then extracted from the data to leave 'background' traffic;
- The 2031 background traffic flows were growthed using the growth rates set out in **Table 14.12**. This results in a 2039 baseline scenario for the RiverOak alternative alignment of the Manston Haine link, referred to as 2039 Baseline – RiverOak Alternative Alignment. This enables an evaluation of the change in traffic flows as a result of the development; and

- The Proposed Development traffic was added back resulting in the 2039 + Development Scenario for use in the junction modelling.

14.5.38 This Chapter presents the future baseline traffic flows at each receptor location for each assessment year.

14.6 Environmental Measures Incorporated into The Proposed Development

14.6.1 Environmental measures that have been incorporated into the Proposed Development are set out in **Table 14.14**. The measures are based on assessments and documents that will form part of the DCO application.

Table 14.14 Rationale for Incorporation of Environmental Measure

Potential Receptors	Predicted Changes and Potential Effects	Incorporated Measures
Construction		
The users of local roads and the occupiers of land uses fronting roads likely to be affected	Changes in the character of traffic (such as increases in HGVs), as a result of proposed construction traffic. Potential effects on: • Severance; • Driver delay; • Pedestrian delay; • Pedestrian amenity; and • Accidents and safety.	A CTMP will be agreed with KCC prior to construction works commencing. The CTMP will seek to keep construction traffic on the strategic highway network and avoid sensitive routes and local communities in order to minimise impacts on receptors and manage environmental effects. The CTMP will manage the daily delivery profiles and control movements and routeing of HGVs through the following measures: • Traffic routing strategy – ensuring vehicles access the site via the most appropriate route and avoid unnecessary conflict with sensitive areas; • Traffic timing strategy – programme vehicle arrival/departures and working hours to lessen the impact on the highway network; • Temporary signage – in accordance with the DfT *Traffic Signs Manual, Chapter 8*[xii] to inform local road users of construction access points and the presence of HGVs; • Temporary traffic management – provided on approaches to accesses in the form of traffic warning signs, possible reductions in speed limit signs to ensure safe passage of vehicles; • Site accesses designed in accordance with DMRB TD 42/95 Geometric Design of Major/Minor Priority Junctions[xiii]; and • Staff travel plan – will provide details of how staff should travel to the site by alternative modes in an effort to reduce single occupancy vehicles travelling to the site. A Construction Environmental Management Plan (CEMP) will be implemented for each phase of the Proposed Development to control construction activities. The CEMP details working practices and any other measures that form part of the Proposed Development. Both the CEMP and CTMP are provided to support the DCO application.
Operation		

Potential Receptors	Predicted Changes and Potential Effects	Incorporated Measures
The users of local roads and the occupiers of land uses fronting roads likely to be affected	Changes in the character of traffic (such as increases in traffic volume), as a result of operation of the Proposed Development. Potential effects on: • Severance; • Driver delay; • Pedestrian delay; • Pedestrian amenity; and • Accidents and safety.	An ASAS has been submitted as part of the DCO application. The ASAS identifies the physical measures to maximise the multi modal accessibility to the site, including identification of bus / rail interchange opportunities, bus provision proposals and pedestrian improvements and linkages, including crossing points, as well as setting out the vehicular access. The proposals for shuttle buses, employee buses, and improvements to local bus interchanges will aim to reduce overall traffic and improve all effects. A TA has been submitted to support the DCO application and identifies the off-site highway works to improve junctions and ensure 'nil-detriment' as a result of the Proposed Development, thereby addressing environmental effects on receptors such as driver delay. Off-site mitigation also considers the effects on pedestrian and incorporates improvements such as footway provision and crossing facilities to address this. Specific proposals include: • Improvement to the access junctions and off-site junctions where operational capacity is adversely affected to minimise driver delay; • Widening along Manston Road and Spitfire Way to accommodate the Proposed Development traffic and minimise driver delay; • Speed reduction along Spitfire Way and road safety improvements in the form of road signs and road markings; • Provision of new pedestrian crossings at all key access junctions to minimise pedestrian delay and optimise pedestrian amenity; • Provision of a new pedestrian link between the Cargo Facility and Passenger Terminal access to optimise pedestrian amenity; and • Accident analysis to inform mitigation schemes and address accident hot spots where improvements are proposed. A Travel Plan for the Proposed Development has been provided to support the DCO application. The Travel Plan sets out initiatives to enable and encourage sustainable travel by public transport, cycling and walking and to reduce and discourage car travel in order to minimise impacts on receptors and manage environmental effects. The Travel Plan sets out: • Physical measures to enable sustainable travel, such as bus provision, cycle parking, footway provision and connectivity to the external network, car share scheme and parking spaces, etc; and • Influencing travel behaviour measures, including sustainable travel information provision and incentives to travel sustainably. A PRoW Management Plan (PRoWMP) has been submitted as part of the DCO application and sets out proposals to retain all pedestrian links and routes that exist currently via diversions if required. As such, impacts on the pedestrian effects will be no worse that they are currently or enhanced with new surfaces and routes.

14.7 Scope of the Assessment

14.7.1 This section sets out information on the process whereby receptors are identified, the potential receptors that could be affected by the Proposed Development and the potential effects on receptors that could be caused by the Proposed Development.

14.7.2 The scope of assessment has been informed by the Scoping Report, consultation with KCC, the Proposed Development design as it stands, the results of work detailed in **Section 14.4** and GEART.

Approach to Identifying Receptors

14.7.3 The identification of receptors is based on the guidance set out in GEART. Receptors are:

- Local roads and the users of those roads, including public transport users, pedestrians, cyclists and equestrians; and
- Land uses and environmental resources fronting those roads, including the relevant occupiers and users.

Spatial and Temporal Scope

14.7.4 The spatial scope of this assessment includes the local highways network taking in elements of the settlements of Ramsgate and Margate to the east through to the settlements of Birchington-on-Sea and Sarre in the west. A plan giving an overview of the study area is shown in **Figure 14.3.**

14.7.5 The temporal scope of this assessment has been established above as the peak year of the development in Year 20, 2039 which is the peak for total traffic from the development. This is the peak of all traffic, at no point in the 19 years previous to Year 20 does a combination of the construction traffic and the operational traffic exceed that of just the operational traffic in Year 20. As such an assessment of the construction period has been scoped out of the environmental assessment. A consideration of the impacts of the construction traffic in Year 1 and 2 before operational traffic commences on the network has however been set out in the PCTMP which is **Appendix K** to the TA. It should be noted this document has been revised as part of the ES resubmission.

Potentially Significant Effects

14.7.6 The types of effects that could be expected during the construction and operational phases of the Proposed Development are taken from the GEART[xiv] and are presented in **Table 14.15**. Those effects of relevance to this Chapter are highlighted in bold text. The remaining issues are considered within the other chapters of this assessment.

Table 14.15 Traffic Related Environmental Effects Identified in GEART

Types of Traffic Related Environmental Effects		
Noise	**Fear and Intimidation**	Heritage and Conservation
Vibration	**Accidents and Safety**	**Pedestrian Delay**
Visual Effects	**Hazardous Loads**	Ecological Effects
Severance	Air Pollution	**Pedestrian Amenity**
Driver Delay	Dust and Dirt	

14.7.7 The potentially significant effects from the Proposed Development, which are subject to further discussion in this Chapter, are summarised below. All other effects in **Table 14.15** are discussed within the corresponding technical chapters of this ES.

14.7.8 The potentially significant effects from the proposed development, which will be subject to further assessment, are summarised below:

- Effects on highway capacity (passenger delay including public transport) and safety at junctions due to an increase in traffic flows due to a presence of operational/construction vehicles (Assessed separately in the TA and PCTMP);
- Effects on road user journey times due to the construction of access points and other onsite highways improvements relative to proposed road works and potential temporary road closures, diversions and/or widening (assessed in the PCTMP);
- Effects on pedestrians and equestrians due to the closure and diversion of PRoWs (additional assessment in the PRoWMS); and
- Effects on vulnerable road users such as cyclists and equestrians on narrow country lanes due to increase in vehicle movements.

Inter-related effects

14.7.9 Inter-related effects are those where a number of different changes considered under different environmental topics have the potential to harm a common receptor.

14.7.10 The following topics have assessed the impact of traffic and transport changes described within this Chapter;

- Air quality (**Chapter 6: Air Quality**) – Effects on sensitive human and ecological receptors due to vehicle emissions and dust generated by traffic;
- Noise (**Chapter 12: Noise and Vibration**) – Effects on road users due to increased traffic flows;
- Landscape and Visual (**Chapter 11: Landscape and Visual Impact Assessment**) - Effects on views, visual amenity and scenic quality as a result of increased traffic.
- Socio-economics (**Chapter 13: Socio-economics**) – Effects on employee and customer access to local businesses, and on amenity, tourism and recreational activities due to disruption to the local road network;
- Human health (**Chapter 15: Health and Wellbeing**) – Effects on health and wellbeing due to changes in traffic and transportation;
- Climate change (**Chapter 16: Climate Change**) - Effects on greenhouse gas emissions as a result of road transport and traffic changes, and effects on human health as a result of air quality changes (linked to traffic and transport changes), compounded by climate change; and
- Major accidents (**Chapter 17: Major Accident and Natural Disasters**) - Effects on humans, buildings, groundwater and surface water as a result of major accidents or disasters related to road use.

14.7.11 The inter-related effect of multiple topics (noise, visual, air quality, socio-economics, health and well-being in addition to traffic and transport) acting in combination on the same human receptors (motor users, public transport users, pedestrians, cyclists, equestrians, occupiers of properties and tourist sites) is considered in **Chapter 18: Cumulative Effects**.

Traffic Related Environmental Effects

14.7.12 The following elements are the traffic related environmental effects considered in this Chapter.

Severance

14.7.13 Severance is the perceived division that can occur within a community when it becomes separated by an increase in traffic on a route that separates people from other people and places. For example, severance may result from the difficulty of crossing a heavily trafficked road or a physical barrier created by the road itself. It can also relate to locations where even low increase in traffic flows impede pedestrian access to essential facilities.

14.7.14 The effects of severance can be applied to motorists, pedestrians or residents, but it is recognised that there are no predictive formulae which give simple relationships between traffic factors and levels of severance.

14.7.15 The GEART state that marginal changes in traffic flow are unlikely to create or remove severance, but that consideration in determining whether severance is likely to be an important issue should be given to factors such as road width, traffic flow and composition, traffic speeds, the availability of crossing facilities and the number of movements that are likely to cross the affected route. Consideration should also be given to different groups such as the elderly and young children.

Driver Delay

14.7.16 Delays to non-development traffic can occur at several points on the local highway network as a result of the additional traffic that would be generated by a development. The GEART state that delays are only likely to be significant when the traffic on the network surrounding the development is already at, or close to, the capacity of the system.

Pedestrian Delay

14.7.17 Changes in the volume, composition or speed of traffic may affect the ability of people to cross roads and therefore, increases in traffic levels are likely to lead to greater increases in delay. Delays will also depend upon the general level of pedestrian activity, visibility and general physical conditions of the crossing location.

14.7.18 Given the range of local factors and conditions which can influence pedestrian delay, the GEART do not recommend that thresholds be used as a means to establish the significance of pedestrian delay, but recommend that reasoned judgements is made instead.

Pedestrian Amenity

14.7.19 Pedestrian amenity is broadly defined as the relative pleasantness of a journey and is considered to be affected by traffic flow, traffic composition and pavement width/separation from traffic.

Fear and Intimidation

14.7.20 The scale of fear and intimidation experienced by pedestrians is dependent on the volume of traffic, its HGV composition, its proximity to people or the lack of protection caused by such factors as narrow pavement widths, as well as factors such as the speed and size of vehicles.

14.7.21 The GEART also note that special consideration should be given to areas where there are likely to be particular problems, such as high-speed sections of road, locations of turning points and accesses. Consideration should also be given to areas frequented by school children, elderly and other vulnerable groups.

Accident and Safety

14.7.22 Where a development is expected to produce a change in the character of the traffic on the local road network, as a result of increased HGV movements for example, the GEART state the implications of local circumstances or factors which may elevate or lessen risks of accidents, such as junction conflicts, would require assessment in order to determine the potential significance of accident risk.

Hazardous Loads

14.7.23 Some developments may involve the transportation of dangerous or hazardous loads by road and this should be recognized within the assessment. The GEART note that the number of movements should be calculated and if it is considered to be significant then a risk analysis should be undertaken.

14.7.24 As details of hazardous loads (e.g. types and quantity of load, number of movements and access route etc.) are yet to be finalised, this has not been included within this assessment.

14.8 Assessment Methodology

Methodology for Screening

14.8.1 The guidance that is followed when assessing the potential significance of road traffic effects is summarised in GEART[xv], which states that:

> *"The detailed assessment of impacts is…likely to concentrate on the period during which the absolute level of an impact is at its peak, as well as the hour at which the greatest level of change is likely to occur." (Paragraph 3.10).*

14.8.2 To assess the impact at its peak, the likely percentage increase in traffic is determined by comparing estimates of traffic generated by the Proposed Development with future predicted baseline traffic flows on the road links in the study area.

14.8.3 To define the scale and extent of this assessment, GEART guidelines[xvi] identify the following rules for assessing potentially significant traffic and transport related environmental effects:

- Rule 1: Include roads where traffic flows are predicted to increase by more than 30% (or where the number of HGVs are predicted to increase by more than 30%); and
- Rule 2: Include any specifically 'sensitive' areas where traffic flows are predicted to increase by 10% or more.

14.8.4 The 10% threshold in Rule 2 considers daily variations in traffic levels, typically around 10%, meaning that an increase in traffic levels of less than 10% is not likely to have an undesirable effect and would not require an assessment.

Receptor Sensitivity

14.8.5 The sensitivity of each highway link included in the assessment has been assigned a sensitivity in accordance with GEART[xvii]. This is based on the proximity of the sensitive receptors to the highway link and the highway environment. **Table 14.16** summarises the rationale used to determine the sensitivity against the corresponding receptors. Professional judgement is also used to determine the sensitivity of the receptor.

Table 14.16 Receptor sensitivity

Sensitivity	Description / Reason	Receptor
High	Receptors of greatest sensitivity to traffic flows: schools, colleges, playgrounds, accident blackspots, retirement homes and urban/residential homes without footways that are used by pedestrians and cyclists.	Residents/workers travelling to and from work or home on foot and by bicycle, school children, leisure walkers and equestrians.
Medium	Traffic flow sensitive receptors including: congested junctions, doctors' surgeries, hospitals, shopping areas with roadside frontage, roads with narrow footways, unsegregated cycle ways, community centres, parks, recreation facilities.	Residents/workers travelling to and from work or home on foot and by bicycle, people visiting these land uses.
Low	Receptors with some sensitivity to traffic flows: places of worship, public open space, nature conservation areas, listed buildings, tourist/visitor attractions and residential areas with adequate footway provision.	Residents/workers travelling to and from work or home on foot or bicycle and people visiting these land uses.
Negligible	Receptors with low sensitivity to traffic flows: Motorway and Dual Carriageways and/or land uses sufficiently distant from affected routes and junctions.	Residents/workers travelling by foot or by bicycle.

14.8.6 Sensitivity judged as High or Medium results in Rule 2 being considered for that highway link. Sensitivity judged as Low or Negligible results in Rule 1 being considered for that highway link.

14.8.7 Given the potential receptors described, **Table 14.17** identifies the sensitivity of highway link and the GEART Rule that applies.

14.8.8 In terms of defining 'sensitive' areas, according to the GEART, some highway links assessed are considered to be 'sensitive' due to the fact that they have residential properties fronting the link or pedestrian activity. Therefore, a change of 10% or more in the total traffic flows or a change of 30% in the number of HGVs would trigger a detailed evaluation of the effects.

14.8.9 To determine the sensitivity of each receptor, considerations taken from GEART have been used. Identified sensitive receptors are as follows:

- People at home;
- People at work;
- Sensitive groups including children, elderly and disabled;
- Sensitive locations such as hospitals, churches, schools and historical buildings;
- People walking;
- People cycling;
- Open spaces, recreational areas, shopping areas;
- Sites of ecological / nature conservation value; and
- Sites of tourist / visitor attractions.

14.8.10 All other receptors which are not considered sensitive are predominantly non-residential in nature, have low pedestrian footfall, or have a road environment suited to the proposed activity and its associated traffic**.** These links are still assessed as part of this Chapter as it is these links that are

proposed to experience the largest increase in total vehicles and HGVs and may trigger the 30% threshold**.**

14.8.11 The links have been identified based on the output from the strategic transport model and include additional receptor points to the ones set out in the ES Chapter submitted in support of the DCO.

14.8.12 **Table 14.17** summarises the links for which the receptors have been identified for this assessment and the resultant receptor sensitivity as identified in accordance with GEART and with use of professional judgement. These receptors and the corresponding highway links are also presented in **Figure 14.8.**

Table 14.17 Summary of Highway Links Where Receptors Have Been Identified

ID	Highway Link	Comments	Receptor Sensitivity	GEART Assessment (Rule 1/Rule 2)
1	A299 Hengist Way between Richborough Way and Sandwich Road	The Link is an undeveloped dual carriageway with no direct fronting properties and no pedestrian footways.	Negligible	1
2	Canterbury Road East between A256 and Royal Harbour Approach	The route is through an agricultural area then to a residential area, but with properties well set back on a service lane.	Negligible	1
3	Manston Road between Haine Road and the railway line	Rural and urban setting with mixed use developments including supermarket and residential properties. Pedestrian flows are expected to be high around this area,	High	2
4	B2014 Newington Road between B2050 Manston Road and A255 High Street	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways and is a main link to Ramsgate.	High	2
5	A255 High Street between B2014 Newington Road and Ellington Place	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways and located in the St Lawrence area of Ramsgate. The link provides access to local parks and schools.	High	2
6	A254 Margate Road	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways and located in the Northwood area of Ramsgate.	High	2
7	A254 Ramsgate Road between Nash Lane and Farley Road	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways.	High	2
8	A254 Ramsgate Road north of the junction with B2052 College Road	A link though a busy residential area with numerous properties adjacent to the carriageway and pedestrian footways. South end of link is a village centre.	High	2
9	A28 Canterbury Road, east of junction with Domneva Road	Predominantly a residential area adjacent to a commercial area with direct fronting shops and residential properties to the carriageway). The link has pedestrian footways.	Medium	2

ID	Highway Link	Comments	Receptor Sensitivity	GEART Assessment (Rule 1/Rule 2)
10	Manston Road between Bramble Lane and Flete Road	.The link is in a rural area with no pedestrian amenities and no accesses abutting the highway.	Low	1
11	Shottendane Road north east of the junction with Park Lane	The link is a single carriageway predominantly in a rural area. The northern section has a small number of properties fronting mainly the eastern side road, and good pedestrian provision on both sides.	Low	1
12	B2050 Park Lane, between A28 Canterbury Road and Manston Road	Predominantly a residential and commercial area and the link does have pedestrian footways. Birchington C of E school also fronts onto the carriageway.	High	2
13	A299 Thanet Way west of junction with A28	The link is a dual carriageway with no properties fronting the carriageway and no pedestrian footways. Already conveys a high percentage of HGVs.	Negligible	1
14	A299 between A253 and A28	The link is a dual carriageway with no direct fronting properties or pedestrian footways. The link carries a high percentage of HGVs.	Negligible	1
15	A299 between B2190 and A253	The link is a dual carriageway with no direct fronting properties or pedestrian footways. The link carries conveys a high percentage of HGVs.	Negligible	1
16	Minster Road southeast of the junction with Plumstone Road	Predominantly agricultural area with directly fronting properties through the small village of Acol. Although it is a small village setting, the village of Acol does not have pedestrian footways.	Medium	2
17	B2050 Manston Road between Spitfire Way and Shottendane Road	Predominantly an agricultural area with limited footway provision (near the junction with Spitfire Way) with some properties well set back from the carriageway.	Low	1
18	B2190 Spitfire Way between B2050 Manston Road and Cargo Access	Predominantly an agricultural area to the north and the Manston Airport site to the south. There are only a few properties along this link which front the carriageway.	Low	1
19	A299 between B2190 and Canterbury Road West	The link is a dual carriageway with no properties fronting the carriageway and no pedestrian footways. The link carries a high percentage of HGVs.	Negligible	1
20	B2050 Manston Road between Manston Road and Manston Court Road	The link runs through the Manston Airport site with no property frontages or pedestrian footway provision.	Low	1
21	Manston Court Road, north of Manston Road	Predominantly an agricultural area with direct property frontages through the small village setting near Manston Court Holiday Park. Despite the village setting there are no footways. The route is also near the tourist site Manston Court Holiday Park.	Medium	2
22	Manston Road, west of the junction with Greensole Lane	The Link routes through a rural area, Accesses about the site which serve a golf course and agricultural sites.	Low	1

ID	Highway Link	Comments	Receptor Sensitivity	GEART Assessment (Rule 1/Rule 2)
23	A256 Haine Road between B2050 Manston Road and Canterbury Road West	The link is a single carriageway with no properties fronting the carriageway and no pedestrian footways. The link carries a high percentage of HGVs.	Negligible	1
24	Canterbury Road West between A299 and Cliff View Road	The link is a single carriageway with no properties fronting the carriageway or pedestrian footways.	Negligible	1
25	Manston Court Road between Link Road and Star Link Development	The link is s single track lane set in a rural area. There are accesses to a caravan site and agricultural sites. A small number of properties front on to the road. There are no pedestrian amenities provided.	Medium	2
26	Star Link Development Link	The link is yet to be constructed, however the link will provide a route to a sensitive link on Manston Court Road.	Medium	2
27	A256 Haine Road, north of Star Link development Roundabout	The link is forms a route around the edge of a leisure development. Shared pedestrian/cyclist footways exist setback on the east side of the carriageway.	Medium	2
28	A256 New Haine Road	The link forms a route through a mixed-use leisure and business development, shared pedestrian/cyclist footways exist setback on both sides of the carriageway.	Medium	2
29	A255 high street, west of the junction with the B2014	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways and located in the St Lawrence area of Ramsgate. The link provides access to local parks and schools.	High	2
30	A256 Richborough Way, south of the junction with the A299	The link is a dual carriageway with no properties fronting the carriageway and no pedestrian footways. Already conveys a high percentage of HGVs.	Negligible	1
31	A299 between Canterbury Road West and A256 Richborough Way	The link is a dual carriageway with no properties fronting the carriageway and no pedestrian footways. Already conveys a high percentage of HGVs.	Negligible	1
32	Tothill Street	Village setting with footways on both sides of the carriageway. A number of properties front onto the road and also serves as part of a local bus route.	Medium	2
33	Minster Road north of A299	Dual carriageway located on the west periphery of the Manston site. Agricultural access located on the western side of the carriageway.	Negligible	1
34	B2190 Spitfire Way between cargo access and B2190 Columbus Avenue	Predominantly an agricultural area to the north and the Manston Airport site to the south. There are only a few properties along this link which front the carriageway.	Low	1
35	B2050 Manston village east of Preston Road	Village setting with pedestrian footway on the northern side of the carriageway and frontage to a number of properties.	High	2

ID	Highway Link	Comments	Receptor Sensitivity	GEART Assessment (Rule 1/Rule 2)
36	B2050 Manston village west of Preston Road	Village setting with pedestrian footway on the northern side of the carriageway and frontage to a small number of properties.	High	2
37	B2050 Manston Road east of Passenger Access	The link runs through the north eastern periphery of the Manston Airport site with no property frontages or pedestrian footway provision.	Low	1
38	Manston Road north of Spitfire Way	Link routes provides access to a museum and MOD property, A pedestrian footway exists on the set back on the west side of the carriageway.	Low	1
39	Manston Road north of NGA	Generally 6.1m or more width single lane carriageway, predominantly rural with a few properties fronting the road on the western side near to the NGA. No pedestrian footways.	Low	1
40	Haine Road between B2050 and Leigh Road	Single carriageway which routes through rural area to the periphery of an industrial site. There are no pedestrian amenities and there is one property frontage.	Low	1
41	A254 Ramsgate Road, north of the junction with Star Lane and Poorhole Lane	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways and located in the Northwood area of Ramsgate.	High	2
42	Poorhole Lane, east of the junction with A254	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways and located in the Northwood area of Ramsgate.	Medium	2
43	Star Lane, west of A254	Commercial and residential area, anticipated high pedestrian flows to local shops schools and businesses. The link has pedestrian footways and located in the Northwood area of Ramsgate.	High	2
44	College Road, east of A254	A link though a busy residential area with numerous properties adjacent to the carriageway and pedestrian footways. West end of link is a village centre.	High	2
45	College Road, west of A254	A link though a busy residential area with numerous properties adjacent to the carriageway and pedestrian footways. East end of link is a village centre.	High	2
46	A28 Canterbury Road west of the junction with B2050 Park Lane	A link though a busy residential area with numerous properties adjacent to the carriageway and pedestrian footways.	High	2
47	A28 Canterbury Road west of the junction with A299	Single Carriageway through a rural area. No frontages or pedestrian footways.	Negligible	1
48	A28 Canterbury Road east of the junction with A299	Dual Carriageway through a rural area. No frontages or pedestrian footways.	Negligible	1
49	A253 west of the Monkton Roundabout	Single Carriageway through a rural area. No frontages or pedestrian footways.	Negligible	1

ID	Highway Link	Comments	Receptor Sensitivity	GEART Assessment (Rule 1/Rule 2)
50	Willetts Hill, south of the Monkton Roundabout	Single track road through a rural area. No frontages or pedestrian footways.	Negligible	1
51	B2050 Manston Road, East of Park Lane	Single Carriageway through a rural area. Not frontages or pedestrian footways	Negligible	1
52	Canterbury Road West , West of the A256/A299 junction	Single Carriageway through a rural area. Not frontages or pedestrian footways	Negligible	1

14.8.13 **Table 14.18** provides details of thresholds used to determine the magnitude of each transport effect based on guidance within GEART.

Table 14.18 Magnitude of Each Transport Effect- Thresholds Used

Transport Effect	Magnitude of Effect			
	Major	**Moderate**	**Minor**	**Negligible**
Severance	Change in total traffic or HGV flows over 90% And/or Where there will be a temporary maximum increase in pedestrian journey length of 500m or more along a road or other Public Right of Way for more than 6 months over a 12-month period	Change in total traffic or HGV flows of 60-90% And/or Where there will be a temporary maximum increase in pedestrian journey length of 250m – 500m along a road or other Public Right of Way for a 3-6-month period over 12 months	Change in total traffic or HGV flows of 30-60% And/or Where there will be a temporary increase in pedestrian journey length of up to 250m along a road or other Public Right of Way for between 4 weeks and 3 months over a 12 month period	Change in total traffic or HGV flows of less than 30% And/or Where there will be no temporary increase in pedestrian journey length.
Driver delay	Change in total traffic or HGV flows over 90%	Change in total traffic or HGV flows of 60-90%	Change in total traffic or HGV flows of 30-60%	Change in total traffic or HGV flows of less than 30%
Pedestrian amenity and delay, fear and intimidation	Change in total traffic or HGV flows over 90%	Change in total traffic or HGV flows of 60-90%	Change in total traffic or HGV flows of 30-60%	Change in total traffic or HGV flows of less than 30%
Accidents and road safety	Informed by a review of existing collision patterns and trends based upon the existing personal injury accident records and the forecast increase in traffic.			

Significance Evaluation Methodology

Effect Evaluation

14.8.14 The significance of a likely traffic and transport effect is derived by considering the sensitivity of the receptor (derived from **Table 14.17**) against the magnitude of effect (derived from **Table 14.18**) as defined in **Table 14.19**.

Table 14.19 Significance Matrix

		Magnitude of Effect			
		Major	**Moderate**	**Minor**	**Negligible**
Receptor Sensitivity	**High**	Major adverse – Significant	Major adverse – Significant	Moderate adverse – Significant	Negligible
	Medium	Major adverse – Significant	Moderate adverse – Significant	Minor to moderate adverse – Not significant	Negligible
	Low	Moderate adverse – Significant	Minor to moderate adverse – Not significant	Minor adverse – Not significant	Negligible
	Negligible	Negligible	Negligible	Negligible	Negligible

14.8.15 The following terms have been used to classify the level of effects, where they are predicted to occur:

- Major adverse or Major beneficial – where the Proposed Development would cause a significant deterioration (or improvement) to the existing environmental effect;
- Moderate adverse or Moderate beneficial – where the Proposed Development would cause a noticeable deterioration (or improvement) to the existing environmental effect;
- Minor adverse or Minor beneficial – where the Proposed Development would cause a small deterioration (or improvement) to the existing environmental effect; and
- Neutral – no discernible deterioration or improvement to the existing environment.

14.8.16 Note that for the purposes of the ES, Major and Moderate adverse effects are considered to be significant, whilst Minor and Negligible adverse effects are considered 'neutral / not significant'.

14.8.17 Effects can also be described, for example, as:

- Beneficial, negligible or adverse;
- Temporary (short-term, medium-term, long-term) or permanent; and
- Local, district, regional or national.

Methodology for Assessing Environmental Effects

14.8.18 In relation to traffic and transport, the significance of each effect identified in **Section 6.7** has been considered against the criteria within GEART[xviii], where possible. However, GEART states that:

'For many effects there are no simple rules or formulae which define thresholds of significance and there is, therefore, a need for interpretation and judgement on the part of the assessor, backed-up by data or quantified information wherever possible. Such judgements will include the assessment of the numbers of people experiencing a change in environmental impact as well as the assessment of the damage to various natural resources.' (Paragraph 4.5).

Severance

14.8.19 There are no predictive formulae which give simple relationships between traffic factors and levels of severance. GEART states that changes in traffic flow of 30%, 60% and 90% are regarded as producing 'slight', 'moderate' and 'substantial' changes in severance. In general, marginal (slight) changes in traffic flow are, by themselves, unlikely to create or remove severance. The magnitude of effect can also be assessed against increases in pedestrian journey length along roads and/ or PRoWs for between four weeks and 12 months, as identified in **Table 14.18**.

Driver Delay

14.8.20 GEART states that delays are only likely to be significant when the traffic on the network surrounding the development is already at, or close to, the capacity of the system. The capacity of a road or a particular junction can be determined by establishing the ratio of flow to capacity (RFC).

14.8.21 For this assessment, criteria from GEART has been used to assess the effects on traffic levels and driver delay, which states the need for assessment where changes in traffic flows exceed 30%.

Pedestrian Delay

14.8.22 Given the range of local factors and conditions which can influence pedestrian delay, GEART does not recommend that thresholds be used as a means to establish the significance of pedestrian delay, but recommend that reasoned judgements be made instead. However, GEART suggests a lower threshold of 10 seconds delay and upper threshold of 40 seconds delay which, for a link with no crossing facilities, equates to the lower threshold of a two-way flow of 1,400 vehicles per hour.

Pedestrian Amenity

14.8.23 GEART notes that changes in pedestrian amenity may be considered significant where the traffic flow is halved or doubled, with the former leading to a positive effect and the latter a negative effect.

Accidents and Safety

14.8.24 Informed by a review of existing collision patterns and trends based upon the existing personal injury collision records and the forecast increase in traffic.

Fear and Intimidation

14.8.25 The scale of fear and intimidation experienced by receptors along the identified access routes is subjective and influenced by the volume and the type of vehicle but also the level of protection available, such as having a property set back from the highway, wide footways and screening by vegetation.

14.9 Assessment of Effects

14.9.1 To undertake the assessment of effects of the traffic generated by the Proposed Development, the Proposed Development traffic flows need to be estimated and trips distributed onto the road network. The methodology that has been developed is outlined in the TA.

14.9.2 In this Chapter, assessment will only be provided for the worst-case traffic flows scenario, which is for the operational traffic. Construction traffic has been screened out on the basis that the flows are less than fully operational. Details of this comparison are outlined in the TA.

14.9.3 The Proposed Development trips for operational traffic been added to future baseline years to provide a clear impact on the difference between the growth of future baseline and the growth of future baseline with Development.

14.9.4 It is at this stage that the significance will be predicted using the rules in **Table 14.19.** For those receptors where the change is considered significant, further assessment will be made using the criteria in **Section 14.7.**

14.9.5 This Chapter sets out the assessment for the peak operational traffic year (Year 20). In response to the Examining Authority's questions regarding the assessment being only for the 24 period, additional assessment has been provided for the AM and PM peak hours. The results of these three assessments are set out in the following sections.

Traffic and Transport Environmental Assessment for the Peak Operational Phase – Year 20 (2039)

14.9.6 The table in **Appendix 14.3** compares the traffic flows for the 24-hour, AM peak and PM peak hour periods for the following scenarios. Where the threshold of change is 30%, or 10% for sensitive locations, this is identified in red.

- Scenario 1 - 2039 Baseline – KCC 'Do Maximum' with Manston Haine Link through the NGA;
- Scenario 2 - 2039 Baseline – RiverOak Alternative Alignment; and
- Scenario 3 - 2039 With Development – RiverOak Alternative Alignment.

14.9.7 A comparison has been made between Scenarios 3 and 2 to identify the change in traffic flows as a result of the development. A secondary comparison has also been made between Scenarios 3 and 1 in order to identify the change in relation to the link road alignment. Where the threshold of change is 30%, or 10% for sensitive locations, this is identified in red.

14.9.8 The links which have exceeded the percentage increase of traffic threshold for their respective sensitivity under the GEART guidelines have been identified based on the comparison between Scenarios 3 and 2, as summarised in **Table 14.20**. These have been taken forward for consideration of assessment of effects in the next section.

14.10 Assessment of Effects on Receptors

14.10.1 The 13 locations where the volume of Proposed Development traffic exceeds the impact threshold percentages. The implications of this and effects on receptors are considered in the following sections. The locations of these receptors are shown in **Figure 14.9**.

Link 14 – A299 between A253 and A28

14.10.2 As set out in the table in **Appendix 14.3**, the total HGV flows are predicted to increase by 42% over a 24-hour period (an increase of 608 HGVs) and 40% in the PM peak period (31 HGVs). Based on **Table 14.17**, the sensitivity of the receptor has been identified as negligible and based on **Table 14.18**, as the change in HGVs is greater than 30% but less than 60%, the magnitude of transport effects is minor. The overall significance is therefore considered to be negligible as set out in **Table 14.19**, and there is no need for an assessment of the environmental effects.

Link 15 – A299 between B2190 and A253

14.10.3 As set out in the table in **Appendix 14.3**, the total HGV flows are predicted to increase by 33% over a 24-hour period (an increase of 608 HGVs) and 31% in the PM peak period (31 HGVs). Based on **Table 14.17**, the sensitivity of the receptor has been identified as negligible and based on **Table 14.18**, as the change in HGVs is greater than 30% but less than 60%, the magnitude of transport effects is minor. The overall significance is therefore considered to be negligible as set out in **Table 14.19**, and there is no need for an assessment of the environmental effects.

Link 18 – B2190 Spitfire Way between B2050 Manston Road and Cargo Access

14.10.4 As set out in the table in **Appendix 14.3**, the total HGV flows are predicted to increase by 71% over a 24-hour period (an increase of 466 HGVs) and 31% in the AM Peak hour 25 HGVs) and 186% in the PM peak period (29 HGVs). Based on **Table 14.17**, the sensitivity of the receptor has been identified as low and based on **Table 14.18**, as the change in HGVs is greater than 90%, the magnitude of transport effects is major. The overall significance is therefore considered to be moderate adverse – significant as set out in **Table 14.19**, and there is a need for an assessment of the environmental effects.

14.10.5 It is noted that as part of the Proposed Development, the following improvements will be made which will benefit the receptors that use and/or front the link section.

- the road will be widened to 7.3m as part of improvements to accommodate the additional traffic as a result of the Proposed Development, particularly the HGVs;
- pedestrian footways and pedestrian crossings will be provided at the Spitfire Way/Manston Road junction which is proposed to be improved to a signal crossroads; and
- a junction safety improvement scheme is also proposed at Spitfire Way/Alland Grange Lane.

14.10.6 **Table 14.21** sets out the assessment of environmental effects.

Table 14.21 Link 18 - Assessment of environmental effects on receptors

Effect	Comments	Magnitude of Effect	Significance of Effect
Severance	There are properties along Spitfire Way, but no pedestrian desire lines across the link except towards the northern where there is an existing short section of pedestrian footway and a bus stop near the B2190/B2050 junction. As part of the Proposed Development a new footway on the southern side of the carriageway will be provided which will connect to the section of footway on the northern side of the link by a signalised crossing at the B2190/B2050 junction. The Proposed Development will therefore be of benefit to receptors and will have a positive effect on severance. On this basis, the magnitude of effect has been revised to negligible.	Negligible	Negligible
Driver Delay	There are a limited number of frontages and accesses and for much of the link the road is rural in nature with grassed verges. As part of the Proposed Development Spitfire Way will be widened to 7,3m between Columbus Avenue and Manston Road to accommodate the volume of traffic. This is also in line with KCC proposals for the new link road design standards. The Proposed Development will therefore be of benefit to receptors and will have a positive effect. On this basis the magnitude of effect has been revised to minor.	Minor	Minor Adverse - Not significant
Pedestrian Delay	As identified above, the pedestrian infrastructure on this link will be improved with a new pedestrian footway to the south side of the carriageway from the cargo access to link with Manston Road. This should reduce pedestrian delay and avoid the need for pedestrians to walk on the carriageway.	Negligible	Negligible

Effect	Comments	Magnitude of Effect	Significance of Effect
Pedestrian Amenity	As identified above, the pedestrian infrastructure on this link will be improved with a new pedestrian footway to the south side of the carriageway from the cargo access to link with Manston Road.	Negligible	Negligible
Fear and Intimidation	As above, the pedestrian infrastructure on this link will be improved with a new pedestrian footway to the south side of the carriageway from the cargo access to link with Manston Road. This should mitigate against an increase in fear or intimidation which would arise as a result of the increase in traffic	Negligible	Negligible
Accidents and Safety	Along the link that forms this receptor there has been 15 accidents including 1 fatal, 2 serious and 12 slight in severity. As part of the development proposals the B2190 will be widened along its length between Columbus Avenue and Manston Road. The speed limit of the road is also to be reduced. In addition, a road safety scheme is proposed at the Spitfore Way/Alland Grange junction. The Proposed Development will therefore be of benefit to receptors and will have a positive effect on accidents and safety. On this basis, the magnitude of effect has been revised to minor.	Minor	Minor Adverse - Not significant

Link 20 – B2050 Manston Road between Manston Road and Manston Court Road

14.10.7 As set out in the table in **Appendix 14.3**, the total flows are predicted to increase by 93% and HGVs by 149% over a 24-hour period (an increase of 3,996 vehicles and 170 HGVs respectively); 45% and 86% in the AM Peak hour (165 vehicles and 13 HGVs) and an 843% in HGVs in the PM peak period (16 HGVs). Based on **Table 14.17**, the sensitivity of the receptor has been identified as low and based on **Table 14.18**, as the change in vehicles and/or HGVs is greater than 90%, the magnitude of transport effects is major. The overall significance is therefore considered to be moderate adverse – significant as set out in **Table 14.19**, and there is a need for an assessment of the environmental effects.

14.10.8 It is noted that as part of the Proposed Development, the following improvements will be made which will benefit the receptors that use and/or front the link section.

- The road will be widened to 7.3m as part of improvements to accommodate the additional traffic as a result of the Proposed Development, particularly the HGVs; and
- Pedestrian footways and pedestrian crossings will be provided along the road.

14.10.9 **Table 14.22** sets out the assessment of environmental effects.

Table 14.22 Link 20 - Assessment of environmental effects on receptors

Effect	Comments	Magnitude of Effect	Significance of Effect
Severance	The Proposed Development is likely to create pedestrian desire lines between the Airport site and the employment within the NGA. However, the proposed pedestrian provision be of benefit to receptors and will have a positive effect on severance. On this basis, the magnitude of effect has been revised to minor.	Minor	Minor adverse – Not significant
Driver Delay	In this location, the B2050 Manston Road is a single carriageway which routes along the northern boundary of the Proposed Development, there are no frontages to properties but the airport access exists on this link.	Minor	Minor adverse – Not significant

Effect	Comments	Magnitude of Effect	Significance of Effect
	As part of the development proposals it is proposed to include a comprehensive widening scheme along Manston Road between Spitfire Way and the Aiport access. The Proposed Development will therefore be of benefit to receptors and will have a positive effect. On this basis the magnitude of effect has been revised to minor.		
Pedestrian Delay	As identified above, the pedestrian infrastructure on this link will be improved with new pedestrian footways and crossing points. The Proposed Development will therefore be of benefit to receptors and will have a positive effect. On this basis the magnitude of effect has been revised to minor.	Minor	Minor adverse – Not significant
Pedestrian Amenity	As identified above, the pedestrian infrastructure on this link will be improved with new pedestrian footways and crossing points. The Proposed Development will therefore be of benefit to receptors and will have a positive effect. On this basis the magnitude of effect has been revised to minor.	Minor	Minor adverse – Not significant
Fear and Intimidation	As identified above, the pedestrian infrastructure on this link will be improved with new pedestrian footways and crossing points. The Proposed Development will therefore be of benefit to receptors and will have a positive effect. On this basis the magnitude of effect has been revised to minor.	Minor	Minor adverse – Not significant
Accidents and Safety	There have been only two slight accidents recorded in the last five years. It is therefore considered that effects are negligible. The proposed pedestrian infrastructure will improve safety for vulnerable road users and the road widening and junctions schemes will be designed to highway standards and subject to road safety audits. The magnitude of effect is considered to be minor.	Minor	Minor adverse – Not significant

Link 21– Manston Court Road, north of Manston Road

14.10.10 As set out in the table in **Appendix 14.3**, the total flows are predicted to increase by 26% over a 24-hour period (an increase of 462 vehicles). Based on **Table 14.17**, the sensitivity of the receptor has been identified as medium and based on **Table 14.18**, as the change in vehicles is less than 30%, the magnitude of transport effects is negligible. The overall significance is therefore considered to be negligible and there is no need for an assessment of the environmental effects.

Link 24 – Canterbury Road West between A299 and Cliff View Road

14.10.11 As set out in the table in **Appendix 14.3**, the HGV flows are predicted to increase by 263% over a 24-hour period (an increase of 42 HGVs); and 100% in the AM Peak hour (an increase of 2 HGVs. Based on **Table 14.17**, the sensitivity of the receptor has been identified as negligible and based on **Table 14.18**, as the change in vehicles and/or HGVs is greater than 90%, the magnitude of transport effects is major. The overall significance is therefore considered to be negligible as set out in **Table 14.19**, and there is no need for an assessment of the environmental effects.

Link 25 – Manston Court Road between link road and Star Link Development

14.10.12 As set out in the table in **Appendix 14.3**, the total flows are predicted to increase by 11% over a 24-hour period (an increase of 1,604 vehicles). Based on **Table 14.17**, the sensitivity of the receptor has been identified as medium and based on **Table 14.18**, as the change in vehicles is less than

30%, the magnitude of transport effects is negligible. The overall significance is therefore considered to be negligible and there is no need for an assessment of the environmental effects.

14.10.13 It is noted this section of Manston Court Road is proposed to be upgraded to an A band road of 7.3m in width with pedestrian footways as part of KCC's draft Transport Strategy and the ICRIS proposals. It will carry traffic generated by the Local Plan site allocations as well as reassigned background traffic and the traffic generated by the Proposed development.

Link 33 – Minster Road, north of A299

14.10.14 As set out in the table in **Appendix 14.3**, the total HGV flows are predicted to increase by 63% over a 24-hour period (an increase of 566 HGVs) and 101% in the PM peak period (29 HGVs). Based on **Table 14.17**, the sensitivity of the receptor has been identified as negligible and based on **Table 14.18**, as the change in HGVs is greater than 90%, the magnitude of transport effects is major. The overall significance is therefore considered to be negligible as set out in **Table 14.19**, and there is no need for an assessment of the environmental effects.

14.10.15 It is also noted that the Proposed Development HGV numbers routeing on the link are fairly modest, but as the baseline HGV numbers are low, the proportional increase is shown as being high. The standard of the road as a dual carriageway is high and is designed to accommodate large numbers of HGV, particularly as it also serves the Manston Park employment area.

Link 34 - B2190 Spitfire Way between cargo access and B2190 Columbus Avenue

14.10.16 As set out in the table in **Appendix 14.3**, the HGV flows are predicted to increase by 60% over a 24-hour period (an increase of 608 HGVs), and 94% in the PM peak hour (an increase of 29 HGVs). Based on **Table 14.17**, the sensitivity of the receptor has been identified as low and based on **Table 14.18**, as the change in vehicles is over 90%, the magnitude of transport effects is major. The overall significance is therefore considered to be Moderate adverse – Significant as set out in **Table 14.19**, and there is a need for an assessment of the environmental effects.

14.10.17 As noted above, the following improvements will be made to Spitfire Way which will benefit the receptors that use and/or front the link section.

- The road will be widened to 7.3m as part of improvements to accommodate the additional traffic as a result of the Proposed Development, particularly the HGVs; and
- A junction safety improvement scheme is also proposed at Spitfire Way/Alland Grange Lane.

14.10.18 **Table 14.23** sets out the assessment of environmental effects.

Table 14.23 Link 34 - Assessment of environmental effects on receptors

Effect	Comments	Magnitude of Effect	Significance of Effect
Severance	The section of the B2190 Spitfire Way serves employment uses on the northern side and there is no existing pedestrian provision or connections/desire lines across the link. There are no receptors which will be affected by the environmental effect of severance through increased HGV levels. On this basis, the magnitude of effect has been revised to negligible.	Negligible	Negligible
Driver Delay	As part of the Proposed Development Spitfire Way will be widened to 7.3m between Columbus Avenue and Manston Road to accommodate the volume of	Minor	Minor Adverse - Not significant

Effect	Comments	Magnitude of Effect	Significance of Effect
	traffic. This is also in line with KCC proposals for the new link road design standards. The Proposed Development will therefore be of benefit to receptors and will have a positive effect. On this basis the magnitude of effect has been revised to minor.		
Pedestrian Delay	As identified above, there are no pedestrian desire lines or pedestrian receptors that would be affected by this environmental effect. On this basis the magnitude of effect has been revised to negligible.	Negligible	Negligible
Pedestrian Amenity	As identified above, there are no pedestrian desire lines or pedestrian receptors that would be affected by this environmental effect. On this basis the magnitude of effect has been revised to negligible.	Negligible	Negligible
Fear and Intimidation	As identified above, there are no pedestrian desire lines or pedestrian receptors that would be affected by this environmental effect. On this basis the magnitude of effect has been revised to negligible.	Negligible	Negligible
Accidents and Safety	There have been 15 accidents on the B2190 between A299 and Manston Road, of which one was fatal, two severe and 12 slight. As part of the development proposals the B2190 will be widened along its length between Columbus Avenue and Manston Road. The speed limit of the road is also to be reduced. In addition, a road safety scheme is proposed at the Spitfore Way/Alland Grange junction. The Proposed Development will therefore be of benefit to receptors and will have a positive effect on accidents and safety. On this basis, the magnitude of effect has been revised to minor.	Minor	Minor Adverse - Not significant

Links 35 and 36 – Manston Road east and west of Preston Road

14.10.19 As set out in the table in **Appendix 14.3**, the total flows are predicted to increase by 70% over a 24-hour period (an increase of 4,035 vehicles), 48% in the AM peak hour (an increase of 258 vehicles) and 77% in the PM peak period (331 vehicles). Based on **Table 14.17**, the sensitivity of the receptor has been identified as high and based on **Table 14.18**, as the change in vehicles is between 60 and 90%, the magnitude of transport effects is moderate. The overall significance is therefore considered to be Major adverse – Significant as set out in **Table 14.19**, and there is a need for an assessment of the environmental effects.

14.10.20 In assessing the environmental effects of the Proposed Development traffic, consideration should also be given to the existing situation and traffic flows. With reference to **Table 14.10** which sets out the results of junction counts undertaken in 2017, it can be seen that 24-hour, AM peak hour and PM peak hour traffic flows along this section of road (Manston Road west of the junction with Greensole Lane) 9,701 vehicles, 788 vehicles and 707 vehicles respectively. The Scenario 3 flows in **Appendix 14.3** are 9,813 vehicles, 801 vehicles and 759 vehicles respectively, a net change of 1% (+112 vehicles), 2% (+13 vehicles) and 7% (+52 vehicles). The traffic flows are less than 10% increase on the existing baseline. This is as a result of the reassignment of traffic onto the Manston-Haine link road.

14.10.21 It is therefore considered that the magnitude of change is negligible and the overall significance is therefore considered to be negligible as set out in **Table 14.19**, and there is no need for an assessment of the environmental effects.

14.10.22 It is also noted that the new link between the A299/A256 roundabout and the B2050 roundabout is likely to attract traffic as it is a quicker route to the A299 than existing.

Link 37 – Manston Road east of Passenger Access

14.10.23 As set out in the table in **Appendix 14.3**, the total flows are predicted to increase by 101% over a 24-hour period (an increase of 4,537 vehicles), 67% in the AM peak hour (an increase of 266 vehicles) and 94% in the PM peak period (337 vehicles). Based on **Table 14.17**, the sensitivity of the receptor has been identified as low and based on **Table 14.18**, as the change in vehicles is more than 90%, the magnitude of transport effects is major. The overall significance is therefore considered to be Moderate adverse – Significant as set out in **Table 14.19**, and there is a need for an assessment of the environmental effects.

14.10.24 In assessing the environmental effects of the Proposed Development traffic, consideration should also be given to the existing situation and traffic flows. With reference to **Table 14.10** which sets out the results of junction counts undertaken in 2017, it can be seen that 24-hour, AM peak hour and PM peak hour traffic flows along this section of road (Manston Road between Manston Road and Manston Court Road) 10,985 vehicles, 1,004 vehicles and 988 vehicles respectively. The Scenario 3 flows in **Appendix 14.3** are 9,019 vehicles, 661 vehicles and 696 vehicles respectively, a net change of -18%, -34% and -30%. The traffic flows are therefore an improvement on the existing baseline. This is as a result of the reassignment of traffic onto the Manston-Haine link road.

14.10.25 It is therefore considered that the magnitude of change is negligible and the overall significance is therefore considered to be negligible as set out in **Table 14.19**, and there is no need for an assessment of the environmental effects

Receptor 38 – Manston Road, north of Spitfire Way

14.10.26 As set out in the table in **Appendix 14.3**, the total HGV flows are predicted to increase by 38% in the PM peak hour (8 HGVs) as a result of the new access onto Manston road from the NGA. Based on **Table 14.17**, the sensitivity of the receptor has been identified as low and based on **Table 14.18**, as the change in HGVs is more than 30%, but less than 60%, the magnitude of transport effects is minor. The overall significance is therefore considered to be Minor adverse – Not significant as set out in **Table 14.19**, and there is no need for an assessment of the environmental effects.

14.11 Summary of Significance Evaluation

14.11.1 **Table 14.24** summarises the significance of road traffic effects on receptors as a result of changes in traffic flows on the local road network that would arise from the Proposed Development**.**

Table 14.24 Summary of Significance of Effects during Maximum Year of Operation (Year 20)

Link	Sensitivity of Receptor	Magnitude of Effect	Level of Significance	Environmental Effect	Significance[1]
Link 14 - A299 between A253 and A28	Negligible	Minor	Negligible	N/A	N/A

Inter-related Effects

14.11.2 The inter-related effect of multiple topics (noise, visual, air quality, socio-economics, health and well-being in addition to traffic and transport) acting in combination on the same human receptors (motor users, public transport users, pedestrians, cyclists, equestrians, occupiers of properties and tourist sites) is considered in **Chapter 18: Cumulative Effects**. No other inter-related effects are anticipated to arise as the receptors within this Chapter do not comprise potential receptors within the definitions used for other assessments within this ES.

14.11.3 Nonetheless, as noted above the predicted changes in traffic within this Chapter have been considered by the following topics to inform these environmental aspects:

- The effects on receptors for noise and air quality directly relates to the predicted increase in traffic flows as a result of proposed traffic on the highway network as a result of the Proposed Development. This is assessed in **Chapter 6: Air Quality** and **Chapter 12: Noise and Vibration**;
- The effects of increased traffic on views, visual amenity and scenic quality are assessed in **Chapter 11: Landscape and Visual Impact Assessment**;
- The potential effects of disruption to the local road network during construction and operation, and the impact on employee and customer access to local businesses, and on amenity, tourism and recreational activities, is assessed in **Chapter 13: Socio-economics**;
- The human health effects of traffic and transport changes as a result of the Proposed Development have been assessed within **Chapter 15: Health and Wellbeing;**
- The effects of road transport and traffic changes on greenhouse gas emissions, and the effect on human health as a result of air quality changes (linked to traffic and transport changes), compounded by climate change, have been assessed within **Chapter 16: Climate Change**; and
- The effects of traffic and transportation changes as a result of the Proposed Development and the impact this has on the potential likelihood and effects of major accidents or disasters has been assessed in **Chapter 17: Major Accidents and Natural Disasters**

Appendix 14.1
Accident Data

Map Reference	1st Road Class & No	Accident Severity	Accident Date	Time (24hr)	Lighting Conditions	Road Surface	Weather Conditions	Number of Vehicles	Number of Casualties	Local Authority	Grid Ref: Easting	Grid Ref: Northing	Location	Description
1	A299	3	04/07/2011	1741	1	1	1	2	1	E07000114	627566	166983	A299 Thanet Way Junction with A28, Birchington, Kent.	Veh 1 was in the left Hand Lane with Veh 2 in right Hand Lane both Going ahead on the A299. Veh 2 Travelled Forward and when Passed the Roundabout Looked to lef and Saw a Clear Area. V2 Indicated to Turn and Move to the left Hand Lane and Veh1 Had Travelled ahead and Collided with Veh 2. Appears Veh 1 was Trying to Undertake Veh 2 and Veh 2 Driver Had Blind Spot and Did Not See Veh 1.
2	A254	3	08/07/2011	1850	1	1	1	3	2	E07000114	635840	169460	A254 Ramsgate Road, O/S Qeqm Hospital, Margate, Kent	V2 and V3 Were Stationary in the Middle of Their Lane Allowing another Vehicle to Get into a Parking Space. Vehicle 1 Didn't Realise the Vehicles Were Stationary. V1 then Hit V2 in the Rear Pushing it into the Rear of V3.
3	A256	2	12/07/2011	0720	1	1	1	3	1	E07000114	635887	167065	Haine Road, Ramsgate, Kent	Veh 2 Has Turned right into Bijou Villas, V3 is Travelling Behind this and Slows to Allow the Turn. Veh1 is Travelling Towards Veh2. as the Veh2 Turns, Veh1 Has Hit Veh2 Causing the Driver of Veh1 to Hit Veh3 on the Bonnet Before Landing on the Floor. V1 Driver Taken to Qeqm with Injuries Detailing Fractured left Shin, Foot and Arm.
4	A254	3	02/07/2011	1700	1	1	9	2	4	E07000114	636428	167930	Westwood Road Rab, Broadstairs, Kent. (Mapped to Ref)	V2 was on the Roundabout Waiting for the Traffic in Front to Clear. when V1 Hit Back of V2 Causing Extensive Damage and Injury to the Driver and Two Passengers.
5	E4149	3	20/07/2011	1500	1	1	1	2	1	E07000114	633605	169302	High Street, Garlinge, Margate, Kent(Mapped to Ref)	Veh 2 Travelling Towards Shottendane Rd in Garlinge High Street, Veh 1 Travelling in the Opposite Direction. Wing Mirrors Hit, Damage Caused. Minor Injury to Driver of Veh 2.
6	A253	2	20/07/2011	0535	1	1	1	2	1	E07000114	628619	165572	A299 Monkton Roundabout Junction with Seamark Road, Monkton, Ramsgate, Kent.	V1 Pulled out of Canterbury Road (A299) onto Roundabout Colliding with V2 on Roundabout. V1 Driver Stated Did Not See V2. Driver of V2 was Knocked from hi Motorcycle Hitting Windscreen of V1 then onto Road.
7	A256	3	24/07/2011	1630	1	1	1	2	1	E07000114	634601	163904	A256 Sandwich Road, Ramsgate, Kent (Mapped to Ref)	V2 Had Broken down V1 Travelling Towards Ramsgate, as he Approached the Broken down Vehicle the Driver Stepped out V1 and Hit Driver Causing Injury.
8	A254	3	19/07/2011	1825	1	1	1	3	1	E07000114	635923	169268	Ramsgate Road J.W Nash Road, Margate, Kent.	V3 and V2 Were Stationary in Traffic on Ramsgate Road in the Direction of Farley Road from Nash Lane. V1 Collided with the Rear Wheel of V2. this Has Caused the Ride of V2 to Come off the Vehicle and Collide with V1 Causing Damage to the Windscreen and Bonnet of V1. V2 was Forced into the Rear Near Side of V3 Causing Damage to V3.
9	E4112	3	26/07/2011	1822	1	1	1	2	1	E07000114	634609	167272	Manston Court Road Junction with Preston Road, Ramsgate, Kent.	V1 V2 Travelling in Opposite Directions at Speed National Spped Limit- V1 Went Wide on a Slow Bend and Hit V2 Offside.
10	B2049	3	29/07/2011	2215	4	1	1	2	1	E07000114	635262	169685	Salmestone Rise, Margate, Kent	V2 Travelling Along Salmestone Rise Towards Traffic Lights. Travelling in the Direction of Shottendane Road. Lights Turned Green as They Approached So Travelled Through the Lights. V1 was Travelling from the Direction of Nash Lane, Jumped a Red Light at Speed & both Collided Mid Junction. V1 Failed to Stop
11	B2052	2	05/08/2011	0712	1	1	1	2	2	E07000114	634198	169959	B2052 George V Avenue Junction with Argyle Avenue, Margate, Kent.	V1 Travelling from Canterbury Road Along Argyle Avenue, Margate Travelled Through George V Avenue in the Path of V2 which was Travelling Along George V Avenue Towards Junction with Canterbury Road. Parked Vehicles Around Junction Area.
12	A254	3	08/08/2011	0900	1	1	1	2	1	E07000114	635721	169614	Ramsgate Road, Margate, Kent (Mapped to Police Ref 635725,169618)	V1 Going onto the Ramsgate Rd Towards Ramsgate, as V1 Has Pulled out Drv Hasn't Seen V2 a Pedal Cycle and V1 Has Knocked Cyclist off Bike. Ltd Location Information.
13	E4152	3	08/08/2011	1130	1	1	1	1	1	E07000114	635560	169575	Nash Court Gardens, Margate, Kent (Mapped to Ref 635560 169560)	V2 was Driving Along the Road at 20Mph or Less in a Built up Area with Cars Parked on both Sides when Suddenly Two Children Ran into the Road from Behind a Parked Van. V2 Broke Suddenly when the 2Nd Child Ran into the Drivers Door Panel
14	C229	2	03/08/2011	0546	1	1	1	3	2	E07000114	634672	168551	Manston Road, Manston, Kent (Mapped to Police Sketch)	V1 Travelling Behind V3. V2 in Opposite Carriageway Travelling Towards V1 and V3. V1 Overtakes V3 on Wrong Side of Road and Collides Head on with V2. the Rider of V1 Suffered Serious Injury. D1 is Currently in a Critical Condition.
15	E4150	3	13/08/2011	0830	1	2	2	2	1	E07000114	634101	169978	George V Avenue J/W Burlington Gardens, Margate, Kent. (Mapped to Grid Ref Provided)	V2 was Riding Along the Road when V1 Pulled out in Front of Him from the Side of the Road. V1 Pulled out Without Seeing V2, Causing V2 to Slam his Brakes On, Causing Him to Skid Along the Road Falling from his Motorcycle.
16	A254	3	22/08/2011	1230	1	1	1	2	1	E07000114	635721	169612	A254 - Ramsgate Road, Margate, Kent (Mapped to Ref 635720 169600)	Slow Moving Traffic Due to the Natural Flow, V1 Failed to Notice V2 Slowed to a Stop & Collided with V2's Rear Bumper, Minimal Damage Caused, Made Worse by Age o V1. Slight Injury to Passenger in V2 Who was Confirmed to Visit Hospital.
17	A28	3	03/08/2011	1556	1	1	1	1	2	E07000114	629313	167908	A28 Canterbury Road, St Nicholas at Wade, Kent. (Mapped to Exact Grid Ref Provided 10/10/11 Ac)	V1 was Travelling Along the A28 Towards Birchington when it Has Lost Control and Spun Around Hitting a Telegraph Pole on the Nearside. the Vehilce left the Roac Landing in the Nearby Field. the Driver Failed the Roadside Breath Test.
18	A28	3	28/08/2011	1000	1	1	1	1	1	E07000114	629964	168748	A28 - Canterbury Road, Birchington, Kent	Inft Parked N/S to Kerb, V1 Approached at Speed as Inft Stood Next to Drivers Door to Allow V1 to Pass. V1 Collided N/S Wing Mirror with Pedestrian Inft. V1 Failed to Stop but Pulled up Approx: 300 Metres up the Road to Adjust Wing Mirror then Drove Off. V1 Sign Written with - Birchwood Plumbing
19	C229	2	26/08/2011	1435	1	2	2	1	1	E07000114	634152	167784	Manston Road, 200 Metres North of Vincent Road, Margate, Kent	Casualty 1 was Walking Along the Eastern Side of Manston Road Pushing a Motorcycle. Vehicle 1 Travelling Southbound Along Manston Road Has Struck Casualty 1 anc the Motorcycle. Weather at the Time was Heavy Rain and Standing Water.

Appendix 14.2 (part 1)
KCC Comments on Manston Airport TA

Technical note:
Kent County Council Comments on Manston Airport TA.

This Technical note (TN) has been prepared to evaluate the comments received from Kent County Council (KCC) in July in response to the Manston Airport TA, and to hence begin outlining how they can be approached or more detailed justification as to why the figures have been calculated. This is the first note to be issues with comments that have been addressed to enable KCC to make a start reviewing the additional justification provided by Wood. Further iterations of this note will be issued including with further details on the technical work underpinning the traffic generation and distribution.

Table 1 – Traffic Generation and Distribution - KCC Comments – Wood Response

	KCC Comment	Wood Response
	Traffic/Trip generation	
	The trip generation methodology presented in the TA is heavily based on assumptions that are not adequately justified or referenced to appropriate 'real world' examples in a number of cases (notably HGV movement profiles and load factors, and airport staff shift patterns and staffing requirements). This limits the ability of the Highway Authority to comment on their validity with a sufficient degree of confidence	The following series of responses will provide the additional narrative or justification, based where possible on real world examples, to the methodology proposed within the Wood Transport Assessment traffic generation methodology. These responses will also as necessary detail the change in pure vehicles should an alternative strategy or approach be suggested by KCC. It is hoped that this narrative will give KCC the confidence that is required to agree with the traffic and transport generation figures for Manston Airport, though it is considered this can still be part of a short iterative process through the early weeks of October.
1.	It is forecast that a total of 340,758 tonnes of freight per annum will be reached in Year 20 (Table 6.3). If this is deemed to be the peak handling capacity of the facility, then an appropriate cap should be	TBC

	attached to any grant of planning consent to ensure that it is not exceeded.	
2.	The adjustment to the 'Total HGVs per annum' figures in Table 6.4 to allow for efficient working should be related to evidence from comparable facilities elsewhere within the UK.	The figure of 30% for efficient working has been assumed and is a very robust assessment. For comparison a look at the Domestic Road Freight Statistics from the DfT indicates that for ALL HGV traffic on UK Roads in 2004 only 27% would run empty, and in 2014 that percentage had increased marginally to 29% and has not varied much in the preceding years. As such this indicates that around 70% of vehicles are loaded from origin to destination while 30% are empty from origin to destination. The Wood TA could have sought to apply discounts for efficient working by discounting HGVs from the figures presented in the TA. Therefore, for a robust assessment a percentage of only 30% of vehicles loaded from origin to destination was used.
3.	It is not considered realistic that HGV trips to the cargo facility would arrive and depart in an even profile throughout a typical 24-hour period. It is considered likely that there would be peaks and troughs associated with flight arrivals and departures and/or specific market demands. Moreover, the Planning Authority may place restrictions on night flights and potentially also HGV movements. Appropriate sensitivity testing should be undertaken to allow for these scenarios.	In the absence of any information about scheduling of ATMS (which without specific contracts is not really possible), then evenly spreading movements across the day was a reasonable assumption. There is not expected to be a time critical component to the traffic as with either bellyhold (which is based on passenger scheduling) or express freight – late evening and early morning (unless such a carrier chooses to relocate from Stanstead because of night noise restrictions) and hence it is difficult to ascribe flight times to freight operators who will be driven by other considerations. To come up with an artificial schedule based on assumed geographical distribution of ATMS and therefore departure windows based on sector times would be possible but spurious. In the absence of any detailed scheduling info we could offer to provide a sensitivity test based on the airport schedule of flights that have been developed as part of the traffic generation methodology. The impacts however of changing the profile to peak the HGVs over the day time period would result in very little change in the HGV numbers from the cargo facility. If all HGVs deliveries to the site were paused 8pm to 4am (which is not at all likely) then with an

even distribution through the day the peak hour HGV trips would change as follows in Year 20;

- 24 hours Even Profile HGV Flows – AM Peak 5 Arrivals and Departures – PM Peak 5 Arrivals and Departures;
- No Night period HGV Flow – AM Peak 7 Arrivals and Departures – PM Peak 7 Arrivals and Departures

It must also be noted of these total HGV numbers, 50% of these are proposed to go directly to the Northern Grass area and not affect the wider network.
As such with the low change in HGV flow using a differing profile, which cannot be defined at this stage in any event it is hope that KCC will be able to agree that the profile used reasonable and that do not need to be amended in the traffic generation calculations set out in the TA.

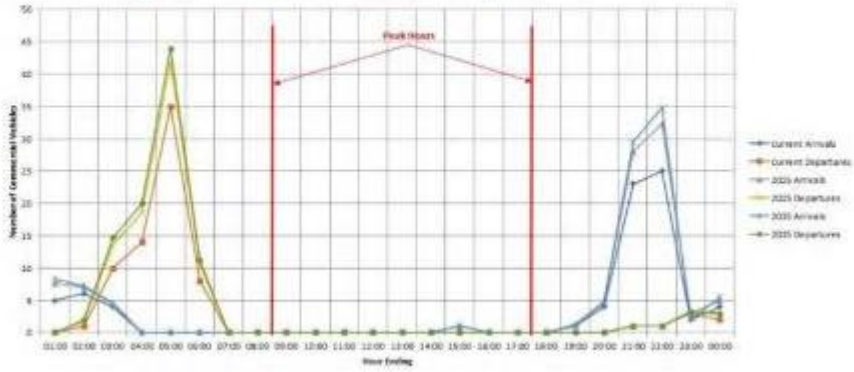
Finally, by way of a real world example. The freight hub being constructed at East Midlands Airport by UPS has provided a detailed narrative of the commercial vehicles and provide an indication of the types of delivery schedules you may expect from a site such as is proposed at Manston. Although it's not proposed that vehicle movements during the day would be as low as shown in the figure below, it does provide credence that freight operators focus delivery schedule peaks over the night time hours and by and large avoid the peak hours. As such the even spreading of the HGV rather than a peaking approach that has been applied in the Manton Airport DCO could be considered a robust form of assessment.

wood.

7.1.2 UPS Commercial Vehicles

UPS has also supplied AECOM with commercial vehicle trip data obtained at the existing EMA UPS premises. As with the personnel data, UPS has also provided forecast commercial vehicle trips by time of arrival and departure (**Appendix C**). **Figure 7.2** summarises the current and forecast 2021 and 2035 commercial vehicles trips at the existing (Current) and proposed Air Gateway (2021/2035), compared to the identified AM and PM peak hours.

Figure 7.2 Existing and Forecast Commercial Vehicle Trips



AECOM
22/78

4.	It is pleasing to see that the 'Airport Passenger Flights per Day, per Carrier' figures in Table 6.6 is now informed by data from comparable UK airports. Whilst these figures are difficult to contest in the absence of other data sources (e.g. TRICS), it is nevertheless necessary to consider the scope for larger planes to operate from Manston, as these would inevitably generate significantly greater levels of passenger activity. As such, further justification for the assumptions made will be necessary, unless the applicant is willing to accept a restriction on the type and frequency of passenger planes that would operate from the airport.	TBC

5.	It is not considered realistic that 80% of departing passengers would arrive at the airport three hours before flight departure. It is envisaged that passenger flights would be short-haul in nature and since the car park is located close to the terminal, and the terminal facilities will be relatively limited in comparison to other UK airports, it is more likely that the majority of passengers would arrive 1-2 hours before their departure time. Indeed, with the increasing uptake of online check-in options and the tendency for short-haul passengers not to place their luggage in the aircraft hold, it is likely that passenger arrival times of less than one-hour prior to departure will be relatively commonplace. Again, evidence from similar airports such as Southend would be valuable in this respect.	TBC
6.	It is not clear why the passenger mode share for "shared taxi" is anticipated to treble during the daytime (from 2% to 6%) and more than quadruple during the night time (from 2.8% to 11%) over a 20-year period – thereby surpassing the "taxi" mode share – as no significant changes to the relative attractiveness of this mode are proposed.	TBC
7.	As outlined within KCC 's previous response, there is limited information provided as to how the fuel tanker trip generation has been calculated. Further justification will be required in order for there to be sufficient confidence in these figures.	The fuel tanker trips have been calculated from a series of complex calculations on the needs for fuel based on the anticipated numbers of flights arriving and departing the site for freight and passengers. A breakdown of these calculations for the year 20 of the proposed programme (worst case) is set out below detailing how the figures of 21 arrivals and 21 departures of fuel tanker have been derived in the TA. Year 20 • Prediction for freight flights a fuel burn of 257,722 (Klitres) per year; • Prediction for passenger flights a fuel burn of 27,898 (Klitres) per year; • Total fuel burn (or fuel requirements) of 285,620 (Klitres) per year;

	• Fuel tankers assumed to be able to carry 38,000 litres of fuel; • As such 285,620 (Klitres) of fuel requires 7,516 fuel tankers per year; and • This is calculated as 21 tankers of fuel per day (rounded up) with deliveries across the 365 days of the year. • Fuel deliveries are, as set out in the TA, anticipated to arrive in a uniform pattern across the 24 hours of the day as the facility cannot accommodate multiple vehicles per hour. Tankers take some time to discharge the contents of the tanker and as such a schedule with the facility operating cross 24 hours is required. The same calculations have been undertaken based on fuel requirements for years 2-20. In summary this results in peak hour impacts of 1 arrival and 1 departures in the AM and PM peak hours and as such the sensitivity of the fuel tanker deliveries, which access directly onto the A299 via Canterbury Road West is not considered materially important in the overall traffic generation calculations of the proposed airport.
8. With respect to the trip generation methodology for the employment uses in the Northern Grass area and for the museum, the TRICS-based approach adopted in the TA is considered appropriate, albeit it is surprising that the trip generation of the existing museum has not been used as a direct reference.	It is pleasing to see that the trip generation methodology using trips is considered appropriate. In terms of the museums, no traffic counts have been undertaken into and out of the museum. It is felt that this would not be appropriate as the scale of the current museums and that which is proposed will be different. As such the approach to use larger museums from the TRICs database was felt the more robust approach. The traffic generated by the museum however is a very small part of overall traffic generation mix of the proposed development. In the AM Peak it is proposed the site would generate 2 arrivals and 1 departure and in the PM Peak 2 arrivals and 7 departures.

		It is hoped therefore that KCC will understand the justification set out above and agree that the traffic generation calculations for this element of the methodology can remain as set out in the DCO Submission Transport Statement.
9.	It is noted that the office/administration staff are now assumed to follow a more traditional 9-5 working pattern, which is an improvement on previous assumptions. However, the majority of the operational staff shift patterns appear to avoid the AM and PM peak hours on the local highway network, which is considered overly optimistic and could potentially underestimate their impact. It is recommended that a sensitivity test is applied, whereby at least one-third of the operational staff generate peak hour trips.	It has been identified that first flights departing smaller airports typically depart between 6.30-7.00am. Staff will be on site at 5.00am to open up and start processing passengers from 5.30am. If an aircraft is based at the airport the final return flight will typically be 10-11.00pm with the terminal being clear of passengers at approximately 11pm. Typically the final passenger processed for departure will be at approximately 8-9pm having arrived at the airport from 7pm onwards. Airports work on a two shift pattern per day and a three shift rotation to cover 7 days a week with typically 40-48 hrs per shift depending on arrival patterns. Above is the case at Newquay and will be so at other similar small airports. The actual patterns for different types of staff (ATC vs security vs ramp vs check-in) will be different but that is too much detail to offer at this stage to define, however the estimates on shift patterns presented in the TA figures provided a robust picture of what may be implemented which corresponds with real world examples.
	Traffic/Trip distribution	
10.	It is stated in Paragraph 6.5.4 of the TA that the scope of the assessed highway network has been agreed with KCC; however, this is not the case. Whilst the area within which material local impacts are likely to be experienced will likely be contained within the model study area, trip origins and destinations will likely be spread over a much wider area.	The scope of assessment for revised assessment work within the strategic model is being scoped with KCC and the following junctions have now been established as a starting point following and email with James Wraight on 28th of September 2018. • Junction 1: A256 / Sandwich Rd (Four arm standard roundabout); • Junction 2: A299 / A256 / Cottington Link Rd (Four arm standard roundabout); • Junction 4: A299 / B2190 (Four arm standard roundabout); • Junction 6: A299 / Seamark Rd / A253 / Willetts Hill (Five arm standard roundabout); • Junction 7: A299 / A28 (Five arm standard roundabout);

- Junction 8: A28 / Park Ln / Station Rd (Three arm mini roundabout with left in / left out simple priority);
- Junction 10: Shottendane Rd / Manston Rd / Margate Hill (Four arm staggered);
- Junction 12: Manston Road / B2050 / Spitfire Way (Four arm staggered priority);
- Junction 13: Manston Court Road / B2050 (Three arm priority);
- Junction 15: Manston Rd / Hartsdown Rd / Tivoli Rd / College Rd / Nash Rd (Five arm signalised);
- Junction 16: Ramsgate Rd / College Rd / A254 / Beatrice Rd (Five arm signalised);
- Junction 17: Ramsgate Road / Poorhole Lane / Margate Road / Star Lane (Four arm standard roundabout);
- Junction 18: Star Ln / Manston Court Rd (Left in / left out simple priority);
- Junction 20a: A256 (N) / A256 (S) / Manston Road East (Three arm priority);
- Junction 20b: A256 / Manston Road West (Three arm standard roundabout);
- Junction 21a: Canterbury Road / Haine Road (Three arm standard roundabout);
- Junction 21b: A299 / A256 / Sandwich Rd / Canterbury Rd E (Four arm signalised);
- Junction 22: Airport Access (Left in / left out priority);
- Junction 24: Star Lane Link / Nash Road (Four arm standard roundabout);
- Junction 25: Tesco Access (Three arm standard roundabout);
- Junction 26: Newington Rd / Manston Rd (Three arm mini roundabout);
- Junction 27: Newington Rd / High Street (Three arm mini roundabout); and
- Junction 28: Wilfred Rd / A255 / Grange Rd (Four arm signalised).

	These junctions form "reasonable coverage" and it's been agreed that this will be developed as part of an iterative process. It is hoped that this discussion will be wrapped up at the meeting with KCC on the 11th of October.
11. There is a lack of robust justification for certain aspects of the trip distribution methodology presented. Examples include the assumed origins and destinations of passenger and freight trips within broad geographical areas, which are simply attributed to the "wider project team". With respect to the latter trip category, it is unclear why international air freight would be directed to/from the international ports of Dover, Folkestone (Channel Tunnel) and Ramsgate. It is also disputed that there are notable freight distribution sites in the Ashford area – there are in fact greater concentrations of these sites in the Sittingbourne, Maidstone and Dartford areas of Kent.	TBC
12. The gravity model approach to distributing passenger trips is considered appropriate in principle, albeit if first-hand information from the most recent period of passenger operations at Manston is available, this would be preferred.	It is pleasing to see KCC agreeing that the gravity model approach for distributing passengers is appropriate. The details on the most recent passenger operations at Manston are not available to us to use.
13. Whilst the gravity model approach to distributing employee trips to/from the Northern Grass area is acceptable, this should be cross-referenced with 2011 Census Journey to work data for the local Middle-level Super Output Areas for validation purposes.	The detailed gravity models for this element of the site have already been based on the Mid-Level Super output areas for the 2011 census (Journey to work data) that KCC have suggested in this comment. The only exceptions to this are for locations outside Thanet where it was appropriate to gather data from a larger source such as district level.
14. It is not considered appropriate to distribute the Northern Grass area HGV trips on the same basis as the freight trips, as the nature of these businesses may be significantly different. It is considered that their catchment area is likely to be more localised.	TBC

Appendix 14.2 (part 2)
Wood Response to KCC Comments on Manston Airport TA

Technical note:

Wood Response to Kent County Council Comments on Manston Airport TA. Version 3

This Technical note (TN) has been prepared to evaluate the comments received from Kent County Council (KCC) in July in response to the Manston Airport TA, and to hence begin outlining how they can be approached or more detailed justification as to why the figures have been calculated.

This is the third iteration of note addressing the outstanding issues raised by KCC related to points 6, 11, 13 and 14.

The remaining comments were provided with detailed justifications or where necessary changes that need to be applied to the Manston Airport DCO traffic generation methodology (related to passenger arrival times to the airport). These comments have been accepted and, on an email, received on the 26th of October 2018 from Paul Lulham it was staged that KCC are *"Generally happy with the justification provided and/or consider that any further revisions would not materially affect the outcome of the further round of modelling"*. As such no further discussion on these points is required at this stage.

Table 1 – Traffic Generation and Distribution - KCC Comments – Wood Response

	KCC Comment	Wood Response	KCC/DHA Transport Response	Wood Response
	Traffic/Trip generation The trip generation methodology presented in the TA is heavily based on assumptions that are not adequately justified or referenced to appropriate 'real world' examples in a number of cases (notably HGV movement profiles and load factors, and airport staff shift patterns and staffing requirements). This limits the ability of the Highway Authority to comment on their validity with a sufficient degree of confidence	The following series of responses will provide the additional narrative or justification, based where possible on real world examples, to the methodology proposed within the Wood Transport Assessment traffic generation methodology. These responses will also as necessary detail the change in pure vehicles should an alternative strategy or approach be suggested by KCC. It is hoped that this narrative will give KCC the confidence that is required to agree with the traffic and transport generation figures for Manston Airport, though it is considered this can still be part of a short iterative process through the early weeks of October.		
1.	It is forecast that a total of 340,758 tonnes of freight per annum will be	Aspects such as this are being dealt with by RiverOak's solicitor's BDB.	**Comments Accepted**	N/A

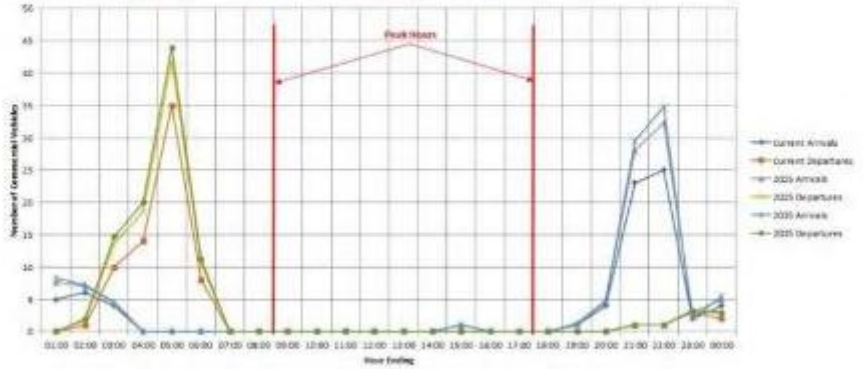
	reached in Year 20 (Table 6.3). If this is deemed to be the peak handling capacity of the facility, then an appropriate cap should be attached to any grant of planning consent to ensure that it is not exceeded.			
2.	The adjustment to the 'Total HGVs per annum' figures in Table 6.4 to allow for efficient working should be related to evidence from comparable facilities elsewhere within the UK.	The figure of 30% for efficient working has been assumed and is a very robust assessment. For comparison a look at the Domestic Road Freight Statistics from the DfT indicates that for ALL HGV traffic on UK Roads in 2004 only 27% would run empty, and in 2014 that percentage had increased marginally to 29% and has not varied much in the preceding years. As such this indicates that around 70% of vehicles are loaded from origin to destination while 30% are empty from origin to destination. The Wood TA could have sought to apply discounts for efficient working by discounting HGVs from the figures presented in the TA. Therefore, for a robust assessment a percentage of only 30% of vehicles loaded from origin to destination was used.	**Comments Accepted**	N/A
3.	It is not considered realistic that HGV trips to the cargo facility would arrive and depart in an even profile throughout a typical	In the absence of any information about scheduling of ATMS (which without specific contracts is not really possible), then evenly spreading movements across the day was a reasonable assumption. There is not expected to be a time critical component to the traffic as with either bellyhold (which is based on passenger scheduling) or express freight – late evening and early morning (unless such a carrier chooses to relocate from Stanstead because of night noise restrictions) and hence it is difficult to ascribe flight times to freight operators who will be driven by other considerations.	**Comments Accepted**	N/A

24-hour period. It is considered likely that there would be peaks and troughs associated with flight arrivals and departures and/or specific market demands. Moreover, the Planning Authority may place restrictions on night flights and potentially also HGV movements. Appropriate sensitivity testing should be undertaken to allow for these scenarios.	To come up with an artificial schedule based on assumed geographical distribution of ATMS and therefore departure windows based on sector times would be possible but spurious. In the absence of any detailed scheduling info we could offer to provide a sensitivity test based on the airport schedule of flights that have been developed as part of the traffic generation methodology. The impacts however of changing the profile to peak the HGVs over the day time period would result in very little change in the HGV numbers from the cargo facility. If all HGVs deliveries to the site were paused 8pm to 4am (which is not at all likely) then with an even distribution through the day the peak hour HGV trips would change as follows in Year 20; • 24 hours Even Profile HGV Flows – AM Peak 5 Arrivals and Departures – PM Peak 5 Arrivals and Departures; • No Night period HGV Flow – AM Peak 7 Arrivals and Departures – PM Peak 7 Arrivals and Departures It must also be noted of these total HGV numbers, 50% of these are proposed to go directly to the Northern Grass area and not affect the wider network. As such with the low change in HGV flow using a differing profile, which cannot be defined at this stage in any event it is hope that KCC will be able to agree that the profile used reasonable and that do not need to be amended in the traffic generation calculations set out in the TA. Finally, by way of a real world example. The freight hub being constructed at East Midlands Airport by UPS has provided a detailed narrative of the commercial vehicles and provide an indication of the types of delivery schedules you may expect from a site such as is proposed at Manston. Although it's not proposed that vehicle movements during the day would be as low as shown in the figure below, it does provide credence that freight operators focus delivery schedule peaks over the night time hours and by and large avoid the peak hours. As such the even spreading of the HGV rather than a peaking approach that has been applied in the Manton Airport DCO could be considered a robust form of assessment.

7.1.2 UPS Commercial Vehicles

UPS has also supplied AECOM with commercial vehicle trip data obtained at the existing EMA UPS premises. As with the personnel data, UPS has also provided forecast commercial vehicle trips by time of arrival and departure (**Appendix C**). **Figure 7.2** summarises the current and forecast 2021 and 2035 commercial vehicles trips at the existing (Current) and proposed Air Gateway (2021/2035), compared to the identified AM and PM peak hours.

Figure 7.2 Existing and Forecast Commercial Vehicle Trips



AECOM
22/78

4.	It is pleasing to see that the 'Airport Passenger Flights per Day, per Carrier' figures in Table 6.6 is now informed by data from comparable UK airports. Whilst these figures are difficult to contest in the absence of other	Aspects such as this are being dealt with by RiverOak's solicitor's BDB.	**Comments Accepted**

	data sources (e.g. TRICS), it is nevertheless necessary to consider the scope for larger planes to operate from Manston, as these would inevitably generate significantly greater levels of passenger activity. As such, further justification for the assumptions made will be necessary, unless the applicant is willing to accept a restriction on the type and frequency of passenger planes that would operate from the airport.			
5.	It is not considered realistic that 80% of departing passengers would arrive at the airport three hours before flight departure. It is envisaged that	The arrival times set out in the Transport Assessment are intended to read as 2 – 3 hours and 1 – 2 hours before flights and have been based on a review of nationwide airport recommendations on arrival times before flight departures. Most airports, including smaller airports such as Southend, advise that passengers arrive at least two hours before flights to allow plenty of extra time to check-in and pass through security. Passengers are generally advised to arrive on the 'airside' at least 30 minutes before flight departure time as boarding closes at least 20 minutes before departure for most flights/airports; some have longer times. Less than 1 hour was not identified due to the time required to	**Comments Accepted**	N/A

passenger flights would be short-haul in nature and since the car park is located close to the terminal, and the terminal facilities will be relatively limited in comparison to other UK airports, it is more likely that the majority of passengers would arrive 1-2 hours before their departure time. Indeed, with the increasing uptake of online check-in options and the tendency for short-haul passengers not to place their luggage in the aircraft hold, it is likely that passenger arrival times of less than one-hour prior to departure will be relatively commonplace. Again, evidence from similar airports arrive at the airport, park and walk to the terminal building, check-in (if appropriate) and get through security, etc.

The airport will carry predominantly short haul, but will also have the potential for long haul flights (as per its previous operations).

There is a difficulty in obtaining information on passenger arrival times at other comparable airports to support the assumptions made within the Transport Assessment. Further consideration of passenger arrival times has been made and in response to the comments, a robust approach has been taken which assumes a greater proportion of passengers arriving nearer the flight time as follows:

- 30% of passengers arrive 2 – 3 hours before the flight;
- 70% of passengers arrive 1 - 2 hours before the flight

This will result in no change to the AM peak period and an additional 102 vehicles in the PM peak period by Year 20.

	such as Southend would be valuable in this respect.			
6.	It is not clear why the passenger mode share for "shared taxi" is anticipated to treble during the daytime (from 2% to 6%) and more than quadruple during the night time (from 2.8% to 11%) over a 20-year period – thereby surpassing the "taxi" mode share – as no significant changes to the relative attractiveness of this mode are proposed.	Shared taxis can also be described as demand responsive transport, commercial shared taxis, or commercially operated airport shuttle services, and are common in countries such as the USA, Canada, Australia and New Zealand, as well as many countries in the developing world. A shared taxi offers the convenience of a taxi, i.e. a door-to-door journey, although will take longer due to multiple passenger drop-offs/pick ups, and a significantly lower price. This is a growing sustainable transport opportunity in the UK and it is envisioned that it will continue to grow as Manston Airport is built out and is something that would be promoted as part of Travel Plan and Surface Access initiatives. Commercial services which currently exist in the UK include: • UberPool which turns a standard Uber into a miniature bus service by matching riders travelling in the same direction. Passengers request the cars as they usually would but can have their fares reduced by being connected with other people, who share the journey and help subsidise the trip. This is currently operating in Zones 1 and 2 as well as Heathrow Airport. • ArrivaClick which has recently started in Liverpool and Sittingbourne. Passengers who use the on-demand ArrivaClick service determines the route by entering their chosen pick-up point and destination. The technology matches people travelling in the same direction to the right vehicle. The app allows people to track their chosen vehicle, tell them the name of the driver and reserve a seat. With no fixed routes, journeys are determined by where passengers want to go within an area running from the city centre to Liverpool John Lennon Airport. Arriva has reported said that when the same technology was piloted in Kent, more than half its passengers had switched from private cars with 43% using it for their daily commute.[1]. As is common at a number of airports, hotels in the vicinity offer car parking and a shuttle service to the airport. The assumption regarding a higher percentage of shared	**Response on 26th October 2018** I am not persuaded by the justification provided here. The commercial shared taxi / airport shuttle services cited are unlikely to be as viable in relation to Manston, in view of its relatively peripheral location, its relatively local catchment area (which limits the potential for hotel stays pre- or post-flight) and the fact that products such as	**Response on 30th October 2018** This response appears to be rather shortsighted, focussing on the 'now' rather than considering the transport situation over the next 20 years, which requires a more visionary stance. KCC has identified the need for new roads to accommodate growth in the residential and working populations. This needs to be complemented by

[1] https://www.bbc.co.uk/news/uk-england-merseyside-44614616

taxi during the night time is because it is more likely that those passengers catching early morning flights will book a hotel and use a private shuttle service to the airport. It is anticipated that this situation would increasingly occur as passenger numbers increase over the 20-year period.

The impact of these percentages that have been proposed are set out below with the maximum numbers of shared taxi trips split out for the year 20 scenario. As can be seen the increase from 6% to 11% for the night team peak only effects a few of the slight arrivals and departures and these increases fall outside of the peak hours.

For the remainder of the day the figures of vehicle generation for arrivals and departures seem a reasonable number. It should be noted however these figures would change of the arrival and departure profile of passenger's changes as set out in point five above.

Time	Departure (Flights) – Arrival to the Airport (Vehicle)		Arrival (Flights) – Departure from the Airport (Vehicle)

15:00 - 16:00	6%	8	6%	10

Uber are not currently available in East Kent. They are generally most effective in high-density metropolitan areas where the scope for lift-sharing is that much greater. I would therefore expect this mode to capture a very small percentage of passenger movements, with the rest likely to use conventional taxi services or be given lifts by friends or relatives.

encouraging and adopting new approaches to travel and transport in the district. The Airport Travel Plan would need to include targets and initiatives to develop shared taxi, and this would help support the growth of this type of scheme for the district.

As identified in our response, the shared taxi scheme ArrivaClick has been introduced this year in Sittingbourne in Kent, a town of comparable population to Margate, and smaller than the combined population of

23:00 - 00:00				

Note the above flows are revised based on the new passenger arrivals times to the airport as set out in point 5 of this TN.

Margate, Ramsgate and Broadstairs. This is not a high densely populated metropolitan area, and whilst it is too early to evaluate the success of the scheme, Arriva must have considered that there was potential for the service in order to introduce within this market town.

Whilst the airport has a peripheral location, there will be demand for hotel provision from a proportion of the 20% that are travelling from West Kent, London and further afield.

	In conclusion, neither Wood nor RiverOak can provide empirical evidence of shared taxi as a mode as this is a new initiative to the UK. If there is the view from KCC that shared taxi is unlikely to be a viable mode of travel, then we would need to discuss this with KCC in terms of revised figures. It is noted however, that in terms of traffic flows, the numbers are low and reducing the proportion of shared taxi would have an insignificant effect on overall traffic generation, particularly in the peak hours (the AM is 0), as set out in the table

				within our original response.
7.	As outlined within KCC 's previous response, there is limited information provided as to how the fuel tanker trip generation has been calculated. Further justification will be required in order for there to be sufficient confidence in these figures.	The fuel tanker trips have been calculated from a series of complex calculations on the needs for fuel based on the anticipated numbers of flights arriving and departing the site for freight and passengers. A breakdown of these calculations for the year 20 of the proposed programme (worst case) is set out below detailing how the figures of 21 arrivals and 21 departures of fuel tanker have been derived in the TA. *Year 20* • Prediction for freight flights a fuel burn of 257,722 (Klitres) per year; • Prediction for passenger flights a fuel burn of 27,898 (Klitres) per year; • Total fuel burn (or fuel requirements) of 285,620 (Klitres) per year; • Fuel tankers assumed to be able to carry 38,000 litres of fuel; • As such 285,620 (Klitres) of fuel requires 7,516 fuel tankers per year; and • This is calculated as 21 tankers of fuel per day (rounded up) with deliveries across the 365 days of the year. • Fuel deliveries are, as set out in the TA, anticipated to arrive in a uniform pattern across the 24 hours of the day as the facility cannot accommodate multiple vehicles per hour. Tankers take some time to discharge the contents of the tanker and as such a schedule with the facility operating cross 24 hours is required. The same calculations have been undertaken based on fuel requirements for years 2-20. In summary this results in peak hour impacts of 1 arrival and 1 departures in the AM and PM peak hours and as such the sensitivity of the fuel tanker deliveries, which access directly onto the A299 via Canterbury Road West is not considered materially important in the overall traffic generation calculations of the proposed airport.	**Comments Accepted**	N/A
8.	With respect to the trip generation methodology for the	It is pleasing to see that the trip generation methodology using trips is considered appropriate. In terms of the museums, no traffic counts have been undertaken into and out of the	**Comments Accepted**	N/A

	employment uses in the Northern Grass area and for the museum, the TRICS-based approach adopted in the TA is considered appropriate, albeit it is surprising that the trip generation of the existing museum has not been used as a direct reference.	museum. It is felt that this would not be appropriate as the scale of the current museums and that which is proposed will be different. As such the approach to use larger museums from the TRICs database was felt the more robust approach. The traffic generated by the museum however is a very small part of overall traffic generation mix of the proposed development. In the AM Peak it is proposed the site would generate 2 arrivals and 1 departure and in the PM Peak 2 arrivals and 7 departures. It is hoped therefore that KCC will understand the justification set out above and agree that the traffic generation calculations for this element of the methodology can remain as set out in the DCO Submission Transport Statement.		
9.	It is noted that the office/administration staff are now assumed to follow a more traditional 9-5 working pattern, which is an improvement on previous assumptions. However, the majority of the operational staff shift patterns appear to avoid the AM and PM peak hours on the local highway network, which is considered overly	It has been identified that first flights departing smaller airports typically depart between 6.30-7.00am. Staff will be on site at 5.00am to open up and start processing passengers from 5.30am. If an aircraft is based at the airport the final return flight will typically be 10-11.00pm with the terminal being clear of passengers at approximately 11pm. Typically the final passenger processed for departure will be at approximately 8-9pm having arrived at the airport from 7pm onwards. Airports work on a two shift pattern per day and a three shift rotation to cover 7 days a week with typically 40-48 hrs per shift depending on arrival patterns. Above is the case at Newquay and will be so at other similar small airports. The actual patterns for different types of staff (ATC vs security vs ramp vs check-in) will be different but that is too much detail to offer at this stage to define, however the estimates on shift patterns presented in the TA figures provided a robust picture of what may be implemented which corresponds with real world examples.	**Comments Accepted**	N/A

	optimistic and could potentially underestimate their impact. It is recommended that a sensitivity test is applied, whereby at least one-third of the operational staff generate peak hour trips.			
	Traffic/Trip distribution			
10.	It is stated in Paragraph 6.5.4 of the TA that the scope of the assessed highway network has been agreed with KCC; however, this is not the case. Whilst the area within which material local impacts are likely to be experienced will likely be contained within the model study area, trip origins and	The scope of assessment for revised assessment work within the strategic model is being scoped with KCC and the following junctions have now been established as a starting point following and email with James Wraight on 28th of September 2018. • Junction 1: A256 / Sandwich Rd (Four arm standard roundabout); • Junction 2: A299 / A256 / Cottington Link Rd (Four arm standard roundabout); • Junction 4: A299 / B2190 (Four arm standard roundabout); • Junction 6: A299 / Seamark Rd / A253 / Willetts Hill (Five arm standard roundabout); • Junction 7: A299 / A28 (Five arm standard roundabout); • Junction 8: A28 / Park Ln / Station Rd (Three arm mini roundabout with left in / left out simple priority); • Junction 10: Shottendane Rd / Manston Rd / Margate Hill (Four arm staggered); • Junction 12: Manston Road / B2050 / Spitfire Way (Four arm staggered priority); • Junction 13: Manston Court Road / B2050 (Three arm priority);	**Comments Accepted**	N/A

	destinations will likely be spread over a much wider area.	• Junction 15: Manston Rd / Hartsdown Rd / Tivoli Rd / College Rd / Nash Rd (Five arm • signalised); • Junction 16: Ramsgate Rd / College Rd / A254 / Beatrice Rd (Five arm signalised); • Junction 17: Ramsgate Road / Poorhole Lane / Margate Road / Star Lane (Four arm standard roundabout); • Junction 18: Star Ln / Manston Court Rd (Left in / left out simple priority); • Junction 20a: A256 (N) / A256 (S) / Manston Road East (Three arm priority); • Junction 20b: A256 / Manston Road West (Three arm standard roundabout); • Junction 21a: Canterbury Road / Haine Road (Three arm standard roundabout); • Junction 21b: A299 / A256 / Sandwich Rd / Canterbury Rd E (Four arm signalised); • Junction 22: Airport Access (Left in / left out priority); • Junction 24: Star Lane Link / Nash Road (Four arm standard roundabout); • Junction 25: Tesco Access (Three arm standard roundabout); • Junction 26: Newington Rd / Manston Rd (Three arm mini roundabout); • Junction 27: Newington Rd / High Street (Three arm mini roundabout); and • Junction 28: Wilfred Rd / A255 / Grange Rd (Four arm signalised). These junctions form "reasonable coverage" and it's been agreed that this will be developed as part of an iterative process. It is hoped that this discussion will be wrapped up at the meeting with KCC on the 11th of October.		
11.	There is a lack of robust justification for certain aspects of the trip	The passenger distribution assumptions have been based on EU actual ticketing data and on 2011 CAA data. In summary the data shows substantive market penetration in east Kent, modest from Mid Kent – Medway towns, Maidstone etc. and depending on rail access some minor	**Response on 26th October 2018**	Appendices sent 29th October 2018 and comment on

distribution methodology presented. Examples include the assumed origins and destinations of passenger and freight trips within broad geographical areas, which are simply attributed to the "wider project team". With respect to the latter trip category, it is unclear why international air freight would be directed to/from the international ports of Dover, Folkestone (Channel Tunnel) and Ramsgate. It is also disputed that there are notable freight distribution sites in the Ashford area – there are in fact greater concentrations of these sites in the Sittingbourne, Maidstone and	penetration into the south east London market. There is little penetration above the River Thames because of the time and cost of travel to the Manston site and the presence of Stansted and Southend Airports. The Lower Thames Crossing could change this dynamic in the floating catchment but not the core catchment. Any location in Kent which is within one hour's drive of London Gatwick will see most traffic gravitating there, only a small amount will be generated by Manston on routes London Gatwick does not serve (e.g. Manchester, Liverpool, and Newcastle) or where it offers cheaper more convenient access to short haul leisure flights. The catchment boundary falls close to Maidstone, although concerns about journey time reliability on the M25 might extend this closer to Sevenoaks because the journey time to Manston would be much more certain. Appendix 1 shows the market analysis of the South East area and the demand profile Manston Airport could generate. Which was presented to the Airport Commission Davies Commission in 2014 by Manston Airport. A similar exercise has been undertaken for freight trips from the airport (drawings to support this are currently being prepared). However, the key points of this are that the distribution catchment for freight trips covers all the M25 and 30-60 minutes out from the M25 the Southern and western aerial routes (as well as the inner elements of the M25). Analysis has been undertaken GIS software to understand the potential distribution of freight trips by analysing trucking times from the Manston Airport site. Two trucking times for a freight vehicle have been assessed, 135 minutes (including a 15 minute delay for heavy traffic) from Manston Airport and 150 minutes (including a 10 minute delay for rush hour traffic) from Manston airport. GIS software provided an output of the distance on a map of the UK of the distance a HGV freight vehicle could achieve in the two trucking times used in the analysis. The results showed that the areas that can be reached in the 135 minute trucking time include all areas of Kent, areas along the M25 corridor to the M3 at Woking and to the M1 at St Albans, along the M23/A23 corridor to Haywards heath in Sussex and to the north along the M11 corridor to Bishops Stortford. The 150 minute trucking time would serve all areas in the 135 minute trucking time with the addition of all junctions of the M25, The M1 corridor to Luton, the A1(M) to	This response assumes knowledge about the dynamics of market penetration and freight journey times that require further explanation. Moreover, the Appendices referred to were not attached to your email. **Response on 30th October 2018** I am content with the passenger trip distribution, which is usefully informed by actual ticketing data from EU Jet's operations at Manston. With regard to the freight trip distribution,	these provided on 30th October. **Response on 30th October 2018** It is pleasing that the provision of the appendices has addressed the issues remaining with passenger distribution which as partiocually resolved the issues in point 11. All that remains is

	Dartford areas of Kent.	Stevenage, M11 to Stevenage, M23/A23 corridor to Brighton and the M3 to Farnborough. The areas located within the trucking time zones have reasonable journey times to Manston Airport. Air cargo trips generated in this area could serve the freight terminal at Manston Airport. Appendix 2 sets out the plans of the GIS assessment set out above. As with the freight capacity information is also from data submitted to the Davies Commission.	could you please explain the significance of the 135 minute and 150 minute trucking times?	to provide more detailed of the trucking times and this will be provided separately once the member of the project team has provided a more detailed narrative to Wood to send onto KCC.
12.	The gravity model approach to distributing passenger trips is considered appropriate in principle, albeit if first-hand information from the most recent period of passenger operations at Manston is available, this would be preferred.	It is pleasing to see KCC agreeing that the gravity model approach for distributing passengers is appropriate. The details on the most recent passenger operations at Manston are not available to us to use.	**Comments Accepted**	N/A
13.	Whilst the gravity model approach to distributing	The detailed gravity models for this element of the site have already been based on the Mid-Level Super output areas for the 2011 census (Journey to work data) that KCC have	**Response on 26th October 2018**	**Response on 30th October 2018**

employee trips to/from the Northern Grass area is acceptable, this should be cross-referenced with 2011 Census Journey to work data for the local Middle-level Super Output Areas for validation purposes.	suggested in this comment. The only exceptions to this are for locations outside Thanet where it was appropriate to gather data from a larger source such as district level.	This is noted and generally accepted; however as we discussed at our recent meeting, it needs to be cross-referenced against the Economic Assessment (or similar) accompanying the DCO application to ensure consistency.	Section 5.3 of *The Economic and Social Impacts of Airport Operations Volume 4 of Manston Airport; National and Regional Aviation Asset*, by Azimuth Associated, dated July 2018 (part of the DCO submission) includes job forecasts by location, however, does not provide any level of detail that could be used for the TA. The approach undertaken for the purpose of the transport assessment, and reported in the TA was to develop a gravity model which resulted in the following distributions:) Thanet 76.16%

				• Remaining East Kent – 23.65% • West Kent – 0.2%
14.	It is not considered appropriate to distribute the Northern Grass area HGV trips on the same basis as the freight trips, as the nature of these businesses may be significantly different. It is considered that their catchment area is likely to be more localised.	The businesses on the Northern Grass Area will be complementary to the airport: 75% of the building areas will be warehouses which will support the proposed cargo facility, likely to comprise large scale and nationally focused businesses that will be looking to serve the South East. A relevant example is East Midlands Airport, the UK's second busiest cargo airport, handling more than 320,000 tonnes p.a. and is the UK hub for DHL and UPS, and support operations for TNT and Royal Mail. UPS has a current hub of 86,000sqft adjacent to the airport and intends to expand this to a 28.5 acre plot costing £114 million. This type of facility serves a wider area than just the local area - data in the Transport Assessment for the UPS planning application indicates that only 1-2% of the total HGVs generated by the site would have origins/destinations within an area local to the East Midlands Airport. This is reflective of the figure of 95% presented within the Manston Airport DCO Transport Assessment. It is clear that these large freight facilities constructed next to airports be that UPS, DHL, Amazon etc are regionally focused and for Manston London and the surrounding areas focused. There will be a smaller office element, but this does not generate significant HGvs and as such it not considered as important as the detailed set out above. This would be more locally focused as reflected in light vehicle trip distribution matrix.	**Response on 26th October 2018** I am not persuaded by this response, as again the geography of East Kent is not at all comparable to that of the East Midlands, which enjoys far superior connectivity to a catchment area encompassing many of England's largest towns and cities. It seems to me inevitable therefore that the nature of the businesses that will locate in the Northern Grass Area will be	**Response on 30th October 2018** This response seems to be based on opinion and ignores the fact that the Manston Airport proposal has been accepted as a Nationally Significant Infrastructure Project on the basis that there is a need for additional air freight capacity in the south east. The location of a distribution company such as UPS or DHL is linked to the opportunity that the cargo airport provides, and the

		materially different to DHL, UPS etc. in many cases.	road connectivity is less relevant. There is ample evidence of other cargo airports which have colocations of distribution companies.

Appendix 1

Appendix 1 (part 1)
Market Analysis to 2030

From the demand profiling work we undertook for our Interim Measures submission, we are confident that there are a number of niche's in the South East passenger market that Manston could help to address, not only in the medium term, but depending on future capacity development scenarios elsewhere, also in the period between 2025-50, which we are taking to correspond with the longer term.

Catchment Area

Using the most recent CAA survey data we have access to (from 2011 and 2012), we have been able to build up a picture of the nature and geographical distribution of existing demand within Manston's current core and extended catchment areas. These are illustrated in **Figure 1**, whose authenticity is verified by empirical evidence gathered during EU Jets operation from Manston in 2005, illustrated in **Figure 2**.

Figure 1: Manston Airports Catchment Area

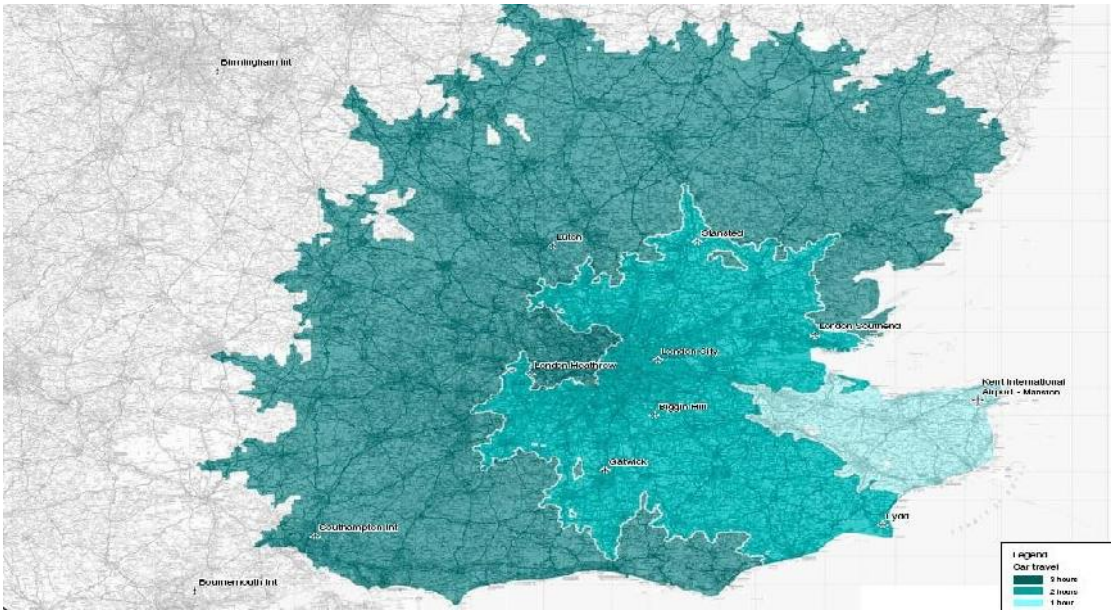

Figure 2: Distribution of EU Jet Passengers Using Manston in 2005

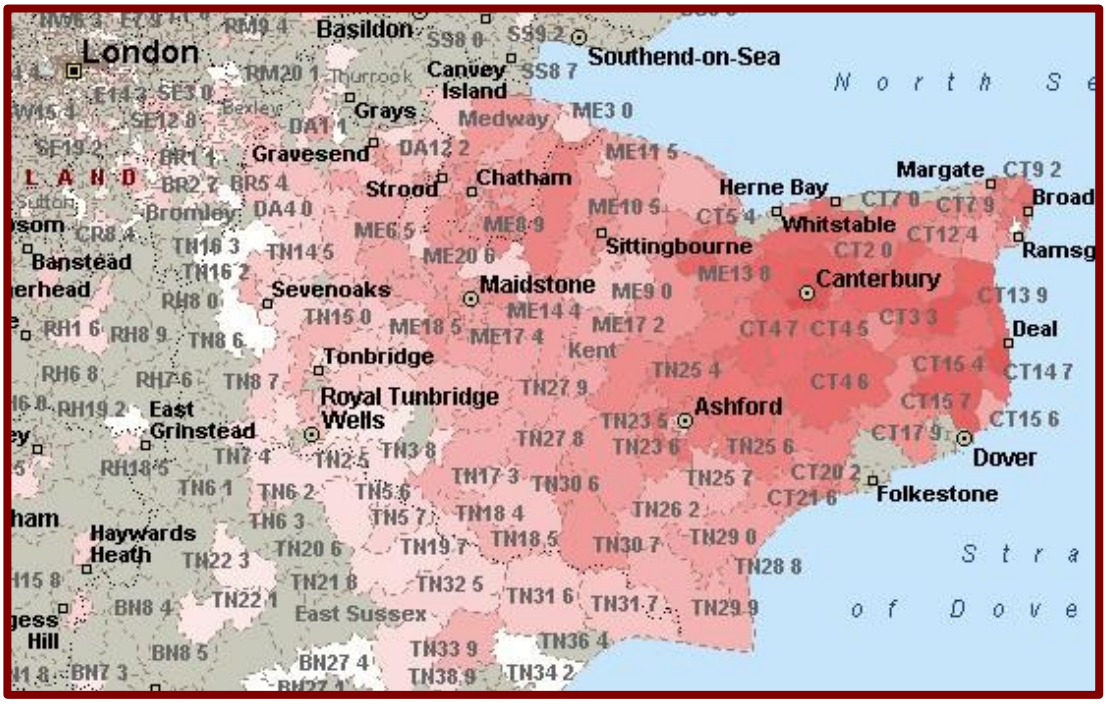

As can be seen, while the Airport's core catchment is focused in Kent within an area bounded by the M25 and M20, its wider (or contested catchment) expands beyond both into East Sussex and the outer London suburbs East and South East of the capital.

Based on this analysis, we sought to identify how many air travellers who use other airports in the London area, have their origins or destinations within Manston's catchment area. We looked at this first based on existing surface access infrastructure and associated travel times, and then extrapolated this based on assumptions about those links to be improved or extended. This then provided a useful platform for the second part of the analysis, which examined the picture painted by DfT's 2011 and 2013 forecasts, in terms of the potential scale and nature of the capacity shortfall facing the South East moving forwards, and the contribution Manston can potentially make to meeting some of that shortfall by targeting certain key markets. This in turn, then acts as a forerunner to a brief description of how Manston could be developed to meet this demand before setting out a series of generic and airport specific policy propositions that we consider necessary to facilitate Manston taking on this role.

It is worth pointing out at this juncture, that this approach has been driven by the absence of any DfT Forecasting model runs that have included Manston. We know that there are spare slots within the model to add airports, and we hope that the Commission will at the very least request DfT produce model outputs for Manston under a Constrained (or Max Use) scenario and one with one additional runway added either at Heathrow or Stansted by 2030 but with the surface access enhancements we outline later incorporated.

Demand Assessment

Figure 3 below, provides an overview of current demand density in the southernmost part of the UK. As can be seen, the level of demand for air travel emanating from Kent is comparable with other parts of the Home Counties around London, save for those immediately adjacent to Heathrow and Gatwick.

Figure 3: Density of Demand in the Southern Half of England and Wales

Source: CAA Data

Our analysis of O&D survey data collected from the other London airports, indicates that Manston's core and floating catchment areas currently generate demand of between 3.5-4.0m passengers per annum, depending on where the exact boundaries of the Airport's catchment is drawn (see **Table 1**).

Table 1: Leakage from Manston's Catchment

Total	**590,740**	**3,181,321**	**3,772,060**

However, from that same analysis and the fact that between 50-100,000 passengers are expected to use Manston this year, we know that most of this traffic is 'leaking' to other South East airports. The data suggests by far the largest percentage of this leaking traffic (around 85%) uses Gatwick and that much of it is leisure orientated (i.e. it is predominantly point-to-point and therefore not dependent on access to a hub airport such as Heathrow to be viable).

This is important, because in a Maximum Use scenario such as that the South East is likely to face until at least 2025, which is likely to be characterised by an increasing shortfall in capacity relative to demand, it is the premium hub airports such as Heathrow and Gatwick where capacity will be most constrained (see Appendix A). This also means that it is these airports where the price of access is likely to rise substantially, displacing thinner route domestic and short haul regional and low cost traffic serving routes with a high VFR/leisure content – a process that can be seen in action with Flybe's sale of its Gatwick slots, but also in Appendix B. It is exactly this traffic, where the journey's are point-to-point, frequency is less significant, airport charges need to be low, but speed and convenience of using an airport high that will have the greatest potential to move to alternative lower cost airports such as Manston.

Catchment Drawings

Figure 1: Catchment Area

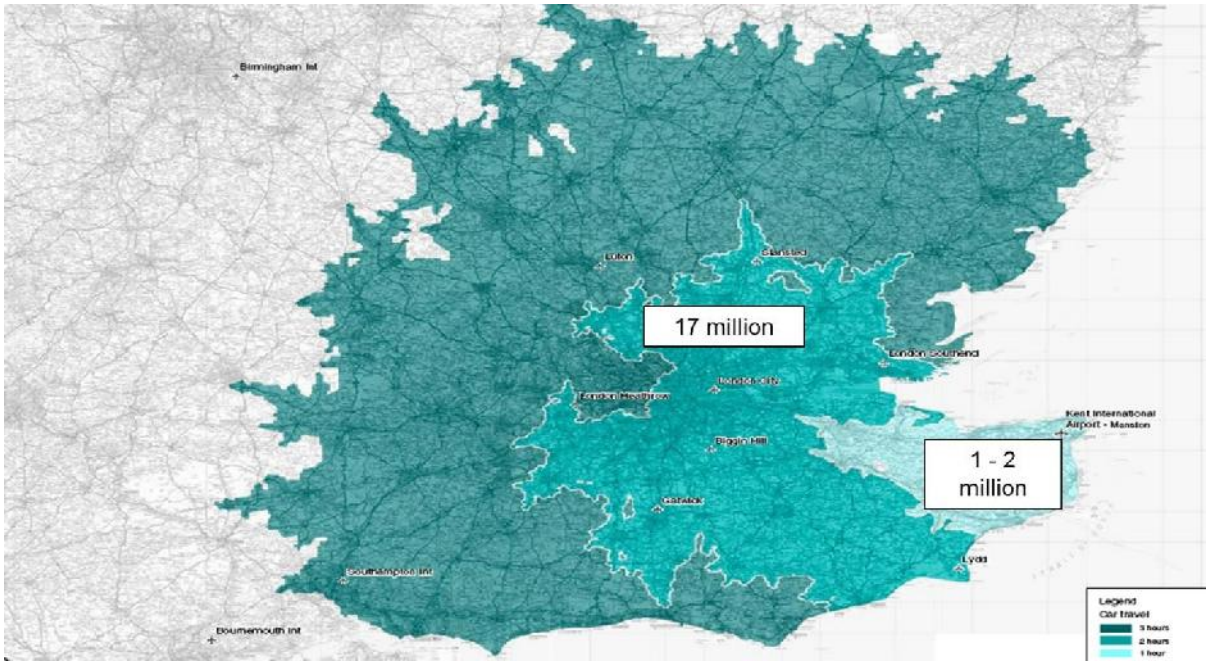

Figure 2: Current Market

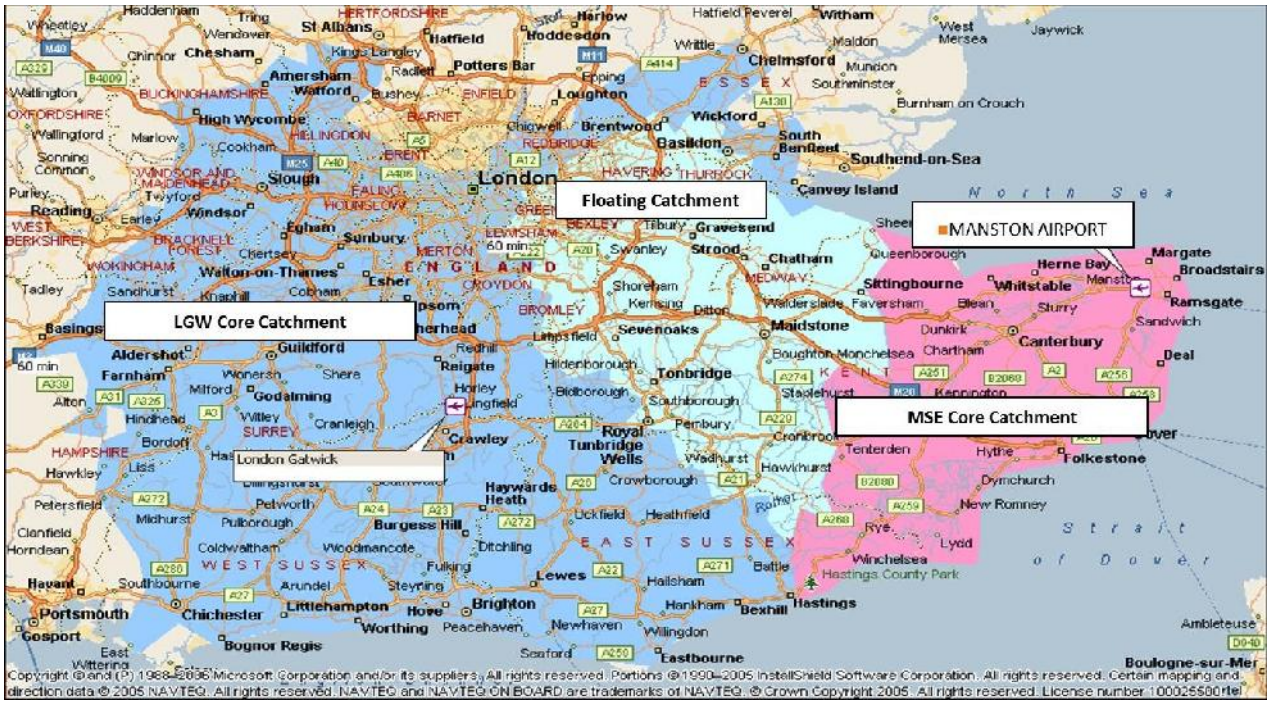

Figure 3: EUJet Actuals Data 2005

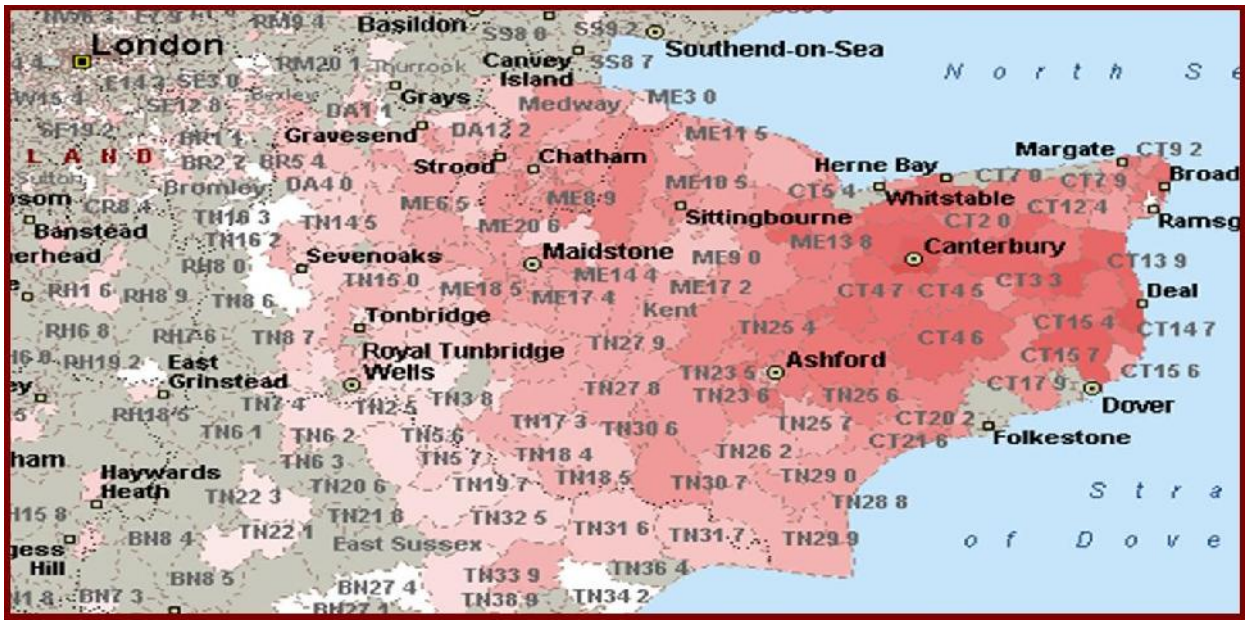

EUJet services confirmed the market response to services offered at MSE.

Catchment Analysis

Catchment Area:

- 'Core' catchment: area where passengers are more closely located to Manston than all other competing airports;
- 'Floating' catchment: area where drive times to/from Manston are similar to competing airports; and
- Level of market penetration is likely to be substantially lower in the floating catchment.

Catchment Population[1]:

- 'Core' is made up of 726,600 people and includes 6 districts within Kent;
- 'Floating' is made up of 889,800 people and covers 7 districts within Kent and East Sussex; and
- Total in 2007 was 1,616,400 people.

Total Passengers:

- C 4mppa, with most using LHR and LGW.

Technical Note

Revised Road Traffic Data and Air Quality Assessment

Manston Airport:
Revised Road Traffic Data and Air Quality Assessment

1. Introduction

1.1.1 The Environmental Statement (ES) [APP-033, 034, 035] supporting the application for a Development Consent Order (DCO) for Manston Airport was submitted in July 2018. This included an Air Quality assessment (Chapter 6).

1.1.2 At the time the application was submitted, the Kent County Council (KCC) Thanet Strategic Transport Model (TSTM), which supports the draft Thanet Local Plan, was being revised and was not available for third party use. It was the intention of the Applicant to apply the TSTM as soon as the model was available for third party use and this approach was agreed with KCC.

1.1.3 Since submission of the DCO application [APP-033, 034, 035], the Applicant has continued to engage with KCC with respect to the use of the model as well as consideration of their strategic plans as described in the Draft Thanet Local Plan and the KCC Transport Strategy. With the TSTM now available, the necessary data for sensitivity testing of the previous air quality modelling has now been generated.

1.1.4 Since road traffic can be a significant source of air pollution, often passing close to residential and other relevant receptors, it is necessary to consider whether the revised road traffic data will affect the air quality assessment. This note reviews the revised traffic data to determine whether further modelling to confirm the results of the ES Air Quality assessment is required.

2. Evaluation criteria

2.1.1 The Institute of Air Quality Management (IAQM) and Environmental Protection UK (EPUK) offer guidance[1] on when it is necessary to carry out an air quality assessment of planned developments that may affect road traffic. The guidance suggests thresholds for increases in traffic (comparing the with-development case against the without-development case). Although not designed for comparing different sets of modelling forecasts, it is not unreasonable to use them for this purpose.

2.1.2 The guidance relates to flows, in terms of annual average daily traffic (AADT) of light duty vehicles (LDVs) and heavy-duty vehicles (HDVs) and considers whether the road is within an Air Quality Management Area (AQMA) or not. It suggests that an air quality assessment is required if there is:

- a change of LDV flows more than 100 AADT within or adjacent to an AQMA;
- a change of LDV flows more than 500 AADT elsewhere;
- a change of HDV flows more than 25 AADT within or adjacent to an AQMA; or
- a change of HDV flows more than 100 AADT elsewhere.

[1] IAQM and EPUK (2017) Land-Use Planning & Development Control: Planning For Air Quality. v1.2.

3. Review of traffic data

3.1.1 There is an AQMA to the east of the Proposed Development covering much of the urban area of Thanet, and a number of roads that are likely to be affected by the Proposed Development are in or close to the AQMA. Other roads that are likely to be affected by Proposed Development are sufficiently far from the AQMA that they are unlikely to have a significant impact on receptors within the AQMA. Therefore, the IAQM/EPUK criteria have been applied to the links depending on whether they are in or close to an AQMA or not.

3.1.2 Comparing the new traffic flows to those in the ES traffic data, six of the 21 road links considered have increases in traffic that meet the criteria for requiring further assessment.

3.1.3 In addition, new the traffic data covers a larger number of road links than the ES traffic data: 52 against 21. Considering the new traffic data in isolation and comparing the With Proposed Development traffic to the Without Proposed Development scenarios, approximately 60% of the road links meet the criteria for assessment using the new traffic flows.

4. Likely impacts

4.1.1 Preliminary modelling with the revised traffic data for Year 20 suggests that there may increases in concentrations at receptors along Spitfire Way (B2190) and Manston Road. The high concentration is largely due to non-airport related road traffic along the upgraded road, with the modelled concentration from the Proposed Development relatively small.

4.1.2 Of the other specifically-modelled human receptors, a number experience different impacts compared to the modelling in the ES, where impacts are classified according to guidance from the Institute of Air Quality Management and Environmental Protection UK[2]. Preliminary modelling suggests nine receptors are classified as having moderate impacts due to the Proposed Development, compared with two in the ES. A further 28 receptors are classified as having slight impacts due to the Proposed Development, compared with 23 in the ES. Although some receptors experience lower concentrations with the preliminary revised modelling, no receptors are reclassified from moderate to slight, or from slight to negligible. At a majority of the modelled receptors, the NO_2 concentration is higher with the revised traffic data than in the ES.

5. Conclusion

5.1.1 It is concluded that a full sensitivity test of the air quality and noise assessments using the new traffic data is required, because:

- The differences between the new traffic data and the ES traffic data cannot be considered to be negligible;
- The differences between the With Proposed Development traffic and the Without Proposed Development scenarios in the new traffic data cannot be considered negligible; and
- A larger number of road links have been modelled.

[2] EPUK and IAQM (2017) Land-use Planning and Development Control: Planning for Air Quality, v1.2.

5.1.2 Due to the late availability of AADT link flow data it has not been possible to carry out the additional modelling for this submission. As such the additional modelling and sensitivity testing of the ES Assessment will be submitted at Deadline 6.

Revised Traffic Data and Noise Impact Assessment

Manston Airport:
Revised Traffic Data and Noise Impact Assessment

1. Introduction

1.1.1 The Environmental Statement (ES) [APP-033, 034, 035] supporting the application for a Development Consent Order (DCO) for Manston Airport was submitted in July 2018. This included a Noise Assessment (Chapter 12).

1.1.2 At the time the application was submitted, the Kent County Council (KCC) Thanet Strategic Transport Model (TSTM), which supports the draft Thanet Local Plan, was being revised and was not available for third party use. It was the intention of the Applicant to apply the TSTM as soon as the model was available for third party use and this approach was agreed with KCC.

1.1.3 Since submission of the DCO application [APP-033, 034, 035], the Applicant has continued to engage with KCC with respect to the use of the model as well as consideration of their strategic plans as described in the Draft Thanet Local Plan and the KCC Transport Strategy. With the TSTM now available, the necessary data for sensitivity testing of the previous noise assessment has now been generated.

1.1.4 The Manston scoping report included road traffic as a noise source to be assessed in the ES [App-033,034,035]. No significant effects for noise from road traffic were reported in Chapter 12.

1.1.5 It is necessary to consider whether the revised road traffic data has the potential to produce adverse impacts upon noise sensitive receptors. This note reviews the revised traffic data to determine whether a more detailed road traffic noise assessment is required.

2. Evaluation criteria

2.1.1 With respect to Noise, the assessment procedure follows the advice set by The Highways Agency (now Highways England), Design Manual for Roads and Bridges (DMRB).

2.1.2 The extents of the road traffic noise model are consistent with the guidance set out within DMRB, being dictated by both distances from 'affected routes' and the likely magnitude of change on those routes. The affected routes are generally defined as:

- All routes that have been bypassed or improved, any proposed new routes or where the road has altered the alignment of any existing carriageway;
- All road segments that were predicted to experience a 25% increase or 20% decrease in vehicle flows, and/or a noticeable change in %HGV content;
- All routes where there has been a change in traffic speed or proportion of heavy goods vehicles which would lead to a 1dB change in road traffic noise levels; and
- Construction traffic haul routes (on public roads).

3. Review of traffic data

3.1.1 As a result of the revised traffic data, a further 30 road links require analysis as well as an amendment to the traffic distribution on the previously assessed links.

3.1.2 Sensitivity testing has been carried out on the traffic data, comparing the road traffic distribution both with and without the development. Results of the sensitivity testing has been illustrated in three figures:

- **Figure 12.22** – Predicted increase in road noise resulting from Manston operational traffic – Year 2;
- **Figure 12.23** – Predicted increase in road noise resulting from Manston operational traffic – Year 6; and
- **Figure 12.24** – Predicted increase in road noise resulting from Manston operational traffic – Year 20.

4. Likely impacts

4.1.1 **Figures 12.22** to **12.24** detail the change in noise level for Year 2, 6 and 20 respectively, visualising road links which require further assessment.

Year 2

4.1.2 **Figure 12.22** details that there are no links which are likely to exceed a change of 1dB during the daytime, as a result of development traffic.

4.1.3 During the night-time, there are 7 links which are likely to exceed a change of 1dB due to development traffic and would therefore require further assessment. These links have the potential to impact receptors off Minster Road, Spitfire Way, Bell Davies Drive and Manston Court Road.

Year 6

4.1.4 **Figure 12.23** details that there are 12 links which are likely to exceed a change of 1dB during the daytime, as a result of development traffic. These links have the potential to impact receptors off Spitfire Way, Bell Davies Drive, Manston Road, Manston Court Road and Star Lane. Therefore, further assessment is required.

4.1.5 During the night-time, there are 5 links which exceed a change of 1dB due to development traffic and would therefore require further assessment. These links have the potential to impact receptors off Manston Road, Manston Court Road and Star Lane.

Year 20

4.1.6 **Figure 12.24** details that there are 6 links which are likely to exceed a change of 1dB during the daytime, as a result of development traffic. These links have the potential to impact receptors off Bell Davies Drive and Manston Road. Therefore, further assessment is required.

4.1.7 During the night-time, there are 10 links which are likely to exceed a change of 1dB due to development traffic and would therefore require further assessment. These links have the potential to impact receptors off Minster Road, Spitfire Way, Bell Davies Drive and Manston Road.

5. Conclusion

5.1.1 An assessment of the revised traffic model has identified a number of road links which could be subject to a greater than 1dB change in noise level as a result of the Proposed Development. This was the screening criterion used for triggering a need to undertake a more detailed noise assessment as set out in our assessment methodology contained in the ES [APP-033,034,035].

5.1.2 It is therefore concluded that furthermore detailed road traffic noise assessment is required to supplement the ES chapter on noise because of the revised traffic data.

5.1.3 It is expected that revised modelling to confirm the findings of the ES will be submitted at Deadline 6.
